System Manual

11/2022

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Table of contents

Installation 1

1.1 Notes on the installation

Content

Information that could not be included in the online help and important information about product characteristics.

Installation in a virtual environment (private cloud)

You can find instructions on how to install TIA Portal in a virtual environment (private cloud) on the installation data medium in the directory "Documents\Readme\<language directory>". You can open the PDF document "TIAPortalCloudConnectorHowTo<language ID>.pdf" here.

Automatic installation

A description of automated installation is available on the product DVD in the directory "Documents\Readme\<Language directory>".

Use of the same versions of TIA Portal products during installation

When installing different TIA Portal products, make sure that you use the same versions of service packs and updates for the installation. For example, if you have installed SP1 for STEP 7 V13, you must also install SP1 for WinCC V13. The service packs and updates must be installed for all products at the same time. Do not start TIA Portal until all products have been upgraded.

You can download the service packs from the Internet under Siemens Industry Online Support (https://support.industry.siemens.com/cs/de/en/).

Target directory of the installation

Do not use any UNICODE characters (for example, Chinese characters) in the installation path.

The installation path cannot be changed after installing one of the TIA Portal products.

Security settings for the installation of WinCC

When you install WinCC, security settings are changed in your operating system. These security settings are listed during the installation.

You must confirm the changes to the security settings.

If you make changes to your operating system after installing it, the security settings can be changed by installing TIA Portal.

You can restore the security settings by installing TIA Portal as follows:
"Start > All Programs > Siemens Automation > Security Controller > Restore settings".

Use of antivirus programs

During the installation, read and write access to already installed files is necessary. Some antivirus programs block this access. Therefore, configure your antivirus program for the installation of TIA Portal so that access to these files is possible.

Installation of PCT V3.5.2

PCT V3.5.1 is automatically uninstalled with the installation of TIA Portal V18.

If necessary, install PCT V3.5.2 manually from DVD 2.

FAQs on TIA Portal

FAQs on TIA Portal are available under FAQs.

1.2 Licensing

1.2.1 Notes on licenses

Availability of licenses

The licenses for the products of the TIA Portal are shipped on an installation data medium or via online software delivery (OSD).

Before you uninstall the TIA Portal, you must transfer and back up the licenses still required. Use the Automation License Manager for this purpose.

Provision of the Automation License Manager

The Automation License Manager is supplied on the installation data medium and is transferred automatically during the installation process.

If you uninstall the TIA Portal, the Automation License Manager remains installed on your system.

Working with the Automation License Manager

The Automation License Manager is a product of Siemens AG, which is used for handling license keys (technical representatives of licenses).

Software products that require license keys for operation, such as the TIA Portal, register the need for license keys automatically with the Automation License Manager . If the Automation License Manager finds a valid license key for this software, the software can be used according to the license usage terms associated with this license key.

Note

For additional information on how to manage your licenses with the Automation License Manager , refer to the documentation supplied with the Automation License Manager .

1.2.2 Licensing STEP 7 and WinCC

Introduction

You require a License Key to license the following STEP 7 editions:

- STEP 7 Basic
- STEP 7 Professional

You can install the corresponding License Key for STEP 7 using the Automation License Manager after the installation has been completed.

There are other licenses available for the optional packages of STEP 7. You can get detailed information in the documentation of the corresponding option package.

You can transfer the corresponding license keys for STEP 7 and STEP 7 options after the installation with the Automation License Manager.

For licensing the following editions in WinCC, you need a License Key:

- WinCC Engineering System
- WinCC Runtime
- Options for WinCC Engineering System
- Options for WinCC Runtime system

You transfer licenses for WinCC and the WinCC add-ons after installation with the Automation License Manager.

Note

The licensee also recognizes that the software (SW) from the Microsoft Corporation or subsidiaries contains licensed software. The licensee hereby agrees to be bound by and comply with the terms of the attached license agreement between Microsoft SQL Server and End User.

Licenses

The following licenses with the corresponding License Keys are available:

- STEP 7 Basic
- STEP 7 Professional
- STEP 7 Professional Combo

- WinCC Basic
- WinCC Comfort
- WinCC Comfort Combo
- WinCC Advanced
- WinCC Advanced Combo
- WinCC Professional
- WinCC Professional Combo
- WinCC Unified Basic Engineering
- WinCC Unified Comfort Engineering
- WinCC Unified PC Engineering
- WinCC RT Advanced
- WinCC RT Professional
- WinCC Unified PC Runtime

Usage possibilities of licenses and devices

The following table shows which devices you can use with which license:

Existing license	**Devices that can be used**						
	Unified Devices			Classic Devices			
	WinCC Unified PC	Comfort Panels	Basic Panels	RT Professional	RT Advanced	Comfort Panels	Basic Panels
WinCC Unified Basic ES**	No	No	Yes	No	No	No	Yes
WinCC Unified Comfort ES	No	Yes	Yes	No	No	Yes	Yes
WinCC Unified PC 10k ES	Yes (10k*)	Yes	Yes	No	Yes	Yes	Yes
WinCC Unified PC 100k ES	Yes (100k*)	Yes	Yes	Yes	Yes	Yes	Yes
WinCC Unified PC max ES	Yes	Yes	Yes	Yes	Yes	Yes	Yes
WinCC Basic	No	No	Yes	No	No	No	Yes
WinCC Comfort	No	Yes	Yes	No	No	Yes	Yes
WinCC Advanced	Yes (10k*)	Yes	Yes	No	Yes	Yes	Yes
WinCC Professional 512	Yes (10k*)	Yes	Yes	Yes (512*)	Yes	Yes	Yes
WinCC Professional 4096	Yes (10k*)	Yes	Yes	Yes (4096*)	Yes	Yes	Yes
WinCC Professional max	Yes (100k*)	Yes	Yes	Yes	Yes	Yes	Yes

* Maximum possible number of PowerTags

** Released with HSP.

Validity of license keys for older versions of STEP 7

With a valid License Key for V18.x of STEP 7 Professional and STEP 7 Professional Combo, you can also operate older versions of STEP 7 without restrictions. The following table provides more detailed information about this:

Edition	License	Valid for
STEP 7 Basic V18.x	STEP 7 Basic	• STEP 7 Basic V18.x • STEP 7 Basic V17.x • STEP 7 Basic V16.x • STEP 7 Basic V15.x • STEP 7 Basic V14.x • STEP 7 Basic V13.x • STEP 7 Basic V12.x • STEP 7 Basic V11.x
STEP 7 Professional V18.x	STEP 7 Professional	• STEP 7 Professional V18.x • STEP 7 Professional V17.x • STEP 7 Professional V16.x • STEP 7 Professional V15.x • STEP 7 Professional V14.x • STEP 7 Professional V13.x • STEP 7 Professional V12.x • STEP 7 Professional V11.x • STEP 7 Basic V18.x • STEP 7 Basic V17.x • STEP 7 Basic V16.x • STEP 7 Basic V15.x • STEP 7 Basic V14.x • STEP 7 Basic V13.x • STEP 7 Basic V12.x • STEP 7 Basic V11.x

Edition	License	Valid for
STEP 7 Professional V18.x	STEP 7 Professional Combo	• STEP 7 Professional V18.x • STEP 7 Professional V17.x • STEP 7 Professional V16.x • STEP 7 Professional V15.x • STEP 7 Professional V14.x • STEP 7 Professional V13.x • STEP 7 Professional V12.x • STEP 7 Professional V11.x • STEP 7 Basic V18.x • STEP 7 Basic V17.x • STEP 7 Basic V16.x • STEP 7 Basic V15.x • STEP 7 Basic V14.x • STEP 7 Basic V13.x • STEP 7 Basic V12.x • STEP 7 Basic V11.x • STEP 7 V5.6 • STEP 7 V5.5 • STEP 7 V5.4 • STEP 7 Professional 2017 • STEP 7 Professional 2010 • STEP 7 Professional 2006

Validity of license keys for older versions of WinCC

With a valid License Key for WinCC V18.x, you can also operate older versions of WinCC without restrictions.

You can find more detailed information in the following table:

WinCC Engineering System

Edition	License	Valid for
WinCC Basic V18.x	WinCC Basic	• WinCC Basic V18.x • WinCC Basic V17.x • WinCC Basic V16.x • WinCC Basic V15.x • WinCC Basic V14.x • WinCC Basic V13.x • WinCC Basic V12.x • WinCC Basic V11.x • WinCC Unified Basic V18.x*

Validity of licenses for WinCC options

WinCC options with version-independent license keys can also be used for future versions.

Starting without a valid license key

If you start the TIA Portal without a valid License Key , the system alerts you that you are working in non-licensed mode. You have the one-time option of activating a Trial License. However, this license is valid for a limited period only and expires after 21 days.

When the Trial License expires, the following scenarios can occur:

- TIA Portal has never been licensed on the PC in question:
  - No license-based actions can be performed in the TIA Portal.
- TIA Portal was already licensed on the PC in question:
  - A window requiring acknowledgment presents an alert for non-licensed mode every 10 minutes and for every action requiring a license.

License requirement for simulation In STEP 7

You do not require additional licenses when you use the menu command "Online > Simulation" to start the simulation in STEP 7.

If the following conditions are met, you need the appropriate licenses for the edition of STEP 7 that you have installed, even for the simulation:

- The connection to the PLC is configured and active.

License requirement for simulation In WinCC Runtime

If the following conditions are fulfilled, you also need the appropriate licenses for WinCC Runtime and for licensed options for the simulation:

- Start the simulator with the menu command "Online > Simulation".

If you do not have a valid license, you can activate the simulation for one hour.

Licenses for the TIA Portal Cloud Connector

For working with the TIA Portal Cloud Connector, you need a valid License Key for each device that you specify as "User device" in the TIA Portal Cloud Connector. The License Key is also required if the TIA Portal is installed on this device. A License Key is not required for devices that you are using as "remote device".

1.2.3 Licensing of WinCC Unified options

1.2.3.1 Logging

Logging

You have two options for logging your data in WinCC Unified:

- File-based logging
- Database-based logging

File-based logging

File-based logging allows you to log up to 5000 logging tags in an SQL Lite database.

Requirement

WinCC Unified Comfort Panel:

- You need a WinCC Unified Engineering System (ES) license for configuring.
- No license is required for logging.

WinCC Unified PC:

- You need a WinCC Unified Engineering System (ES) license for configuring.
- You need a WinCC Unified Runtime (RT) license for logging.

Licensing

To log up to a maximum of 5000 logging tags you need one or more licenses depending on the number of tags to be logged. To do this, refer to the licenses in the table below.

Upgrade

You do not need an upgrade license for logging when you upgrade the system.

Trial

If you do not have a valid license, you can configure the logging tags in trial mode.

Database-based logging

Database-based logging allows you to log all logging tags up to the high limit in an MS SQL database.

Requirement

WinCC Unified Comfort Panel:

- Not available

WinCC Unified PC:

- You need a WinCC Unified Engineering System (ES) license for configuring.
- You need a WinCC Unified Runtime (RT) license for logging.

Licensing

Besides the functionality, database-based logging also includes an MS SQL server. Therefore, you need the "WinCC Unified Database Storage" license.

You also need one or more license(s) according to the number of tags to be logged. To do this, refer to the licenses in the table below.

File-based or database-based licenses

The license(s) required for the number of tags to be logged can be found in the table below:

License[1]	Number of logging tags	File-based	Database-based
WinCC Unified PC 100 Logging Tags	100	X	X
WinCC Unified PC 500 Logging Tags	500	X	X
WinCC Unified PC 1000 Logging Tags	1000	X	X
WinCC Unified PC 5000 Logging Tags	5000	X	X
WinCC Unified PC 10000 Logging Tags	10000	---	X

License[1]	Number of logging tags	File-based	Database-based
WinCC Unified PC 30000 Logging Tags	30000	---	X
WinCC Unified Database Storage[2]	---	Not required	X

[1] You can cumulate the logging tag licenses. This means that the sum of licenses corresponds to the number of tags that need to be logged.

[2] The license allows logging in the MS SQL database.

Upgrade

Depending on the MS SQL server, an upgrade license for WinCC Unified Database Storage may be required when upgrading the system.

Old licenses must be updated if required.

Trial

No trial mode is available for database-based logging.

1.2.3.2 Parameter sets

Parameter sets

Requirement

WinCC Unified Comfort Panel:

- You need a WinCC Unified Engineering System (ES) license for configuring.

WinCC Unified PC:

- You need a WinCC Unified Engineering System (ES) license for configuring.
- You need a WinCC Unified Runtime (RT) license for use in runtime.

Licensing

To use parameter sets on a Runtime PC, you need a license:

License	WinCC Unified PC	WinCC Unified Comfort Panel
WinCC Unified Parameter Control (PC)	X	Not required

Upgrade

The license is version dependent and requires the corresponding upgrade license for the upgrade.

Trial

If you do not have a valid license, you can configure the parameter sets in trial mode.

1.2.3.3 Process diagnostics

Process diagnostics

Requirement

WinCC Unified PC:

- You need a WinCC Unified Engineering System (ES) license for configuring.
- You need a WinCC Unified Runtime (RT) license for use in runtime.

Licensing

To use process diagnostics on a Runtime PC, you need a license:

License	WinCC Unified PC	WinCC Unified Comfort Panel
WinCC Unified ProDiag	X	Not required

Trial

If you do not have a valid license, you can configure the process diagnostics in trial mode.

1.2.3.4 Client

Requirement

WinCC Unified Comfort Panel:

- You need a WinCC Unified Engineering System (ES) license for configuring.
- A WinCC Unified Comfort Panel can be accessed by a maximum of 3 simultaneous remote access operations.
- The license for first access is free of charge.
- The use of remote access must be approved in the firmware.

Licensing

For remote access, you need a license depending on the number and type of accesses. The required license is listed in the table below:

	Monitoring only	Operator control and monitoring
WinCC Unified Panel Client Monitor (1)	X	---
WinCC Unified Panel Client Operate (1)	---	X

Requirement

WinCC Unified PC:

- You need a WinCC Unified Engineering System (ES) license for configuring.
- You need a WinCC Unified Runtime (RT) license for use in runtime.

The following client functions are included in the license for WinCC Unified Runtime:

- Two accesses for operator control and monitoring (two local accesses or one local and one remote access)
- One access for monitoring (one local access or one remote access)

Licensing

For remote access, you need a license depending on the number and type of accesses. The required license is listed in the table below:

	Monitoring only	Operator control and monitoring
WinCC Unified Client Monitor (1)	X	---
WinCC Unified Client Monitor (3)	X	---
WinCC Unified Client Monitor (10)	X	---
WinCC Unified Client Monitor (30)	X	---
WinCC Unified Client Monitor (100)	X	---
WinCC Unified Client Operate (1)	---	X
WinCC Unified Client Operate (3)	---	X
WinCC Unified Client Operate (10)	---	X
WinCC Unified Client Operate (30)	---	X
WinCC Unified Client Operate (100)	---	X

Upgrade

The license is version independent and does not require any upgrade to a new version.

Trial

If you do not have a valid license, you can configure the client in trial mode.

1.2.3.5 Reporting

Reporting

Requirement

WinCC Unified Comfort Panel:

- You need a WinCC Unified Comfort (ES) license for configuring.
- You need a WinCC Unified Runtime (RT) license for use in runtime.

WinCC Unified PC:

- You need a WinCC Unified Engineering System (ES) license for configuring.
- You need a WinCC Unified Runtime (RT) license for use in runtime.

Licensing

You do not need a license to configure the Reporting option.

License

The option license "Configuration and manual Report Execution" is included in the WinCC Unified Engineering System and WinCC Unified RT licenses.

You need the "WinCC Unified Report Execution" license for automatic execution of Reporting (time, event).

License	WinCC Unified Comfort Panel	WinCC Unified PC
WinCC Unified Report Execution	X	X

Upgrade

The license is version dependent and requires the corresponding upgrade license for the upgrade.

Trial

If you do not have a valid license, you can configure the Reporting option in trial mode.

1.2.3.6 Openness

Openness

Requirement

WinCC Unified PC:

- You need a WinCC Unified Engineering System (ES) license for configuring.
- You need a WinCC Unified Runtime (RT) license for use in runtime.

Licensing

No license is required for the Openness option.

Upgrade

No license is required for the upgrade.

Trial

If you do not have a valid license, you can configure the Openness option in trial mode.

1.2.3.7 Unified Collaboration

Unified Collaboration

Requirement

WinCC Unified Comfort Panel:

- You need a WinCC Unified Engineering System (ES) license for configuring.
- You need a WinCC Unified Runtime (RT) license for use in runtime.

WinCC Unified PC:

- You need a WinCC Unified Engineering System (ES) license for configuring.
- You need a WinCC Unified Runtime (RT) license for use in runtime.

Licensing

You do not need a license to configure the Unified Collaboration option.

You need a license for each device involved to use the Unified Collaboration option.

License	WinCC Unified Comfort Panel	WinCC Unified PC
WinCC Unified Collaboration	X	X

Upgrade

The license is version dependent and requires the corresponding upgrade license for the upgrade.

Trial

If you do not have a valid license, you can configure the Unified Collaboration option in trial mode.

1.2.3.8 Audit

Audit

Requirement

WinCC Unified Comfort Panel:

- You need a WinCC Unified Engineering System (ES) license for configuring.
- You need a WinCC Unified Runtime (RT) license for use in runtime.

WinCC Unified PC:

- You need a WinCC Unified Engineering System (ES) license for configuring.
- You need a WinCC Unified Runtime (RT) license for use in runtime.

Licensing

You do not need a license to configure the Audit option.

You need a license to use the Audit option in runtime.

License

You can use the following licenses for the Audit option in WinCC Runtime:

License	Description
WinCC Unified Audit Basis	Secured communication Logging the Audit Trail Recording of process data changes (automatically, via script or system function) Confirmation with / without comment Exporting Audit Trail entries Audit Trail report and tamper indication Logging in and logging out Audit Trail entries Simple electronic signature Backing up and restoring Audit Trail database segments
WinCC Unified Audit Enhanced	In addition: Multiple electronic signature (2 persons) Display and analysis of the Audit Trail in the Audit Viewer Alias name for tag names

You need a license for each device involved to use the Audit option.

License	WinCC Unified Comfort Panel	WinCC Unified PC
WinCC Unified Audit Basis	X	X
WinCC Unified Audit Enhanced	X	X

Upgrade

The license is version dependent and requires the corresponding upgrade license for the upgrade.

Trial

If you do not have a valid license, you can configure the Audit option in trial mode.

1.2.4 Licensing of Plant Intelligence options

1.2.4.1 Calendar

Requirement

WinCC Unified PC:

- You need a WinCC Unified Engineering System (ES) license for configuring.
- You need a WinCC Unified Runtime (RT) license for the Calendar PI option in Runtime.

Licensing

You do not need an additional license to configure the Calendar PI option.

You need the following licenses to use the Calendar PI option in Runtime:

License	Description
WinCC Unified Calendar Base	Per server: • Three independent basic calendars • Unlimited number of derived calendars • Unrestricted use of the option • Version-based
WinCC Unified Calendar Extension (1)*	• One additional basic calendar

* Valid per extension, is independent of version and cumulative

Example:

WinCC Unified Calendar Base + WinCC Unified Calendar Extension (1) → 3 + 1 = 4

Upgrade

When upgrading to the next higher version, you need a WinCC Unified Calendar Base Upgrade license.

On the other hand, the WinCC Unified Calendar Extension (1) license is version-independent.

Trial

If you do not have a valid license, you can configure the Calendar PI option in trial mode.

1.2.4.2 Performance Insight

Requirement

WinCC Unified PC:

- You need a WinCC Unified Engineering System (ES) license for configuring.
- You need a WinCC Unified Runtime (RT) license for the Performance Insight PI option in Runtime.

Licensing

You do not need an additional license to configure the Performance Insight PI option.

You need the following licenses to use the Performance Insight PI option in Runtime:

License	Description
WinCC Unified Performance Insight Base	Per server: • Three analyzed plant objects • Unrestricted use of the option • Version-based
WinCC Unified Performance Insight Extension (10)*	• 10 additional analyzed plant objects
WinCC Unified Performance Insight Extension (30)*	• 30 additional analyzed plant objects

License	Description
WinCC Unified Performance Insight Extension (100)*	• 100 additional analyzed plant objects
WinCC Unified Performance Insight Extension (300)*	• 300 additional analyzed plant objects

* Valid per extension, is independent of version and cumulative

Example:

WinCC Unified Performance Insight Base + WinCC Unified Performance Insight Extension(10) → 3 + 10 = 13

WinCC Unified Performance Insight Base + WinCC Unified Performance Insight Extension (10) + WinCC Unified Performance Insight Extension (30) → 3 + 10 + 30 = 43

Upgrade

When upgrading to the next higher version you need a WinCC Unified Performance Insight Base Upgrade license.

On the other hand, the WinCC Unified Performance Insight Extension licenses are version-independent.

Trial

If you do not have a valid license, you can configure the Performance Insight PI option in trial mode.

1.2.4.3 Sequence

Requirement

WinCC Unified PC:

- You need a WinCC Unified Engineering System (ES) license for configuring.
- You need a WinCC Unified Runtime (RT) license for the Sequence PI option in Runtime.

Licensing

You do not need an additional license to configure the Sequence PI option.

You need the following licenses to use the Sequence PI option in Runtime:

License	Description
WinCC Unified Sequence Base	Per server: • 3 concurrent equipment modules • Unrestricted use of the option • Version-based
WinCC Unified Sequence Extension (5)*	• 5 additional concurrent equipment modules

* Valid per extension, is independent of version and cumulative

Example:

WinCC Unified Sequence Base + WinCC Unified Sequence Extension(5) → 3 + 5 = 8

WinCC Unified Sequence Base + WinCC Unified Sequence Extension (5) + WinCC Unified Sequence Extension (5) → 3 + 5 + 5 = 13

Upgrade

When upgrading to the next higher version you need a new WinCC Unified Sequence Base Upgrade license.

On the other hand, the WinCC Unified Sequence Extension (5) license is version-independent.

Trial

If you do not have a valid license, you can configure the Sequence PI option in trial mode.

1.2.4.4 Line Coordination

Requirement

WinCC Unified PC:

- You need a WinCC Unified Engineering System (ES) license for configuring.
- You need a WinCC Unified Runtime (RT) license for the Line Coordination PI option in Runtime.

Licensing

You do not need an additional license to configure the Line Coordination PI option.

You need the following licenses to use the Line Coordination PI option in Runtime:

License	Description
WinCC Unified Line Coordination Base	Per server: • 3 units • Unrestricted use of the option • Version-based
WinCC Unified Line Coordination Extension (5)*	• 5 units
WinCC Unified Line Coordination Extension (10)*	• 10 units
WinCC Unified Line Coordination Extension (50)*	• 50 units

* Valid per extension, is independent of version and cumulative

Example:

WinCC Unified Line Coordination Base + WinCC Unified Line Coordination Extension (5) → 3 + 5 = 8

WinCC Unified Line Coordination Base + WinCC Unified Line Coordination Extension (5) + WinCC Unified Line Coordination Extension (10)

→ 3 + 5 + 10 = 18

Upgrade

When upgrading to the next higher version you need a new WinCC Unified Line Coordination Base Upgrade license.

On the other hand, the WinCC Unified Line Coordination Extension licenses are version-independent.

Trial

If you do not have a valid license, you can configure the Line Coordination PI option in trial mode.

1.2.5 Handling licenses and license keys

Introduction

You need a valid License Key in each case to use STEP 7 Basic, STEP 7 Professional as well as WinCC Engineering System, options for WinCC Engineering System and WinCC Runtime.

NOTICE
Destruction of license keys by copying
A License Key cannot be copied. The copy protection prevents the License Keys from being copied. If there is an attempt to copy a License Key, the License Key gets destroyed.

Trial License

If you start the TIA Portal without a valid License Key, the system alerts you that you are working in non-licensed mode. You can activate a trial license once. The trial license expires after 21 days.

When the trial license has expired, the TIA Portal only runs with restrictions. For the full version of the TIA Portal, you need to purchase the corresponding license.

Installing license keys for STEP 7 and WinCC

Install the license with the Automation License Manager from the accompanying data storage medium to your PC.

You need additional License Keys to use WinCC Runtime or simulation on the Engineering-PC with the menu command "Online > Simulation > Start". You need to use Automation License Manager for this.

When you install a license, the relevant License Key will be removed from the original storage location of the License Keys.

Transferring license keys to the HMI device

You must transfer the License Keys to the HMI device to operate WinCC.

You transfer a License Key to the HMI device in the following cases:

- To operate WinCC Runtime
- To use add-ons for WinCC Runtime

When you transfer a license to an HMI device, the associated License Key is removed from the License Keys storage location.

If you no longer need the license or want to back up data, you must transfer the License Keys from the operator panel. You can then use this license on another PC or HMI device.

Uninstalling license keys

License Keys are always uninstalled using the Automation License Manager. Call the Automation License Manager before uninstalling

and back up the license key to be uninstalled to another storage location.

You uninstall a License Key in the following cases:

- When backing up data.
- If you no longer require the license.

You can also use a valid license on another PC.

Modification to the data media of the engineering system

Modifying the data medium of the engineering system can destroy the License Key. To do this before such modifications, open the Automation License Manager and back up License Key to be uninstalled to another storage location.

NOTICE
Destruction of license keys on PCs If one of the following cases applies, first, uninstall all License Keys : • Format the hard disk • Compress the hard disk • Restore the hard disk • Start an optimization program that moves fixed blocks • Install a new operating system Read the description of Automation License Manager ("Start > Siemens Automation > Documentation"). Comply with all warnings and notices.

Data backup of operating panels (Backup/Restore)

When backing up data on the HMI device, remove the License Keys on the HMI device. To do this, open the Automation License Manager and back up the License Key to another storage location.

NOTICE
Destruction of license keys on non-PC-based HMI devices License keys transferred as a result of backup/restore operations are destroyed in the case of the following HMI devices: • 270s series • 370s series Proceed as follows before restoring: 1. Use the Automation License Manager and ProSave to check if there are License Keys on the HMI device. 2. Transfer the existing License Keys from the HMI device. After restoring has been carried out, transfer the License Keys back to the HMI device.

Invalid license after time zone change

The installed licenses will no longer work if you change the time zone on a PC as follows: from a full-hour time zone to a time zone that is not based on a full hour.

To avoid this inconvenience, uninstall the License Key with the Automation License Manager under the time zone setting that was set when the License Keys was installed.

Example: You want to use the HMI device from the time zone "GMT +3:00" in the time zone "GMT +3:30".

1. Uninstall the License Key with the time zone setting "GMT +3:00".
2. Change the time zone settings accordingly on your PC.
3. Install the License Key.

This behavior does not apply to the Trial License.

Defective license

A license is defective in the following cases:

- If the License Key is no longer accessible at the storage area.
- If the License Key disappears during its transfer to the destination drive.

Note

If you reset the system date to an earlier time, all licenses are invalidated.

You can use the Automation License Manager to repair the defective license. Use the "Restore" function or the "Restore wizard" of the Automation License Manager

for this purpose. Contact Customer Support to restore them. You can find more detailed information on the Internet: Siemens Industry Online Support (https://support.industry.siemens.com/cs/de/en/)

Note

Runtime can also be operated without errors if the license is missing or defective. The system alerts you at brief intervals that you are working in non-licensed mode.

Microsoft SQL Server

A license is required for use of the Microsoft SQL Server database. The license is included in a properly licensed and installed version of WinCC.

The SQL Server which is licensed with the installation of WinCC can only be used in connection with WinCC.

Its use for other purposes requires an additional license. These include, for example:

- Use for custom databases
- Use for third-party applications
- Use of SQL access mechanisms which are not provided via WinCC.

Uninstalling

After uninstalling WinCC, you must uninstall the "WinCC" SQL server instance. To do this, select the entry "Microsoft SQL Server 20.." under "Control Panel > Programs" and uninstall it.

1.3 System requirements for installation

1.3.1 Notes on licenses

Availability of licenses

The licenses for the products of the TIA Portal are shipped on an installation data medium or via online software delivery (OSD).

Before you uninstall the TIA Portal, you must transfer and back up the licenses still required. Use the Automation License Manager for this purpose.

Provision of the Automation License Manager

The Automation License Manager is supplied on the installation data medium and is transferred automatically during the installation process.

If you uninstall the TIA Portal, the Automation License Manager remains installed on your system.

Working with the Automation License Manager

The Automation License Manager is a product of Siemens AG, which is used for handling license keys (technical representatives of licenses).

Software products that require license keys for operation, such as the TIA Portal, register the need for license keys automatically with the Automation License Manager . If the Automation License Manager finds a valid license key for this software, the software can be used according to the license usage terms associated with this license key.

Note

For additional information on how to manage your licenses with the Automation License Manager , refer to the documentation supplied with the Automation License Manager .

1.3.2 General software and hardware requirements

System requirements for installation

The following table shows the minimum software and hardware requirements that have to be met for the installation:

Hardware/software	Requirement
Processor	Intel® Core™ i3-6100U, 2.30 GHz
RAM	8 GB
Hard disk	S-ATA with at least 20 GB available space
Network	From 100 Mbit

Hardware/software	Requirement
Screen resolution	1024 x 768
Operating systems *	**Windows 10 (64-bit)** • Windows 10 Professional Version 21H1 • Windows 10 Professional Version 21H2 • Windows 10 Enterprise Version 2009/20H2 • Windows 10 Enterprise Version 21H1 • Windows 10 Enterprise Version 21H2 • Windows 10 Enterprise 2016 LTSB • Windows 10 Enterprise 2019 LTSC • Windows 10 Enterprise 2021 LTSC **Windows 11 (64-bit)** • Windows 11 Home Version 21H2 • Windows 11 Professional Version 21H2 • Windows 11 Enterprise 21H2 **Windows Server (64-bit)** • Windows Server 2016 Standard (full installation) • Windows Server 2019 Standard (complete installation) • Windows Server 2022 Standard (full installation)

* Including all security updates up to Microsoft Security Bulletin Summary for August 2022 (MS22-AUG). For more detailed information on operating systems, refer to the help on Microsoft Windows or the Microsoft Web site.

Some protocols might also support additional Windows versions. You can find more information in the product-specific requirements or check the compatibility with the compatibility tool. The compatibility tool is available on the Internet at https://support.industry.siemens.com/kompatool/pages/main/index.jsf?.

Recommended PC hardware

The following table shows the recommended hardware requirements:

Hardware/software	Requirement
Computer	SIMATIC FIELD PG M6 Comfort or higher (or comparable PC)
Processor	Intel® Core™ i5-8400H (2.5 to 4.2 GHz; 4 cores + Hyper-threading; 8 MB Smart Cache)
RAM	16 GB or more (32 GB for large projects)
Hard disk	SSD with at least 50 GB available memory space
Network	1 GBit (for multiuser)
Monitor	15.6" Full HD Display (1920 x 1080 or higher)

Supported virtualization platforms

You can install the software packages "SIMATIC STEP 7" and "SIMATIC WinCC" on a virtual machine. For this purpose, use one of the following virtualization platforms in the specified version or a newer version:

- VMware vSphere Hypervisor (ESXi) 6.7 or higher
- VMware Workstation 12.5.5 (only WinCC)
- VMware Workstation 15.5.0 or higher
- VMware Player 12.5.5 (WinCC only)
- VMware Player 15.5.0 or higher
- Microsoft Hyper-V Server 2019 or higher

The following host and guest operating systems are recommended for these virtualization platforms:

Operating system	VMware vSphere Hypervisor (ESXi)	VMware Workstation	VMware Player	Microsoft Hyper-V
Windows Server 2016 Standard (full installation)	G	-	-	G
Windows Server 2019 Standard (complete installation)	G	-	-	H/G
Windows Server 2022 Standard (full installation)	G	-	-	H/G
Windows 10 Enterprise Version 2009/20H2	H/G	H/G	H/G	G
Windows 10 Enterprise 2016 LTSB	H/G	H/G	H/G	G
Windows 10 Enterprise 2019 LTSC	H/G	H/G	H/G	G
Windows 10 Enterprise 2021 LTSC	H/G	H/G	H/G	G

H: Can be used as host operating system

G: Can be used as guest operating system

H/G: Can be used as host and guest operating system

-: Cannot be used as the host or guest operating system

Note

- The same hardware requirements apply to the host operating system as for the respective TIA products.
- The plant operator must ensure that sufficient system resources are available for the host operating systems.
- The hardware certified by the manufacturers is recommended for the use of HyperV server and ESXi.
- When you use Microsoft Hyper-V, accessible stations cannot be displayed.

Supported security programs

The following security programs are compatible with "SIMATIC STEP 7 Basic" and "SIMATIC WinCC":

- Antivirus programs:
  - Symantec Endpoint Protection 14.3
  - Trend Micro Office Scan 14.0
  - McAfee Endpoint Security (ENS) 10.6 and 10.7
  - Windows Defender
  - Qihoo 360 "Safe Guard 12.1" + "Virus Scanner"

  Note

  Make sure that your virus scanner and its databases are always up-to-date.

  The last update of the virus pattern was on 13 Sept. 2022.
- Encryption software:
  - Microsoft Bitlocker
- Host-based Intrusion Detection System:
  - McAfee Application Control 8.3.3

1.3.3 Product-specific special characteristics

1.3.3.1 Uninstalling WinCC Unified

Uninstalling WinCC

If you have already installed an update for WinCC Unified V16 and want to install WinCC V17, proceed as follows:

1. Open the Control Panel.
2. Start the uninstallation of SIMATIC WinCC Unified PC V16.0 UPDx.
3. When selecting the components, select "SIMATIC WinCC Update 16.0 UPDx" for uninstallation.
4. After completing this uninstallation, uninstall all desired components of WinCC V16 via the installation medium.

The information is contained in the readme under "Important notes (WinCC Unified)".

1.3.3.2 Installation of WinCC Runtime Unified

Specific requirements for the operating system and software configuration must be met for the installation.

Installation in domains and workgroups

WinCC Unified is generally approved for operation in a domain or workgroup.

However, be aware that domain group policies and restrictions of the domain might hinder the installation. In this case, remove the computer from the domain before installing WinCC Unified and Microsoft SQL Server. Log on to the local machine with administrator rights. Perform the installation. After successful installation, you can restore the WinCC computer to the domain. If the domain group policies and restrictions of the domain do not impede the installation, the computer need not be removed from the domain during the installation.

Be aware that domain group policies and restrictions of the domain might also hinder operation. If you cannot avoid these restrictions, run the WinCC computer in a workgroup.

Consult with the domain administrator if needed.

Operation on a network server

It is not permitted to operate WinCC Unified Runtime on a network server (e.g. domain controller, file server, name service server, router, software firewall, media server, exchange server).

Windows computer name

Before you start the WinCC installation, specify the Windows computer name. Follow the Windows naming rules.

Note

How to proceed after a subsequent change of the computer name is described in the WinCC Unified Runtime installation manual in the section "Changing the computer name or IP address".

The following characters are not permitted for the computer name:

- . , ; : ! ? " ' ^ ` ~ _
- + = / \ | @ * # $ % &
- ( ) [ ] { } < >
- Space

Follow these recommendations when assigning the Windows computer name:

- Only uppercase letters may be used.
- The first character must be a letter.
- The first 12 characters of the computer name must be unique.
- The computer name can have a maximum of 15 characters.

Hardware requirements for the installation

The following table shows the minimum hardware requirements that have to be met for the installation:

Hardware	Requirement
Processor type	Intel Core i3
RAM	4 GB
Free hard disk space	10 GB, 8 GB CF

Software requirements for the installation

Operating system

Software	Configuration	Comments
Windows 10 Pro	Windows 10 Pro Version 1909 (OS Build 18363) Windows 10 Pro Version 2004 (OS Build 19041) Windows 10 Pro Version 2009/20H2 (OS Build 19042) Windows 10 Pro Version 21H1 (OS Build 19043) Windows 10 Pro Version 21H2 (OS Build 19044)	64-bit
Windows 10 Enterprise	Windows 10 Enterprise Version 1909 (OS Build 18363) Windows 10 Enterprise Version 2004 (OS Build 19041) Windows 10 Enterprise Version 2009/20H2 (OS Build 19042) Windows 10 Enterprise Version 21H1 (OS Build 19043) Windows 10 Enterprise Version 21H2 (OS Build 19044)	
Windows 10 IoT Enterprise LTSB	Windows 10 Enterprise 2016 LTSB (OS Build 14393) (Test for IPC) Windows 10 Enterprise 2019 LTSC (OS Build 17763) (Test for IPC) Windows 10 Enterprise 2021 LTSC (OS Build 19044) (Test for IPC)	
Windows 11	Windows 11 Home Version 21H2 (OS Build 22000)	64-bit
Windows 11 Pro	Windows 11 Pro Version 21H2 (OS Build 22000)	
Windows 11 Enterprise	Windows 11 Pro Version 21H2 (OS Build 22000)	
Windows Server 2016 Standard Windows Server 2019 Standard Windows Server 2022 Standard	Full installation	64-bit

Note

Number of supported clients and connections

Desktop operating systems support a maximum of 5 clients. In server operating systems, more than 5 clients can connect to the server.

Windows limits the number of incoming connections on desktop operating systems to 20. This limits the number of possible accesses to runtime.

Compatible browsers

Operating system	Browser
Microsoft Windows	• Google Chrome • Microsoft Edge • Mozilla Firefox, Mozilla Firefox ESR
Android	• Google Chrome • Firefox • Edge
iOS, Mac	• Safari • Google Chrome • Firefox • Edge

More information on the use of browsers is available in the SIMATIC Unified PC Readme in the section "Internet browsers for WinCC Unified PC".

Windows specific software settings for IIS (Internet Information Services)

The following settings for IIS are automatically enabled in Windows during the installation of WinCC Runtime Unified:

- HTTP error
- HTTP Redirection
- Default document
- Static content
- .NET extensibility 3.5
- ASP
- ASP.NET 4.5
- ISAPI extensions
- ISAPI filters
- Dynamic Content Compression
- Static Content Compression
- Request Filtering

Table 1-1 Additional software requirements

Topic	Version / setting	Comment
Web browser	The browser must support HTML 5.	
User rights for installation	Administrator rights	
SOFTNET-IE S7 Lean Single License		You need this license to be able to operate Runtime Unified with up to 10 connections.
SIMATIC NET	V13 SP1	You need this license to be able to operate Runtime Unified with more than 10 connections.

Previously installed versions of WinCC Unified PC Runtime

The installation of Unified PC Runtime V18 is possible on devices for which the following applies:

- No Unified PC Runtime installed, or
- WinCC Unified PC Runtime V17 installed
  The V17 installation must not have been upgraded from V16.

Ports

When a Windows firewall is used, the installation routine of WinCC Unified Runtime sets up the following ports:

- HTTPS: 443
- Network Discovery (IS): 137
- Totally Integrated Automation administrator: 8888
- UMC AttachAgent: 4002
- OPC UA Discovery: 4840

If your system uses a different firewall solution, make sure the ports are set up accordingly.

You can find a list of the ports used by Unified Runtime in the user help SIMATIC Unified PC readme in the section "Security information".

Note

Disable HTTP port

For security reasons, it is recommended to disable port 80 on the IIS server:

1. On the Unified PC, launch "Internet Information Services (IIS) Manager".
2. Click "Default Web Sites" on the right.
3. Select "Remove" or "Manage Website > Exit".

Note

Blocked ports after operating system update or upgrade

Updating or upgrading the operating system of the Unified PC, e.g. from Windows Server 2016 to Windows Server 2019, may change the firewall settings. As a result, the OPC UA ports may be blocked.

If this happens, start the Siemens "Security Controller" tool and run "Restore settings".

Virtualization

You can install the "SIMATIC WinCC Runtime Unified" software package on a virtual machine. The following virtualization systems were tested:

- VMware vSphere Hypervisor (ESXi) 6.7 (or higher)
- VMware Workstation 12.5.5 and VMware Workstation 15.5.0 (or higher)
- VMware Player 12.5.5 and VMware Player 15.5.0 (or higher)
- Microsoft Hyper-V Server 2019 (or higher)

In a virtualization platform, all approved operating systems can be used as host operating system.

Requirement

The performance data of the virtual computers must meet the minimum requirements of WinCC clients.

Note

- Ensure that terminal and PLC networks are separated on the host system by using separate network adapters (dedicated, physically separated network adapters).
- The same hardware requirements apply to the host operating system as for the respective TIA products.
- The plant operator must ensure that sufficient system resources are available for the host operating systems.
- The hardware certified by the manufacturers is recommended for the use of HyperV server and ESXi.

Supported security programs

The following security programs are compatible with Unified Runtime:

Virus scanner	Symantec Endpoint Protection 14.3
	McAfee Endpoint Security (ENS) 10.6 and 10.7
	Trend Micro Office Scan 14.0
	Windows Defender (as part of the Windows operating system)
	Qihoo 360 "Safe Guard 12.1" + "Virus Scanner"

Whitelisting	McAfee Application Control 8.3.3
Hard disk encryption	Microsoft BitLocker (as part of the Windows operating system)

Principle

Care must be taken to ensure that the use of the antivirus software does not impair the process operation of a plant.

Rules for antivirus software (virus scanning clients)

- Integrated virus scanner firewall
  In WinCC Unified, the local Windows firewall used is configured with SIMATIC Security Control. Do not install or enable the integrated firewall of the antivirus software.
- Manual scan
  You must not perform a manual scan while Runtime is running. Perform disk on regular intervals on all plant PCs, for example, during the maintenance interval.
- Automatic scan
  For automatic scan it is sufficient to scan the incoming data traffic.
- Scheduled scan
  You must not perform a scheduled scan while Runtime is running.
- Pattern update
  The pattern update of the virus scanning clients (the plant PCs which are checked for viruses) performed by the higher-level virus scanning server (the plant PC which centrally manages the virus scanning clients).
- Dialog
  To avoid impairing the process operation, no dialog messages can be displayed on the virus scanning clients.
- Drives
  To prevent overlapping scans on network drives, only the local drives are scanned.

Otherwise apply the default settings.

What is secured?

The incoming data traffic is checked for viruses. The impairment of the process mode is minimized.

Note

If you are using an anti-virus scanner, make sure that the computer has sufficient system resources.

Supported database types

The following database types are supported by SIMATIC WinCC Unified PC:

HMI device	Supported database type
SIMATIC WinCC Unified PC	SQLite
	Microsoft SQL

Microsoft SQL for Unified PC

WinCC Unified PC uses SQLite as the default database type. To use Microsoft SQL, the system provides an installation option with a setup package.

- Logging with SQLite is not possible after the installation of Microsoft SQL.
- Existing SQLite files are retained, but they cannot be accessed in runtime.
- No backup can be created for SQLite.

Microsoft SQL Server 2017 is used as of TIA Portal V17. SQL Management Studio is no longer part of the Microsoft SQL Server installation package and is therefore not included in the Totally Integrated Automation Portal installation. You can install SQL Management Studio separately if needed.

To establish secure SQL Server connections, please observe the notes in the Microsoft documents:

- Server Network Configuration
- Enable encrypted connections to the Database Engine

1.4 Overview of processes and services of TIA Portal components

Additional processes and services are also installed during the installation of the TIA Portal or components of the TIA Portal.

The following tables provide an overview of these processes, the corresponding services and respective functions:

Table 1-2 Automation License Manager

Process	Corresponding service	Function
almsrv64x.exe	alm service	License management service / main process
almsrvbubble64x.exe	-	Process for tray icon info bubbles
almgui64x.exe	-	Graphical user interface of the Automation License Manager

Table 1-3 TIA administrator

Process	Corresponding service	Function
almsrv64x.exe	alm service	License management service
node.exe	SiemensTiaAdmin	Main process of the TIA Administrator website
TiaAdminNotifier.exe	-	User notifications and tray icon of the TIA Administrator

Table 1-4 ProSave

Process	Corresponding service	Function
PTProSave.exe	-	ProSave, graphical user interface main process
S7TraceService64x.exe	S7TraceServiceX	S7Dos related tracing
s7oiehsx64.exe	s7oiehsx64	S7Dos Helper Service
s7epasrv64x.exe	-	Event and parameter handling
s7oPNDiscoveryx64.exe	SIMATIC PnDiscovery Service	PN Discovery (accessibility via PN device name)
TraceConceptX.exe	TraceConceptX	S7Dos related tracing
ALMPanelPlugin.exe	-	Plugin for communication with Automation License Manager
-	S7DOS SCP Remote	Is also installed, but is only active with Cloud Connector
CommunicationSettings.exe	-	Setting access points

Table 1-5 WinCC Audit Viewer

Process	Corresponding service	Function
AuditViewer.exe	-	WinCC Audit Viewer main process

Table 1-6 Migration Tool

Process	Corresponding service	Function
Siemens.Automation.MigrationApplication.exe	-	Tool for converting WinCC and Simatic Manager projects into migration-compatible files

Table 1-7 Port Configuration Tool (PCT)

Process	Corresponding service	Function
Siemens.Simatic.Pct.ApplicationLoader.exe	-	Main process of the Port Configuration Tool (PCT)
s7oiehsx64.exe	s7oiehsx64	S7Dos Helper Service
s7epasrv64x.exe	-	Event and parameter handling
S7TraceService64x.exe	S7TraceServiceX	S7Dos related tracing
s7oPNDiscoveryx64.exe	SIMATIC PnDiscovery Service	PN Discovery (accessibility via PN device name)
TraceConceptX.exe	TraceConceptX	S7Dos related tracing
s7elonls64.exe	-	Routing between 32- and 64-bit application parts
CommunicationSettings.exe	-	Setting access points
-	S7DOS SCP Remote	Is also installed, but is only active with Cloud Connector

Table 1-8 Cloud Connector

Process	Corresponding service	Function
CloudConfigurator.exe	-	GUI for configuring the Cloud Connector
s7oiehsx64.exe	s7oiehsx64	S7Dos Helper Service
s7epasrv64x.exe	-	Event and parameter handling
S7TraceService64x.exe	S7TraceServiceX	S7Dos related tracing
s7oPNDiscoveryx64.exe	SIMATIC PnDiscovery Service	PN Discovery (accessibility via PN device name)
TraceConceptX.exe	TraceConceptX	S7Dos related tracing
CC.TunnelServiceHost.exe	S7DOS SCP Remote	Host of the tunnel service for the Cloud Connector
CommunicationSettings.exe	-	Setting access points

Table 1-9 Project server

Process	Corresponding service	Function
Siemens.Automation.Portal.Server(.exe)	V[Version number]prjsrv	TIA Portal project server main process
Siemens.Automation.Portal.Project.Server(.exe)	-	TIA Portal project server main process
Siemens.Automation.Portal.Server.Configuration(.exe)	-	User interface for configuring the project server
Siemens.Automation.Portal.Server.Administration(.exe)	-	User interface for the administration of the project server
Siemens.Automation.ProjectServer.AccessControl(.exe)	-	Controls the access authorization of the administration tool

Table 1-10 WinCC Runtime Advanced

Process	Corresponding service	Function
ScsServer.exe	-	Central data communication
StartCenter.exe	-	Start Center which permits starting of runtime, for example
HmiRTm.exe	-	The actual WinCC Advanced Runtime
s7elonls64.exe	-	Routing between 32- and 64-bit application parts
Miniweb.exe	-	Web contents of the WinCC Runtime Advanced
CodeMeterCC.exe	-	Runtime service of the code meter
CmWebAdmin.exe	CmWebAdmin.exe	Web administrator of the code meter
SmartServer.exe	cortsmartserver	Smart Server host process for remote connection
CodeMeter.exe	CodeMeter.exe	Code meter licensing during runtime
S7TraceService64x.exe	S7TraceServiceX	S7Dos related tracing
s7oiehsx64.exe	s7oiehsx64	S7Dos Helper Service

Process	Corresponding service	Function
s7epasrv64x.exe	-	Event and parameter handling
s7oPNDiscoveryx64.exe	SIMATIC PnDiscovery Service	PN Discovery (accessibility via PN device name)
-	OpcEnum	Service is only installed, but not started.

Table 1-11 TIA Portal with STEP 7 / WinCC Comfort / Advanced

Process	Corresponding service	Function
CodeMeterCC.exe	-	Runtime service of the code meter
Siemens.Automation.Portal.exe	-	The TIA Portal itself
Siemens.Automation.ObjectFrame.FileStorage.Server.exe	-	Process for data management in TIA Portal projects
Siemens.Automation.Diagnostics.CrashDetector.exe	-	Process for detecting TIA Portal crashes and displaying the crash box
Siemens.Automation.Tracing.ETW.EventCollector.ServiceHost.exe	Siemens Diagnostics Data Collector Service	Process for event data collection
s7oiehsx64.exe	s7oiehsx64	S7Dos Helper Service
s7epasrv64x.exe	-	Event and parameter handling
CmWebAdmin.exe	CmWebAdmin.exe	Web administrator of the code meter
CodeMeter.exe	CodeMeter.exe	Code meter licensing during runtime
S7TraceService64x.exe	S7TraceServiceX	S7Dos related tracing
Siemens.Simatic.TelemetryConnector.WindowsService.exe	Siemens Telemetry Connector Service	Service for collecting and sending telemetry data
s7oPNDiscoveryx64.exe	SIMATIC PnDiscovery Service	PN Discovery (accessibility via PN device name)
TraceConceptX.exe	TraceConceptX	S7Dos related tracing
IPCSecCom.exe	umscsvc	Communication to an UMC server
um.Ris.exe	-	Basic executable for UMC
um.sso.exe	-	Single sign-on for UMC
um.ess.exe	-	Basic executable for UMC
S7otbxsx64.exe	-	S7Dos block administration
-	OpcEnum	Service is only installed, but not started
-	UMC Service	Only used when UMC / UMAC is used

Table 1-12 STEP 7 / Safety / WinCC Professional ES incl. simulation

Process	Corresponding service	Function
CodeMeterCC.exe	-	Runtime service of the code meter
Siemens.Automation.Portal.exe	-	The TIA Portal itself
Siemens.Automation.ObjectFrame.FileStorage.Server.exe	-	Process for data management in TIA Portal projects
Siemens.Automation.Diagnostics.CrashDetector.exe	-	Process for detecting TIA Portal crashes and displaying the crash box

Process	Corresponding service	Function
Siemens.Automation.Tracing.ETW.EventCollector.ServiceHost.exe	Siemens Diagnostics Data Collector Service	Process for event data collection
s7oiehsx64.exe	s7oiehsx64	S7Dos Helper Service
s7epasrv64x.exe	-	Event and parameter handling
CmWebAdmin.exe	CmWebAdmin.exe	Web administrator of the code meter
CodeMeter.exe	CodeMeter.exe	Code meter licensing during runtime
S7TraceService64x.exe	S7TraceServiceX	S7Dos related tracing
Siemens.Simatic.TelemetryConnector.WindowsService.exe	Siemens Telemetry Connector Service	Service for collecting and sending telemetry data

um.sso.exe	-	Single sign-on for UMC
um.ess.exe	-	Basic executable for UMC
S7otbxsx64.exe	-	S7Dos block administration
CCDeltaLoader.exe	CCDeltaLoader	Responsible for determining whether a delta download is possible
RedundancyControl.exe	RedundancyControl	Responsible for the determination and management of the state of the redundant WinCC partner
CCTextServer.exe	CCTextServer	Server for runtime display of texts
CCPerfMon.exe	CCPerfMon	WinCC STOBS, monitoring of the system parameters and WinCC processes
SCSFsX.exe	SCSFsX	WinCC File Service between clients and servers
CCRtsLoader_x64.exe	CCRtsLoader	WinCC RT Tag management
CCSystemDiagnosticsHost.exe	CCSystemDiagnosticsHost	Host for displaying system diagnostics
CcAlgRtServer.exe	CCAlgRtServer	WinCC Alarm Logging Runtime Server
CCArchiveManager.exe	CCArchiveManagerService	Management of WinCC archives
CCRedundancyAgent.exe	CCRedundancyAgent Service	Archiving component for managing and reconciliation of the RT archive
CCTlgServer.exe	CCTlgServer	WinCC Tag Logging Server
CCUsrAcv.exe	CCUsrAcv	Responsible for managing user archives
CCProfileServer.exe	CCProfileServer	Saving RT persistence data of the WinCC Controls
sqlservr.exe	MSSQL$WINCC	SQL server for WinCC
CCAgent.exe	CCAgent	WinCC RT component for communication between WinCC stations
CCEServer_x64.exe	CCEServer	WinCC RT component for communication between WinCC stations
CCProjectMgr.exe	CCProjectMgr	WinCC Project Manager, handling of WinCC projects
SDiagRT.exe	-	System diagnostics data collector
gscrt.exe	-	WinCC Global Script Runtime

Process	Corresponding service	Function
PassDBRT.exe	-	Managing login data and passwords
CCUAImport.exe	-	WinCC RT User Archive component for importing TIA recipes
script.exe	-	WinCC RT C Scripting component
PdlRt.exe	-	Graphic runtime
SCSDistServiceX.exe	SCS Distribution Service	WinCC RT component for communication between WinCC stations
SCSMX.exe	SCSMonitor	WinCC RT component for communication between WinCC stations
sqlbrowser.exe	SQLBrowser	Microsoft SQL process (WinCC uses SQL server)
sqlwriter.exe	SQLWriter	Microsoft SQL process (WinCC uses SQL server)
CCDBUtils.exe	CCDBUtils	WinCC component for managing the WinCC SQL database
CCRemoteService.exe	CCRemoteService	WinCC component for remote management of the WinCC SQL database
sqlceip.exe	SQLTELEMETRY$WINCC	Microsoft SQL process (WinCC uses SQL server)
CCEClient_x64.exe	CCEClient	WinCC RT component for communication between WinCC stations
RedundancyState.exe	RedundancyState	Client-side monitoring of the WinCC server states
CCPackageMgr.exe	CCPackageMgr	WinCC components for managing the server packages
CCNSInfo2Provider.exe	CCNSInfo2Provider	WinCC component for browsing WinCC/ STEP 7 tags
Siemens.Simatic.Srm.RdpComp.Data.ContextMgrX.exe	-	SCADA RT Professional Compiler component
CCDmRuntimePersistence.exe	-	WinCC RT component for reconciliation of the internal tags in redundant systems
CCWriteArchiveServer.exe	-	Responsible for writing archive data in the SQL database (3 instances: TLG-fast / TLG-slow / ALG)
CCLicenseService.exe	CCLicenseService	Responsible for allocation and release of licenses
CCUCSurrogate.exe	-	WinCC RT Professional application for the system tray icon in the Windows taskbar
Simulation.exe	-	WinCC RT Professional tag simulation
CCConfigStudio.exe	-	WinCC Config Studio is an application for the WinCC RT Professional tag simulation
WinCCChnDiag.exe	-	WinCC channel diagnostics
-	CCTMTimeSyncServer	Is used in redundant servers to synchronize time stamps
-	CcUaDAS	WinCC OPC UA component
-	CCOpcUaImporter	WinCC OPC UA component

Process	Corresponding service	Function
-	CCAlgIAlarmDataCollector	WinCC RT Professional alarm system
-	SQLAgent$WINCC	Microsoft SQL process (WinCC uses SQL server)
-	OpcEnum	OPC Foundation component (WinCC OPC); Service is only installed, but not started
-	UMC Service	Only used when UMC / UMAC is used

Table 1-13 WinCC Advanced Runtime Simulation

Process	Corresponding service	Function
HmiRTm.exe	-	The actual WinCC Advanced Runtime
Miniweb.exe	-	Web contents of the WinCC Runtime Advanced
SmartServer.exe	cortsmartserver	Smart Server host process for remote connection
HmiRTmSim.exe	-	WinCC Advanced Tag Simulation

Table 1-14 WinCC Unified Engineering Package

Process	Corresponding service	Function
opcualds.exe	UALDS	OPC UA Local Discovery Service
mDNSResponder.exe	OPCF Bonjour Service	DNS name resolution
GfxWebBrowser.exe	-	Graphic rendering

Table 1-15 WinCC Unified Simulation

Process	Corresponding service	Function
WCCILS7pComDrv(.exe)	-	Process for communication with S7-1200 and S7-1500 controllers
RTILtraceTool(.exe)	TraceLogger_WinCC_Unified_PC	Unified Simulation related tracing
RTILtraceTool(.exe)	TraceProfiler_WinCC_Unified_PC	Unified Simulation related tracing
w3wp(.exe)	-	IIS Process Worker, host process for web pages
WCCILscs(.exe)	WCCILScsService	Siemens Communication Service, responsible for the internal data communication
WCCILpmon(.exe)	-	WinCC Process Monitoring
WCCILalg(.exe)	-	WinCC AlarmLogging, responsible for logging alarms
WCCILevent(.exe)	-	WinCC Event handling, responsible for handling events
GfxLicenseServer(.exe)	-	Responsible for granting and releasing licenses

Process	Corresponding service	Function
JobSchedulerHost(.exe)	-	Responsible for scheduling jobs
GfxRTS(.exe)	-	Preparation of the graphical runtime
WCCILSDAMgr(.exe)	-	System Diagnostics Manager, responsible for the system diagnostics information
OpennessManagerHost(.exe)	-	Host for the Openness Manager
WCCILdist(.exe)	-	WinCC Unified Simulation basic process
WCCILdata(.exe)	-	WinCC Unified data manager
WCCILals(.exe)	-	WinCC AlarmServer, responsible for receiving and acknowledging alarms
WCCILpaco(.exe)	-	WinCC Parameter Control
WCCILtlg(.exe)	-	WinCC TagLogging, responsible for logging tags
WCCILs7(.exe)	-	Process for communication with S7-300 and S7-400 controllers
umcd(.exe)	UmclService	EMS basic process
idp(.exe)	UmclIdpService	EMS basic process
-	EventLogger	Event Logging Service
-	UmclWebUMService	Web service for User Management
-	umscsvc	User Management Secure Communication Service
-	w3logsvc	IIS Logging Service
-	WMSVC	IIS Web Management Service

Table 1-16 Add-Ins

Process	Corresponding service	Function
Siemens.Automation.AddIn.Rollout.Service.exe	Siemens Add-In Rollout Service	Mass rollout of Corporate Add-Ins

1.5 Using Security Logging

1.5.1 Security Logging in the TIA Portal

Security Logging in the TIA Portal is a function to acquire, save and analyze security-relevant event and log data from the Engineering System, as well as from components of the automation environment.

The event and log data is stored locally in Windows systems. This data can be analyzed, saved and exported through the Windows Event Viewer.

In a further step, the event and log data can be transferred to SIEM systems (**S**ecurity **I**nformation and **E**vent **M**anagement). Thus, Security Logging makes it possible to centrally collect and analyze security-relevant events from different systems in the network, and

to react to threats. Security Logging is part of a bundle of measures recommended by international security standards and regulations for increasing security.

Security Logging is disabled by default in the TIA Portal. Administrators can initially activate Security Logging through a batch file. When Security Logging has been activated, the function can be deactivated and re-activated either by means of batch files or through the Windows Registry.

See also

Activating and deactivating Security Logging (Page 75)

1.5.2 Activating and deactivating Security Logging

The event channel for Security Logging is registered when the TIA Portal is installed on the computer; however, the function is disabled by default. You can activate and deactivate Security Logging in the Windows Registry by setting the corresponding value in the "AuditLogOn" key. The value "1" activates Security Logging while other values deactivate it. By default, Security Logging is deactivated in the TIA Portal.

The "AuditLogOn" key is not created at the time of installation of the TIA Portal. There are two batch files in the installation directory of the TIA Portal in the "bin" folder:

- The batch file "SecurityAuditLoggingEnable.bat" creates the key "AuditLogOn" and activates Security Logging.
- The batch file "SecurityAuditLoggingDisable.bat" deactivates Security Logging.

Security Logging is version-specific. The setting does not have any effect on other versions of the TIA Portal.

Requirements

- You have Windows administrator rights.
- To log user accounts, the project must be protected.

Activating Security Logging with a batch file

1. Navigate to the "bin" folder in the installation directory of the TIA Portal.
2. Run the batch file "SecurityAuditLoggingEnable.bat".

Deactivating Security Logging with a batch file

1. Navigate to the "bin" folder in the installation directory of the TIA Portal.
2. Run the batch file "SecurityAuditLoggingDisable.bat".

Activating and deactivating Security Logging in the Windows Registry

1. In Windows, open the Registry Editor.
2. Go to the key "HKEY_LOCAL_MACHINE\SOFTWARE\Siemens\Automation\SecurityLogging\18.0\Settings\AuditLogOn".
3. To activate Security Logging, in the "LoggingOn" key, input the value "1".
   To deactivate Security Logging, in the "LoggingOn" key, delete or change the value "1".
4. Confirm your input with "OK".

Security Logging in the TIA Portal (Page 74)

Overview of events (Page 76)

1.5.3 Overview of events

The following tables provide an overview of user actions, the relevant log entries, the event categories and event types:

In addition to the content of the events listed in the following tables, each event contains the following information:

- Version of the TIA Portal
- Name of the project
- Name of the logged-on user from the user administration (UMAC - User Management and Access Control)

Note

Name of the logged-on user

The value for the name of the logged-on user from the user administration (UMAC) is set in three different categories:

- Category 1: The text "No user logged in." appears in the case where user administration (UMAC) is either not enabled in the project or no user is logged on outside the project on a device under "Accessible devices".
- Category 2: The text "Background process" appears in the case where UMAC is enabled for the project but a safety-critical operation is triggered by a background process (e.g. when a process loads data into a device in Multiuser Commissioning in "asynchronous mode").
- Category 3: The name of the logged-on user from the user administration (UMAC) appears in the case where UMAC is enabled for the project and the event was written by the TIA Portal main process.

Overview of events

Table 1-17 User administration (UMAC - User Management and Access Control)

User action	Log entry	Event category	Type of event
Creating a new local project user	Local user "{target user}" added	Access control	Information
Deleting a local project user	Local user "{target user}" deleted	Access control	Information
Adding a global user	Global user "{target user}" added	Access control	Information
Deleting a global user	Global user "{target user}" removed	Access control	Information
Adding a global user group	User group "{target user}" added	Access control	Information
Deleting a global user group	User group "{target user}" removed	Access control	Information
Logging on to a protected project	Local / Global user "{target user}" with role(s) "{semicolon seperated list of roles}" logged in successfully Local / Global user "{target user}" login failed Anonymous user with role(s) "{semicolon seperated list of roles}" logged in successfully Anonymous user login failed For Auto Log On No DSSO Session : Global user login failed as no desktop session is available	Access control	Information, errors
Authorized user logs out of a protected project	Local / Global user "{target user}" logged out Anonymous user logged out	Access control	Information
Changing the user name of a local project user	User "{target user}" renamed to "{new target user name}"	Configuration	Information
Changing the password of a local project user or one's own password	Local / Global user "{target user}" password changed	Configuration	Information
Activating a local project user, a global user or a global group	Local / Global user / group "{target user}" activated	Configuration	Information
Deactivating a local project user, a global user or a global group	Local / Global user / group "{target user}" de-activated	Configuration	Information
Changing the properties of a user	User "{target user}" property '{property name}' changed to {new property value}	Configuration	Information
Creating a user-defined role in the TIA Portal	Custom role "{role name}" created	Configuration	Information

User action	Log entry	Event category	Type of event
Deleting a user-defined role in the TIA Portal	Custom role "{role name}" deleted	Configuration	Information
Renaming a user-defined role in the TIA Portal	Custom role "{old role name}" renamed to "{new role name}"	Configuration	Information
Changing the assignment of a function right to a user-defined role in the TIA Portal.	Custom role "{role name}" function rights assignment changed to "{semicolon seperated list of function rights}"	Configuration	Information
Changing the runtime timeout of a user-defined role in the TIA Portal	Custom role "{role name}" property 'Runtime timeout' changed to {new runtime timeout}	Configuration	Information
Assigning a role to a user or a user group	Local user / Global user / User group "{target user name}" roles assignment changed to "{semicolon seperated list of roles}"	Configuration	Information

Table 1-18 Changes to CPU data (offline)

User action	Log entry	Event category	Type of event
Checking project integrity	Data integrity check succeeded / failed. A {data integrity error type} Integrity corruption found in object {object id} in project {project name}	AuditLog	Supervision successful, error

Table 1-19 Loading to CPU

User action	Log entry	Event category	Type of event
Loading a hardware configuration to a CPU	Download of hardware configuration to {PLC name} with address {address}	Configuration	Supervision successful
Loading a standard user program to a CPU (Start alert)	Software download started to target PLC: {PLC name} with address {address} Operating mode during download: {RUN|STOP} Type of download: {Delta|Complete}	Configuration	Information

User action	Log entry	Event category	Type of event
Loading a standard user program into a CPU (list of blocks to be loaded or deleted, if necessary several times)	Software objects downloaded (+) / deleted (-): {+|-} {full qualified name of object} {+|-} {full qualified name of object} ...	Configuration	Information
Loading a standard user program into a CPU (completion message with software signature)	Successful: Software download succeeded Software signature after sownload {signature|"null"} Error: Software download aborted with error: {error message} • PLC was left in an inconsistent state → Download in STOP • PLC software contents was rolled back → Download in RUN	Configuration	Supervision successful, error
Loading a failsafe program to a CPU	Downloaded safety program with the collective F-signature {collective F-signature}.	Configuration	Supervision successful

Table 1-20 Loading the device as a new station

User action	Log entry	Event category	Type of event
Loading a configuration from a CPU	Upload of {PLC name} with address {address}.	Configuration	Supervision successful, error

Table 1-21 Changes to CPU data (online)

User action	Log entry	Event category	Type of event
Access to a CPU	Successful: Login to Plc {PLC name} with address {address} is successful. Error: Login to Plc {PLC name} with address {address} failed.	Access control	Supervision successful, error
Forcing variables via online access to a CPU	Forcejob installed on target CPU: {PLC name} with address {address} Forced variables (address : value): Adr1 : value1 Adr2 : value2 ... Forcejob on target PLC replaced: {PLC name} with address {address} Forced variables (address : value): Adr1 : value1 Adr2 : value2 ... Forcejob on target CPU stopped: {PLC name} with address {Address}	Configuration	Supervision successful
Changing the IP/network configuration of a CPU via online access	Change the network settings of {device name}({address}) to [IpAddress:{address to set}| SubnetMask:{subnet mask}| Router address:{router address}]	Configuration	Supervision successful, error
Changing the password for protecting confidential configuration data via online access	Set password for "Protection of PLC configuration data" of {PLC name}({address}) Delete password for "Protection of PLC configuration data" of {PLC name}({address})	Configuration	Supervision successful, error
Changing the operating state of a CPU via online access	Set {PLC name}({address}) to Run/Stop	Configuration	Supervision successful, error
Changing the system time of a CPU via online access	Change the system time of {device name}({address}) to {date time}	Configuration	Supervision successful, error

User action	Log entry	Event category	Type of event
Backing up/restoring a CPU via online access	Backup: Backup created from {PLC name} with address {address}. Restore: Online backup {backup name} restored to {PLC Name} with address {address}.	Configuration	Supervision successful
Initiating firmware update of a CPU via online access	Firmware update of {PLC name} ({address}) to version {fw version}	Configuration	Supervision successful, error
Reset CPU to factory settings	Reset to factory setting of {PLC name} ({address}). Settings: • Delete IP address • Delete master password • Format memory card	Configuration	Supervision successful, error
MRES via online access	Memory reset of {PLC name} {address}	Configuration	Supervision successful, error
Format memory card	Formatting the memory card of {PLC name}{address}	Configuration	Supervision successful, error

Table 1-22 Changing the access level

User action	Log entry	Event category	Type of event
Changing the access level	Protection access level is changed from "{previously selected access level}" to "{current selection access level}" for {PLC name}	Configuration	Supervision successful, error
Configuring the password for full access	Protection Access password is configured successfully / failed to configure for "Full Access" for {PLC name}	Configuration	Supervision successful, error
Changing the password for full access	Protection access password is changed successfully / failed to change for "Full Access" for {PLC name}	Configuration	Supervision successful, error
Configuring the password for full access including failsafe (no protection)	Protection access password is configured successfully / failed to configure for "Full access incl. fail safe (no protection)" for {PLC name}	Configuration	Supervision successful, error
Changing the password for full access including failsafe (no protection)	Protection access password is changed successfully / failed to change for "Full Access incl. fail safe (no protection)" for {PLC name}	Configuration	Supervision successful, error

User action	Log entry	Event category	Type of event
Configuring the password for read access	Protection access password is configured successfully / fail to change for "Read Access" for {PLC name}	Configuration	Supervision successful, error
Changing the password for read access	Protection access password is changed successfully / fail to change for "Read Access" for {PLC-name}	Configuration	Supervision successful, error
Configuring the password for HMI access	Protection access password is configured successfully / failed to configure for "HMI Access" for {PLC name}	Configuration	Supervision successful, error
Changing the password for HMI access	Protection access password is changed successfully / fail to change for "HMI Access" for {PLC name}	Configuration	Supervision successful, error

Table 1-23 Protection of PLC Configuration Data

User action	Log entry	Event category	Type of event
Deactivating protection of confidential CPU configuration data	"Protection of PLC configuration data" is disabled / failed to disable for {PLC name}	Configuration	Supervision successful, error
Activating protection of confidential CPU configuration data	"Protection of PLC configuration data" is enabled / failed to enable for {PLC name}	Configuration	Supervision successful, error
Configuring the password for protection of confidential CPU configuration data	Password for "Protection of PLC configuration data" is configured successfully / failed to configure for {PLC name}	Configuration	Supervision successful, error
Changing the password for protection of confidential CPU configuration data	Password for "Protection of PLC configuration data" is changed successfully / failed to change for {PLC name}	Configuration	Supervision successful, error
Resetting the password for protection of confidential CPU configuration data	Password for "Protection of PLC configuration data" is reset successfully / failed to reset for {PLC name}	Configuration	Supervision successful, error

Security Logging in the TIA Portal (Page 74)
Displaying and managing events (Page 83)

1.5.4 Displaying and managing events

Events can be displayed and managed in Windows in the Event Viewer. In addition to this, functions are provided via Microsoft Windows to track events automatically.
To centrally collect, analyze and further process events from different systems in the network, events can be transmitted in a SIEM (**S**ecurity **I**nformation and **E**vent **M**anagement) system. Use the documentation of the provider for information on transferring events to a SIEM system.

Displaying events in the Event Viewer

1. In Windows, open the Event Viewer.
2. In the left-hand column, go to the node "Event Viewer (Local) > Application and Services Logs > SiemensAG > Automation > TIAPortal".
3. Select the "Operational" log.
   The events of the log are displayed in the upper part of the main window.
4. Select an event.
   Information on the selected event is displayed in the lower part of the main window, in the tabs "General" and "Details".
5. To open the information on an event in a new window, double-click the event.

Managing events in the Event Viewer

1. In the Event Viewer, switch to the right-hand column, "Actions".
2. Use the actions to manage your log files.
   You can, for example, filter, search, save and delete logs.

Automated event tracking

The following Microsoft Windows functions can be used for automated event tracking:

- The command line program **wevtutil** can be used to read events from the command line. The program is provided via Microsoft Windows.
- TIA Portal provides the events via **E**vent **T**racing for **W**indows - **ETW**. Applications (for example, a SIEM system) that wish to call the events can access these events via the event source "SiemensAG-Automation-TIAPortal".

For more information on implementing automated event tracing, use Microsoft's documentation of features.

Security Logging in the TIA Portal (Page 74)

1.6 Installation log

Function of the installation log

The progress during the following installation processes is logged in a file:

- Installing products
- Modifying or updating already installed products
- Repairing an existing installation
- Uninstalling products

If errors occur during the installation process or warnings are issued, these can be evaluated with the help of the log file. You can do this yourself or contact product support.

Installation logs storage location

The log file is the most recent file with the file extension ".log" and the name of which that starts with "SIA".

The location of the log file is stored in the environment variable "%autinstlog%". You can enter this environment variable in the address bar of Windows Explorer to open the folder with the log files. Alternatively, you can navigate to the corresponding directory by entering "CD %autinstlog%" in the command line.

The storage location is dependent on the operating system, e.g. "C:\ProgramData\Siemens\Automation\Logfiles\Setup" in English-language Windows.

Setup_Report (CAB file)

To make it easier to provide Product Support with all necessary files, an archive file that contains the installation log and all other required files is saved in CAB format. This log can be found at "%autinstlog%\Reports\Setup_report.cab". Send this CAB file to Product Support if you need assistance with installation. With this information, Product Support can determine whether the installation was executed properly. CAB files that were generated during earlier installation processes are saved with a date ID in the "Reports" directory.

1.7 Starting installation

Introduction

Software packages are installed automatically by the setup program. The setup program starts once the installation medium has been inserted in the drive.

Requirement

- Hardware and software of the programming device or PC meet the system requirements.
- You have administrator privileges on your computer.
- All running programs are closed.

Procedure

To install the software packages, follow these steps:

1. Insert the installation medium in the relevant drive.
   The setup program starts automatically unless you have disabled Autostart on the programming device or PC.
2. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.
   The dialog for selecting the setup language opens.
3. Choose the language in which you want the setup program dialogs to be displayed.
4. To read the information on the product and installation, click "Read Notes" or "Installation Notes".
   The help file containing the notes opens.
5. Once you have read the notes, close the help file and click "Next".
   The dialog for selecting the product languages opens.
6. Select the languages for the product user interface, and click "Next".

   Note

   "English" is always installed as the basic product language.

   The dialog for selecting the product configuration opens.
7. Select the products you want to install:
   - If you wish to install the program in a minimal configuration, click "Minimal".
   - If you wish to install the program in a typical configuration, click "Typical".
   - If you wish to personally select the products to be installed, click "User-defined". Then select the check boxes for the products you wish to install.
8. If you want to create a shortcut on the desktop, select the "Create desktop shortcut" check box.
9. Click "Browse" if you want to change the target directory for the installation.

   Note

   Please note the following:
   - The length of the installation path must not exceed 89 characters.
   - You can only change the installation path if no other product from the software package which you intend to install, has been installed, yet.
   - To increase security, select a directory that is protected by administrative rights as the target directory.

10. Click "Next".
    The dialog for the license terms opens.
11. To continue the installation, read and accept all license agreements and click "Next".
    If changes to the security and permission settings are required in order to install the TIA Portal, the security settings dialog opens.
12. To continue the installation, accept the changes to the security and permissions settings, and click "Next".
    The next dialog displays an overview of the installation settings.
13. Check the selected installation settings. If you want to make any changes, click "Back" until you reach the point in the dialog where you want to make changes. Once you have completed the desired changes, return to the overview by clicking on "Next".
14. Click "Install".
    Installation is started.

    Note

    If no license key is found during installation, you have the chance to transfer it to your PC. If you skip the license transfer, you can register it later with the Automation License Manager.

    Following installation, you will receive a message indicating whether the installation was successful.

15. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now.". Then click "Restart".
16. If the computer does not reboot, click "Exit".

Result

The TIA Portal along with the products and licenses you have ordered and the Automation License Manager have been installed on your computer.

1.8 Displaying the installed software

You can find out which software is installed at any time. In addition, you can display more information on the installed software.

Procedure

To display an overview of the software installed, follow these steps:

1. Click "Installed software" in the "Help" menu.
   The "Installed software" dialog opens. You will see the installed software products in the dialog. Expand the entries to see which version is installed in each case.
2. If you would like to display additional information on the installed automation software, click the link on the "Detailed information about installed software" dialog.
   The "Detailed information" dialog opens.
3. Chose the topic you want more information about in the area navigation.

1.9 Modifying or updating installed products

You have the option to modify installed products using the setup program or to update to a new version.

Blocks with know-how protection from earlier versions of the TIA Portal are not automatically upgraded with the project. Remove the know-how protection of the blocks before you update the TIA Portal. Then set up the know-how protection with the current version of TIA Portal. For more detailed information, refer to the information system.

Requirement

- Hardware and software of the programming device or PC meet the system requirements.
- You have administrator privileges on your computer.
- All running programs are closed.

Procedure

To modify or update installed products, follow these steps:

1. Insert the installation medium in the relevant drive.
   The setup program starts automatically unless you have disabled Autostart on the programming device or PC.
2. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.
   The dialog for selecting the setup language opens.
3. Choose the language in which you want the setup program dialogs to be displayed.
4. To read the information on the product and installation, click the "Read Notes" or "Installation Notes" button.
   The help file containing the notes opens.
5. Once you have read the notes, close the help file and click the "Next" button.
   The dialog for selecting the installation variant opens.
6. Select the "Modify/Upgrade" option button and click the "Next" button.
   The dialog for selecting the product languages opens.
7. Select the check boxes of the product languages that you want to install. You can remove previously installed product languages by clearing the corresponding check boxes.

   Note

   Note that the product language "English" cannot be removed.

8. Click the "Next" button.
   The dialog for selecting the product configuration opens.
9. Select the check boxes of the components that you want to install. You can remove previously installed components by clearing the corresponding check boxes.

10. Click the "Next" button.

    Note

    Note that you cannot change the target directory because the existing installation is being modified.

    If changes to the security and permission settings are required in order to install the TIA Portal, the security settings dialog opens.

11. To continue the installation, accept the changes to the security and permissions settings, and click the "Next" button.
    The next dialog displays an overview of the installation settings.

12. Click the "Modify" button.
    This starts the installation of the additional components.

    Note

    Following installation, you will receive a message indicating whether the existing installation was successfully changed.

13. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".

14. If the computer does not reboot, click "Exit".

Result

The existing installation has been modified on your computer.

1.10 Repairing installed products

You have the option to repair installed products by completely reinstalling them using the setup program.

Requirement

- Hardware and software of the programming device or PC meet the system requirements.
- You have administrator privileges on your computer.
- All running programs are closed.

Procedure

To repair installed products, follow these steps:

1. Insert the installation medium in the relevant drive.
   The setup program starts automatically unless you have disabled Autostart on the programming device or PC.
2. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.
   The dialog for selecting the setup language opens.
3. Choose the language in which you want the setup program dialogs to be displayed.
4. To read the information on the product and installation, click the "Read Notes" or "Installation Notes" button.
   The help file containing the notes opens.
5. Once you have read the notes, close the help file and click the "Next" button.
   The dialog for selecting the installation variant opens.
6. Select the "Repair" option button, and click the "Next" button.
   The next dialog displays an overview of the installation settings.
7. Click the "Repair" button.
   This starts the repair of the existing installation.

   Note

   Following installation, you will receive a message indicating whether the existing installation was successfully repaired.

8. It may be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".
9. If the computer does not reboot, click "Exit".

Result

The installed products have been reinstalled.

1.11 Starting to uninstall

Introduction

Software packages are removed automatically by the setup program. Once started, the setup program guides you step-by-step through the entire removal procedure.

You have two options for removing:

- Removing selected components via the Control Panel
- Removing a product using the installation medium

Note

The Automation License Manager will not be removed automatically when you remove the software packages, because it is used for the administration of several license keys for products supplied by Siemens AG.

Removing selected components via the Control Panel

To remove selected software packages, follow these steps:

1. Open the Control Panel.
2. Click "Programs and Features".
   A dialog with the list of installed programs opens.
3. Select the software package to be removed and click the "Uninstall" button.
   The dialog for selecting the setup language opens.
4. Select the language in which you want the dialogs of the setup program to be displayed and click "Next".
   The dialog for selecting the products you want to remove opens.
5. Select the check boxes for the products that you want to remove and click "Next".
   The next dialog displays an overview of the installation settings.
6. Check the list with the products to be removed. If you want to make any changes, click the "Back" button.
7. Click the "Uninstall" button.
   Removal begins.
8. It might be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".
9. If the computer does not reboot, click "Exit".

Removing a product using the installation medium

To remove all software packages, follow these steps:

1. Insert the installation medium in the relevant drive.
   The setup program starts automatically unless you have disabled Autostart on the programming device or PC.
2. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.
   The dialog for selecting the setup language opens.
3. Select the language in which you want the setup program dialogs to be displayed.
4. To read the information on the product and installation, click "Read product information" or "Read installation notes".
   The help file containing the notes opens.
5. Once you have read the notes, close the help file and click the "Next" button.
   The dialog for selecting the installation variant opens.

6. Select the "Uninstall" option button and click the "Next" button.
   The next dialog displays an overview of the installation settings.
7. Click the "Uninstall" button.
   Removal begins.
8. It might be necessary to restart the computer. If this is the case, select the "Yes, restart my computer now." option button. Then click "Restart".
9. If the computer does not reboot, click "Exit".

1.12 Installing updates and support packages

1.12.1 Checking availability of updates and support packages and installing them

By default, the TIA Portal checks automatically if new software updates or support packages are available, for example, Hardware Support Packages (HSPs). The automatic search for updates takes place after each computer restart and then cyclically every 24 hours. You can also deactivate the automatic search at any time or reactivate it. You can also search for updates manually.

If updates are found, you can download and install them.

Note

Updates and support packages from TIA Portal V13 or higher are supported.

Deactivate or activate automatic search for software updates

To deactivate or reactivate the automatic search for software updates, follow these steps:

1. Select the "Settings" command in the "Options" menu.
   The "Settings" window is displayed in the work area.
2. Select the "General > Software Updates" group in the area navigation.
3. Deselect the "Check for updates daily" check box if you want to deactivate the automatic search for software updates.
4. Select the "Check for updates daily" check box if you want to reactivate the automatic search for software updates.

Manually searching for software updates

If you want to search for software updates manually, follow these steps:

1. Click "Installed software" in the "Help" menu.
   The "Installed software" dialog opens.
2. Click "Check for updates".
   The TIA Administrator opens.
3. Click on the "Manage software" tile.
   The available updates are displayed.

Or:

1. Select the "Settings" command in the "Options" menu.
   The "Settings" window is displayed in the work area.
2. Select the "General > Software Updates" group in the area navigation.
3. Click "Check for updates now".
   The TIA Administrator opens.
4. Click on the "Manage software" tile.
   The available updates are displayed.

Or:

1. Open the TIA Administrator via "Start > All Programs > Siemens Automation > TIA Administrator".
2. Click on the "Manage software" tile and on the "Check for updates" button there.
   The available updates are displayed.

Setting the server

You must set the corresponding server depending on whether you want to download updates and/or support packages from the TIA Automation Update Server or from a corporate server. To do this, follow these steps:

1. Open the TIA Administrator.
2. Click "Options" and select the "TIA Automation Software Update Server" option in the dialog that appears in the "Server used to check for updates" area.
   The software searches for available updates on the server of the manufacturer.

Or:

1. Open the TIA Administrator.
2. Click "Settings" and select the "Corporate server" option in the "Software management" tab.

3. Enter the server URL which you received from your administrator. The URL must be entered either in the format https://[URL of the server]/[path to the file directory] or in the format https://[server IP address]/[path to the directory]. If you are not sure which format to use, contact your administrator!
   The software looks for available updates on the server of your company.
4. Check the name of the production line and change this if necessary "ProductionLine1" is set by default.
   The purpose of production lines is to provide different users with specific updates/support packages. If your company does not work with different production lines, retain the specified entry.
   You can find detailed information on creating projects and working with production lines in the help on the TIA Updater Corporate Configuration Tool.

You can set a different server on which the updates are to be searched for at any time. However, changing this setting is blocked during a download process. After switching the server, all downloaded updates and support packages are displayed, even if they are not available on the currently set server.

Installing updates/support packages

For the exact procedure for installing updates/support packages, refer to the TIA Administrator help.

Alternative procedures for the installation of support packages

Another procedure is available for the installation of a support package. To do this, follow these steps:

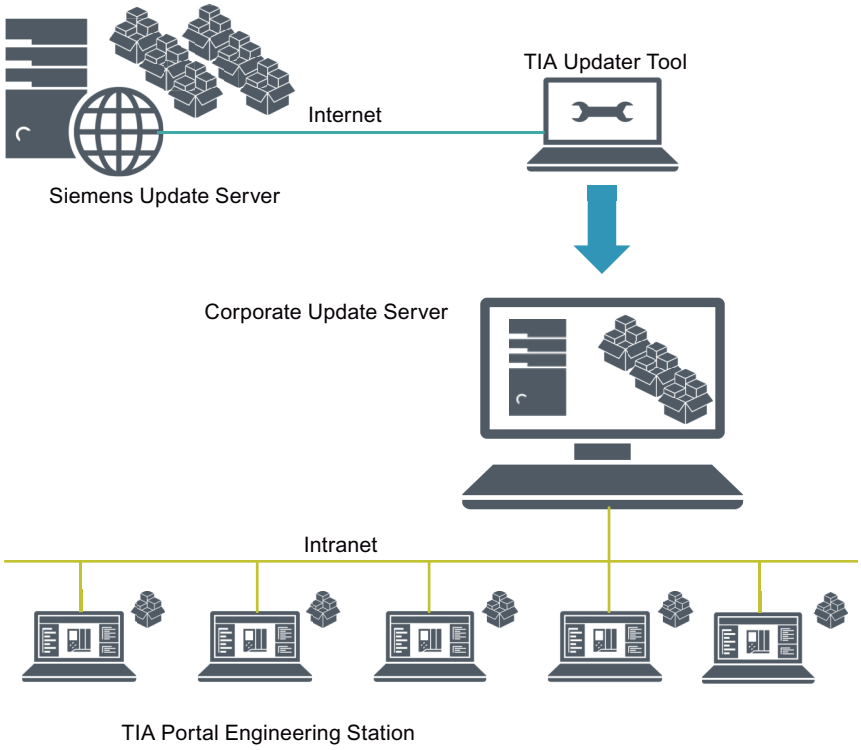
1. Click "Support packages" in the "Options" menu of the TIA Portal.
   The "Detailed information" dialog opens. A table lists all support packages from the directory that you selected as the storage location for support packages in the settings.
2. If you want to install a support package that is not in the list, you have the following options:
   - If the support package is already on your computer, you can add it to the list by selecting "Add from file system".
   - If you add a support package from the "Service & Support" page on the Internet, first you download it by selecting "Download from the Internet". Then you can add it from the file system.
3. Select the support package that you want to install.
4. Click "Install".
5. Close and then restart the TIA Portal.

1.12.2 Working with a company-internal server

1.12.2.1 Properties and advantage of a corporate server

Introduction

Using a corporate server, you can place selected updates / support packages on a local server and make them available to users, e.g. for different production lines. This has the advantage that users do not have to access the Internet, but can install updates via the intranet, an external hard disk, etc. Since users do not need direct access to the Internet, the protection against trojans or malicious software that contacts the Internet from the internal company network is significantly increased.



Configuring the server and creating projects

In the first phase, the corporate server is configured by a server administrator and the updates / support packages are deployed using the TIA Updater Corporate Configuration Tool. In addition, projects for different production lines can be created through which users can receive the updates they require. Users need to have access to the server area and have the name of the production line and be informed about the storage directory.

You can find detailed information on creating projects and working with production lines in the help on the TIA Updater Corporate Configuration Tool.

Working with the server

With the TIA Updater, users can download and install the updates and support packages that are relevant and relevant for them. Multiple download operations can be initiated at the same time. The installation of the updates / support packages must be done one after the other.

1.12.2.2 Configuring a corporate server for updates

Introduction

To provide available updates, support packages and language packages to users from a central location, you must configure a corporate server. Use the Microsoft Server Manager to do this.

The following is an example of the steps required to create and configure the server using the TIA Updater Corporate Configuration Tool (with the Microsoft Server 2016 operating system). Further settings which may be required for operation in your company are **not** covered in this description!

Note

Please note that the structure of the start menu and the storage location of the programs may vary depending on the different operating systems.

For more detailed information on configuration and operating the Server Manager, refer to the Microsoft help.

Requirement

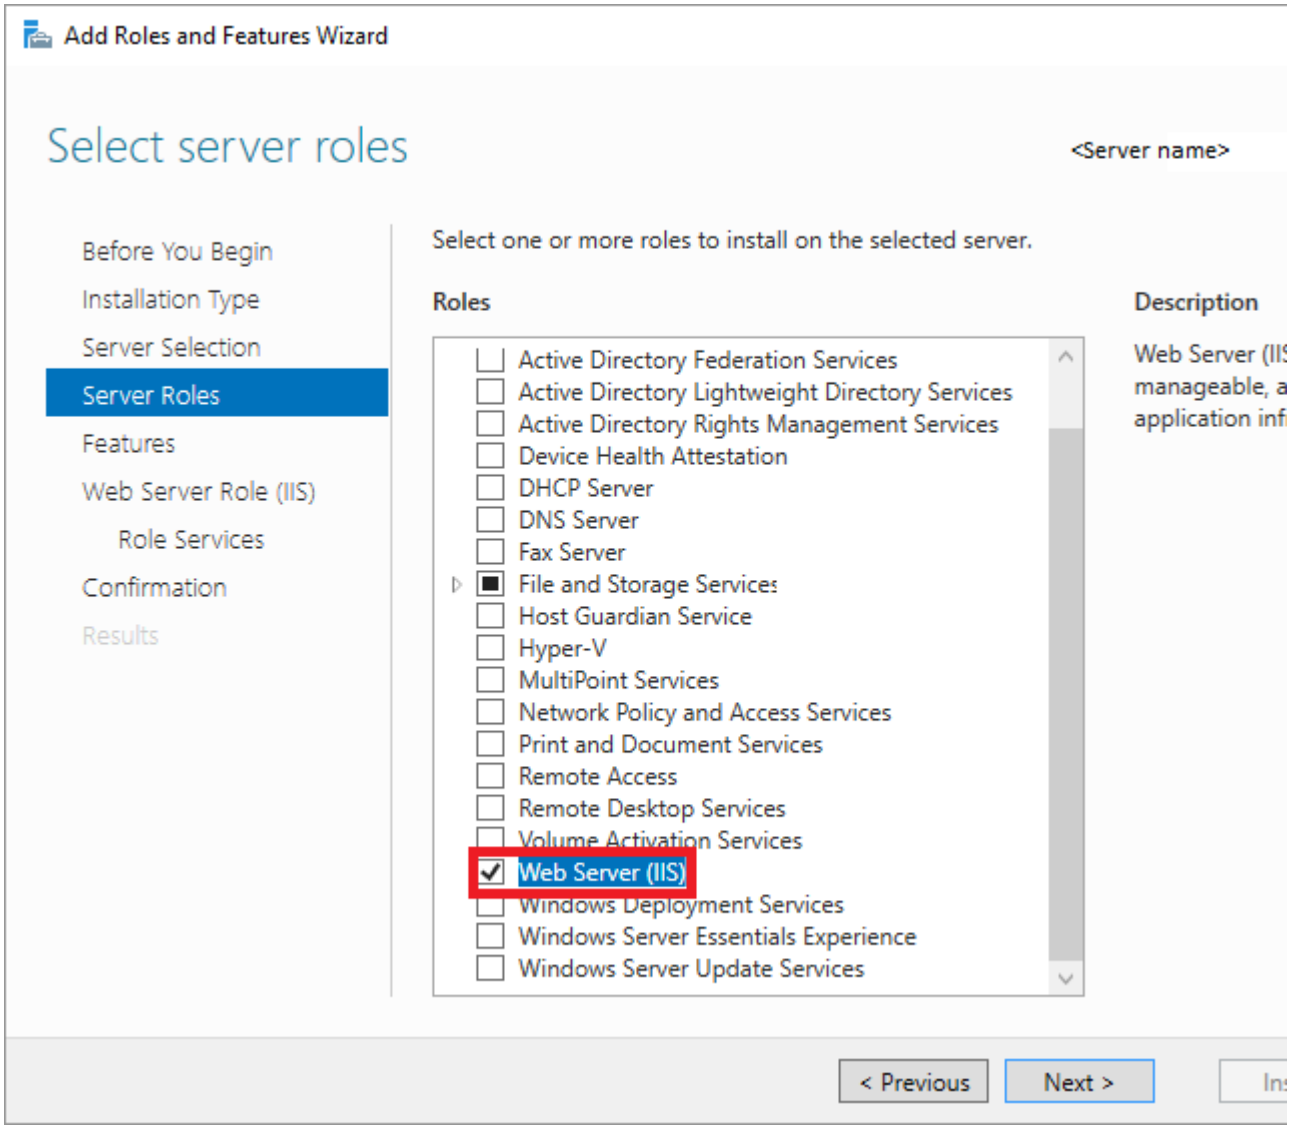
You must have administrator rights.

Install Web server role (IIS)

To install the required Web server role, follow these steps:

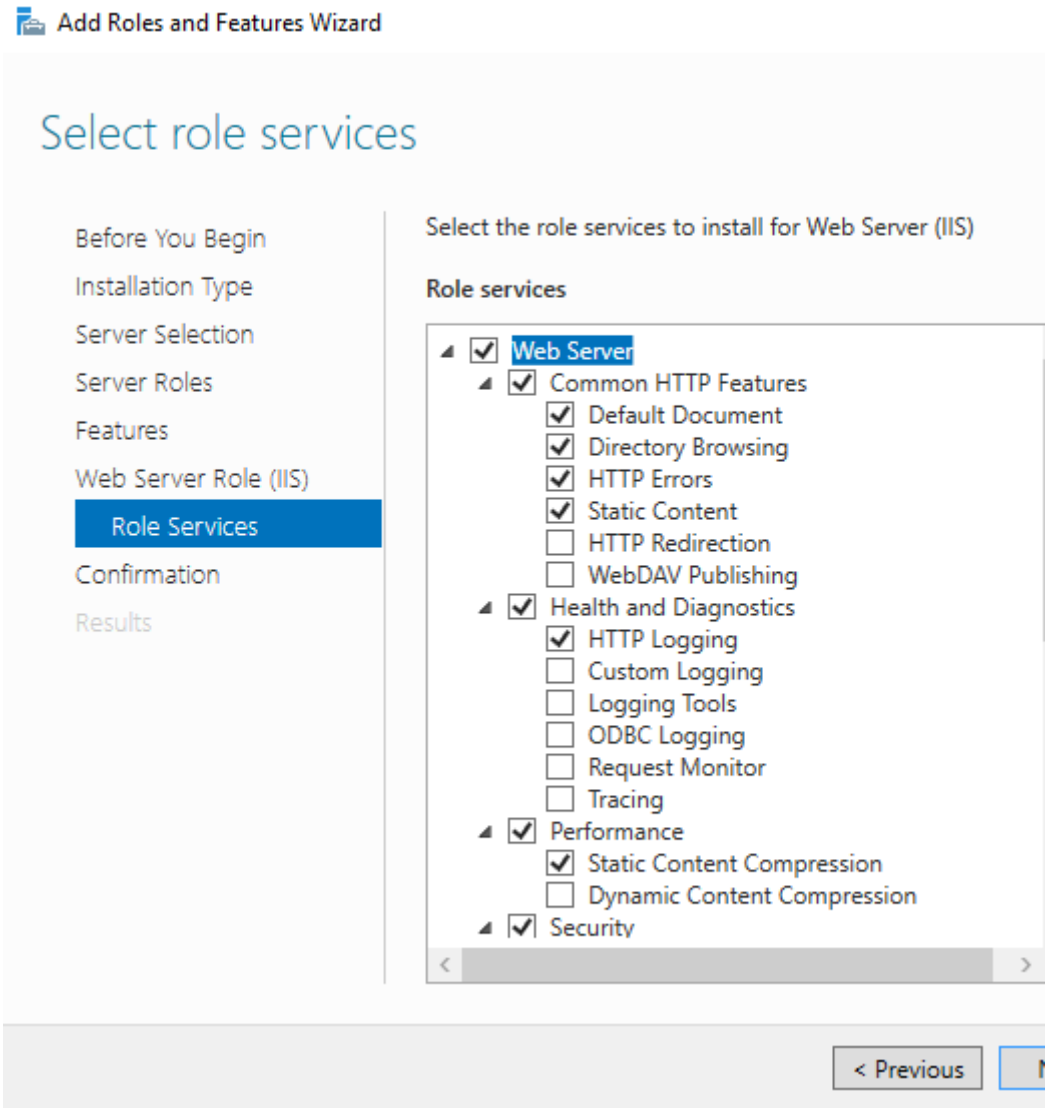
1. Open the start menu and select "Server Manager".
2. Click "Add roles and features" in the dashboard.
3. Use the "Add roles and features" wizard to add the Web server roles.
   Before the wizard starts, it is verified that a complex password has been assigned to the administrator, that the network settings have been configured accordingly and that the latest Windows security updates have been installed.
4. Select "Role-based or feature-based installation" as the installation type and click "Next".
5. Select the target server and click "Next".

6. Note the pre-selected roles that are installed by default, and then select the additional role "Web Server (IIS)".



7. Click "Add features" followed by "Next". The features for the web server are displayed.

8. Click "Role Services" and make sure that the following features are selected or select them:



"Web server" area

- Default document
- Directory browsing
- HTTP errors
- Static content

"Health and diagnostics" area

- HTTP logging
- Request monitor

"Performance features" area

- Static content compression

"Security" area

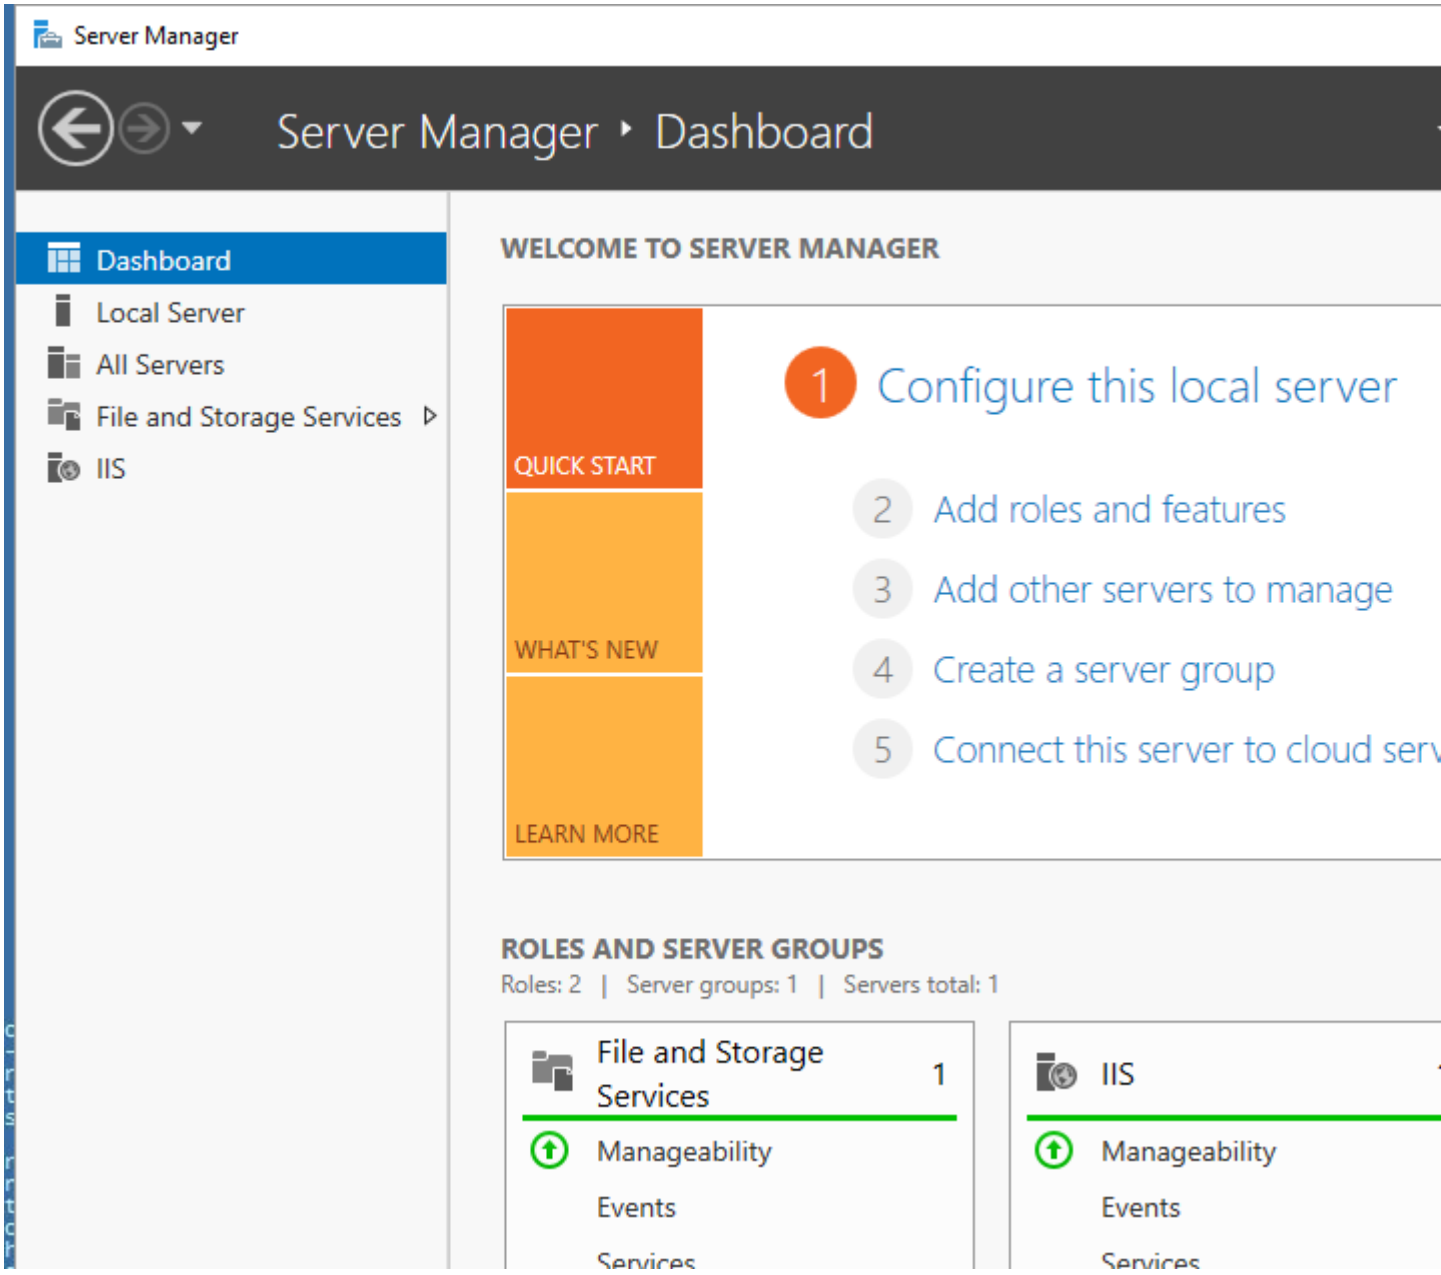
- Request filtering

"Application Development Features" area

- .NET Extensibility 3.5
- .NET Extensibility 4.6
- ASP.NET 3.5
- ASP.NET 4.6
- ISAPI Extensions
- ISAPI Filters

9. Click "Next".
10. Check your selection in the "Confirm installation selection" dialog box and click "Install".

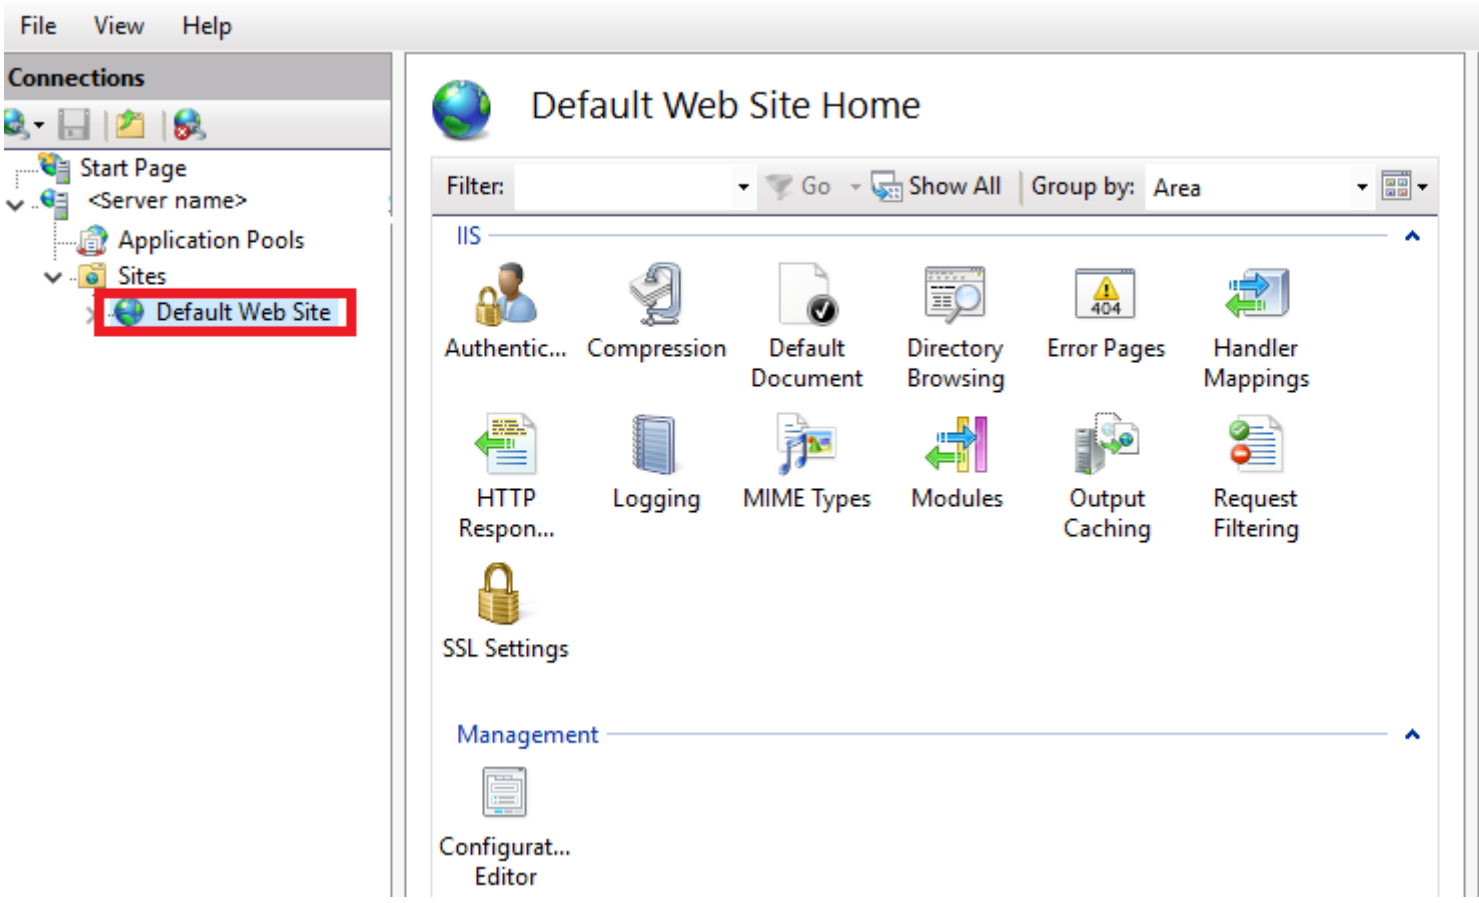
"IIS" is added in the dashboard and can be further configured.



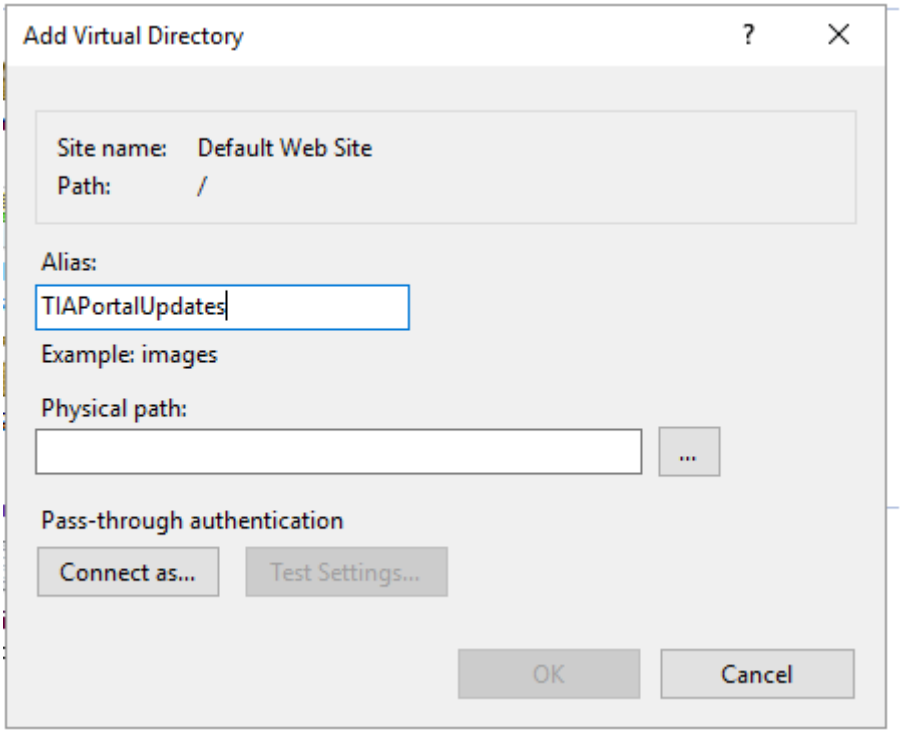
Create website

1. In the navigation area, click "IIS" and right-click in the "Servers" area and select "Internet Information Services (IIS) Manager".
2. In the "Connections" area, click "Sites" and then "Default Web site".

3. Right-click to select the "Add Virtual Directory..." option.



4. In the dialog that opens, enter a display name in the "Alias" field, for example, "TIAPortalUpdates".



5. In the "Physical Path" field, enter the physical path of the folder in which the website is located or click the button to browse (**...**), in order to search for the folder in the file system.

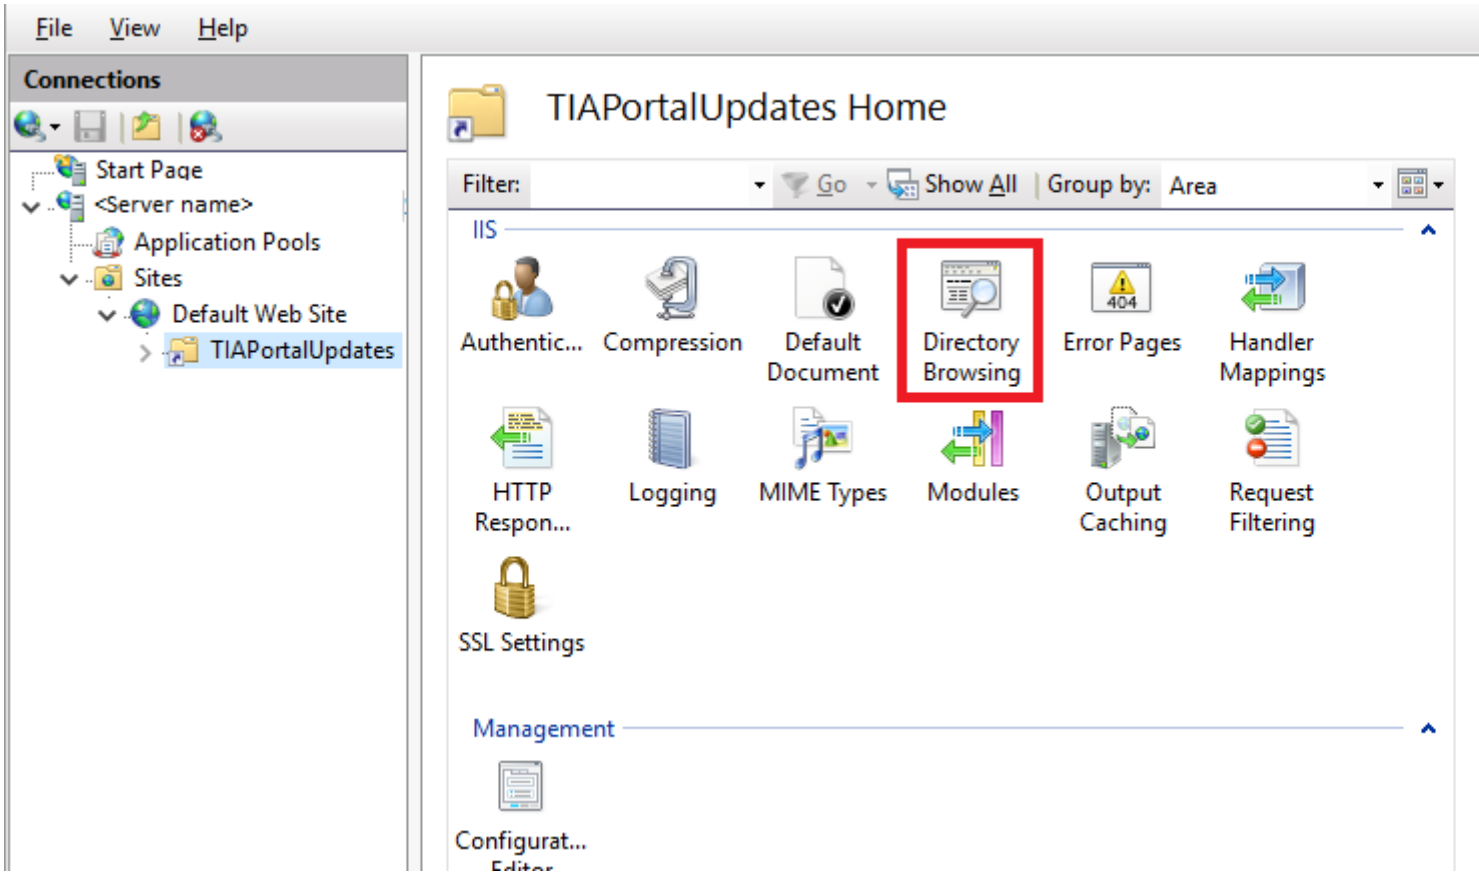
Note

The default website must be created in the directory that contains the 'UpdatesSummaryCatalog.xml' file.

6. Click "Test Settings..." to check whether the settings are correct.
7. Click "OK".

Activating virtual directory

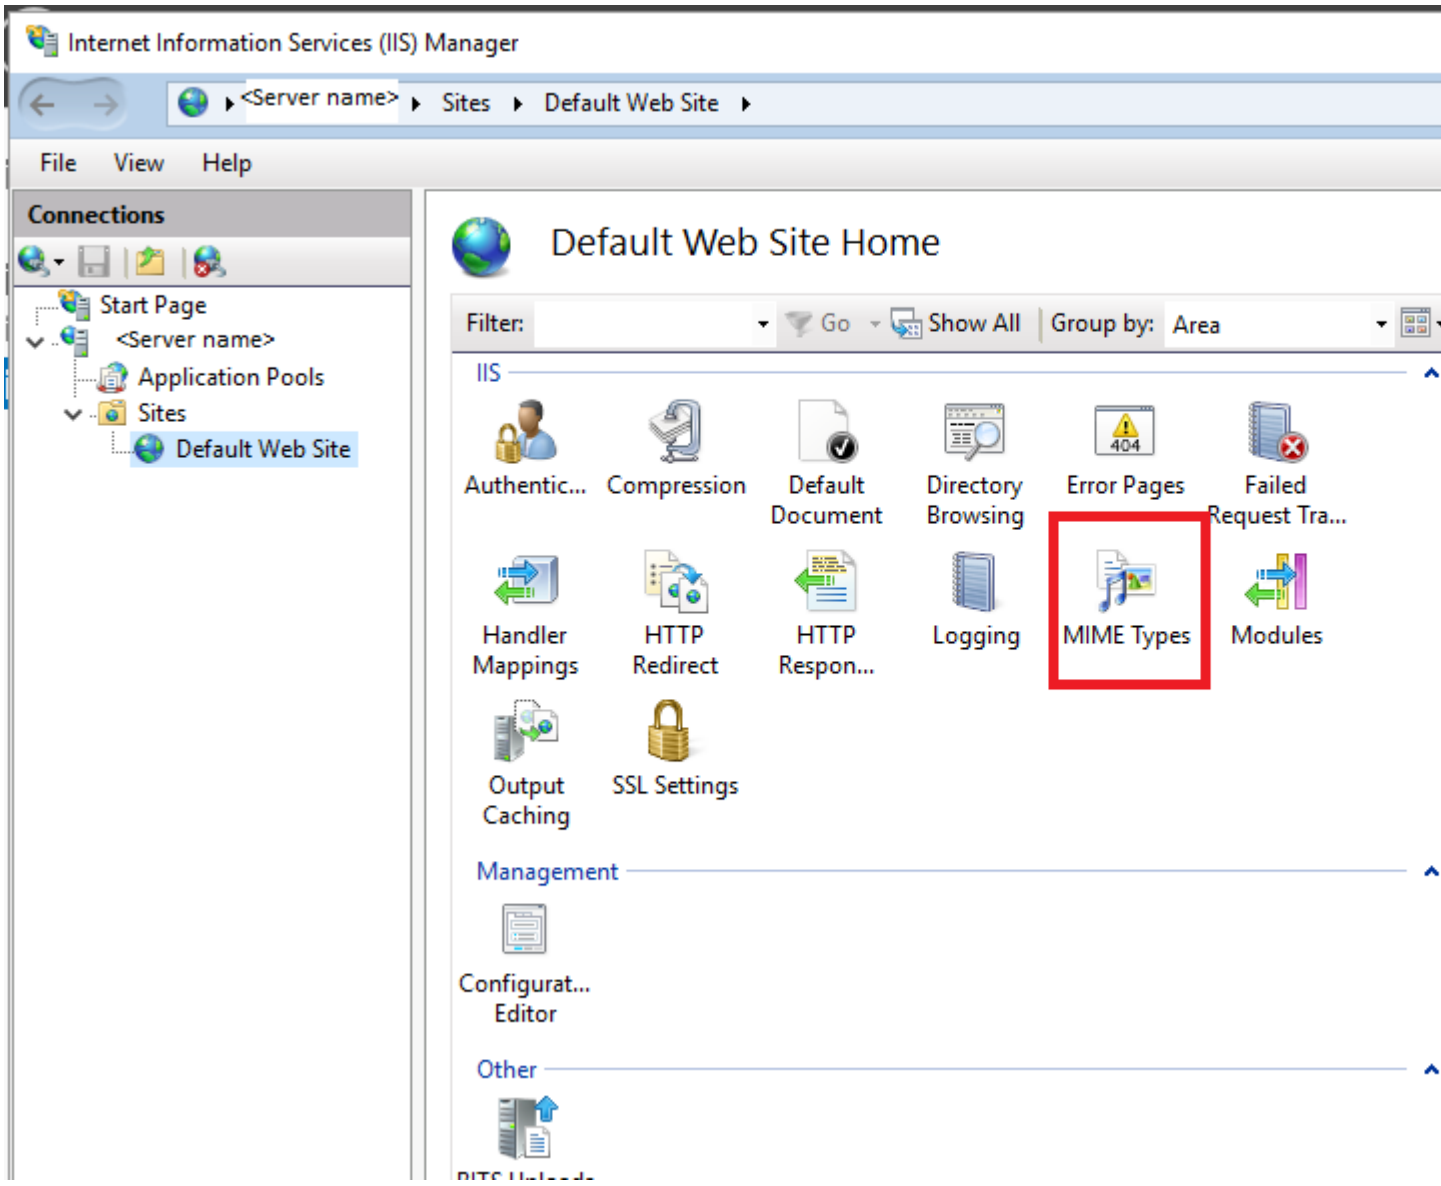
1. In the area "Connections > Sites > Default Web site", select the virtual directory you created.
2. In the "Features" view, double-click the item "Directory browsing".



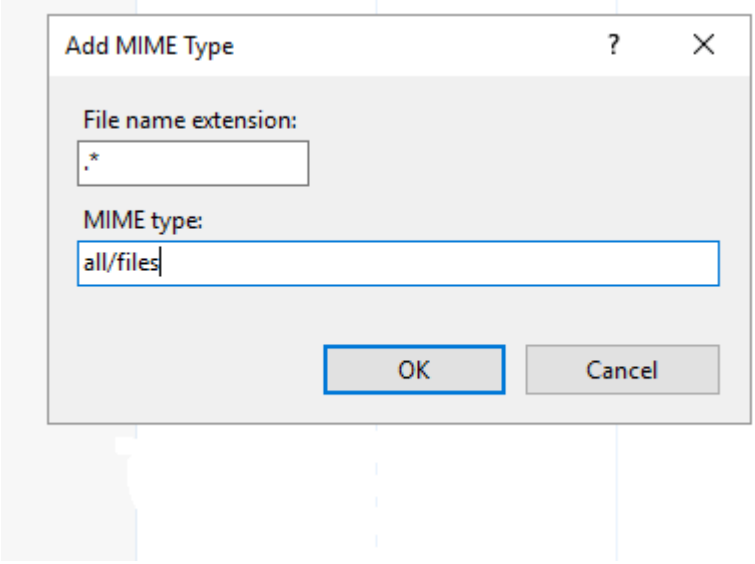
3. Click "Enable" in the "Actions" area.

Adding and configuring MIME type

1. In the "Connections" area, select the website you created.
2. Double-click "MIME type" in the "Features" view.



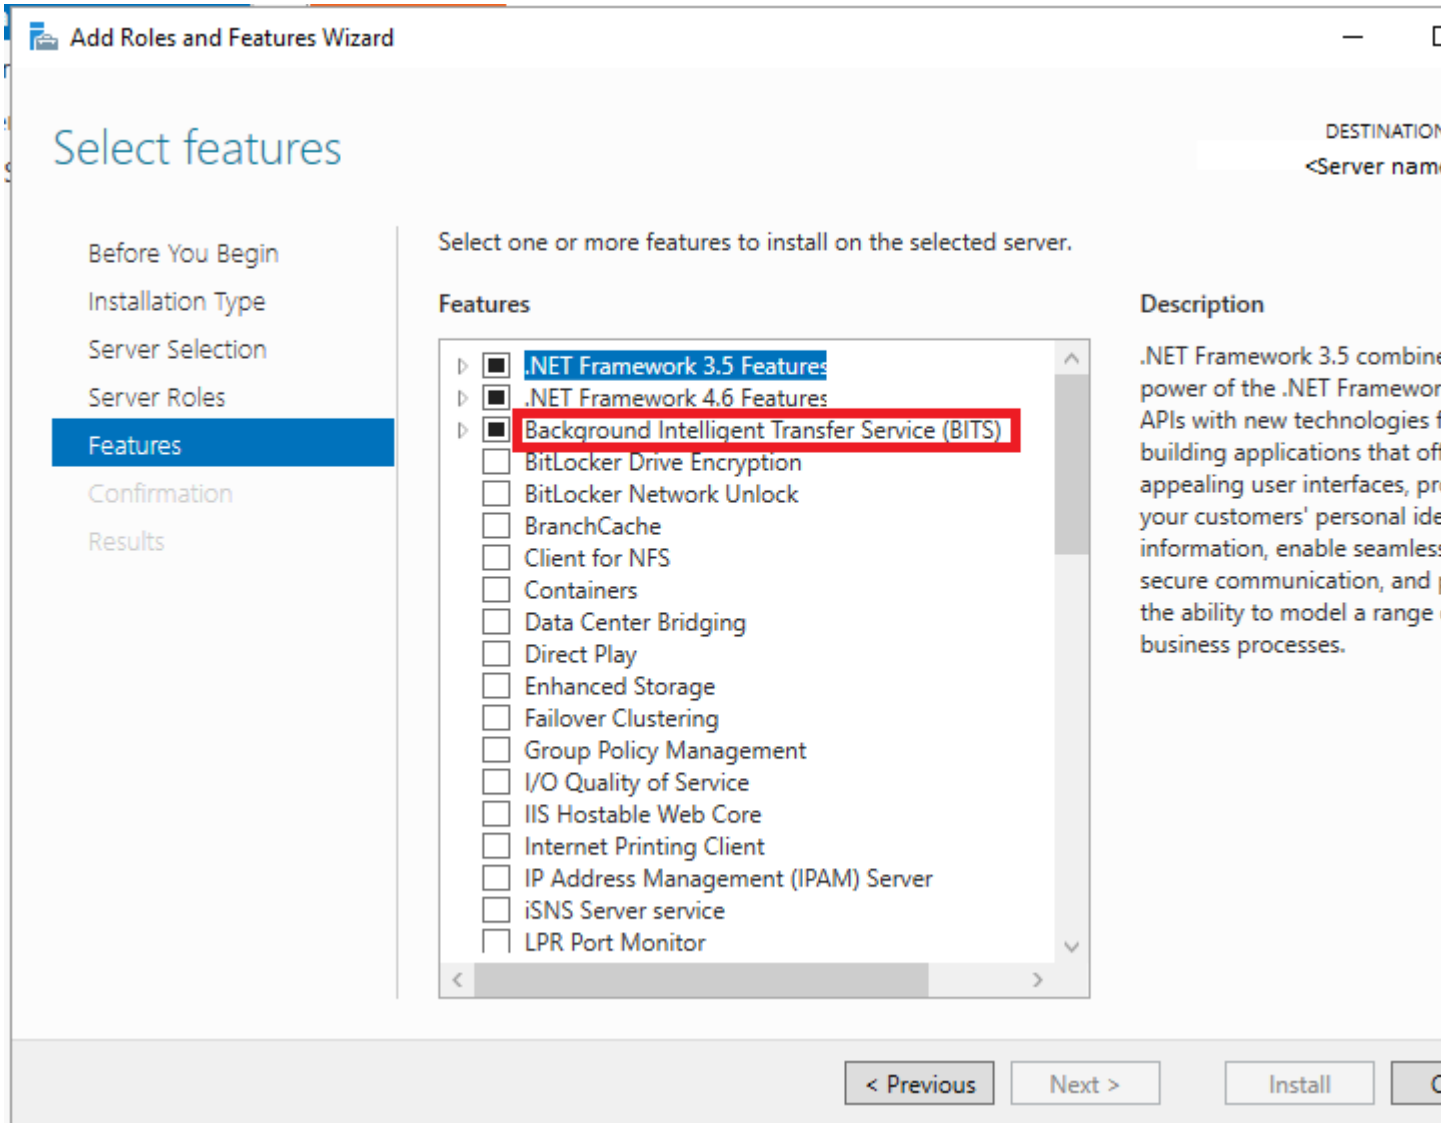
3. Click "Add" in the "Actions" area.
4. Enter .* in the "File name extension" text field in the "Add MIME type" dialog.
5. Enter "all/files" in the "MIME type" text field.
6. Click "OK".



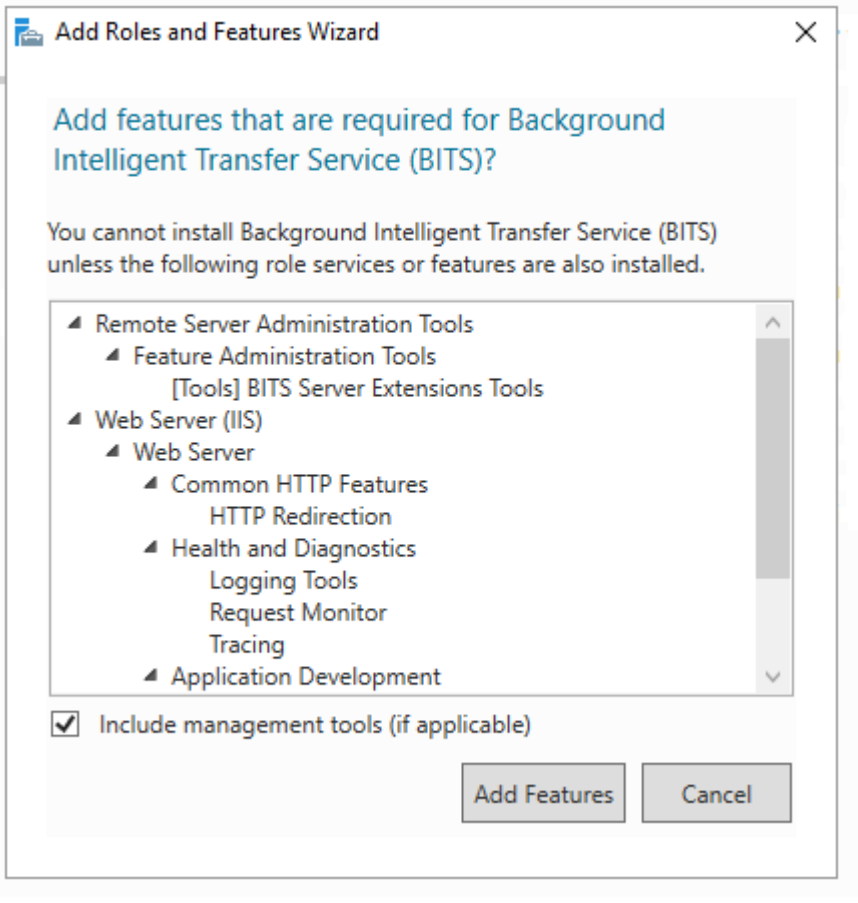
Add MIME Type
File name extension:
.*
MIME type:
all/files
OK
Cancel

Activate BITS-IIS server extension

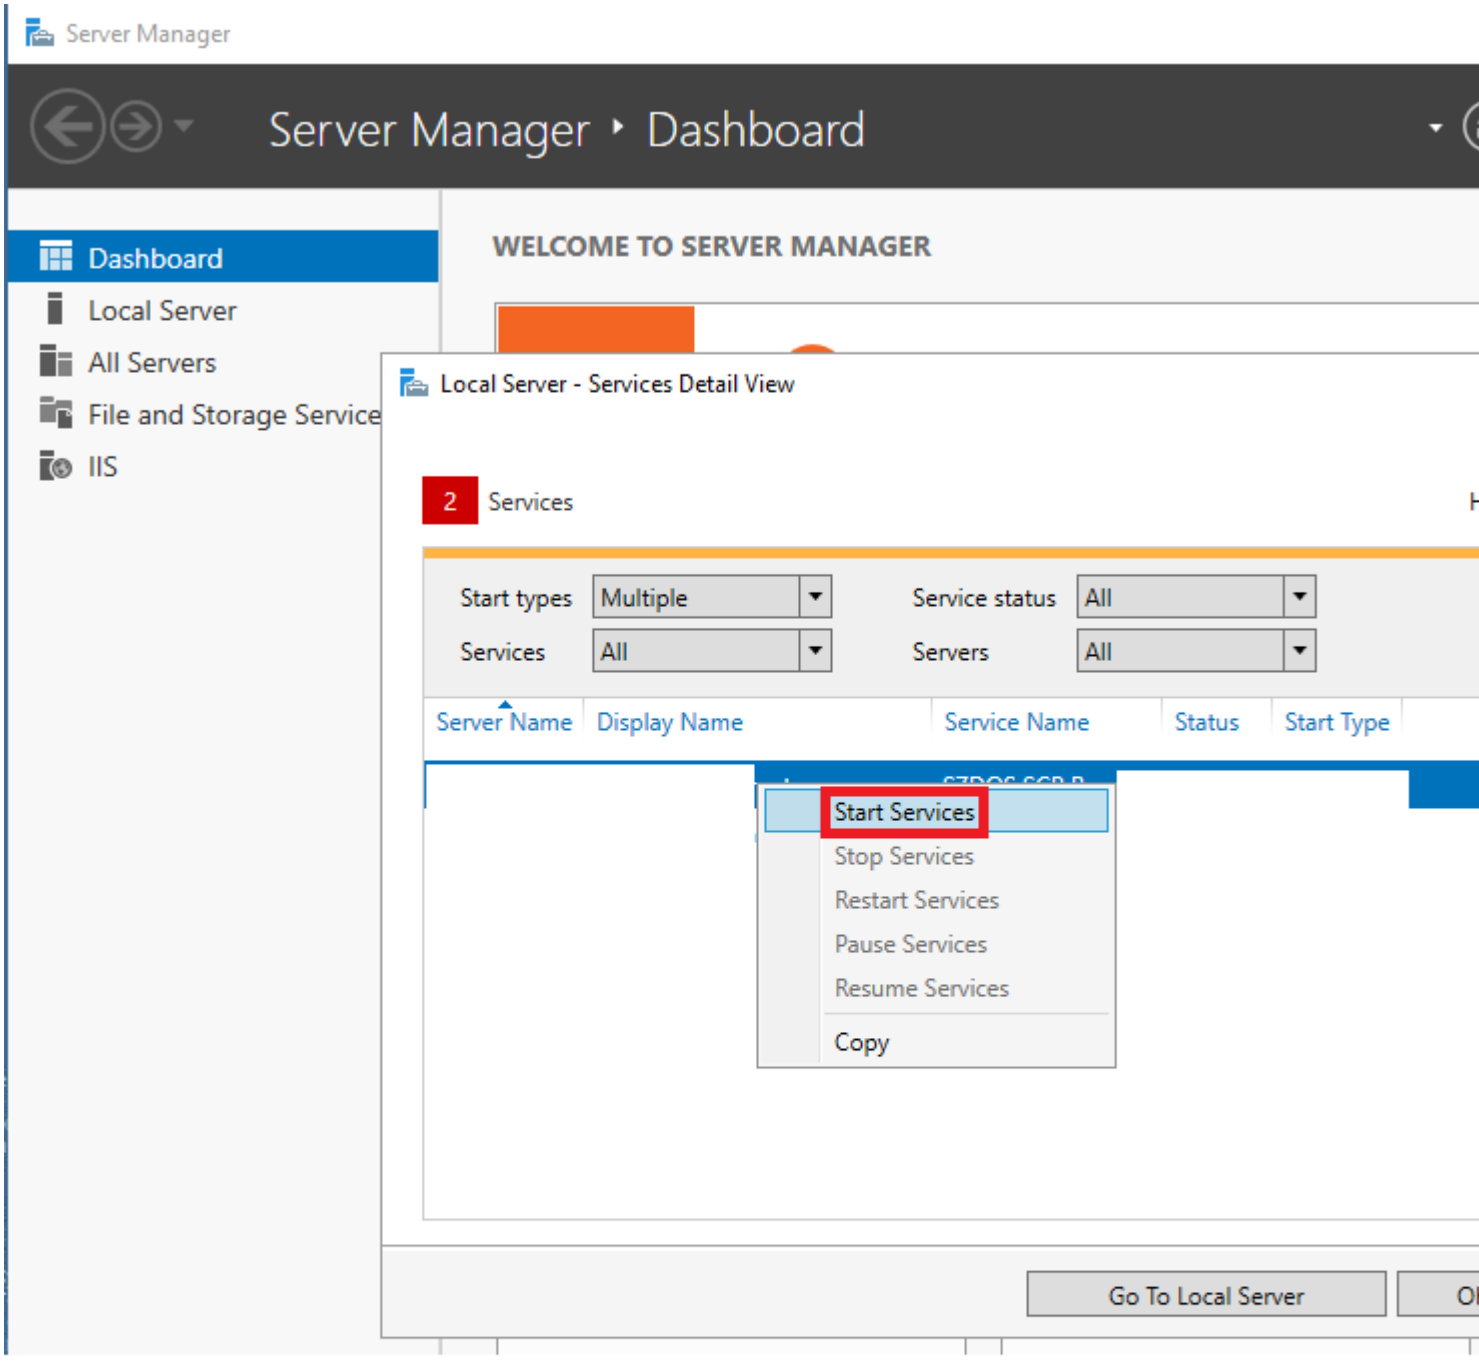
1. Switch to the virtual directory in the IIS Manager.
2. Click "Add roles and features" to verify that BITS is installed. If necessary, enable and install the "Background Intelligent Transfer Service" feature.



3. In the Dashboard, in the "Local Server" area, click "Services".



4. Select the local server, right-click and select the menu command "Start Services".



Server Manager
Server Manager ‣ Dashboard

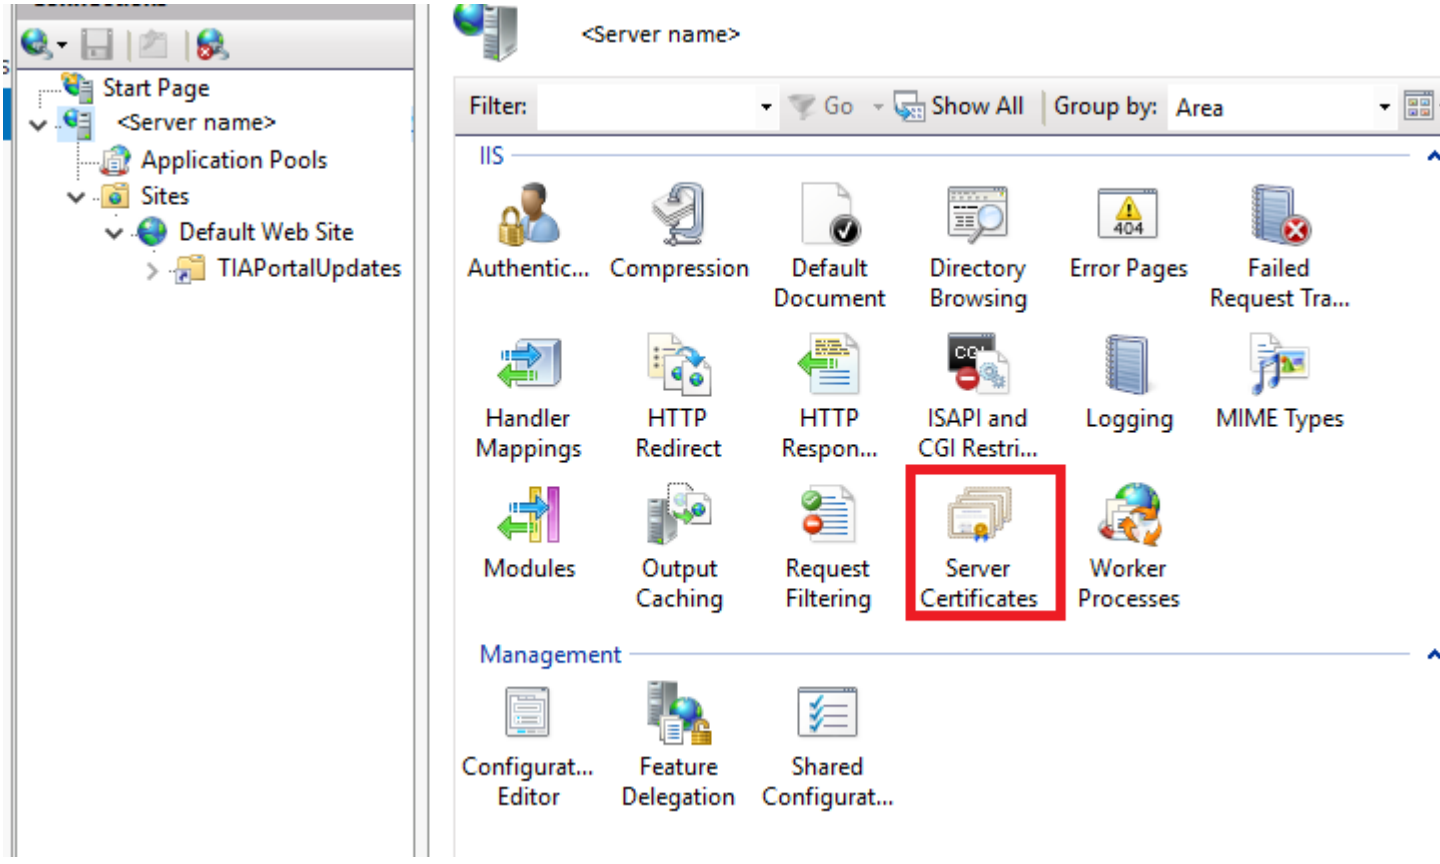
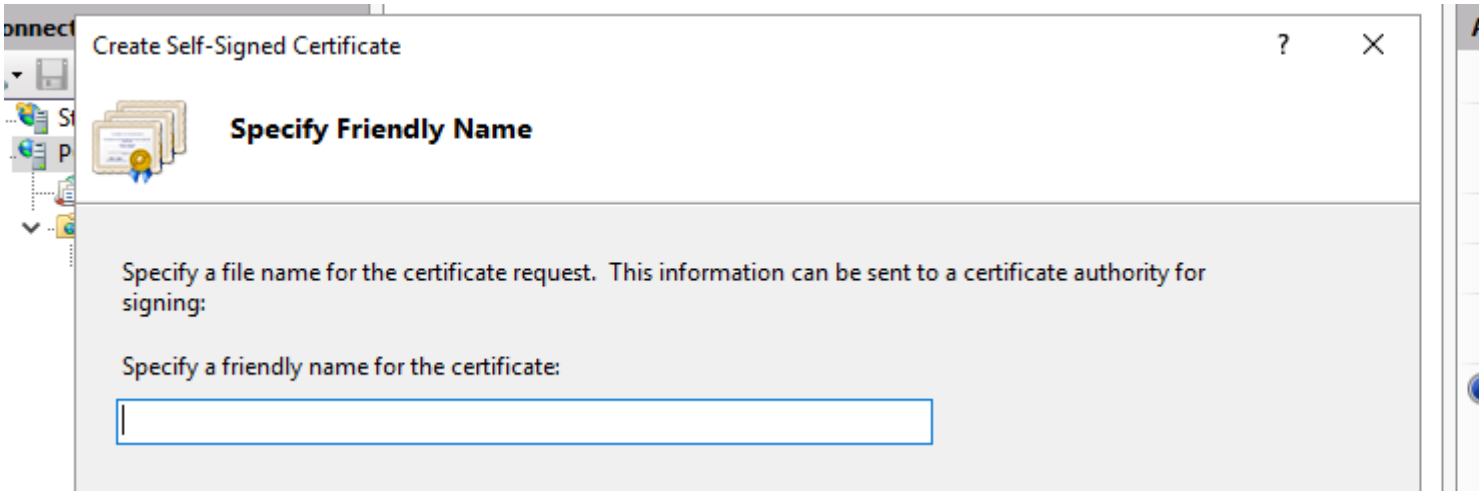
Create a self-signed server certificate

It is strongly recommended that you use a signed certificate created by your company's IT department; in this way the company's own server receives a qualified (secure) certificate. You can also purchase such a certificate from trusted third-party companies/certification authorities. If this is not possible for you, you can create a self-signed certificate. Note that such a certificate is not secure! To do this, follow these steps:

1. In the "Connections" area, navigate to the level which you want to manage.
2. Double-click "Server Certificates" in the "Features" view.



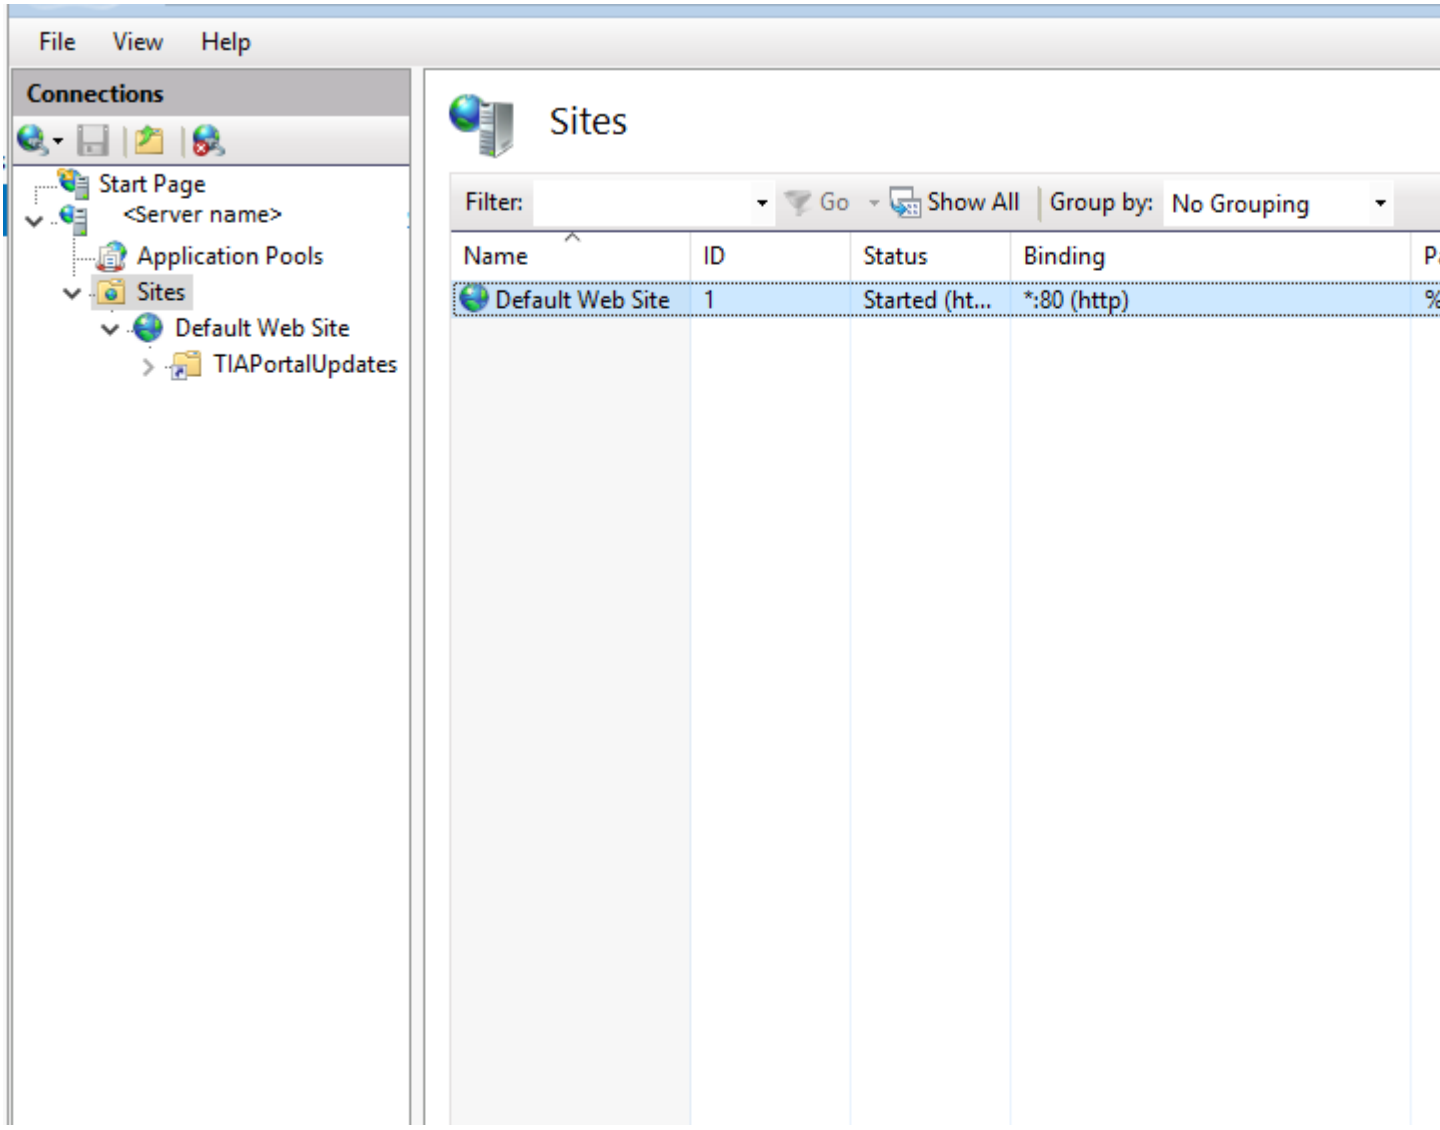
3. Click "Create Self-Signed Certificate" in the "Actions" area.



4. In the "Create Self-Signed certificate" dialog, enter a display name for the certificate in the "Specify a friendly name for the certificate" field and click "OK".

Create SSL binding

1. Expand the "Sites" entry in the "Connections" area, and then click the site to which you want to add a binding.
2. Click "Bindings" in the "Actions" area.



3. In the "Site Bindings" dialog, click "Add".
4. In the "Add Site Binding" dialog, select the certificate you created under "Type" "https" and under "SSL certificate" and then click "OK".

Verify SSL binding

1. In the "Actions" area, click the previously created binding under "Browse website".
   An error page is opened in Internet Explorer, because the self-signed certificate was created by your computer.
2. Click "Continue to this website (not recommended)".
   This message is no longer displayed when you add the certificate to the "Trusted Root Certification Authorities" certificate memory.

Configure SSL settings

1. Double-click "SSL settings" in the "Features" view.
2. Use one of the following procedures in the "Client certificates" area of the "SSL Settings" dialog:
   - Select "Ignore" if no client certificates are to be accepted even if a client has a certificate.
   - Select "Accept" if client certificates are to be accepted.
   - Select "Require" if client certificates are to be required. The "Require SSL" option must be activated to allow the "Require client certificates" option to be used.
3. Click "Apply" in the "Actions" area.

1.12.2.3 Distributing updates to different areas

It may be the case that different departments need different updates or support packages. In this situation, we recommend creating multiple production lines which offer different updates and support packages. The procedure for this is described in the help of the TIA Updater Corporate Configuration Tool.

Note

The main advantage of different production lines is that less storage space is required. When an already downloaded update, support package, or language pack is added to a new production line, a copy of it is not created, instead, the various production lines reference that update, support package, or language pack.

Procedure

You can also operate multiple servers that provide different updates, support packages, and language packs. To do this, follow these steps:

1. Set up different company-owned servers as described above.

or

1. Set up different company-owned servers as described above.
2. Set up multiple websites.
   Make sure that you assign unique names for these websites and the physical paths so that there will be no confusion.
3. Set the features described previously for the Web server or the websites.

You can now store the required updates and support packages for the different departments in the defined directories.

1.12.2.4 Providing updates on a corporate server

Introduction

In the TIA Updater Corporate Configuration Tool, you can set a corporate server on which the available updates/support packages/language packs are stored and can be made available to the users.

Requirement

You must have administrator rights.

A corporate server can only be set up on a Microsoft server operating system, because it requires the operation of the BITS IIS service and a running IIS sever.

Adding updates from the TIA Automation Software Update Server

To add updates from the TIA Automation Software Update Server, follow these steps:

1. Open the TIA Updater Corporate Configuration Tool.
   The available updates are displayed.
2. Click the "Add update" button and select the "Add TIA Automation Software Update Server" check box in the dialog that appears.
3. In the dialog "Add update from TIA Automation Software Update Server", select the required updates (software and support packages) and click "Add".
   If updates are already located on the corporate server, these are grayed out. You cannot load them again. During the download process, the status and the remaining time is displayed in the dialog.

Canceling the download process

To cancel the process, follow these steps:

1. Click "Cancel download".
2. Click "Yes" to confirm the dialog that appears.
   The download of the update is cancelled and it is deleted from the list.

Deleting updates from the corporate server

To delete updates, follow these steps:

Select the required updates and click "Remove".

- If an update only belongs to **one** project/**one** production line, confirm the dialog with "Yes". The selected update is removed from the list and deleted from the file system.
- If an update belongs to **multiple** projects/production lines, the following applies:
  - The remove update dialog does not appear.
  - The selected update is only removed from the current project list and not deleted from the file system.

  To delete updates from the file system, all instances of the updates must be deleted. To do this, follow these steps:
  - Open the existing project/global production line from the "Project" menu.
  - Select the updates you want and click "Remove".
  - Confirm the dialog that appeared when deleting the last instance with "Yes".

Server options

In the dialog "TIA Automation Software Update Server", click "Settings" to determine the following:

1. Under "Server path", specify the folder in which the downloads are to be saved. You can select either a local drive or a network drive.

   Note

   When you work directly on the server, the target directory is the same as the provision directory on the server. All changes are applied directly. This procedure is not recommended, as conflicts can occur with active downloads.

   We recommend that you work on another computer; the target directory can be any directory. The content of this directory must then still be copied to the provision directory. Here, also, make sure that no conflicts occur with active downloads.

2. Select the check box "Always run server in background (icon is shown in the taskbar)", if the server is to always run in the background.
3. Confirm your entries with "OK".

1.13 Installing support packages automatically

1.13.1 Installing support packages automatically

Introduction

As of V15.1, you can use the Support Package Installer to install or upgrade all support packages automatically via the command line; these include HSPs (hardware support packages) that are compatible with the installed version of the TIA Portal (e.g. isp.15_1).

Requirement

- Hardware and software of the programming device or PC meet the system requirements.
- You have administrator privileges on your computer.
- All running programs have been closed.

Procedure

To start the installation with the desired options directly via the command line, proceed as follows:

1. Open the Windows command prompt with "Start > Run > cmd".
2. Switch to the directory that contains the "Siemens.Automation.SupportPackageInstaller.exe" file. This is the installation directory of your installed TIA Portal.
3. In the command prompt, enter the following command:
   %Installation directory% > Siemens.Automation.SupportPackageInstaller.exe <Support Package(HSP)-storage directory> [-l <Name of log file>] [-warnaserror]

<Support Package-storage_directory>
Mandatory directory containing the support package files (*.isp). This can be either a local folder or a Remote Share.

-l <Storage location of log file>
This parameter is optional and specifies the path to the log file. If it is not set, the log file is created in the binary directory. However, you need to have write permissions in the storage folder.

-warnaserror
This parameter is optional and indicates that every message that would usually have been reported as a warning will be reported as an error instead. If a HSP does not meet the necessary conditions, for example, a corresponding return value/abort value is output to the command line and the affected HSP is skipped.

-?
This parameter is optional and shows the Help.

Note

- If the storage directory or the name of the log file contains spaces, you need to place the name in quotation marks.
- Only support packages located directly in the storage directory are considered; subdirectories are ignored. This means that the *.isp files must be located directly in the storage directory.

Return values from the installation process (Page 118)

Log file (Page 119)

1.13.2 Return values from the installation process

Return values from the installation process

The following table shows the return values and their descriptions:

Code	Description
0	The installation was successful.
1	The installation was successful and a restart is required.
-1	The installation failed.
-2	The installation failed: The TIA Portal is still running.
-3	The installation failed: Another installation is already running.
-4	The installation failed: You do not have sufficient rights. The installation requires administrator rights.
-6	The installation failed: Insufficient memory space.
-7	The installation failed: A restart is required before the installation can start.

See also

Installing support packages automatically (Page 117)

Log file (Page 119)

1.13.3 Log file

Contents of the log file

The log file contains detailed information about every installation. If the log file already exists, it is supplemented. Headers and footers are created for each log file between which you can find the desired information.

An entry is generated for the following events:

- Support packages that are listed in the storage directory and are available during the installation but could not be installed due to missing products. The entry in the log file indicates which products and which versions of these products are missing.
- Support packages that could not be installed successfully.
- Support packages that were installed successfully.

The file name of the HSP including the file extension is logged for each entry.

2.1 Security information (Unified)

Security information

Siemens provides products and solutions with industrial security functions that support secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary, and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

You can find more information on the protective measures possible in the area of industrial security at:

https://www.siemens.com/industrialsecurity

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends applying product updates as soon as they are available and always using only the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under

https://www.siemens.com/cert

Network settings

The following table shows the network ports that are used by WinCC Unified for internal and external communication. These ports must not be used for any other purpose.

The setup configures the firewall to ensure smooth operation.

WinCC Unified		
Name	**Port number**	**Transport protocol**
ILScs Manager	20008	TCP
UMC	20009	TCP
ILPmon Manager	4999	TCP
ILEvent Manager	1235	TCP
ILDist Manager	4777	TCP

WinCC Unified		
ILDataManager	1234 5001	TCP
Node Processes	3103 443 8888	TCP
Graphics Runtime	1339 1345	TCP
License server	1366	TCP
Screen debugger	9222	TCP
Job debugger	9224	TCP
WCCIL Proxy Manager	5678	TCP
Network Discovery (IS)	137	TCP
UMC AttachAgent	4002	TCP
OPC UA Discovery	4840	TCP
RFID	5003	TCP
GraphQL	4000	TCP

Note

Block HTTP port

For security reasons, it is recommended that Port 80 be disabled on the IIS server.

1. Start "Internet Information Services (IIS) Manager" on the Unified PC.
2. Right-click "Default Web Site".
3. Select "Remove" or "Manage Website > Stop".

2.2 Breaking changes

PI options in ODK

ODK does not support PI options in V18.

Scrolling behavior for pop-ups

If you move the visible screen section of a process screen in Runtime and a pop-up window is visible there, for example a faceplate container, Runtime behaves as follows:

WinCC Unified V17	The pop-up window is moved together with the screen section.
As of WinCC Unified V18	The pop-up window is not moved with it.
Simulation of an HMI device with installed device version V17 in a WinCC project V18	The pop-up window is moved together with the screen section.

Operation of objects behind a screen window

If a screen window has an empty area and the screen or faceplate displayed in the screen window has the "transparent" setting as the fill pattern for the background, Runtime behaves as follows:

WinCC Unified V17	Objects that are in the background of the screen window in the empty area of the screen window are visible. The objects cannot be operated by clicking.
As of WinCC Unified V18	The objects can be operated by clicking. Application example: You use a round menu with a button next to it. To prevent the rectangular border surrounding the menu from obscuring the button, make the menu available in a screen window.

Zoom behavior of screen windows on touch devices

Runtime now supports panning and zooming with a two-finger gesture.

WinCC Unified V17	No panning and zooming with two-finger gestures.
As of WinCC Unified V18	Panning and zooming with two-finger gestures is supported. Default: Activated If you want, you can disable this feature by clearing "Format > Allow zoom" property for the screen window.

Exclusion of "Uncertain - initial value" quality code as trigger

WinCC Unified V17	If a tag is used as a trigger for a script and the tag is used in a screen, e.g. by an I/O field, the script is executed twice in quick succession when the screen is loaded: • When reporting the initial value • When reporting the process value
As of WinCC Unified V18	Default setting: QualityCode 0x4C (Quality status: Uncertain, Substatus: Initial value) is ignored as a tag trigger. If a tag is used as a trigger for a script and the variable is used in a screen, e.g. by an I/O field, the script is only executed when the process value is reported as the screen is loaded. To enable the quality code as a trigger, proceed as described below.

To enable quality code 0xC4 as a trigger in V18, do the following:

1. Open a file browser and navigate to the following folder:
   `C:\Program Files\Siemens\Automation\WinCCUnified\bin\_config`
2. Open the following configuration file:
   - For scripts in screens: `IOWA_GfxComponentConfigurationSrv.xml`
   - For scheduled tasks: `IOWA_SchedComponentConfiguration.xml`
3. Delete the line for <Attribute key>:

```
<ComponentConfiguration componentKey="GfxTriggerManager"
name="Trigger Manager">
   <AttributeList>
      <Attribute key="IgnoredTagQualities" value="0x4c"/> <!–
0x4c: "Initial Value" quality >
   </AttributeList>
</ComponentConfiguration>
```

Simulation of Runtime

To use the simulation, you must install WinCC Unified Runtime. If no license is found for Runtime, start the simulation in demo mode.

2.3 Notes on use

Contents

Information that could not be included in the online help and important information about product features.

Previously installed versions of WinCC Unified

The installation of Unified V18 is possible on devices for which the following applies:

- No Unified installed yet, or
- WinCC Unified V17 installed
  The V17 installation must not have been upgraded from V16.

Special characters in the installation path

Special characters in the installation path may lead to objects not being visible when inserted into a screen. To see the object, you have to close the screen and open it again.

Copying between WinCC Unified and other devices

Copying data via the clipboard or via the library, for example is only supported between Unified devices. Copying data between Unified devices and other devices is not supported.

Secure communication

Secure communication via the TLS protocol can only be established via integrated connections.

If you use Inter-Project Engineering (IPE) in your project, i.e. an HMI device is connected to a device proxy PLC, and an error message about inconsistent certificates appears during compiling, you need to correct the certificates of the associated PLC in the original project. Then you have to compile, export and re-import the PLC.

Changing HMI device names or log paths

If you make the following changes in the engineering system for a project that is already loaded in Runtime, the existing log data is lost when you load the device again:

- You rename the HMI device in the project navigation
- You rename a log folder or change the log path in the Runtime settings

The data from the old log is not available in the new log after reloading.

Access to subnets via TCP/IP Auto

Use the TCP/IP Auto setting on your engineering device (programming device) when you connect the device to a local subnet. (Control Panel > Set PG/PC interface)

The engineering device then allows additional IP addresses from the subnet to be added to its network adapter.

Note

This setting cannot be used if you use a router.

No setting is necessary on the devices belonging to the external network.

For stationary operation, use the TCPI/IP setting.

Fault in the connection between the server and the client

If there is a fault in the connection between the server and client, check the settings of the PG/PC interface. TCP/IP Auto should not be used for the setting "Interface parameter assignment used". Use fixed IP addresses instead.

Changes at a PLC user data type

After a change to a PLC user data type, the PLC must be compiled to make this change known to all Unified devices that use this user data type. If compilation of the PLC does not take place, error messages can occur during the compilation of the HMI devices.

Inter Project Engineering (IPE) in faceplates

Inter Project Engineering is not supported by faceplates. User data types of a device proxy PLC cannot be interconnected with a faceplate.

Certificate configuration after upgrading a Runtime Collaboration device

The certificate configuration created in V16 cannot be reused in V17. For both upgraded devices and devices newly introduced in V17, the certification authority (CA) including certificate configuration must be created again using the WinCC Unified Certificate Manager V17 tool.

1. Create a new certification authority.
2. Add the devices from V16 to the new certification authority.
3. Add new V17 devices.
4. Create the certificates of the devices.
5. Distribute and install the certificate configuration to the devices.

Starting Runtime

Runtime cannot be started via WinCC Runtime Start if the "Load preview" dialog is displayed in the engineering system.

Status "Partly running"

If it is not possible to start the simulation or the Unified Runtime, open the Runtime Manager. If the status of the project is displayed as "partly running", check

- whether the user currently logged on in Runtime has sufficient rights. Is the user entered in the following Windows user groups:
  PLCSimUsers
  RTIL Tracing Users
  Siemens TIA Engineer
  SIMATIC HMI
  SIMATIC HMI VIEWER
- whether the computer name is not longer than 15 characters.
- whether "OPC UA" is activated in the Runtime settings and a certificate exists.
- whether "Runtime Collaboration" is enabled in the Runtime settings of a Unified Panel and a certificate is available.

Simulation with S7-PLCSIM

Always start the simulation in WinCC and then S7-PLCSIM.

WinCC Unified Tag Simulator

The WinCC Unified Tag Simulator is not part of WinCC Unified V18.

Process control

At this time, no archive values can be deleted with the "Delete archive value" button.

Dynamic SVG types

If you manually assign a type version to a dynamic SVG type or rename the type, a delta download is no longer possible.

Encryption with TLS

Always use the most current version of TLS. Disable the older version.

The use of older versions (TLS 1.0 and 1.1) is at your own risk.

Assigning text lists and graphics lists for reports

It is not possible to read in values from texts lists and graphics lists, neither in the add-in nor when generating the report.

Page numbering in audit

Because of a problem with the page numbering, the system functions "ReadElectronicRecord" and "ExportElectronicRecordAsCSV" only deliver the first 1000 electronic data records on the provided filter.

GraphQL

The GraphQL interface only supports Unified PC in V18.

2.4 Screens and screen objects

Contents

Information that could not be included in the online help and important information about product features.

Screen objects for Unified Comfort Panel

These following objects are supported in WinCC only for Unified PC.

- Plant overview
- Process control

If you have configured the plant overview or the process control on a Unified Comfort Panel, you must delete these objects before the compilation.

Adaptations to screens and screen objects

The settings that you define under "Settings > Visualization" in the "Resize screen" area have no effect on the HMI devices:

- SIMATIC Unified PC
- SIMATIC Unified Comfort Panel

Trend control

In a trend control with several configured trend areas, the buttons "First data record" and "Last data record" always act only on the last trend area that was configured. In other trend areas, you can use the "Select time range" button to navigate to the first or last data record.
If you have to navigate to the first or last data record very frequently in all configured trend areas, it is advisable to configure the trend area in several trend controls.

Process control

At this time, no archive values can be deleted with the "Delete archive value" button.

System diagnostics

The "System diagnostics display" control supports the S7-1500 as of firmware version 2.0. The prerequisite is that the "Central alarm management in the PLC" setting is activated at the PLC.

If you configure HMI connections to more than 50 PLCs for the control, this can lead to an overload in Runtime. As a result, HMI connections can no longer be established.

Process diagnostics

- You require the WinCC Unified ProDiag license to use the "Process diagnostics" control.
- The control supports S7 GRAPH instance data blocks as of version 6.0.
- The button for activating/deactivating the criteria analysis is reserved for future versions.
- With the following buttons you navigate to the previous or next sequence of the displayed S7 GRAPH block, not as described in the user help to the previous or next network:

Clock

The "Clock" object does not have a property that sets the design of the clock as a digital display or as an analog display. When using the light or dark style, the digital display is used if the clock is configured smaller than 100 x 100 pixels.

SVG graphics

SVG graphics and dynamic SVG graphics support the SVG 1.2 Tiny standard. The use of SVG graphics that include the elements or commands according to the SVG 2.0 standard can lead to unexpected behavior.

The file names of SVG graphics must not include German umlauts or Chinese characters.

No embedding of session-local tags in dynamic information

Alarms and screens can contain texts in with dynamic information is embedded. This dynamic information is read from alarm parameters, text lists or tags.
Examples of texts with dynamic information: Alarm texts, text list entries, the "Text" property of screen elements such as buttons

Session local variables are not supported as a source of such dynamic information.

Faceplates: Passing interface properties of the "Resource list" data type to pop-ups

When you call pop-up windows outside a faceplate type, you pass the interface properties by script. For interface properties of the "Resource List" data type, text and graphic lists can be passed.

To specify graphic lists, use the prefix "GraphicListCollection", for example, "GraphicListCollection.Graphic_List_1".

To specify text lists, use "@Default" as a prefix, e.g. "@Default.Text_list_1".

Faceplates: Passing interface properties of the "Multilingual text" data type to pop-ups

When you call pop-up windows outside a faceplate type, you pass the interface properties by script. Interface properties of the "Multilingual text" data type cannot be passed.

In this case, use the interface property of the "configuration string" data type. The configuration string contains the different values of the text in the respective language separated by a semicolon. Use the script to read the active Runtime language and then use the "Case" command to make a case distinction depending on the active Runtime language.

Faceplates: "Cleared" event

The "Cleared" event occurs when the faceplate is closed. The relevant faceplate container is dissolved.

Therefore, no interface tags or interface properties can be passed on the "Cleared" event.

2.5 Alarms and alarm view

Contents

Information that could not be included in the online help and important information about product features.

Alarms and alarm view

Controller alarms

If the connection between HMI device and controller is interrupted, only the last occurring controller message can be sent and displayed after restarting the runtime software. When the connection is re-established, all controller messages are transmitted correctly again.

Alarm block "Duration"

Alarm block "Duration" is not supported in V17.

2.6 "Smoothing" property for logging tags

Contents

Information that could not be included in the online help and important information about product features.

Smoothing (Unified Comfort Panel)

The following applies to logging tags and PLC tags: If the value "No smoothing" is set in the Logging tag properties under "Smoothing > Mode", the values are nevertheless smoothed.

Example:

A logging tag changes its value as follows: "100" > "101" > "101".

Even if "No smoothing" is set in the properties of the tag, the values [100, 101] are stored in the log.

2.7 System functions and scripts

Contents

Information that could not be included in the online help and important information about product features.

JavaScript arguments of specific object events

The following applies to the rectangle, gauge, button and circle objects: If you configure a JavaScript to an event, only the "Item" argument is passed correctly to the script. You can process the event in the script, but not the other arguments.

"StartProgram" in the Scheduler - Unified Comfort Panel

Calling up a program via the "StartProgram" system function in the Scheduler is not supported by Unified Comfort Panel. Instead, use a "Tag" trigger in the Scheduler to initiate the system function.

"Press key" and "Release key" events - Unified Comfort Panel

The events "Press key" and "Release key" are not supported on a Unified Comfort Panel.

Methods of the "ProDiag" object

With the "OpenTIAPortal" methods of the "ProDiag" object, TIA Portal can be opened from the Runtime. Prerequisite for this is that the "Allow start of external processes via Unified Runtime" setting is activated on the HMI device in SIMATIC Runtime Manager.

The following system functions are reserved for future versions:

- "ResetToConfiguration"
- "OpenPlcCodeViewByFCCall"
- "OpenProDiagDetailsByCall"

With the parameter "screenItemPath" of the " IsJumpableAlarm" method, you transfer the path of the screen object which is activated when the alarm that is selected in the alarm display is a ProDiag alarm – not the path of the code viewer as described in the user help. Example: Transfer the path of a button for which a jump into the PLC code display was configured. If the selected alarm is a ProDiag alarm, operators jump to the PLC code display in Runtime by clicking the button.

The system function "OpenViewerGraphByBlock" expects the name of the data block of the GRAPH function block as second parameter.

ExportParameterSets

The system function "ExportParameterSets" expects as third parameter the path plus file name of the file to which the ParameterSets are exported.

Uniform display of custom web controls

To make the display of a Custom Web Control independent of the browser you are using, you must use a stylesheet when programming the Custom Web Control.

2.8 Parameter sets and parameter set display

Contents

Information that could not be included in the online help and important information about product features.

Using parameter set display from V16 project

If you have configured a parameter set control in WinCC V16 without updates, open this project with WinCC V17 and download it to the HMI device, then the numbers of the parameter sets are not displayed on the HMI device. Proceed as follows to continue using this parameter set control:

1. Create a new project in a new instance of WinCC V16 with installed update.
2. Insert a Unified Comfort Panel or a SIMATIC Unified PC into the project.
3. Copy the devices from the original project into the new project.

Configuring a storage medium for parameter sets

Select the same storage medium that you have configured for tag persistence or alarm logging under "Properties > Information" for parameter set types. If you specify different storage media, the "EjectStorageMedium" system function is not available.

2.9 WinCC Unified PC

2.9.1 Notes on the operation of Unified PC

Contents

Information that could not be included in the online help and important information about product features.

Generic logon error due to browser language settings

If a language that is not supported by Unified Runtime is set as the browser language, the "Generic error" occurs during logon.

Follow these steps:

1. Open the browser language settings.
2. Select one of the languages supported by Unified Runtime.
3. Log on in Runtime.

Restoring log segments

The following requirements apply to restoring log segments with SIMATIC Runtime Manager:

- A project that is in the "Running" status is loaded into runtime.
- At least one backup of a tag or alarm log is available for the project.
- If the project was loaded several times, no logs were reset during complete loading in the "Load preview" dialog.

TraceViewer

If the user logged on in Runtime belongs to the "RTIL Tracing Users" and "SIMATIC HMI" user groups, all trace messages are visible in the TraceViewer, otherwise only the trace messages from SIMATIC Runtime Manager.

2.9.2 Internet browsers for WinCC Unified PC

Ensure you have the latest operating system and browser version if you want to access Runtime Unified with this device.

WinCC Unified displays the runtime elements in HTML5. The browser used also has to support this standard. Since the browsers interpret HTML5 differently, it is possible that objects are displayed differently depending on the browser and the browser version used. For example, browsers sometimes display fonts differently.

Compatibility tests were performed for the following browsers. The focus of the compatibility tests was on the browsers marked with *:

Operating system	Browser
Microsoft Windows	• Google Chrome* • Microsoft Edge • Mozilla Firefox, Mozilla Firefox ESR
Android	• Google Chrome* • Firefox • Edge
iOS, Mac	• Safari* • Google Chrome • Firefox • Edge

Browser recommendation

In view of the performance and support of the Runtime standard elements, Google Chrome has proven to be the preferred browser. Its memory requirements are slightly higher than those of the other browsers.

Note

Operating system and browser version

For Runtime operation via Android or iOS, always use the latest operating system.

Use the latest browser version.

Note

Performance differences in different versions of individual browsers

The browser versions can differ from each other, which can result in different behavior regarding the memory requirements and speed.

Note

Suitability for continuous operation

MS Edge and Mozilla Firefox have proven to be problematic in continuous operation.

Known browser problems

The following restrictions apply to the following browsers:

Internet browser	Limitation
MS Edge	• High memory capacity utilization in continuous operation
Mozilla Firefox	• High memory capacity utilization in continuous operation
Mozilla Firefox ESR	• Support of touch gestures for touch panels as of Firefox ESR V59
Google Chrome	• High memory capacity utilization in uninterrupted duty depending on the version. • On Android: Grid lines with a line width ≤1 are not displayed correctly. This is due to the browser's own line thickness representation. As a solution, it is helpful to use a line width ≥1. • No correct representation of elements that use an SVG graphic as background graphic scaled in the Engineering System.

Restrictions to the various functions can also occur, such as the availability of the before and after buttons in the controls.

Current information on browser problems

You can find up-to-date information on display problems in browsers at the Siemens Online Support under the entry ID 109757952.

2.9.3 Activating and testing ASIA licenses

Overview

The license keys for WinCC Runtime Unified are available on the "License Key USB Hardlock" license storage medium.

The licensed ASIA version is executable in parallel to the European version by switching to Unicode.

The "License Key USB Hardlock" (dongle) checks the following conditions:

- WinCC GUI language
- Runtime language
- Asian characters are used in the WinCC project.
- Operating system settings

Note

It is not allowed to run WinCC in process mode without a valid license.

Delete configuration languages

If you do not have a license for an ASIA version and delete the Asian configuration languages, the WinCC project continues to run in demo mode.

To disable Demo mode, close the WinCC project. When reopened it is recognized that the WinCC project no longer requires licenses for an ASIA version.

Testing the validity of the licenses

If you start a correctly licensed WinCC version without the connected dongle, an error message appears. The same error message appears after a few minutes if you disconnect the dongle from the computer with a correctly licensed WinCC version.

If this error message does not appear, a non-licensed WinCC version is installed. No right of usage for WinCC is available in this case. Uninstall this WinCC version and purchase a legally licensed version of WinCC.

If necessary, contact WinCC Support and provide the serial number of your software version:

- http://www.automation.siemens.com/partner/index.asp

You can find the serial number on the "Certificate of License" (CoL).

Working with the "License Key USB Hardlock"

Please note the following:

- Do not edit data on the "License Key USB Hardlock".
  The actions not allowed include:
  - Rename data
  - Delete data
  - Copy data to the "License Key USB Hardlock"
- Do not format the "License Key USB Hardlock".
- Do not remove the "License Key USB Hardlock" from the PC while WinCC is running.

NOTICE
Do not remove the "License Key USB Hardlock" dongle If you remove the dongle from the computer, an error message is generated and WinCC switches to Demo mode. If you re-connect the dongle to the computer, the error message disappears and Demo mode is disabled. WinCC works once again in licensed mode.

2.10 Notes on the operation of Unified Comfort Panel

Contents

Information that could not be included in the online help and important information about product features.

Printing on a Unified Comfort Panel

With the objects "Trend control", "Function trend control", "Value table", Unified Comfort Panel supports printing via the button in the toolbar. The data to be printed are sent to the specified standard printer in the Control Panel. The last 10 print orders are saved as a graphic on the panel in the directory /home/industrial/ControlScreenshot.

Changes to the settings of the SOC1 interface (X1)

The following changes to the settings of the SOC1 interface (X1) require a manual restart of the Panel:

- Settings related to the mode and speed of the SOC1 ports
- Media redundancy settings
- Deactivating the forwarding of DCP broadcasts
- Deactivating the sending of LLDP

Screen objects for Unified Comfort Panel

The following screen objects are not supported by Unified Comfort Panel:

- Process control

Hotkeys for buttons

The "Hotkeys" functionality is not supported on the Unified Comfort Panel for the "Object" button and the buttons in other objects.

Objects with buttons

Some objects such as the trend control or the parameter set control have buttons for which you can configure access rights. To operate access-protected buttons, a user with the required authorization must log on via the Control Panel or a configured operating object.

"Press key" and "Release key" events

"Press key" and "Release key" events are not supported on a Unified Comfort Panel.

Alarm control - Displaying logged alarms

Logged alarms are not displayed after starting the Runtime software if the static value "Logged alarms updated" is configured in the properties of the alarm control under "General > Alarm source". To make logged alarms visible in the alarm control, click the "Show logged alarms" or "Show and update logged alarms" button in the alarm control.

The "Update and display logged alarms" list shows a maximum of 100 alarms.

"StopRuntime" system function

The StopRuntime system function only works if encrypted transfer has been configured in the Runtime settings of the Panel.

System function "StartProgram" in the Scheduler

Calling up a program via the "StartProgram" system function in the Scheduler is not supported by Unified Comfort Panel. Instead, use a "Tags" trigger in the Scheduler to initiate the system function.

Access to MS SQL databases and SQLite databases

You can access MS SQL databases and SQLite databases via JavaScript functions from Unified Comfort Panel. Note that the resource utilization is directly proportional to the number of the requests to the database and the size of the data to be read or written. This means that the accesses to databases also affect the performance in Runtime. In order to not impair the operation as a visualization system the possibility to access databases should be used prudently.

From a Unified Comfort Panel you can only access databases which support the driver "Microsoft ODBC Driver for SQL Server" in Version 17.9.

These include:

- Azure SQL Database
- Azure Synapse Analytics
- Azure SQL Managed Instance
- SQL Server 2019
- SQL Server 2017
- SQL Server 2016

- SQL Server 2014
- SQL Server 2012

Date/time values

Column sorting of date/time values in the alarm control

In the engineering system, you can configure different output formats for displaying date/time values. The following applies to the column sorting of these values in an alarm control on the Unified Comfort Panel:

The following output formats do not support sorting in columns:

- {D,@EEE, MMM dd, `yy}
- {D,medium}
- {D,long}
- {D}

The following output formats support sorting in columns only in English:

- {D,@dd. MMMM yyyy}
- {D,@dd. MMM}
- {D, @MMM dd, yyyy}
- {D, @MMMM dd}
- {D} {T}

Display of date/time values in the alarm and trend control

After the first download of a project, date/time values in alarm and trend controls are shown in English time format by default. If your prioritized language is not English, then switch the language once to English and then back to your prioritized language. After that, the date/time values are shown in alarm and trend controls in your prioritized language.

Gauge output format

If you specify the value {H} (Hexadecimal) in the Inspector window of a gauge under "Properties > General > Scale > Output format", negative values in the gauge will not be displayed correctly. If you want to output negative values via a gauge, use {F}, {N} or {I} as output format.

Runtime Collaboration - function trend control

If a function trend control is configured in a screen to display logged data and you access this screen with Runtime Collaboration, no existing logged data is displayed in the trend control. The first value displayed is the value that will be written to the log after the screen is opened.

User management

In the engineering system you can configure a maximum session duration for a role as well as for a user. If these values are different, only the smaller of the two values is transferred to the Panel during loading.

Differences between simulation and Unified Comfort Panel

There are differences in the simulation regarding the following screen objects as compared to the Unified Comfort Panel Runtime:

- Alarm control:
  - Filter options
- Faceplates:
  - Scaling in JavaScript method "OpenFaceplateInPopup"
  - Arrangement of the faceplate containers for JavaScript method "OpenFaceplateInPopup"
- Screen window:
  - Scaling with system function "OpenScreenInPopup"
- I/O field: Default display for Word and DWord data types
- Parameter set display: Default display for Word data type
- Browser:
  - The display of pages of the S7 WebServer is not possible in the simulation.

Loading a project

When you have made changes to the Runtime settings in the User management area in Engineering, you must ensure before loading that the page "Security > UMAC settings" is closed in the Control Panel of the Unified Panel. Otherwise, the changes may not be applied after loading.

Simulation in connection with SD-X51

The simulation of tag retentivity and alarm logging in connection with the "SD-X51" storage medium is not supported.

2.11 Remote access to a Unified device

Contents

Information that could not be included in the online help and important information about product features.

Synchronize client values with server time

By default, the following controls display values with client time:

- Alarm control
- Trend companion
- Trend control
- f(x) trend control
- Process control

To synchronize the time displayed on the client with the server, proceed as follows:

- iOS devices:
  To prevent an iOS device from synchronizing with time.apple.com, create a profile file and upload it to the device.
  Profile files enable time synchronization within a secure corporate network.
- Android devices:
  Use a third-party app for time synchronization.

Access to a Unified device

Ensure you have the latest operating system and browser version if you want to access Runtime Unified with this device.

WinCC Unified displays the runtime elements in HTML5. The browser used also has to support this standard. Since the browsers interpret HTML5 differently, it is possible that objects are displayed differently depending on the browser and the browser version used.

Compatibility tests were performed for the following browsers. The focus of the compatibility tests was on the browsers marked with *:

Operating system	Browser
Microsoft Windows	• Google Chrome* • Microsoft Edge • Mozilla Firefox, Mozilla Firefox ESR
Android	• Google Chrome* • Firefox • Edge
iOS, Mac	• Safari* • Google Chrome • Firefox • Edge

With respect to the performance and support of the standard Runtime elements, Google Chrome has proven to be the preferred browser. Its memory requirements are slightly higher than those of the other browsers.

Note

Performance differences in different versions of individual browsers

The browser versions can differ from each other, which can result in different behavior regarding the memory requirements and speed.

Note

Suitability for continuous operation

MS Edge and Mozilla Firefox have proven to be problematic in continuous operation.

Unified Collaboration

Unified Collaboration is only permitted between devices with the same device version (starting from V16).

If Unified Collaboration uses local user management and the Collaboration partners are configured in different projects, it is possible to create users with the same name but different function rights. If one of these users logs on to a device in Runtime, the user has the function rights configured for this device as well as the function rights configured for the Collaboration partner. If you use several projects, you should configure the local user management identically in all projects.

2.12 Working with plant objects and plant views

Contents

Information that could not be included in the online help and important information about product features.

Introduction

You have the possibility to upgrade the project to V17 when opening your V16 project with a system configuration. The configured Runtime version of the HMI devices must be changed separately to V17.

Updating blocks

If blocks from a global or from a project library are used in the project, do the following:

1. Open the plant object type that uses a block from a library.
2. Delete the interconnection of the PLC tag.
3. Open the "Library" task card.

4. In the library, open the shortcut menu of the block used.
5. Click on "Project" under "Update types".
   The "Update types in the project" dialog opens.
6. Select the option "Force update (types including their dependent types are updated regardless of their version number)".
   All other options are already selected by default.
7. Click "OK".
8. Compile the PLC.
9. Interconnect the PLC tag for the plant object type.
10. Compile and download your project.

Note

Alternatively, delete all plant objects (instances) from the plant hierarchy, perform the update and create all plant objects (instances) again in the plant hierarchy. If you have linked a screen to the plant object in the "Visualization" tab, deleting the plant object not only deletes the link, but also entire screen. Create a copy of the screen and link the screen to the new plant object after updating the blocks.

2.13 Audit

Contents

Information that could not be included in the online help and important information about product features.

Restore database segments in Runtime

To analyze the logged and deferred data, as an HMI Administrator of an HMI device, you can restore backed up audit database segments in Runtime. After the analysis, these segments can be discarded again to empty the memory space.

WinCC Unified 3

3.1 Introduction

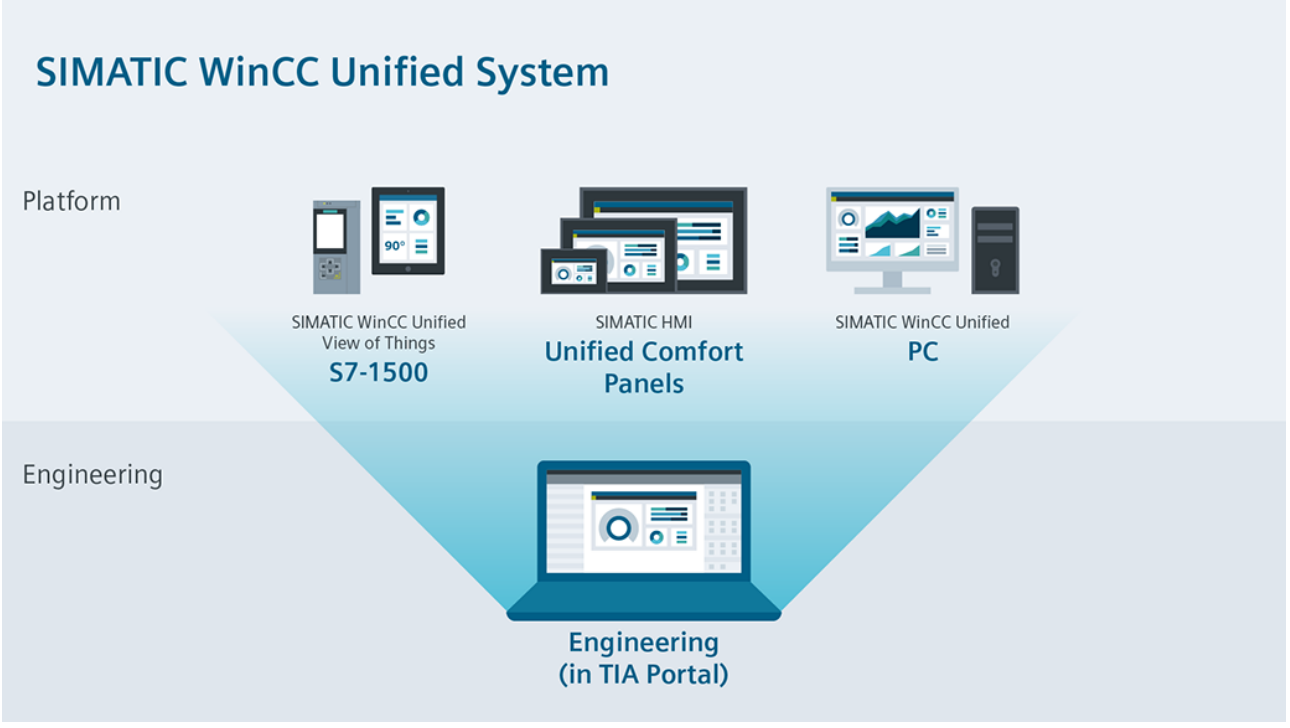
WinCC Unified helps you meet the challenges of digitization in machine and plant construction. Based on native web technologies such as HTML5, SVG and JavaScript, you can work independently of devices and environment.

An integrated system - from Panel to PC

For you, this means being able to efficiently configure a large number of mobile end devices on one engineering platform, such as Unified Comfort Panels, Unified PCs, Control Centers or applications in View of Things. In this way, WinCC Unified combines the advantages of strong products like WinCC Advanced, WinCC Professional and WinCC Comfort in one software and offers you maximum flexibility, scalability and efficiency.

Overview of advantages of the uniform engineering system in the TIA Portal:

- Reuse of components on all WinCC Unified platforms
- End-to-end usability of UI controls
- Uncomplicated device replacement between all devices that work with WinCC Unified



From the panel on the machine to the complex SCADA solution: WinCC Unified offers various options for industry-specific requirements and can be extended by user-specific applications through its open interfaces.

What makes WinCC Unified so special?

WinCC Unified combines SIMATIC HMI and SCADA in one product. This means WinCC Unified users can configure runtimes for device types across classes with one engineering system. An engineering system that is installed on a Unified PC, for example, can be used to configure runtimes for Unified Comfort Panels and Unified PCs. WinCC Unified therefore offers tremendous scalability and flexibility in the use of device classes within a system or via remote access for distributed systems.

3.2 Additional documentation

Siemens Industry Online Support will provide you with the latest documentation, which will help you with the initial working with and migrating to WinCC Unified.

Getting Started

A guideline to getting started quickly with WinCC Unified is available online: Getting Started (https://support.industry.siemens.com/cs/us/en/view/109801175).

Guideline for migrating to WinCC Unified

You can get support for migrating to WinCC Unified here: Guideline for migrating from Comfort Panel to Unified Comfort Panel and from WinCC Runtime Advanced to WinCC Unified PC Runtime (https://support.industry.siemens.com/cs/us/en/view/109768002).

Familiarize yourself with the differences between Comfort Panel/Runtime Advanced and Unified Comfort Panel/Unified PC Runtime. In addition, you will learn how you can migrate the essential elements (for example, pop-ups, slide-ins) to WinCC Unified.

Data2Unified

Continue to use the project content you have created when you switch to SIMATIC WinCC Unified and save engineering time with the "Data2Unified" add-in.

Information and download are available from Industry Online Support: Data2Unified (https://support.industry.siemens.com/cs/us/en/view/109770510)

The "Data2Unified" add-in is being continuously developed further (see the last change), so that even more TIA Portal project elements will be gradually supported.

The latest version of the add-in is provided for downloading in this contribution.

3.3 Creating a user interface efficiently

Screen editor

With the Unified screen editor, you can create user interfaces for various applications with a uniform structure. You will receive support particularly in the following areas:

- Operation and display in the screen editor, e.g.:
  - Labeling of screen objects for direct editing
  - Display of catch lines
  - Drawing of lines and polygons
- Drag-and-drop, e.g.:
  - An IO field is created during drag-and-drop of tags into the screen editor.
  - A parameter set control view is created during drag-and-drop of parameter set types.
- Changing properties of screen objects:
  - If multiple screen objects are selected, you can edit the properties at the same time.

Information on configuring screens can be found under "Basics of screens (Page 259)" and the following sections.

- Configuring screen objects (Page 361)
- Configuring text lists and graphics lists (Page 446)
- Configuring dynamization (Page 462)

Faceplates

Unified Faceplates are the new generation of HMI picture modules. Faceplates are user-defined groups of display and operating objects that can be reused as needed and thus reduce the configuration effort.

Faceplates are saved in a library and are managed there. The advantages of the type-instance concept are fully used. All functions that you are already familiar with from the library, such as updating of types, are supported.

You can create different versions of a faceplate type for use in screens or as a pop-up. Flexibly replace faceplate versions that are already in use with updated versions.

To connect the tags and interface properties defined in the faceplate individually to the process for each instance, use the different faceplate interfaces. For interface properties, use the pre-defined data types or the interface properties of the type "Configuration string" to assign the properties of each data type to a faceplate or the screen object in it using a script.

You can find more information under "Configuring faceplates (Page 524)".

Styles

WinCC Unified provides you with styles during the configuration to enable a user-friendly and flexible design of your runtime.

You can use these styles to easily customize the appearance of the runtime for each HMI device. While runtime is running, the style, for example, switches to a dark mode during a shift change.

You can find more information under "Using styles (Page 261)".

Custom web controls

Custom web controls are independent web pages with an interface to Unified Runtime. Custom web controls offer you the option of adding your own elements to the visualization elements provided. Custom web controls thus extend usability and functionality to achieve an optimal visualization result.

Custom web controls are run on the web client and hosted in Runtime Unified. A custom web control can be displayed as an independent web page in any web browser and on any mobile end device.

You can find more information under "Custom web controls (Page 7790)" and in the following sections.

Dynamic SVG graphics

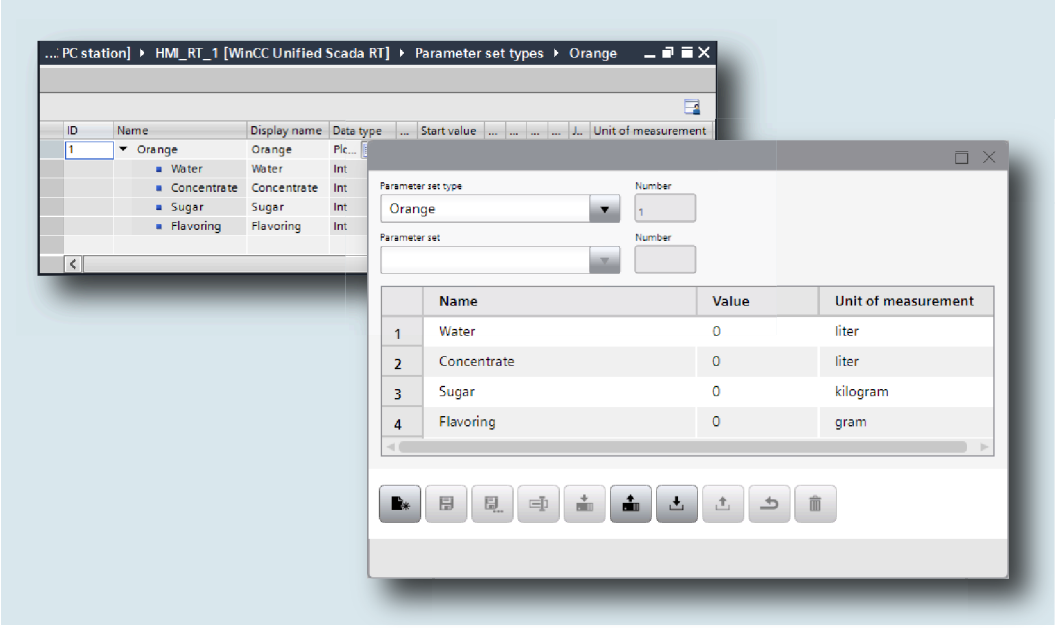
You can use dynamic SVG graphics in WinCC Unified. The Siemens Graphic Library offers a large selection of dynamic SVG graphics in the "Dynamic widgets". You use these graphics to design screens for your runtime that you can then configure as needed.

You can find more information under "Managing dynamic SVG graphics (Page 358)".

3.4 Controlling with parameter sets

A parameter set represents a recipe. Parameter sets are used for higher-level control.

Parameter sets are based on parameter set types which, in turn, are based on user data types. In this way you can achieve a high degree of reuse. Use the control "Parameter set control" to control the parameter set.



Parameter set types support the nesting of complex data types. You can, for example, assign another user data type to a user-data-type element as the data type.

You can find more information under "Configuring parameter sets (Page 863)".

3.5 Using distributed systems

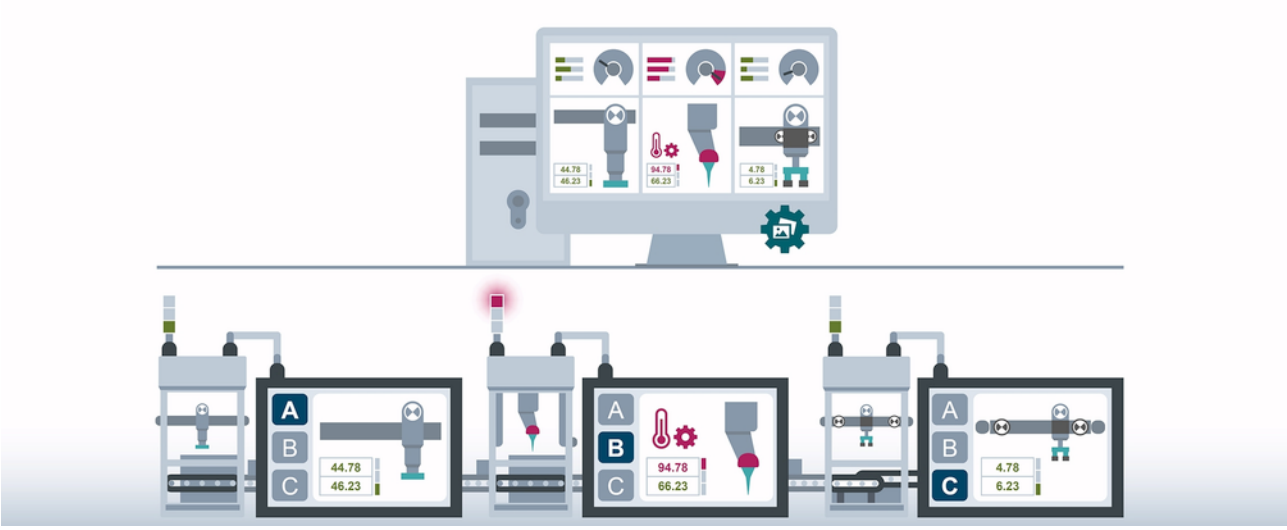
WinCC Unified offers remote access options.

Unified Collaboration allows the cross-device display and operation of individual screens.

With the web client, runtime access is possible from any device.

Unified Collaboration

With Unified Collaboration you can avoid redundant configuring. You have the option to create an overview with content from different Unified HMI devices. To this end, you access screens of a different HMI device across devices. You can display and operate screens of a different HMI device. Screen windows and alarms are supported here.



An HMI device that participates in collaboration is referred to as a collaboration device.

Unified Collaboration is supported by Unified PC and Unified Comfort Panel and allows cross-project access.

You can find more information under "Unified Collaboration (Page 7557)".

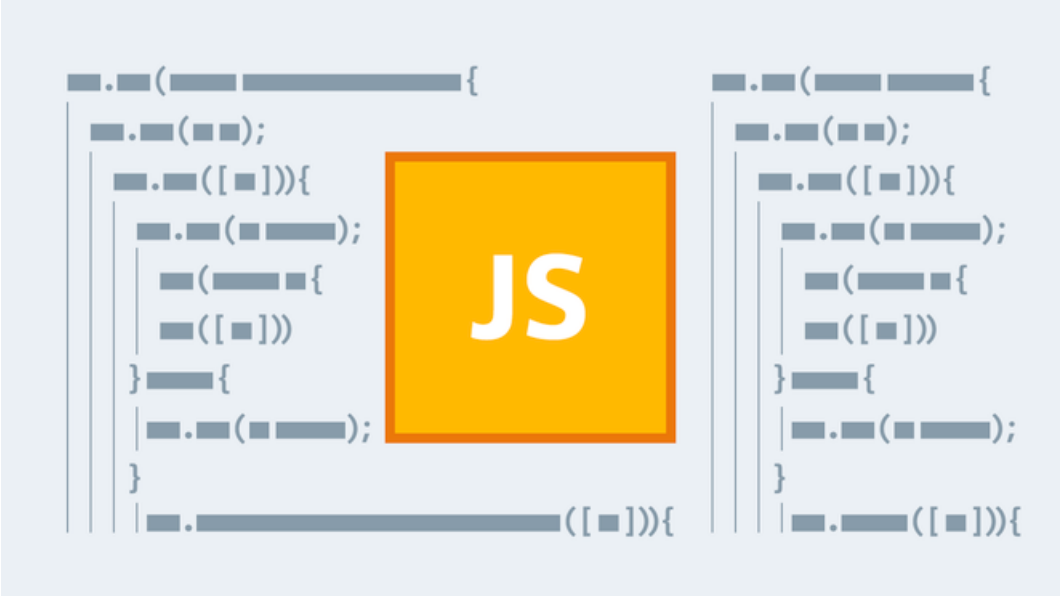
Web client

You use the web client to access a Unified PC or a Unified Comfort Panel via remote access. Access is possible from any device. The web client is used as standard remote access for Unified PC. The clients are independent of one another and independent of the locally displayed runtime. This means the runtime can be operated by multiple users simultaneously. To prevent overlaps and undesirable effects, we distinguish between synchronous and asynchronous functions.

You can find more information under "Web Client (Page 7589)".

3.6 Dynamization and automation through scripts

WinCC Unified provides a modern scripting environment that you can use to automate system components, such as the graphical runtime system. The scripting environment maps individual elements of the system components, such as the screens of the graphical runtime system, via the object model. The object model supports you in solving different tasks through runtime scripting and in controlling processes.



The scripting environment offers:

- Efficiency and the latest technologies
  The scripting environment supports Unicode and uses JavaScript (JS) as the scripting language. The scripting environment is object-oriented and offers asynchronous operations for high-performance and secure script execution.
- Support of mass data
  The scripting environment is optimized for the processing of mass data, for example, writing 1000 tags in one pass. Special script objects are available to this purpose that handle numerous HMI objects of the same type. These script objects execute operations on all the HMI objects simultaneously instead of processing each HMI object individually.
- Input support:
  - Syntax highlighting
  - Snippets (code templates)
  - Referencing HMI objects
  - Tooltips
  - Autocomplete
  - Error marking and correction
  - System functions (Page 909)

You can find more information under "Introduction to runtime scripting (Page 969)" and in the following sections.

Here you will find Notes on creating scripts (Page 972), a description of the Script editor (Page 981) and examples of scripts (Page 989).

In the SiePortal, your can find support for creating scripts in JavaScript: Tips and tricks for creating scripts (https://support.industry.siemens.com/cs/ww/en/view/109758536).

3.7 Central user management

The user management of WinCC Unified allows for the plant-wide, central management of users including optional connection of Microsoft Active Directories. The user management forms the basis for the efficient and integrated management of personalized access rights in a plant. Security risks are significantly reduced. The person-specific assignment of roles and rights minimizes the maintenance effort. At the same time, a high level of transparency is achieved.

The User Management Component (UMC) option allows for the setup of a project-wide, central user management.

The user management of WinCC Unified offers:

- Central, cross-project management of user groups and users in a system.
- Import of user groups and users from Microsoft Active Directory.
- Failsafe performance thanks to redundant design of a User Management Control domain (UMC domain).
- Load distribution thanks to multiple UMC stations in one UMC domain.

You can find more information under "User management in the TIA Portal (Page 6887)" and in the following sections.

3.8 Connectivity

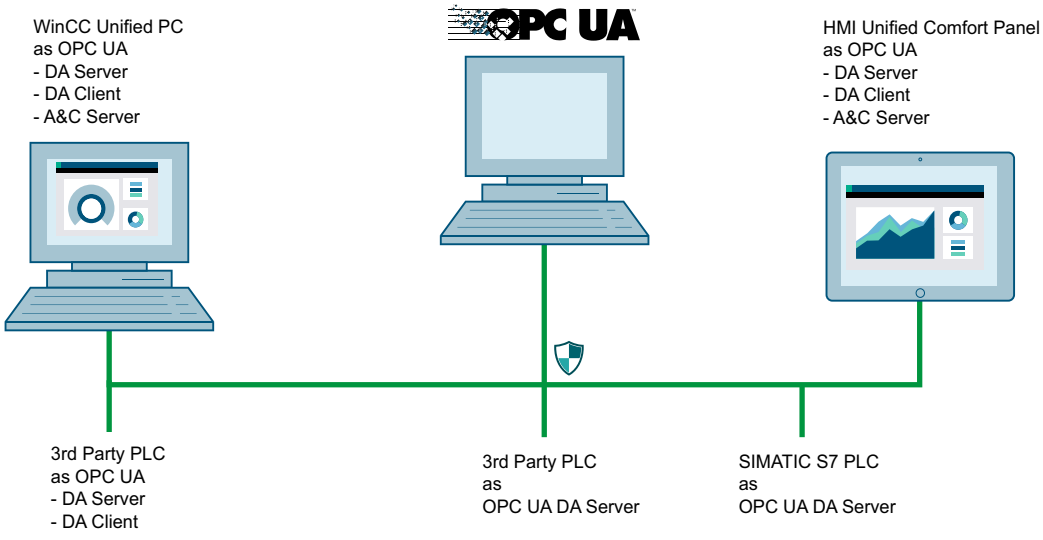
WinCC Unified offers you the highest level of integration of SIMATIC PLCs. The TIA Portal of WinCC Unified offers you an easy connection of

- Up to 128 PLCs for Unified PC systems
  If more than 10 connections are used, SIMATIC NET PC software must be installed.
- Up to 16 PLCs for Unified Comfort Panel systems
- S7-1500 Software Controller
- S7-1200/1500
- S7-300/400
- Support of native 3rd party products via
  - Modbus TCP
  - Allen-Bradley EtherNet/IP
  - Mitsubishi
  - Omron
  - Support of additional products via the Channel Support Package

You can find more information under "Basics of communication (Page 6973)" and in the following sections.

OPC UA

OPC UA is a standardized manufacturer-independent software interface for data exchange in automation engineering and is the technology succeeding OPC. OPC UA is platform-independent and supports different protocols as communication medium.



With WinCC Unified you can use OPC UA as connection standard for WinCC Unified PC and Unified Comfort Panels.

You can use WinCC Unified PCs and Unified Comfort Panels as needed:

- OPC UA DA server
- OPC UA DA client
- OPC UA A&C server

The WinCC Unified security concept guarantees your data security through secure OT/IT connections via OPC UA for connections to 3rd party applications.

You can find more information under "WinCC Unified OPC UA server (Page 7025)" and "WinCC Unified OPC UA client (Page 7044)".

3.9 Logging and traceability

Traceability and therefore the documentation of production data is becoming increasingly important in many sectors such as the pharmaceutical industry, the food and beverage industry, and the related mechanical engineering industry.

Logging of production data in electronic form offers many advantages compared to paper documents, such as simple acquisition and logging of data. WinCC Unified supports the two database types Microsoft SQL and SQLite.

However, it is also important to ensure that data cannot be falsified and that it can be read at any time.

Therefore, sector-specific and cross-industry standards have been developed for the electronic documentation of production data. The most important set of regulations is the FDA Guideline 21 CFR Part 11 for electronic data records and electronic signatures issued by the FDA, the US Food and Drug Administration.

In addition, different EU regulations apply, such as EU 178/2002, depending on the industry. Requirements for production systems in these industries have been developed based on 21 CFR Part 11 and the corresponding interpretation to comply with GMP (Good Manufacturing Practice). They are also required for other industries.

With WinCC Unified, you can configure projects in compliance with GMP and thus ensure traceability and data integrity.

WinCC Unified provides you with the optimal logging solution for each of your applications. You can start your application with file-based logging and extend it by a database option. File-based logging is especially suited for small and medium applications.

You can find more information under "Log basics (Page 837)" and in the following sections.

Detailed descriptions can be found at "Logging alarms (Page 769)" and "Logging tags (Page 653)".

3.10 Configuring plant hierarchies

Plant Model

WinCC Unified offers you object-oriented configuration. With the plant model, you can define reusable plant object types by arranging the associated plant object instances in hierarchical plant views.

In this way, you can model the technological hierarchy of your machine or unit/plant, for example, based on user-defined or standardized technology objects.

You create the plant structure from individual objects, each of which represents a component or a plant unit. Each object is configured in the context of the operator control and monitoring solution.

In plant object types, you combine all required configuration elements for visualization, e.g. faceplates, tags, alarms, scripts. Changes to the plant object type automatically affect all instances. This translates into significant time savings, especially for plants with a high degree of standardization.

If necessary, you can start object-oriented plant modeling based on the engineering data and derive the configuration of the HMI devices and automation systems from this.

Break the machine or unit/plant up into reusable technological units and arrange them hierarchically in a technological plant view according to the plant structure.

The following options are available to you in technology-oriented and object-oriented configuration:

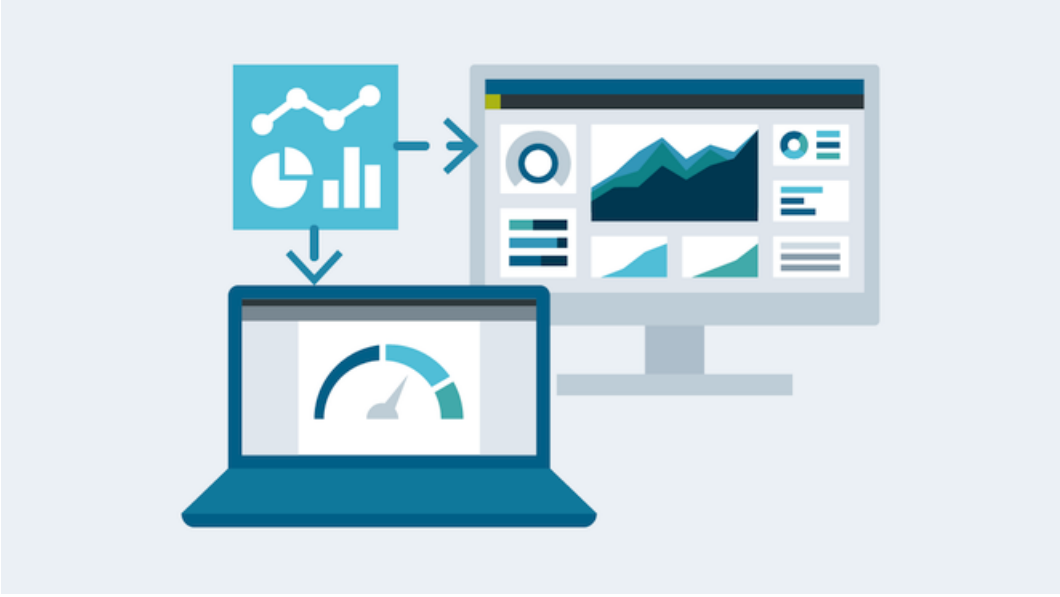
- Creating various hierarchical plant views: technological view, building view, independent of the HMI device that is used.
- Configuration of plant objects and plant object types with data elements for mapping the actual plant configuration
- Access to plant objects (data elements, HMI alarms, logs, screens, etc.)
- Generation of the screen hierarchy
- Expansion of configured plant objects and types using Plant Intelligence options

You can find more information under "Visualizing plant objects in runtime (Page 7113)" and in the following sections.

Plant Intelligence options

The Plant Intelligence options supplement the WinCC Unified visualization system with efficient functions:

- Calendar: For the visualization of structured planning of the production processes.
  You can find more information under "Calendar Basics" and in the following sections.
- Performance Insight: For the calculation of individual Key Performance Indicators (KPIs) according to ISO standard 22400 and comprehensive selection of WinCC controls for their display and analysis.



You can find more information under "Basics of Performance Insight" and in the following sections.

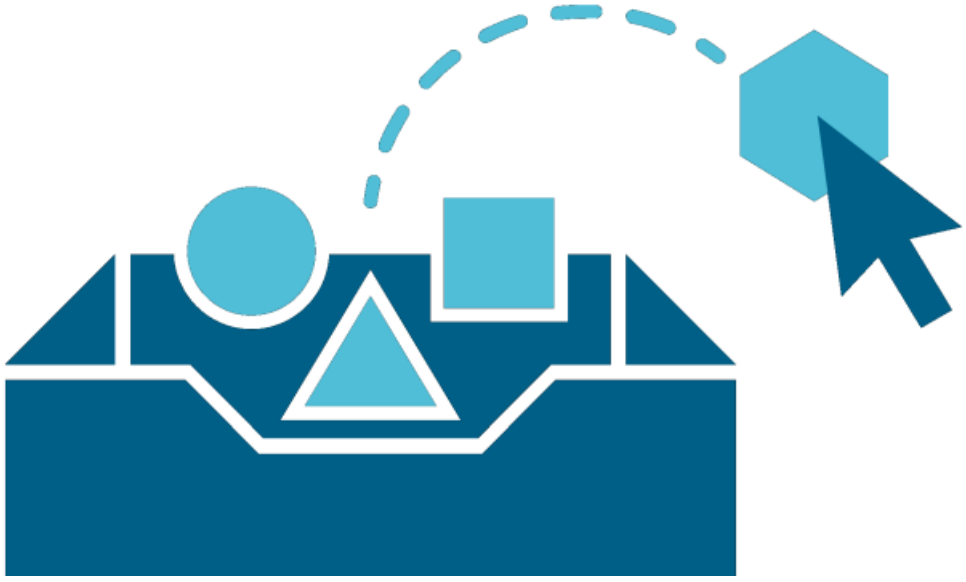
- Line Coordination: Automation of recipe-controlled and batch-controlled production processes.
  You can find more information under "AUTOHOTSPOT" and in the following sections.
- Sequence: Fast and easy change of production processes and parameters without changing the PLC program.
  You can find more information under "AUTOHOTSPOT" and in the following sections.

3.11 Working with libraries

3.11.1 Re-using libraries

The object-oriented HMI concept of WinCC Unified allows you a high degree of reusability of elements both within and across projects. The new library concept contains the following elements that you can configure and reuse in your projects as needed:

- HMI Faceplates
- HMI user data types
- HMI styles
- HMI style sheets
- Graphics and dynamic SVG graphics
- Script modules



Types and instances

You can create instances from types that you have created in a library and which you manage and edit there. Use them in your project. The instances are linked to the respective type.

Master copies and copies

In addition, you can access many master copies for cross-project configurations in the global libraries. You can also yourself create master copies and manage them in the project library or in a global library that you have yourself created.

From a master copy, you can create an independent copy in the project, which you can edit independently of the underlying library object.

3.11.2 Basics on libraries

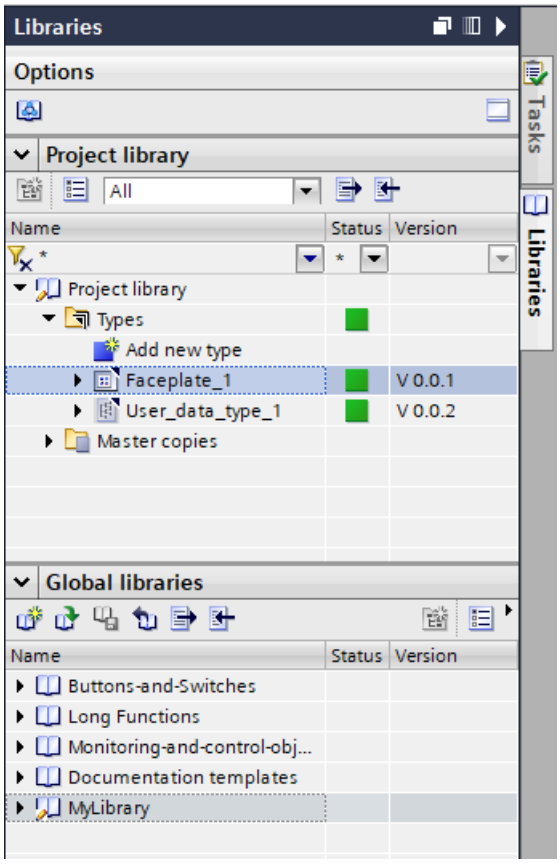
Introduction

Store all objects you need frequently in the libraries. An object that is stored in the library only has to be configured once. It can then be used repeatedly as often as required. Library objects extend the number of available screen objects and increase the effectiveness during configuration through multiple use.

Your WinCC software package is supplied with comprehensive libraries that contain, for example, "Motor" or "Valve" objects. You can also define library objects yourself.

Libraries are managed in the "Libraries" task card or in the library management. The following libraries are available:

- Project library
- Global libraries



Project library

There is one library for each project. Objects of the project library are stored alongside with the project data and are available only for the project in which the library was created. If the project is moved to another PC, any project library created in it is also moved.

To use the library object of the project library in other objects, move or copy the object into a global library.

Global libraries

A global library is saved independently of the project data in its own file with the extension ".alxx", whereby "xx" stands for the current WinCC version number.

A project can access several global libraries. A global library may be used concurrently in several projects.

When a library object is changed by a project, this library will be changed in all projects in which these libraries are open.

Library objects

A library can contain various WinCC objects.

Examples of types:

- HMI Faceplates
  If you want to use configurable object groups several times in screens and change them centrally, create faceplates for them. If you change the properties of a faceplate in the library, the changes affect all screens and scripts that use this faceplate.
- HMI user data types
- HMI styles
- HMI style sheets
- Graphics and dynamic SVG graphics
- Script modules

Examples of master copies:

- Complete HMI device
- Screen
- Tag
- Parameter set type
- Script

3.11.3 Types and master copies

Introduction

Both the "Project library" and the "Global library" contain the two folders "Master copies" and "Types". You can create or use the library objects either as a master copy or a type.

Types

Create instances of objects of the "Types" folder and use these in your project. The instances are bound to their respective type.

More information is available here (Page 176).

Master copies

Use master copies to create independent copies of a library object.

More information is available here (Page 185).

Administration of the library objects

You can copy and move library objects to other libraries. You copy master copies to the "Master copies" folder or any subfolder of "Master copies". You can only insert types in the "Types" folder or any sub-folder of "Types".

3.11.4 Creating types and master copies

Creating a new type

You can create a new type in the project library.

You can later copy the type into a global library that you yourself have created.

1. To create a new type, select "Add new type" in the project library.
   The "Add new type" dialog is displayed.
2. Select the class of the type.
3. Provide further information on usage.

- or -

1. Drag and drop an object from the project tree to the "Types" folder in the project library.
   The object must be suitable for creating a type, for example, a user data type.

More information: Using types and their versions (Page 176)

Create a new master copy

1. To create a master copy, drag and drop an object from the project tree to the "Master copies" folder of the project library or a self-created global library.
   The object must be suitable for creating a type. You can use objects that you yourself have created in the project tree as a master copy.
   The cursor indicates if creating the master copy is possible.

More information: Using master copies (Page 185)

3.11.5 Managing libraries

3.11.5.1 Overview of the library management

Function of the library management

Master copies and types with dependencies on other library elements are subject to functional restrictions. For example, they cannot be deleted while dependencies still exist. This prevents other library elements from becoming useless. The library management is used to identify the dependencies and to create an overview of the work progress.

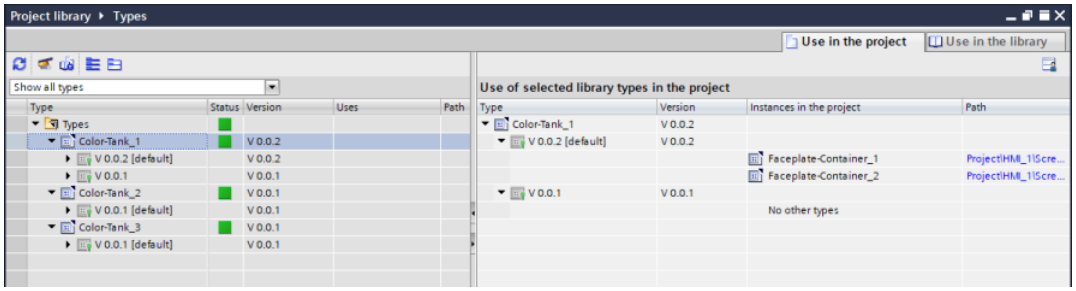
The library management offers the following functions:

- Display of the correlations of types and master copies
  If a type is referenced in other types or master copies, the relationships are displayed in the library management. You will also be able to see which library elements reference a type or a master copy.
- Display of points of use of types in the project
- Display all types that include a version with the "In test" or "In progress" status

Layout of the library management

The figure shows the library management, which consists of the following components:

- Toolbar of the library management
- "Types" area
- "Use" area



Toolbar of the library management

You can perform the following tasks in the toolbar of the library management:

- Update view
  If the project was changed, you can update the view of the library management.
- Clean up library
  You can clean up the project library and global libraries. Cleaning up a library deletes all types and type versions that are not linked to any instance in the project.
- Harmonize project
  By harmonizing a project, you adapt the names and the path structures of type uses in the project to the corresponding names and path structures of the types within a library.
- Collapse all
  Shows only the top node
- Expand all
  Shows all nodes (types and versions)

"Types" area

The "Types" area displays the contents of the folder or type you selected in the "Libraries" task card.

The selection list following filters:

- Show all types
- Types with pending changes
- Released types
- Types with multiple versions
- Types not used in the project
- Types with inconsistencies in the default version
- Highest version of the type without "default" identifier.

For each type, the types that it references are displayed.

"Uses" area

The "Uses" area gives you an overview of the points of use of the selected types. The "Uses" area is divided into two tabs:

- "Uses in the project" tab
  In the "Uses in the project" tab, display the instances of type versions and the path to the point of use in the project.
  To get to the instance in the project, click the entry under "Path".
- "Uses in the library" tab
  The "Uses in the library" tab is used to show all points within the library at which a type is used.

3.11.5.2 Opening library management

Procedure

To open the library management, follow these steps:

1. Open the "Libraries" task card.
2. Select a type or any folder that contains types.
3. Select the "Open library management" button  .
   - or -
4. In the shortcut menu, select "Library management element".

Result

The library management opens and the types are displayed with their versions.

Working with large or multiple monitors

The library management window can be detached and moved as desired.

3.11.5.3 Filtering types in the library management

Introduction

A filter function in the library management enables you to limit the displayed types. The following filters are available:

- Show all types
- Types with pending changes
- Released types
- Types with multiple versions
- Types not used in the project
- Types with inconsistencies in the default version
- Highest version of the type without "default" identifier.

Requirement

At least one type has been created.

Filtering by types with pending changes

1. Select the "Types" folder in the project library.
2. Open the library management.
3. Select "Types with pending changes" in the drop-down list.
   The "Types" area only displays types that have the "in progress" status.

Filter by released types

1. Select the "Types" folder in the project library.
2. Open the library management.
3. Select "Released types" in the drop-down list.
   The "Types" area only displays types that have released versions.

Filtering for types with multiple versions

1. Select the "Types" folder in the project library.
2. Open the library management.
3. Select "Types with multiple versions" in the drop-down list.
   The "Types" area only displays types that have more than one version.

Filtering for types that have no instances in the project

1. Select the "Types" folder in the project library.
2. Open the library management.
3. Select "Types not used in project" in the drop-down list.
   The "Types" area only displays types that have no instances in the project.

Filtering by types with inconsistencies in the default version

1. Select the "Types" folder in the project library.
2. Open the library management.
3. Select "Types with inconsistencies in the default version" in the drop-down list.
   Only the types whose default version is inconsistent are displayed in the "Types" area.

Filter by types whose highest version is not the default version

1. Select the "Types" folder in the project library.
2. Open the library management.
3. In the drop-down list, select "Highest version of the type without default identifier".
   In the "Types" area, only those types are displayed whose highest version is not the default version.

3.11.5.4 Creating a global library

Introduction

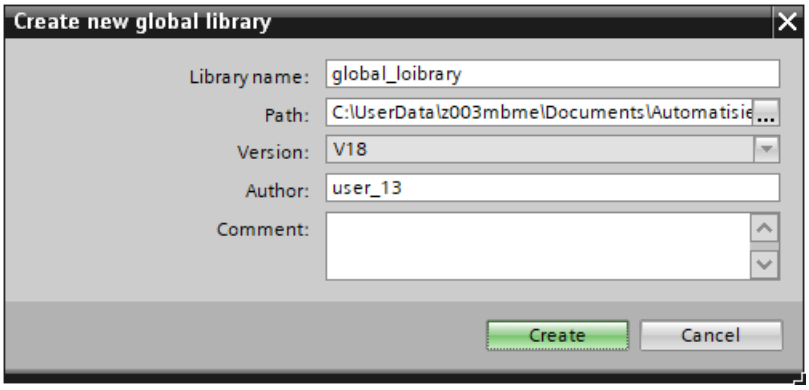
In the libraries you store the configured objects that you want to use several times in your configuration. To use objects in several projects, create a global library.

Requirement

- A project is open.
- The "Libraries" task card is opened.

Procedure

1. Click the icon under "Global library".
   The "Create new global library" dialog opens.



2. Enter a name.
3. Select the path where the new library is to be stored.
4. Click "Create".

Result

The new library is shown in the "Global libraries" palette. The global library contains the "Types", "Master copies" and "Common data" folders. Under "Common data" you can reports for the global library.

A folder with the name of the global library is created in the file system at the storage location of the global library. This actual library file is given the file name extension ".alxx", whereby "xx" stands for the current WinCC version number.

3.11.5.5 Saving a Shared Library

Introduction

A global library is saved as a separate file. This file contains all the objects of the global library, including the referenced objects. For example, the reference of a tag which was configured on an I/O field is also saved in the library.

WinCC prompts you to save the global libraries when you close WinCC or your project without saving. You also can store the global library during configuration, without storing the entire project.

Requirement

- A project with at least one global library is open.
- The "Libraries" task card is opened.
- A global library has been changed.

Procedure

1. Select the global library that you want to save.
2. Click the  icon in the "Global library" palette.
   You can alternatively select the "Save Library" command in the shortcut menu.

Save as:

1. To save the global library to another folder, select "Save as" from the shortcut menu.
2. Select the path in which you want to store the new library and enter a file name.

Result

The global library is saved under the current file name or the newly assigned file name.

3.11.5.6 Opening a global library

Introduction

In WinCC, the global libraries are stored in separate files. You can use a global library in every project.

Requirement

- You have saved a global library.
- A project is open.
- The "Libraries" task card is opened.

Procedure

1. Click the  icon in the "Global library" palette.
   The "Open global library" dialog box is displayed.
2. Select the path in which the library is stored.
3. Click "Open".

Note

To have the access to a global library from multiple projects, open the global library in write-protected mode. When a global library is read-only, access from other projects is blocked.

Result

The global library is displayed in the "Global libraries" palette.

3.11.5.7 Showing logs of global libraries

Logs listing all changes made to the global library are created when global libraries are updated. The logs are stored together with the global library and are always available once you have opened the global library.

Procedure

To open the logs of a global library, follow these steps:

1. Open the global library in the "Libraries" task card.
2. Open "Common data > Logs" in the lower-level folder.
3. Double-click on a log.
   The log is opened in the editor.

3.11.5.8 Updating a project with the contents of a project library

Introduction

After you have edited several types in the project library, update all instances in the project to the most recent version of the types from the project library.

Each of the following elements can be selected as source for the update:

- Individual folders within a library
- Individual types

Requirement

The "Libraries" task card or the library management is opened.

Procedure

1. Select a folder within the project library or individual types.
2. Select "Update types > Project..." from the shortcut menu.
   A dialog opens.
3. Select either the entire project or individual devices for the update.
4. Select "Update instances in project".
5. To delete all older versions of the updated types from the project library, select the check box "Delete unused type versions without "default" identifier from the library".
6. Confirm with "OK".

Result

All instances of the types are updated in the project to the most recent version of the selected types in the project library.

You can find a log of the update process in the project tree under "Common data".

3.11.5.9 Updating a library with the contents of another library

The following options are available for updating libraries:

- Updating a global library with types from another global library
- Updating the project library with types from a global library

Each of the following elements can be selected as source for the update:

- Individual folders within a library
- Individual types

Requirement

- The "Libraries" task card or the library management is opened.

Procedure

To update a library with the contents of a different library, follow these steps:

1. Select a folder within the library or individual types.
2. Right-click the source and select the "Update types > Library..." command from the shortcut menu.
   The "Update library" dialog box opens.
3. Select the type of library you want to update:
   - Select "Update project library" to update the project library with types from a global library.
   - Select "Update global library" if you want to update a global library.
4. Optional: Select the global library you want to update from the drop-down list.
5. Enable the desired update options:
   - Updating instances in the project
   - Delete unused type versions without "Default" label from the library
   - Force update
     Types are updated including their dependent types regardless of their version number.
6. Confirm with "OK".

Result

- Types not yet available in the target library are supplemented there with all their versions. More recent versions are added to the types that already exist in the target library.
  If a more recent version of a type already exists in the target library, the latest version is nevertheless copied from the source library and automatically assigned a newer version number.
- A log listing all performed changes to the target library is created for the update process.
  If you have updated the project library, you can find the log in the project tree under "Common data > Logs".
  If you have updated a global library, you can find the log in the "Common data > Logs" folder in the level below the global library.

3.11.5.10 Exporting and importing library texts

Introduction

You can export the texts of the library objects to an .xlsx file to edit them in MS Excel, for example, or export them for compilation.

You export and import texts of the following objects in the library:

- Individual library types and master copies
- Multiple library types and master copies
- All library objects of the project library or a global library

After editing or external compilation, you import the texts into the TIA Portal.

When the texts are imported, all texts from the import file are imported for the entire library, even if you have only selected one library object. The target languages of the import file must be activated in the project.

During import to a master copy, the texts of the template are overwritten in the library with the new texts from the import file. During import of the texts to a library type, the latest version is overwritten in the library with the new texts from the import file. If a version of a type has not been released yet in a project library, no texts can be imported for the entire project library.

Defining the source language and target language

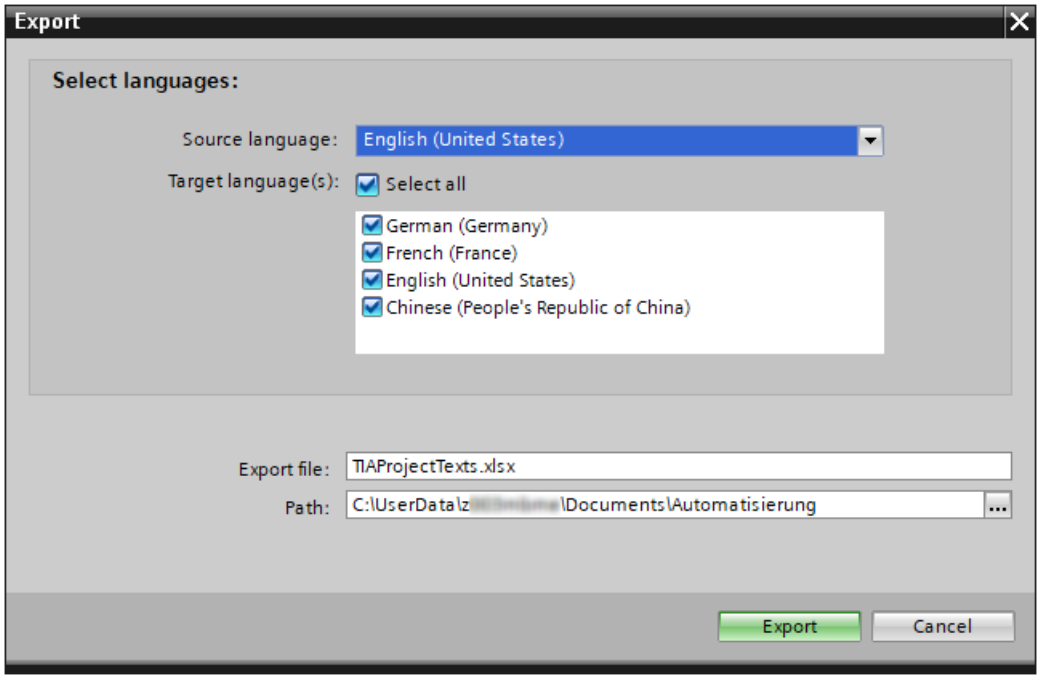
You define the source language and target language for export of the texts in the Export dialog. The selection of available languages depends on the project languages defined.

With the global library, the selection of available source and target language depends on the languages defined by the creator of the library. To see the available languages of the global library, double-click the entry "Library languages" in the project folder "Language and Resources" of the library in question.

Exporting texts

To export the texts of a single or several library objects, follow these steps:

1. Open the project library or a global library.
2. Select the library object in the library.
3. Select the command "Export library texts" in the shortcut menu of the object.
   Alternatively, click the "Export library texts" button in the toolbar.
   The "Export" dialog box opens.
4. Select the source language and the target language for export in the dialog.
5. Enter the name and path for the export file.



6. Click "Export".
   After successful export, the export file is stored under the specified path.

Importing texts

Note

Restrictions for text import

The texts which belong to the following library objects cannot be imported:

- Type instances which are contained in a master copy
- Library types whose versions have not yet been released and which have the status "In progress" or "In test"
- Write-protected global library

If importing into a project library, all versions must be released in this project library.

To import the texts after editing or compilation into the TIA Portal again, follow these steps:

1. Open the project library or the global library.
2. Select the command "Import library texts" in the shortcut menu of the object.
   Alternatively, click the "Import library texts" button in the toolbar.
   The "Import" dialog box opens.
3. Select the path and the name of the import file from the "Select file for import" field.
   Activate the "Import source language" check box if you have made changes to the source language in the export file and would like to overwrite the entries in the project with the changes.
4. Click on "Import".

3.11.6 Managing objects in a library

3.11.6.1 Displaying library objects

Introduction

The elements of a library can be displayed in the folder structure under the library or in the "Elements" palette.

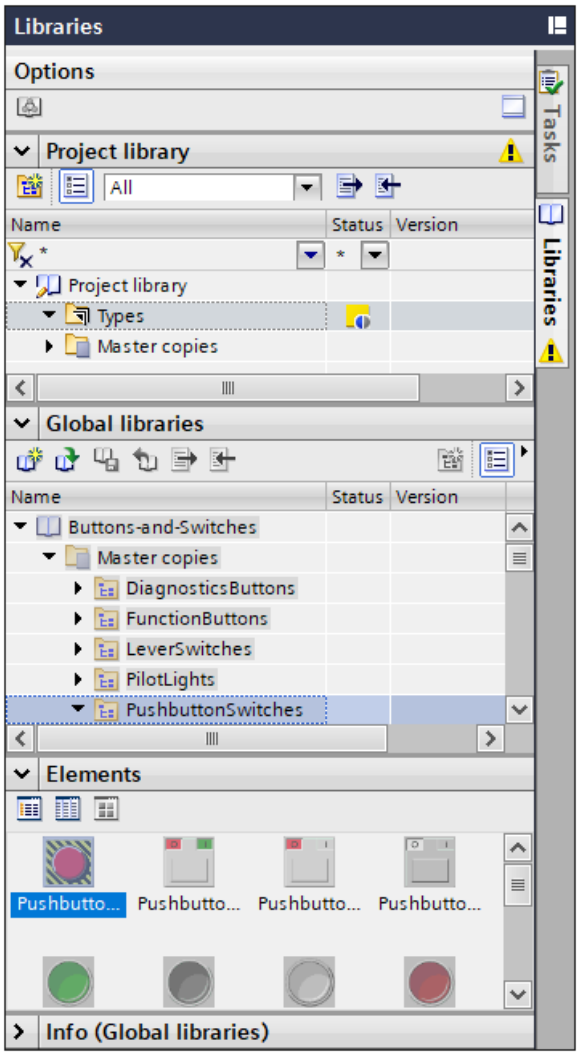
Requirement

- At least one library object has been created in a library.
- The "Libraries" task card is opened.

Displaying parts of the library objects

1. Select the folder of a library whose elements are to be displayed.
2. Click .
   The objects contained are displayed in the "Elements" palette.

3. To display components of an element, click on an element in the "Elements" palette.
   The parts of the element are displayed in the "Elements" palette.



4. Select a view:

Icon	View
	Details mode
	List mode
	Overview with icons

Result

The library objects are displayed with the selected view in the "Elements" palette.

3.11.6.2 Storing an object as master copy

Introduction

In libraries you can store WinCC objects, e.g. screens, tags, alarms, scripts or parameter set types as master copies. To do this, drag and drop the object from the project tree, the work area or the detail view into the library. If you have created subfolders in the library, you can also insert an object directly there.

Requirement

- The project tree or the work area is open.
- An object has been created.
- The "Libraries" task card is displayed.

Procedure

1. Select the object in the project tree or in the work area.

Note

Objects from the project tree as master copy

You can use all objects as master copy, which you can create new in the project tree:

- HMI devices, PLCs, technology objects, ...
- Screens
- Tag tables
- Parameter set types
- Scripts

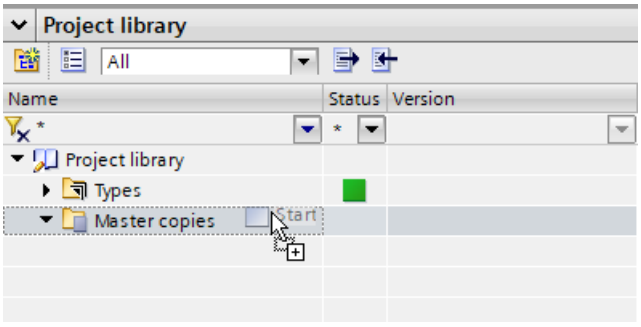
Note

Objects from a work area as master copy

You can use objects as master copy, which you can create new in a work area:

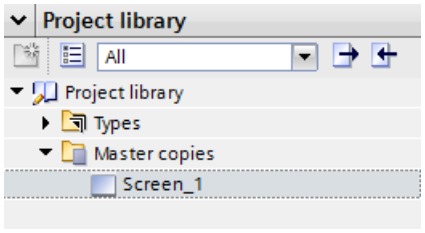
- Tags
- HMI alarms
- Tasks
- Cycles
- Text and graphic lists

2. Drag and drop the object into the "Master copies" folder in the library.
The mouse pointer is transformed into a crosshair with an appended object icon.



Result

The object is saved to the library for further use in multiple instances of your configuration.



3.11.6.3 Inserting a library object

Introduction

The system always assigns the inserted library object a name which consists of the name of the object type and of a consecutive number.

If the inserted object already exists, you have the option of replacing the object or of saving it under a new name.

You cannot insert library objects that are not supported by the HMI device.

Note

If you insert a screen with interconnected template from the library, the template will also be inserted. An existing, suitable template is not used.

Requirement

- The "Libraries" task card is opened.
- The editor in which you want to insert the library object is open.

Procedure

1. Select a library object from the library.
2. Drag-and-drop the library object to the position in the work area where you want to insert the object.
   The library object is inserted.

Result

If the object was contained in the "Copy templates" folder, you have inserted an independent copy of the library object in the editor.

If the object was contained in the "Types" folder, you have inserted an instance of the library object in the editor.

3.11.7 Using types and their versions

3.11.7.1 Status of versions of a type

Introduction

Depending on the point of use, the version of a type has different states.

Released version

The "Released version" status is available for all types, regardless of the point of use.

If you want to edit a released version, you must first create a new test version or an "in progress" version.

Released type versions of scripts and screens can be opened and viewed at their instance.

"In progress" version

When you create a new type or a new version of a released type, the type is set to the "In progress" state.

Types with the "in progress" state can be edited in the library management without the need for a reference to an instance in the project. Upon release, the compatibility of the type is tested by a consistency check.

"In test" version

Versions of HMI user data types can be in the "in test" state.

If you create a new PLC data type and add it as HMI user data type to a library, then this type is set to the "In test" state during editing. Select a device as the test environment before opening the editor for the type.

A version with "In test" status is linked to an instance in the project. You can set only one version to "In test" for each type at a given time.

An "In test" version may only be linked to a single instance in the project. Therefore, it is not possible to copy an instance to the clipboard, to duplicate it or to create an additional type from the instance as long as it has "In test" status.

3.11.7.2 Adding types to a project library

Requirement

- A project is open.
- An HMI device has been created and opened.
- The project tree is open.
- The "Libraries" task card or the library management is opened.

Procedure

1. In the "Project Library" palette, select a folder that contains types
   - or -
   Open a folder from the project library that contains types in the library management.
2. Select "Add new type..." from the shortcut menu.
   - or -
   Click "Add new type" in the "Project library" palette.
   The "Add new type" dialog is displayed.

3. Select the type.
4. Specify the device for which the type is being created.
5. Click "OK".
   Depending on the selected type, the editor for editing the type opens.
6. Close the note at the top of the window and edit the type.
7. Release the version of the type after the editing.

Result

You have added a type to the project library.

3.11.7.3 Create a new version of a type

If you create a new version of a type, the point of use of the type determines the status of the newly created version.

Requirement

- The "Libraries" task card is opened.
- A type has been created and released.

Procedure

1. Select the released type.
2. Select "Edit type" from the shortcut menu.

Result

- A new version of the type is created.
- The version of a type has the state "In progress".
  - or -
  The version of an HMI user data type has the state "In test".
- The editor opens.

3.11.7.4 Editing a type

Introduction

To edit a type, open the type in the library management or in the "Project library" task card.

The editor for the type opens. In the note at the top of the editor you can find information about the status of the type as well as about additional options for editing.

Requirement

At least one type is created in the project library.

Procedure

1. Select "Open" in the shortcut menu of the type.
   For types of the "User data type" type, the dialog for setting the test environment is displayed.
   The editor for the type is displayed.
2. Close the note at the top.
3. Edit the type.
4. To release the version of the type or to discard the changes, reopen the note at the top.
   

3.11.7.5 Consistency status of types

Types may no longer be consistent after changes. The "Status" column in libraries indicates whether a type is consistent or inconsistent. The following statuses are displayed:

Icon	Meaning
	The type is consistent.
	The type has more than one inconsistency.
	The default version of the type does not use the default version of its dependent type.
	The type has duplicate versions.
	More than one version of the type is instantiated in the device.
	A version other than the default version of the type is instantiated in the device.

3.11.7.6 Generating a faceplate as a type

Introduction

To define a new faceplate type, add a new type in the project library.

Procedure

1. Open the "Libraries" task card.
2. Select the "Add new type" command under "Types" in the shortcut menu of the project library.
   A dialog opens.
3. Select "HMI faceplate".
4. Specify the device for the new type.
5. Assign a descriptive name to the new faceplate type.

Result

The new faceplate type is created and displayed under the selected name in the project library.

The faceplate type is assigned the status "In progress" and the version 0.0.1.

The editor for a faceplate opens.

Using a faceplate type

- Open a screen to edit.
- Drag and drop the type from the "Libraries" task card into the screen.
  A faceplate container is created.

3.11.7.7 Generating a HMI user data type as type

Introduction

To define a new HMI user data type, add a new type in the project library.

Procedure

1. Open the "Libraries" task card.
2. Select the "Add new type" command under "Types" in the shortcut menu of the project library.
   A dialog opens.
3. Select "HMI user data type".
4. Specify the device for the new type.
5. Assign a descriptive name to the new HMI user data type.

Result

The new HMI user data type is created and displayed under the selected name in the project library.

The user data type is assigned the status "In progress" and the version 0.0.1.

The editor for the user data type opens.

Using an HMI user data type

The released default version of the type is available in the tag tables for HMI tags as data type for internal tags.

3.11.7.8 Generating HMI user data type from PLC data type

Introduction

To create a new HMI user data type based on a PLC data type, add a PLC data type in the project library.

Requirement

- A PLC is created in the project.
- A PLC data type with at least one element is configured.

Procedure

1. Navigate in the project tree to the PLC and here to the "PLC data types" node.
2. Drag and drop the PLC data type node to the "Types folder" in the project library.
3. In the "Add type" dialog you specify the properties of the new type.

Result

The new HMI user data type is created and displayed under the selected name in the project library.

The User data type is assigned the status "Released" and the version 0.0.1.

Editing HMI user data type based on PLC data type

1. Select "Edit type" in the shortcut menu of the type.
   This can be occur in the project tree or in the "Libraries" task card.
2. To open the editor for editing, you must set a test environment.
   The version is in the "In test" state and can be edited.
3. Release the version after editing.

Using an HMI user data type

- To use the PLC data type stored in the library at another PLC, drag and drop the node from the library to the "PLC data types" node of a PLC in the project tree.

  Note

  PLC data types can only be instantiated at PLCs of the same type.

  The PLC data type is available as data type in the tag tables for PLC tags.

The new HMI user data type can be stored in a global library.

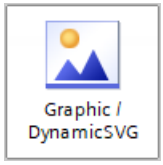
3.11.7.9 Creating a graphic and dynamic SVG as type

Introduction

To define a new graphic type or define a dynamic SVG as a type, add a new type in the project library.

Procedure

1. Open the "Libraries" task card.
2. Select the "Add new type" command under "Types" in the shortcut menu of the project library.
   A dialog opens.
3. Select "Graphic/Dynamic SVG".



4. Select whether you are adding a graphic or a dynamic SVG as type.

Result

The new type is created and displayed in the project library. The type is assigned the status "In progress" and the version 0.0.1.

For graphics, the editor for graphics (Page 238) opens.

For dynamic SVG graphics, the editor for dynamic SVG graphics (Page 182) opens and a dynamic standard SVG is displayed.

Graphics and dynamic SVGs can be instantiated in screens and faceplates.

3.11.7.10 Editing dynamic SVG type

Create dynamic SVGs as type to be able to exchange and update SVGs conveniently.

The type instance concept is implemented for dynamic SVGs. The selection of the dynamic SVG is defined in the type, and the dynamization of the properties takes place at the instance.

A type contains exactly one dynamic SVG.

Dynamic SVGs are language-neutral.

In contrast to using SVGs from the "Graphics" task card, using types in faceplates allows different SVGs with the same name in one faceplate.

Note

Version compatibility of dynamic SVG types

Dynamic SVG types have been introduced with WinCC Unified V18. They cannot be used with faceplates < V18. They cannot be used with device versions or project versions < V16.

If you load a project that uses an instance of a dynamic SVG type in a faceplate into a Runtime V17, this results in an error during loading.

Note

Faceplates and dynamic SVGs

If you create a faceplate type from a group of selected screen objects, dynamic SVGs are not included. To insert a dynamic SVG into a faceplate, open the faceplate type in the editor and insert the SVG from the library here.

Note

Manual assignment of a type version

If you manually assign a type version to a dynamic SVG type or rename the type, a DELTA download is no longer possible.

Introduction

After a new type is created, a dynamic standard SVG is displayed. You replace this SVG with the SVG you need.

No properties are displayed for the standard SVG.

To replace an SVG that has already been created or edit its properties, open the type in the editor.

Procedure

1. To replace the dynamic standard SVG or the SVG of the previous version, select "Replace with other dynamic SVG" in the shortcut menu of the SVG.
   Other shortcut menu options are not available in V18.
2. Select a dynamic SVG in the file system.
   The existing SVG is replaced by the SVG you selected.
   For an instance of the dynamic SVG type, the properties are displayed in the Inspector window of the image editor or faceplate editor. It is possible to dynamize properties here.

If the selected SVG cannot be fully displayed in the visible area of the screen, scroll bars will be displayed so that the view can be shifted horizontally and vertically.

If you select a file that does not contain a valid dynamic SVG, an error message is output in the Inspector window.

Release version

1. To release the version of the type, open the note at the top.

2. When releasing the type, enable the "Set dependent types to edit mode" option.
   Faceplate types in which the dynamic SVG is used are set to edit mode and thus use the current version of the dynamic SVG.

Notes on dynamization

- The dynamization of properties, e.g. color, affects the instance, not the type.
- The dynamization of properties is retentive if the new SVG has the same properties as the previous version when the type is changed.
  If the properties of the new SVG differ from the previous version, default values are used. In this case, no dynamization is specified.
- When a type is instantiated in a screen, the "Contained type - name" property in the Inspector panel under "Properties > Miscellaneous" shows the name and version of the instantiated type.

3.11.7.11 Creating a script module as a type

Introduction

To define a new script module type, add a new type in the project library.

Procedure

1. Open the "Libraries" task card.
2. Select the "Add new type" command under "Types" in the shortcut menu of the project library.
   The "Add new type" dialog opens.
3. Select "Script module".
4. Define the lowest device version.

Result

The new script module type is created and displayed in the project library.

The script module type is assigned the status "In progress" and the version 0.0.1.

The editor for a script module opens.

Working with script modules

In the editor for script modules, you create functions in which you can define parameters. You select these functions when dynamizing screens, screen images or tasks via events in the function list. If you change or delete functions or parameters in the script module type, the referenced functions will be adapted automatically.

To check the syntax, click on  "Syntax check" in the editor.

Error messages that allow you to analyze the script are displayed in the Inspector window under "Info > Compile".

When creating scripts, you are supported by snippets that you access from the shortcut menu under "Snippets" and which contain logic blocks for the following groups:

- Faceplate
- HMIRuntime
- Logic

See also

"Scripts" editor (Page 981)

3.11.8 Using master copies

3.11.8.1 Basics

You can save objects that you have created in the project tree as a master copy in a library. Based on the master copy, you can create a new object in the project tree.

Master copies allow you to efficiently create the same or similar objects. By using master copies in a global library, these objects can be used in other projects.

Basics

You can use all objects as master copy, which you can create new in the project tree:

- HMI devices, PLCs, technology objects, ...
  and the objects contained in these objects, e.g. cams
- Screens
- Tag tables
- Parameter set types
- Scripts

You can use objects as master copy, which you can create new in a work area:

- Tags
- HMI alarms
- Tasks

- Cycles
- Text and graphic lists

Objects can be added as a master copy in the project library or in an open global library.

Basic procedure

Once you have used this method to create and edit an object that you want to use it as a master copy, drag and drop it onto the "Master copy" folder in a library.

Then drag and drop the master copy back into the project tree to create a new object that you can further customize.

3.11.8.2 Using a script as a master copy

Requirement

- A project is open.
- An HMI device has been created and opened.
- The project tree is open.
- The "Libraries" task card is opened.

Procedure

You can store a global module, a global definition area or a function as a master copy.

1. Open the "Scripts" editor in the project tree.
2. Drag and drop a script into the "Master copies" folder of a library.

Result

You have created a master copy from a script in the library.

Using a master copy

1. Drag and drop the master copy from the library into the "Scripts" folder in the project tree. A new script is created.
2. Edit the script.

3.11.8.3 Using a screen as a master copy

Requirement

- A project is open.
- An HMI device has been created and opened.

- The project tree is open.
- The "Libraries" task card is opened.

Procedure

1. Open the "Screens" editor in the project tree.
2. Drag and drop the screen into the "Master copies" folder of a library.

Result

In a library you have created a master copy from a screen.

Using a master copy

1. Drag and drop the master copy from the library into the "Screens" folder in the project tree. A new screen has been created.
2. Edit the screen.

3.12 Using WinCC version compatibility

3.12.1 Basics on version compatibility

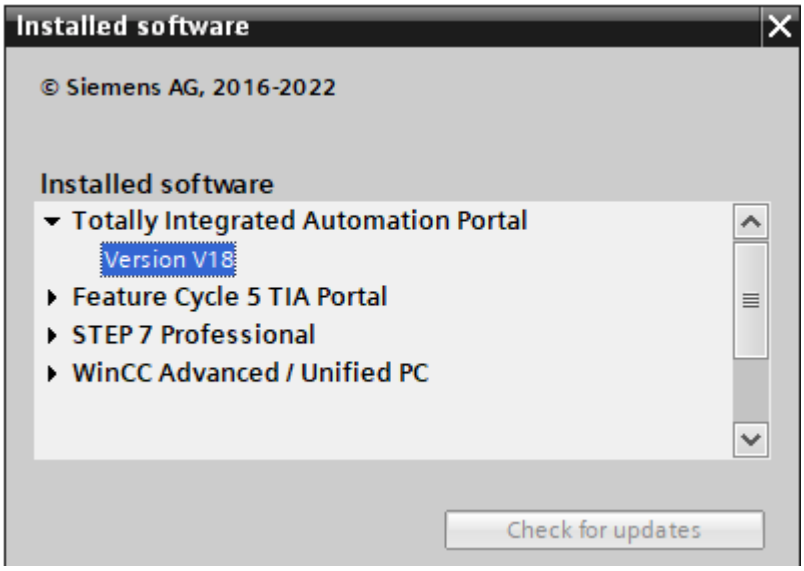
Introduction

The interaction of the following versions is of importance for version compatibility:

- WinCC version
- Project version
- Configured Runtime version
- Installed Runtime version

WinCC version

The WinCC version is the WinCC version installed on the configuration PC for TIA Portal, for example, WinCC Unified V18.

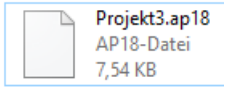


The installed version is displayed under "Help > Installed software ...".

Project version

The project version is the version of a WinCC project.

- When you create a new WinCC project, the project version is always the same as the WinCC version.
- A project successfully opened in WinCC Unified always has the version of the software used. Projects with older versions are automatically upgraded at the time of opening.
- An existing project can have a project version that is older than the WinCC version. You can make out the version of a project from the file ending of the project file.



Note

To open a WinCC project that was created with an older version of TIA Portal, you must first upgrade its project version to the WinCC version of the currently installed TIA Portal.

After the upgrade, the functions of the current WinCC version are available in the project. You can then open, edit, save, compile, download or simulate the project.

You can find additional information at AUTOHOTSPOT.

If the project version cannot be changed, open the project in a TIA Portal whose WinCC version is the same as the project version. There, you edit, save, compile, download or simulate the project.

Configured Runtime version

The configured Runtime version is the version of the runtime configured in a WinCC project for an HMI device.

A WinCC project can contain HMI devices with differently configured Runtime versions. HMI devices whose configured Runtime version is older than the current version can be restricted in their functions when compared to the HMI devices with the current version.

The configured Runtime version must be compatible with the Runtime version installed on the target device for the project to be downloaded.

When you add a new HMI device to a WinCC project, its pre-selected, configured Runtime version is always the highest available Runtime version.

To add a new device with an older version, select the desired version in the "Add new device" dialog.

You can change the configured Runtime version in the "Devices & Networks" editor or the device properties in the project tree.

You can find additional information at Changing the configured runtime version (Page 206).

Installed Runtime version

The installed Runtime version is the version of Runtime installed on the HMI device. The version is displayed on the HMI device. You can find information on this in the documentation of the hardware.

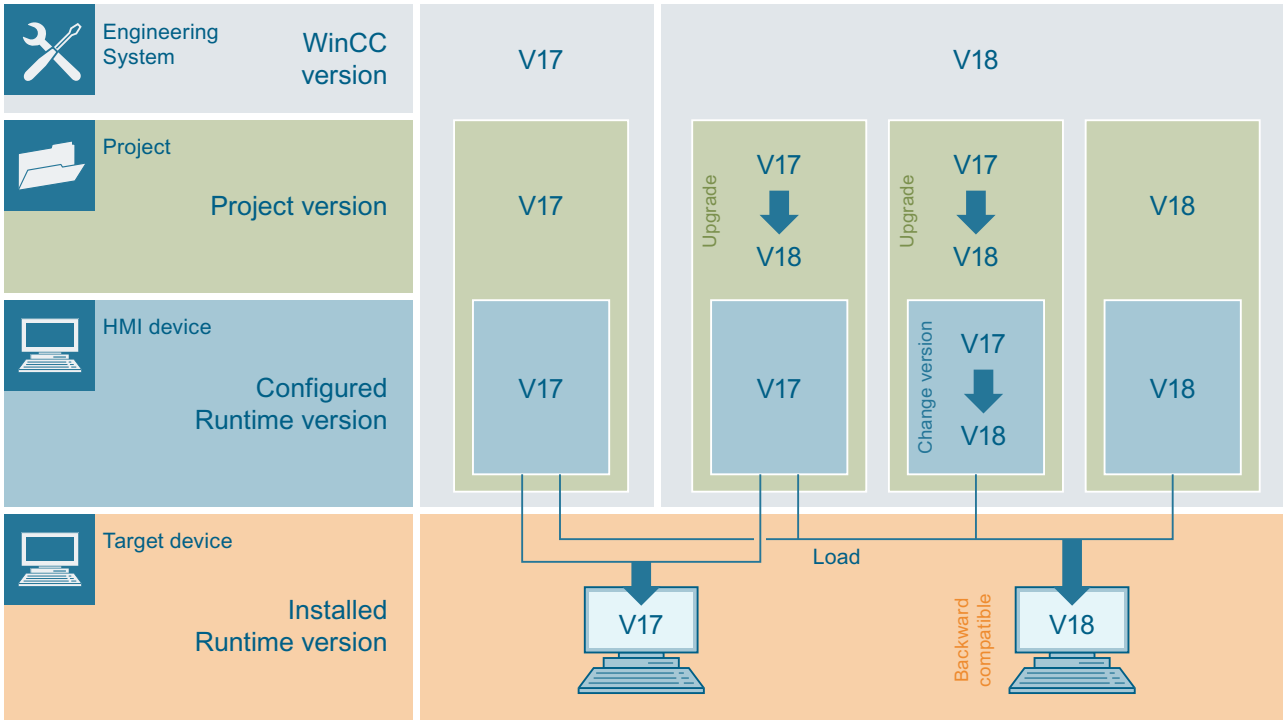
An installed Runtime version V18 or higher supports backward compatibility up to V17.

You can find more information about the installed Runtime version under:

- Installed Runtime version for Unified Comfort Panel (Page 191)
- Installed Runtime version for Unified PC (Page 192)

Version compatibility

The following diagram shows the interaction of the different versions:



When downloading to a target device, make sure that the configured and the installed Runtime versions are compatible.

TIA Portal checks the compatibility during the download. The following applies when incompatible versions are detected:

- Unified Comfort Panel: In the "Load preview" dialog, you are given the option to install an image with a compatible version on the Panel.
  You can find additional information at Basics for downloading projects (Page 7147).
- Unified PC: Download is not possible

Note

When loading from an external storage medium, compatibility is checked while you load the project to the device (Unified PC).

Simulation

With an installed Runtime as of version V17, backward compatibility is also supported for simulations.

You can simulate Runtime projects with a configured Runtime version of V16 onwards.

3.12.1.1 Installed Runtime version for Unified Comfort Panel

Note

Changing the installed Runtime version deletes all data on the Unified Comfort Panel

When an image is installed, the data on the Unified Comfort Panel is deleted.

Back up the following data before you install an image.

- Database for the tag persistence
- Data logs
- Alarm logs
- Parameter sets

For Unified Comfort Panels, the operating system and the runtime are bundled into one image with a device version that can be transferred to the HMI device if necessary. The device version determines which version of the operating system and Runtime can be installed with the image.

The Runtime version installed with the image on the Unified Comfort Panel must be compatible with the configured Runtime version for the project to be downloaded.

Note

Installing image with compatible version

There are several ways to install an image with a compatible version:

- When TIA Portal detects an incompatible runtime version during online loading, you have the option in the "Load Preview" dialog to install an image with a compatible, installed Runtime version on the Unified Comfort Panel before the download.
  You can find additional information at Basics for downloading projects (Page 7147).
- Independent of the download, you have the following options for installing an image:
  - Updating the operating system of the HMI device (Page 7167)
  - Updating the operating system of the HMI device from a data storage medium (Page 7169)

Backwards compatibility

HMI devices starting from the installed Runtime version V17 are backward compatible. Runtime projects with a configured Runtime version V16 or higher can run on them.

Note

Conversion of the logging data with backward compatibility

When a project is started for the first time in runtime in the backward compatibility mode, its logging data is adapted to the new database schema. This process is irreversible.

Example:
A project with configured Runtime V17 is loaded to a device on which Runtime V18 is installed. During the project start, the logging data is adapted to match the database schema of V18. You can no longer transfer the log to a device with Runtime V17 and run it there.

See also

Basics on version compatibility (Page 187)

Basics for downloading projects (Page 7147)

Updating the operating system of the HMI device (Page 7167)

Updating the operating system of the HMI device from a data storage medium (Page 7169)

3.12.1.2 Installed Runtime version for Unified PC

For Unified PC, the operating system and Runtime are installed independently of each other. The installed Runtime version must be compatible with the configured Runtime version.

Backwards compatibility

HMI devices starting from the installed Runtime version V17 are backward compatible. Runtime projects with a configured Runtime version V16 or higher can run on them.

Note

Conversion of the logging data with backward compatibility

When a project is started for the first time in runtime in the backward compatibility mode, its logging data is adapted to the new database schema. This process is irreversible.

Example:

A project with configured Runtime V17 is loaded to a device on which Runtime V18 is installed. During the project start, the logging data is adapted to match the database schema of V18. You can no longer transfer the log to a device with Runtime V17 and run it there.

See also

Basics on version compatibility (Page 187)

3.12.1.3 Use cases

Introduction

When commissioning a plant, the following versions are usually identical:

- WinCC version
- Project version
- Configured Runtime version
- Installed Runtime version

If you want to replace an HMI device or expand your system, the versions can differ. In such cases, WinCC version compatibility helps you to continue operating your plant with as little modification work as possible.

Example: Replacing the HMI device

Your system contains a Unified Comfort Panel with an installed Runtime version V17.

You want to replace this Unified Comfort Panel with another Unified Comfort Panel with an already preinstalled Runtime version V18. Nothing should be changed in the configuration.

To be able to download your Runtime project V18 to the HMI device, use the backwards compatibility.

More information can be found in the section Replacing a Unified Comfort Panel (Page 210).

Example: Expanding an existing system with an HMI device with an installed Runtime version

You want to expand your system with a Unified Comfort Panel with an installed Runtime version V17.

You are already using WinCC V18 on your configuration PC.

To use the HMI device, follow these steps:

1. Upgrade the project version.
2. Configure a Unified Comfort Panel V17 in the Engineering System.
3. Compile and download the Runtime project to the Unified Comfort Panel with an installed Runtime version V17.

Example: Expanding an existing system with an HMI device with a later Runtime version installed

You want to expand your system with a Unified Comfort Panel with an installed Runtime version V18 and use the functionalities of the current version.

You are using WinCC V17 on your configuration PC.

To use the HMI device, follow these steps:

1. Install WinCC V18 on your configuration PC.
2. Upgrade the project version.

3. Configure a Unified Comfort Panel V18 in the Engineering System.
4. Compile and download the Runtime project to the Unified Comfort Panel with an installed Runtime version V18.

Example: Upgrading an HMI device

Your system contains a Unified PC with an installed Runtime version V16 or V17.

You want to use the functionalities of the current version on the Unified PC.

You can find additional information at Upgrading a Unified PC (Page 207).

Replacing a Unified Comfort Panel (Page 210)

Upgrading a Unified PC (Page 207)

Upgrading a Unified Comfort Panel (Page 208)

Replacing a Unified PC (Page 212)

3.12.2 Upgrade project

Introduction

To open a WinCC project that was created with an older version of the Engineering System, you must first upgrade the project version to the WinCC version of the currently opened Engineering System.

Requirements

- The project version is a predecessor of your WinCC version.

  Note

  No version skips

  You cannot skip any version when upgrading. A project with version V16 must first be upgraded in a TIA Portal version V17 before you can upgrade it in a TIA Portal version V18 to the current version.

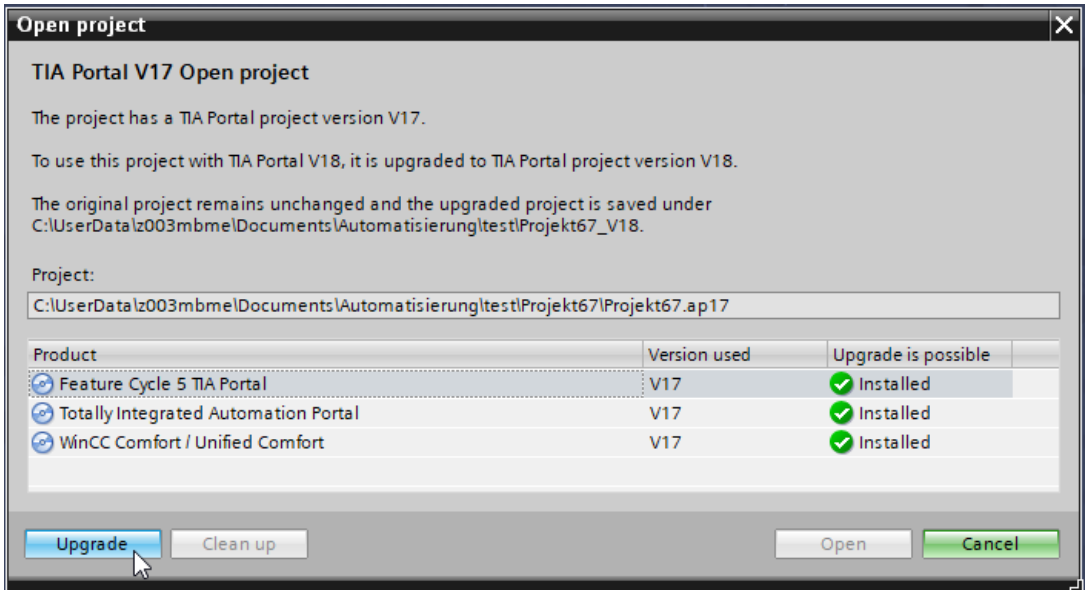
- You have write access to your project drive.
- The project drive has sufficient storage capacity for another project of this size.

Procedure

To upgrade a project from TIA Portal V17 or higher to your WinCC version, follow these steps:

1. Select the "Open" command in the "Project" menu.
   The "Open Project" dialog box opens and the list of recently used projects is displayed.
2. Select a project from the list and click "Open".
3. If the project is not included in the list, click the "Browse" button. Navigate to the project folder and open the project file.
   The "Open Project" dialog opens.

4. Click "Upgrade".



The project is upgraded to the current project version and opened. The procedure can take time, depending on the number of devices and objects used in the project.

Note

Unsupported devices

If there are devices in the project that are not supported by the current version, an upgrade is not possible.

Open the project in the version of the TIA Portal in which it was created, and remove the unsupported devices or replace them with supported devices.

More information: Unsupported devices (Page 198)

Note

Devices not fully supported

If devices are configured in the project that are only partially supported, an upgrade is possible.

In the upgraded project, replace the devices with fully supported devices.

More information: Devices not fully supported (Page 197)

5. Check whether devices and library objects have to be adapted to the new version.

Result

- The content of the old WinCC project is saved in a new project with the current project version.
  The original project is not overwritten and can still be edited with a compatible older version of the TIA Portal.
- You can open, edit, save, compile, download or simulate the project.

- All functions of the current WinCC version are available in the project.
- If necessary, match the Runtime version of the HMI devices.

See also

Upgrading the installed Runtime version of a device (Page 207)

3.12.3 Devices not fully supported

Error during upgrade

If a project contains devices or device versions that are no longer fully supported in the current version of WinCC, the project can be upgraded to the current version of WinCC.

Unsupported devices may be present in a project in the following locations:

- Devices in the project tree
- Devices in the master copies of the project library

Devices that are no longer fully supported are flagged with a symbol: 

If you compile a device that is no longer complete, you get an error message:

- The device is not supported. Compilation is therefore not possible. Please switch to a supported device.
- The Runtime version is not supported. Compilation is therefore not possible. Switch to a supported version.

Changing the device type or the device version in the project tree

To change the device type or the device version of a device in the project tree, follow these steps:

1. Select the "Change device/version" command in the shortcut menu of the outdated device.
2. In the "Change device" dialog, select as new device a device or device version that is supported in the current version of WinCC.

TP2200 Comfort V2	15.0.0.0

You can find detailed compatibility lists of all HMI devices using the compatibility tool (https://support.industry.siemens.com/cs/ww/en/view/64847781).

3.12.4 Unsupported devices

Error during upgrade

If a project contains devices or device versions that are no longer supported in the current version of WinCC, upgrading is not possible. To upgrade the project to the current version, you need to open the project in an older version of WinCC and change the device type or version to a value supported by the current version of WinCC.

Devices that are no longer supported are flagged with a symbol: 

Unsupported devices may be present in a project in the following locations:

- Devices in the project tree
- Devices in the master copies of the project library

Changing the device type or the device version in the project tree

To change the device type or the device version of a device in the project tree, follow these steps:

1. Select the "Change device/version" command in the shortcut menu of the outdated device.
2. In the "Change device" dialog, select as new device a device or device version that is supported in the current version.

Changing the device type or device version in the library

To change the device type or the device version of a device in the project library, follow these steps:

1. Search for the outdated device in the master copies of the project library.
2. Copy the master copy from the project library to the project tree.
3. Make a note of the name of the master copy. Delete the master copy in the project library.
4. Select the "Change device/version" command in the shortcut menu of the outdated device.
5. In the "Change device" dialog, select as new device a device or device version that is supported in the current version of WinCC.
6. Create a new master copy of the project library from this device.
7. Give the new master copy the same name as the deleted master copy.

Devices and device versions not supported

KTP400 Basic 2nd Generation	13.0.0.0, 14.0.0.0
KTP700 Basic 2nd Generation	13.0.0.0, 14.0.0.0

TP2200 Comfort V2	11.0.0.0, 12.0.0.0
WinCC Runtime Advanced	11.0.0.0, 12.0.0.0

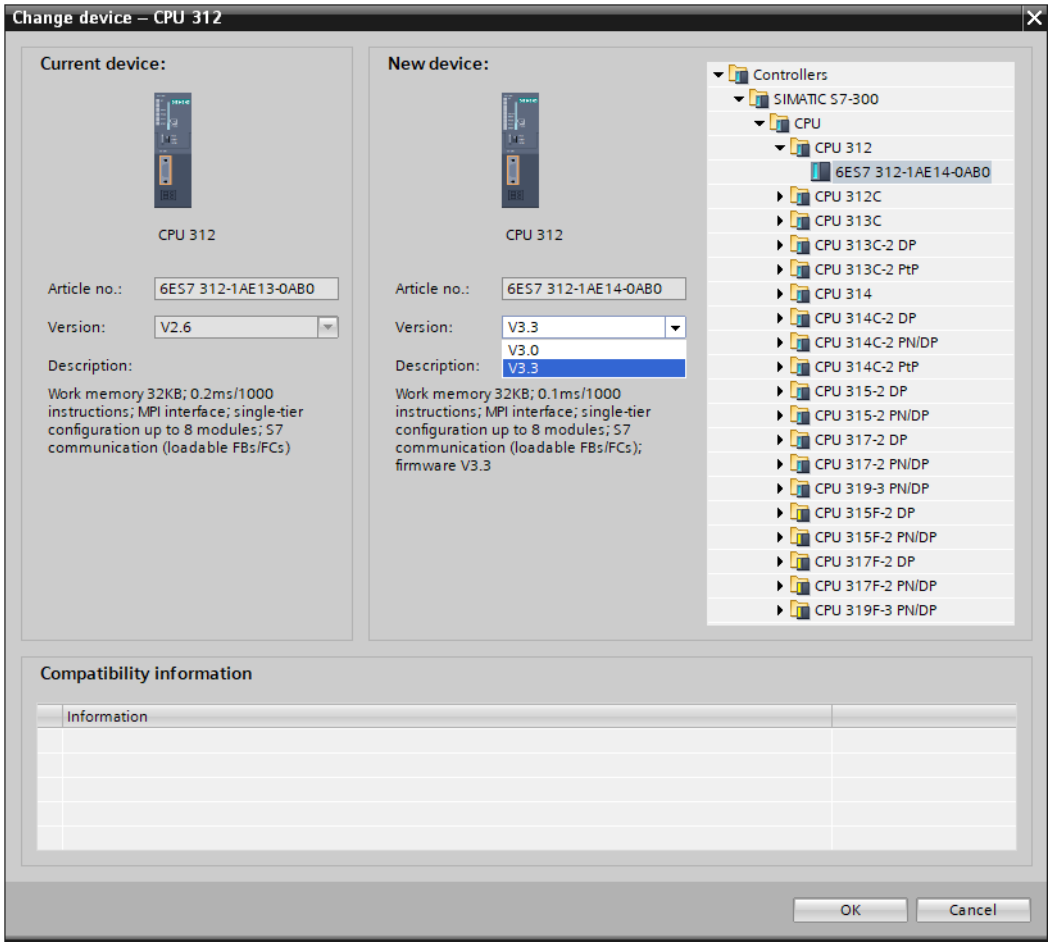
You can find detailed compatibility lists of all HMI devices using the compatibility tool (https://support.industry.siemens.com/cs/ww/en/view/64847781).

3.12.5 Matching objects after upgrading

After the successful upgrading of a project, you must match the versions of individual devices and objects if required.

Matching devices after upgrading

1. In the project tree for a device, in the shortcut menu, select "Replace device ....".
2. Check whether the device is available in a newer version.



More information:

- Replacing the configured HMI device (Page 202)
- Replacing a device (Page 209)

3. Then compile each device in the project.

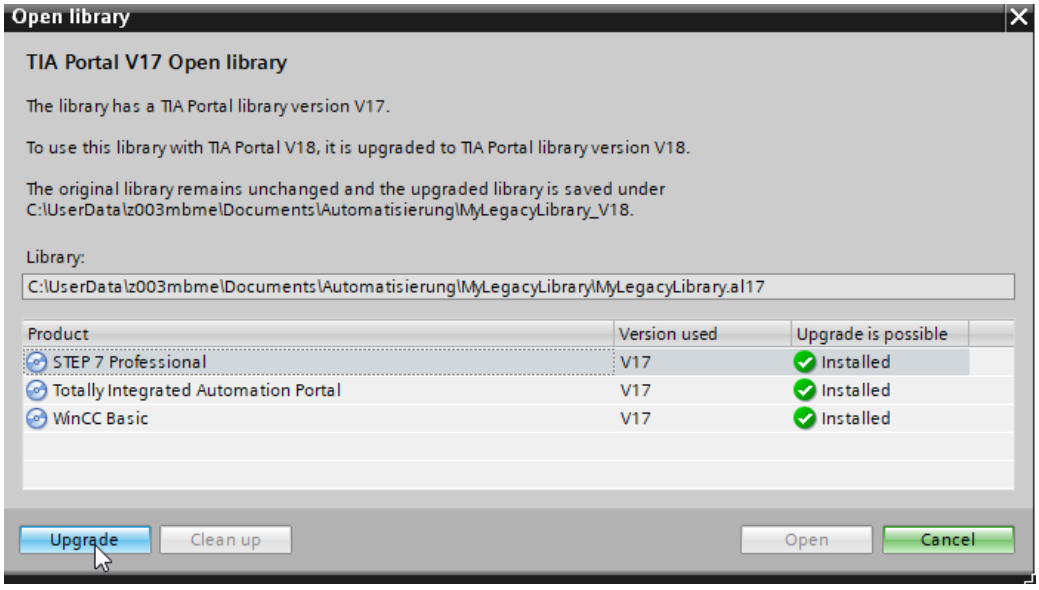
Note

Sequence of compilation

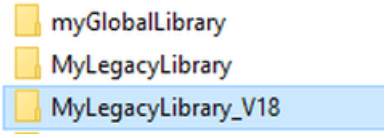
Compile the PLCs first and then the HMI devices in your project. In this way, you ensure that the controller data required to compile the HMI devices is available.

Upgrading global libraries

1. Open a global library that was created with an older version of the TIA Portal.
   The "Open Library" dialog is displayed.



2. Click "Upgrade".
   The library is upgraded and saved as a new global library with the appendage "_V18".
   The library of the predecessor version is retained.



See also

Upgrading a global library (Page 205)

3.12.6 Replacing the configured HMI device

3.12.6.1 Basics for replacing the configured HMI device

Introduction

When you replace the devices, you can use existing configurations for your new HMI devices.

For example, you replace a Unified PC for a Unified Comfort Panel or a 7" Unified Comfort Panel for a 12" Unified Comfort Panel.

All data configured by you is retained in the configuration data. This means you do not need to copy individual objects of one device and paste them to another.

Note

When you replace a Unified Comfort Panel and select a PC station as your new device, for example, WinCC Unified PC RT is automatically moved below the PC Station in the project tree.

Adjusting the screen size

If the new device supports a different resolution than the previous device when you replace a device, adjust the screen size.

Customizing a connection

When you have configured a connection to a PLC and are replacing the HMI device with a different device type, error messages may occur, for example "The object 'IE general' is not supported in the new configuration and will be removed".

This may happen, for example, when you replace a Unified PC with a Unified Comfort Panel because the configured communications module is not supported after the exchange.

Therefore, check the configured connections and make adaptations if necessary.

See also

Basics on version compatibility (Page 187)

3.12.6.2 Replacing the configured HMI device

Requirement

- A project has been created and opened.
- A Unified PC or a Unified Comfort Panel is used in the project.
- The screens have been adapted.

Procedure

To replace an HMI device with another HMI device, follow these steps:

1. In the project tree, select the HMI device to be replaced.
   Alternatively, select the HMI device to be exchanged in the "Devices & Networks" editor.
2. Depending on the device, select "Change device / version" or "Change device" from the shortcut menu.
   The "Change device" dialog opens.

3. Select the desired device.
   Details of hardware differences can be found in the "Compatibility information".
   If necessary, adapt the version.
   You can find additional information at Changing the configured runtime version (Page 206).
4. Confirm the dialog.

Result

You have replaced the HMI device used in the project.

If needed, make the following adaptations:

- If you have exchanged a Unified Comfort Panel with a Unified PC or vice versa, for example, you need to adapt the configured connections.
- If you have selected an HMI device with a different screen resolution, adjust the screens.

Further procedure

To complete the device change, the following further steps are necessary:

- If necessary, replace the HMI device in your plant.
- Transfer the stored data to the new HMI device.

  Note

  Data transfer

  Note that when changing the device type (changing from Unified Comfort Panel to a Unified PC or vice versa), the transfer of databases is not supported.

  Data of the central user administration (UMC) cannot be transferred and must be loaded together with the Runtime project.

- Compile and load the Runtime project into the new HMI device.

See also

Changing the configured runtime version (Page 206)

3.12.6.3 Adapting the configuration of the connection

Introduction

If an HMI device is changed, error messages may occur, for example "The object 'IE general' is not supported in the new configuration and will be removed".

These alarms refer to configured connections of the device and are triggered, for example, by different interfaces when replacing the Unified Comfort Panel with a Unified PC.

These connections are marked red after a device replacement. If you would like to continue to use these connections, you have to adapt the configuration of the connection.

Procedure

To connect a PLC to the HMI device again after the device replacement, follow these steps:

1. Open the "Devices and Networks" editor.
2. Click "Network" in the toolbar of the network view.
3. If necessary, add a communications module.
4. Network the interface of the HMI device with the interface of the PLC.
5. In the table area of the network view, click on the "Connections" table.
6. Select the connection marked red.
7. Enter the new interface under "Properties > General > General > Connection path" in the Inspector window.

3.12.7 Upgrading a global library

Introduction

To process objects of a global library in a project, you must first upgrade the version of the global library to the project version. You are prompted accordingly when you open the global library.

Requirements

- The version of the global library is a predecessor version of your project version.
- You have write access to your project drive.
- All types in the library have been released.

Procedure

To upgrade a global library from TIA Portal V16 or V17, proceed as follows:

1. Open the global library.
   The "Upgrade global library" dialog box opens.
2. Click "OK".

Result

A copy of the global library is created and upgraded. The global library opens.

3.12.8 Changing the configured runtime version

Introduction

If you want to upgrade or exchange the HMI device, change the configured Runtime version of an HMI device.

Change, for example, the configured Runtime version of a Unified Comfort Panel from V17 to V18.

Requirements

- A project has been created and opened.
- The project contains an HMI device.

Procedure

To change the configured Runtime version, follow these steps:

1. Double-click on "Devices & Networks" in the project tree.
   The editor opens.
2. Select the desired HMI device in the device view.
3. Select "Change device/version" in the device shortcut menu of the HMI device.
   A dialog opens.
4. Select the required HMI device.
5. Depending on the Runtime version installed on the target device, select a compatible Runtime version under "Version".

   Note

   Selection of Runtime versions

   The project version determines which Runtime versions are offered to you.

6. Confirm your selection with "OK".

Alternatively, you can also change the configured Runtime version in the device properties in the project tree.

Result

You have changed the configured Runtime version of the HMI device in the WinCC project.

To successfully download the project, a compatible Runtime version must be installed on the target device.

In the next step, you upgrade the installed Runtime version of the HMI device or exchange the device.

See also

Replacing the configured HMI device (Page 203)

Replacing the configured HMI device (Page 202)

3.12.9 Upgrading the installed Runtime version of a device

3.12.9.1 Upgrading a Unified PC

Introduction

To use the new functionalities of the current Runtime version, you must upgrade the Unified PC.

Requirement

- No project is running in Runtime on the Unified PC.

Note

No version skips

You cannot skip any version when upgrading.

Procedure

1. Install the higher Runtime version on the Unified PC.
   The existing data is retained, e.g. logs and parameter sets.

   Note

   Converting logging databases

   When a project is started for the first time in Runtime after upgrading, its logging data is adapted to the new database schema. This process is irreversible.

2. Upgrade the engineering system to the WinCC version that corresponds to the Runtime version installed on the Unified PC.
3. Upgrade the project version of the project to the WinCC version.
4. Upgrade the configured Runtime version of the HMI device.
5. Compile and download the project into the Unified PC.
6. Start the project on the Unified PC in Runtime.

See also

Use cases (Page 193)

Changing the configured runtime version (Page 206)

3.12.9.2 Upgrading a Unified Comfort Panel

Introduction

To use the new functionalities of the current Runtime version, you must upgrade the Unified Comfort Panel.

Note

Protection against loss of data

To simplify data transmission, save the following data to external storage media:

- Database for the tag persistence
- Data logs
- Alarm logs
- Parameter sets

Data from central user administration (UMC) cannot be backed up and must be loaded with the Runtime project.

Note

No version skips

You cannot skip any version when upgrading.

Requirement

- No project is running in Runtime on the Unified Comfort Panel.

Procedure

To upgrade a Unified Comfort Panel, follow these steps:

1. Store the above-mentioned data of the Runtime project on external storage media.
2. Load an image with the higher Runtime version.

NOTICE
Data loss All data stored internally on the Unified Comfort Panel will be lost.

3. Make the backed up data available to the Unified Comfort Panel again.
   Do not save the tag persistence database and the parameter sets on the same storage medium as the logs.

4. Upgrade the engineering system to the WinCC version that corresponds to the Runtime version installed on the Unified Comfort Panel.
5. Upgrade the project version of the project to the WinCC version.
6. Upgrade the configured Runtime version of the device.
7. Compile and load the project into the Unified Comfort Panel.
8. Start the project on the Unified Comfort Panel in Runtime.

See also

Use cases (Page 193)

Changing the configured runtime version (Page 206)

3.12.10 Replacing a device

3.12.10.1 Basics

Introduction

When replacing the Unified HMI devices, you can use existing configurations for your new devices and optimize these configurations with very little manual effort. The configuration data are retained.

If you replace an HMI device, for example, a Unified Comfort Panel, and select a PC station as the new device, the configured data is automatically moved under the PC station. The adaptation of the screens to the new screen size takes place in one step after the device replacement. You can find additional information at "Adjusting screens to the new HMI device (Page 213)".

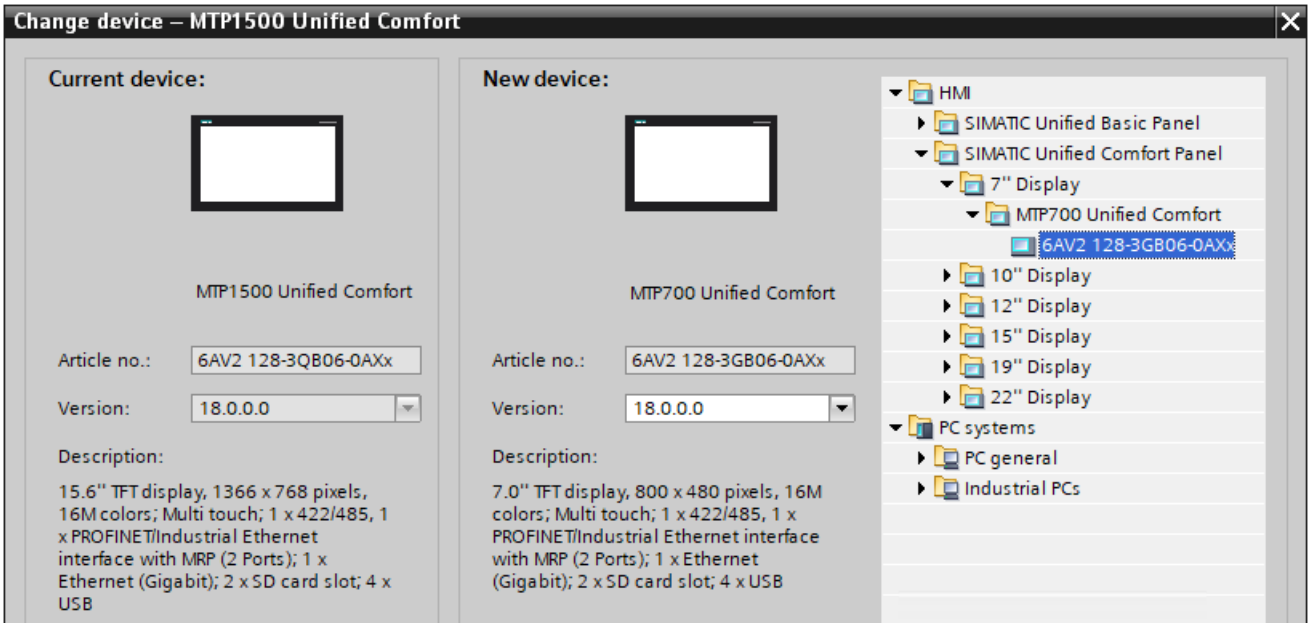
Requirement

- A project has been created and opened.
- In the project, Unified Control Panels or WinCC Unified PCs are used for the visualization.

Introduction

1. Double-click "Devices" in the project navigation.
   The editor opens.
2. Click the required HMI device.

3. Select "Change device/version" in the device shortcut menu.
   A dialog opens.



4. Select the new HMI device and the FW version. Details of hardware differences can be found in the "Compatibility information" at the bottom of the table.
5. Click "OK".
   Replacement of the device is started.

Result

You have replaced the device used in the project.

3.12.10.2 Replacing a Unified Comfort Panel

Introduction

If you replace a Unified Comfort Panel with Runtime version V17 installed, you can replace the device with a Unified Comfort Panel with Runtime version V17 or V18 installed.

HMI devices starting from the installed Runtime version V17 are backward compatible. Runtime projects with a configured Runtime version V16 or higher can run on them. Compile and download existing Runtime projects without any additional adaptation.

Note

Data transfer

Save the following data on external storage media:

- Database for the tag persistence
- Data logs
- Alarm logs
- Parameter sets

Data from central user management (UMC) cannot be backed up and must be loaded with the Runtime project.

Alternatively, replace the Unified Comfort Panel with a Unified PC. To do this, follow the steps under Replacing a Unified PC (Page 212). Note that when replacing the device type, the transfer of databases is not supported.

Requirement

- The desired WinCC version is used.
- The project is available in the engineering system.
- The project version and the WinCC version are identical.

Procedure

Note

Conversion of the logging databases with backward compatibility

When a project is started for the first time in Runtime in the backward compatibility mode, its logging data is adapted to the new database schema. This process is irreversible.

1. Store the above-mentioned data of the Runtime project on external storage media.
2. Make the backed up data available to the new Unified Comfort Panel.
   Do not save the tag persistence database and the parameter sets on the same storage medium as the logs.
3. Load the project in the new Unified Comfort Panel.
4. Start the project on the new Unified Comfort Panel in Runtime.

If you have replaced a Unified Comfort Panel with an installed Runtime version V17 with a Unified Comfort Panel with an installed Runtime version V18, the projects are automatically started in the backward compatibility mode at the start.

Result

You have replaced a Unified Comfort Panel.

The project runs on the new device in runtime.

If needed, make further adaptations, e.g. Upgrading a Unified Comfort Panel (Page 208).

See also

Use cases (Page 193)

3.12.10.3 Replacing a Unified PC

Introduction

If you replace a Unified PC with an installed Runtime version V17, you can replace the device with a Unified PC with an installed Runtime version V17 or V18.

HMI devices starting from the installed Runtime version V17 are backward compatible. Runtime projects whose configured Runtime version is ≥ V16 can run on them. Compile and download existing Runtime projects without any additional adaptation.

Note

Data transfer

Do not save databases directly on a network drive. Power supply can be interrupted at any time. Reliable operation is therefore not guaranteed.

Save the following data on external storage media:

- Database for the tag persistence
- Data logs
- Alarm logs
- Parameter sets
  On Unified PC, parameter sets are saved in the directory of the Runtime project.

Data from central user management (UMC) cannot be backed up and must be loaded with the Runtime project.

Alternatively, replace the Unified PC with a Unified Comfort Panel. To do this, follow the steps under Replacing a Unified Comfort Panel (Page 210). Note that when replacing the device type, the transfer of databases is not supported.

Requirement

- The desired WinCC version is used.
- The project is available in the engineering system.
- The project version and the WinCC version are identical.

Procedure

Note

Conversion of the logging databases with backward compatibility

When a project is started for the first time in Runtime in the backward compatibility mode, its logging data is adapted to the new database schema. This process is irreversible.

1. Install the desired Runtime version on the new PC.
2. Store the above-mentioned data of the Runtime project on external storage media.
3. Make the backed up data available to the new Unified PC.
   On the new PC, select the log directory configured in the "WinCC Unified Configuration" tool during Runtime installation as the storage location for the logs.
4. Compile and download the project into the Unified PC.
5. Start the project on the new unified PC in Runtime.

If you have replaced a Unified PC with an installed Runtime version V17 with a Unified PC with an installed Runtime version V18, the projects are automatically started in backward compatibility mode at the start.

Result

You have replaced a Unified PC.

The project runs on the new device in runtime.

If needed, make further adaptations, e.g. Upgrading a Unified PC (Page 207).

See also

Upgrading a Unified PC (Page 207)

Use cases (Page 193)

3.12.10.4 Adjusting screens to the new HMI device

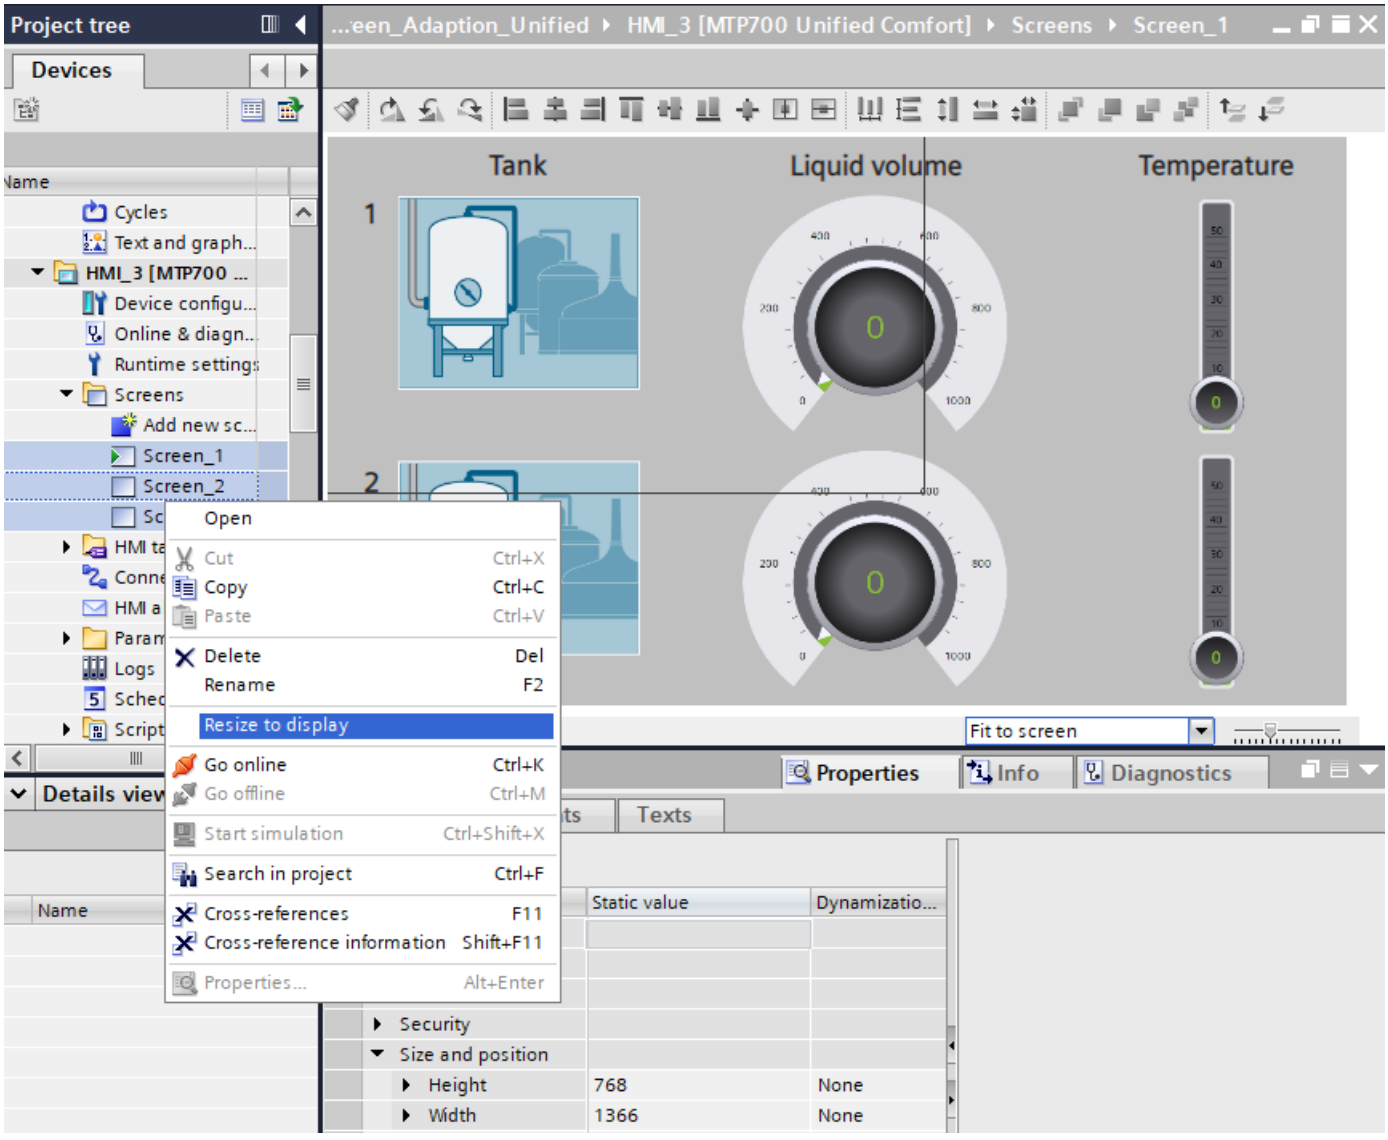
If you replace an HMI device with a smaller or larger display, the configured screen sizes do not fit the new HMI device. The Unified Comfort Panels and Unified PCs offer an easy adaptation of the screen size, the objects and fonts used, all in one step.

Requirement

- A project has been created and opened.
- Unified Control Panels or WinCC Unified PCs are used in the project for the visualization.
- A screen is configured.
- You have exchanged an HMI device for another Unified Control Panel or a WinCC Unified PC.

Adjusting the screen size

1. Double-click "Devices" in the project navigation.
   The editor opens.
2. Click the HMI device.
3. Select a screen under "Screens" and, on the bottom edge of the window, set the scale "Fit to screen".
   - If the new screen size is smaller than the screen size of the exchanged device, a part of the screen is framed by a thin black line. In this case, only the part in the frame would be shown on the display of the new device.
   - If the new screen size is larger than the screen size of the exchanged device, the screen only fills a part of the display area.

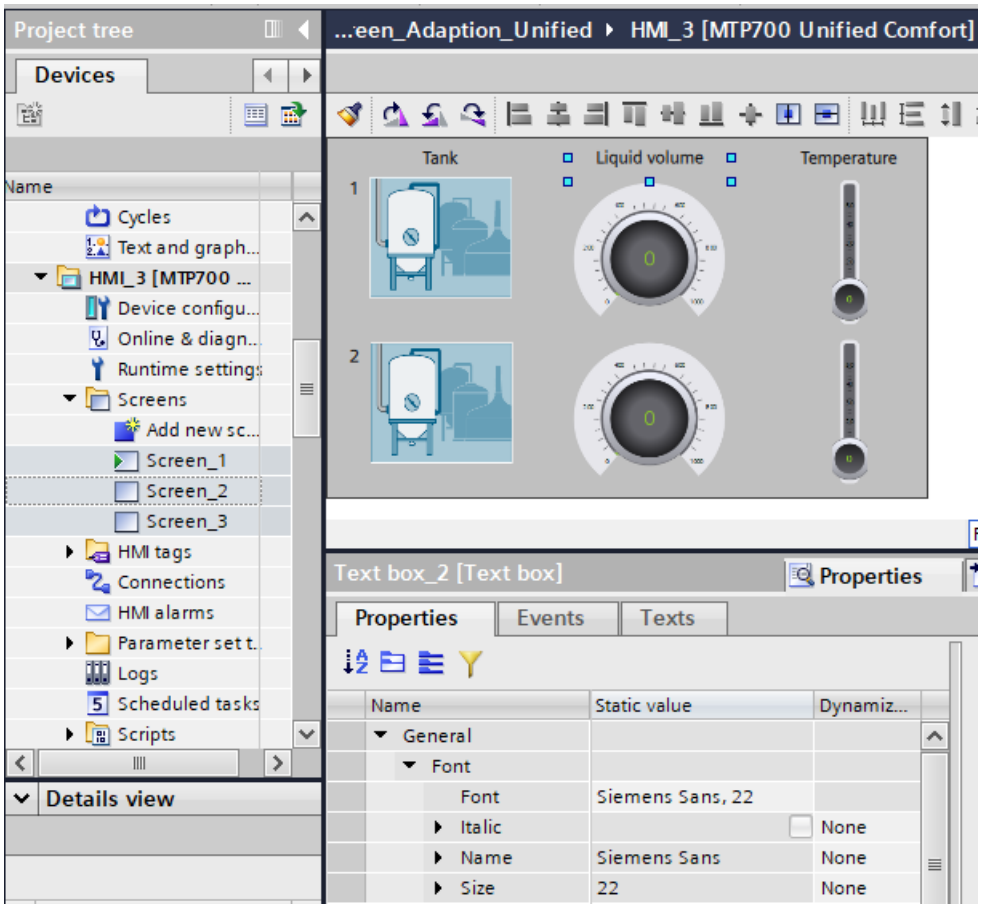


4. Select a screen, a screen group or several screens. Right-click the selected screens and select "Resize to display".

If you scale a large number of screens, an information window is shown that informs you about the progress of the change.

Result

The screen size, the objects, and fonts used are scaled in one step in all the selected screens.



Note

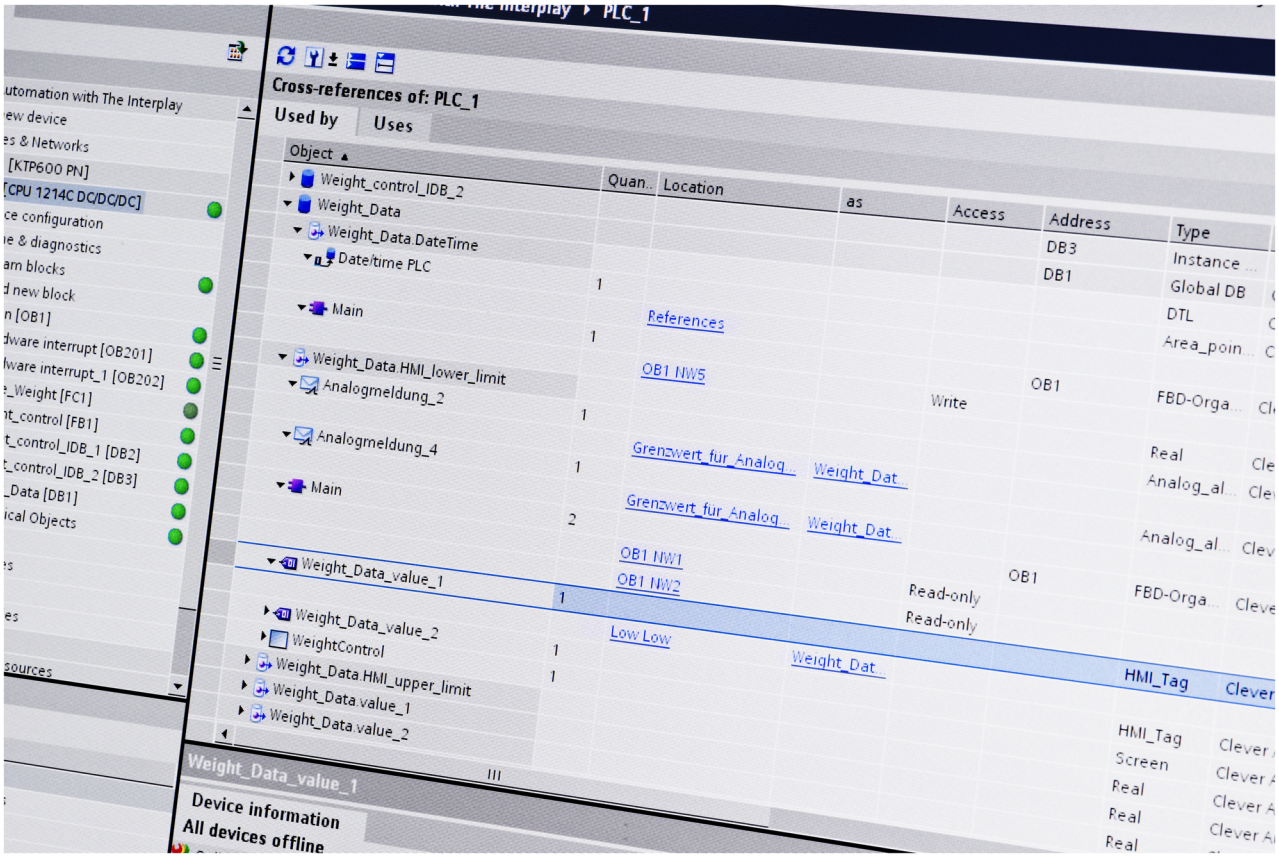
After replacing the HMI device with a substantially larger or smaller variant, check the appearance of the configured screens. Changed display sizes can result, for example, in the fonts being too small or too large.

3.13 Using cross-references

3.13.1 General notes about cross-references

Introduction

The cross-references provide an overview of the use of objects and devices within the project and the project library. The relationships and the dependencies between the objects can be displayed using the cross-references.



- To open the "Cross-references" editor, select "Cross-references" in the shortcut menu of the navigation object in the project tree.
  - or -
  Press <F11>
  - or -
  In the Inspector window, select "About > Cross-references".
- To open the "Cross-reference information", select "Cross-reference information" in the shortcut menu of an object, tag, alarm, etc.
  - or -
  Press <⇑ + F11>.

Benefits of cross-references

Cross-references offer the following advantages:

- When creating the project and when there are changes, you maintain an overview of the devices, objects, tags, faceplate types, alarms, scripts, etc. that you have used.
- From the cross-references, you can jump directly to the respective location of use of objects.
- You can see whether the respective object uses other objects or is itself used.
- During troubleshooting you will learn, for example, the following:
  - Which objects are used in which screen and on which devices.
  - Which alarms and parameter sets are displayed in which display.
  - Which tag is used in which alarm or which object.

See also

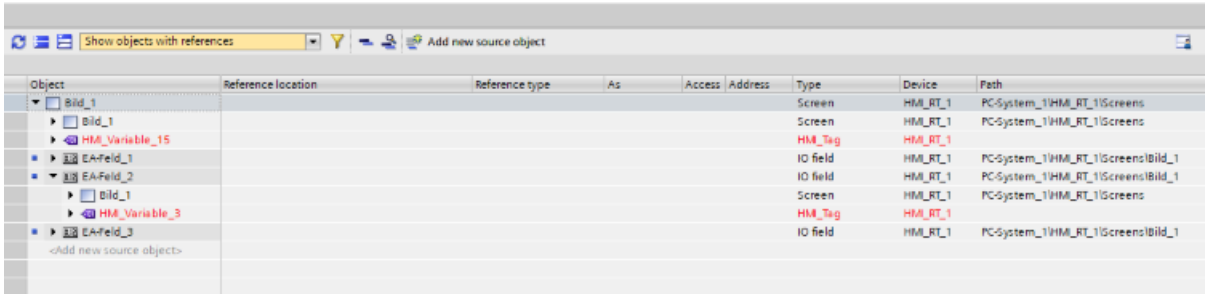
Displaying the "Cross-references" editor (Page 219)

Display cross-references in the Inspector window (Page 221)

3.13.2 Textual cross-references

Introduction

Textual cross-references are cross-references that are stored as pure text. With the help of textual cross-references, you cannot navigate to a different object. These cross-references are shown in red.



Textual cross-references are created as follows:

- You create a textual cross-reference for a non-existent object manually by entering the object name under Property and updating the cross-reference list.
- The object used has already been deleted, and the connection to it is shown as textual cross-reference.

Basics

When references and subordinate objects of a source object are deleted, they are converted into textual cross-references. A textual cross-reference is not stored when the source object itself is deleted.

Note

Almost all objects, with the exception of tag and alarm logs, support textual cross-references.

Note

Textual cross-references cannot be deleted.

You can also create a textual cross-reference manually to establish a connection to a non-existent object. This procedure can be helpful if you want to access tags directly using scripts.

Using textual cross-references when working with scripts

When working with scripts, you can reference tags directly with the help of textual cross-references.

When you enter an object name, the referenced object is searched for.

Sample code

```
export async function IO_Field_1_OnTapped(item, x, y, modifiers, trigger)
{
    HMIRuntime.Tags.SysFct.IncreaseTag("HMI_Tag_1", 0);
}
```

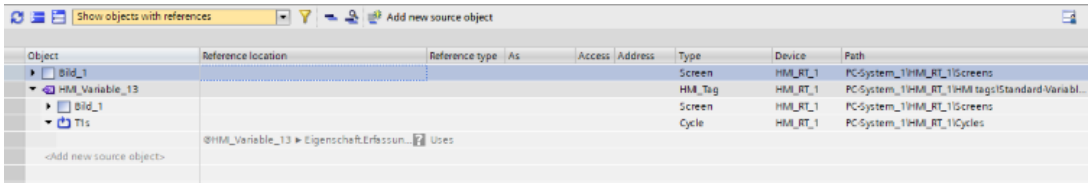
If a tag exists under the name "Variable_Test", it is referenced.

If there is no tag with the name "Variable_Test", the system creates a textual cross-reference for the tag.

The textual cross-reference is assigned to the tag that you create under this name. The textual cross-reference becomes a linked cross-reference.

3.13.3 Invalid cross-references

A cross-reference can become invalid as a result of certain changes to the configuration. Invalid cross-references are shown as grayed out.



Invalid cross-references do not have any negative implications for your project.

If an object or location of use is invalid, you cannot navigate to that object or location of use. You cannot change the properties of an invalid location of use. No shortcut menu is available for invalid locations of use.

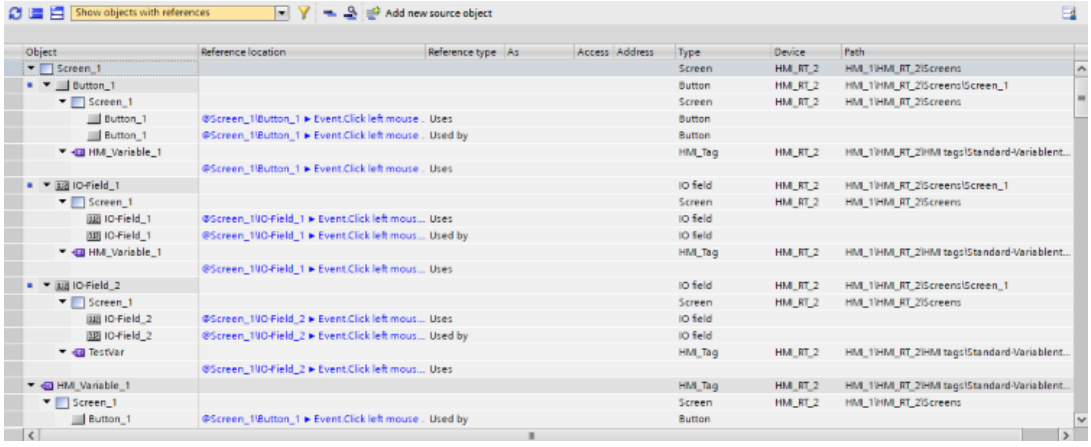
3.13.4 Displaying the "Cross-references" editor

Introduction

Depending on the object selected in the project tree, all the cross-references available for the object are displayed. In the project tree you can show cross-references for HMI devices, folders, and all editors. The detail view also lets you select individual objects of the editors, for example, individual screens.

Cross-references are always displayed for the selected object and for all lower-level objects.

The display of the cross-references for an object is specific to the project and device. You can display multiple cross-reference editors at the same time.



Requirement

- A project has been created.
- Multiple objects with references have been created.

Procedure

1. Select the required entry in the project tree or detail view.
2. Select "Cross-references" in the shortcut menu.
   Alternatively, select the "Cross-reference" command from the "Tools" menu.
   The "Cross-references" editor is opened in the working area.
   - The relevant selected object is the "source object" and is at the top in the "Object" column.
   - Point of use: Shows the locations at which the objects shown in the cross-reference list are used.
   - Type of use: Indicates whether the object is used.
3. To go to the location of use for a specific object, click on the cross-reference shown in blue in the "Point of use" column.
4. To go to the specific object, select the required object and select "Open editor" from the shortcut menu.
   The editor in which the object can be processed opens.
5. You can perform the following actions using the icons in the toolbar:
   - Updating
   - Collapse all
   - Expand all
   - Define filters for the cross-reference list
   - Show overlapping access
   - Check overlapping access
   - Add new source object
   - Save window settings

Note

Restoring cross-references after a project upgrade.

After a project upgrade to a higher TIA Portal version, you have the option of recreating the associated cross-reference data for the updated project.

This happens automatically at the end of the upgrade process. The updated project is opened and the cross-references are available again.

If the cross-reference data is inconsistent or incomplete, you will receive information. A banner text with a link to this information is displayed when the cross-reference list is opened. In this case, you can reorganize the cross-references yourself.

Delete

If you select a source object and "Delete" in the shortcut menu or press <Del>, then the object and not only the cross-reference is deleted.

A warning is displayed before the deletion.

After an object has been deleted, the cross-reference list is updated.

You cannot delete cross-reference lists.

3.13.5 Display cross-references in the Inspector window

Introduction

In the Inspector window, the cross-reference information for a selected object is displayed in the "Info > Cross-references" tab. In this way, you can see at a glance all the cross-references of the respective object without changing the cross-reference list.

All included elements and their use in the cross-reference list are displayed for structured tags, user data types and instances of a PLC data type.

Requirement

- A project has been created.
- Multiple objects with references have been created.

Procedure

1. Select an object.
2. Select "Cross-reference information" in the shortcut menu.
   The cross-references are opened in the Inspector window.

	**Tip for an efficient procedure**
If you select another object, the contents of the Inspector window are automatically refreshed. The cross-references to the selected object are displayed.	

Note

"Inspector window" restrictions

The Inspector window provides you with almost the same functions as in the "Cross-references" editor.

With more than 10,000 objects, the source objects and referenced objects are not sorted alphabetically in the Inspector window.

Example

When you select an object in the screen and an HMI tag is being used as the process tag at the object, the object and the linked HMI tag are displayed in the cross-references.

When the HMI tag is interconnected with a PLC tag or a data block tag, the locations of use of the interconnected PLC tag or data block tag are also displayed.

Result

The instances where and the other objects by which the selected object is being used are displayed.

The table below shows the additional information listed in the "About > Cross-reference" tab:

Column	Content/meaning
Object	Name of the object that uses the lower-level objects or that is being used by the lower-level objects.
Point of use	Each point of use, for example, an object or event
Type of use	Object relationships between the source object and its uses: • "Used by": The source object uses this object • "Uses": The source object is used by this object • "Type instance": The source object is a type or an instance of the referenced object • "Belongs to": The source object belongs to the reference object • "Contains": The source object contains the reference object
As	Shows additional information about objects, for example, that a tag is used by several devices
Access	Shows whether access to the object is read (R) and/or write (W)
Address	Displays the address of the object
Type	Displays information about the type and language used to create the object
Device	Displays the associated device name
Path	Displays the path of the object in the project tree with specification of folders and groups.
Comment	Displays user comments on individual objects, if available.

Depending on the installed products and the selected objects, additional columns or different columns are displayed for the cross-references.

3.13.6 Restoring cross-references after project upgrade

Introduction

After a project upgrade to a higher TIA Portal version, you have the option of recreating the associated cross-reference data for the updated project.

This happens automatically at the end of the upgrade process. The updated project is then opened and the cross-references are available again.

If the cross-reference data is inconsistent or incomplete, you will receive information. A banner text with this information and a further link is displayed when you display the cross-references.

In this case, you can reorganize the cross-references yourself.

Requirement

You have performed a project upgrade and received the message that the cross-reference data is inconsistent or incomplete.

Recreate cross-reference information

To create new cross-reference information, follow these steps:

1. Click the link to restore the cross-reference information in the displayed message.
   As an alternative, you can also navigate to "Cross-references" under "Tools > Settings > General".
2. Click the displayed "Recreate the cross-reference information" button.
3. Once the restore process is complete, check the message in the Inspector window to see if the operation was successful.
   If the process was not successful, you receive an error message.
4. In the cross-reference list, click the "Update" button to close the displayed banner again.

Result

The cross-references for the selected project have been recreated.

3.14 Configuring cycles

3.14.1 Basics of cycles

Cycles are used to control actions that reoccur regularly in runtime. Classic applications include:

- The acquisition cycle
- The logging cycle
- The screen cycle

You can also define your own cycles in addition to those already provided in WinCC.

Principle

Typical applications for cycles:

- Acquisition of external tags
  The acquisition cycle determines when the HMI device will read the process value of an external tag from the PLC. Set the acquisition cycle to suit the rate of change of the process values. The temperature of an oven, for example, changes much more slowly than the speed of an electrical drive.
  Do not set the acquisition cycle too low, since this will unnecessarily increase the communication load of the process.
- Triggering scheduled tasks
  In scheduled tasks you have the option to configure a task with a cyclical trigger. Use the cycle time to determine when the scheduled task is executed.
- Logging process values
  The logging cycle determines when a process value is saved in the logging database. The logging cycle is always an integer multiple of the acquisition cycle.

The smallest value for a cycle in Runtime Unified is 100 ms. You can configure all other values with an increment of 50 ms. The default value for the setting is 500 ms.

Application example

You can use cycles for the following tasks:

- To record and archive process values
- To trigger tasks
- To regularly log a process
- To draw attention to maintenance intervals

3.14.2 Defining cycles

Introduction

Use cycles to control actions that are run at regular intervals in runtime. You can also define your own cycles in addition to those already provided in WinCC.

Requirement

The project is open.

Procedure

To define a cycle, follow these steps:

1. Double-click the "Cycles" entry in the project navigation.
   The "Cycles" editor opens.
2. In the "Name" column of the "Cycles" editor, double-click "Add".
   A new cycle time is created.
3. Enter a unique name in the "Name" field.
4. Select the desired cycle unit.
5. Select the desired value for the cycle time.
   The available selection of values varies depending on the cycle unit selected.
6. As an option, you can enter a comment regarding the use of the cycle.
7. Save the project.

Result

The cycle you configured is created and beside the default cycles in WinCC for use during configuration.

3.15 Configuring in multiple languages

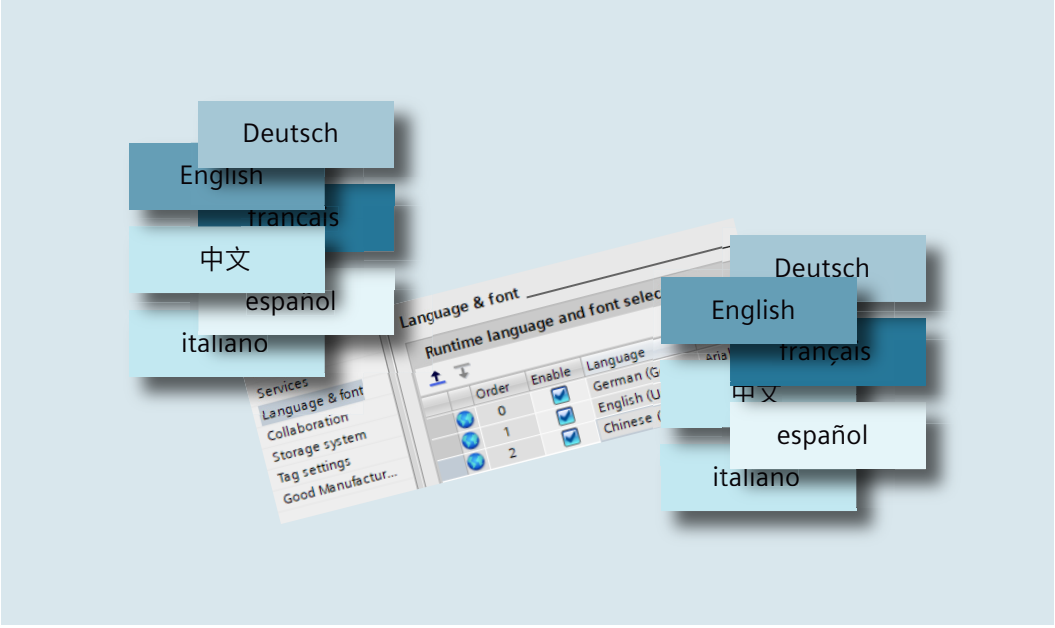
3.15.1 Languages in WinCC

User interface language and project languages

A distinction is drawn between two different language levels in WinCC:

- User interface language
  During configuration, the text in the WinCC menus and dialogs is displayed in the user interface language. The user interface language also affects the labeling of operating elements, the parameters of the system functions, the online help, etc.
- Project languages
  Project languages are all languages in which a project will later be used. Project languages are used to create a project in multiple languages.

The two language levels are completely independent of one another. For example, you can create English projects at any time using a German user interface and vice versa.



Project languages

The following languages are differentiated within the project languages:

- Reference language
  The reference language is the language that you use to configure the project initially. During configuration, you select one of the project languages as the reference language. You use the reference language as a template for translations. All of the texts for the project are first created in the reference language and then translated. While you are translating the texts, you can have them displayed simultaneously in the reference language.
- Editing language
  You produce translations of the texts in the editing language.
  Once you have created your project in the reference language, you can translate the texts into the remaining project languages. Select a project language respectively as an edit language and edit the texts for the appropriate language variant. You can change the editing language at any time.

  Note

  When switching the project languages, the assignment to the keys on the keyboard also changes. For some languages (for example, Spanish), the operating system does not allow you to switch to the corresponding keyboard assignment. In this case, the keyboard assignment is switched to English.

- Runtime languages
  Runtime languages are those project languages that are transferred to the HMI device. You decide which project languages to transfer to the HMI device depending on your project requirements.
  You must provide appropriate operator controls so that the operator can switch between languages in Runtime.

3.15.2 Settings for languages in the operating system

Introduction

The configuration PC operating system settings influence WinCC language management in the following areas:

- Selection of project languages
- Regional format of dates, times, currency, and numbers
- Displaying ASCII characters

Project language selection

A language is not available as a project language unless it is installed in the operating system.

Regional format of dates, times, currency, and numbers

WinCC specifies a fixed date and time format in the Date - Time field for the selected project language and runtime language.

In order for dates, times, and numbers to be presented correctly in the selected editing language, this language must be set in the Regional Options in the Control Panel.

Displaying ASCII characters

With text output fields, the display of ASCII characters as of 128 depends on the set language and the operating system being used.

If the same special characters are to be displayed on different PCs, the PCs must use the same operating system and regional settings.

3.15.3 Settings for Asian languages in the operating system

Settings on Western operating systems

If you want to enter Asian characters, you must enable support for this language in the operating system.

The Input Method Editor (IME) is available in Windows for configuring Asian texts. Without this editor, you can display Asian text but not edit it. For more information on the Input Method Editor, refer to the documentation for Windows. To enter Asian characters when configuring, switch to the Asian entry method in the "Input Method Editor".

Switch the operating system to the appropriate language to have language-specific project texts, such as alarm texts, displayed in the simulator in Asian characters.

Settings on Asian operating systems

If you are configuring on an Asian operating system, you must switch to the English default input language to enter ASCII characters, for example, for object names. As the English default input language is included in the basic installation of the operating system, you do not need to install an additional input locale.

Enabling language support

1. Open "Settings" from the Windows Start menu.
2. Select "Time & Language > Language".
3. Select "Preferred languages > Add a language".
4. Select the language.
   The "Install language features" dialog box is displayed.
5. Install the selected language pack and enable additional options, if necessary
6. Under "Related settings > Administrative language settings", you can find settings for programs that do not support Unicode.

Note

The options may be named or arranged differently depending on the operating system.

3.15.4 Setting project languages

3.15.4.1 Selecting the user interface language

Introduction

The user interface language is used for displaying menu entries, title bars, infotext, dialog texts and other designations in the WinCC user interface.

You can switch between the installed user interface languages during configuration. The labeling of the operating elements remains in the language you set when you added the object even if you change the user interface language.

Procedure

1. Select "Options > Settings" in the menu.
   The "Settings" dialog box is opened.
2. Select the user interface language under "General > General".

Result

WinCC will use the selected language as user interface language.

3.15.4.2 Enabling project languages

Introduction

The project languages are set in the "Project languages" editor. You define which project language is to be the reference language and which the editing language.

Enabling project languages

1. Click on the arrow to the left of "Languages & resources" in the project tree.
   The lower-level elements will be displayed.
2. Double-click on "Project languages".
   The possible project languages will be displayed in the working area.
3. Enable the relevant project languages.

Note

Copying multilingual objects

The copies of multilingual objects to a different project only include text objects in the project languages which are activated in the target project. Activate all project languages in the target project to include the corresponding text objects when transferring the copy.

Disabling project languages

1. Disable the languages which are not relevant for the project.

NOTICE
If you disable a project language, all text and graphic objects you have already created in this language will be deleted from the current project.

3.15.4.3 Selecting the reference language and editing language

Introduction

The project languages are set in the "Project languages" editor. You define which project language is to be the reference language and which the editing language. You can change the editing language at any time.

Requirements

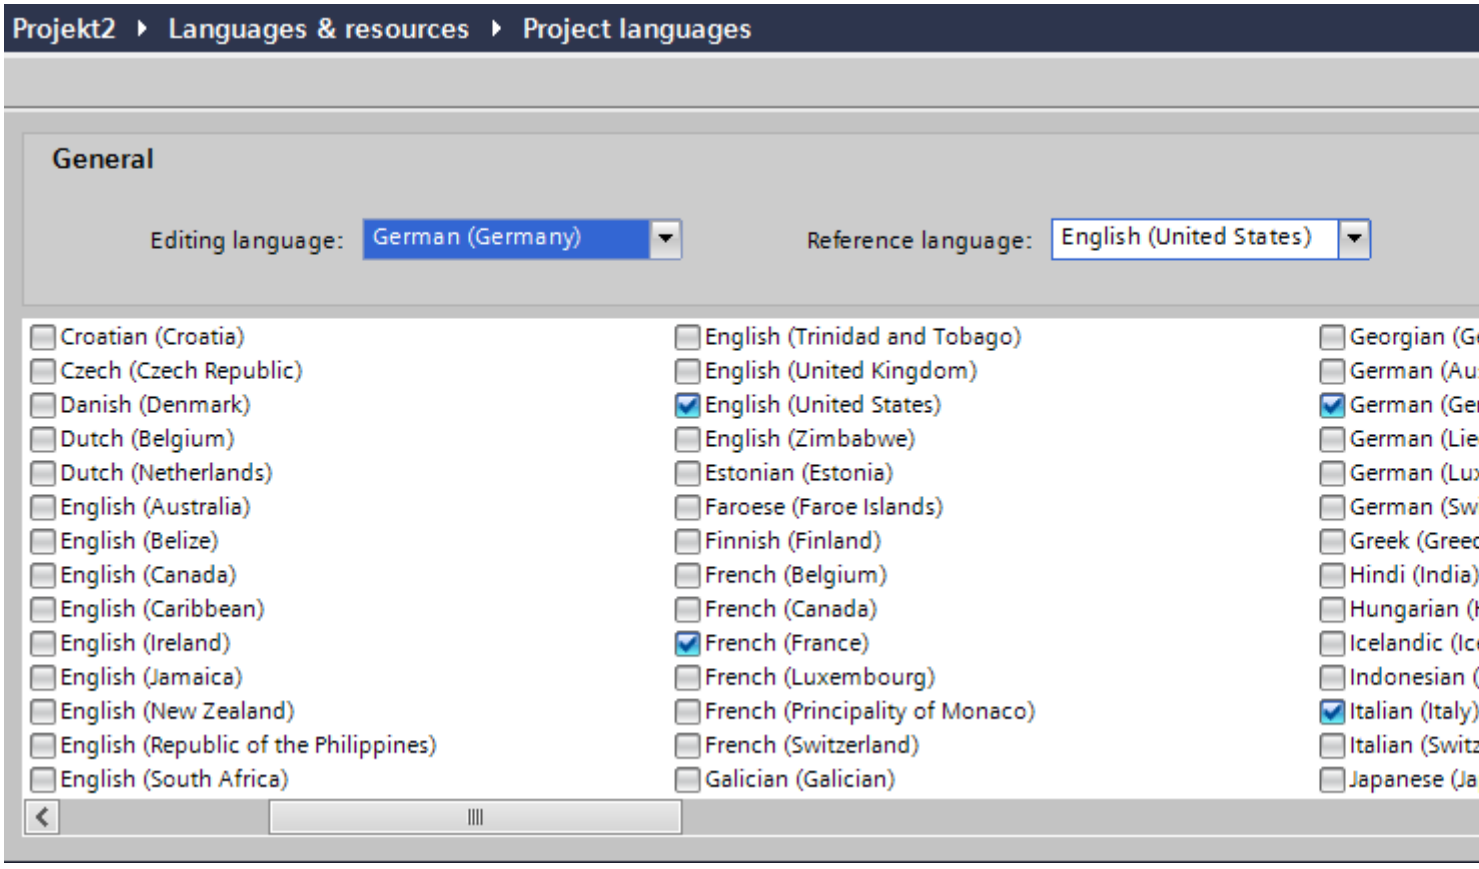
The "Project languages" editor is open.

Several project languages have been activated.

Selecting the reference language and editing language

1. Click the arrow in the drop-down list in the "General > Editing language" section.
2. Click the required language in the drop-down list, for example, German.
3. Click on the arrow in the drop-down list in the "General > Reference language" section.
4. Click the required language in the drop-down list, for example, English.

The language selection is displayed in the list box.



Result

You have now selected the editing and reference languages.

If you change the editing language, all future text input will be stored in the new editing language.

Configuring multilingual alarm texts (Page 747)

3.15.5 Creating one project in multiple languages

3.15.5.1 Working with multiple languages

Multilingual configuration in WinCC

You can configure your projects in multiple languages using WinCC. There are various reasons for creating a project in multiple languages:

- You would like to use a project in more than one country.
  You would like to create the project in multiple languages. When the HMI device is commissioned, only the language spoken by the operators at the respective site is transferred to the HMI device.
- The operators of a system speak different languages.
  Example: An HMI device is used in Germany, but the operating personnel understand only English.

Translating project texts

With WinCC, you can enter project texts directly in multiple languages in various editors, for example, in the "Project texts" editor. WinCC also allows you to export and import your configuration for translation purposes. This is advantageous if you configure projects containing a large amount of text and want to have it translated.

Language management and translation in WinCC

The following editors are used to manage languages and translate texts in WinCC:

Editor	Short description
Project languages	Selection of project languages, editing language and reference language.
Languages and fonts	Selection of Runtime languages and the fonts used on the HMI device.
Project texts	Central management of configured texts in all project languages.
Project graphics	Project graphics for managing graphics and their language-specific versions.

See also

Configuring multilingual alarm texts (Page 747)

3.15.5.2 Basics of project texts

Texts in different languages in the project

Texts that are output on HMI devices during process operation are typically entered in the language in which the automation solution is programmed. Comments and the names of objects are also entered in this language.

If operators do not understand this language, they require a translation of all operator-relevant texts into a language they understand. You can therefore translate all the texts into any language. In this way, you ensure that anyone who is subsequently confronted with the texts in the project sees the texts in his/her language of choice.

User texts and system texts

In the interests of clarity, a distinction is drawn between user texts and system texts:

- User texts are texts created by the user.
- System texts are texts created automatically and which are a product of configuration in the project.

The project texts are managed in the project text editor. This can be found in the project tree under "Languages & Resources > Project texts".

Examples of multilingual project texts

You can create and manage the following text types in multiple languages:

- Display texts
- Alarm texts
- Comments in tables
- Labels of screen objects
- Texts in text lists

Translating texts

There are two ways of translating texts.

- Translating texts directly
  You can enter the translations for the individual project languages directly in the "Project texts" editor.
- Translating texts using reference texts
  You can change the editing language for shorter texts. You can enter the new texts in the editing language while the texts of the reference language are displayed.

Missing translation for texts of screen elements

Note

If no translation in the current user interface language exists for a text of a screen element, the text entered for the default language is displayed.

See also

Configuring multilingual alarm texts (Page 747)

3.15.5.3 Translating texts directly

Translating texts

If you use several languages in your project, you can translate individual texts directly. As soon as you change the language of the software user interface, the translated texts are available in the selected language.

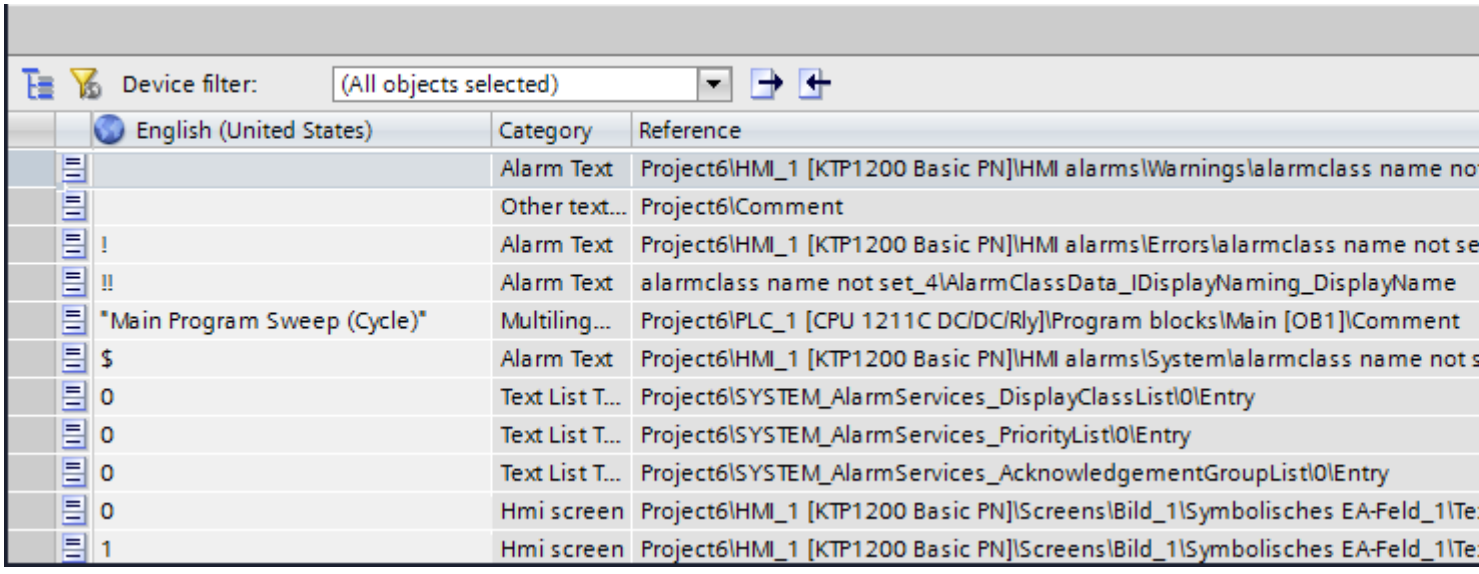
Requirements

- You are in the project view.
- A project is open.
- You have selected at least two other project languages.

Procedure

Proceed as follows to translate individual texts:

1. Click on the arrow to the left of "Languages & resources" in the project tree.
   The elements below this are displayed.
2. Double-click on "Project texts".
   A list with the texts in the project is displayed in the work area. There is a separate column for each project language.



3. To group identical texts and translate them simultaneously, click "" in the toolbar.
4. To hide texts that do not have a translation, click in the toolbar.
5. Click a cell and enter the translation.

Result

You have translated individual texts in the "Project texts" editor. The texts will then be displayed in the runtime language.

See also

Configuring multilingual alarm texts (Page 747)

Configuring optional parameters for discrete alarms and analog alarms (Page 745)

3.15.5.4 Translating texts using reference texts

Introduction

After changing the editing language, all texts are shown in input boxes in the new editing language. If there is not yet a translation available for this language, the input boxes are empty or filled with default values.

If you enter text again in an input field, this is saved in the current editing language. Following this, the texts exist in two project languages for this input field, in the previous editing language and in the current editing language. This makes it possible to create texts in several project languages.

You can display existing translations for an input box in other project languages. These serve as a comparison for text input in the current editing language and they are known as the reference language.

Requirement

There is at least one translation into a different project language for an input field.

Procedure

To display the translation of an input cell in a reference language, follow these steps:

1. Select "Tasks > Languages & resources" in the task card.
2. Select a reference language from the "Reference language" drop-down list.

Result

The reference language is preset. If you click in a text field, translations that already exist in other project languages are shown in the "Tasks > Reference language" task card.

3.15.5.5 Exporting project texts

Project texts are exported for translation. Texts are exported to Office Open XML files ending in ".xlsx". These can be edited in Microsoft Excel, for example.

You can exchange the file with the translators and import it directly back into the project after translation.

Requirements

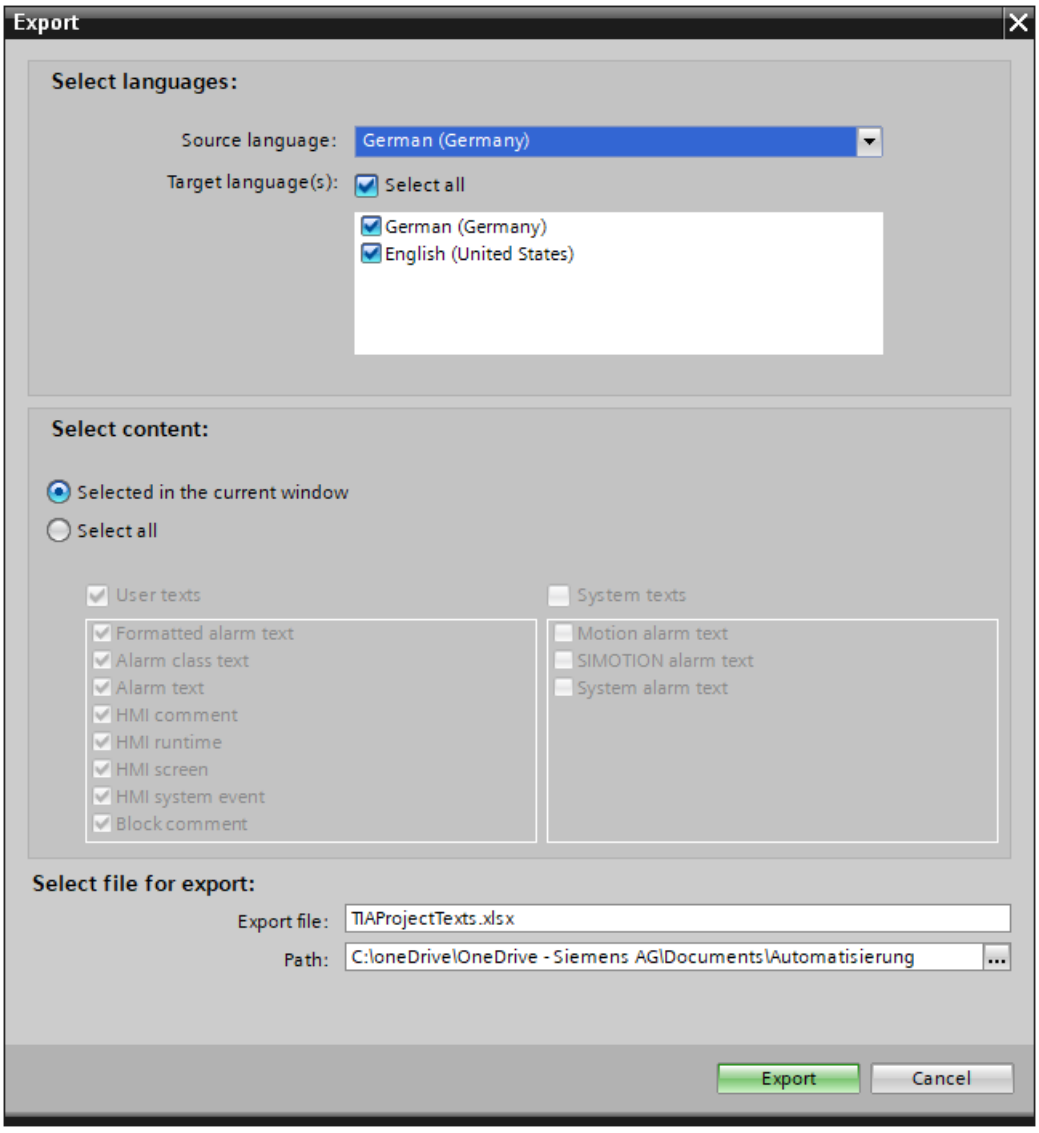
- At least two languages have been enabled in the "Project languages" editor, e.g. Italian and French.

Exporting project texts

To export individual project texts, proceed as follows:

1. Click on the arrow to the left of "Languages & resources" in the project tree.
   The child elements are displayed.
2. Double-click on "Project texts". The "Project texts" editor will open.
3. Select the texts you want to export.

4. Click on the button. The "Export" dialog box opens.



5. Select the language you want to translate from in the "Source language" drop-down list.
6. Select the check box(es) for the target language(s) into which you want the texts to be translated.
7. Under "Select content", select the categories of texts you want to translate.
8. In the "Export file" input field, specify the file name for the export file.
9. Enter a file path for the export file in the "Path" input field.
10. Click "Export".

Result

The texts selected in the "Project texts" editor are written to an xlsx file. The xlsx file will be stored in the specified folder.

Note

Project texts in library objects cannot be exported.

See also

Configuring optional parameters for discrete alarms and analog alarms (Page 745)

3.15.5.6 Importing project texts

Once translation is complete, import the xlsx file with the translated texts. The target languages are imported to the corresponding object in the project.

Note

In WinCC, you import previously exported project texts only into the source project. Importing into a different project is not supported.

Requirements

- At least two languages have been enabled in the "Project languages" editor.

Importing project texts

To import a file with project texts, proceed as follows:

1. Click on the arrow to the left of "Languages & resources" in the project tree.
   The lower-level elements will be displayed.
2. Double-click on "Project texts".
   The "Project texts" editor will open.
3. Click on the  button. The "Import" dialog box opens.
4. Select the path and the file name of the import file from the "Select file for import" field.
5. Activate the "Import source language" check box if you have made changes to the source language in the export file and would like to overwrite the entries in the project with the changes.
6. Click on "Import".

Result

You have imported the project texts.

See also

Configuring multilingual alarm texts (Page 747)

3.15.6 Using language-specific graphics

3.15.6.1 "Project graphics" editor

Introduction

You use the "Project graphics" editor to manage the configured graphic objects in different language versions. Multilingual projects require language-dependent versions of the graphics, for example, if:

- The graphics contain text
- Cultural aspects play a role

Opening the "Project graphics" editor

- Double-click in the project tree on "Languages and resources > Project graphics".

Work area

The work area displays all configured graphic objects in a table. There is a separate column in the table for each project language. Each column in the table contains the versions of the graphics for one particular language.

In addition, you can specify a default graphic for each graphic to be displayed whenever a language-specific graphic for a project language does not exist.

Preview

The preview shows you how the graphics will look on various HMI devices.

3.15.6.2 Storing an image in the project graphics

Introduction

You use the "Graphics" editor to import graphics for use in screen objects in the "Screens" editor. Here you import and manage language-dependent graphic versions. A preview shows how the graphic looks on various HMI devices.

Note

File names for language-dependent graphics

Case is relevant in the file names of language-dependent graphics. Make sure to use the same spelling for all languages.

Note

File format of language-dependent graphics

In the language-dependent versions of a graphic, use only graphic files with the same format. Graphic versions with different file formats are not supported.

Requirement

- The language-dependent versions of a graphic are available.
- Multiple languages have been enabled in the "Project languages" editor.
- The "Graphics" editor is open.

Adapting the view of the project graphics

1. To show/hide the columns with language-dependent graphics, click on  .
2. To add another project language to the table, click on  .

Inserting graphics

1. Click "<Add>" in the "Project graphics" table.
   The dialog for selecting a file opens.
2. Select the graphic file and click "Open."
   The graphic is inserted into the project as a standard graphic and displayed in all cells of this row in the "Graphics" editor.
   The standard graphic is displayed in Runtime for languages for which there is no language-specific graphic.
3. Right-click in the cell of a language for which a language-dependent version of this graphic is to be imported.

4. Select "Replace with graphic" in the shortcut menu.
   The dialog for selecting a file opens.
5. Select the graphic file and click "Open."
   The language-dependent version of the graphic is inserted in the table.

Alternatively, you can drag&drop a graphic from Windows Explorer to the desired position in the "Project graphics" table.

Inserting graphics by copying

1. Select "Copy" in the shortcut menu of an existing graphic.
2. Select "Paste" in the shortcut menu of an empty cell.
   A new row is inserted. The copied graphic is inserted for all languages.
3. Select "Paste" in the shortcut menu of a filled cell.
   The existing graphic is replaced by the copied graphic.

Displaying graphics in the device preview

1. Select an HMI device in the "Select device for preview" drop-down list in the editor.
2. Click on a graphic in the table.
   In the Inspector window under "Properties > General > Preview for HMI device", you see the graphic as it will appear in Runtime on the selected HMI device.

Result

The inserted graphics are available in the project. The graphic assigned to the respective editing language will be displayed during editing. The standard graphic is displayed in editing languages for which no screen has been imported.

The screens assigned to the respective Runtime language are displayed in Runtime. The standard graphic is displayed in Runtime languages for which no screen has been imported.

Note

If you disable a project language, all previously inserted graphics in this language are deleted in the current project.

3.15.6.3 Storing an external image in the project graphics

Introduction

To use a graphic created in an external graphics program in screens, you add it to the project graphics.

Requirement

- Multiple languages have been enabled in the "Project languages" editor.
- The "Graphics" editor is open.
- There is a graphic in the "Graphics" editor.

Creating and adding a new graphic as an OLE object

1. Right-click in a cell containing a graphic.
2. Select "Replace with object" in the shortcut menu.
   The "Insert object" dialog box opens.

   Note

   In addition, the "External application running..." dialog opens. The dialog is closed when the external application has finished.

3. Select "Insert object > Create new" and an object type in the dialog.
4. Click "OK."
   The graphics program assigned by the operating system opens.
5. Create the graphic.
6. Close the graphics program.
   The graphic is saved in the standard format of the graphics program and inserted into the project graphics.

Result

The inserted OLE objects are available in the "Graphics" editor.

Versions of the graphics for the current editing language are displayed in the "Screens" editor. The default graphic is displayed in all editing languages for which no screen has been imported.

The graphic is displayed in Runtime in the set Runtime language. The default graphic is displayed in all Runtime languages for which no graphic has been imported.

3.15.6.4 Editing a graphic

Graphics can be edited directly from the project graphics with an external graphics program.

Requirement

- The "Graphics" editor is open.
- There is a graphic in the "Graphics" editor.

Editing a graphic

1. Select "Edit" in the shortcut menu for a graphic.
   The assigned program, e.g. "Paint", opens.

   Note

   In addition, the "External application running..." dialog opens. The dialog is closed when the external application has finished.

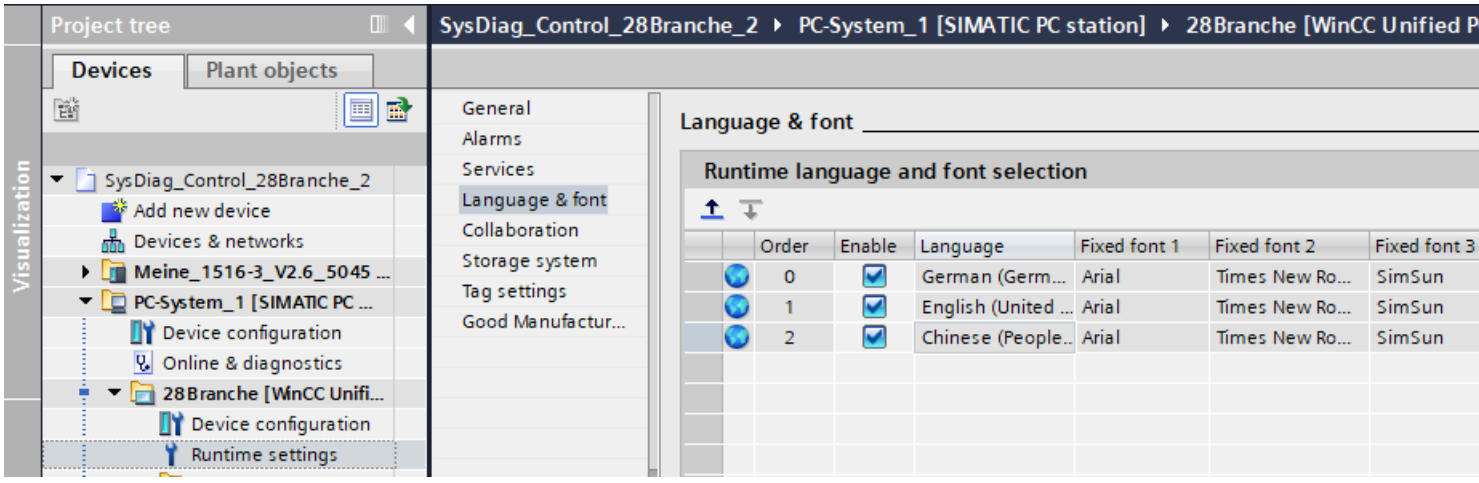
2. Edit the graphic.
3. Close the external program, e.g. with the "Close and return to document" command.
   The edited graphic is available in the project graphics.

3.15.7 Languages and fonts in runtime

3.15.7.1 Using multiple runtime languages

In the Runtime settings, you define which project languages are used in Runtime on a particular HMI device. The number of Runtime languages that are available at one time on the HMI device depends on the device. To enable the operator to switch between languages in Runtime, you need to configure a corresponding operator control.

1. In "Languages & Resources", you configure project languages that are available as Runtime languages for the respective device.
2. In "Runtime settings > Language & Font", you define the order in which the languages are switched.



At Runtime start, the Runtime project is displayed in the language that is set in the "User login" dialog. If this language is not configured in the Runtime settings of the HMI device, the language with the lowest number in the "Order" column is used.

You change the order with . Four predefined fonts are stored for each language. The fixed font 1 is always provided for the respective HMI device.

3.15.7.2 Own fonts

Downloading your own font

Using fonts that require licenses on HMI devices

When a font that requires a license is installed on your configuration PC, you can load this font onto your HMI device under certain conditions. Whether or not you can load the font onto your HMI device depends on the embeddability of the font.

Check the properties of the font in Windows:

1. Open the "C:\Windows\Fonts" folder in Windows Explorer.
2. Select the desired font.
   If several fonts are grouped into a font family, click on the entry for the font family. The individual fonts are now displayed.
3. Right-click the entry for the font.
4. Select "Properties".
5. In the "Details" tab, you find information about the embeddability of the font and the license terms and conditions.

The embeddability of fonts can have the following statuses:

- "Installable" status: Font can be installed on your HMI device without an additional license.
- "Editable" status: Font can be installed on your HMI device without an additional license.
- "Preview/Print" status: Warning during compilation that the font cannot be installed on your HMI device.
- "Restricted license embedding" status: Font can be installed on your HMI device with an additional license.
- "Bitmap embedding only" status: Compilation of the project is aborted with an error; the font cannot be installed on your HMI device.
- "No subsetting" status: Warning during compilation that the font can only be loaded onto the HMI device as a complete set. Substitute fonts and options for partial fonts cannot be used during compilation.

Note

The fonts configured in the Engineering System (TrueType fonts) are converted into web fonts and both TrueType fonts and web fonts are downloaded to the Runtime machine: WinCC Unified PC (Windows) or Unified Comfort Panel (Linux). The user is responsible for ensuring that the license of the fonts used allows this.

Additional information is available under Font redistribution (https://docs.microsoft.com/en-us/typography/fonts/font-faq#document-embedding) and OpenType_fsType (https://docs.microsoft.com/en-us/typography/opentype/spec/os2#fstype).

Loading fonts onto the HMI device

Introduction

When a font that requires a license is installed in Windows on your configuration PC, you can also use this font on your HMI device under certain conditions. You are responsible for ensuring that your devices have valid licenses.

Downloading a customer-specific font

The TIA Portal project does not include any configured TrueType or Web fonts. The Runtime font conversion uses an RDF filed that was written in the RDF language (Resource Description Framework) and is used for displaying information on the resources. The RDF file contains metadata in a structured format; the metadata comprise the font file (ttf) as CSD resource.

The result of the GetNearestFont mechanism is transferred to the Runtime. The GetNearestFont function first searches for the font of the same name. If such a font does not exist, other fonts are checked one after the other.

Note

The fonts configured in the Engineering System (TrueType fonts) are converted into web fonts and both TrueType fonts and web fonts are downloaded to the Runtime machine: WinCC Unified PC (Windows) or Unified Comfort Panel (Linux). The user is responsible for ensuring that the license of the fonts used allows this.

Additional information is available under Font redistribution (https://docs.microsoft.com/en-us/typography/fonts/font-faq#document-embedding) and OpenType_fsType (https://docs.microsoft.com/en-us/typography/opentype/spec/os2#fstype).

3.15.7.3 Methods for language switching

Introduction

To enable switching between configured Runtime languages on the HMI device, you provide a language switching means. This is necessary to enable the operator to switch between the various Runtime languages.

Methods for language switching

You can configure the following methods for language switching:

- Direct language selection
  Each language is set by means of a separate button. You create a button for each Runtime language.
- Language switching
  The operator switches the languages using a button. Each click of the button changes the Runtime language to the next Runtime language.

Regardless of the method used, the button names must be translated into each of the languages used. You can also configure an output field that displays the current language setting.

3.15.7.4 Starting a project in a different language

Introduction

If the language "German" is configured in Unified Comfort Panel, the Runtime project is always started in German, regardless of the defined language sequence.

To start the project in another language, use the "HMIRuntime.Language" system function.

Procedure

Proceed as follows to start a project once automatically in English:

1. Create a "Bool" type tag, for example, "doOnlyAtStartup".
2. For the project start screen, link the "Loaded" event with the following script:

```
export function Screen_1_OnLoaded(item)
{
if(!Tags('doOnlyAtStartup').Read())
{
HMIRuntime.Language = 1033;
Tags('doOnlyAtStartup').Write(true);
}
}
```

To start the project in another language, enter the decimal Windows Locale Code (LCID=Locale ID) for the desired language instead of "1033". You can find the LCIDs on the Internet, for example.

3.15.7.5 Enabling the runtime language

Introduction

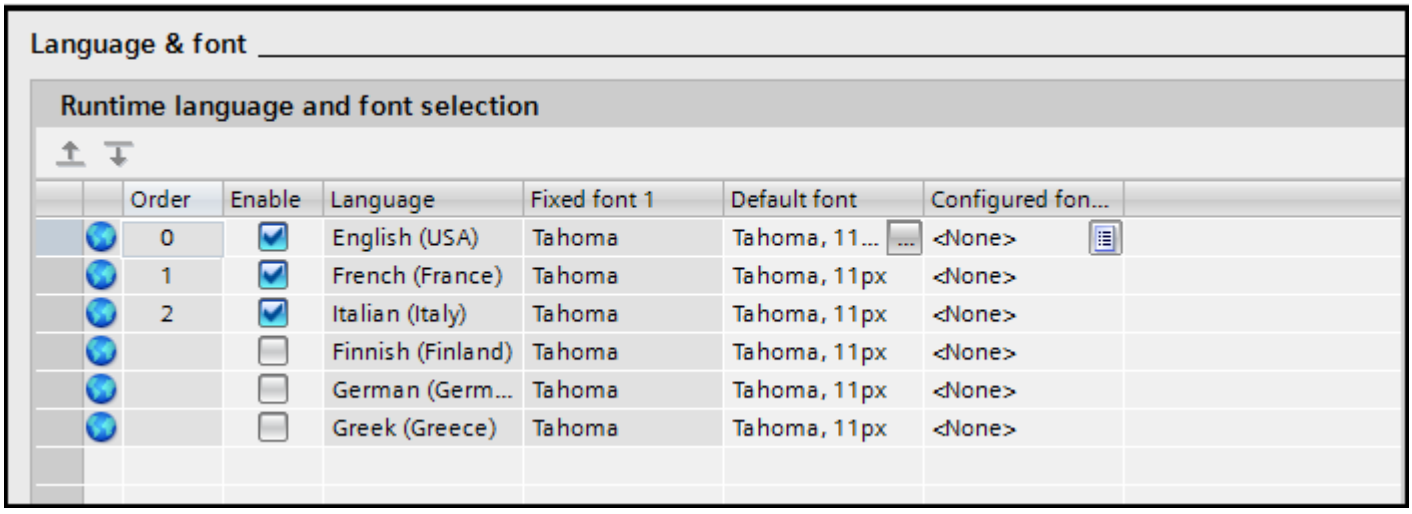
The "Language & Font" editor shows all project languages available in the project. You select which project languages are to be available as Runtime languages on the HMI device.

Requirements

Multiple languages have been selected in the "Project languages" editor.

Procedure

1. Double-click on "Runtime settings" in the project tree.
2. Click on "Language & Font".
3. Select the following languages:
   - English
   - French
   - Italian



Result

You have now set three Runtime languages. A number is automatically assigned to each language in the "Order" column. The enabled Runtime languages are loaded onto the HMI device with the compiled project.

If the number of languages selected exceeds the number that can be transferred to the HMI device, the table background changes color.

3.15.7.6 Standardizing font for all languages

Introduction

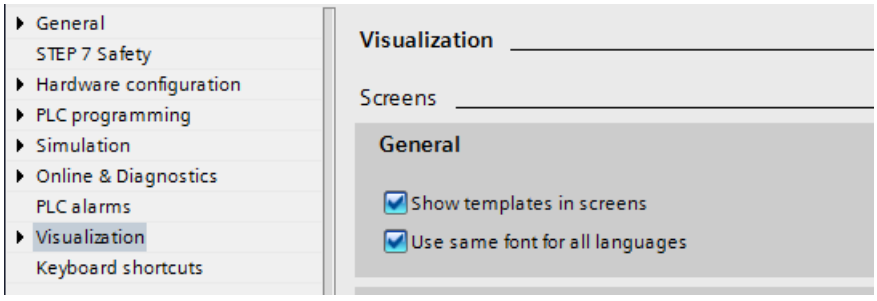
You can standardize the font for all project languages during configuration with the "Use same font for all languages" option.

Requirement

- Multiple languages have been selected in the "Project languages" editor.
- Multiple languages have been selected in the "Language & font" editor.
- The same font is defined for the selected runtime languages under "Configured font".

Procedure

1. In the "Options > Settings > Visualization > General" menu, select the "Use same font for all languages" option.



Result

You have enabled the option "Use same font for all languages". If you change the font of an object in one language during configuration, this font will be applied to all active languages.

3.15.7.7 Specific features of Asian and Eastern languages in runtime

Introduction

Note the following special considerations for the operation in Runtime of projects for Asian languages.

Note

During configuration, only use the Asian fonts that your configuration computer supports.

Memory requirement for Asian character sets

The memory requirement is greater when using Asian languages. Therefore look out for corresponding error messages when compiling the project.

Font size for Asian character sets

Use at least a font size of 10 points to display the text of projects created for Asian languages in Runtime. Asian characters will become illegible if smaller font sizes are used. This also applies to the default font in the Runtime settings under "Language & font".

3.16 Performance features

3.16.1 General technical data

3.16.1.1 SIMATIC Unified Comfort Panel

Unified Comfort Panel

The following tables of performance features help you to assess whether your project conforms to the system limits of a given HMI device.

The specified maximum values are not additive. It cannot be guaranteed that configurations running on the devices at the full system limits will be functional.

Furthermore, the complexity of configuring the screens, such as the number of objects per screen, the number of tag connections, cycle times and scripts, has a significant influence on the open screen times and the performance in runtime.

In addition to the specified limits, allowances must be made for restrictions imposed by configuration memory resources.

Tags

	Unified Comfort 7-12"	Unified Comfort 15-22"
Number of tags in the project	8000	
Number of elements per array	1600	

Alarms

	Unified Comfort 7-12"	Unified Comfort 15-22"
Number of alarm classes	32	
Number of discrete alarms	9000	
Number of analog alarms	300	

	Unified Comfort 7-12"	Unified Comfort 15-22"
Size of the alarm buffer [1)]	2000	
Length of an alarm in characters	512	
Number of alarm texts per alarm	10	
Number of process values per alarm	10	
Number of queued alarm events	750	
Number of controller alarms	160000	
Number of OPC UA A&C alarms	20000	

1) Corresponds to the number of all states of the messages of all configured alarm classes and includes the alarms of alarm classes which are not shown in an alarm view due to the configuration.

Number of alarms that can be displayed in an alarm view

The maximum number of alarms that can be displayed in runtime depends on the selected view.

	Unified Comfort 7-12"	Unified Comfort 15-22"
Show active alarms	No restriction	
Show defined alarms	No restriction	
Alarm statistics - view	No restriction	
Show logged alarms	1000	
Show and update logged alarms	100	

Screens

	Unified Comfort 7-12"	Unified Comfort 15-22"
Maximum size in the engineering system	20,000 * 20,000 pixels	
Maximum size in runtime	20,000 * 20,000 pixels	
Number of screens	1200	
Number of lower-level screen windows	10	
Number of objects per screen	800	1200
Number of objects from the "Controls" area per screen	40	80
Number of tags per screen	600	800

Parameter sets

	Unified Comfort 7-12"	Unified Comfort 15-22"
Number of parameter set types	750	
Number of parameter set type elements	1000	

	Unified Comfort 7-12"	Unified Comfort 15-22"
Number of parameter sets	2000	
Reserved memory for data records in the internal Flash	12 MB	

Libraries

	Unified Comfort 7-12"	Unified Comfort 15-22"
Number of versions of dynamic SVGs	1000 with an average size of 10 KB	

Logs

	Unified Comfort 7-12"	Unified Comfort 15-22"
Number of logs	50	
Maximum size of a log	4 TB	
Maximum size of a segment	4 TB	
Number of logging tags:	SQLite: 5000	
Memory requirements of the data log		
Size of entry of logging tag	The size of the entry of a logging tag is largely determined by the data type. Depending on the data type, the following memory requirements apply: • 32-bit value, e.g. Bool, Int, LReal, ... : ~ 80 byte / entry • 64-bit value, e.g. LInt, DateTime, LTime, ... ~ 106 byte / entry • Text value (any length), e.g. WString, WChar: ~ 586 bytes/entry	
Additional memory requirement of a segment:	SQLite: Approx. 0.5 MB	
Memory requirements of the alarm log		
Basic entry in the alarm log without alarm text:	SQLite: Approx. 300 bytes	
Memory requirement of the alarm text per character and language:	SQLite: at least 1 byte	
Additional memory requirement per language (one-off):	SQLite: Approx. 100 bytes	

Trends

	Unified Comfort 7-12"	Unified Comfort 15-22"
Number of trends	600	
Number of trends per trend control	20	
Number of trend areas per trend control	2	5

Text lists and graphics lists

	Unified Comfort 7-12"	Unified Comfort 15-22"
Number of graphics lists	750	
Number of text lists	750	
Number of entries per text or graphics list	750	
Number of graphic objects	6000	
Number of text elements	60000	

Scripts

	Unified Comfort 7-12"	Unified Comfort 15-22"
Number of scripts	600	
Number of functions per function list	25	

Scheduler

	Unified Comfort 7-12"	Unified Comfort 15-22"
Number of tasks, time- or event-triggered	70	

Communication

	Unified Comfort 7-12"	Unified Comfort 15-22"
Number of S7 connections	16	

Reporting

	Unified Comfort 7-12"	Unified Comfort 15-22"
Number of templates	--	
Number of report tasks	--	
Number of report tasks started at the same time	--	
Number of reports executed at the same time	--	

OPC UA

	Unified Comfort 7-12"	Unified Comfort 15-22"
Number of connected OPC UA clients	3	

Languages

	Unified Comfort 7-12"	Unified Comfort 15-22"
Number of runtime languages	32	

User management

	Unified Comfort 7-12"	Unified Comfort 15-22"
Number of roles	50	
Number of predefined function rights	20	
Number of users	200	

Project

	Unified Comfort 7-12"	Unified Comfort 15-22"
Size of the project files on the device	< 100 MB	

3.16.1.2 SIMATIC Unified PC

Unified PC based

The following tables of performance features help you to assess whether your project conforms to the system limits of a given HMI device.

The specified maximum values are not additive. It cannot be guaranteed that configurations running on the devices at the full system limits will be functional.

Furthermore, the complexity of configuring the screens, such as the number of objects per screen, the number of tag connections, cycle times and scripts, has a significant influence on the open screen times and the performance in runtime.

In addition to the specified limits, allowances must be made for restrictions imposed by configuration memory resources.

Tags

	SIMATIC Unified PC
Number of PowerTags	600000 (depends on the license)
Number of internal tags	200000
Number of elements per array	2000

Alarms

	SIMATIC Unified PC
Number of alarm classes	32
Number of discrete alarms	200000
Number of analog alarms	10000
Length of an alarm in characters	512
Number of alarm texts per alarm	10
Number of process values per alarm	10
Number of alarms for every second (continuous load)	20
Number of queued alarm events	unlimited
Number of alarms for every 10 seconds (alarm burst)	8000
Number of controller alarms	160000
Number of OPC UA A&C alarms	20000

Number of alarms that can be displayed in an alarm view

The maximum number of alarms that can be displayed in runtime depends on the selected view.

	SIMATIC Unified PC
Show active alarms	No restriction
Show defined alarms	No restriction
Alarm statistics - view	No restriction
Show logged alarms	1000
Show and update logged alarms	100

Screens

	SIMATIC Unified PC
Maximum size in the engineering system	20,000 * 20,000 pixels
Maximum size in runtime	20,000 * 20,000 pixels
Number of screens	2000
Number of lower-level screen windows	unlimited
Number of objects per screen	1500
Number of tags per screen	1000

Parameter sets

	SIMATIC Unified PC
Number of parameter set types	1000
Number of parameter set type elements	1000
Number of parameter sets	5000

Libraries

	SIMATIC Unified PC
Number of versions of dynamic SVGs	1000 with an average size of 10 KB

Logs

	SIMATIC Unified PC
Number of logs	100
Maximum size of a log	4 TB
Maximum size of a segment	4 TB
Number of logging tags:	SQLite: 5000 Microsoft SQL: maximum number of PowerTags
Number of entries in the data log per second with Microsoft SQL	Microsoft SQL: 30000
Memory requirements of the data log	
Size of entry of logging tag	The size of the entry of a logging tag is largely determined by the data type. Depending on the data type, the following memory requirements apply: • 32-bit value, e.g. Bool, Int, LReal, ... : ~ 80 byte / entry • 64-bit value, e.g. LInt, DateTime, LTime, ... ~ 106 byte / entry • Text value (any length), e.g. WString, WChar: ~ 586 bytes/entry
Additional memory requirement of a segment:	SQLite: Approx. 0.5 MB Microsoft SQL: Approx. 5 MB
Memory requirements of the alarm log	
Basic entry in the alarm log without alarm text:	SQLite: Approx. 300 bytes Microsoft SQL: Approx. 2000 bytes
Memory requirement of the alarm text per character and language:	SQLite: at least 1 byte Microsoft SQL: at least 2 bytes
Additional memory requirement per language (one-off):	SQLite: Approx. 100 bytes Microsoft SQL: Approx. 200 bytes
Additional memory requirement of a segment:	Microsoft SQL: Approx. 3.5 MB

Trends

	SIMATIC Unified PC
Number of trends	1000
Number of trends per trend control	60
Number of trend areas per trend control	5

Text lists and graphics lists

	SIMATIC Unified PC
Number of graphics lists	1000
Number of text lists	2000
Number of entries per text or graphics list	3500
Number of graphic objects	unlimited
Number of text elements	unlimited

Scripts

	SIMATIC Unified PC
Number of scripts	unlimited
Number of functions per function list	50

Scheduler

	SIMATIC Unified PC
Number of tasks, time- or event-triggered	200

Communication

	SIMATIC Unified PC
Number of S7 connections [1)]	128

[1)] SIMATIC NET is required to use more than 8 connections.

Reporting

	SIMATIC Unified PC
Number of templates	500
Number of report tasks	500
Number of report tasks started at the same time	20
Number of reports executed at the same time	5

OPC UA

	SIMATIC Unified PC
Number of connected OPC UA clients	10

Languages

	SIMATIC Unified PC
Number of runtime languages	32

User management

	SIMATIC Unified PC
Number of roles	50
Number of predefined function rights	20
Number of users	200

Plant objects

	SIMATIC Unified PC
Number of plant object types	400
Number of plant object instances	65000
Number of hierarchy levels	unlimited

3.16.2 Permitted special characters

Introduction

The following table shows the restrictions that must be observed when allocating names.

Permitted characters

Name	Restriction
Device name	The following constraints apply to the assignment of the device name: • Do not use the following characters: – , ; : ! ? " ' ^ ´ ` ~ _ + = / \ ¦ @ * # $ % & § ° ( ) [ ] { } < > – Spaces • Use upper case only. • The first character must be a letter. • The first 12 characters of the device name must be unique.
Object names	The use of the following special characters is not supported: • Pipe | • Forward slash / • Inverted slash \ • Dot . • Comma , • Semicolon ; • Colon : • Quotes " • Apostrophe ' • Angle brackets < > • Tilde ~ • Hash # • Dollar $ • Star * • Question mark ? The use of the following control characters is not supported: • \x01\x02\x03\x04\x05\x06\x07\x08\x09\x0A\x0B\x0C\x0D\x0E\x0F \x10\x11\x12\x13\x14\x15\x16\x17\x18\x19\x1A\x1B\x1C\x1D\x1E\x1F When creating scripts, also consider the restrictions relating to special characters of the programming language.
User name	The use of the following special characters is not supported: • Forward slash / • Comma , • Parenthesis { }

Configuring screens

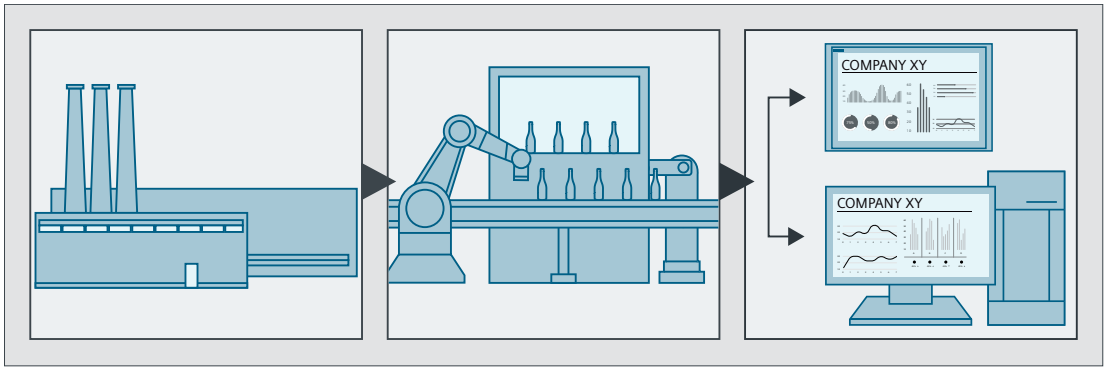
4

4.1 Basics

4.1.1 Basics of screens

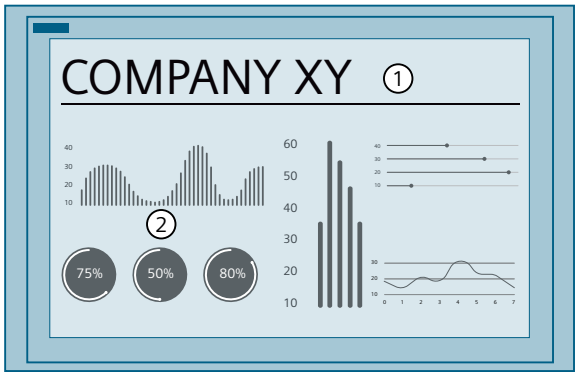
Introduction

In WinCC you create screens that a user can use to control and monitor machines and plants. When you create screens, the pre-defined object templates support you in visualizing your plant, displaying processes and specifying process values.



Structure of screens

Insert the objects you need to represent the process into your screen. Configure the objects to match the requirements of your process.



A screen can consist of static and dynamic elements:

- ① Static elements such as text or graphic objects in the screen above do not change in runtime.
- ② Dynamic elements change their status based on the process. You visualize current process values from the memory of the PLC or the HMI device. Dynamic objects include, for example, alphanumeric displays, trends and bars, as well as input fields on the HMI device, such as IO fields, switches and sliders. Process values and operator inputs are exchanged between the PLC and the HMI device by means of tags.

Start screen

The start screen is the initial screen displayed when the project is started in runtime. From the start screen, the operator can navigate to the other screens.
To compile and download a project, a screen must be defined as the start screen in the project.

Screen window

You display other project screens in the screen window. The screen window enhances navigation between screens and allows "screen in a screen" display.

You can use screen windows for purposes such as:

- Frequent switching between plant units
- Showing and hiding screens, for example without exiting central process visualization
- Displaying multiple plant units in one screen

4.1.2 Changing the screen resolution

Introduction

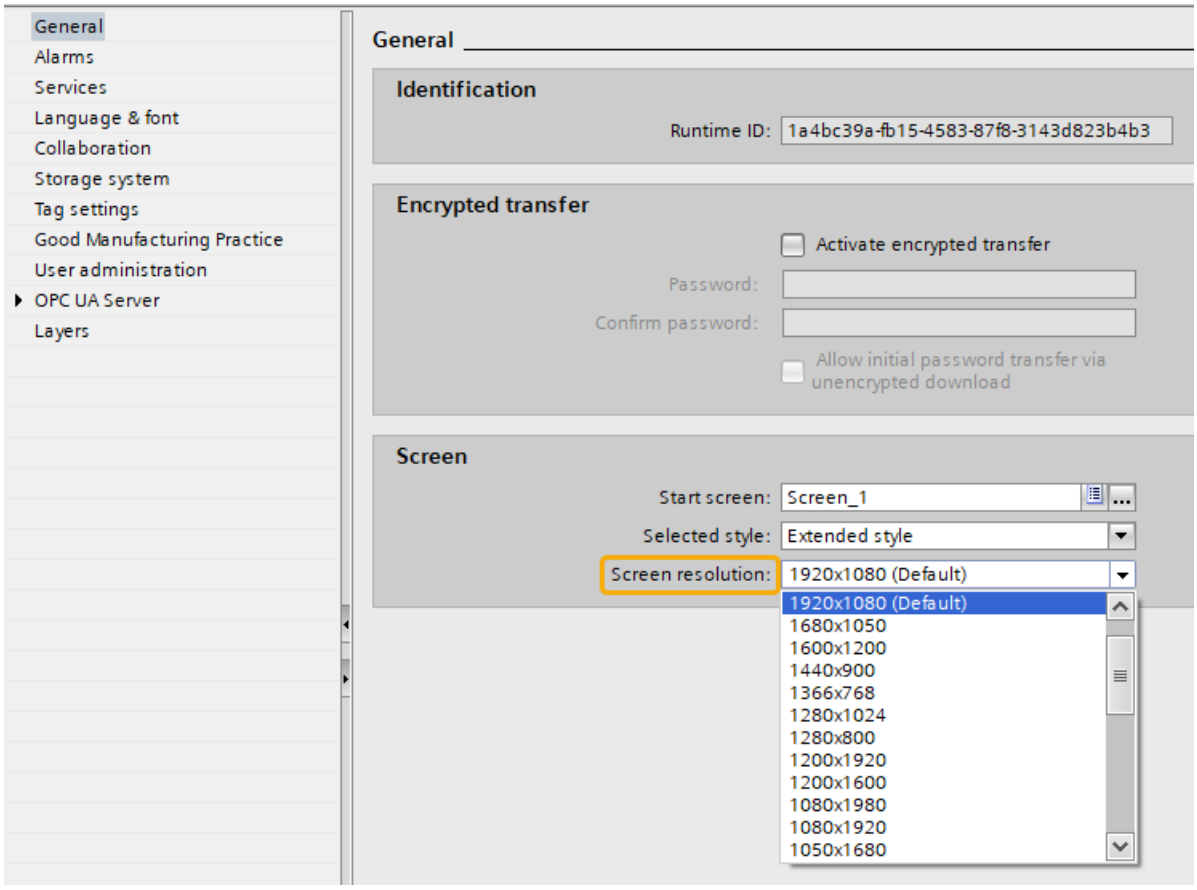
The default screen size is adjusted to the resolution of the device.

You change the screen resolution in the runtime settings of the device.

Configuring a fixed screen resolution

To change the screen resolution, follow these steps:

1. Open the runtime settings of the device.
2. Select the screen resolution under "General > Screen > Screen resolution".



The screen resolution is adapted.

Scrolling in the screen

If not all objects are visible in the screen, a scroll bar appears on the right edge of the screen.

To view all objects, move the scroll bar up and down with the mouse.

	Tip for working effectively
• Place the mouse cursor in the screen. Move forward or backward with the mouse wheel to scroll up and down in the screen.	

4.1.3 Using styles

4.1.3.1 Basics on working with styles

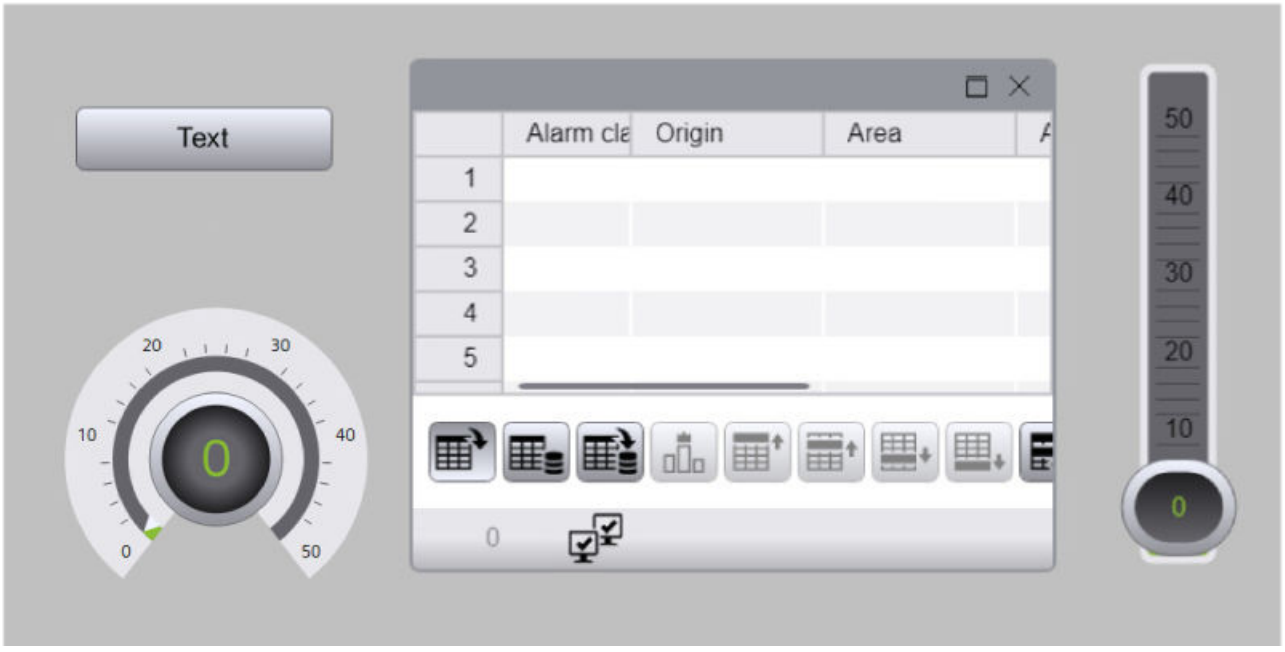
You can assign a predefined style to the objects of the WinCC Unified device.

You can choose from the bright, dark or extended style.

Bright style

Dark style

Expanded style



4.1.3.2 Defining the style

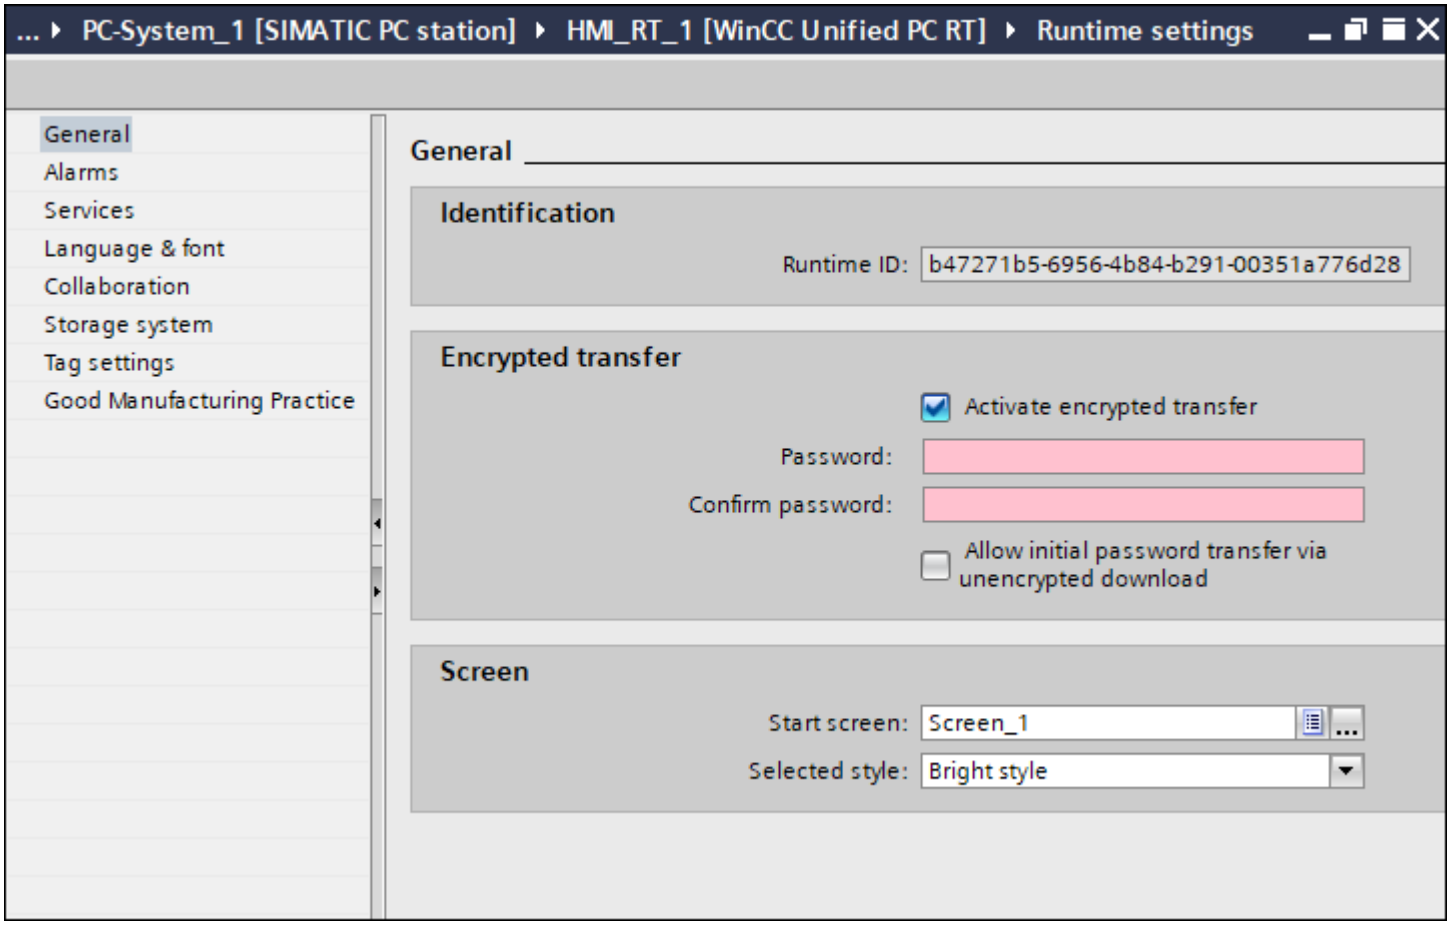
Introduction

You can specify predefined styles for Unified devices. Predefined styles are write-protected and cannot be changed.

Defining the style

To specify a style, follow these steps:

1. Open the "Runtime settings" folder in the project tree.
2. Select the desired style under "General > Screen":
   - Bright style
   - Dark style
   - Expanded style



Result

You have specified a new style that is applied to objects or projects.

4.1.3.3 Switching styles by means of user-defined functions

In runtime, you can change the style with user-defined functions.

```
//Switch to bright style
HMIRuntime.UI.Style = "FlatStyle_Bright";
//Switch to dark style
HMIRuntime.UI.Style = "FlatStyle_Dark";
//Switch to extended style
HMIRuntime.UI.Style = "ExtendedStyle";
```

Determining the currently defined style in runtime

In runtime, you can determine the style with user-defined functions.

```
let MyStyle;
MyStyle = HMIRuntime.UI.Style;
HMIRuntime.Trace("My current style is: " + MyStyle);
```

4.1.4 Task cards

Introduction

The following task cards are available in the "Screens" editor:

- Toolbox: Display and operating objects
- Layout: Aid for customizing the display
- Tasks: "Find and replace" function and language selection
- Libraries: Administration of the project library and of the global libraries

Toolbox

The "Toolbox" task card contains objects in different palettes:

- Basic objects
- Elements
- Controls
- My controls
- Graphics
- Dynamic widgets

You paste objects from the palettes into the screens by drag&drop or a double click. The objects available for selection are determined by the features of the HMI device you are configuring.

You can toggle between the following views in the "Toolbox" task card:

- Thumbnails view 
- List view 

In the symbol view you can switch the labeling of the objects on or off in the shortcut menu.

Layout

The "Layout" task card contains the following palettes for displaying objects and elements:

- Layers: Serves to manage screen object layers The layers are displayed in a tree view and contain information about the active layer and the visibility of all layers.
- Objects out of range: Objects that lie outside the visible area are displayed with name, position and type.

Tasks

The "Tasks" task card contains the following palettes:

- Find and replace: Used to search within an open editor. It includes all options that you need for an efficient search. You have the option of replacing hits individually or automatically replacing all the found texts.
- Languages and resources: Used to select the editing and reference language.

Libraries

The "Libraries" task card show the following libraries in separate palettes:

- Project library: In the "Project library" palette, you can store the library elements that you want to use more than once in the project. The project library is stored together with the project.
- Global library: In the "Global libraries" palette, you manage the global libraries whose library elements you want to reuse over several projects. The global library is stored in a separate file in the specified path on your configuration PC.
- Info (project library): The following is displayed in the "Info" palette:
  - The contents of the library elements
  - The individual versions of types
  - The last date of change of the version

4.1.5 Defining the start screen:

Introduction

The start screen is the initial screen displayed when the project is started in runtime. Define a start screen for each target system. From the start screen, the operator navigates to the other screens.

To compile and download a project, a screen must be defined as the start screen in the project.

Requirement

- A WinCC Unified PC or a Unified Comfort Panel is installed.
- At least one HMI screen is open.

Defining the start screen

To define the start screen, follow these steps:

1. In the project tree, right-click on the screen that you want to define as the start screen.
2. Select "Define as start screen" in the shortcut menu.

Alternatively, right-click in the open screen editor. Select "Define as start screen" in the shortcut menu.

The selected screen is displayed as the start screen when the project is started in runtime.

4.1.6 Screen zooming

Introduction

You can zoom the screen from the zero point. The zero point is located in the upper left corner of the screen.

Requirement

- A screen is open.

Zooming the screen from the zero point

To zoom a screen from the zero point, select one of the following options:

- Click the selection list in the lower-right corner of the screen editor.

  - Select a percentage value.
    The screen is enlarged or reduced by the selected percentage value.
  - Select "Fit to screen", "Fit to width" or "Fit to height".
    The screen is adapted to the window size, the width or the height of the screen.

- Click the scroll bar to zoom in or out of the screen.

  The screen is enlarged or reduced by 25% with each click.

- Press <Ctrl>. Move the mouse wheel forward or backward at the same time to enlarge or reduce the screen.

Objects in the zoomed screen

The size of the objects in the screen is adapted proportionally to the zoom factor.

For objects in a screen with a small zoom factor, the bounding box and the handles are adjusted proportionally to the zoom factor.

4.2 Overview of screen objects

4.2.1 Show object type and name in the tooltip

Introduction

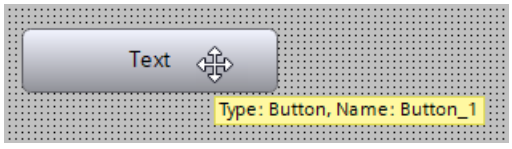
You can display the type and name of the object in the screen.

Displaying the object type and object name in the tooltip

To show the type and name of the object in the tooltip, follow these steps:

1. Move the cursor over the object in the screen.
2. Hover with the cursor over the object.

The type and name of the object are displayed in a tooltip.

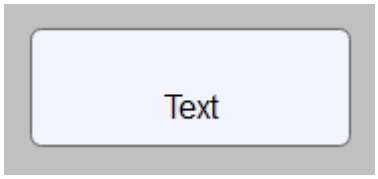


4.2.2 Basic objects

4.2.2.1 Text box

Use

The "Text box" is a closed object which you can fill with a color. You create a text in the text box.



Layout

In the Inspector window, you customize the position, geometry, style, color, and font types of the object. You can adjust the following properties in particular:

- "Text": Specifies the text for the text box.
- "Text trimming": Specifies whether ellipsis is to be displayed after a line break for a long text.
- "Text break": Specifies whether the next word is to be automatically moved to the next row for a long text.

Text

To define a text for the text box, follow these steps:

1. In the Inspector window, click "Properties > Properties > General > Font".
2. Select a font.
3. In the Inspector window, click "Properties > Properties > General > Text" .
4. Enter a text.

	**Efficiency tip**
• Separate the words in the input window "Text" with <Shift+Return>. The words are displayed in individual rows in the text box.	

Direct text input

To change the labeling in the text box directly via the keyboard, follow these steps:

1. Select the text box.
2. Double-click in the text box and enter a text.

Note the following special information:

- Diacritics, such as ä ê ñ, can only be entered if the keyboard layout provides a key for this character. Key sequences such as <`a> for à are not recognized.
- It is not possible to enter Unicode characters using Alt codes.
- Asian language characters cannot be entered using an Input Method Editor (IME).

If you need such characters in the label, you have the following options:

- Use a keyboard layout on which this character is present as a key.
- Copy the character or full label from any source and paste it into the selected object.
- Edit the label in the Inspector window under "Properties > Properties > General > Text".

Trimming text

You can specify ellipsis characters for a text that cannot be displayed in full in the text box.

1. In the Inspector window, click "Properties > Properties > Format > Text trimming".
2. In the "Static value" column, select the option "With character ellipsis".

The text displayed is truncated with ellipsis.

Enabling line breaks

You can enable line breaks for a text that cannot be displayed in full in the text box. If you find that the text box is large enough for display with line breaks:

1. In the Inspector window, click "Properties > Properties > Format > Text break".
2. Select the option "Word wrap" in the "Static value" column.

The text is displayed in full with line breaks.

Dynamizing a text box with text list

To dynamize the text box with text list, follow these steps:

1. Create a text box.
2. Select a resource list in the "Dynamization" column in the Inspector window under "Properties > Properties > General > Text".
3. Select an existing tag or create a new tag using the "Add" button under "Resource list > Settings > Tag".
4. Select an existing text list or add a new text list using the "Add" button under "Resource list > Settings > Resource list".

	**Efficiency tip**
• You can create a text box by dragging-and-dropping a text list from the detail view of the text and graphics lists into the screen. The text box is linked to the text list. Configure the tags whose values determine the display in the text box.	

Dynamizing a text box

Drag-and-drop a tag from the detail view of the tag table directly into the text box. The text box is linked to the tag and the tag name appears in the text box.

See also

Entering multiline text (Page 407)

Enter text directly into the object (Page 406)

4.2.2.2 Graphic view

Use

The "Graphic view" object is used to display graphics.

Use the following graphic formats in the "Graphic view" object: *.bmp, *.ico, *.gif, *.tiff, *.png, *.svg, *.jpeg, *.jpg. The graphic format *.gif is displayed animated. You can also use graphics as OLE objects in the Graphic view.

High-resolution graphic objects require a lot of memory in the project and cause long loading times. In addition, the performance in runtime decreases. Use graphic objects with a resolution that is sufficient for a high-quality display in the runtime project. Note the display resolution of the target device and the size in which the graphic object is displayed on the display of the target device. Adapt the resolution of large graphic objects accordingly before using them in your project.

Layout

In the Inspector window, you customize the settings for the position, shape, style, and color of the object. You can adapt the following properties in particular:

- "Graphic": Specifies the graphic file that is displayed in the object.
- "Background graphic - scale": Specifies how the graphic is scaled.

Inserting graphics

1. In the Inspector window, click "Properties > Properties > General > Graphic".
2. In the "Static value" column, click the arrow in the text box. Graphics from the graphics collection are displayed in the preview. You have the following options for inserting a graphic:
   - Select a graphic from the graphics collection.
   - Insert a graphic from a file using the  button.
   - Create a new graphic from an OLE object using the  button.
3. Click "Apply" to insert the graphic in the Graphic view.

	Tips for an efficient procedure
• Drag-and-drop a graphic from the detail view into the screen. A graphic view is created and linked to the graphic.	

Scaling a background graphic

The following modes for scaling graphics are available:

- None
  The graphic is inserted centered into the graphic view. If the graphic is larger than the graphic view, the graphic is displayed incompletely.
- Fill
  The graphic fills the graphic view. This mode can lead to a distortion of the graphic.
- Uniform
  The graphic is fully displayed and without distortion in the graphic view.
- Stretch to fit
  The graphic is adjusted to the size of the graphic view without distortion. As a result, the graphic may not be displayed completely.
- Tiled
  The graphic is displayed in original size, multi-tiled until the graphic view is filled.

To select a mode for scaling the graphic, proceed as follows:

1. Click "Format > Scale background graphic" in the Inspector window.
2. Select the desired mode in the "Static value" column.

Dynamizing a graphic view with graphic list

To dynamize a graphic view with graphic list, follow these steps:

1. Create a graphic view.
2. Select a resource list in the "Dynamization" column in the Inspector window under "Properties > Properties > General > Graphic".
3. Select an existing tag or create a new tag using the "Add" button under "Resource list > Settings > Tag".
4. Select an existing graphic list or add a new graphic list using the "Add" button under "Resource list > Settings > Resource list".

	Tips for an efficient procedure
• You create a graphic view by dragging and dropping a graphic list from the detailed view of the text and graphic lists into the screen. The graphic view is linked to the graphics list. Configure the tags whose values determine the display in the graphic view.	

4.2.2.3 Line

Application

The "Line" object is an open object.

Layout

In the Inspector window, you customize the settings for the object position, shape, style, and color. You can adapt the following properties in particular:

- "Line - Type"
- "Line - Start" and "Line - End"

Dash type

The layout of the line is specified under "Properties > Properties > Appearance > Line - Type" in the Inspector window. The line is shown without interruption if you select "Solid", for example.

Note

The available line types depend on the selected HMI device.

Line start and end

The start and end points of the line are specified under "Properties > Properties > Appearance > Line - start / Line - end" in the Inspector window.

Use arrow points, for example, as the start and end points of the line. The available start and end points depend on the device.

See also

Changing the object size (Page 381)

4.2.2.4 Rectangle

Application

The "Rectangle" is a closed object which you can fill with a color.

Layout

In the Inspector window you can customize the settings for the position, geometry and color of the object. You can adapt the following properties in particular:

- "Corner > Radius": Specifies the horizontal and vertical distance between the corner of the rectangle and the start point of a rounded corner.

Specifying the corners

The corners of the "Rectangle" object can be rounded to suit your requirements. If the "Radius" property for all four corners is set to 0, a standard rectangle without rounded corners is displayed.

To define the layout of the corners, follow these steps:

1. In the Inspector window, click "Properties > Properties > Appearance > Corners".
2. Enter the radius for each corner.

4.2.2.5 Circle

Application

The "Circle" object is a closed object which can be filled with a color or pattern.

Layout

In the Inspector window you can customize the settings for the object position, geometry, style, frame and color. You can adapt the following properties in particular:

- "Radius": Specifies the size of the circle.

Radius

The radius of the "Circle" object is specified in the Inspector window. The value is entered in pixels.

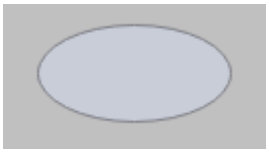
To specify the radius, follow these steps:

1. In the Inspector window, click "Properties > Size and position > Radius".
2. Enter a value of between 0 and 2500.

4.2.2.6 Ellipse

Application

The "Ellipse" is an enclosed object that can be filled with a color or pattern.



Layout

In the Inspector window you can customize the settings for the object position, geometry, style, frame and color. You can adapt the following properties in particular:

- "Radius X": Specifies the vertical radius of the elliptical object.
- "Radius Y": Specifies the horizontal radius of the elliptical object.

Radius X

The horizontal radius of the "Ellipse" object is specified in the Inspector window. The value is entered in pixels.

1. Click "Properties > Size and position" in the Inspector window.
2. For "Radius X", enter a value between 0 and 2500.

Radius Y

The vertical radius of the "Ellipse" object is specified in the Inspector window. The value is entered in pixels.

1. Click "Properties > Size and position" in the Inspector window.
2. Enter a value between 0 and 2500 for "Radius Y".

4.2.2.7 Polyline

Use

The "Polyline" is an open object. Use the "Polygon" object if you want to fill the object with color.

Layout

In the Inspector window, you customize the settings for the position, shape, style, and color of the object. You can adapt the following properties in particular:

- "Line start" and "Line end": Specifies the type of line start and line end.
- "Points": Modifies, deletes or adds corners.

Line start and end

Define the start and end of the line in the "Properties" Inspector window. Use arrow point, for example, as start and end point. The available start and end points depend on the device.

Points

The corner points are numbered in the order of their creation. You can change, delete, or add more corner points:

1. In the Inspector window, click "Properties > Size and position > Points".
2. Select the required corner point. Enter a value for "X coordinate" and "Y coordinate".
3. Click on the selection button in the "Static value" column to add or delete a corner point. A dialog opens.
4. Use the "Add" command to create a new point. You can delete corner points by selecting the corresponding row in the dialog and selecting "Delete" from the shortcut menu for the row.

Automatic creation of points

To create the points automatically, follow these steps:

1. Select a cell in the "X coordinate" or "Y coordinate" column.
2. Drag the blue border up or down. The value is applied to the target cells.

If you select multiple cells and there is a logical relationship between the values, the values of the destination cells are adapted according to the logical relationship.

Configuring rotation in runtime

You configure the "Polyline" object so that it rotates about a reference point in runtime.

Enter the values for rotation in degrees:

1. In the Inspector window, click "Properties > Size and position".
2. Enter the required values for the following attributes:
   - Pivot point
   - Rotation
   - X pivot point
   - Y pivot point

See also

Changing the object size (Page 381)

Automatically filling in of property values for an object collection (Page 379)

4.2.2.8 Polygon

Use

The "Polygon" is a closed object which you can fill with a background color.

Layout

In the Inspector window, you customize the settings for the position, shape, style, and colors of the object. In particular, you can customize the following property:

- "Points": Modifies, deletes or adds corners.

Points

The corner points are numbered in the order of their creation. You can change, delete, or add more corner points:

1. In the Inspector window, click "Properties > Size and position > Points".
2. Select the required corner point. Enter a value for "X coordinate" and "Y coordinate".

3. Click on the selection button in the "Static value" column to add or delete a corner point. A dialog opens.
4. Use the "Add" command to create a new point.
   You can delete corner points by selecting the corresponding row in the dialog and selecting "Delete" from the shortcut menu for the row.

Automatic creation of points

To automatically create the points for polygons and polylines, follow these steps:

1. Select a cell in the "X coordinate" or "Y coordinate" column.
2. Drag the blue border up or down. The value is applied to the target cells.

If you select multiple cells and there is a logical relationship between the values, the values of the destination cells are adapted according to the logical relationship.

Configuring rotation in runtime

You configure the "Polygon" object so that it rotates about a reference point in runtime.

Enter the values for rotation in degrees.

1. In the Inspection window, click "Properties > Size and position".
2. Enter values for the following attributes in the "Rotation" area.
   - Pivot point
   - Rotation
   - X pivot point
   - Y pivot point

See also

Changing the object size (Page 381)

Automatically filling in of property values for an object collection (Page 379)

4.2.2.9 Circular arc

Use

The "Circular arc" is an open object. Use the "Circle segment" object if you want to fill the object with color. By default, a circular arc is a quarter circle. It can be customized as required.

Layout

In the Inspector window, you customize the settings for the object position, shape, style, and color. You can adapt the following properties in particular:

- "Radius": Define the size of the circular arc.
- "Angle - start" and "Angle - range": Specify where the start and end angle lie on a virtual circle of 360°.

Defining the radius

You define the radius of the "Circular arc" object in the Inspector window. Enter the value in pixels.

1. Click "Properties > Size and position" in the Inspector window.
2. Enter a value for "Radius".

Defining the start angle and angle range

You set the length of the circular arc using the "Angle - start" and "Angle - range" attributes. Enter the values using Degrees as the unit.

1. Click "Properties > Size and position" in the Inspector window.
2. Enter one value each for "Angle - start" and "Angle - range".

4.2.2.10 Elliptical arc

Use

The "Elliptical arc" is an open object. Use the "Ellipse segment" object if you want to fill the object with color. By default, an elliptical arc is a quarter ellipse. It can be customized as required.

Layout

In the Inspector window you can customize the settings for the object position, geometry, style, frame and color. You can adapt the following properties in particular:

- "Radius": Specifies the size of the elliptical arc.
- "Radius X" and "Radius Y": Specifies the horizontal and vertical radius of the elliptical object.
- "Angle - start" and "Angle - range": Specify where the start and end point lie on a virtual circle of 360°.

Defining the radius

Define the horizontal and vertical radius of the "Elliptical arc" object in the Inspector window. Enter the values using Pixels as the unit.

1. Click "Properties > Size and position" in the Inspector window.
2. Enter one value each for "Radius X" and "Radius Y".

Defining the start angle and angle range

Set the length of the elliptical arc using the "Angle - start" and "Angle - range" attributes. Enter the values using Degrees as the unit.

1. Click "Properties" in the Inspector window.
2. Enter one value each for "Angle - start" and "Angle - range".

4.2.2.11 Circle segment

Use

The "Circle segment" is a closed object that you can fill with a color or pattern. By default, a circle segment is a quarter circle. It can be customized as required.

Layout

In the Inspector window, you customize the settings for the object position, shape, style, and color. You can adapt the following properties in particular:

- "Radius": Define the size of the circle segment.
- "Angle - start" and "Angle - range": Specify where the start and end angle lie on a virtual circle of 360°.

Radius

You define the radius of the "Circle segment" object in the Inspector window. Enter the value using Pixels as the unit.

1. Click "Properties > Size and position" in the Inspector window.
2. Enter a value for "Radius".

Defining the start angle and angle range

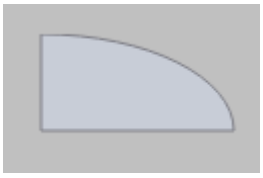
Set the size of the circle segment using the "Angle - start" and "Angle - range" attributes. Enter the values using Degrees as the unit.

1. Click "Properties > Size and position" in the Inspector window.
2. Enter one value each for "Angle - start" and "Angle - range".

4.2.2.12 Ellipse segment

Use

The "Ellipse segment" is a closed object that you can fill with a color or pattern. By default, an ellipse segment is a quarter ellipse. It can be customized as required.



Layout

In the Inspector window, you customize the settings for the object position, shape, style, and color. You can adapt the following properties in particular:

- "Radius X" and "Radius Y": Specifies the horizontal and vertical radius of the elliptical object.
- "Angle - start" and "Angle - range": Specify where the start and end point lie on a virtual circle of 360°.

Defining the radius

Define the horizontal and vertical radius of the "Ellipse segment" object in the Inspector window. Enter the values using Pixels as the unit:

1. Click "Properties > Size and position" in the Inspector window.
2. Enter one value each for "Radius X" and "Radius Y".

Defining the start angle and angle range

Set the size of the ellipse segment using the "Angle - start" and "Angle - range" attributes. Enter the values using Degrees as the unit.

1. Click "Properties > Size and position" in the Inspector window.
2. Enter one value each for "Angle - start" and "Angle - range".

4.2.2.13 Example: Configuring a rectangle

Task

In this example, you learn how to configure the rectangle.

You configure:

- Color = red
- Black border 2 pixels wide
- Position = (20, 20)
- Size = (100,100)

Changing the color of the rectangle

Follow these steps to change the color of the rectangle:

1. Select the rectangle.
2. Define the background color under "Properties > Appearance > Background - color" in the Inspector window.
3. Select the "Solid" option under "Background - fill pattern".
4. Define the border color under "Properties > Appearance > Border - color".
5. Enter the value "2" for "Border width".

The rectangle is red and has a black border with a width of two pixels.

Repositioning and resizing the rectangle

Follow these steps to change the position and size of the rectangle:

1. Select the rectangle.
2. Enter the value "20" in each case under "Properties > Size and position > Position - left / Position - top".
3. Enter the value "100" in each case under "Properties > Size and position > Size - width / Size - height".

Result

The rectangle is positioned at the coordinates (20, 20), and has a width and height of 100 pixels.

4.2.3 Elements

4.2.3.1 IO field

Use

The "IO field" object is used to enter and display process values.

	Tips for working effectively
• You can create an IO field by moving a configured tag from the detail view onto the screen using drag-and-drop. An IO field is created and linked to the tag. • If you select multiple tags and move them from the detail view onto the screen using drag-and-drop, an IO field is created for each tag which is linked to the respective tag.	

Layout

In the Inspector window, you customize the settings for the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- "Mode": Specifies whether the values are entered and displayed in Runtime or if the values are only displayed.
- "Reaction to input": Specifies the behavior of the object in Runtime.
- "Hidden input": Specifies whether the input value is displayed normally or encrypted during input.

Mode

You can define the behavior of the IO field in the Inspector window under "Properties > General > Mode".

Mode	Description
"Input/output"	Values can be input and output in the IO field in runtime.
"Output"	The IO field is used for the output of values only.

Note

Reports

In reports, IO fields only output data. "Output" mode is preset. Properties for configuring input are not available, for example "Hidden input".

Connection to Char data type

If you connect the IO field to a controller tag of data type "Char", the following restrictions apply:

- The input accepts digits only: 0 ... 9.
  The entered string of digits is converted to the corresponding character according to the ASCII table.
  Example: Input 6 + 5 becomes "A".
- Only enter digit sequences between 0 and 129.

To input alphanumeric characters directly, use the alternative data type "WChar", for example.

Hidden input

In runtime, the input can be displayed normally or encrypted, for example for hidden input of a password. A "*" is displayed for each character in hidden input. The data format of the value entered cannot be recognized.

1. In the Inspector window, select "Properties > Miscellaneous > Reaction to input".
2. Select "Hidden input".

Value range for the LTIME data type

LTime values are saved as 64-bit Int with sign. For HMI tags with LTime data type:

Value range	-9223372036854775808 to 9223372036854775807
Unit	100 ns

Note

Setting an LTime PLC tag via HMI

S7-1500 tags with data type LTime have the unit nanoseconds (ns). HMI user inputs in IO fields that are linked with such tags are converted to ns when the value is sent to the controller.

Note

MAX_SAFE_INTEGER

Depending on the Javascript engine of the web client, the actual value may lose accuracy during communication between the HMI device and the controller due to rounding if it is outside the value range of MAX_SAFE_INTEGER.

Additional information on MAX_SAFE_INTEGER can be found here (https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/Number/MAX_SAFE_INTEGER).

4.2.3.2 Symbolic IO field

Use

You can use the "Symbolic IO field" object to configure a selection list for input and output of texts or graphics in runtime.

Note

Selecting the default entry is not possible in runtime.

Layout

In the Inspector window, you customize the settings for the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- "Mode": Specifies the response of the object in runtime.
- "Resource list": Specifies the text or graphic list that will be linked with the object.

Mode

The response of the symbolic IO field is specified in the Inspector window in "Properties > Properties > Miscellaneous > Mode".

Mode	Description
"Output"	The symbolic IO field is used for the output of values.
"Input/output"	The symbolic IO field is used for the input and output of values.

Linking symbolic IO field with text list

To link a text list with the symbolic IO field, follow these steps:

1. In the Inspector window, select "Properties > Properties > General > Resource list".
2. Open the selection list for "Text list" in the "Static value" column.
3. Select a text list.
4. Open the "Text and graphic lists" editor in the project tree.
5. Select the "Text lists" tab. Click on the selected text list.
6. Select an entry in the "Text list entries" table as the default entry. The text from the default entry is displayed in the object.
   If you have not specified a default entry, the first entry in the "Text" column is displayed in the object.

	Tips for working effectively
•	Drag a text list from the detail view of the text and graphic lists to the symbolic IO field. The symbolic IO field is linked to the text list.

Linking symbolic IO field with graphic list

To link a graphic list with the symbolic IO field, follow these steps:

1. In the Inspector window, select "Properties > Properties > General > Resource list".
2. Open the selection list for "Graphic list" in "Resource list".
3. Select a graphic list.
4. Open the "Text and graphic lists" editor in the project tree.
5. Select the "Graphic lists" tab. Click on the selected graphic list.
6. Select an entry in the "Graphic list entries" table as the default entry. The graphic from the standard entry is displayed in the object.
   If you have not specified a default entry, the first entry in the "Graphic" column is displayed in the object.

	Tips for working effectively
•	Use drag-and-drop to move a graphic list from the detail view of the text and graphic lists to the symbolic IO field. The symbolic IO field is linked to the graphic list.

Dynamizing a symbolic IO field

To dynamize the symbolic IO field using a tag, follow these steps:

1. In the Inspector window, select "Properties > Properties > General > Process value".
2. Select "Tag" in the "Dynamization" column. The "Tag" page will open.
3. Select:
   – Select an existing tag under "Tag > Process > Tag", or
   – Create a new tag using the "Add" button.

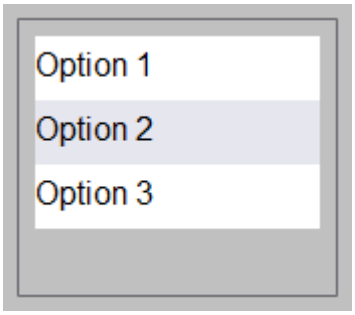
	Tips for working effectively
•	Use drag-and-drop to move a tag from the detail view of the tag table to the symbolic IO field. The symbolic IO field is linked to the tag.

4.2.3.3 List box

Use

You use the "List box" object to present and select multiple list entries. You activate list entries by default so that the operator only changes the preset entry if necessary. If the list box is larger than the bounding box, WinCC automatically adds a scroll bar to the right margin.

To incorporate list boxes into the process, dynamize the corresponding properties.



Layout

In the Inspector window, you customize the position, style, colors and font type settings of the object. You can adjust the following properties in particular:

- "Selection items": Defines the list entries.
- "Select item": Defines which entry is displayed as activated by default.

Defining the number of entries

You specify the number of entries in the Inspector window:

1. In the Inspector window, select "Properties > General > Selection items".
2. Click on the selection button in the "Static value" column.
   A dialog opens.
3. Specify the desired number of entries with "Add".
   To delete entries, click in the corresponding line and press the <DEL> key or click ✕.
4. To change the order of the entries, click in the corresponding line and move the entry using the icons ↑ ↓.

Specifying the default value of the list entry

Use the "Select item" property of a selection item to specify which list item is to be shown as enabled.

You can activate multiple options.

To do so, select the check box in the "Static value" column of the "Select item" property of the respective selection item.

Dynamizing a list box

Drag-and-drop a tag from the detail view of the tag table into the list box. The list box is linked to the tag.

Dynamization of graphic properties with tags or scripts

You can dynamize the following property containing a graphic with a tag or with a script:

- Graphic

See also

Automatically filling in of property values for an object collection (Page 379)

Entering multiline text (Page 407)

4.2.3.4 Button

Use

The "Button" object allows you to configure an object that the operator can use in runtime to execute a configurable function.

Layout

In the Inspector window, you customize the position, geometry, style, color, and font types of the object. You can adjust the following properties in particular:

- "Type": Define the graphic display of the object.
- "Background graphic - scale": Specify how the graphic is scaled.

Defining the content

You can specify how the button is displayed under "Properties > General > Content > Type" in the Inspector window.

Type	Description
"Text"	The button is displayed with text. This text explains the function of the button.
"Graphic"	The button is displayed with a graphic. This graphics represents the function of the button.
"Graphics or text"	The button is displayed with text or graphics. If the graphics cannot be displayed, the corresponding text is displayed.
"Graphics and text"	The button is displayed with text and graphics.

Different options are available depending on the device.

Scaling a background graphic

	Tips for working effectively
•	You add a graphic to the button by dragging-and-dropping the graphic from the detail view of the project graphics to the button.

The following modes for scaling graphics in buttons are available:

- None
  The graphic is inserted centered inserted into the button. If the graphic is larger than the button, the graphic will be displayed incompletely.
- Fill
  The graphic fills the button. This mode can lead to a distortion of the graphic.
- Uniform
  The graphic is fully displayed and without distortion in the button.
- Stretch to fit
  The graphic is adjusted to the size of the button without distortion. This may cause the graphic to be displayed incompletely.

To select a mode for scaling the graphic, follow these steps:

1. In the Inspector window, select "Properties > General > Content > Background graphic - scale".
2. Select the desired mode in the "Static value" column.

Text / Graphic

Depending on the "Content" property, define whether the display is static or dynamic. The display is defined under "Properties > General > Text" or "Graphic" in the Inspector window.

Your options for the type "Text" or "Graphic" include the following.

Type	Description
"Text"	Use "Text with pressed button" to specify the text displayed in the button for the "ON" state.
"Graphic"	Use "Graphic with pressed button" to specify a graphic displayed in the button in the "ON" state.

Direct text input

To change the labeling in the button directly via the keyboard, follow these steps:

1. Selecting the button.
2. Double-click in the button and enter a text.

Note the following special information:

- Diacritics, such as ä ê ñ, can only be entered if the keyboard layout provides a key for this character. Key sequences such as <`a> for à are not recognized.
- It is not possible to enter Unicode characters using Alt codes.
- Asian language characters cannot be entered using an Input Method Editor (IME).

If you need such characters in the label, you have the following options:

- Use a keyboard layout on which this character is present as a key.
- Copy the character or full label from any source and paste it into the selected object.
- Edit the label in the Inspector window under "Properties > Properties > General > Text".

Configuring a screen change

1. Drag a button from the "Toolbox" task card to a screen.
2. Configure the "ChangeScreen" system function to an event of the button.
3. Add another screen in the "Value" column.

	**Tips for working effectively**
• You can configure a screen change by dragging-and-dropping a configured screen from the project tree into the open screen. A button is automatically created and linked to the screen.	

Dynamizing a button with text list

Drag-and-drop a text list from the detail view of the text and graphic lists to the button. The button is linked to the text list.

Dynamizing a button with graphic list

Drag-and-drop a graphic list from the detail view of the text and graphic lists directly to the button. The button is linked to the graphic list.

Dynamization of graphic properties with tags or scripts

You can dynamize the following properties containing a graphic with a tag or with a script:

- Graphic
- Graphic - pressed button

See also

Enter text directly into the object (Page 406)

Entering multiline text (Page 407)

4.2.3.5 Switch

Use

The "Switch" object is used to configure a switch that is used to switch between two predefined states in runtime. The current state of the "Switch" object can be visualized with either a label or a graphic.

The following figure shows a "Switch" type switch.

Layout

In the Inspector window, you customize the position, geometry, style, color, and font types of the object. In particular, you can customize the following property:

- "Type": Specifies the graphic representation of the object.

Type of representation

You can specify how the switch is displayed under "Properties > General > Content > Type" in the Inspector window.

Type	Description
"Graphic"	The current state of the switch is shown with a graphic. In runtime click on the button to actuate the switch.
"Text"	The current state of the switch is shown with a label. In runtime click on the button to actuate the switch.
"Graphics or text"	The switch displays graphics or a text. If the graphics are not available, the text is displayed.
"Graphics and text"	The switch displays graphics and a text.

Dynamizing a switch with text list

Drag-and-drop a text list from the detail view of the text and graphics lists directly to the switch. The switch is linked to the text list.

Dynamizing a switch with graphics list

Drag-and-drop a graphics list from the detail view of the text and graphics lists to the switch. The switch is linked to the graphics list.

Dynamization of graphic properties with tags or scripts

You can dynamize the following properties containing a graphic with a tag or with a script:

- Graphic
- Graphic - pressed button

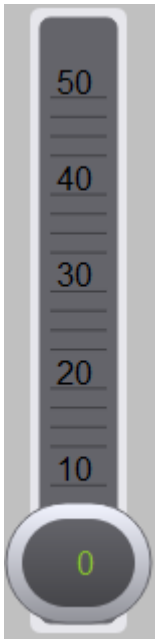
See also

Entering multiline text (Page 407)

4.2.3.6 Bar

Use

The tags are displayed graphically using the "Bar" object. The bar graph can be labeled with a scale of values.



Layout

In the Inspector window, you customize the settings for the position, shape, style, color, and font types of the object. You can adapt the following properties in particular:

- "Trend indicator - show": Shows whether the current value is higher or lower than the previous value.
- "Process value indicator - mode": Specifies how the process value is displayed in the bar chart.
- "Scale": Specifies the properties for the bar scale.

When the object in the light or dark style does not meet the following dimensions in Runtime, it is automatically displayed in compact mode:

- Vertical alignment: 100 pixels high or 30 pixels wide
- Horizontal alignment: 30 pixels high or 100 pixels wide

Displaying the process value indicator

You can use the "Process value indicator - mode" property to select the process value of the selected tags in the bar in runtime:

1. In the Inspector window, click "Properties > Miscellaneous > Process value indicator - mode".
2. Select another "Indicator" mode in the "Static value" column.
3. Go to "Process value indicator - foreground color" and select the display color for the process value.

Define bar segments

You can define the settings for the bar scale under "Properties > General > Scale":

- "Scaling type": Specifies how the bar scale is calculated, for example "Linear".
- "Alignment": Specifies whether the bar is displayed horizontally or vertically.
- "Scale mode": Specifies whether the scale is subdivided with tick marks, numbers, or not at all.
- "Scale value - maximum" and "Scale value - minimum": Specifies the start and end value displayed on the scale.

Defining scale gradation

Use the "Division count" property to define the subdivision count for the bar scale divisions.

The "Subdivision count" property defines the number of ticks between the division marks.

1. In the Inspector window, click "Properties > General > Scale".
2. Enter the required values for the "Division count" and "Subdivision count".

Note

The division count can only be changed if "Automatic scaling" is disabled.

Dynamizing bars

Drag a tag from the detail view of the tag table into the bar. The bar is linked to the tag.

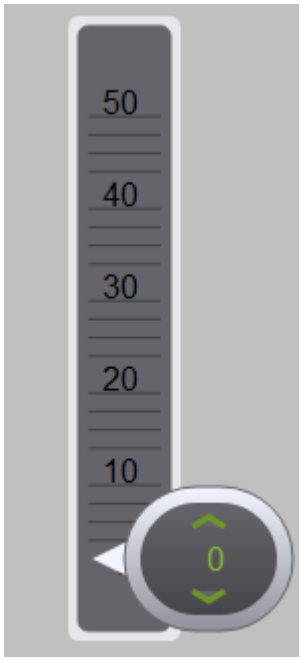
See also

Entering multiline text (Page 407)

4.2.3.7 Slider

Use

Process values are monitored and adapted within a defined range with the "Slider" object. The monitored range is visualized in the form of a slider. By adjusting the slider, you intervene in the process and correct the displayed process value.



Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You can, in particular, adapt the following properties as required:

- "Scale value - maximum" and "Scale value - minimum": Specifies the top and bottom values of the scale.
- "Process value indicator - mode": Specifies how the current process value is displayed in the slider.
- "Trend indicator - show": Specifies how the current value has changed compared to the previous values.

When the object in the light or dark style does not meet the following dimensions in Runtime, it is automatically displayed in compact mode:

- Vertical alignment: 100 pixels high or 30 pixels wide
- Horizontal alignment: 30 pixels high or 100 pixels wide

Maximum and minimum scale value

The top and bottom end values of the scale are specified in the Inspector window.

1. In the Inspector window, click "Properties > Properties > General > Scale".
2. Enter a number each at "Scale value - maximum" and "Scale value - minimum". If you select a tag as the end value of the scale, the number will be no longer available.

Show value

Specify that the value of the current position is displayed below the slider in the Inspector window.

1. Click "Properties > Miscellaneous" in the Inspector window.
2. Select "Value - show".

Process value indicator - mode

Specify a mode for process value display:

1. In the Inspector window, click "Properties > Miscellaneous > Process value indicator - mode".
2. Select a mode in the "Static value" column.

Mode	Description
Bar	Displays the bar with the process value indicator.
Indicator	Shows the process value indicator as a position on the bar.
Detailed indicator	Shows the process indicator in the bar.
Bar with detailed indicator	Shows the current process value and its position in the slider bar.

Note

If you have configured a tag for the "Process value indicator mode" property of a slider, changing the tag in runtime has no effect on the slider.

Dynamizing a slider

Drag a tag from the detail view of the tag table into the slider. The slider is linked to the tag.

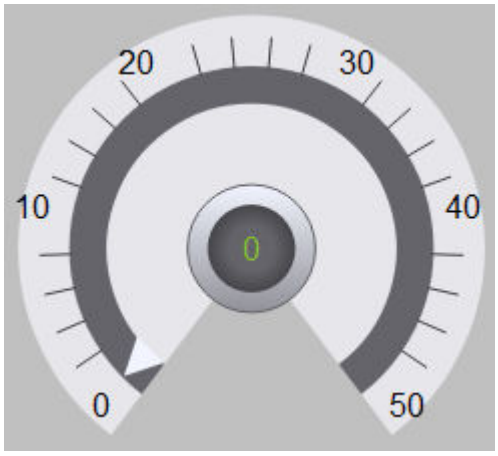
See also

Entering multiline text (Page 407)

4.2.3.8 Gauge

Use

The "Gauge" object shows numeric values in the form of an analog gauge. For example, a glance in runtime is enough to note that the boiler pressure is in the normal range. The gauge is for display only and cannot be controlled by the operator.



Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You can adapt the following properties in particular:

- "Peak indicator": Specifies whether the measurement range is indicated with a peak indicator.
- "Scale value - maximum" and "Scale value - minimum": Specifies the top and bottom values of the scale.
- "Normal range - color": Specifies the color in which the normal range is displayed.
- "Scale": Specifies various settings for the scale view.

When the object in the light or dark style is less than 180 pixels tall or wide in Runtime, it is automatically displayed in compact mode.

Display peak value

The "Peak indicator" property can be used to enable a marker function for the maximum or minimum pointer movement in runtime.

1. Click "Properties > Miscellaneous > Peak indicator" in the Inspector window.
2. Select the option "High" or "Low" in the "Static value" column.

Scale value - maximum and scale value - minimum

You can set the top and bottom end values of the scale in the Inspector window.

1. In the Inspector window, click "Properties > General > Scale".
2. Enter a number each at "Scale value - maximum" and "Scale value - minimum".
   If you select a tag as the end value of the scale, the number will be no longer available.

Configuring a scale

1. In the Inspector window, click "Properties > General > Scale".
2. Under "Angle - start", specify the angle at which the scale is to start. The angle is specified in degrees, starting at the zero position.
   The scale runs clockwise. A starting value of 0 corresponds to a display of 3 o'clock.
3. Under "Angle - range", specify the range in degrees to be covered by the scale.
4. Under "Scale mode", specify whether the divisions are displayed as ticks or numbers.

Dynamizing a gauge

Drag a tag from the detail view of the tag table into the gauge. The pointer instrument is linked to the tag.

4.2.3.9 Clock

Use

The "Clock" object displays the time.

Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You can adapt the following properties in particular:

- "Clock face - mode": Specifies whether the hour marks of the analog clock are displayed as ticks or numbers.
- "Hand - show hours", "Hand - show minutes" and "Hand - show seconds": Specifies whether the hour hand, minute hand and second hand are displayed on the clock.

When the object in the light or dark style is less than 100 pixels tall or wide in Runtime, it is automatically displayed in compact mode.

Configuring the clock face

In the Inspector window, you can specify how the hour marks are displayed.

1. In the Inspector window, click "Properties > General > Clock face - mode".
2. Select "Ticks" to display hours as ticks.
   Alternatively, select "Numbers" for a numerical display of the hours in the view.

Dynamizing the clock

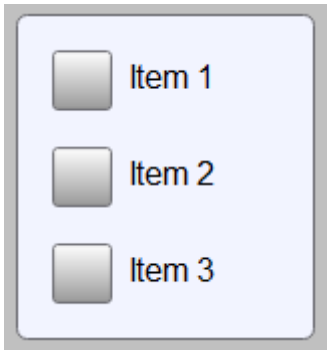
Drag-and-drop one tag from the detail view of tag table into the clock. The clock is linked to the tag.

4.2.3.10 Check box

Use

You use the "Check box" object to display and select multiple entries. You activate a selection item by default so that the operator only changes the preset value if necessary. The operator can select multiple options in runtime. You can specify a text or a graphic for each option.

To integrate the check box into the process, dynamize the corresponding properties.



Layout

In the Inspector window, you customize the position, geometry, style, color, and font types of the object. You can adjust the following properties in particular:

- "Selection items": Defines the number of options.
- "Select item": Defines which entries are displayed as activated by default.

Note

The item height option of the radio button is set to "0" during the creation of a new object. This value does not represent the actual value 0, but a default setting.

Defining the number of entries

You specify the number of entries in the Inspector window:

1. In the Inspector window, select "Properties > General > Selection items".
2. Click on the selection button in the "Static value" column.
   A dialog opens.
3. Specify the desired number of entries with "Add".
   To delete entries, click in the corresponding line and press the <DEL> key or click ✕.
4. To change the order of the entries, click in the corresponding line and move the entry using the icons ↑ ↓.

Using graphics and texts in the selection items

You can mark the selection items with texts or graphics. The following modes are available:

- "Graphic and text": The selection item shows text and graphic.
- "Graphic or text" The selection item is visualized either by a graphic or a text. If the graphic is not available, the text is displayed.
- "Graphic": The selection item is visualized with a graphic.
- "Text": The selection item is visualized with an inscription.

To configure the CheckBox contents, follow these steps:

1. Under "Properties > Format > Content > Type" select the type for display of the selection items, e.g. "Graphic and text".
2. Under "General > Selection items > [x] Selection item > Text" enter the text that is to be shown in the check box as the selection item.
3. Under "Selection items > [x] Selection item > Graphic", open the selection list.
4. Select the appropriate graphic.

Specify default of the check box

Use the "Select item" property of a selection item to define whether it is to be shown as enabled in a check box list.

You can activate multiple options.

To do so, select the check box in the "Static value" column of the "Select item" property of the respective selection item.

Dynamizing a check box

Drag-and-drop a tag from the detail view of the tag table directly to the check box. The check box is linked to the tag.

Dynamization of graphic properties with tags or scripts

You can dynamize the following property containing a graphic with a tag or with a script:

- Graphic

See also

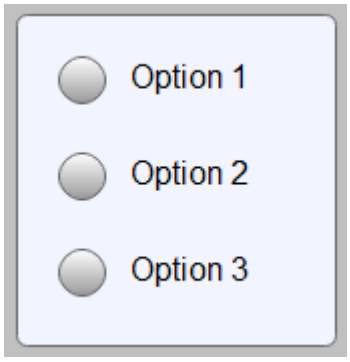
Automatically filling in of property values for an object collection (Page 379)

Entering multiline text (Page 407)

4.2.3.11 Radio button

Use

You can use the "Radio button" object to display and select various options. Only one of these options can be selected by the operator. Enable one of the options by default so that the operator only changes the default value if necessary. To incorporate a radio button into the process, dynamize the corresponding attributes.



Layout

In the Inspector window, you can customize the settings for the position, geometry, style, and color of the object. You can adjust the following properties in particular:

- "Selection items": Defines the number of options.
- "Select item": Defines which entry is displayed as activated by default.

Note

The item height option of the radio button is set to "0" during the creation of a new object. This value does not represent the actual value 0, but a default setting.

Defining the number of entries

You specify the number of entries in the Inspector window:

1. In the Inspector window, select "Properties > General > Selection items".
2. Click on the selection button in the "Static value" column.
   A dialog opens.
3. Specify the desired number of entries with "Add".
   To delete entries, click in the corresponding line and press the <DEL> key or click ✕.
4. To change the order of the entries, click in the corresponding line and move the entry using the icons ↑ ↓.

Using graphics and texts in the selection items

You can mark the selection items with texts or graphics. The following modes are available:

- "Graphic and text": The selection item shows text and graphic.
- "Graphic or text" The selection item is visualized either by a graphic or a text. If the graphic is not available, the text is displayed.
- "Graphic": The selection item is visualized with a graphic.
- "Text": The selection item is visualized with an inscription.

To configure the contents in the radio button, follow these steps:

1. Under "Properties > Content > Type", select the type for display of the selection items, e.g. "Graphic and text".
2. Under "Selection items > [x] Selection item > Text" enter the text that is to be shown in the check box as the selection item.
3. Under "Selection items > [x] Selection item > Graphic", open the selection list.
4. Select the appropriate graphic.

Specifying the default value of the radio button

Use the "Select item" property of a selection item to specify which radio button item is to be shown as enabled.

You can only enable one item.

Under "Properties > Selection items", activate the "Select item" property of the item to be activated by default.

Dynamizing a radio button

Drag-and-drop a tag from the detail view of the tag table into the radio button. The radio button is linked to the tag.

Dynamization of graphic properties with tags or scripts

You can dynamize the following property containing a graphic with a tag or with a script:

- Graphic

See also

Automatically filling in of property values for an object collection (Page 379)

Entering multiline text (Page 407)

4.2.3.12 Touch area

Use

The "Touch area" object allows you to configure an object that the operator can use in runtime to execute any configurable function. A gesture on the user interface starts the execution of the function. The gesture is recognized in the area where it begins.

Layout

In the Inspector window, you customize the settings for the position, shape and color of the object. The "Touch area" object is shown as a dotted area in the engineering system.

Define gestures

The "Touch Area" object distinguishes between the following gestures:

- Right
- Left
- Up
- Down

To distinguish between the gestures, program a J-Script that evaluates the gesture.

1. Click  in the Inspector window under "Properties > Events > Gesture detected".
2. Copy the code example into the programming window.

Code example

```
export function Touch_area_1_OnGestureDetected(item, gesture) {
// value of tag ‚MyTag1' will be set depending on the detected gesture
if(gesture == UI.Enums.HmiGesture.SwipeRight)
{
UI.RootWindow.Screen = 'ScreenRight';
let tag1 = Tags('tag1');
tag1.Write(1); //write value '1234' to tag 'MyTag1'
}
if(gesture == UI.Enums.HmiGesture.SwipeLeft)
{
UI.RootWindow.Screen = 'ScreenLeft';
let tag1 = Tags('tag1');
tag1.Write(2); //write value '1234' to tag 'MyTag1'
}
if(gesture == UI.Enums.HmiGesture.SwipeUp)
{
UI.RootWindow.Screen = 'ScreenUp';
let tag1 = Tags('tag1');
tag1.Write(3); //write value '1234' to tag 'MyTag1'
}
if(gesture == UI.Enums.HmiGesture.SwipeDown)
{
UI.RootWindow.Screen = 'ScreenDown';
let tag1 = Tags('tag1');
tag1.Write(4); //write value '1234' to tag 'MyTag1'
}
if(gesture == UI.Enums.HmiGesture.Unknown)
{
let tag1 = Tags('tag1');
tag1.Write(0); //write value '1234' to tag 'MyTag1'
}
}
```

4.2.3.13 Examples

Example: Configuring an IO field

Task

In this example, you learn how to configure an IO field and connect it to a tag.

You configure:

- Color = blue
- Border color = gray

- Mode = Input/output
- HMI tag = MyTag

Requirement

- A project is open.
- A screen is configured.

Configuring an IO field

To configure an IO field, follow these steps:

1. Open the "Elements" palette in the "Toolbox" task card.
2. Drag the "IO field" object onto the screen.
3. In the Inspector window, navigate to "Properties > Appearance > Background - color".
4. In the "Static value" column, select the blue color.
5. Navigate to "Properties > Appearance > Border - color".
6. In the "Static value" column, select the gray color.
7. Select the "Input/output" mode under "Properties > General > Mode".

Connecting the IO field to a tag

To connect the IO field to a tag, follow these steps:

1. In the Inspector window, click "Properties > General > Process value" in the "Dynamization" column.
2. Select the entry "Tag" from the list.
   The "Tag" dialog opens.
3. Click on the selection button under "Tag > Process > Tag". A dialog opens.
4. Click the "Add" button to add "MyTag" tag. Click "OK".
5. Go to "Properties > Miscellaneous > Reaction to input" and set how the values are to be handled in runtime, for example "Accept value after exit".

Result

The IO field has been configured as specified and connected to the tag. In runtime, you can see the current value of the tag in the IO field and can also input the value for the tag. The value is applied to the tag.

Example: Set values

Task

In this example, you learn how to show the process values in runtime, enter the values, or change the values. You also learn how to visualize the display of the actual speed of a motor and how to regulate it.

You configure:

- Two IO fields for the input and output of the process values.
- Two text boxes for describing the IO fields.
- A slider to display and adjust the values.

Requirement

- A project is open.
- A screen is configured.
- The tags "SetValue" and "ActualValue" have been created as process values for the motor speed.

Configuring IO fields

With two IO fields, you can display the current value of the tags in the screen. You can enter the values for the process or change the values.

To configure the IO fields, follow these steps:

1. Insert the "IO field" object from the "Toolbox" task card into the screen.
2. Specify the height, width, and position for the object under "Properties > Size and position".
3. Under "Properties > General > Mode" specify the "Input/output" mode in the "Static value" column.
4. Click under "Properties > General > Process value". In the drop-down list of the "Dynamization" column, select the entry "Tag".
   The "Tag" dialog opens.
5. Under "Tag" specify the "SetValue" tag whose values you want to display and change in runtime.
6. Define an additional IO field for the "ActualValue" tag in "Output" mode.
7. Configure two text boxes, "Actual value" and "Set value", as the IO fields description.

	**Efficiency tip**
• You can also create a new IO field by moving a configured tag from the detail view onto an HMI screen using drag-and-drop. An IO field is created automatically and connected to the desired tag.	

Configuring a slider

You can use a slider to intervene in the process and change the displayed process value.

Follow these steps to configure the slider:

1. Add the "Slider" object to the screen from the "Toolbox" task card.
2. Specify the desired height, width and position for the object under "Properties > Size and position".
3. Under "Properties > Miscellaneous > Process value indicator - mode", specify the "Detailed indicator" mode in the "Static value" column.
4. Click under "Properties > General > Process value".
5. In the drop-down list of the "Dynamization" column, select the entry "Tag".
   The "Tag" dialog opens on the right in the Inspector window.
6. Under "Tag" specify the "SetValue" tag whose values you want to display and change in runtime.

Result

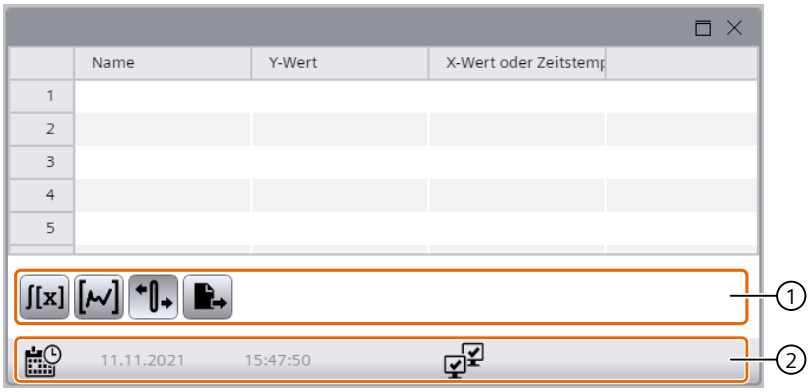
In runtime, the actual motor speed is displayed in the IO field. You can transfer the speed in the IO field "Set value" to the motor. Using the slider, you can read the actual speed and control the speed yourself by moving the slider.

4.2.4 Controls

4.2.4.1 Configuring the toolbar and information bar

Introduction

You can operate the controls in runtime using the buttons in the toolbar. The information bar displays the status messages of the control. During configuration, you define the contents of the toolbar and information bar.



① Toolbar
② Information bar

Requirement

- You have opened the screen which contains at least one object, for example, the trend companion.
- The Inspector window is open.

Configuring the toolbar

To configure the toolbar, follow these steps:

1. In the Inspector window under "Properties > Miscellaneous > Toolbar", configure the general properties of the toolbar, such as background color or visibility.
2. In the Inspector window, under "Properties > Properties > Miscellaneous > Toolbar > Elements > Button > Visibility", enable the buttons that you need in Runtime.

   Note

   Only elements whose visibility is activated in the TIA Portal are transferred to the runtime. Items whose visibility is disabled in the TIA Portal are deleted from the array of elements. You cannot address them in runtime, e.g. via a script.

   If you hide an element, the numbering of the following elements in the runtime changes. Example:
   The parameter set control has 10 elements. Array numbers 0 to 9 are assigned to the elements in the TIA Portal. If you deactivate the visibility of the element with the array number 8, the element with the array number 9 must be addressed in runtime with the number 8.

   If you want to hide an element and still access it, use dynamization, e.g. via a script.
3. Configure the button display, for example, background color, border and size.
4. Under "Properties > Properties > Miscellaneous > Toolbar > Elements > Button > Authorization", select the authorization that is required in Runtime to operate the button.
5. When a button is not operated in Runtime, disable "Allow operator control". You can reactivate a disabled a button by using a script in runtime, for example.

Configuring the information bar

To configure the information bar, follow these steps:

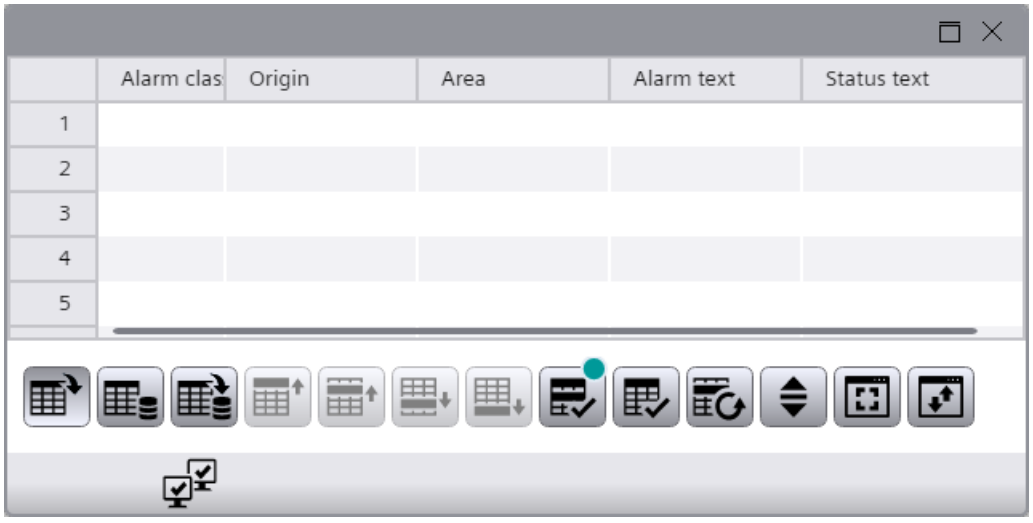
1. In the Inspector window under "Properties > Properties > Miscellaneous > Information bar", configure the general properties of the information bar, such as background color or visibility.
2. In the Inspector window under "Properties > Properties > Miscellaneous > Information bar > Elements > State display > Visibility", enable the elements that you need in Runtime.
3. Configure the display of the respective element.
4. Select the authorization that is required in Runtime to operate the element.
5. When an element is not operated in Runtime, disable "Allow operator control". You can enable a disabled element again, for example, with a script in Runtime.

4.2.4.2 Alarm control

Use

The "Alarm control" object displays alarms that occur during the process in a plant. You can also use the alarm control to display the alarms in lists.

WinCC offers various views, such as "Show active alarms" or "Show logged alarms".



Layout

You can change the settings for the position, geometry, style, color, and font of the object in the Inspector window. You can adapt the following properties in particular:

- "Alarm control": Defines various properties for the display of alarms, e.g. background color and row height.
- "Sorting - allow": Defines whether the alarms are sorted in runtime.
- "Information bar": Defines the elements of the information bar.
- "Toolbar": Defines the buttons of the alarm control.
- "Focus - show visual": Specifies whether the selected properties are visible.

Defining the properties of the alarm control

To define the properties of the alarm control, follow these steps:

1. In the Inspector window, click "Properties > Properties > Miscellaneous > Alarm control".
2. Define settings for the rows and cells, e.g.:
   – "Row height": Defines the height of the rows in the alarm control.
3. Define the settings for the headers under "Header - settings", e.g.:
   – "Row header": Defines whether each row has a header.
   – "Column header": Specifies the representation of the column header.
4. Define the width and color of the grid lines.
5. Define the use of scroll bars.

Configuring output of alarms

Define the following properties to configure the outputs of the alarm control:

- "General > Alarm source": Defines which alarms are displayed in this alarm control.
- "Miscellaneous > Alarms - show current":
  If you activate this property, the following applies in runtime:
  - The most recent alarms are always displayed first in the alarm control.
  - Alarms that have been filtered out of the alarm control are not displayed.
  - The visible area of the alarm control is shifted automatically, as needed.
  - Users cannot select alarms individually or sort them by column.

  If you configure the "Alarms - show current" button as visible and operable, users can pause and start this behavior in runtime as required. The alarm control always starts with the behavior configured via "Miscellaneous > Alarms - show current".
- "Miscellaneous > Alarm statistics settings": Setting options that contribute to the evaluation of the alarm statistics, e.g. start time, maximum number of alarms.

Setting up column sorting

To set up the column sorting, follow these steps:

1. In the Inspector window, click on "Properties > Miscellaneous > Alarm control > Columns > [1] Alarm statistics column".
2. Select the sorting direction and sorting order for the individual columns.

Define the sorting direction of the alarms in the alarm control, e.g. "Ascending", under "Properties > Properties > Format > Starting sorting direction".

Configuring reordering of the columns

Configure whether operators can reorder the table columns in runtime using drag-and-drop. More information is available in the section Configuring reordering of the columns (Page 392).

Access protection in runtime

To configure access protection in runtime, follow these steps:

- Activate the "Operator control - allow" property under "Properties > Properties > Miscellaneous > Toolbar > Elements > [1] Button > Operator control - allow".
- Define the type of authorization in the "Static value" column under "Properties > Properties > Miscellaneous > Toolbar > Elements > [1] Button > Authorization".

A user with the required authorization can acknowledge and edit alarms using the buttons in the alarm control.

Dynamization of graphic properties with tags or scripts

You can dynamize the following properties containing a graphic with a tag or with a script:

- Graphic
- Icon

Configuring the information bar

The information bar of the alarm control shows you the current time and the connection status, for example.

To configure the information bar, follow these steps:

1. Configure the general properties of the information bar, such as the font and background color, under "Properties > Properties > Miscellaneous > Information bar".
2. Configure the display of the information bar elements under "Properties > Properties > Miscellaneous > Information bar > Elements".

Toolbar

You can define the buttons of the alarm control in runtime and their operator authorizations in the Inspector window under "Properties > Properties > Miscellaneous > Toolbar > Elements". Some buttons are enabled by default. To display additional buttons in the object, activate the "Visibility" property in the settings of the corresponding button.

The following buttons are available for the alarm control:

Button		Function
	Show active alarms	Shows the currently active alarms.
	Show logged alarms	Shows the logged alarms.
	Show and update logged alarms	Updates the logged alarms and shows them.
	Show defined alarms	Shows the alarms configured in the system.
	Alarm statistics - view	Visualizes statistical information, such as frequency and display duration of logged alarms.
	Alarm annunciator	Not supported in WinCC Unified.
	First line	Selects the first of the active alarms. The visible area of the alarm control is moved. This button is only enabled if the "Show recent" function is disabled.

Button		Function
	Previous line	Selects the previous alarm in relation to the currently selected alarm. The visible area of the alarm control is moved. This button is only enabled if the "Show recent" function is disabled.
	Next line	Selects the next alarm in relation to the currently selected alarm. The visible area of the alarm control is moved. This button is only enabled if the "Show recent" function is disabled.
	Last line	Selects the last of the active alarms. The visible area of the alarm control is moved. This button is only enabled if the "Autoscroll" function is disabled.
	Move to next acknowledgeable alarm	Selects the next alarm in relation to the currently selected alarm. The visible area of the alarm control is moved. This button is only enabled if the "Autoscroll" function is disabled.
	Previous page	Navigates to the next page
	Next page	Moves to the previous page
	Single acknowledgment	Acknowledges an individual alarm. A counter shows how many alarms are unacknowledged. The counter includes all connected servers, but no filters.
	Group acknowledgment	Acknowledges all active visible alarms in the alarm control that require acknowledgment, unless they are subject to single acknowledgment.
	Single confirm	Resets the alarm. Relevant for alarms with the state machine "Alarm with acknowledgment and confirmation" that have already been acknowledged and are outgoing.
	Alarms - show current	Defines whether the current alarm is always selected in the alarm control. Button not pressed: The "Show recent" function is active. • The current alarms in the alarm control are always displayed first. • The visible area of the alarm control is shifted automatically, as needed. • You cannot select the alarms individually or sort them by column. Button pressed: The "Show recent" function is paused.
	Infotext - configuration	Opens a dialog to display an infotext.
	Comment - configuration	Opens a dialog for adding a comment.
	Alarm statistics - configuration	Opens the dialog to change the time range for the alarm statistics.
	Disable alarm	Disables an alarm in the current alarm list and in the alarm log lists. The alarm is added to the display "Disabled alarms."
	Enable alarm	Shows an alarm once again.

Button		Function
	Shelve alarm	Shelves an alarm, for example, to prevent an alarm message from impairing the effectiveness of your system. The alarm appears in the "Shelved alarms" display.
	Unshelve alarm	Unshelves the respective alarm.
	Copy lines	Copies the selected alarms.
	Time base - configuration	Opens a dialog for setting the time zone for the time information shown in alarms.
	Selection display	Opens a dialog for filtering alarms. You can define the filter criteria or filter the alarms by criteria defined in the Engineering System.
	Sorting setup	Opens a dialog for setting user-defined sort criteria for the displayed alarms.
	Display options - configuration	Opens a dialog for configuring the display options of the alarm control. You can define which alarms are displayed, for example, only shelved alarms or all alarms.
	Locked alarms - configuration	Opens a dialog for configuring the display options of the locked alarms.
	Export	Starts exporting the alarms to a CSV file.
	Select context	Opens the configuration dialog of the context.

See also

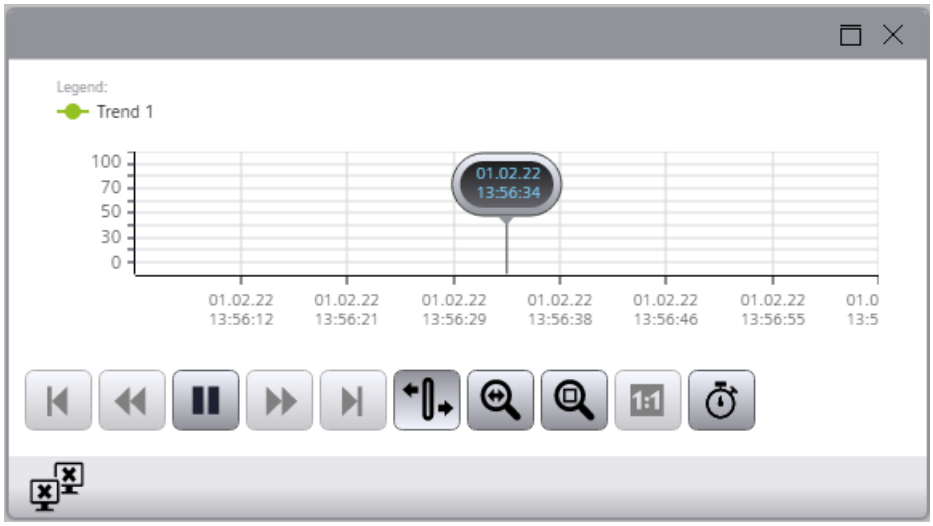
Configuring an alarm control (Page 753)

Automatically filling in of property values for an object collection (Page 379)

4.2.4.3 Trend control

Use

You can use the "Trend control" object to display tag values from the current process or from the log in the form of trends as an autorepeat.



Note

Trend display in future time range

The trend area located in the future continues the last drawn value.

Layout

In the Inspector window, you can customize the position, geometry, style, colors, and font types of the object. You can adapt the following properties in particular:

- "Trend areas": Specifies the representation of the trends.
- "Trends": Defines the configuration of the trends.
- "Toolbar": Defines the buttons for the trend control.

Configure trend area

To configure the trend display, follow these steps:

1. Create the following under "Properties > Properties > General > Trend areas":
   - Common or individual trend areas
   - Common or separate axes
   - Writing direction of all trends

   By default, the first trend area [0] is already created in the object. You can create more trend areas using the selection button in the "Static value" column.
2. Configure the value axes and the time axes.
3. Open the settings of the time axis under "Properties > General > Time axes bottom > Time axis [0]".
   Configure the "Time range" of the trend display:
   - "Time interval": You define the time range using a starting time and a following time interval.
   - "Start time and end time": You define the time range using a starting time and an end time.
   - "Measuring points": You define the time range using a starting time and a number of measuring points.
4. Open the settings of the value axis under "Properties > General > Trend areas > Trends > Left value axis > Value axis Y [0]":
   - If required, configure the value range, the output format, and the scaling of the value axis.
   - If required, configure the value range, the output format, and the scaling of the value axis.
5. Go to "Properties > General > Trend areas > Trends" and configure the trends for the trend area.

Configuring trends

To configure the trends for each trend area, follow these steps:

1. Select the data supply for the respective trend under "Properties > General > Trend areas > Trends > [0] Trend > Data source Y > Source":
   - "Logging tag": The trend control is supplied with values from a tag log.
   - "HMI tag": The trend control is supplied with values of a tag.
2. Select the data supply for the tag under "Properties > General > Trend areas > Trends > Trend [0] > Data source Y > Tag".
   - In the case of an HMI tag, specify the tag name in the "Static value" column.
   - In the case of a logging tag, enter the name of the HMI tag in the "Static value" column first.
     Enter the name of the associated logging tags separated by a colon, for example, "HMITag_1:LoggingTag_1".
3. Configure the display mode for trends under "Trend mode".

Note

In a trend control with multiple trends, a trend can also be selected using the legend in runtime.

Dynamization of graphic properties with tags or scripts

You can dynamize the following properties containing a graphic with a tag or with a script:

- Graphic
- Graphic - pressed button
- Icon

Toolbar

You can define the buttons of the trend control in runtime and their operator authorizations in the Inspector window under "Properties > Properties > Miscellaneous > Toolbar > Elements". Some buttons are enabled by default. To display additional buttons in the object, activate the "Visibility" property in the settings of the corresponding button.

The following buttons are available for the trend control:

Button	Name	Function
	First record	Shows the trend direction starting with the first logged value.
	Previous record	Shows the trend direction of the previous time interval.
	Start/Stop	Stops and starts the trend update. Started: The trend is continuously updated. It always shows the latest values. Stopped: New values are buffered and updated as soon as you start the trend update again.
	Next record	Shows the trend direction of the next time interval.
	Last record	Shows the trend direction up to the last logged value.
	Previous trend	Displays the previous trend in the foreground.
	Next trend	Displays the next trend in the foreground.

Button	Name	Function
	Ruler	Determines the coordinates of a point of the trend.
	Zoom time axis +/-	Enlarges or reduces the time axis display.
	Zoom value axis +/-	Enlarges or reduces the value axis display.
	Zoom area	Increases the size of any section of the trend window.
	Zoom +/-	Enlarges or reduces the view in the trend window.
	Move trend area	Moves the display in the trend area. Values from the future trend area apply the last displayed value.
	Move axes area	Moves the display in the axes area.
	Original view	Switches from the magnified trend control back to the normal view.
	Select time range	Opens the dialog for setting the time range displayed in the trend window.
	Select trends	Opens the dialog for setting the visibility of trends.
	Select data connection	Opens the dialog for selecting the logs and tags to serve as the data source for the trend control.
	Statistics area	Enables you to define a time range for which statistical values are determined. Vertical lines which you use to set the time range are displayed in the trend window. To display the values, connect the trend control to the trend companion.
	Calculate statistics	Opens a statistics window to display the minimum, maximum, means, and standard deviation for the selected time range and the selected trend. To display the values, connect the trend control to the trend companion.
	Print	Starts printing the trends shown in the trend window.

Button	Name	Function
	Export	Opens the dialog for saving the trend data in CSV format.
	Select context	Opens the configuration dialog of the context.

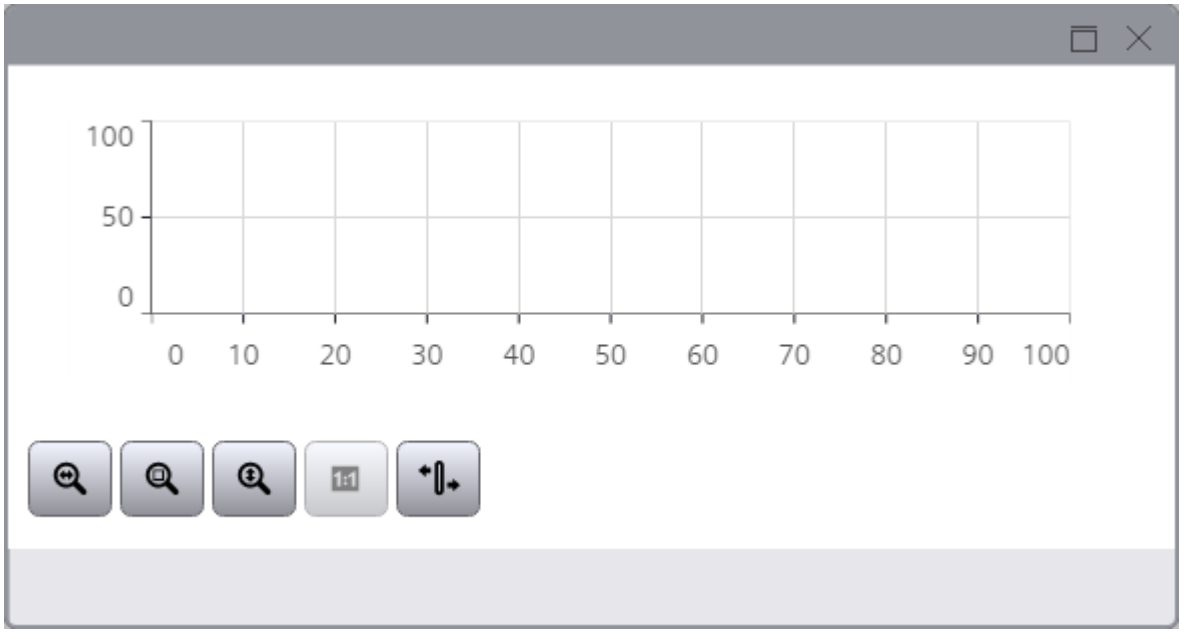
Defining the data source (Page 692)

Automatically filling in of property values for an object collection (Page 379)

4.2.4.4 Function trend control

Use

You can use the "Function trend control" object to represent the values of a tag as a function of another tag. This means that you can present temperature trends as a function of the pressure, for example. You can also compare the trend to a setpoint trend.



Note

Trend display in future time range

The trend area located in the future continues the last drawn value.

Layout

In the Inspector window, you can customize the position, geometry, style, colors, and font types of the object. You can adapt the following properties in particular:

- "Function trends": Defines the configuration of the function trends.
- "Toolbar": Defines the buttons of the function trend control.

Configuring function trends

To configure the function trends for each function trend area, follow these steps:

1. Select the data supply for the function trend under "Properties > General > Function trend - area > Function trends > [0] Function trend > Data source X > Source".
   - "Logging tag": The trend control is supplied with values from a tag log.
   - "HMI tag": The trend control is supplied with values of a tag.
2. Enter the tag name under "Properties > General > Function trend - areas > [0] Function trend - area > Function trends > [0] Function trend > Data source X > Tag":
   - In the case of an HMI tag, specify the tag name in the "Static value" column.
   - In the case of a logging tag, enter the name of the HMI tag in the "Static value" column first. Enter the name of the associated logging tags separated by a colon, for example, "HMITag_1:LoggingTag_1".
3. Configure the data supply for "Data source Y".

4. Open the settings of the time axis under "Properties > General > Function trend - area > Function trends > [0] Function trend > Time range".
   Configure the trend display for the "Time range".
   - "Time interval": You define the time range using a starting time and a following time interval.
   - "Start time and end time": You define the time range using a starting time and an end time.
   - "Measuring points": You define the time range using a starting time and a number of measuring points.
5. Configure the value range of the trend display under:
   - "Properties > General > Function trend - areas > [0] Function trend - area > Value axes - left > [0] Value axis Y".
   - "Properties > General > Function trend - areas > [0] Function trend - area > Value axes - bottom > [0] Value axis X".

   Select one of the options:
   - "Automatically adapt value range". The displayed value range is automatically adapted to the current values.
   - "Scale value - maximum" and "Scale value - minimum". Define the minimum value and maximum value for the value range.

Dynamization of graphic properties with tags or scripts

You can dynamize the following properties containing a graphic with a tag or with a script:

- Graphic
- Graphic - pressed button
- Icon
- Marker graphic

Toolbar

You can define the buttons of the function trend control in runtime and their operator authorizations in the Inspector window under "Properties > Properties > Miscellaneous > Toolbar > Elements". Some buttons are enabled by default. To display additional buttons in the object, activate the "Visibility" property in the settings of the corresponding button.

The following buttons are available for the function trend control:

Button	Name	Function
	Start/Stop	Stops and starts the trend update. Started: The trend is continuously updated. It always shows the latest values. Stopped: New values are buffered and updated as soon as you start the trend update again.
	Zoom X axis +/-	Zooms in to or out of the X axis in the trend window.
	Zoom area	Increases the size of any section of the trend window.
	Zoom +/-	Enlarges and/or shrinks the trends in the trend window.
	Zoom Y axis +/-	Enlarges and/or reduces the Y axis in the trend window.
	Original view	Switches from the magnified trend control back to the normal view.
	Previous trend	Displays the previous trend in the foreground.
	Next trend	Displays the next trend in the foreground.
	Ruler	Determines the coordinates of a point of the trend.
	Move trend area	Moves the trends along the X axis and Y axis in the trend window. Values from the future trend area apply the last displayed value.
	Move axes area	Moves the trends along the value axis in the trend window.
	Select time range	Opens the dialog for setting the time range displayed in the trend window.
	Select trends	Opens a dialog for setting the visibility of trends.
	Select data connection	Opens a dialog for selecting logs and tags.

Button	Name	Function
	Print	Starts printing the trends shown in the trend window. The print job used during printing is defined in the configuration dialog in the "General" tab.
	Export	Starts the export of all or the selected runtime data to a "csv" file.

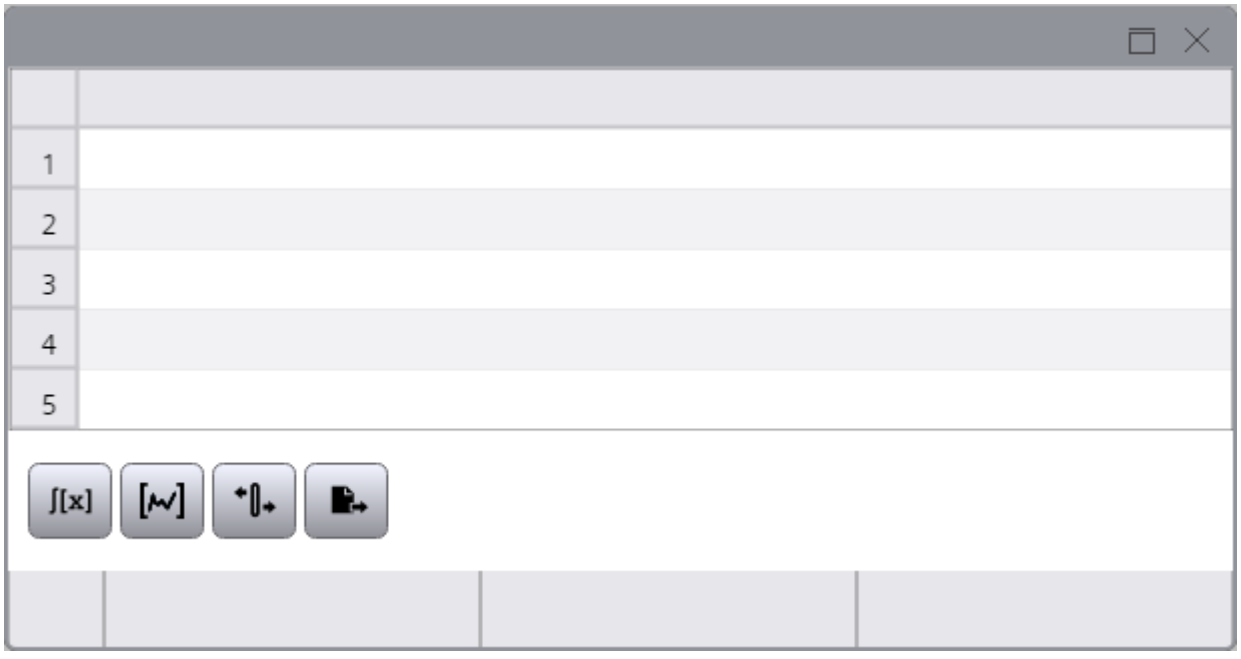
Defining the data source (Page 692)

Automatically filling in of property values for an object collection (Page 379)

4.2.4.5 Trend companion

Use

You use the "Trend companion" object to show evaluated data and statistics from a trend control or function trend control in a table.



Layout

In the Inspector window, you can customize the position, geometry, style, colors, and font types of the object. You can adapt the following properties in particular:

- "Data source": Specifies the source for representing the values.
- "Trend companion - mode": Defines the mode of the values display in the trend companion.
- "Toolbar": Specifies the buttons in the trend companion.

Defining the data source for displaying the values

To define the display of values in the trend companion, follow these steps:

1. Configure a trend control or a function trend control.
2. Select the trend companion. Click "Properties > General > Data source".
3. Select the trend control or function trend control as the data source.

To adapt the display to the connected object, select the "Data source - use background color" and "Data source - use font color" options under "Properties > Format".

By default, the format of the connected object is adopted during the configuration for the display format. The size, value range and zoom factor of the object are taken into account to display the optimum number of decimal places.

You can configure the display formats for individual values in the Inspector window of the trend companion, for example, to display an exact number of decimal places.

Defining the mode of the trend companion

To define the mode of the trend companion, follow these steps:

1. Select the mode under "Properties > Properties > General > Trend companion - mode".
2. Select one of 3 different mode types depending on the data source:
   - The "Ruler" mode shows the coordinate values of the trends on the ruler or the values of a selected row in the table.
   - The "Statistics area" mode shows the values of the low limit and high limit of the trends between two rulers or the selected area in the table.
     The "Statistics area" mode is not available for the function trend control object.
   - The "Statistic result" mode shows the statistical evaluation of the trends between two rulers or the selected values in the table.
     The "Statistics result" mode is not available for the "function trend control" object.

Configuring reordering of the columns

Configure whether operators can reorder the table columns in runtime using drag-and-drop. More information is available in the section Configuring reordering of the columns (Page 392).

Dynamization of graphic properties with tags or scripts

You can dynamize the following properties containing a graphic with a tag or with a script:

- Graphic
- Icon

Toolbar

You can define the buttons of the trend companion in runtime and their operator authorizations in the Inspector window under "Properties > Properties > Miscellaneous > Toolbar > Elements". Some buttons are enabled by default. To display additional buttons in the object, activate the "Visibility" property in the settings of the corresponding button.

The following buttons are available for the trend companion:

Button	Brief description	Description
	Calculate statistics	Shows the statistical values in the statistics window. The displayed values refer to a selected trend with the configured calculation time period. The button is only enabled if a statistics window is connected with a trend control.
	Statistics area	Enables you to define a time range for which statistical values are determined.
	Ruler window	Queries the coordinate points of a trend. The trend data are displayed in the ruler window.
	Print	Reserved for future versions.
	Export	Starts the export of all or the selected runtime data to a "csv" file.

See also

Configuring the trend companion (Page 689)

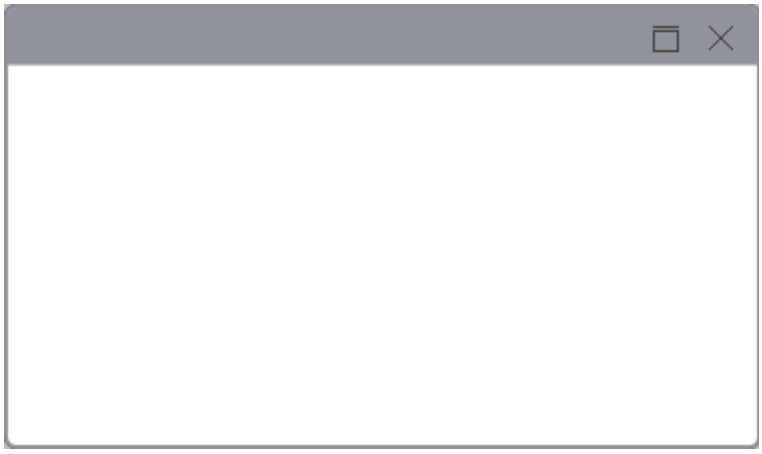
Automatically filling in of property values for an object collection (Page 379)

4.2.4.6 Screen window

Use

You can use the "Screen window" object to represent other screens from the project in the current screen. To constantly update the content of a screen window, for example, you dynamize the object.

You can also use independent screen windows independently of the screen in question. With appropriate hardware equipment and support by the operating system you can also control multiple monitors and map processes in a more comprehensive and differentiated manner.



Layout

In the Inspector window, you can customize the settings for the position, geometry, style, and color of the object. You can adapt the following properties in particular:

- "Zoom - factor": Defines the size of the embedded screen.
- "Size - fit": Specifies whether:
  - The embedded screen is scaled to the size of the screen window.
  - The screen window is scaled to the size of the embedded screen.

Matching the size of the embedded screen and screen window

To match the size of the embedded screen to the size of the screen window, choose one of the following options:

- To reduce the size of the embedded screen:
  Set the desired zoom factor in the Inspector window under "Properties > Format > Zoom - factor".
- To scroll to a section of the embedded screen:
  Enable the visibility of the horizontal and vertical scroll bars in the Inspector window under "Properties > Format". Set the position of the scroll bars.
  The user can move to details of the embedded screen in runtime.
- To adapt the embedded screen to the size of the screen window or vice versa:
  Select either "Fit window to screen" or "Fit screen to window" in the Inspector window under "Properties > Format > Size - fit".

Resizing in runtime

To allow users to resize a screen window in runtime, follow these steps:

1. Activate the options "Show border" and "Can be sized" in the Inspector window "Properties > Appearance > Window settings".
   The width of the border is not evaluated.

If the embedded screen is larger than the screen window, you can configure the scroll bars for the screen window under "Properties > Format".

Moving screen window in runtime

To allow users to move a screen window in runtime, follow these steps:

1. Activate the options "Show heading" and "Can be moved" in the Inspector window "Properties > Appearance > Window settings".

Scaling and moving screen windows in runtime with two-finger gesture

To allow users to scale the screen window on touch devices with a two-finger gesture in runtime, or to move the displayed section with a two-finger gesture, follow these steps:

1. In the "Properties > Format" Inspector window, activate the "Zoom - allow" property. Default setting: Activated

Clicking on an object behind the screen window in runtime

Screen windows can overlay other objects placed on the screen that users must operate in runtime.

To allow users to click an object placed below the screen window in runtime, follow these steps:

1. Under "Properties > General > Screen", select the screen you want to load into the screen window, for example, "Screen_2".
2. Set the "Transparent" entry in the "Static value" column under "Appearance > Background - fill pattern" in the properties of the screen selected in step 1.

Application example: You use a round menu with a button next to it. To prevent the rectangular border surrounding the menu from obscuring the button, make the menu available in a screen window. Proceeding as described above has the result that the button remains operable for users.

Dynamization of graphic properties with tags or scripts

You can dynamize the following property containing a graphic with a tag or with a script:

- Icon

4.2.4.7 Faceplate container

Use

The faceplate container is used to display faceplates in runtime. If a faceplate type has been instantiated in the container, the desired faceplate type is specified in the "Contained type" property.

You can find detailed information on configuring faceplates in the section "Configuring faceplates (Page 524)".

Layout

You can change the settings for the position, geometry, style, color, and font of the object in the Inspector window. You can adjust the following properties in particular:

- "Window settings": Specifies the representation of the faceplate container in runtime.
- "Faceplate type": Defines the faceplate type that is instantiated in the faceplate container.

Defining window settings

To resize a faceplate instance in runtime, activate the options "Show border" and "Can be sized" in the Inspector window "Properties > Appearance > Window settings".

The width of the border is not evaluated.

To move a faceplate instance in runtime, select the options "Show heading" and "Can be moved" in the Inspector window under "Properties > Appearance > Window settings".

Defining the faceplate type

To define the faceplate type, select the faceplate type that is instantiated in the faceplate container under "Properties > Miscellaneous > Faceplate type".

Dynamization of graphic properties with tags or scripts

You can dynamize the following property containing a graphic with a tag or with a script:

- Icon

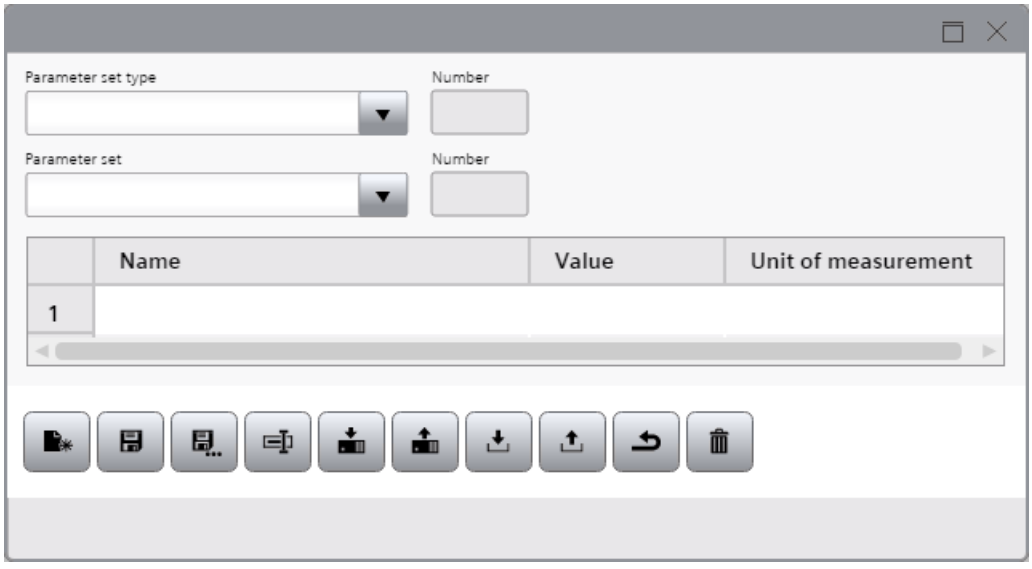
See also

Basics of faceplates (Page 524)

4.2.4.8 Parameter set control

Use

You can use the "Parameter set control" object to display and manage parameter sets in runtime and to exchange them with the controller.



Layout

You can change the settings for the position, geometry, style, color, and font of the object in the Inspector window. Under "Miscellaneous", you can adapt the following properties in particular:

- "Parameter - view": Specifies the representation of the parameter table in the object.
- "Editing mode": Defines the activation status of the toolbar buttons.
- "Information bar": Specifies the representation of the information bar.
- "Toolbar": Defines the buttons of the parameter set control.

Using a parameter set type

If you only want to use a particular parameter set type with its parameter sets in runtime, select the desired parameter set type under "Properties > General > Fixed parameter set type".

Configuring the time zone

To configure the time zone, follow these steps:

Under "Properties > Miscellaneous > Time zone", set the desired time zone by entering a numerical value.

The numerical value stands for a time zone, for example:

- "-1" stands for UTC-1h (Central European Time, standard time)
- "1" stands for UTC-12h (International Date Line West)
- "2" stands for UTC-11h (Hawaii)

Defining the editing mode

To specify the editing mode and to enable or disable the buttons, follow these steps:

Under "Properties > Miscellaneous > Editing mode", configure the activation status of the toolbar buttons "Create", "Save", "Save as", "Rename" and "Delete". These toolbar buttons are used to edit parameter sets.

You can select between the following settings:

- "None": Deactivates all buttons.
- "Update": Activates the "Save" and "Rename" buttons.
- "Create": Activates the "Create" and "Save as" buttons.
- "Delete": Activates the "Delete" button.

Configuring reordering of the columns

Configure whether operators can reorder the table columns in runtime using drag-and-drop. More information is available in the section Configuring reordering of the columns (Page 392).

Dynamization of graphic properties with tags or scripts

You can dynamize the following properties containing a graphic with a tag or with a script:

- Graphic
- Icon

Configuring the information bar

To configure the information bar, follow these steps:

1. Configure the general properties of the information bar, such as the font and background color, under "Properties > Miscellaneous > Information bar".
2. To adjust the height of the "Status text" element, specify the height under "Properties > Miscellaneous > Information bar > Elements > [0] Element".

The "Status Text" element is the only status line element of the parameter set control. Status messages are displayed in this element in runtime.

Toolbar

You can define the buttons of the parameter set control in runtime and their operator authorizations in the Inspector window under "Properties > Miscellaneous > Toolbar > Elements". By default, all buttons are displayed in the toolbar. To hide specific buttons, deactivate the "Visibility" property in the settings of the corresponding button.

The following buttons are available for the parameter set control:

	Button	Function
	Create	Creates a new parameter set.
	Save	Saves a parameter set.
	Save as	Saves an existing parameter set under a new name and new ID.
	Rename	Renames the selected parameter set.
	Write to PLC	Writes the values of the selected parameter set to the PLC.
	Read from PLC	Writes the values of the selected parameter set from the PLC.
	Import	Imports parameter sets from a "*.tsv" file.
	Export	Exports parameter sets to a "*.tsv" file.
	Cancel	Cancels the process.
	Delete	Deletes the selected parameter set.

Note

A "*.tsv" file is a text file that uses the tabulator as a list separator.

See also

Configuring the parameter set view (Page 880)

Automatically filling in of property values for an object collection (Page 379)

4.2.4.9 System diagnostics display

Use

You can use the "System diagnostics control" object to display the diagnostic status of several PLCs using traffic light SVGs. The diagnostic status contains the overall status of all relevant PLCs. The merged state is always the worst state of all PLCs.

Layout

You can change the settings for the position, geometry, style, color, and font of the object in the Inspector window. You can adjust the following properties in particular:

- "Diagnostic view": Defines various properties for the display of system diagnostics, such as the background color and row height.
- "Information bar": Specifies the representation of the information bar.
- "Toolbar": Specifies the buttons of the system diagnostics control.

Access protection in runtime

You can configure access protection with the properties "Operator control - allow" and "Authorization" under "Properties" in the Inspector window. A logged-in user having the required authorization can acknowledge and edit the system diagnostics control using the buttons in the system diagnostics control.

Defining the properties of the system diagnostics control

To define the properties of the system diagnostics view, follow these steps:

1. Click "Properties > General > Diagnostic view" in the Inspector window.
2. Define the settings for the rows and cells.
   - "Row height": Defines the height of the rows in the alarm control.
   - "Cells - internal spacing": Defines the internal spacing in the cells.
3. Define the settings for the headers under "Properties > General > Diagnostic view > Header - settings":
   - "Row header": Defines whether each row has a header.
   - "Column header": Specifies the representation of the column header.
4. Define the width and color of the grid lines.
5. Define the use of scroll bars.

Setting up column sorting

To set up the column sorting, follow these steps:

1. In the Inspector window, click "Properties > General > Diagnostic view > Columns > [0] Column".
2. Select the sorting direction and sorting order for the individual columns.

Configuring reordering of the columns

Configure whether operators can reorder the table columns in runtime using drag-and-drop. More information is available in the section Configuring reordering of the columns (Page 392).

Dynamization of graphic properties with tags or scripts

You can dynamize the following properties containing a graphic with a tag or with a script:

- Graphic
- Icon

Configuring the information bar

The information bar of the system diagnostics control shows the connection status and path.

To configure the information bar, follow these steps:

1. Configure the general properties of the information bar, such as the font and background color, under "Properties > Miscellaneous > Information bar".
2. Configure the display of the information bar elements under "Properties > Miscellaneous > Information bar > Elements".

Toolbar

You can define the buttons of the system diagnostics control in runtime and their operator authorizations in the Inspector window under "Properties > Properties > Miscellaneous > Toolbar > Elements". Some buttons are enabled by default. To display additional buttons in the object, activate the "Visibility" property in the settings of the corresponding button.

The following buttons are available for the system diagnostics control:

Button		Function
	Home	Shows the home page.
	Reload	Updates the view of the diagnostic event.
	First line	Selects the first of the pending diagnostic events. The visible area of the view is moved.
	Previous line	Selects the previous diagnostic event, starting from the currently selected diagnostic event. The visible area of the view is moved.
	Next line	Selects the next diagnostic event, starting from the currently selected diagnostic event. The visible area of the view is moved.
	Last line	Selects the last of the pending diagnostic events. The visible area of the view is moved.
	Share view	Enables/disables the detail view.
	Previous	Navigates to the previous PLC.
	Show diagnostic buffer	Changes from the matrix view to the diagnostic view. The diagnostic view shows the diagnostics buffer of the PLC. This button is only enabled if a PLC or one of its lower-level modules is shown in the matrix view.

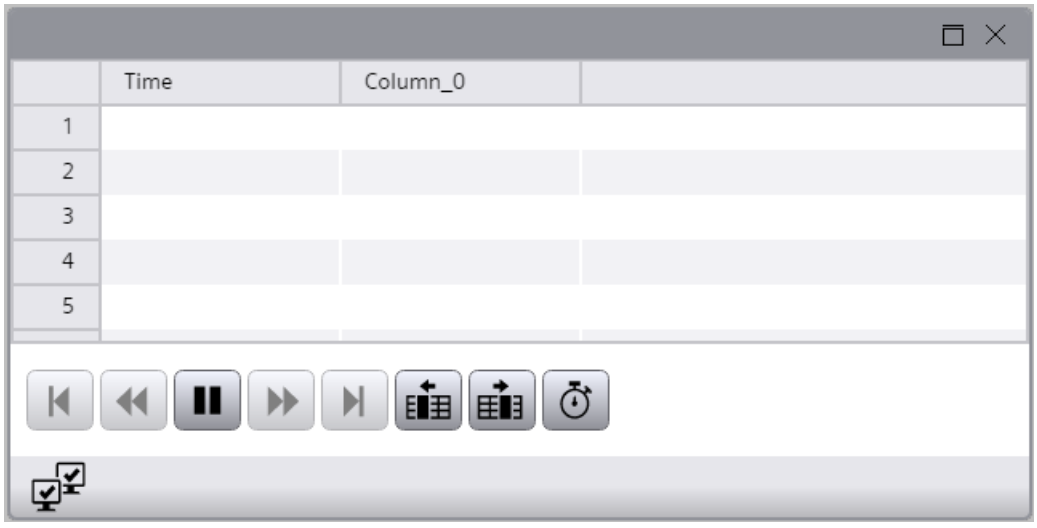
See also

Automatically filling in of property values for an object collection (Page 379)

4.2.4.10 Process control

Use

You use the "Process control" object to display the tag values in a table. You can display current, or logged values in the table. You can configure up to nine value columns. The first column is reserved for the time column.



Layout

In the Inspector window, you can customize the position, geometry, style, colors, and font types of the object. You can adapt the following properties in particular:

- "Column": Defines the setting of the value column.
- "Data source": Specifies the source for representing the values.
- "Toolbar": Specifies the buttons for the process control.

Configuring columns

To configure the columns, follow these steps:

1. Open the settings of the time column under "Properties > Miscellaneous > Process control > Columns > Time range column [0]".
2. Under "Properties > Miscellaneous > Process control > Columns > [0] Time range column > Time range", select the time range of the table:
   - "Time interval": You define the time range using a starting time and a following time interval.
   - "Start time and end time": You define the time range using a starting time and an end time.
   - "Measuring points": You define the time range using a starting time and a number of measuring points.

3. Open the settings of the respective value column under "Properties > Miscellaneous > Process control > Columns > [1] Column".
4. Under "Sort order", define the order in which the columns of the process control are shown.
5. Set the direction in which the values are sorted under "Sorting direction - default".
6. Define whether operators can re-arrange the table columns in runtime using drag-and-drop. More information is available in the section Configuring reordering of the columns (Page 392).

Defining the data source for displaying the values

To define the display of the values in the process control, follow these steps:

Under "Properties > Miscellaneous > Process control > Columns > [1] Column > Data source > Source", select:

1. Type of data source:
   - HMI tag
   - Logging tag
2. Tag that supplies the column with values.

Dynamization of graphic properties with tags or scripts

You can dynamize the following properties containing a graphic with a tag or with a script:

- Graphic
- Icon

Toolbar

You can define the buttons of the process control in runtime and their operator authorizations in the Inspector window under "Properties > Properties > Miscellaneous > Toolbar > Elements". Some buttons are enabled by default. To add more buttons in the display object, activate the "Visibility" property under the settings of the corresponding button.

The following buttons are available for the process control:

Button	Name	Function
	First record	Shows the tag values starting with the first logged value.
	Previous record	Shows the tag values in the previous time interval.
	Start/Stop	Stops and starts the column update. The values are buffered and updated as soon as you start column update again.

Button	Name	Function
	Next record	Shows the values of the tag in the next time interval.
	Last record	Shows the tag values up to the last logged value.
	Edit	Allows the editing of data in any table field that is opened when the user double-clicks it.
	Previous column	Displays the previous column in the foreground
	Next column	Displays the next column in the foreground
	Select time range	Opens the dialog for setting the time range displayed in the process control.
	Select data connection	Opens the dialog for selecting the archives and tags that serve as data the source for this process control.
	Create archive value	Creates an archived value.
	Delete log value	Deletes a logged value.
	Export	Starts the export of all or the selected runtime data to a "csv" file.

See also

Configuring the process control (Page 688)

Automatically filling in of property values for an object collection (Page 379)

4.2.4.11 Web control

Use

You use the "Web control" object to display basic HTML pages and documents in PDF format.

You have access to the data of the local user management in runtime via a "Browser".

Layout

Customize the object position and size in the Inspector window. In particular, you can customize the following property:

- "URL": Specifies which Internet address is opened in the HTML Browser.
- "Toolbar": Specifies the buttons of the browser.

Defining the URL

The "browser" object supports the following protocols:

- On a Unified Comfort Panel, HTTP protocol and HTTPS protocol.
- On a Unified PC, only the HTTPS protocol.

To define the URL, follow these steps:

Define the Internet address in the Inspector window under "Properties > Properties > URL".

Displaying HTML pages

Please note the following when using the object:

- The "Web control" object only displays content that is supported by the web browser in which runtime is open.
- The object is implemented as an iFrame. Pages with X-frame option settings that prevent the display in an iFrame are not displayed in the object.

Limitations

The "Web control" object has a limited range of functions compared to a standard browser:

- Navigation from the "Web control" object is not supported (top-level navigation).
- Calls of queries and dialogs (popups and modal dialogs) are only supported if they were activated in the file <Path for the WinCC Unified installation directory>WinCCUnified\WebRH\public\content\custom\CustomSettings.json:
  `{"CustomSettings": {"HmiWebControl" : {"AllowPopups" : true,"AllowModals" : true}}}`

  Note

  Popups and modal dialogs stop the update.

Displaying PDF files in the "Browser" on a Unified PC

The "Browser" object displays PDF files that are available:

- Locally on the HMI device
- On the Internet

You can view a PDF file in the following ways:

- Copy the PDF files to the directory "C:\Program Files\Siemens\Automation\WinCCUnified\WebRH\public".
  Under "Properties > URL", enter the address "https://localhost/WebRH/<pdfname.pdf>".

  Note

  You cannot display any PDF files that are saved locally in a different directory on your PC.

  You can also use the IP address or the PC name instead of "localhost".
  If you operate runtime on a different PC than the TIA Portal, also save the PDF files on the runtime PC.
- Enter a valid Internet address under "Properties > Properties > URL".

Influencing how the document is displayed on a Unified PC

The "Browser" object supports a large number of default parameters with which you can influence how a PDF file is displayed.

Examples of parameters when opening the PDF file:

- Jump to specific page: https://winccunified/WebRH/UCPManual.pdf#page=18
- Jump to table of contents: https://winccunified/WebRH/UCPManual.pdf#Inhaltsverzeichnis
- Zoom in on page: https://winccunified/WebRH/UCPManual.pdf#zoom=200

Displaying PDF files in the "Browser" on a Unified Comfort Panel

The "Browser" object displays PDF files that are available:

- Locally on the HMI device
- On an external storage medium

You can view a PDF file in the following ways:

- Enter path and file name in the URL input field of the "Browser" operating object.
- In the configuration of the "Browser" operating object under "Properties", link the URL with a tag of the type WString which contains path and file name.

Syntax: file:///<path>/<filename>.pdf

Pay attention to uppercase/lowercase spelling.

Examples:

- Open file from the data memory card: file:///media/simatic/X51/UCPManual.pdf
- Open locally saved file: file:///home/industrial/UCPManual.pdf

Influencing how the document is displayed on a Unified Comfort Panel

The "Browser" object supports a large number of default parameters with which you can influence how a PDF file is displayed.

Examples of parameters when opening the PDF file:

- Open file on page 20: file:///media/simatic/X51/UCPManual.pdf?20#page=20
- Open file with zoom factor 150%: file:///media/simatic/X51/UCPManual.pdf?150#zoom=150
- Open file on page 20 with zoom factor 150%: file:///media/simatic/X51/UCPManual.pdf?(20,150)#page=20&zoom=150

Dynamization of graphic properties with tags or scripts

You can dynamize the following properties containing a graphic with a tag or with a script:

- Graphic
- Icon

Toolbar

You can define the buttons of the browser in runtime and their operator authorizations in the Inspector window under "Properties > Properties > Miscellaneous > Toolbar > Elements". Some buttons are enabled by default. To add more buttons in the display object, activate the "Visibility" property under the settings of the corresponding button.

See also

Automatically filling in of property values for an object collection (Page 379)

4.2.4.12 Media Player

Use

You use the "Media Player" object to play multimedia files in Runtime.

Layout

You can set the following properties in the Inspector window:

- "URL": Defines the file that is played back in the Media Player.
- "Toolbar": Specifies the buttons of the Media Player.

Supported file formats

The Media Player supports all file formats that are supported by the utilized browser.
The playback of multimedia files in the object depends not only on the file format, but also on the video and audio codecs installed on the computer.

Note

If you copy the project to another PC, keep the following in mind: Files specified in the WinCC Media Player are not copied with the project if the files are dynamically linked and no UNC path is specified. You have to load the files into the project again.

Accessing a file in the Media Player

To access files in the Media Player, you must have stored them in the Public directory of the WinCC Unified installation.

To access a file in the Media Player, follow these steps:

1. Store the file in the Public directory of the WinCC Unified installation, e.g. "C:\Program Files\Siemens\Automation\WinCCUnified\WebRH\public". You can also create a subdirectory, e.g. "MediaFiles".
2. Click "Properties > All properties > URL". Enter the URL.
   You can structure a valid URL according to the following scheme: "https://<ComputerName>.<DomainName>/WebRH/<FileName>".
   Example: "https://mycomputer.siemens.net/WebRH/Twistlock.mp4".
   If you have created a subdirectory, e.g. "MediaFiles", enter the URL in the following format: "https://mycomputer.siemens.net/WebRH/MediaFiles/Twistlock.mp4".

Alternatively, you can change the address via a script, e.g.:

```
Screen.FindItem('MediaControl').Url = https://
<ComputerName>.<DomainName>/WebRH/<FileName>
```

Dynamization of graphic properties with tags or scripts

You can dynamize the following properties containing a graphic with a tag or with a script:

- Graphic
- Graphic - pressed button
- Icon

Toolbar

You can define the buttons of the Media Player in Runtime and their operator authorizations in the Inspector window under "Properties > Properties > Miscellaneous > Toolbar > Elements". Some buttons are enabled by default. To add more buttons in the display object, activate the "Visibility" property under the settings of the corresponding button.

The following buttons are available for the Media Player:

Button	Name	Function
	Play	Plays the video or audio file.
	Pause	Pauses the video or audio file.
	Stop	Stops the video or audio file.
	Search forward	Searches for the next video or audio file.

Button	Name	Function
	Search backward	Searches for the last video or audio file.
	Mute	Mutes the video or audio file.

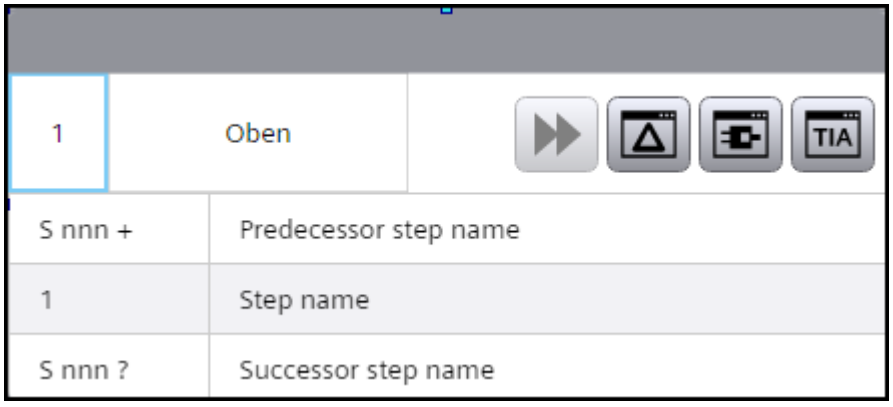
http://support.automation.siemens.com (http://support.automation.siemens.com/WW/view/en/62101921)

4.2.4.13 GRAPH overview

Use

The "GRAPH Overview" object is used to display the current program status for executed steps of the GRAPH sequencer. Errors during execution of a program are displayed directly at the corresponding step.



The following information is displayed in the "GRAPH Overview" object:

- Name and status of the function block
- Status of initial and simultaneous steps
- Number and name of the first step currently executed step
- Operating mode for running the GRAPH sequencer

WinCC supports the display of step names for the GRAPH blocks in multiple languages starting from Version 6.0. The step names will then be displayed in the selected Runtime language following a language changeover in Runtime. If the selected language is not available in the GRAPH block, the names are displayed in the default language (English).

Note

Device dependency of the "GRAPH Overview" object

The "GRAPH overview" object is available for Unified PC.

Note

Requirement for display in GRAPH overview

For the display of the program status of an S7 GRAPH instance data block in the "GRAPH overview" object to be possible, the instance-specific properties of the block must be set as "Visible in HMI" and "Accessible from HMI".

Layout

In the Inspector window, you customize the position, style, colors and font types of the object. You can adapt the following properties in particular:

- Assigned GRAPH DB tag
- Buttons of the toolbar

Operating mode

Four operating modes are available for running the GRAPH sequence:

- AUTO (default setting) - Automatically switches to the next step when the transition is fulfilled.
- TAP - Automatically switches to the next step when the transition is fulfilled and there is an edge change from "0" to "1" at the T_PUSH parameter.
- TOP - Automatically switches to the next step when the transition is fulfilled or there is an edge change from "0" to "1" at the T_PUSH parameter.
- MAN - The next step is not automatically enabled when the transition is fulfilled. The steps can be selected and deselected manually.

Note

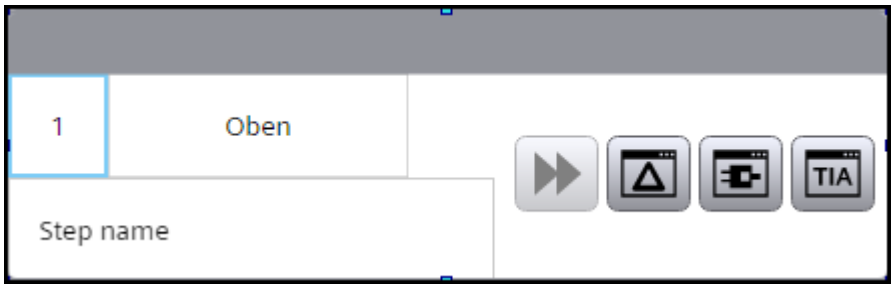
You set the operating mode by modifying the interface parameters of the GRAPH block in your control program.

In WinCC Unified Runtime, you have the option to customize the name for the operating mode that is displayed in the GRAPH overview.

Configuring a compact view

You can also configure a slim GRAPH overview without toolbar buttons and operating mode display.

To display a slim GRAPH overview in single-line compatibility mode, drag the control to the desired size.



Symbols

The symbols displayed in the GRAPH overview are pre-defined:

Symbol	Name	Function
	Error	Indicates that an error has occurred during the execution of a step.
	Initial step	Indicates that the currently executing step is the first step in the GRAPH block.
	Simultaneous step	Shows that there are other simultaneous steps in the GRAPH block in addition to the current one.

Buttons

You specify the buttons that are displayed in the GRAPH overview under "Properties > Miscellaneous > Toolbar > Elements".

Button	Name	Function
	Next Step	Jumps to the next step in parallel step. When you get to the last step, you can jump back to the first step.
	Jump to Alarm Control	Opens the configured alarm view with the error alarm in WinCC Unified. The button is intended to be populated with appropriate system functions/ scripts.
	Jump To PLC Code Viewer	Opens the configured PLC code view. The button is intended to be populated with appropriate system functions/ scripts. Ideally, use the "OpenViewerGraphFromOverview" system function.
	Jump to TIA Portal	Several system functions are available for opening the TIA Portal.

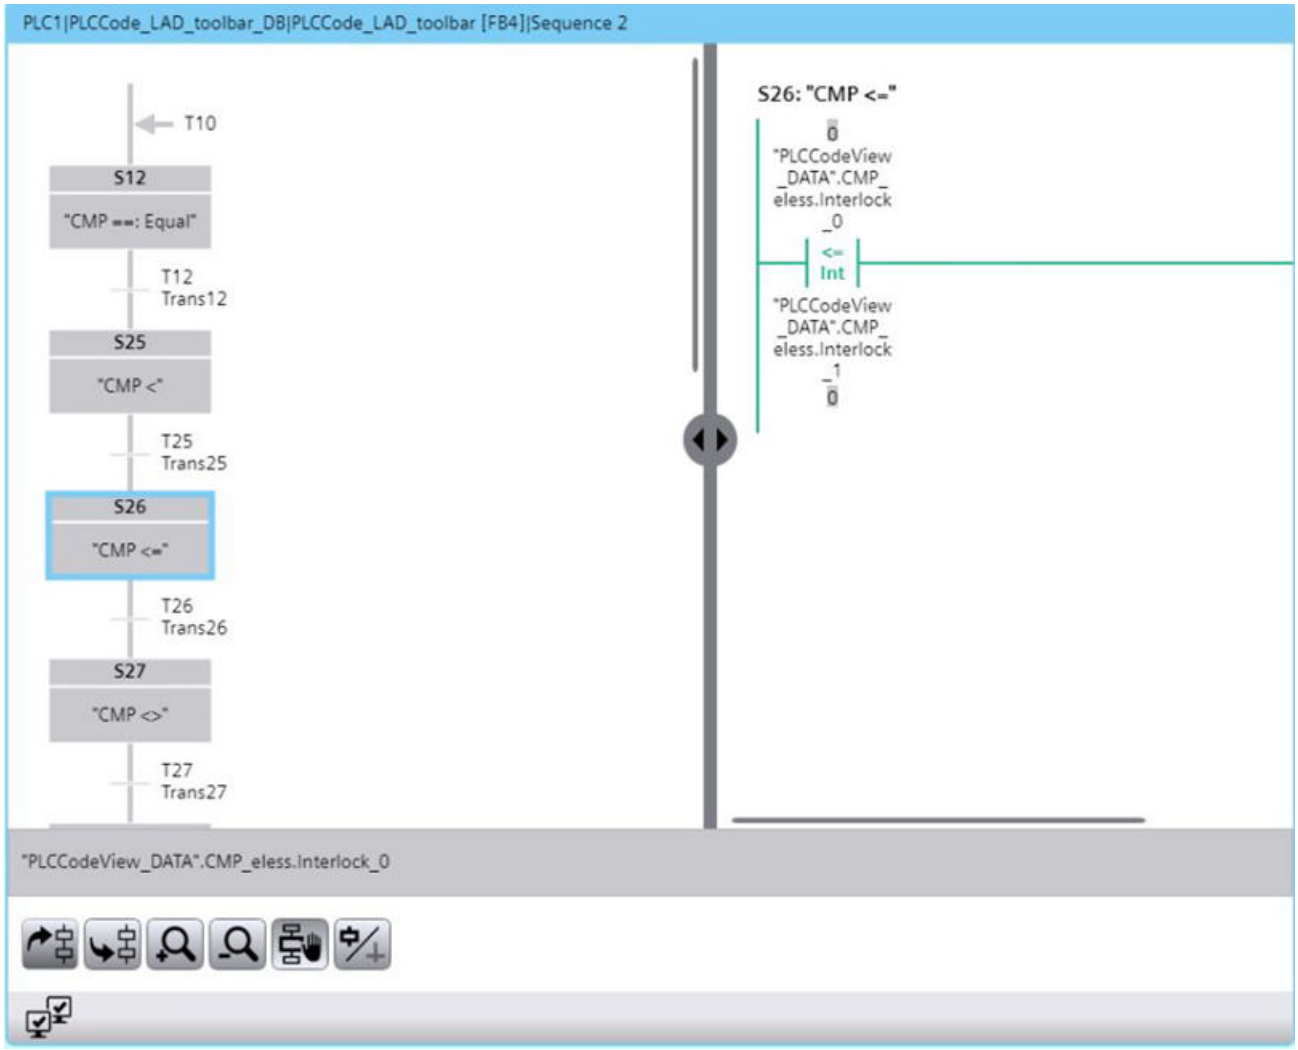
4.2.4.14 PLC code view

Use

The "PLC code viewer" object is used to display the current program status of user programs that have been programmed in the GRAPH programming language.

In the PLC code view, you display various items of information about the user program:

- Information area
- Toolbar
- Detail view
- Transition/Interlock view



Information area

The information area shows the GRAPH sequence in the left area and the details, e.g. for the step or for the transition, in the right area.

Toolbar

The toolbar shows information about the first or the selected icon.

Buttons of the toolbar

The table below shows the buttons on the toolbar and their meaning.

Operating element	Description	Function
	"Previous network"	Navigates to the previous network.
	"Next network"	Navigates to the next network.
	"Zoom in"	Enlarges the information area.
	"Zoom out"	Reduces the information area.
	"Step mode"	Switches between manual and automatic step selection for the active step.
	"Transition or Interlock"	Switches between the transition and interlock networks.

4.2.5 My Controls

4.2.5.1 Using custom web controls

Introduction

You can use custom web controls in WinCC.

For custom web controls to be displayed in the TIA Portal, store the custom web controls in the folder <project_folder>/UserFiles/CustomControls.

Requirement

- A project has been created.
- A Unified device has been created.
- A screen is open.

Using custom web controls

Custom web controls are stored in the TIA Portal in "Tools > My Controls".

If you want to use a custom web control, follow these steps:

1. Insert the custom web control into the open screen by dragging-and-dropping the control from the "My Controls" palette to the screen.
2. Specify the properties of the custom web control in the Inspector window.
3. Configure the events for the custom web control.

Using custom web controls as a master copy

When you add the custom web control as a master copy to the project library, the control is changed.

You update the copied custom web control by clicking on the "Update" icon.

Managing properties and events

You can change the properties and create or delete events without having to open the project again or restart TIA Portal.

You have the following two options for managing the properties and events:

- Extract the manifest file from the .zip file, make the changes, and save the manifest file back to the .zip file.
- Create a separate .zip file with the changed manifest file and overwrite the .zip file in the CustomControls folder.

4.2.5.2 Updating Custom Web Controls

Introduction

After changing the properties for custom web controls or configuring new events, you can update custom web controls.

Updating custom web controls

If you have changed the properties for custom web controls or configured new events, you can update the custom web controls as follows:

1. Click the Update icon in the "My Controls" palette.
2. Custom web controls are updated.
3. A message appears in the Inspector window:
   - "The object '{0}' was updated successfully".
   - "The object '{0}' was updated successfully, but some properties have been lost due to incompatible changes to the interface."
   - "All objects are up to date". You have not changed any properties or alarms.

Note

The placeholder '{0}' stands for a unique and complete path on which the custom web control is stored.

Restrictions for the update

If you have opened a project as read-only, the update is not possible.

The following changes to the custom web control prevent the automatic update:

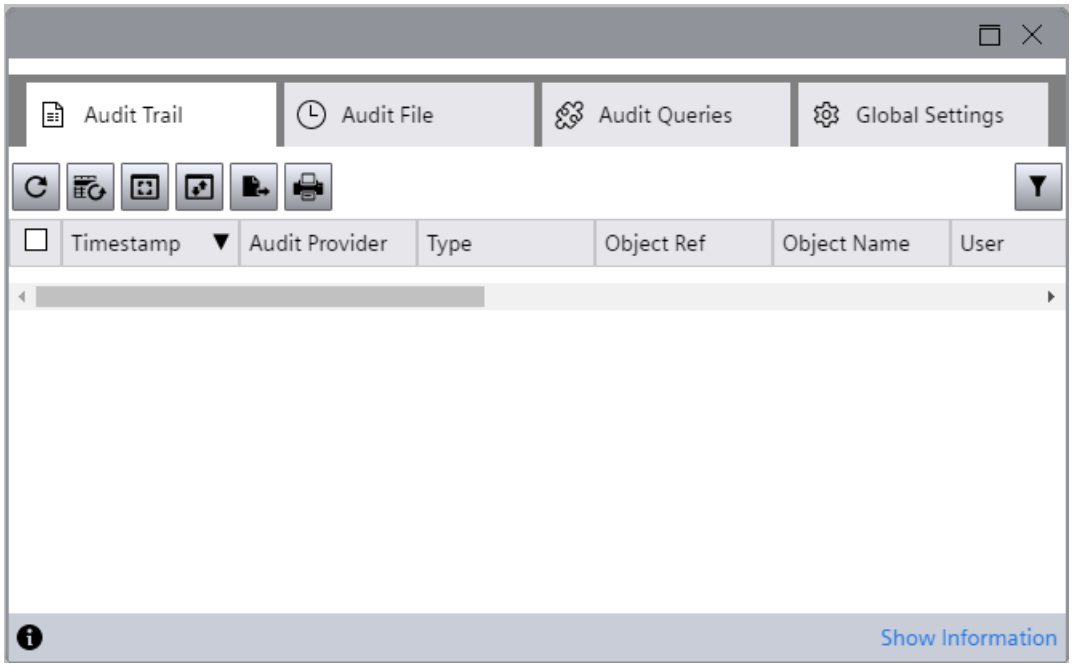
- Renaming properties or events
- Deleting properties or events
- Changing the data type

4.2.5.3 My Controls - Overview

Audit Viewer

Use

You use the "Audit Viewer" object to evaluate in table form all data of the audit trail in Runtime.



Layout

In the Inspector window, you can customize the settings for the position, geometry, style, and color of the object. You can adjust the following properties in particular:

- "Text": Specifies the text for the label.
- "Window settings": Defines the settings for display in Runtime.

Text

To set a text for the Audit Viewer, follow these steps:

1. Click "Properties > Miscellaneous > Label > Font" in the Inspector window.
2. Select a font.
3. Click "Properties > Miscellaneous > Label > Text" in the Inspector window.
4. Enter a text.

Resizing in Runtime

To resize the Audit Viewer in Runtime, follow these steps:

1. Activate the options "Show border" and "Can be sized" in the Inspector window "Properties > Appearance > Window settings".
   The width of the border is not evaluated.

Dynamization of graphic properties with tags or scripts

You can dynamize the following property containing a graphic with a tag or with a script:

- Icon

Plant overview

Use

You use the "Plant overview" object to display the configured plant view in runtime.

You use it to navigate to the plant objects within the plant structure and get an overview of your plant at one glance.

If you have configured screens or alarms for the lower-level plant objects and have linked them to the "Plant overview" object, navigate to these screens and alarms and display them.

Layout

You change the settings for the position, geometry, style, and color of the object in the Inspector window.

To enable navigation between the screens of the plant objects, configure the companion controls under "Properties > Miscellaneous > Interface > Companion controls".

Buttons

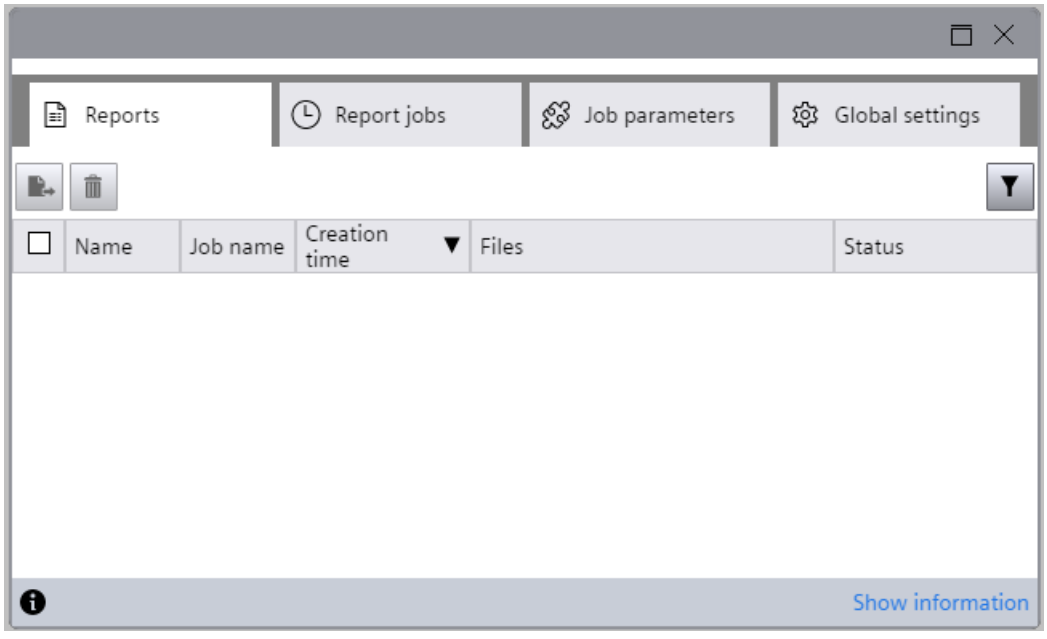
The following buttons are available for the "Plant overview" object in runtime:

Button	Name	Function
	Expand	Expands the plant view with the lower-level plant objects.
	Collapse	Collapses the plant view with the lower-level plant objects.
	Filter	Defines which plant objects are displayed.

Reports

Use

You use the "Reports" object to create and manage report tasks in runtime. You have access to the reports generated by the report jobs.



You can find detailed information on configuring the object in the engineering system in the section Configuring production reports in the engineering system (Page 7655).

You can find detailed information on configuring report tasks in runtime in the section Working with production reports in Runtime (Page 7719).

Layout

In the Inspector window, you change general settings of the object such as the position, height, width, label and window settings.

See also

Basics of Reporting (Page 7647)

The user interface of the "Reports" control (Page 7722)

4.2.6 Graphics

4.2.6.1 External graphics

Introduction

You can use graphics created with an external graphic program in WinCC. To use these graphics you store them in the project graphics of the WinCC project.

You can save graphics in the project graphics:

- When you drag-and-drop graphics objects from the "Graphics" pane into the work area, these are stored automatically in the project graphics. The graphic names are numbered in the order of their creation, for example, "Graphic_1." Use the <F2> function key to rename the graphic.
- As a graphic file with the following formats:
  *.bmp, *.ico, *.emf, *.wmf, *.gif, *.tif, *.png, *.svg, *.jpeg or *.jpg
- As an OLE object that is embedded in WinCC and is linked to an external graphic editor. In the case of an OLE link, you open the external graphic editor from WinCC. The linked object is edited using the graphic editor. An OLE link only works if the external graphic editor is installed on your PC, and supports OLE.

Note

High-resolution graphic objects require a lot of memory in the project and cause long loading times. They also reduce performance in Runtime.

Use graphic objects with a resolution that is sufficient for a high-quality display in the Runtime project. Note the display resolution of the target device and the size in which the graphic object is displayed on the display of the target device. Adapt the resolution of large graphic objects accordingly before using them in your project.

Use of graphics from the project graphics

Graphics from the project graphics are used in your screens:

- In a graphic view
- In a graphic list
- As labeling for a button

To use a graphic in the screen or in the screen object, drag-and-drop the desired graphic to the screen or the screen object. Alternatively, select the graphic from the selection list in the "Graphic" property in the Inspector window.

Transparent graphics

In WinCC, you also use graphics with a transparent background. When a graphic with a transparent background is inserted into a graphic object of WinCC, the transparency is replaced by the background color specified for the graphic object. The selected background color is linked firmly to the graphic. If you use the graphic in another graphic object of WinCC, this object is displayed with the same background color as the graphic object that was configured first. If you want to use the graphic with different background colors, include this graphic in the project graphics again under a different name. The additional background color is configured when the graphic is used at the corresponding graphic object of WinCC.

Managing graphics

An extensive collection of graphics, icons and symbols is installed with WinCC. In the Toolbox window of the "Graphic" pane the graphic objects are structured by topic in the "WinCC graphics folder." The link to the WinCC graphics folder cannot be removed, edited or renamed.

The "Graphics" pane is also used to manage the external graphics. The following possibilities are available:

- Creating links to graphics folders
  The external graphic objects in this folder, and in the subfolders, are displayed in the toolbox and are thus integrated in the project.
- Editing folder links
- You open the program required for editing of the external graphic in WinCC.

4.2.6.2 Managing external graphics

Introduction

External graphics that you want to use in WinCC are managed in the "Screens" editor by using the "Tools" task card in the "Graphics" pane.

Requirement

- The "Screens" editor is open.
- The "Toolbox" task card is open.

- The graphics are available.
- The graphics have the following formats:
  *.bmp, *.ico, *.emf, *.wmf, *.gif, *.tif, *.svg, *.jpeg, *.jpg

Creating a folder link

1. Click "My graphics folder."
2. Select "Link" in the shortcut menu.
   The "Create link to folder" dialog is opened. The dialog suggests a name for the folder link.
3. Edit the name as required. Select the path containing the graphic objects.
4. Click "OK" to confirm your input.
   The new folder link is added to the "Graphics" object group. The external graphics that are located in the target folder and in sub-folders are displayed in the toolbox.

Editing folder links

1. Select the folder link to edit.
2. Select the "Edit link..." command from the shortcut menu.
   The "Create link to folder" dialog is opened.
3. Edit the name and path of the folder link as required.
4. Click "OK" to confirm your input.

Renaming the folder link

1. Select the folder link to rename.
2. Select "Rename" from the shortcut menu.
3. Assign a name to the new folder link.

Removing a folder link

1. Select the folder link you want to delete.
2. Select "Remove" in the shortcut menu.

Edit external graphics

1. Select the graphic you want to edit.
2. Select the "Edit graphic" command from the shortcut menu.
   This opens the screen editor associated with the graphic object file.

Editing graphics folders from WinCC

1. Select the graphic you want to edit.
2. Select "Open folder" from the shortcut menu.
   The Windows Explorer opens.

4.2.6.3 Managing SVG graphics

Introduction

You can import SVG graphics into the TIA Portal for visualization. You can adapt the source file for the SVG graphics so that the SVG graphics are displayed correctly in the TIA Portal.

Requirement

- The HMI screen is open.

Importing SVG graphics

To import an SVG graphic into the TIA Portal, follow these steps:

1. In the project tree, under "Languages & Resources", click on "Project graphics".
2. Use drag-and-drop to add an SVG graphic from your storage location into the project graphics.
3. In the "Default graphic" column, click the added graphic.
4. Information about the SVG graphic is displayed in the Inspector window under "General > Properties".

Displaying SVG conversion information

In the Inspector window, under "Properties > General" in the "Graphics" area, you can find the "Show SVG conversion information" button.

To display the SVG conversion information, follow these steps:

1. Click on the button.
2. An "SVG conversion information" dialog with 2 scrollable read-only text boxes opens:
   - "SVG content": The content of the SVG image file is imported into the TIA Portal as a result of the conversion.
   - "SVG conversion protocol": Messages about the changes during conversion.
     During the import of SVG files into the TIA Portal, the contents that are not supported by WinCC Unified and HMI systems are removed.

You can select and copy the text in the dialog.

"SVG conversion information" dialog

The "SVG conversion information" dialog contains:

- Messages created during the import of the SVG file.
- Information on the content that was removed during conversion.

Depending on the exact content of the original SVG file, checking and conversion may be carried out in multiple test cycles. The protocol segments of the test cycles are separated by a hyphenated separator line ("-----"). The row number of the original SVG file is only specified for the first conversion test cycle.

The conversion protocol is created and provided in English, regardless of the current user interface language or runtime language settings in the project.

Editing SVG graphics

To edit an SVG graphic, follow these steps:

1. Right-click the graphic in the "Default graphic" column.
   The shortcut menu opens.
2. Click "Edit".
   An external editor for editing the graphics opens.

You can now edit the SVG graphic.

4.2.6.4 Restrictions on SVG graphics

Introduction

The SVG graphics support the SVG 1.2 Tiny standard. Note the following restrictions when using SVG graphics:

Restrictions on SVG graphics

- The CSS definitions are converted to inline attributes.
- Embedded scripts and non-local URLs are not supported in the SVG graphics and are removed from the original graphics during conversion when imported into the TIA Portal.
- The use of SVG graphics with embedded animations is not supported.
- The use of large SVG graphics affects performance due to the load associated with the increased characters.
- Migration of SVG graphics from WinCC V7 to TIA Portal is not supported.

- The following SVG characteristics are not supported:
  - Scripting
  - Interactivity
  - Styling
  - Expandability - no ForeignObjects
  - Animations
- Screen objects using an SVG graphic that was scaled in the Engineering System as a background graphic are not displayed correctly in Runtime in Chrome.
- SVG graphics for which the "Scale background graphic" property in engineering in faceplates is set to "Stretch to fit" are not displayed correctly in Runtime in Chrome.
  Convert such a graphic into a bitmap to use it in engineering. Or, for Runtime, select a web browser other than the web client, such as Firefox.
- If the "Scale background graphic" property is configured with the value "None" for screen objects, set the following SVG attributes to display SVG graphics:
  - Width: Pixel or percent
  - Height: Pixel or percent

  Specifications for width and height are recommended in pixels. If the width and height are not set, the pixel values entered in the SVG attribute "viewbox" are used. This does not apply to Firefox.

4.2.7 Dynamic widgets

4.2.7.1 Managing dynamic SVG graphics

Introduction

You can use dynamic SVG graphics in WinCC. For SVG graphics to be displayed in the TIA Portal, store the graphics in the folder <project_folder>/UserFiles/SVGControls.

Requirement

- A project has been created.
- A Unified device has been created.
- A screen is open.

Managing dynamic SVG graphics

The dynamic SVG graphics are stored in the TIA Portal in "Tools > Dynamic widgets > Project graphics".

If you want to manage an SVG graphic, follow these steps:

1. Insert the SVG graphic into the open screen by dragging the graphic from the "Project graphics" folder to the screen.
2. Specify the properties of the SVG graphic in the Inspector window.
3. Configure the events for the SVG graphic.

You can change the properties and create or delete events without having to open the project again or restart TIA Portal.

The SVG graphic is also displayed in the project graphics in "Project tree > Languages and resources".

Updating dynamic SVG graphics

If you have changed the properties of the SVG graphic or configured new events, you can update the SVG graphic as follows:

1. Click the Update icon  in the "Dynamic widgets" palette.
2. The dynamic SVG graphics are updated.
3. A message appears in the Inspector window:
   - "The object '{0}' was updated successfully".
   - "The object '{0}' was updated successfully, but some properties have been lost due to incompatible changes to the interface."
   - "All objects are up to date". You have not changed any properties or alarms.

Note

The placeholder '{0}' stands for a unique and complete path on which the SVG graphic is stored.

Restrictions for the update

If you have opened a project as read-only, the update is not possible.

The following changes to the SVG graphic prevent the automatic update:

- Renaming properties or events.
- Deleting properties or events.
- Changing the data type.

Using dynamic SVG graphic as a master copy

When you add the SVG graphic as a master copy to the project library, the SVG graphic is changed.

You update the copied SVG graphic by clicking on the "Update" icon.

Restrictions on SVG graphics

The SVG graphics support the SVG 1.2 Tiny standard. Note the following restrictions when using SVG graphics:

- The CSS definitions are converted to inline attributes.
- Embedded scripts and non-local URLs are not supported in the SVG graphics and are removed from the original graphics during conversion when imported into the TIA Portal.
- The use of SVG graphics with embedded animations is not supported.
- The use of large SVG graphics affects performance due to the load associated with the increased characters.
- Migration of SVG graphics from WinCC V7 to TIA Portal is not supported.
- The following SVG characteristics are not supported:
  - Scripting
  - Interactivity
  - Styling
  - Expandability - no ForeignObjects
  - Animations

If screen items have the value "None" for the "Scale background graphic" property, set the following SVG attributes to display SVG graphics:

- Width: Pixel or percent
- Height: Pixel or percent

Note

Specifications for width and height

Specification in pixels is recommended. If the width and height are not set, the pixel values entered in the SVG attribute "viewbox" are used. This does not apply to Firefox.

Note

Scaled SVG graphics in Chrome

Elements using an SVG graphic that was scaled in the engineering system as background graphic are not displayed correctly in Chrome in Runtime.

Editing dynamic SVG graphics

It is not possible to open SVG graphics in an external editor using the "Edit" command.

4.3 Configuring screen objects

4.3.1 Select multiple objects

Introduction

To align the object with one another or rotate them, select all affected objects. This procedure is called "multiple selection."

The Inspector window shows all the properties of the selected objects.

You have the following options to select multiple objects:

- Draw a selection border around the objects.
- Hold down the <Shift> key, and click the required objects.

Selection border of a multiple selection

The selection border surrounds all objects of a multiple selection. The selection border is comparable with the bounding box that surrounds an object.

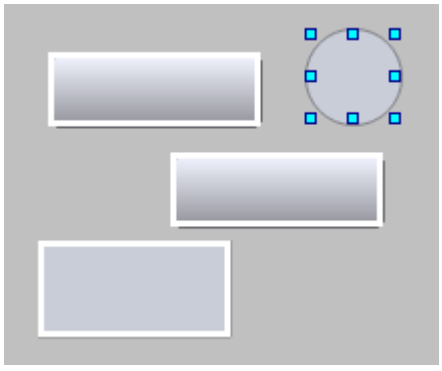
The selection border is only visible as long as it is pulled up with the mouse button pressed. When you have made your multiple selection, the following border is displayed:

- The reference object is indicated by the bounding box.
- The other selected objects are indicated by a border. The color of the border depends on the background color of the screen.

The color of the selection border is adapted to the background color of the screen in such a way that the selection border is correctly displayed and visible with multiple selection.

Specifying a reference object

The reference object is the object upon which the other objects are oriented. The reference object is framed by a bounding box with handles. The following figure shows a reference object with three additional selected objects:



You have the following options to specify the reference object:

- Select the objects via multiple selection. The object selected first is then the reference object.
- Draw a selection border around the objects. As a reference object, the object is automatically defined as on top in the foreground. If you wish to specify a different object within the selection as the reference object, click on the desired object. This action does not cancel your multiple selection.

Requirement

- The HMI screen is open with at least two objects.

Selecting multiple objects with a selection border

To select multiple objects using a selection border, follow these steps:

1. Position the mouse pointer in the work area close to one of the objects to be selected.
2. Hold down the mouse button, and draw a selection border around the objects to be selected.

Selecting multiple objects using the <Shift> key

To move multiple objects with the <Shift> key, follow these steps:

1. Hold down the <Shift> key.
2. Click the relevant objects, working in succession.
   All the selected objects are identified by borders.
   The object selected first is identified as reference object.

Note

To remove an object from the multiple selection, press <Shift>, hold it down and then click the relevant object once again.

Result

Multiple objects are selected. An object is identified as the reference object. You can perform the following steps:

- Move or rotate all objects together.
- To resize all objects by the same ratio, drag the selection border to increase or reduce the size.
- Align the objects to the reference object.
- Change object properties.

4.3.2 Copying objects

Introduction

You can copy objects individually or with a multiple selection.

Requirement

- The HMI screen is open with at least one object.

Copying objects

To copy an object, follow these steps:

1. Select the object.
2. Copy the object with <Ctrl + C> or select "Copy" in the shortcut menu.
3. Paste the object with <Ctrl + V> or select "Paste" in the shortcut menu.
4. Drag and drop the copied object to the required position.

If you want to copy multiple objects using multiple selection, draw a selection frame around the desired objects and proceed as described above.

Using copied objects with the same spacing

If you want to use the copied object multiple times, proceed as described above. Press <Ctrl + V> or select "Paste" repeatedly to automatically paste the objects in the HMI screen with equal spacing.

The same principle also applies to multiple selection of the objects.

4.3.3 Creating objects automatically

Introduction

You can automatically create the objects by dragging a screen, a graphic, a graphic list, a text list or a tag into an HMI screen.

Requirement

- The HMI screen is open.

Creating objects automatically

You can create the following objects automatically:

- Button: Drag an HMI screen from the project tree to another screen.
- Graphic view:
  - Drag a graphic from the detail view of the project graphics into the screen.
  - Drag a graphic list from the detail view of the text and graphic lists into the screen.
- Text box: Drag a text list from the detail view of the text and graphic lists into the screen.
- IO field: Drag a tag from the detail view of the tag table into the screen.

4.3.4 Defining the output format

Introduction

In many objects you can adjust the output format for the displayed values or define it yourself. You can process and output the process value that is displayed in the object in different notations. You can select frequently used output formats directly in the user interface. You can adjust the formatting codes or define them yourself.
You can define the output of a screen object in "Properties > General > Output format" for the following data:

- Floating-point numbers
- Binary
- Hexadecimal
- Decimal
- Text
- Duration, date, time
- Percent, currency, unit
- Numerical values

The definition of the output format is based on UNICODE CLDR. You can find additional information on the CLDR project and on the definitions on the Internet at http://cldr.unicode.org/ (http://cldr.unicode.org/)

Requirement

- The HMI screen is open with at least one object.

Defining the output format

You can define the output format by stringing together formatting codes. The formatting codes act as placeholders for a specific group of characters. If, for example, a formatting code that only allows the display of the digits 0-9 is specified for a position in the display of the IO field, you cannot input letters at this position.

The definitions for the output format are independent of the language. The output format can be language-specific and thus take linguistic differences into account, for example, for output of the date.

You can define and combine different format patterns yourself.

	**Efficiency tip**
• Select the output format from the drop-down list or edit it manually in the input window. You can also customize the combined output formats, for example, change the output format "{D} {T}" manually to "{D,long} {T}".	

The tables below show examples for the definition of output formats that are frequently used.

"Binary" data format

You use the "Binary" data format to display binary values. The "Binary" data format has the following inputs:

- Sign "B"
- Number of digits (optional)
- Information on forming blocks (optional)

Output format example	Mindigits	Block size	Tag value	Result
{B}	Default	-	16	1 0000
{B8}	8	-	16	0001 0000
{B8}	8	-	80	0101 0000
{B8,4}	8	4	80	0101 0000
{B,2}	Default	2	80	1 01 00 00
{B}	Default	-	-1	1111 1111

Mindigits	Number of digits (optional)	Minimum: 1	Maximum: 64	Default value: 1
Block size	Number of digits in front of the separator (optional)	Minimum: 0 (none)	Maximum: 8	Default value: 4

Note

The "Binary" data format does not support any negative values in Unified Runtime.

If you wish to output negative values, use the "Integer" or "Float" data formats with the {F} or {N} sign.

"Hexadecimal" data format

You use the "Hexadecimal" data format to display hexadecimal values. The "Hexadecimal" data format has the following inputs:

- Sign "H"
- Number of digits (optional)
- Information on forming blocks (optional)

Output format example	Mindigits	Block size	Tag value	Result
{H}	Default	-	1	1
{H}	Default	-	15	F
{H}	Default	-	45054	AFFE
{H4,2}	4	2	45054	AF FE
{H,2}	Default	2	45054	AF FE

Mindigits	Number of digits (optional)	Minimum: 1	Maximum: 16	Default value: 1
Block size	Number of digits in front of the separator (optional)	Minimum: 0 (none)	Maximum: 8	Default value: 4

Note

The "hexadecimal" data format does not support any negative values in Unified Runtime.

If you wish to output negative values, use the "Integer" or "Float" data formats with the {F} or {N} sign.

"Integer" data format

You use the "Integer" data format to display decimal values. The "Integer" data format has the following inputs:

- Sign "I"
- Number of digits (optional)
- Plus or minus sign in front of the sign (optional)

Output format example	Mindigits	Tag value	Result
{I}	Default	9	9
{I4}	4	9	0009
{0000}	Default	9	0009
{I2}	2	123	123
{I}	Default	1.6	1
{+I}	Default	1	+1
{I1}	1	123456789	123456789
{#,##0}	Default	1,234	1,234
{E}	Default	1.12E+3	1.12E+3
{E3}	3	1.123E+3	1.123E+3

+/-	Sign (optional)			Default value: None
Mindigits	Number of digits (optional)	Minimum: 1	Maximum: 16	Default value: 1

"Float" data format

You use the "Float" data format to display values with floating-point numbers. The "Float" data format has the following inputs:

- Sign "F", "N", "E"
- Number of decimal places (optional)
- Plus or minus sign in front of the sign (optional)

Output format example	Mindigits	Tag value	Result
{F}	default	123.456	123.45
{+F}	default	123.1	+123.10
{F3}	3	123.123	123.123
{N}	default	123	123.00
{+N}	default	123	+123.00
{N1}	1	123	123.0
{#,##0.###}	default	1234.567	1,234.567
{#,##0.##}	default	1234.123	1234.12
{#,###.#}	default	1234.123	1,234.1
{E}	default	1123	1.12E+3
{E1}	1	1123	1.1E+3
{E3}	3	1123	1.123E+3
{+E}	default	1123	+1.12E+3
{E0}	0	1123	1E+3

+/-	Sign (optional)			Default value: None
Mindigits	Number of decimal places (optional)	Minimum: 1	Maximum: 16	Default value: 2

"String" data format

You use the "String" format to display texts. The "String" data format has the following inputs:

- Sign "S"
- Number of characters (optional)
- Formatting parameters (optional)

Output format example	Maxchars	String format	Tag value	Result
{S}	Default	-	Motor	Motor
{S4}	4	-	Motor	Moto
{S,trim}	Default	trim	Motor	Motor
{S,upper}	Default	upper	Motor	MOTOR
{S,lower}	Default	lower	Motor	motor
{S,trim,upper}	Default	trim, upper	Motor	MOTOR
{S3,trim,upper}	3	trim, upper	Motor	MOT

Maxchars	Number of characters (optional)	Minimum: 1	Maximum: 99	Default value: Complete input
String format	Parameters for formatting of the input (optional)	trim: Outputs the input string without spaces. upper: Outputs the input string in uppercase letters. lower: Outputs the input string in lowercase letters.		

"Duration" data format

The accuracy of the duration inputs is limited to 1 ms. All inputs of less than 1 ms are shown as 0 in runtime.

To display fractions of a second, use .S, .SS or .SSS according to the pattern for the duration.

The "Period" data format has the following inputs:

- Sign "P"
- Number of time units (optional)

Output format example	Tag value (ns)	Result
{P}	1:20	1:20
{P,s}	10000000	1
{P,s}	-10000000	-1

Output format example	Tag value (ns)	Result
{P,s}	10000000	01
{P,m:ss}	35990000000	59:59
{P,h:mm:ss}	36000000000	1:00:00
{P,hh:mm:ss}	36000000000	01:00:00
{P,D hh:mm:ss}	864000000000	1D 00:00:00
{P,DD hh:mm:ss}	864000000000	01D 00:00:00
{P,s.S}	10000	0.0
{P,s.SS}	10000	0.00
{P,s.SSS}	10000	0.001
{P,s.SSS}	9999	0.000

Durationunit Duration

The output format {P} enables automatic mode. In the mode the result with the smallest necessary unit of time is written. The table below shows some examples for tag values and their output in automatic mode.

Tag value (ns)	Result	Meaning
9999	0	0.9999 ms
10000	0.001	1ms
9990000	0.999	999ms
10000000	1	1s
10010000	1.001	1s 1ms
600000000	1:00	1m
700000000	1:10	1m 10s
35999990000	59:59.999	59m 59s 999ms
36000010000	1:00:00.001	1h 1ms
863999990000	23:59:59.999	23h 59m 59s 999ms
937845670000	1D 02:03:04.567	1D 2h 3m 4s 567ms
86400000000000	100D	100D

Localized output: "Date" and "time" data format

"Date" and "time" data formats can be localized. The output format depends on the system language. The table below shows the examples for "German".

Data format	Permitted values and default values	Output format example	Tag value	Result
Date: {D,Length}	Length: short medium long or code according to CLDR format with the sign @ Default value: short	{D}	2019-03-21T21:08:33	21.03.19
		{D,medium}	2019-03-21T21:08:33	21.03.2019
		{D,long}	2019-03-21T21:08:33	March 21, 2019
		{D,@y}	2019-03-21T21:08:33	2019
		{D,@dd.MM.yyyy}	2019-03-21T21:08:33	21.03.2019
		{D,@dd. MMMM yyyy}	2019-03-21T21:08:33	March 21, 2019
		{D,@dd.MM}	2019-03-21T21:08:33	21.03
		{D,@dd. MMM}	2019-03-21T21:08:33	March 21
		{D,@MM-dd-yyyy}	2019-03-21T21:08:33	03-21-2019
		{D,@MMM dd, yyyy}	2019-03-21T21:08:33	March 21, 2019
		{D,@M.d}	2019-03-21T21:08:33	3.21
		{D,@MMMM dd}	2019-03-21T21:08:33	March 21
		{D,@yyyy/mm/dd}	2019-03-21T21:08:33	2019/03/21
		{D,@EEE, MMM dd, 'yy}	2019-03-21T21:08:33	Thu., June 15, '19
		{D,@EEEE, MMMM d, yy}	2019-03-21	Thursday, March 21, 19
Time: {T,Time format}	Time format: short medium medium.S medium.SS medium.SSS or code according to CLDR format with the sign @ Default value: medium	{T}	2019-03-21T21:08:33	21:08:33
		{T,short}	2019-03-21T21:08:33	21:08
		{T,@h:mm a}	21:08:33	9:08 p.m.
		{T,@HH:mm}	21:08:33	21:08
		{T,@hh:mm a}	21:08:33	9:08 p.m.
		{T,@HH:mm:ss}	21:08:33	21:08:33
		{T,@HH:mm:ss.SSS}	21:08:33.1230	21:08:33.123
		{T,medium.SSS}	21:08:33.1239	21:08:33.123

Combined output

You can combine the output formats:

Description	Output format example	Tag value	Result
Date and time	{D} – {T}	2019-03-21T21:08:33	21.03.2019 – 21:08:33
	{D} {T}	2019-03-21T21:08:33	21.03.19 21:08:33
	{D,@EEEE, dd. MMMM yyyy, h:mm:ss a}	2019-03-21T21:08:33	Donnerstag, 21. März 2019, 9:08:33 nachm.
	{D,@dd.MM.yyyy HH:mm}	2019-03-21T21:08:33	21.03.2019 21:08
Date and time with line break	{D}\n{T}	2019-03-21T21:08:33	21.03.2019 21:08:33
Two numerical values	hex {H} – dec {I}	45054	hex AFFE – dec 45054
Text with prefix	myMotor {S}	motor34	myMotor motor34
Number with prefix	MyMotor#{00}	12	MyMotor#12
Percent	{I}%	20	20%
Currency	{#,##0} EUR	20	20 EUR
Currency	${#,##0.##}	20	$20
Unit	{F2} m/s	10.00	10.00 m/s

Configuring an alarm control (Page 753)

http://cldr.unicode.org/ (http://cldr.unicode.org/)

4.3.5 Disable remote control

Introduction

You can disable the "Allow operator control" property for operable objects. You cannot then operate the objects in runtime. The object or the buttons on the object are dimmed.

Requirement

- The HMI screen is open with at least one object.

Disable the "Allow operator control" property

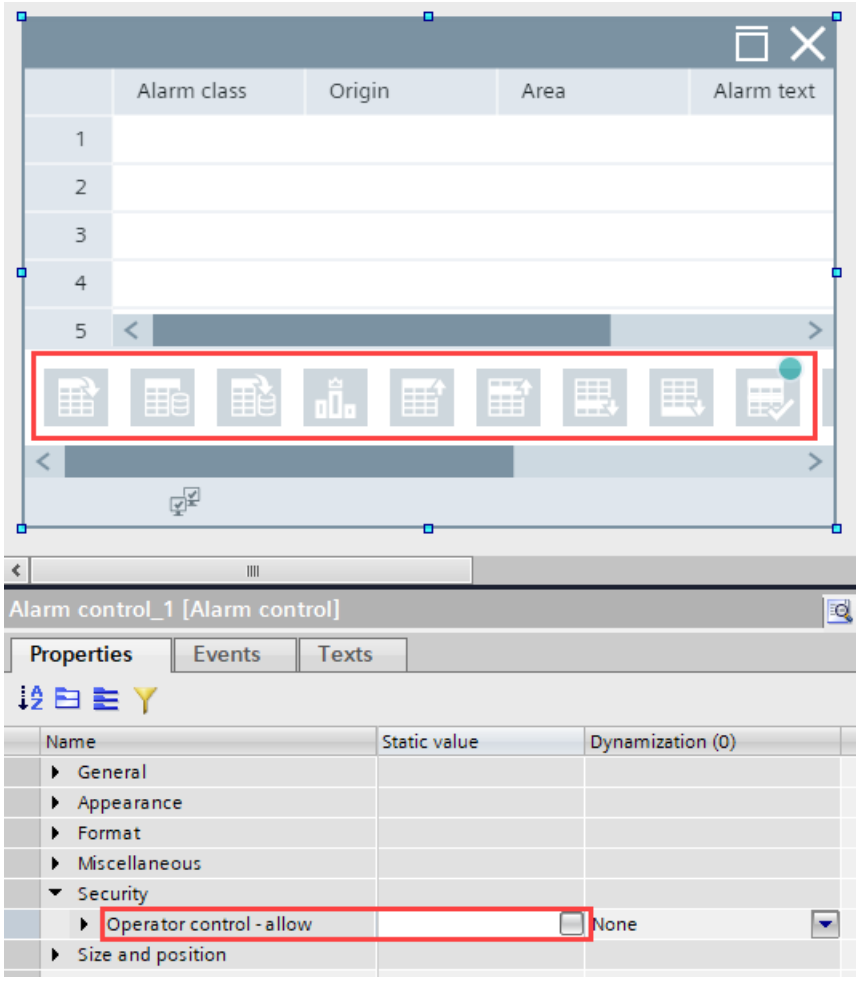
You can disable the option for operator control in runtime using the "Allow operator control" property.

The disabled property "Allow operator control" has the following effect:

- The objects in the "Elements" group are grayed out.
- For objects in the "Controls" group, the operable areas, e.g. buttons on the toolbar, are grayed out.

The objects are displayed in the same way in the engineering system and in runtime.

The following figure shows the grayed out buttons in the alarm control:



4.3.6 Hotkeys

Introduction

You can use the hotkeys in Runtime to perform various actions. You can specify the hotkeys as a key or key combination in the Engineering System.

Examples of hotkey functions:

- Change language
- Change screen
- Acknowledge alarm

The use of hotkeys is supported for WinCC Unified PCs.

The use of hotkeys is not supported for Unified Comfort Panels.

Note

Hotkeys are also supported for the View Of Things application.

Hotkeys are not supported for faceplates.

Note

It is recommended to use the US English layout keyboard.

Requirement

- The HMI screen is open with at least one button or a Control.

Supported objects

You can configure hotkeys in the "Properties" tab of the Inspector window for the following objects:

- Button
- Controls with one toolbar

The default value for a hotkey in the "Static value" column is "None".

Configuring hotkeys

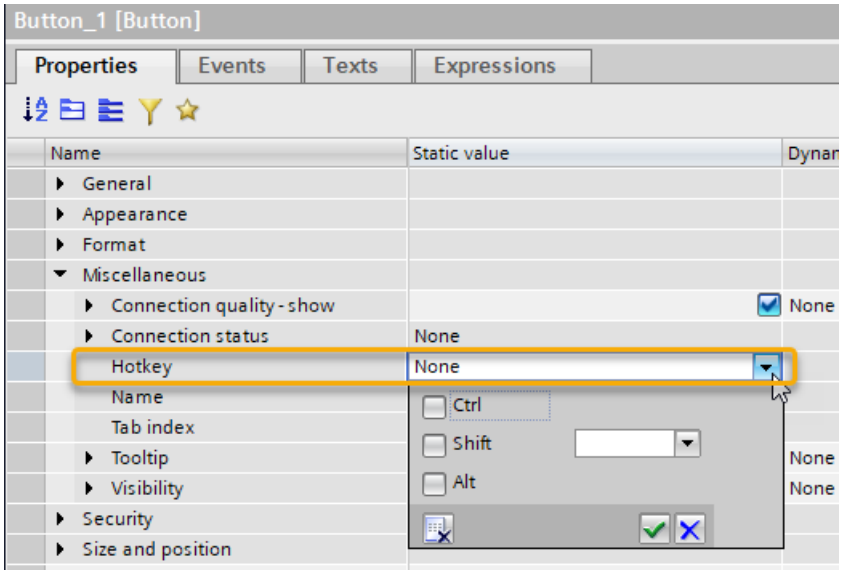
You can find the "Hotkey" property in the Inspector window in the "Properties" tab:

- Button: "Properties > Miscellaneous > Hotkey".
- Controls with one toolbar: "Properties > Miscellaneous > Toolbar > Elements > [0] Button > Hotkey".

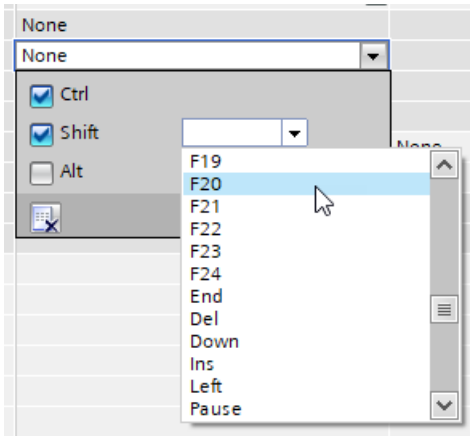
To configure a hotkey for a button, for example, follow these steps:

1. Select the button.
2. Select "Properties > Miscellaneous > Hotkey".

3. In the input field, click in the "Static value" column.
   A dialog opens.



4. Select a keyboard shortcut.



Note

You may use a keyboard shortcut only once in a screen. In case of duplicate use, an error message will appear.

5. Using the options in the selection dialog, you can do the following:
   - Delete settings and close the dialog .
   - Discard changes and close the dialog .
   - Apply settings and close the dialog .

Result

You have configured a key or key combination for a hotkey.

4.3.7 Configuring object properties

4.3.7.1 Managing object properties

Introduction

The properties of an object are displayed in the property list in the Inspector window. Here you can edit the properties, e.g. change the size and position of an object, or dynamize objects.

You manage the properties via the  icons.

Display of the property list in the Inspector window

The properties are displayed in the property list either in alphabetical order or in categories.

You can sort the property list as follows:

- Display of properties in alphabetical order
- Display of the properties grouped in categories

With both views, all details of the individual properties can be shown or hidden:

- All details are shown
- All details are hidden

	**Tip for working effectively**
• Drag-and-drop a tag or resource list from the details view in the project tree to a property in the Inspector window. The details of the lower-level of the property are displayed.	

"Filter" function

You can locate the individual properties by using the "Filter" function .

"Favorites" function

You define the favorite object properties via the function "Favorites" .

Dynamized properties

Dynamized properties are shown in dark blue font and in bold in the Inspector window in the "Name" column.

Groups containing a dynamized property are shown in dark blue font.

See also

Displaying dynamization of the properties (Page 463)

"Filter" function (Page 376)

Adding an object property to favorites (Page 377)

4.3.7.2 "Filter" function

Introduction

You can locate the individual properties of an object by using the "Filter" function in the Inspector window.

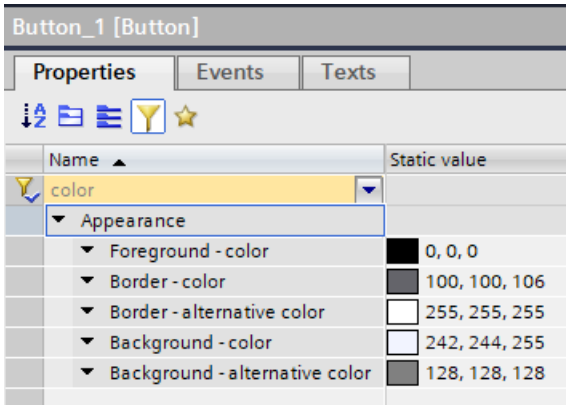
Requirement

- The HMI screen is open with at least one object.

Filter properties

To filter the properties of a screen object, follow these steps:

1. Click on the "Filter" icon in "Properties > Properties" in the Inspector window.
2. In the "Search" input field, type in the term you are looking for, e.g. "Color" in the "Name" column.
3. Confirm the input with the <Return> key.

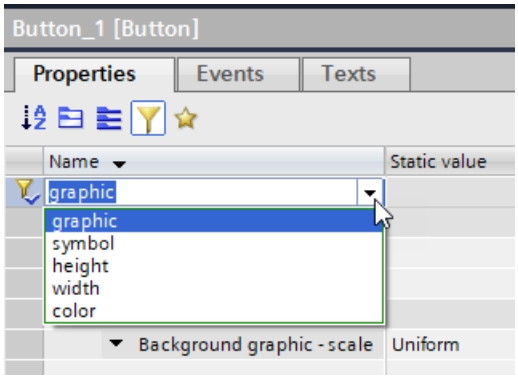


All hits of the properties which contain the term "color" are displayed.

Using search terms with other objects or screens

If you choose another screen object or another screen, the current search term remains in the input field.

The search terms that you have entered in the currently open project are retained until the opened project is closed.



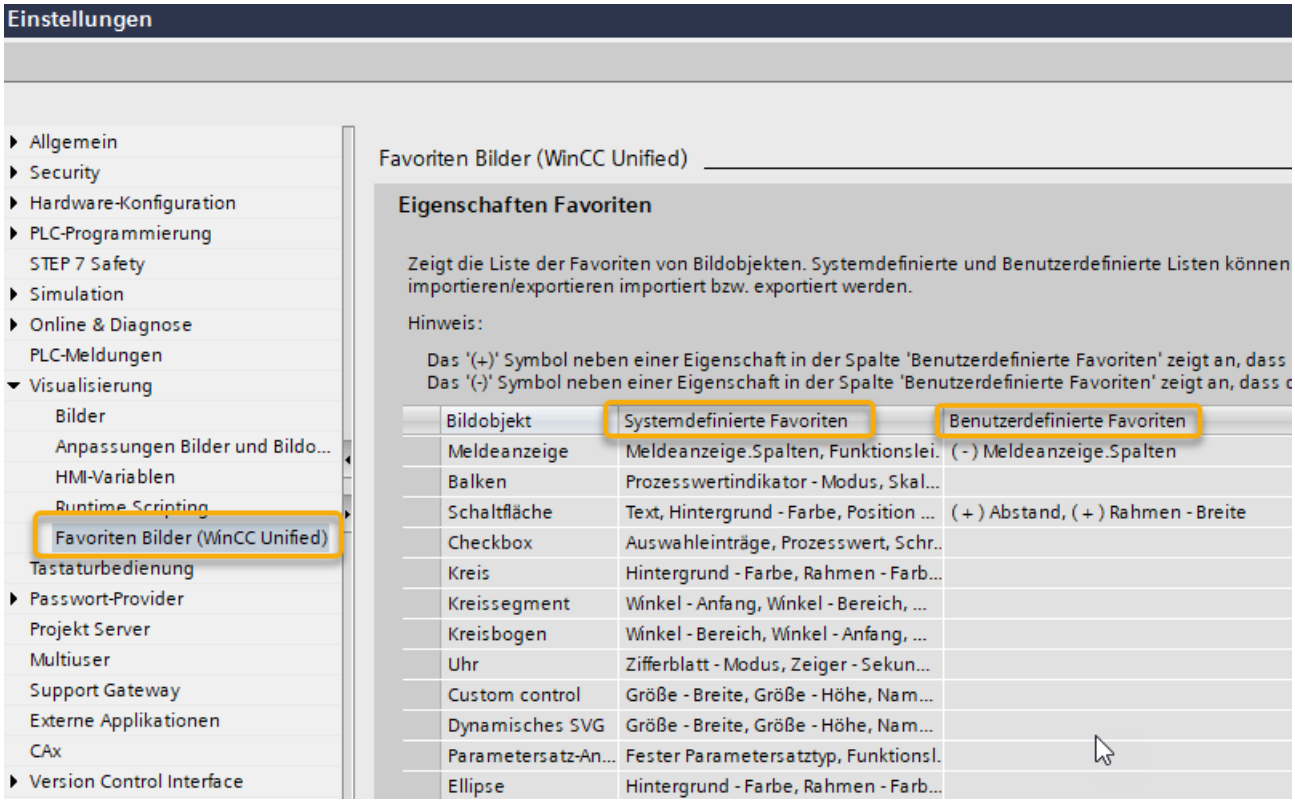
4.3.7.3 Adding an object property to favorites

Introduction

You can define your own favorite properties for each screen object.

Some properties are defined as favorites by the system.

You can find an overview of system-defined favorites under "Settings > Visualization > Favorites screens (WinCC Unified)" in the "Favorites properties" table:



The user-defined favorites are shown in the "User-defined favorites" column in the table.

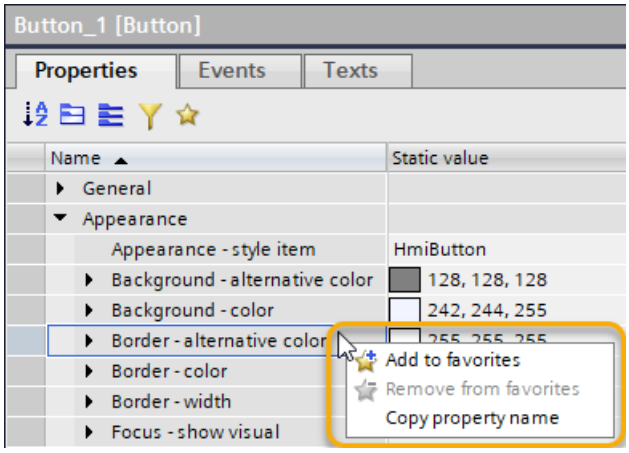
You can also locate the individual properties of an object by using the "Filter" function in the Inspector window .

Add property to favorites

You can add your favorite properties of a screen object to the favorites.

To add a property to the favorites, follow these steps:

1. Right-click on a property that is not defined as a favorite by the system.
   The shortcut menu opens.

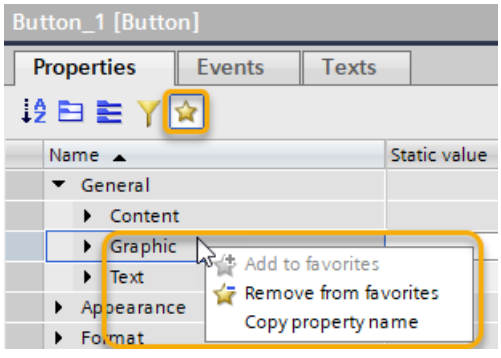


2. Select "Add to favorites". The number of favorite properties is not limited.
3. To display all favorites, click the icon .

Remove property from favorites

To remove a property from the favorites, follow these steps:

1. To display all favorites, click the icon .
2. Right-click on the favorite property.
   The shortcut menu opens.



3. Select "Remove from favorites".

You can find all favorites added or deleted by you in the "Favorite properties" table under "Settings > Visualization > Favorites screens (WinCC Unified)".

Managing object properties (Page 375)

4.3.7.4 Changing a property for multiple objects

Introduction

You can change the static value of a property for multiple objects at the same time.

Requirement

- The HMI screen with at least two objects is open.

Changing properties for multiple objects

To change the static value of a property for multiple objects at the same time, follow these steps:

1. Select several objects in the screen via multiple selection.
2. Select a property, e.g. the background color, in the Inspector window.
3. Change the static value of the property.

The property is changed on all selected objects that have this property.

See also

Select multiple objects (Page 361)

4.3.7.5 Automatically filling in of property values for an object collection

Introduction

You can automatically fill in the values of properties of an object collection.
Examples of object collections are:

- Points for:
  - Polygon
  - Polyline
- Entries for:
  - Check box
  - Radio button
  - List box
- Columns of an alarm control

- Trend areas of a trend control
- Symbols of a toolbar of a screen object

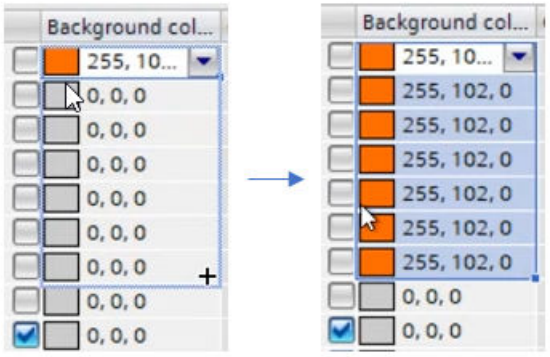
Requirement

- The HMI screen is open with at least one object.

Automatically fill in property values for objects

To automatically fill in the values of properties for objects, follow these steps:

1. Select the collection according to the object:
   - For polygons and polylines, click "Properties > Properties > Size and position > Points".
   - For the elements, e.g. check box, click "Properties > Properties > General > Selection items".
   - With the controls, e.g. alarm control, click "Properties > Properties > Miscellaneous > Alarm control > Columns".
   - For the controls with a toolbar, click "Properties > Miscellaneous> Information bar > Elements".
2. Select one or more contiguous cells in the collection in the right part of the Inspector window.
3. Drag the blue border around this cell up or down.



The values are transferred to the destination cells.

Moving and deleting cells

To move or delete the cells, follow these steps:

1. In the right part of the Inspector window, drag the blue border around the cells.
2. Move or delete the selected cells using the ✕ and ↥ ↧ buttons.

The cells are moved or deleted.

4.3.8 Designing objects

4.3.8.1 Changing the object size

Introduction

When you select an object, it is framed by a bounding box with blue handles. You have the following options for resizing an object:

- Use the mouse to drag the blue handles on the bounding box.
- Configure the properties in the Inspector window.

Note

You can change the form of the objects "Line", "Polyline" and "Polygon" as follows:

- Use the mouse to drag the orange handles on the object.
- Configure the properties in the Inspector window.

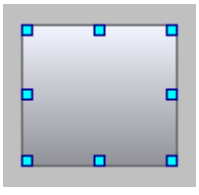
Requirement

- The HMI screen is open with at least one object.

Changing object size with the mouse

To change the object size with the mouse, follow these steps:

1. Select the object you want to resize.
   The bounding box is displayed. The following figure shows a selected object:



2. Drag a handle of the box to a new position.

The object size is changed.

	**Tips for working effectively**
If you press the <Ctrl + Shift> keys while dragging, the object size is changed according to the aspect ratio.	

Changing the size of multiple objects with the mouse

To change the size of multiple objects with the mouse, follow these steps:

1. Select the objects by multiple selection.
   The bounding box is displayed.
2. Drag a handle of the box to a new position.

The size of the selected objects is changed.

	**Tips for working effectively**
If you press the <Ctrl + Shift> keys while dragging, the selected objects are resized according to the aspect ratio.	

Configuring the object size through properties

To change the object size through properties, follow these steps:

1. Select "Properties" > "Properties" > "Size and position".
2. In the "Static value" column, enter the "Size - width" and "Size - height" coordinates.

The object size is changed.

Changing object size using keys

To change the object size using keys, follow these steps:

1. Select the object you want to resize.
2. On the keyboard, press the keys:
   - <Ctrl + Arrow key>
   - <Ctrl + Shift + Arrow key>

The object size is changed depending on the arrow key selected.

4.3.8.2 Changing the position of an object

Introduction

When you select an object, it is framed by a bounding box with blue handles. You have the following options for repositioning an object:

- Position the object with the mouse.
- Configure the object properties in the Inspector window.

Requirement

- The HMI screen is open with at least one object.

Changing the object position with the mouse

To change the object position with the mouse, follow these steps:

1. Select the object whose position you want to change.
   The bounding box is displayed.
2. Left-click the object and keep the left mouse button pressed.
3. Move the object with the mouse pointer to the new position.

The object is moved to the new position.

Configuring the object position through properties

To change the object position using properties, follow these steps:

1. Select "Properties" > "Properties" > "Size and position".
2. In the "Static value" column, enter the "Position - left" and "Position - top" coordinates.

The position of the object in reference to the screen origin is changed. The zero position is located at the top left-hand corner of the screen.

Changing the object position using keys

To change the object position using keys, follow these steps:

1. Select the object you want to resize.
2. On the keyboard, press the <Shift + Arrow> keys

The object position is changed depending on the arrow key selected.

4.3.8.3 Transfer format

Introduction

You can transfer the format of an object to another object. You can find the "Transfer format" icon in the function bar of the screen editor.

Transferring the format

You use the "Transfer format" function to transfer the properties of the source object to the target object.

You can transfer edit the properties:

- From a source object to the same target object, for example, from line to line.
- From a source object to a different target object, for example, from line to a circle.
- From a source object to multiple target objects, for example, from line to line, circle and button.

Requirement

- The HMI screen is open with at least one object.

Transferring the format

To transfer the properties of an object to a single target object, follow these steps:

1. Select an object.
2. Click on the "Transfer format" icon. The mouse pointer icon changes.
3. Click on another object.

The properties are transferred to the target object.

To transfer the properties of an object to multiple target objects, follow these steps:

1. Select an object.
2. Click on the "Transfer format" icon. The mouse pointer icon changes.
3. Click on one object after another.

The properties are transferred to multiple target objects.

Table of objects and categories of the properties

The table below contains the objects and categories of the properties that you can transfer to another object.

These properties can be found in the Inspector window under:

- "Properties > General"
- "Properties > Format"
- "Properties > Appearance"

The properties that you cannot transfer to another object are listed in the "With the exception of" column.

Object	All properties of the category	With the exception of

4.3.8.4 Designing the fill pattern

Introduction

You can design the fill pattern of an object. The design options change in the Inspector window depending on the object for which you are making the filling pattern.

For certain objects, you can define a color background, a transparent background or a background with a color gradient.

Requirement

- The HMI screen is open with at least one object.

Designing the fill pattern of an object

To design the fill pattern of an object, e.g. a circle, follow these steps:

1. In the Inspector window, click "Properties > Properties > Appearance > Background - Fill pattern".
2. To define a transparent background for the object, for example, select "Transparent".

	**Efficiency tip**
Using multiple selection, you can set the fill pattern in multiple objects at the same time.	

Result

The object is shown as transparent.

Additional design options

Additional design options are available in the Inspector window under "Properties > Properties > Appearance". The procedure for using these options is the same as the one described in the examples above.

Restriction for objects with events

Events for operator actions are only triggered if the operator action takes place in the marked, visible area of the object.

If the fill pattern of an object is transparent, click exactly on the object border in runtime in order to trigger the events configured for the object. Select the border width so that you can hit the border.

Note

Objects for which the "Opacity" property has the value "0" are also not visible in runtime and do not trigger events.

4.3.8.5 Designing the border of an object

Introduction

Elements and some basic objects have a border. You can configure the width and color of the border.

Requirement

- The HMI screen is open.
- An element or one of the following basic objects is placed:
  - Text box
  - Rectangle
  - Circle and circle segment
  - Ellipse and ellipse segment
  - Polyline

Change frame width

1. Select the object.
2. In the Inspector window, click "Properties > Properties > Appearance > Border - width".
3. Enter the desired width.

For elements and text boxes, the border is drawn on the inner edge of the object; for the other basic objects, the border is drawn on the inner and outer edges. The values of the "Size - width" and "Size - height" properties remain the same.

Change frame color

1. Select the object.
2. Click "Properties > Properties > Border - color" in the Inspector window.
3. Enter the RGB values of the color or select a color from the drop-down list.
   Select "More colors" in the drop-down list to add custom colors to the selection, specify HSL, and more.

Note

Alternatively, you can change the color in the central color management of the object.

See also

Central color management (Page 401)

4.3.8.6 Configuring reordering of the columns

Introduction

You have the option of configuring the following table-based controls in such a way that operators can rearrange the table columns in runtime:

- Alarm control
- Trend companion
- Parameter set control
- System diagnostics control
- Process control

Requirement

- The screen editor is open.
- One of the above-named controls has been placed on the screen.

Procedure

1. Select, for example, an alarm control in the work area.
2. In the Inspector window, click "Properties > Properties > Miscellaneous > Alarm control > Header - settings".
3. To allow the columns to be rearranged in runtime, enable the property "Columns - Change sequence".
   To prevent reordering, deselect the property.

Result

Once the project has been downloaded to the device, operators can use drag-and-drop to reorder the columns displayed in the control in runtime.

4.3.8.7 Rearranging columns in runtime

Introduction

You can reorder the table columns in the following table-based controls:

- Alarm control
- Trend companion
- Process control
- Parameter set control
- System diagnostics control

Requirement

Reordering of columns is allowed by the configuration of the control in the engineering.

Procedure

Using drag-and-drop, move the header of the column to be moved onto the header of another column.

Note

The time column cannot be moved.

Result

The moved column is inserted at the position that the mouse pointer had when the drag-and-drop movement ended.

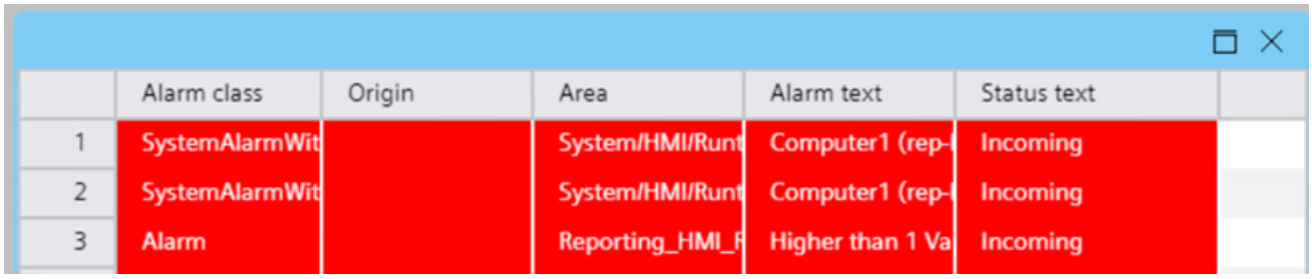
The new column order applies only to the current client. If you switch to another page or refresh the browser window, the column order is lost.

Note

If you move a column next to a hidden column and then show this column afterwards, it is always displayed to the right of the moved column.

Example 1: Inserting columns to the right or the left

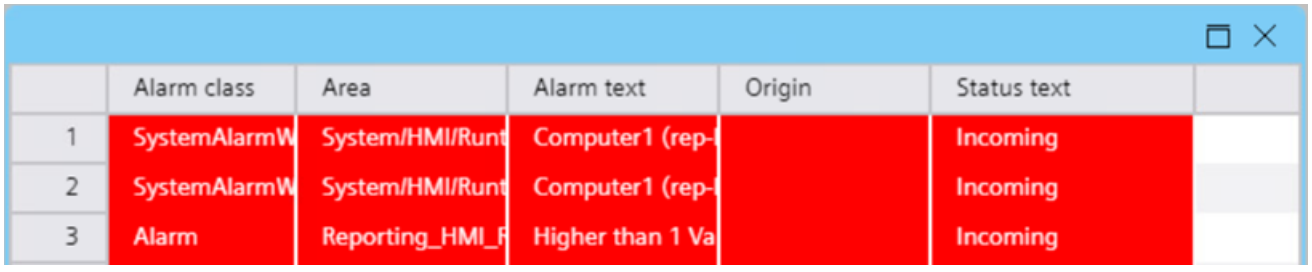
The procedure is illustrated using the example of an alarm control. In the initial situation, the alarm control table has the following column arrangement:



To insert the "Origin" column to the right of the "Alarm text" column, follow these steps:

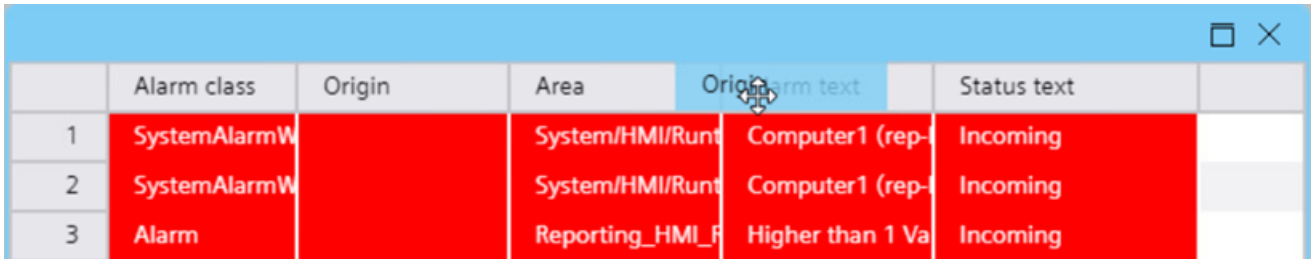
1. Drag-and-drop the column header from "Origin" to the right column header half of the "Alarm text" column:

2. The "Origin" column is inserted to the right of the "Alarm text" column.



To insert the "Origin" column to the left of the "Alarm text" column, follow these steps:

1. Drag-and-drop the column header from "Origin" to the left column header half of the "Alarm text" column:



2. The "Origin" column is inserted to the left of the "Alarm text" column.

Example 2: Reordering of columns in combination with hidden columns

This example illustrates the reordering of columns in combination with hidden columns.

- The alarm control has the same column order as in Example 1.
- The alarm control has been configured in the engineering system in such a way that the display of the "Origin" column is controlled dynamically in runtime by setting a tag.

To reorder the columns in combination with hidden columns, follow these steps:

1. Hide the "Origin" column by setting the tag.
2. Insert the "Status text" column to the left of the "Area" column.
3. Show the "Origin" column by setting the tag.

The order of the columns is as follows: "Alarm class", "Status text", "Origin", "Area", "Alarm text".

4.3.9 Moving objects

4.3.9.1 Aligning objects

Introduction

You can align the screen objects in the screen with reference to a reference object.

Requirement

- The HMI screen is open with at least two objects.

Aligning objects flush

The selected objects will be aligned flush to the reference object. The reference object is the object that you selected first.

Icon	Description
	Aligns the selected objects to the left edge of the reference object.
	Aligns the selected objects to the vertical center axis of the reference object.
	Aligns the selected objects to the right edge of the reference object.
	Aligns the selected objects to the upper edge of the reference object.
	Aligns the selected objects to the horizontal center axis of the reference object.
	Aligns the selected objects to the lower edge of the reference object.
	Centers the selected objects to the center points of the reference object.
	Centers the selected objects vertically in the screen.
	Centers the selected objects horizontally in the screen.
	Distributes at least 3 selected objects evenly horizontally.
	Distributes at least 3 selected objects evenly vertically.
	Specifies the same height for all selected objects.
	Specifies the same width for all selected objects.
	Specifies the same height and width for all selected objects.

Aligning selected objects

To align the selected objects in relation to a reference object, follow these steps:

1. Select the desired objects using multiple selection.
2. Specify an object as the reference object.
3. Select the desired command for alignment in the toolbar or the shortcut menu.

The selected objects are now aligned in relation to a reference object.

Aligning individual objects

To align an object in the screen in relation to other objects using minor lines, follow these steps:

1. Select an object.
2. Drag the object to a position until the blue minor lines become visible.
3. Position the object using the auxiliary lines.

The object is now aligned in relation to other objects.

4.3.9.2 Move objects

Introduction

There are various ways in which you can move objects individually or with a multiple selection.

Requirement

- The HMI screen is open with at least one object.

Move objects

To move the objects, follow these steps:

1. Select the object that you want to move.
2. The following options are available for moving:
   - Moving by selecting and dragging with the mouse.
   - Moving using the arrow keys on your keyboard with pixel accuracy.
   - Coarser move using <Shift> and the arrow keys on your keyboard. The increment depends on the settings that you have configured for the grid under "Options > Settings > Visualization > Screens > Grid".

The same principle also applies to multiple selection of the objects.

Automatic scrolling

If you drag-and-drop the object to one of the corners of the screen, automatic scrolling is triggered. You can place the object in other areas of the screen.

4.3.9.3 Rotating object

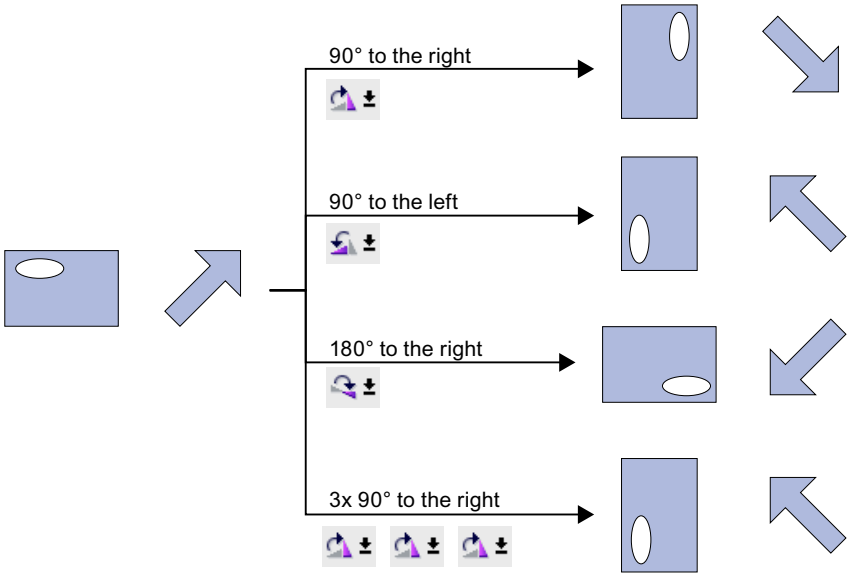
Introduction

You can rotate an object clockwise or counterclockwise around its center axis in steps of 90°.

You can also rotate multiple objects using the multiple selection function. Each object has its own reference point for rotation and is rotated around its own reference point during multiple selection.

Certain WinCC objects, e.g. controls, cannot be rotated.

The alignment of elements in an object will change in a rotated object. The following figure shows how a rectangle and an ellipse behave under the different commands for rotating an object:



Requirement

- The HMI screen is open with at least one object.

Rotating an object

To rotate an object, follow these steps:

1. Select the object that you want to rotate.
2. Click one of the following symbols on the toolbar:

	The object is rotated clockwise around its center. The angle of rotation is 90°.
	The object is rotated counter-clockwise around its center. The angle of rotation is 90°.
	The object is rotated clockwise by 180°.

The object is now displayed rotated.

Alternatively, select from the shortcut menu the desired command to rotate the objects.

4.3.9.4 Rotating an object around a pivot point

Introduction

You define the rotation of an object around a pivot point. In the Inspector window of an object, specify the coordinates of the "Pivot point X" and "Pivot point Y". Specify the angle of rotation for the object under "Properties > Rotation - angle".

The pivot point can be outside the object.

Requirement

- The HMI screen containing at least one object group is open.

Rotation

Defines the rotation of an object around the pivot point. Rotation is specified in degrees. The configured start point corresponds to a value of 0°. The position of an object deviates from its configured initial position by the rotation value. The negative and positive values are allowed.

You can also place an object outside the visible plant complex. You can view objects outside the visible area by using the "Layout > Objects out of range" task card. You change the position of an object in the Inspector window under "Properties".

Pivot point

Define the pivot point under "Properties > Rotation - Pivot point":

- Absolute to the center point: Sets the rotation to around the absolute center of the object.
- Absolute to screen: Sets the rotation to around the absolute zero point of the screen. The zero point is in the top left corner of the screen.

Rotation position

The attributes "X pivot point" and "Y pivot point" define the horizontal and vertical distance of the pivot point from the point of origin.

- Center point of the object
- Zero point of the screen

The values are specified as a device-independent pixel (DIP).

The pivot point can also be located outside the bounding box. The negative and positive values are allowed.

Example: Configuring rotation for a rectangle

To configure the rotation of a rectangle, follow these steps:

1. Open the "Basic objects" palette in the "Toolbox" task card.
2. Drag the "Rectangle" object into the screen.

3. Click "Properties > Pivot point" in the Inspector window.
4. In the "Static value" column, select "Absolute to center point".
5. Enter a value of 45 for "Rotation".

The object is rotated clockwise by 45°.

4.3.10 Designing colors

4.3.10.1 Designing the background color

Introduction

You can design the background color of an object. For certain objects, you can define a background with a color gradient.

Requirement

- The HMI screen is open with at least one object.

Designing the background color of an object

To design the background color of an object, follow these steps:

1. In the Inspector window, click "Properties > Properties > Appearance > Background - color".
2. Select a color for the background of the object, for example, yellow.

	**Efficiency tip**
Using multiple selection, you can define the background color simultaneously in multiple objects.	

Result

The object is filled with the selected color.

4.3.10.2 Defining color gradients

Introduction

You can define different color gradients for the objects. Change the category in the Inspector window, depending on which surface you fill with a color gradient.

Requirement

- The HMI screen is open with at least one object.

Configure horizontal color gradient with two colors

To configure a horizontal color gradient for an object, follow these steps:

1. Select an object, e.g. rectangle.
2. In the Inspector window, select "Horizontal gradient" under "Properties > Background - fill pattern".
3. Go to "Properties > Fill direction" and select the direction in which the color is to run, for example "Left to right".
4. Select a background color for the horizontal color gradient, e.g. orange, under "Properties > Background - color".
5. Select the other color for the gradient, e.g. yellow, under "Properties > Background - alternative color".

Result

The background of the rectangle is displayed with a color gradient of orange to yellow.

4.3.10.3 Central color management

Basic principles for central color management

Introduction

In WinCC Unified, you can change the colors that are used in a project in a centralized manner.

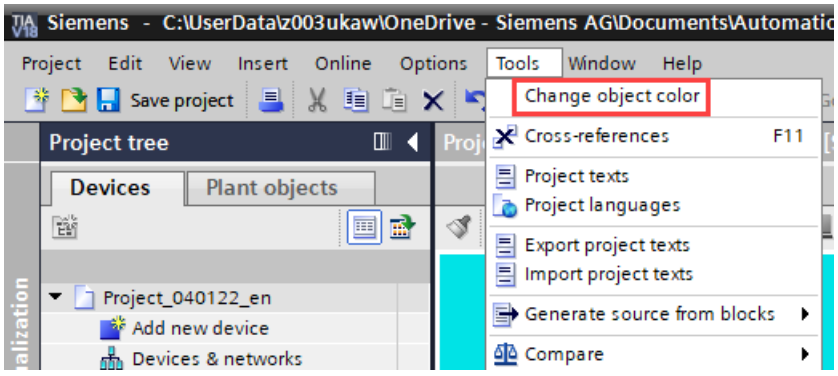
Requirement

- You have created a project.
- You have created a screen.

Opening the "Change object color" dialog box

You open the "Change object color" dialog box:

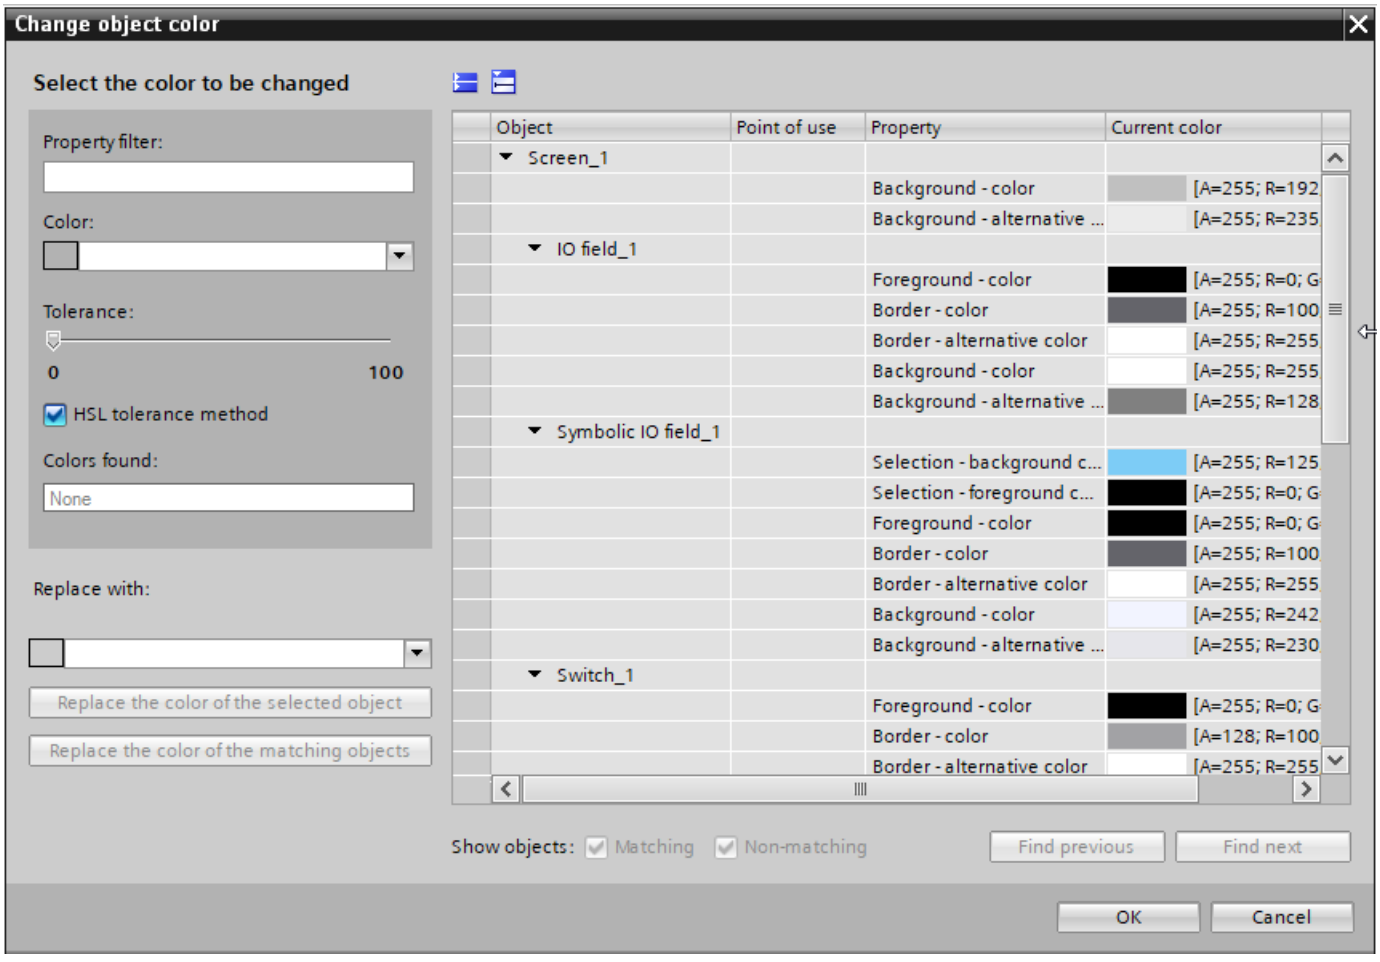
- In the shortcut menu of a device or object
- In the menu bar under "Tools > Change object color"



Using the "Change object color" dialog box

The "Change object color" dialog box contains a hierarchical overview of all color-relevant object properties.

In the display, you can navigate within the display and operating objects. You will receive an overview of all colors in use. You specify a color selection and replace it with other colors.



Unsupported objects

You have access to all colors used and configured in the project with the "Change object color" dialog.

Excluded from this are colors that are used:

- In types and instances from a library
- In scripts
- In designs
- In screens with write protection

See also

Changing the object color (Page 404)

Changing the object color

Introduction

The scope of the objects displayed in the "Change object color" dialog depends on the location at which the dialog is called:

- If you select a device and call the dialog, all color references used on the device are displayed.
- If you select an object within a screen and call the dialog, only those color references that are included in the object are displayed.

Requirement

- You have created a project.
- You have created a screen.
- At least one object has been created in the screen.

Opening the "Change object color" dialog box

To change the object color, follow these steps:

1. Select the object that contains the required color references.
2. Select "Change object color" in the shortcut menu of the object.
   The "Change object color" dialog box opens.

Select the color you want to change

The following table shows you the options for choosing the color you want to change:

Select the object property whose color you want to change.	• Select a property directly in the overview. • Enter a property in the "Property filter" dialog. The selected property is now visible in the overview table.
In the "Color" text box, select the color that you want to change.	1. Click on the arrow in the "Color" text box. The project color selection opens. 2. Select a standard color. To select a user-defined color, click "More colors".
Select the color directly from the selected object.	1. Drag a color box from the "Current color" column to the "Color" text box.

Change color

To change a color, proceed as follows:

1. Select the color you want to change as described above.
2. To display the current selection, enable one or both of the options "Matching" and "Non-matching".
3. To select similar colors as well, set the tolerance. Enable the "HSL tolerance method" option. In the "Colors found" text box, you will see the number of similar colors.
4. In the "Replace with" text box, select a color.
5. Select one of the buttons:
   - "Replace the color of the selected object"
   - "Replace the color of the matching objects"

   The selected color is displayed in the "Replace with" column.
6. Click "OK".
   The dialog closes. The colors in the object are changed.

Result

You have configured new color references in the selected object.

4.3.11 Formatting text in the object

4.3.11.1 Enter text directly into the object

Introduction

You can change the label of the "Text box" and "Button" objects directly via the keyboard.

Requirement

- The HMI screen with a text box or a button is open.

Entering text directly into the object

To enter text directly in a text box or a button, follow these steps:

1. Select the object that you want to label.
2. Double-click in the object and type the text.

The text has been entered into an object.

Special features of direct text input

The following special features apply to direct input:

- Diacritics, such as ä ê ñ, can only be entered if the keyboard layout provides a key for this character. Key sequences such as <`a> for à, are not recognized.
- It is not possible to enter Unicode characters using Alt codes.
- Asian language characters cannot be entered using an Input Method Editor (IME).

If you need such characters in labeling the object, you have the following options:

- Use a keyboard layout on which this character is present as a key.
- Copy the character or full label from any source. Paste the text into the selected object.
- Edit the label in the Inspector window under "Properties > Properties > General > Text".

Direct text entry also supports multiline text. Enter the line break with the keyboard shortcut <Shift + Enter>.

See also

Text box (Page 269)

Button (Page 289)

4.3.11.2 Entering multiline text

Introduction

For objects with the "Text" property, you can enter the text on multiple lines.

Requirement

- The HMI screen with at least one object with the "Text" property is open.

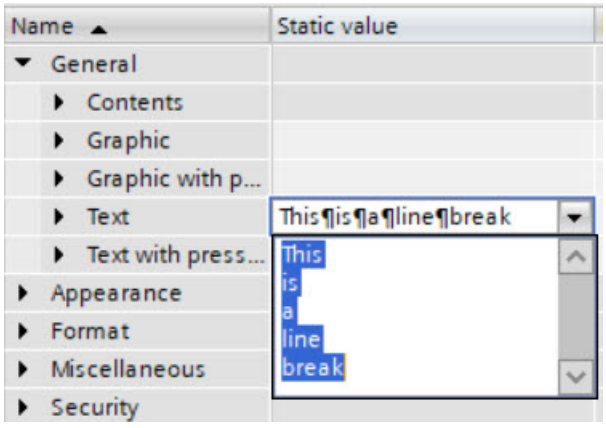
Enable line break

Enter the line break using the <Shift + Enter> key combination.

Multiple line text for objects

Enter the multiple line text for the following objects in the Inspector window under "Properties > Properties > General > Text":

- Text box
- Button
- Switch



Enter the multiple line text for the following objects under "Properties > Properties > General > Title > Text".

The text may only contain 2 lines at a time.

- Bar
- Slider

For the following objects, enter the multiple line text under "General > Selection items > [x] Selection item> Text".

The text may contain more than 2 lines if the property "Format > Item height" is adjusted accordingly.

- Check box
- Radio button
- List box

You can use multiple line texts with a maximum of two lines in the text list for symbolic IO fields.

Alternatively, enter the multiple line text

Alternatively, enter the multiple line text:

- In the Inspector window, under "Properties > Text".
  Enter the line break using the <Shift + Enter> key combination. A line break is displayed as a blank.

- By entering text directly into the object for:
  - Text box
  - Button

4.3.11.3 Show default entry of text and graphic list in the object

Introduction

For objects with the dynamization type "Resource list", you can have a text or a graphic from the resource list displayed as the default entry in the object.

Requirement

- The HMI screen with an object, e.g. a button, is open.
- At least one object property supports the "Resource list" dynamization type, for example, "text" or "graphic".

Displaying a text as the default entry in the object

To display a text as the default entry in the object, follow these steps:

1. In the Inspector window, select "Properties > Properties > General > Text".
2. Select "Resource list" in the "Dynamization" column.
3. In the "Resource list" dialog, select a text list under "Settings > Resource list".

4. Click on the button in the "Resource list" line .
   The selected text list opens.
5. Select an entry in the "Text list entries" table as the default entry. The text from the default entry is displayed in the object.
   If you have not specified a default entry, the first entry in the "Text" column is displayed in the object.

Displaying a graphic as the default entry in the object

To display a graphic as the default entry in the object, follow these steps:

1. In the Inspector window, select "Properties > Properties > General > Graphic".
2. Select "Resource list" in the "Dynamization" column.
3. In the "Resource list" dialog, select a graphic list under "Settings > Resource list".
4. Click on the button in the "Resource list" line .
   The selected graphic list opens.
5. Select an entry in the "Graphic list entries" table as the default entry. The graphic from the standard entry is displayed in the object.
   If you have not specified a default entry, the first entry in the "Graphic" column is displayed in the object.

See also

Configuring object with a text list (Page 453)

4.3.11.4 Displaying tag value in the object dynamically

Introduction

In some objects, dynamic information can be displayed in the properties that contain a text.

If you insert the reference to a tag in the "Text" or "Tooltip" property, for example, the current value of the inserted tag is displayed in the object in Runtime.

Supported objects:

- Text box
- Button
- Symbolic IO field
- Switch

Note

In the message texts, e.g. for the alarm control, the dynamic information may already be inserted.

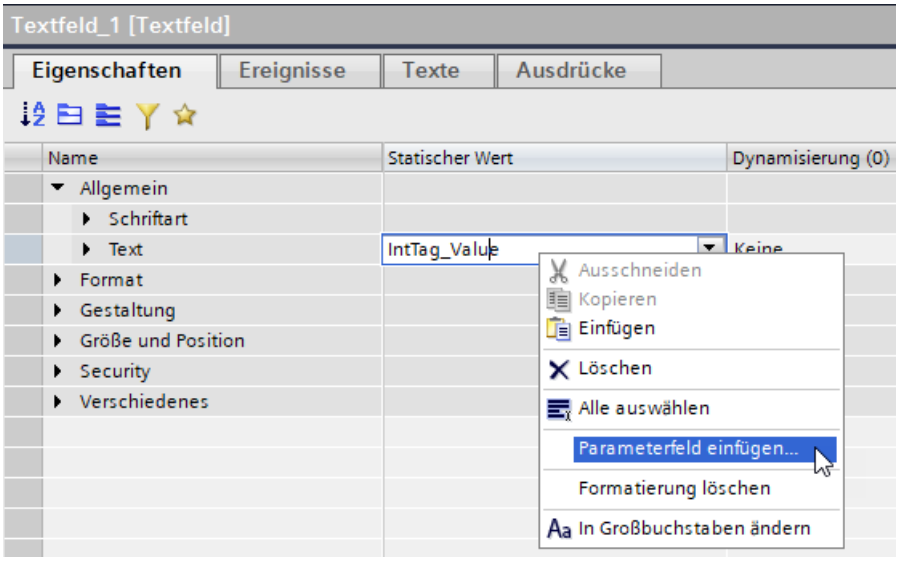
Requirement

- The HMI screen with an object, e.g. a text box or a button, is open.

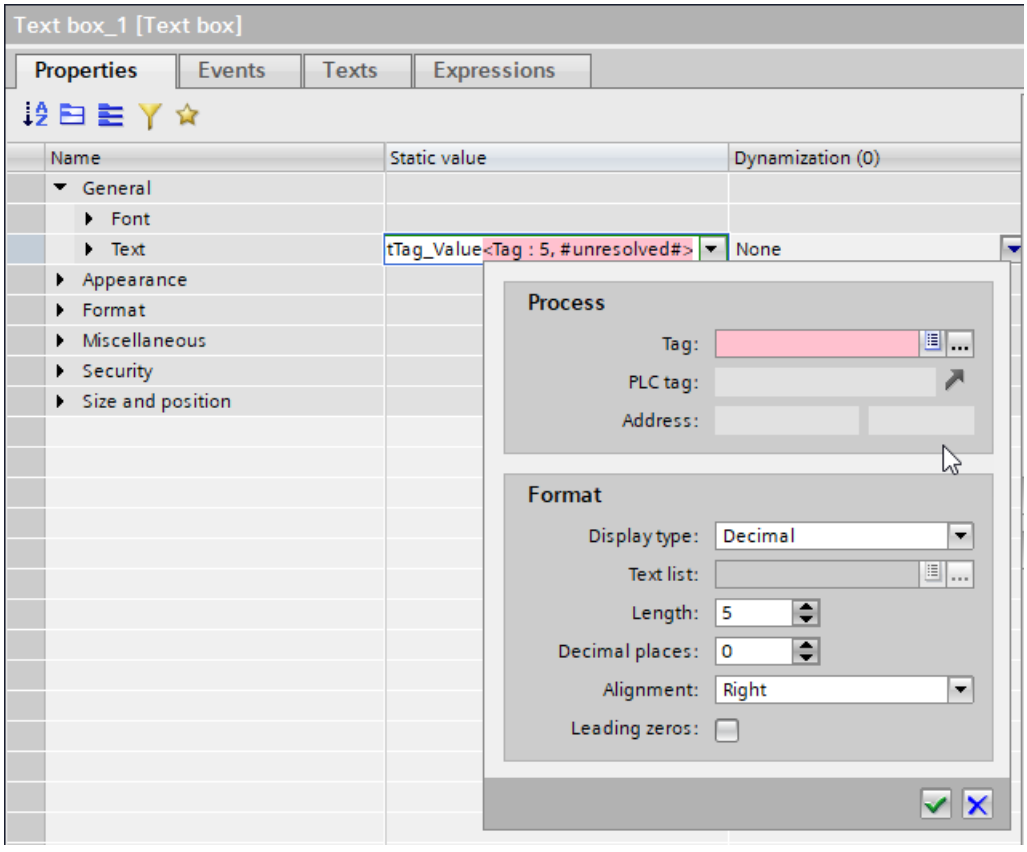
Configuring a tag value in the object

To configure a tag value in an object, e.g. in a text box, follow these steps:

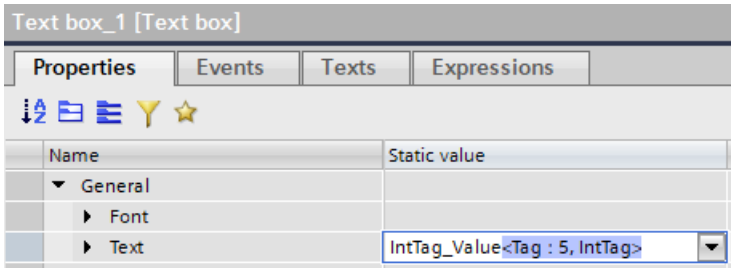
1. Configure a tag, e.g. "IntTag".
2. In the Inspector window, select "Properties > Properties > General > Text".
3. Enter a text in the "Static value" column in the input field, e.g. "IntTag_Value".
4. Right-click in the input field. The shortcut menu opens.



5. Select "Insert parameter field" in the shortcut menu. A dialog opens.



6. Select the "IntTag" tag under "Tag" in the dialog.
7. Configure the format of the display:
   - Display type
   - Length
   - Decimal places
   - Alignment:
   - Leading zeros
8. Confirm the selection. The field with the tag name becomes visible in the input field.



9. Compile and load the device.

Note

If you have inserted the parameter field with a tag in an object, you cannot edit the text in the object directly. After deleting the parameter field, you can edit the text in the object directly again.

More information on direct text input is available in Enter text directly into the object (Page 406).

Result

The object displays the current tag value in Runtime.

4.3.11.5 Dynamically displaying a text list in the object

Introduction

In some objects, dynamic information can be displayed in the properties that contain a text.

If you insert a reference to a text list in the "Text" or "Tooltip" property, for example, the current value of the inserted text list is displayed in the object in Runtime.

Supported objects:

- Text box
- Button
- Symbolic IO field
- Switch

Note

In the message texts, e.g. for the alarm control, the dynamic information may already be inserted.

Requirement

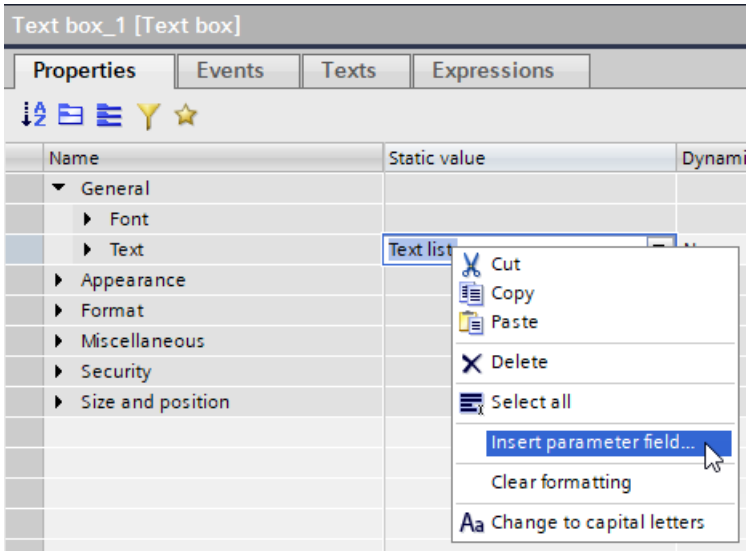
- The HMI screen with an object, e.g. a text box or a button, is open.

Configuring a text list in the object

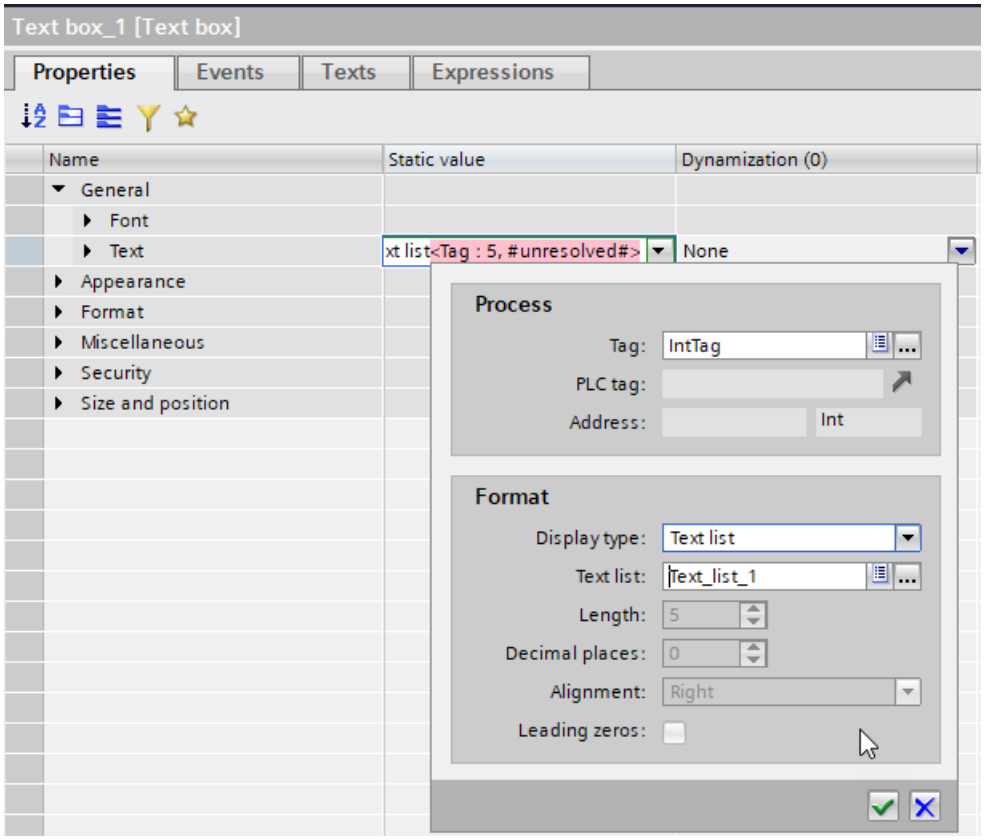
To display a text list in an object, e.g. in a text box, follow these steps:

1. Configure a tag, e.g. "IntTag".
2. Configure a text list, e.g. "Textliste_1".
3. In the Inspector window, select "Properties > Properties > General > Text".
4. Enter a text in the "Static value" column in the input field, e.g. "Text list".

5. Right-click in the input field. The shortcut menu opens.

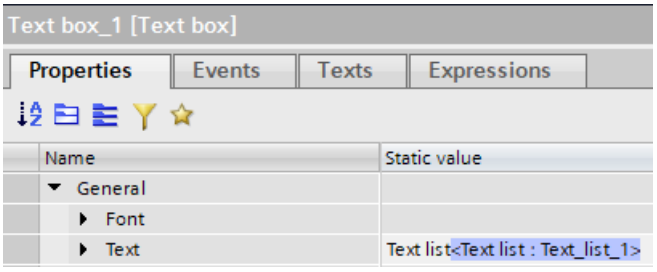


6. Select "Insert parameter field" in the shortcut menu. A dialog opens.



7. Select the "IntTag" tag under "Tag" in the dialog.
8. Under "Display type", select "Text list".
9. Under "Text list", select the text list "Textlist_1".

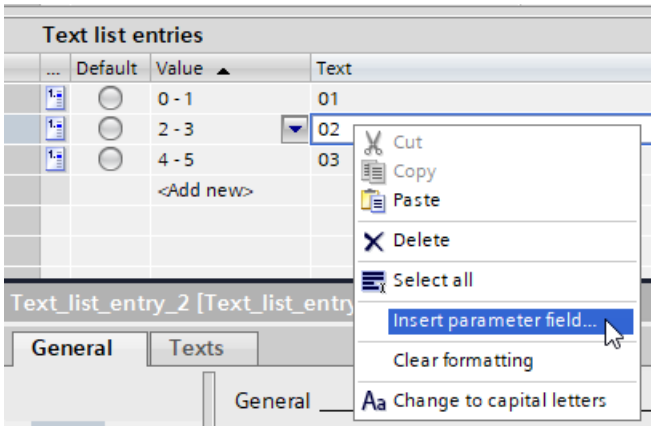
10. Confirm the selection. The field with the tag name becomes visible in the input field.



The default entry of the text list is displayed in the text box.

11. Compile and load the device.

Alternatively, you can configure the text list entry directly in the text list.



Note

Circular references are not supported.

Result

The object displays the current text list entry in Runtime.

4.3.12 Linking objects

4.3.12.1 Linking an object to a text list

Introduction

You can link the objects to a text list.

Requirement

- The HMI screen with an object is open.

Linking objects to a text list

You can link a text list to the following objects:

- Text box
- Button
- Switch
- Symbolic IO field

To link a text list to an object, follow these steps:

1. In the Inspector window, select "Properties > Properties > General > Text".
2. Select the "Resource list" option in the "Dynamization" column. The "Resource list" page opens.
3. Select the text list from which the text is displayed.

The text list has been linked to an object.

	Tips for an efficient procedure
•	Use drag-and-drop to move a text list from the detail view of the text and graphic lists directly onto an object in a screen. The object is linked to the text list.

4.3.12.2 Linking an object to a graphic list

Introduction

You can link the objects to a graphic list.

Requirement

- The HMI screen with an object is open.

Linking objects to a graphic list

You can link a graphic list to the following objects:

- Graphic view
- Button
- Switch
- Symbolic IO field

To link a graphic list to an object, follow these steps:

1. In the Inspector window, select "Properties > Properties > General > Graphic".
2. Select the "Resource list" option in the "Dynamization" column. The "Resource list" page opens.
3. Select the graphic list from which the graphic is displayed.

The graphic list has been linked to an object.

	**Tips for an efficient procedure**
• Use drag-and-drop to move a graphic list from the detail view of the text and graphic lists directly onto an object in a screen. The object is linked to the graphic list.	

4.3.12.3 Linking an object to tags

Introduction

You can link the objects to a tag.

Requirement

- The HMI screen with an object is open.

Link objects to a tag

You can link a tag to the following objects:

- Text box
- IO field
- Symbolic IO field
- List box
- Bar
- Slider
- Gauge
- Clock
- Check box
- Radio button
- Trend control
- Process control

To link a tag with an object, proceed as follows:

1. In the Inspector window, select "Properties > Properties > General > Process value".
2. Select "Tag" in the "Dynamization" column. The "Tag" page will open.
3. Select an existing tag under "Tag > Process > Tag".
   Alternatively, create a new tag using the "Add" button.

The tag has been linked to an object.

	Tips for an efficient procedure
•	Drag a tag from the detail view of the tag table directly to an object in a screen. The object is linked to the tag.

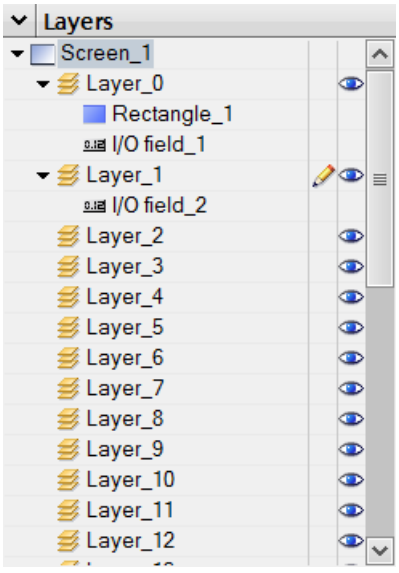
4.3.13 Using layers

4.3.13.1 Basic information on using layers

Layers

Use layers in order to achieve differentiated editing of the objects in a screen. Using layers, multiple objects can be combined and edited together, for example. Layers are also used to improve clarity during configuring, because multiple objects can be hidden and displayed again when required.

A screen has 32 layers. The name of the individual layers is determined by the user interface language and changes when the user interface language is changed. If you assign objects to the layers, you thereby define the screen depth. Objects of layer 0 are located in the screen background, while objects of layer 31 are located in the foreground.



The objects of a single layer are also arranged hierarchically. If you create a new object, it is arranged in the foreground. You can shift objects forwards and backwards within a layer.

Principle of the layer technique

Always one layer of the 32 layers is active. New objects you add to the screen are always assigned to the active layer. The active layer is indicated in the "Layout > Layers" task card.

When you open a screen, all 32 layers of the screen are displayed. You can hide all layers except for the active layer in the "Layout > Layers" task card. You then explicitly edit objects of the active layer.

In the "Layout > Layers" task card, you can also manage layers and objects with drag-and-drop and the shortcut menu.

Application examples

Use layers, for example, in the following cases:

- To hide the labeling of objects when editing,
- To hide individual objects, while you configure other objects

4.3.13.2 Renaming a layer

Introduction

When you create a screen, the 32 layers are numbered consecutively by default. To improve clarity, you can rename the layers to suit your requirements.

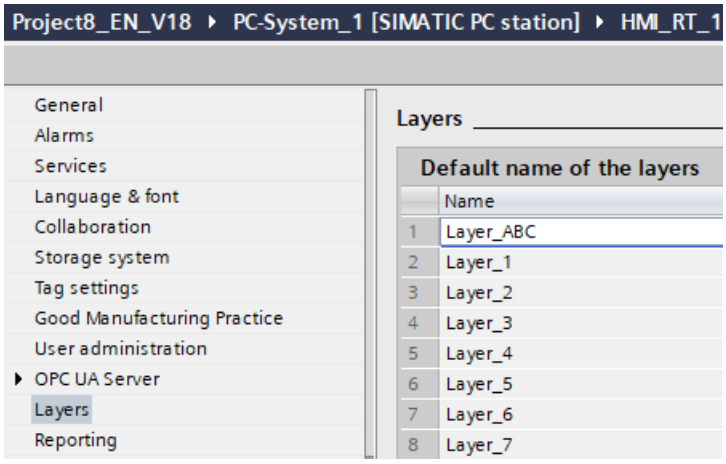
Requirement

- A screen with an object is open.

Renaming a layer

To rename the name of a layer, follow these steps:

1. Click on Runtime settings in the project tree.
2. In the "Name" column, click in the row of the layer.
3. Enter a name.



Result

The selected layer has been renamed.

4.3.13.3 Moving objects between layers

Introduction

By default, newly inserted objects are in the foreground of the active layer. You can assign an object to a different layer and change the order of objects within a layer at a later time.

Requirement

- A screen with an object is open.

Moving objects between layers

To move the objects, follow these steps:

1. Select the object in the "Layout > Layers" task card.
2. Drag-and-drop the object to the required layer.

Changing the order of objects within a layer

To change the sequence of objects, follow these steps:

1. Select the object in the screen.
2. Select the desired command under "Arrange" in the shortcut menu. Depending on the current position of the object, you can move it completely into the foreground, to the front, to the back or completely into the background.

Result

The object is arranged according to the selection. In the "Layout > Layers" task card, the order of the objects is displayed as follows: Objects of layer 0 are located in the screen background, while objects of layer 31 are located in the foreground. Within a layer, the objects displayed at the top of the list are in the background of the layer.

4.3.13.4 Specifying the active layer

Introduction

The screen objects are always assigned to one of the 32 layers. There is always an active layer in the screen. New objects you add to the screen are always assigned to the active layer.

The active layer is indicated by a  icon in the "Layout > Layers" task card.

You can activate a different layer during configuration, if necessary.

Requirement

- You have opened a screen which contains at least one object.

Procedure

To set a layer as active, follow these steps:

1. Select "Layout > Layers" in the "Layout" task card.
2. Select the "Set to active" command from the shortcut menu of a layer.

Result

The selected layer becomes the active layer.

4.3.13.5 Hiding and showing layers

Introduction

You can show or hide the layers of a screen as required.

Requirement

- The screen is open.

Hiding or showing layers

To hide or show layers, follow these steps:

1. Select the layer that you want to hide or show in the "Layout > Layers" task card.
2. Click one of the icons next to the corresponding layer:

- A shown layer is hidden.
- A hidden layer is shown.

You cannot hide the active layer.

Alternatively, select the "Hide layer" or "Show layer" command from the shortcut menu of a layer.

Result

Only the displayed layers are shown in the Engineering System.

Setting the visibility of the levels in the Engineering System has no influence on the visibility of the levels in Runtime.

4.3.13.6 Toggle the visibility of layers in runtime in the ES

Introduction

You can toggle the visibility of layers in runtime in the Engineering System.

Requirement

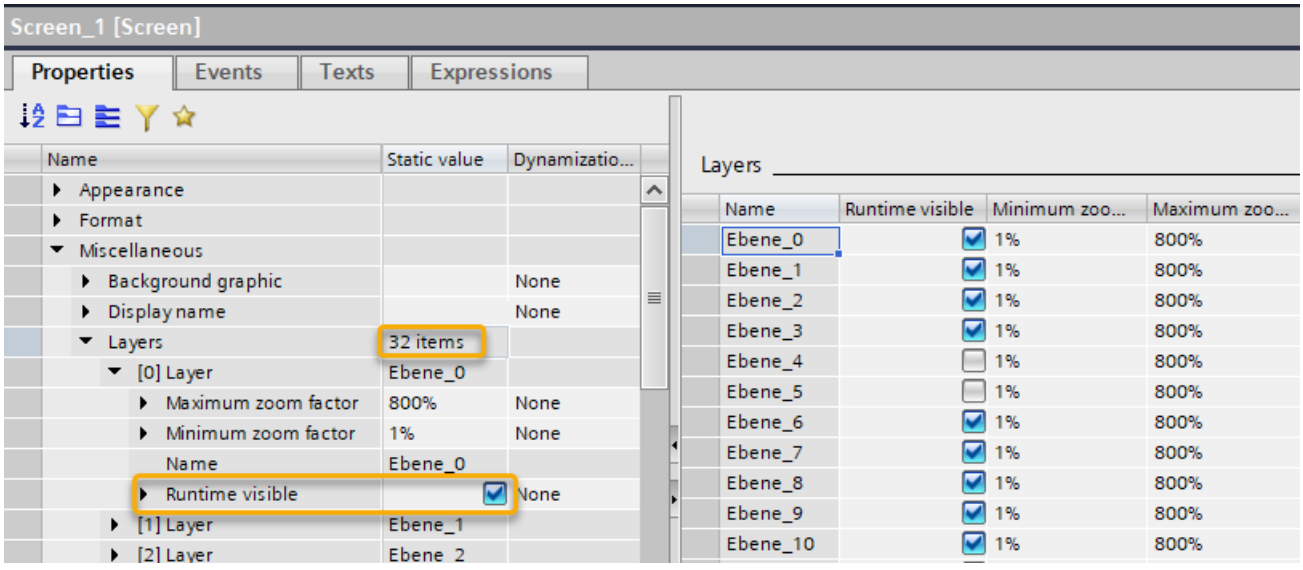
- The screen is open.

Toggling the visibility of layers in the Engineering System

To switch the visibility of layers in runtime in the Engineering System, follow these steps:

1. In the Inspector window, select "Properties > Properties, Miscellaneous > Layers".
2. Select the layer whose runtime visibility you want to toggle.

3. Under "Miscellaneous > Levels > [x] Level", select the "Runtime visible" option in the "Static value" column.



4. If you now click on the field "Layers" under "Miscellaneous", the overview of all layers becomes visible in the right part of the Inspector window.
   You can toggle the visibility directly in the overview.

Result

You can now toggle the visibility of the layers in Runtime.

Only the displayed layers are shown in the Engineering System.

Setting the visibility of the levels in runtime has no influence on the visibility of the levels in the Engineering System.

4.3.13.7 Toggling the visibility of layers in runtime using the JScript function

Introduction

You can toggle the visibility of layers in runtime using the JScript function.

Requirement

- The screen is open.

Toggling the visibility of layers via the JScript function

To toggle the visibility of the layers in runtime using a JScript function, follow these steps:

1. In the Engineering System, place the objects of a screen in the "Layout" task card on different layers.
2. Program a JScript function to change the visibility of, for example, "Layer_1" in the current screen.
   ```
   Screen.Layers ("Layer_0").Visible = false;
   ```
3. Configure this function, e.g. on an event of a button.

If the event occurs in runtime, all objects placed on this layer become invisible.

To make a layer visible in the current screen, use:
```
Screen.Layers("Layer_0").Visible = true;
```

Result

You can change the visibility of the layers in Runtime.

4.3.14 Using groups

4.3.14.1 Basics of groups

Introduction

You can put two or more objects together to form a group with the "Group" function.

You can manage a group of objects in the Engineering System and in Runtime just like you manage an individual object, e.g. you can change the color or visibility of all grouped objects in one step.

Grouping is available on a Unified PC and Unified Control Panel as of version V18. The grouping of objects is not supported in the VoT application.

Editing objects together

You can edit multiple objects together by means of:

- Multiple selection (Page 361): With multiple selection, the bounding boxes of all objects are displayed.
- Grouping objects (Page 426): With a group, one bounding box is displayed for the whole group.

Groupable objects

You can add the following objects to a group:

- Basic objects
- Elements
- Faceplate containers
- Graphics
- Dynamic widgets

Nesting of groups – group in group – is not supported.

Non-groupable objects

You cannot add the following objects to a group:

- Controls (except faceplate containers)
- Custom controls

Layers

All objects of a group are located in the same layer. The groups are arranged hierarchically in a layer.

You can also add objects to a group or remove them from a group in the "Layout > Layers" task card using drag-and-drop.

Properties of a group

- The group has its own coordinate system. The coordinates of all objects contained in the group are referenced to the upper left corner of the group.
- Each group has its own properties. You can define the properties of a group for the runtime:
  - Via a dynamic property.
  - Via a script.
- If you set a property for a group, all objects of the group inherit this property.
- If you configure the same property differently on an object in the group, the property value on the object is valid in runtime, not the value in the group.
- When you resize an object, the group is also resized.
- The grouping of objects is also possible within faceplate types.
- Groups have no events for which you can configure event scripts or function lists. The events of the objects in the group work in the same way as for objects that are not grouped.
- Nesting of groups – group in group – is not supported.

4.3.14.2 Grouping objects

Introduction

The "Group" menu command combines multiple objects to form a group.

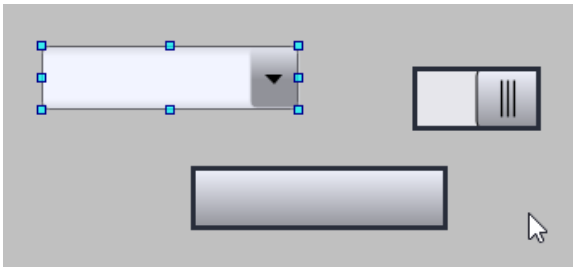
Requirement

- A screen containing at least two objects is open.

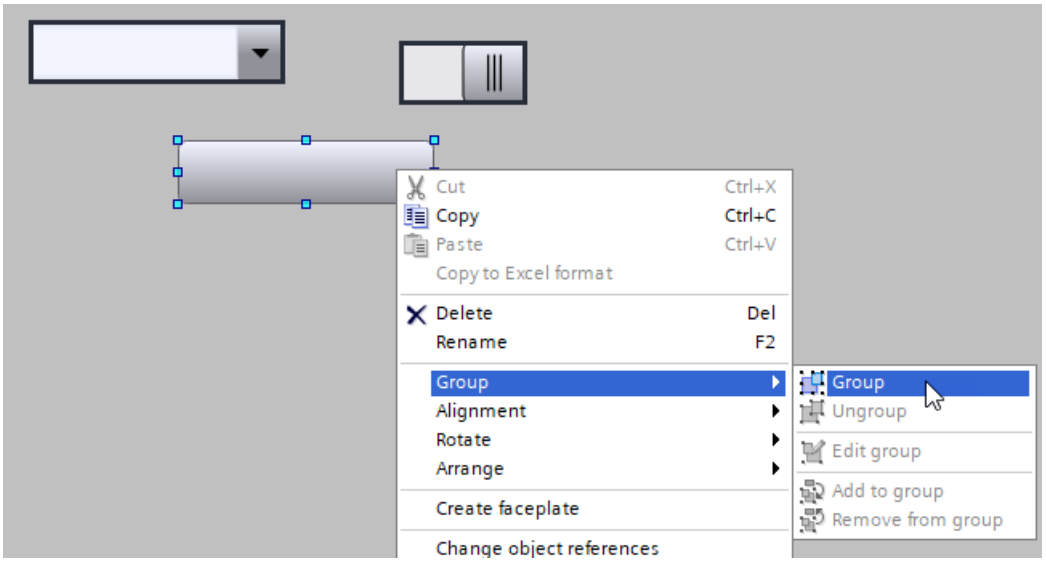
Grouping objects

Follow these steps to group objects:

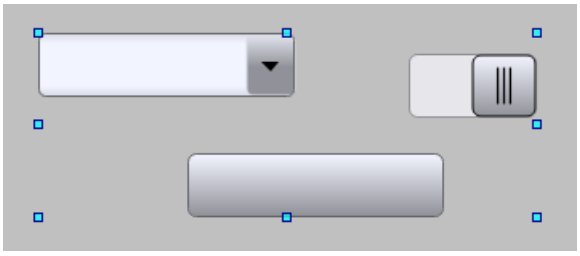
1. Select all the objects you want to group using multiple selection.



2. Select the "Group > Group" command from the shortcut menu.



3. The group objects are displayed with a bounding box.



Result

The selected objects are combined in a group. The multiple selection bounding box becomes the group bounding box. The resizing handles are shown only for the group.

The group is in the active layer.

The group is given a unique default name, e.g. "Group_1".

The coordinates of the upper left corner of the group are defined in such a way that the position of the objects contained in the group remains unchanged in the screen. The height and width of the group is defined to accommodate the full extent of the objects contained in the group.

4.3.14.3 Managing groups

Introduction

You can select, copy, paste and ungroup a group.

Requirement

- A screen containing at least one group of objects is open.

Selecting a group

When you click on an object in the group, the whole group is selected.

If the whole group is visible in the screen editor, you can also select the group by drawing a lasso around it.

Copying and pasting a group

To copy a group, follow these steps:

- Right-click the group in the "Layers" task card. Select "Copy" and "Paste" in the shortcut menu.
- Select the group. Copy the group with <Ctrl + C> and paste it with <Ctrl + V>.

You can paste the copied group:

- In the same screen
- In a different screen
- On another Unified device

Note

References in function lists or scripts to other objects in the group are kept as the original reference.

Example:

Group_1 contains Button_1 and Circle_1.

Button_1 has a script that references Circle_1.

After copying and pasting, the copied Group_2 contains Button_2 and Circle_2.

The script on Button_2 continues to reference Circle_1.

Ungrouping a group

To ungroup a group, follow these steps:

1. Select the group.
2. Right-click to open the shortcut menu.
3. In the shortcut menu, select the "Group > Ungroup" command.

The group is ungrouped. The objects from the group remain in the screen.

4.3.14.4 Changing the size of the group

Introduction

You can change the size of an object group in the Engineering System.

When you select the group, it is framed by a bounding box with blue handles. You have the following options for changing the size and position of a group:

- Drag with the mouse
- Configure group properties

After the size of the group has been changed, the objects contained in the group are scaled proportionally to their original size and the target size.

Requirement

- The HMI screen containing at least one object group is open.

Changing the size of the group with the mouse

To change the size of the group with the mouse, follow these steps:

1. Select the group whose size you want to change.
   The bounding box is displayed.
2. Drag a handle of the box to a new position.

The size of the group is changed.

	**Tips for working effectively**
If you press the <Shift> key while dragging, the group is resized according to the aspect ratio.	

Note

- Circular objects, such as circles, circular arcs, circle segments, gauges, and clocks, are only resized if both dimensions are changed at the same time by dragging one of the corner handles. If the size of the group is not adapted proportionally, the circular objects cannot be displayed correctly.
- If a group was first significantly reduced in size and then enlarged again, the objects in it may shift or reshape due to precision losses.

Configuring the size of the group through properties

To change the size of the group through properties, follow these steps:

1. Select the group whose size you want to change.
2. Select "Properties" > "Properties" > "Size and position".
3. In the "Static value" column, enter the "Size - width" and "Size - height" coordinates.

The object size is changed.

4.3.14.5 Moving a group

Introduction

You can move an object group in various ways.

Requirement

- The HMI screen containing at least one object group is open.

Moving an object group

To move the object group, follow these steps:

1. Select the object group you want to move.
2. The following options are available for moving:
   - Moving by selecting and dragging with the mouse.
   - Moving with pixel accuracy using the arrow keys on your keyboard.
   - Moving in larger pixel increments using <Shift> and the arrow keys on your keyboard. The increment depends on the settings you configured for the grid under "Options > Settings > Visualization > Screens > Grid".

4.3.14.6 Moving groups between layers

Introduction

You can move groups between layers in the "Layout > Layers" task card and change the order of groups within a layer.

The objects in the groups are moved to the same layer as the parent group and keep their order.

Requirement

- The HMI screen containing at least one object group is open.

Moving groups between the layers

You have the following options for moving one or more groups between the layers:

- Moving one group to another layer using drag-and-drop
- Selecting the "Arrange" command in the shortcut menu of the group, and then selecting:
  - "Bring to front"
  - "Bring forward"
  - "Send backward"
  - "Send to back"
- Moving multiple groups using multiple selection and drag-and-drop.

Note

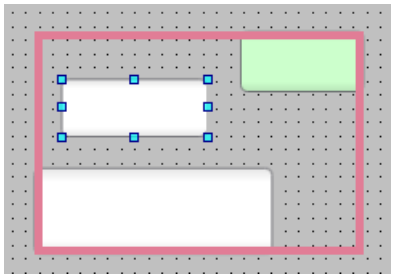
Moving of groups is only possible if no objects contained in the group have been selected.

4.3.14.7 Groups in editing mode

Introduction

You can configure the individual objects in the group in editing mode.

When you select an object within the group, the group goes into editing mode. When the group is in editing mode, it is framed by a red rectangle.



Requirement

- The HMI screen containing at least two objects is open.
- The objects have been put together to form a group.

Activating editing mode

To activate editing mode for a group, choose one of the following options:

- Click an object in the group with the left mouse button. Select "Group > Edit group" in the shortcut menu.
- Double-click an object in the group.
- Select an object within a group by clicking on the object in the "Layout > Layers" task card.
- An object in the group can be selected through an error message, cross-reference or search result.

Options in editing mode

- When the group is in editing mode, you can select an object contained in the group by clicking it. The group remains in editing mode.
- If you select an object outside the group, the editing mode is deactivated.
- You can also select the following using multiple selection:
  - Multiple objects in a group.
  - Multiple groups in the screen.
- Direct text input: If you double-click an object in which a direct text input is possible, you can enter the text. If the group is not in editing mode, editing mode is activated.
- A rotated group is displayed as not rotated in editing mode. After editing mode is deactivated, the group is displayed rotated again. The configured value of the "Rotation - angle" property remains unchanged.

Configuring objects in editing mode

You can configure the objects in the group in editing mode in the following ways:

- Changing properties of the selected objects.
- Aligning or distributing objects or setting them to the same size.

- Adding or removing points of point-based objects, e.g. for polyline and polygon.
- Copying objects. When pasted, the objects are placed outside the group.
- Linking objects, e.g. with a tag, using drag-and-drop.

The group is updated after size or position changes of the objects it contains.

See also

Aligning objects in the group (Page 436)

4.3.14.8 Adding an object to the group

Introduction

You can add one or more objects to a group.

Requirement

- The HMI screen containing at least one object group is open.
- At least one object has been configured outside the group.

Adding an object to a group

To add an object to a group, follow these steps:

1. Select a group and one or more objects using multiple selection.
2. Right-click to open the shortcut menu.
3. In the shortcut menu, select the "Group > Add to group" command.

Note

The command is hidden if you have selected unsupported objects, e.g. a control or another group.

Result

The object(s) are added to the group. The size of the bounding box of the group is adjusted to accommodate the added objects.

The added objects are displayed in the "Layout > Layers" task card at the bottom position of the group.

Adding an object to a group using drag-and-drop

You can also add objects to a group or remove them from a group in the "Layout > Layers" task card using drag-and-drop.

4.3.14.9 Managing objects in groups

Introduction

You can move or delete one or more objects in the group or remove one or more objects from the group.

Requirement

- A screen containing at least one group of objects is open.

Moving an object in the group

You can move the objects within a group in the "Layout > Layers" task card using drag-and-drop.

If you move an object directly to the group using drag-and-drop, the object is positioned last within the group.

Note

You can also add objects to a group or remove them from a group in the "Layout > Layers" task card using drag-and-drop.

Deleting an object in the group

It is not possible to delete an object that is contained in a group.

To delete an object, follow these steps:

1. Move the object directly to a layer using drag-and-drop.
2. Delete the object.

Removing an object from the group

To remove an object from a group, select one of the following options:

- Drag-and-drop the object from the group to the "Layers" task card.
  If you move an object directly to a layer using drag-and-drop, the object is positioned last within the level.
-

You cannot remove the last object from the group because an empty group is not permitted.

4.3.14.10 Rotating a group and objects in the group

Introduction

You can rotate the group and the objects in the group.

You can define the rotation of an object around a pivot point. You can specify the "Pivot point X" and "Pivot point Y" coordinates of the pivot point in the Inspector window of the group. You can specify the rotation angle for the rotation of the group under "Properties > Rotation - angle".

The pivot point can also be located outside the group.

Requirement

- The HMI screen containing at least one object group is open.

Rotating an object group

The rotation defines the rotation of the group around the pivot point. The value of the rotation is specified in degrees. The configured initial position corresponds to a value of 0°. The position of the group differs from its configured initial position by the rotation value. Negative and positive values are permissible.

Pivot point

Define the pivot point under "Properties > Rotation - pivot point":

- Absolute to center: Specifies that the rotation is an absolute rotation around the center point of the group.
- Absolute to screen: Specifies that the rotation is an absolute rotation around the zero point of the screen. In this case, the zero point is located at the top left corner of the screen.

Pivot point positioning

The attributes "Pivot point X" and "Pivot point Y" define the horizontal and vertical distance of the pivot point from the origin point.

- Center point of the group
- Zero point of the screen

The values are specified in device-independent pixels (DIP).

The pivot point can also be located outside the bounding box. Negative and positive values are permissible.

Result

The group is rotated. All objects in the group are rotated according the rotation of the group.

Rotated objects in the group

You have the following options:

- You can create a group of the rotated objects.
- You can rotate the objects in the group.

Pivot points X and Y are viewed relative to the group, if pivot point mode "Absolute to screen" is selected.

Limitations

- The rotation of objects contained in the group is not taken into account when calculating the group boundaries or when changing the size of a group.
- When you edit the objects in a rotated group, the group is displayed non-rotated while it is in editing mode. After editing mode is exited, the group is displayed rotated. The configured value of the "Rotation - angle" property remains unchanged.
- The rotation of a group is not taken into account when adding and removing objects to and from the group.
- Based on these limitations, the following is recommended:
  - Configuring a group and its objects without rotation.
  - Use a dynamic rotation in runtime when needed.

4.3.14.11 Aligning objects in the group

Introduction

You can align the selected objects in relation to a reference object in a group.

Requirement

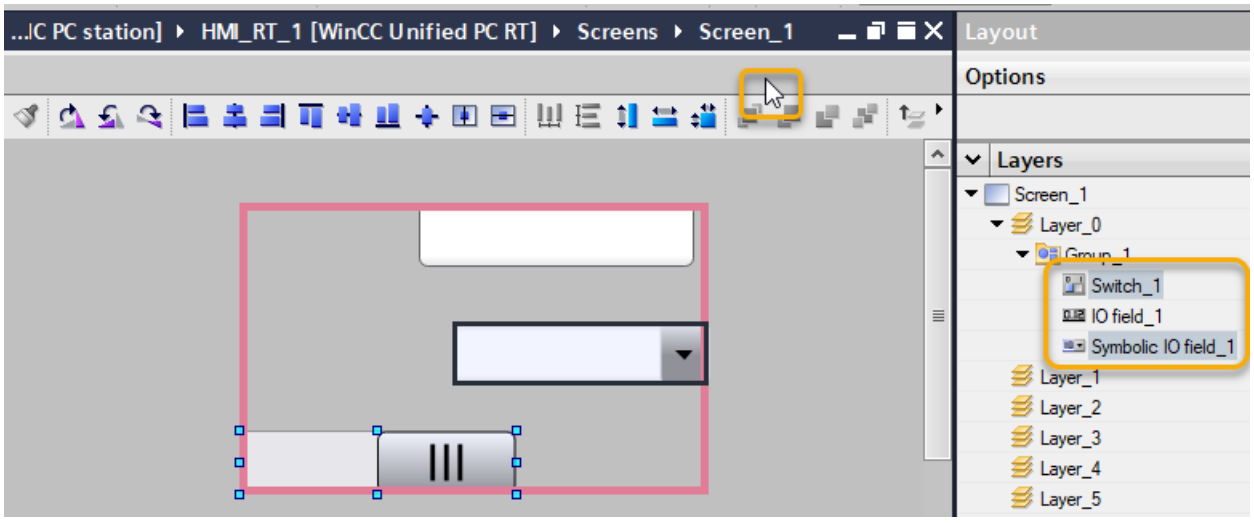
- The HMI screen containing at least two objects is open.
- The objects have been put together to form a group.

Aligning selected objects in a group

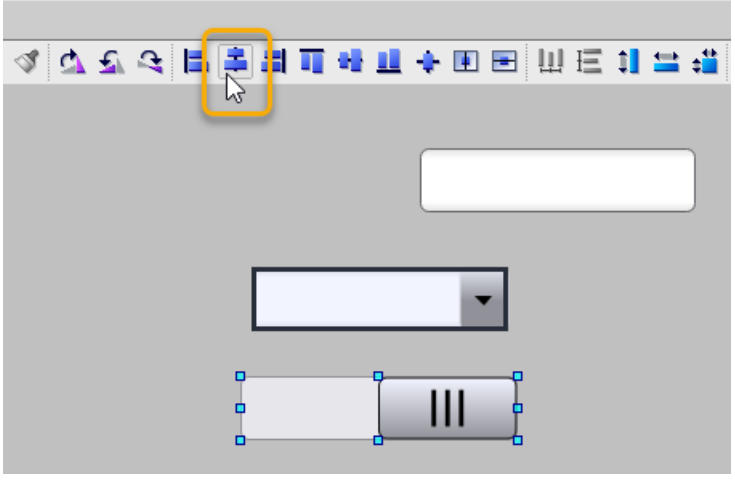
The reference object is the object that you selected first.

To align selected objects in a group in relation to a reference object, follow these steps:

1. Select the desired objects in the "Layout > Layers" task card.
2. Click on the bar above the toolbar.
   The icons in the toolbar are displayed.



3. Select the desired command for alignment in the toolbar.



The selected objects in the group are aligned in relation to the reference object.

See also

Aligning objects (Page 395)

Groups in editing mode (Page 431)

4.3.14.12 Properties of the group

Introduction

Properties of the group are properties that you edit at the group level.

You can configure the group properties in the Engineering System and interpret them in runtime.

Properties of the group

The following properties affect the entire group.

- Name
- Coordinates "Position - left" and "Position - top". The coordinates of all objects contained in the group are referenced to the upper left corner of the group.
- "Size - height" and "Size - width" form the outer boundary of the objects contained in the group.
  These values are automatically updated when:
  - Objects are added to the group.
  - Objects are removed from the group.
  - The position of the objects contained in the group is changed.
- Rotation-related properties:
  - "Rotation - pivot point"
  - "Rotation - angle"
  - "Rotation - pivot point X"
  - "Rotation - pivot point Y"

  If the group is rotated, all objects contained in the group are displayed rotated.
- Visibility: The visibility is only toggled in runtime. All objects are always visible during engineering.
  The visibility functions in a cascaded manner:
  - If the visibility of the group has been set to "false", all objects are invisible.
  - If the visibility of the group has been set to "true", the objects for which visibility is set to "true" are visible.
- When "Operator control - allow" is activated, operator control of the objects in the group is permitted.
  Activation of the operator control functions in a cascaded manner:
  - If the "Operator control - allow" property is deactivated, operator control is not possible for any objects.
  - If the "Operator control - allow" property is activated, operator control of objects for which "Operator control - allow" is activated is possible.

  Deactivated objects are displayed grayed out.

See also

Rotating a group and objects in the group (Page 434)

Adding an object property to favorites (Page 377)

4.3.14.13 Adding a property of the group to favorites

Introduction

You can define your own favorite properties in the "Group" screen object.

The following properties are defined as favorites by the system:

- "Name"
- "Top"
- "Left"
- "Height"
- "Width"
- "Visibility"

Adding property to favorites

To add a property to favorites, follow these steps:

1. Right-click on a property that is not defined as a favorite by the system.
2. Select "Add to favorites" in the shortcut menu.
3. To display all favorites, click the icon .

The number of favorite properties is not limited.

Note

You cannot add the aggregated properties of the objects contained in the group to favorites.

Removing property from favorites

To remove a property from favorites, follow these steps:

1. To display all favorites, click the icon .
2. Right-click the favorite property.
3. Select "Remove from favorites" in the shortcut menu.

4.3.14.14 Aggregated properties of the objects in groups

Introduction

The object properties in the group are displayed as aggregated properties in the Inspector window under "Properties > Miscellaneous > Interface". You can either configure these properties with a static value or dynamize them.

Note

Only the properties of the topmost level are available on the interface for aggregated properties. Properties within the sub-hierarchy are not available.

Requirement

The HMI screen containing at least one object group is open.

Aggregated properties with a static value

The following applies for the aggregated properties with a static value:

- When you configure a property with a static value under "Properties > Miscellaneous > Interface", this value is passed to every object in the group that has this property. A similar behavior takes place when a multiple selection is made.
  This static value is not retained at the group level.
- If the static value of a configured property is the same for all objects, the current value is displayed at the group level.
- If the static value of a configured property is different for the objects, "Ambiguous value" is displayed in the input field in the "Static value" column. In this case, too, you can configure any property value in the input field.
- For the aggregated properties at the group level, no validation information is displayed, even if the configured static value of the property is invalid for at least one object.
  Validation only takes place at the level of the individual objects.

Non-aggregatable properties

The following object properties are not displayed under the aggregated properties. You cannot configure or dynamize these object properties at the group level:

- Your own properties of the group, e.g. coordinates or visibility. You can only configure these properties individually.
- Appearance - style item
- Resource list
- Selection item
- Connection status
- Focus - show visual

Static values of the following properties are displayed empty. You cannot configure the properties with a static value.

- Process value
- Text

Dynamization of the aggregated properties

You can configure dynamization of an aggregated property at the group level under "Properties > Miscellaneous > Interface".

As soon as the configured dynamization is triggered in runtime, the dynamization affects all objects in the group that retain this property.

Note

The dynamization type "Flashing" is not available for dynamization of the aggregated properties of a group.

4.3.14.15 Group as part of a multiple selection

Introduction

A group, together with other groups and/or other objects, can be part of a multiple selection. The custom and aggregated properties are displayed under the aggregated properties.

Group as part of a multiple selection

The aggregated group properties are:

- Displayed uncategorized under the "Properties" part.
- Not aggregated with the properties of the objects that are not grouped.

If static property values are defined for multiple selection, the values are passed to all parts of the multiple selection, including custom and aggregated group properties.

If the property is dynamically configured for multiple selection, the dynamic configuration is propagated to all parts of the multiple selection, including custom and aggregated group properties.

Example

If a multiple selection includes the objects of the topmost level as well as groups, you can change the background color of all objects.

1. Specify "Appearance > Background color" for the objects of the topmost level.
2. Specify "Miscellaneous > Interface > Background color" for the grouped objects.

4.3.15 Two-hand operation of operator controls

4.3.15.1 Two-hand operation of operator controls

Introduction

WinCC supports two-hand operation of operator controls for Unified PC. It ensures safe operation of operator controls which are used to change critical system settings, for example, control tags with machine limits.

Locked and unlocked operator controls

You define specific operator controls as "locked operator controls" for two-hand operation of operator controls. Locked operator controls usually cannot be operated in runtime. Operators can only operate the locked operator controls when they press a release button at the same time.

In runtime, locked operator controls can only be accessed with the tab sequence when a release button is pressed at the same time.

Locked operator controls and release buttons

You can configure all operator controls as locked.

You must configure at least one button in the screens as release button. This can be any unlocked button. The unlocking of locked operator controls by pressing the release button has an effect on all open screens.

Display in runtime

The locked operator controls are displayed as dimmed in runtime. The locked operator controls are completely visible when they are unlocked by means of the release button.

Simulation of projects with multi-touch functions

WinCC supports the simulation of configured multi-touch functions. Requirement is that your monitor supports multi-touch operation.

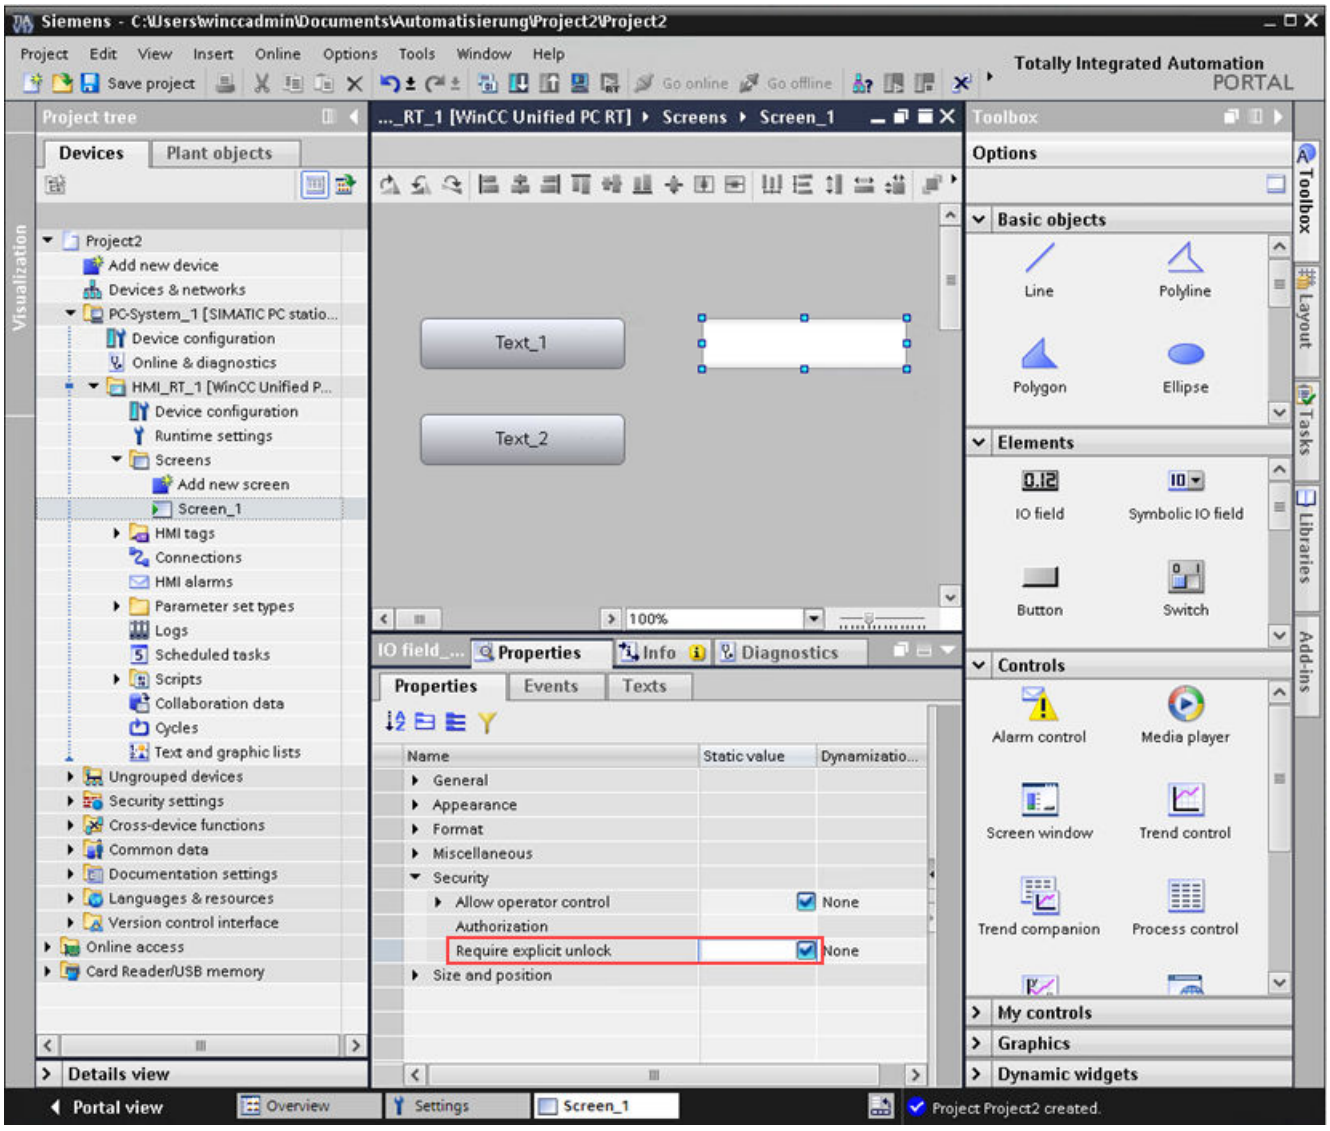
4.3.15.2 Locking and unlocking operator controls

You can lock and unlock operator controls in projects for multi-touch devices. Locked operator controls can only be operated in runtime when the operator presses a release button at the same time.

You can lock and unlock individual operator controls or several operator controls simultaneously.

Procedure

1. Configure operator controls of the type I/O field, button or slider.
2. Select the required operator control(s).
3. To lock the operator controls, enable the "Require explicit unlock" option under "Properties > Properties > Security".



4. To unlock the operator controls, disable the "Require explicit unlock" option under "Properties > Properties > Security".

In runtime, locked operator controls can only be operated when a release button is pressed at the same time.

Note

Locking of operator controls is an add-on to the existing security settings of the operator control. This means that in case of locked operator controls - in addition to pressing the release button - the general operability ("Allow operator control" option) and the required operator control ("Authorization" property) must be present so that the operator control can be operated in runtime.

Defining the release button

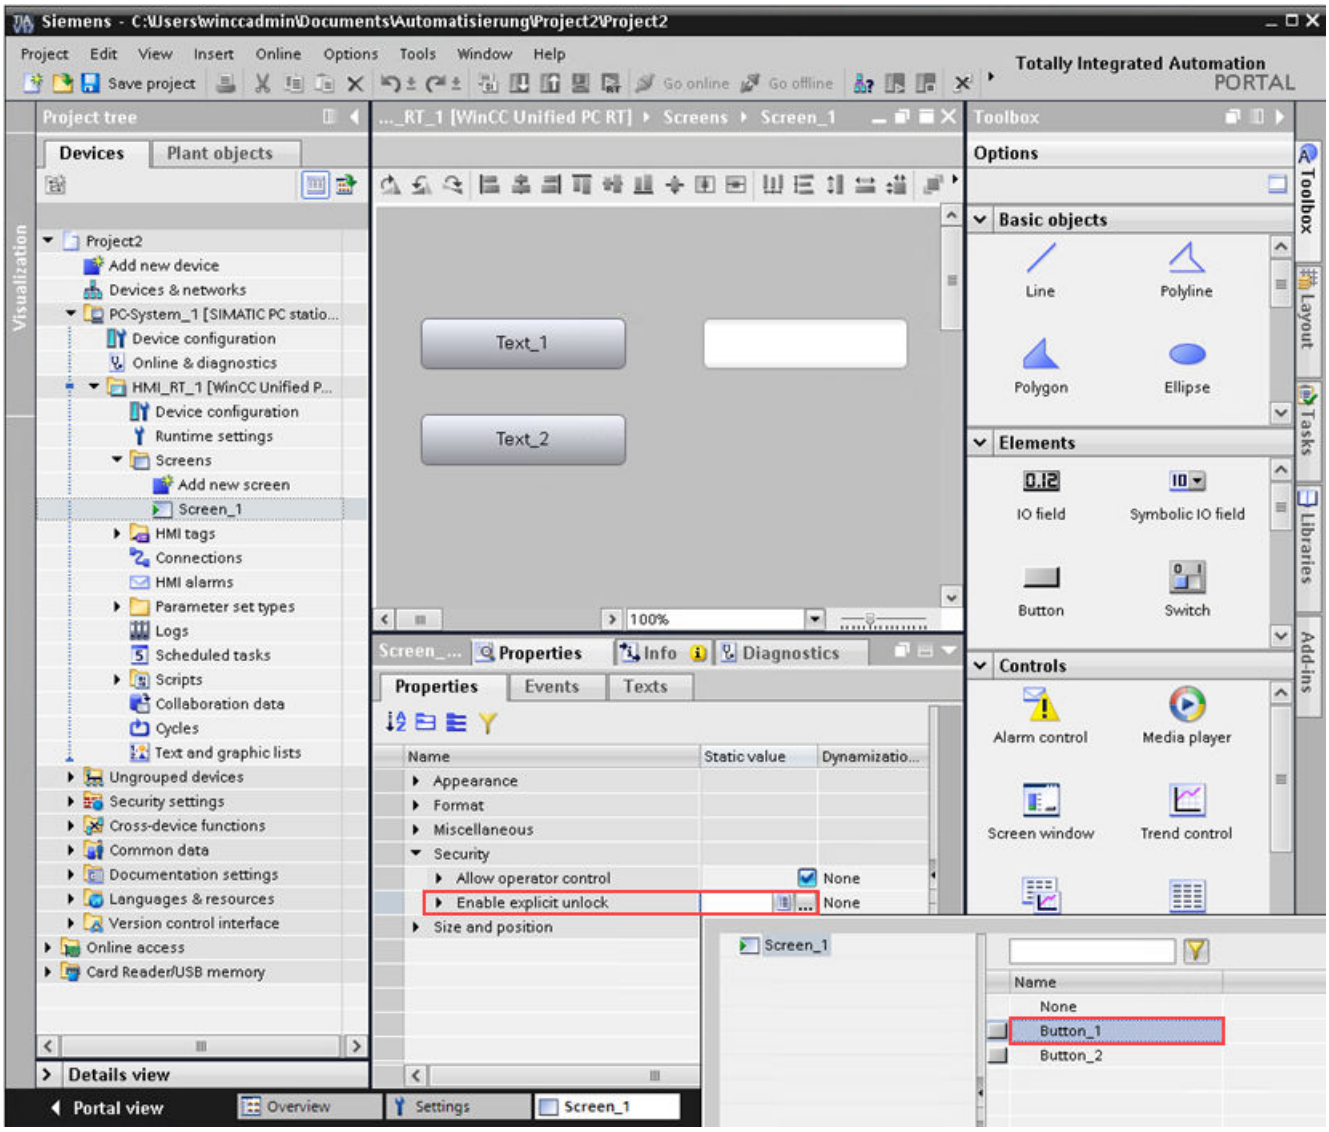
To use the locked operator controls, you must configure at least one release button in one of the displayed screens.

4.3.15.3 Configuring the release button in the screen

So that you can operate locked operator controls on multi-touch devices, configure a release button.

Procedure

1. Select the screen.
2. Select the desired button of the screen under "Properties > Security" under "Enable explicit unlock".



3. To turn a release button back into a normal button, select a different button or "None" under "Properties > Security" under "Enable explicit unlock".

4.4 Configuring text lists and graphics lists

4.4.1 Configuring text lists

4.4.1.1 Basics of text lists

Introduction

Texts are assigned to the values of a tag in a text list. During configuration, you assign the text list to a text field, for example. This supplies the text to be displayed to the object.

You create and edit the text list in the "Text and graphic list" editor. You configure the interface between the text list and a tag at the object that uses the text list.

The availability of the text list is determined by the HMI device used.

Application

You can configure the text list for the following applications:

- Output of texts depending on tag value.
- Display of a selection list in a list box. The associated texts are displayed in the list box depending on the value of the configured tags.

Note

Display of tag values without text

The display of tag values to which no text has been assigned depends on the runtime:

- The display and operating element remains empty.
- Three asterisks *** are displayed.

Ranges for the text list

Three types are available for the text lists:

- Value/Range
  This setting assigns text entries from the text list to integer values or value ranges of a tag. You can select the number of text entries as needed. The maximum number of entries depends on the HMI device you are using.
  You specify a default value which is shown if the value of the tag lies outside the defined range.
- Bit (0, 1)
  This setting assigns text entries from the text list to two states of a binary tag. You can create a text entry for each state of the binary tag.
- Bit number (0-31):
  This setting assigns a text entry from the text list to each bit of a tag. The maximum number of text entries is 32. You use this form of text list, for example, in a sequential control chart when processing a sequencer in which only one bit of the used tag may be set. You influence the behavior of the bit number (0 - 31) with the set bit of the least significance and a default value.

Multilingual texts

You can configure multiple languages for the texts in a text list. The texts will then be displayed in the set language in runtime. To this purpose you set the languages in the Project window under "Languages & Resources > Project languages."

Configuration steps

The following steps are necessary to display texts in a screen object:

1. Creating the text list
2. Assignment of the texts to values or value ranges of a text list
3. Assigning a text list in the display object
4. Assigning a tag

4.4.1.2 Creating a text list

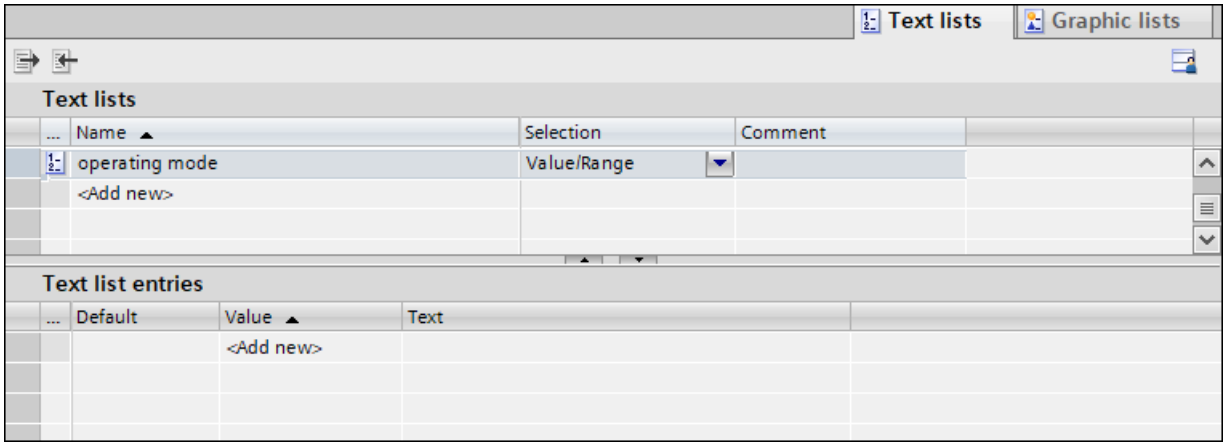
Introduction

The text list allows you to assign specific texts to values and output these in runtime, for example in an I/O field. Specify the I/O field type, for example, as a pure input field.

Procedure

Follow these steps to create a text list:

1. Double-click "Text and graphic lists" in the project tree.
2. Open the "Text lists" tab.



3. Click "Add" in the "Text lists" table. The Inspector window of the text list is open.
4. Assign a name to the text list that indicates its function.
5. Select the text list type under "Selection":
   - Value/Range: Text from the text list is displayed when the tag has a value that lies within the specified range.
   - Bit (0,1): A text from the text list is displayed if the tag has adopted the value 0. Another text from the text list is displayed if the tag has adopted the value 1.
   - Bit number (0-31): Text from the text list is displayed when the tag has the value of the assigned bit number.
6. Enter a comment for the text list.

Result

A text list is created.

4.4.1.3 Assigning texts and values to an area text list

Introduction

For each area text list you specify which texts are displayed at which value range. The entered text is only displayed when the value is within the permitted range.

The following options are available:

- "Range": You enter the minimum value and maximum value for the range.
- "To": You enter the maximum value for the permitted range.

- "Single value": When the specified bit is set, the text is displayed in runtime.
- "From": You enter the minimum value for the permitted range.

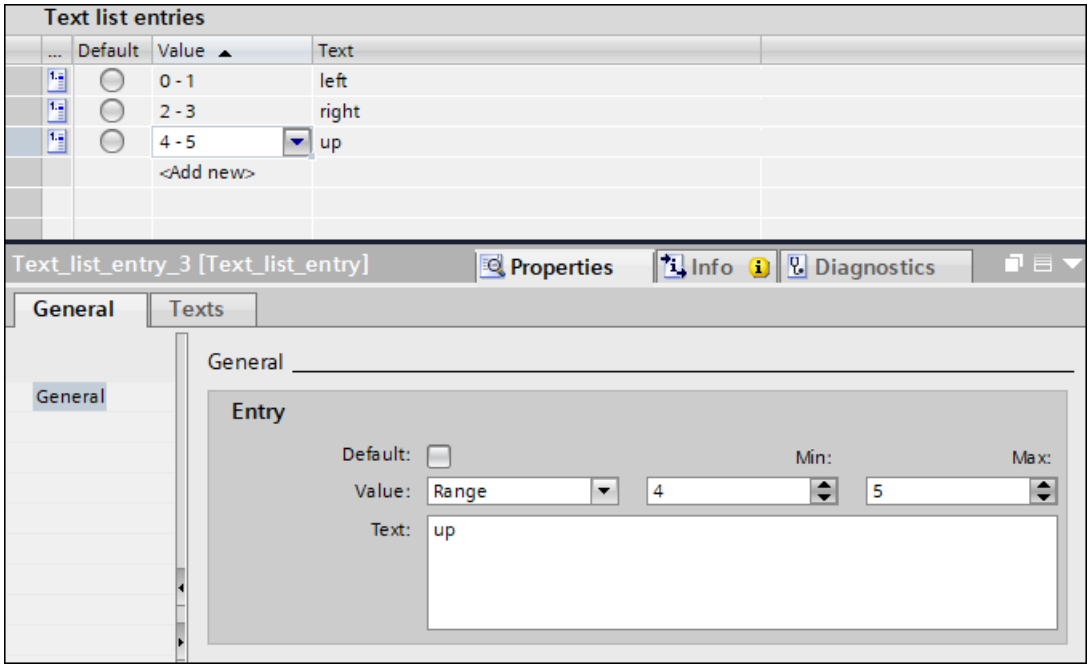
Requirement

- The "Text and graphic list" editor is open.
- The "Text lists" tab is open.
- An area text list has been created and selected.

Procedure

To assign texts and values to a range text list, follow these steps:

1. Click "Add" in the "Text list entries" table.
   The Inspector window for this list entry opens.



2. Select one of the options in the Inspector window "Properties > General > Value" and enter values.
3. Enter the text that is displayed in runtime when the tag has the specified value or lies within the specified range of values under "Text." The text may contain a maximum of 128 characters.
4. Activate the "Default entry" for all unassigned values. The entered text is always displayed when the tag has an undefined value. Only one default entry is possible per list.

   Note

   Selecting the default entry is not possible in runtime.

5. Add additional entries to the text list for additional value ranges.

Result

An area text list is created. Texts that appear in runtime are assigned to the possible values.

4.4.1.4 Assigning texts and values to a bit text list

Introduction

For each bit text list, you specify which text is displayed at which bit value.

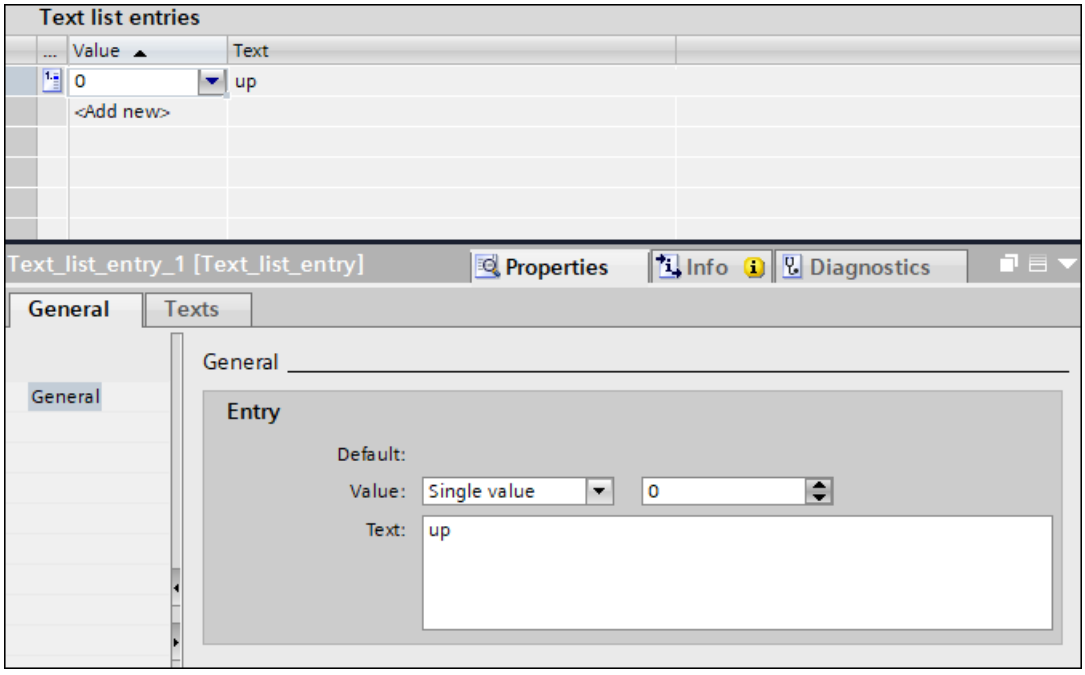
Requirement

- The "Text and graphic list" editor is open.
- The "Text lists" tab is open.
- A bit text list has been created and selected.

Procedure

To assign texts and values to a bit text list, follow these steps:

1. Click "Add" in the "Text list entries" table.
   The Inspector window for this list entry opens.



2. Select the setting "Single value" in the Inspector window "Properties > General > Value" and enter "0" as "value".
3. Under "Text", type in the text that is displayed in runtime when the tag has the value "0". The text may contain a maximum of 128 characters.
4. Click "Add" in the "Text list entries" table. A second list entry is created.

5. Select the setting "Single value" in the Inspector window "Properties > General > Value" and enter "1" as "value".
6. Under "Text", type in the text that is displayed in runtime when the tag has the value "1".

Result

A bit text list is created. Texts that appear in runtime are assigned to the possible values "0" and "1".

4.4.1.5 Assigning texts and values to a bit number text list

Introduction

For each bit number text list you specify which texts are displayed at which bit number.

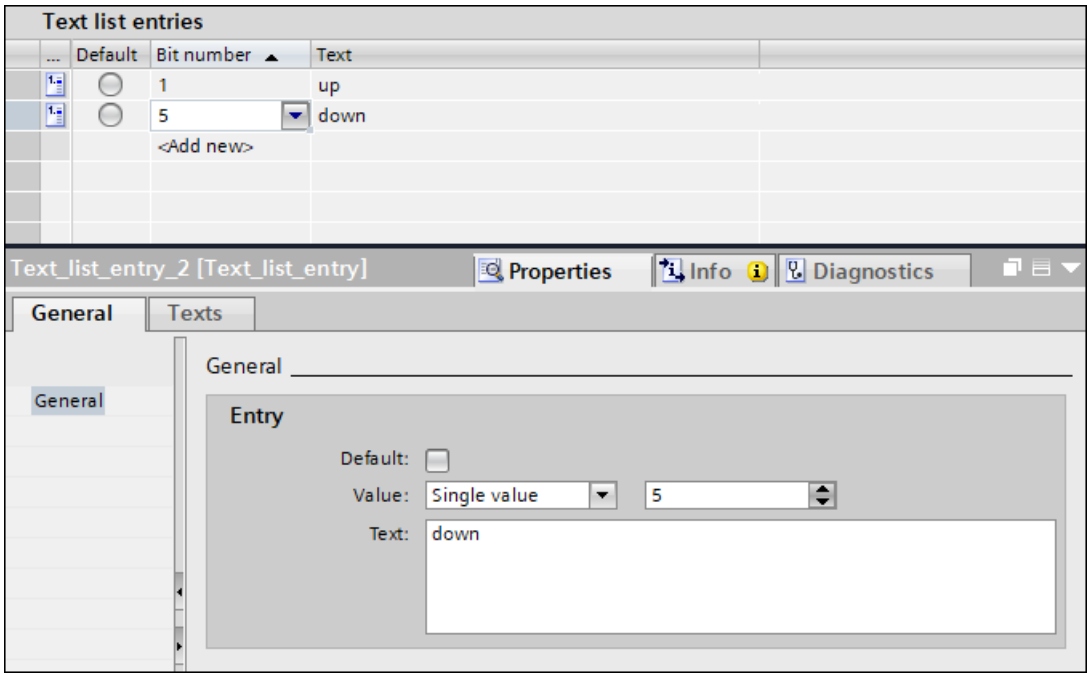
Requirement

- The "Text and graphic list" editor is open.
- The "Text lists" tab is open.
- A bit number text list has been created and selected.

Assign texts and values to the bit number text list

To assign texts and values to a bit number text list, follow these steps:

1. Click "Add" in the "Text list entries" table.
   The Inspector window for this list entry opens.



2. In the Inspector window, select the "Single value" setting under "Properties > General > Value". Enter "5", for example, for "Value".
3. For all unassigned values, enable the "Default" option for the default entry. The text appears when the tag assumes an undefined value. Only one default entry is possible per list.

   Note

   Selecting the default entry is not possible in runtime.

4. Enter the text under "Text". When the tag has taken the value "5", the text is displayed in runtime.
   The text may contain a maximum of 128 characters.
5. You can add additional entries to the text list for more bit numbers.

Result

A bit number text list is created. Texts that appear in runtime are assigned to the specified bit numbers.

Multiline text list entries

For objects with the "Text" property, you can enter the text on multiple lines.

Use the <Shift + Return> key combination to enter a line break in the text entry. Line breaks are represented in the text box by the "¶" paragraph mark.

See also

Entering multiline text (Page 407)

4.4.1.6 Configuring object with a text list

Introduction

The output value and value application for text lists are specified in the display and operating object that displays the texts of the text list in runtime. The properties of these objects are configured as required.

Requirement

- A text list is created. The values have been defined. The texts are assigned to the values.
- You have created a tag.
- The "Screens" editor is open.
- A screen with an object, such as a text box, is open. The text box is selected.

Procedure

1. In the Inspector window under "Properties > Properties > General > Text" in the "Dynamization" column, select the "Resource list" entry.
2. Select the tag whose values determine the display in the text box under "Resource list > Settings > Tag".
3. Select the text list which you want to display in runtime under "Resource list > Settings > Resource list".
4. Click on the button in the "Resource list" line .
   The selected text list opens.
5. Select an entry in the "Text list entries" table as the default entry. The text from the default entry is displayed in the object.
   If you have not specified a default entry, the first entry in the "Text" column is displayed in the object.

Tips for an efficient procedure
• Drag-and-drop a text list from the detail view into the screen. A text box is created and linked to the text list. Configure the tags whose values determine the display in the graphic view.

Result

The defined texts of the text list are displayed in the text field in runtime when the tag has the specified value.

See also

Show default entry of text and graphic list in the object (Page 409)

4.4.2 Configuring graphics lists

4.4.2.1 Basics of graphic lists

Introduction

The possible values of a tag are assigned to specific graphics in a graphic list. During configuration, assign the graphic list to a button or a graphic view. This supplies the graphics to be displayed to the object.

The graphic lists are created with the "Text and graphic list" editor. You configure the interface between the graphic list and a tag at the object that uses the graphic list.

The availability of the graphic list is determined by the HMI device used.

Application

You can configure the graphic list for the following situations:

- Selection list with a graphic view.
- State-specific graphic for a button.

Graphic sources

Graphics can be added to the graphic list from the following sources:

- By selecting from the project graphics.
- By selecting an existing file. You can use the following file types: *.bmp, *.ico, *.emf, *.wmf, *.gif, *.tiff, *.png, *.svg, *.jpeg, *.jpg.
- Creating a new file.

Ranges for the graphic list

Three types are available for the graphic lists:

- Value/Range
  This setting assigns graphic entries from the graphic list to integer values or value ranges of a tag. You can select the number of graphic entries as needed. The maximum number of entries depends on the HMI device you are using.
  You specify a default value which is shown if the value of the tag lies outside the defined range.
- Bit (0, 1)
  This setting assigns graphic entries from the graphic list to two states of a binary tag. You can create a graphic entry for each state of the binary tag.
- Bit number (0-31):
  This setting assigns a graphic entry from the graphic list to each bit of a tag. The maximum number of graphic entries is 32. You use this form of graphic list, for example, in a sequential control system when processing a sequencer in which only one bit of the used tags can be set. You influence the behavior of the bit number (0 - 31) with the set bit of the least significance and a default value.

Multilingual graphics

The graphics in a graphic list can be configured as multilingual. The graphics are then be displayed in the set runtime language. To this purpose you set the languages in the Project window under "Languages & Resources > Project languages".

Configuration steps

The following steps are required to display graphics in a graphic view:

1. Creating the graphic list
2. Assignment of the graphics to values or value ranges of a graphic list
3. Assigning a graphic list in the display object.
4. Assigning a tag

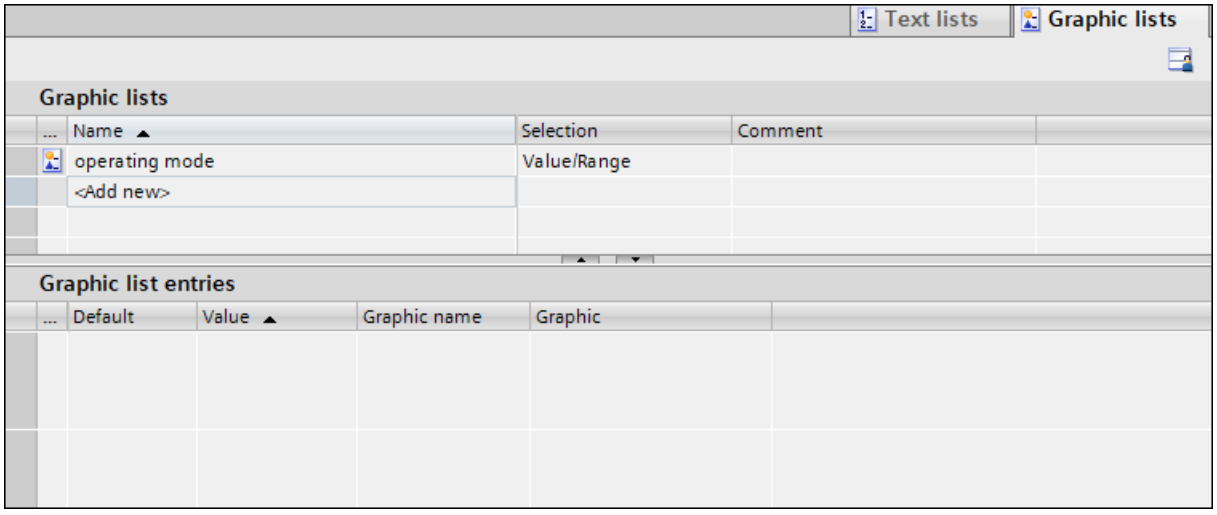
4.4.2.2 Creating a graphic list

Introduction

The graphic list allows you to assign specific graphics to variable values and output these in a graphic I/O field in runtime. Specify the type of the graphic I/O field, for example, as a pure output field.

Procedure

1. Double-click "Text and graphic lists" in the project tree.
2. Open the "Graphic lists" tab.



3. Click "Add" in the "Graphic lists" table. The Inspector window of the graphic list will open up.
4. Assign a name to the graphic list that indicates its function.
5. Select the graphic list type under "Selection":
   - Value/Range: Graphic from the graphic list is displayed when the tag has a value that lies within the specified range.
   - Bit (0,1): A graphic from the graphic list is displayed when the tag has the value 0. A different graphic from the graphic list is displayed when the tag has the value 1.
   - Bit number (0-31): Graphic from the graphic list is displayed when the tag has the value of the assigned bit number.
6. Enter a comment for the graphic list.

Result

A graphic list is created.

4.4.2.3 Assigning graphics and values to an area graphic list

Introduction

For each area graphic list you specify which graphics are displayed at which value range. The selected graphic is only displayed when the value is within the permitted range.

The following options are available:

- "Range": You enter the minimum value and maximum value for the range.
- "To": You enter the maximum value for the permitted range.

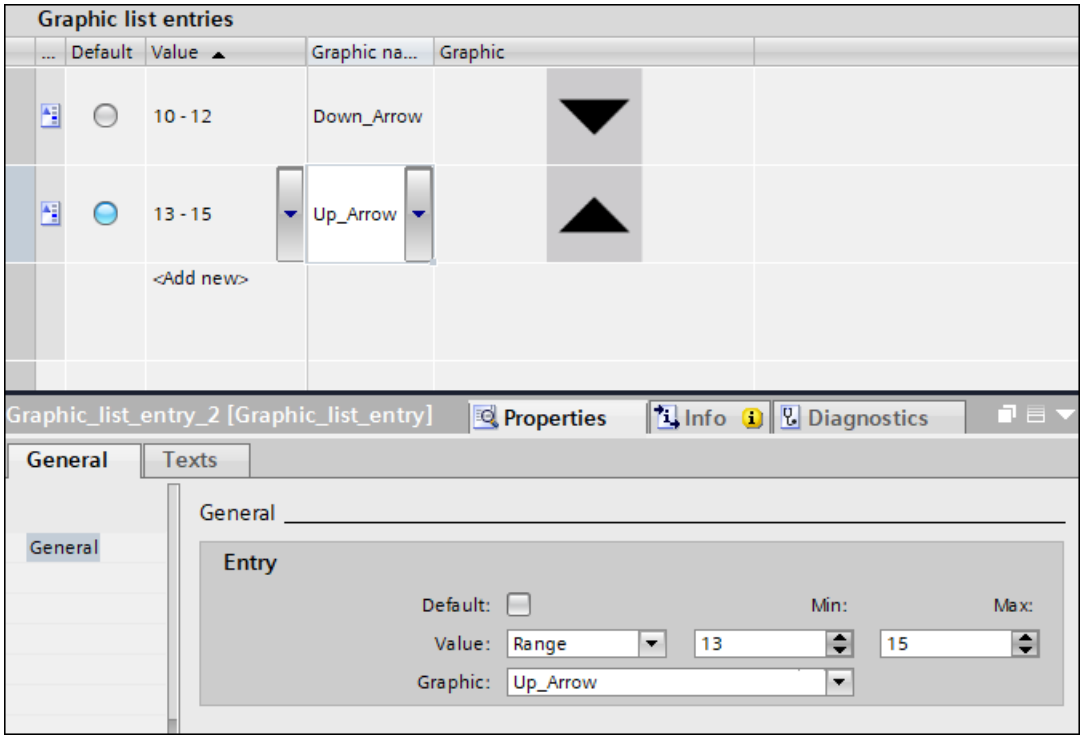
- "Single value": When the specified bit is set, the selected graphic is displayed in runtime.
- "From": You enter the minimum value for the permitted range.

Requirement

- The "Text and graphic list" editor is open.
- The "Graphic list" tab is open.
- An area graphic list has been created and selected.

Procedure

1. Click "Add" in the "Graphic list entries" table.
   The Inspector window for this list entry opens.



2. Select an option in the Inspector window "Properties > General > Value". Enter values.
3. In the "Graphic" column, select a graphic to be displayed in runtime if the tag has the specified value or is within the specified value range.
4. For all unassigned values, enable the "Default" option for the default entry. The graphic is displayed when the tag has an undefined value. Only one default entry is possible per list.

   Note

   Selecting the default entry is not possible in runtime.

5. Add additional entries to the graphic list for additional value ranges.

	**Tips for an efficient procedure**
Inserting a graphic using drag-and-drop operation: 1. Select a graphic in the library or in your file system. 2. Drag-and-drop the graphic into the "Graphic list entries > Graphic" table.	

Result

An area graphic list is created. Graphics that appear in runtime are assigned to the possible values.

4.4.2.4 Assigning graphics and values to a bit graphic list

Introduction

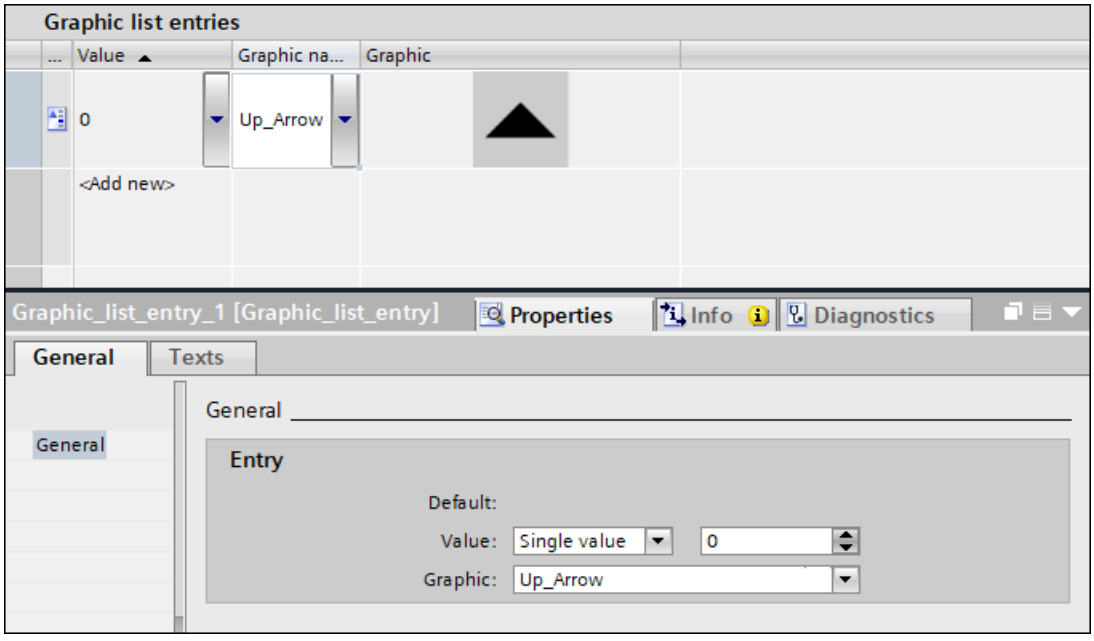
For each bit graphic list you specify which graphic is displayed at which bit value.

Requirement

- The "Text and graphic list" editor is open.
- The "Graphic list" tab is opened.
- A bit graphic list has been created and selected.

Procedure

1. Click "Add" in the "Graphic list entries" table.
   The Inspector window for this list entry opens.



2. Select the setting "Single value" in the Inspector window under "Properties > General > Value" and enter "0" as "value".
3. Click "Add" in the "Graphic list entries" table. A second list entry is created.
4. Select the setting "Single value" in the Inspector window under "Properties > General > Value" and enter "1" as "value".
5. Select a graphic that is displayed in runtime when the tag has the value "1".

	Tips for an efficient procedure
Inserting a graphic using drag-and-drop operation: 1. Select a graphic in the library or in your file system. 2. Drag-and-drop the graphic into the "Graphic list entries > Graphic" table.	

Result

A bit graphic list is created. Graphics that appear in runtime are assigned to the values "0" and "1".

4.4.2.5 Assigning graphics and values to a bit number graphic list

Introduction

For each bit number graphic list you specify which graphics are displayed at which bit number.

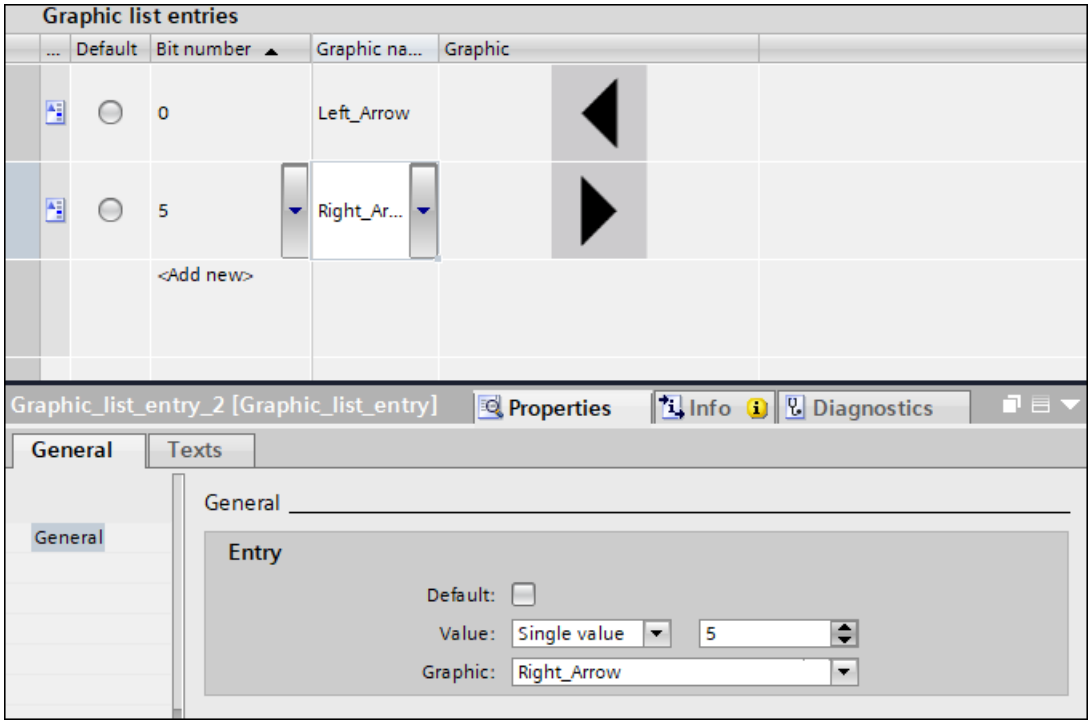
Requirement

- The "Text and graphic list" editor is open.
- The "Graphic list" tab is open.
- A bit number graphic list has been created and selected.

Assigning graphics and values to the bit number graphic list

To assign the graphics and values to a bit number graphic list, follow these steps:

1. Click "Add" in the "Graphic list entries" table.
   The Inspector window for this list entry opens.



2. Select the "Single value" settings in the Inspector window "Properties > General > Value". Enter "5", for example, for "Value".
3. For all unassigned values, enable the "Default" option for the default entry. The graphic is displayed when the tag has an undefined value. Only one default entry is possible per list.

   Note

   Selecting the default entry is not possible in runtime.

4. Enter the graphic under "Properties > General > Graphic". When the tag has taken the value "5", the graph is displayed in runtime.
5. You can add additional entries to the graphic list for more bit numbers.

	Tips for an efficient procedure
Inserting a graphic using drag-and-drop operation: 1. Select a graphic in the library or in your file system. 2. Drag-and-drop the graphic into the "Graphic list entries > Graphic" table.	

Result

A bit number graphic list is created. Graphics that appear in runtime are assigned to the specified bit numbers.

4.4.2.6 Configuring objects with a graphic list

Introduction

The output value and value application for graphic list are specified in the display and operating object that displays the graphics of the graphic list in runtime. The properties of these objects are configured as required.

Requirement

- A graphic list is created. The values have been defined. Graphics have been assigned to the values.
- You have created a tag.
- The "Screens" editor is open.
- A screen with an object, such as a graphic view, is open. The graphic display is selected.

Procedure

1. In the Inspector window under "Properties > Properties > General > Graphics", in the "Dynamization" column, select the "Resource list" entry.
2. Under "Resource list > Settings > Tag", select the tag whose values determine the display in the graphic view.
3. Select the graphic list which you want to have displayed in runtime under "Resource list > Settings > Resource list".
4. Click on the button in the "Resource list" line .
   The selected graphic list opens.
5. Select an entry in the "Graphic list entries" table as the default entry. The graphic from the standard entry is displayed in the object.
   If you have not specified a default entry, the first entry in the "Graphic" column is displayed in the object.

Tips for an efficient procedure

- Drag a graphics list from the detail view of the text and graphics lists to the screen. A graphic view is created and linked to the graphics list. Configure the tags whose values determine the display in the graphic view.

Result

If the tag adopts the specified value, the defined graphics are displayed in the graphic view in runtime.

4.5 Configuring dynamization

4.5.1 Basics of dynamizing screens

Dynamizing objects

Dynamics are used to change the properties of screen objects and screens in runtime depending on another value. The source for this value changes is referred to as "Dynamization type".

Dynamization types

The following table shows the dynamization types available in WinCC:

Dynamization type	Description	Supported property classes	Examples
Tag	Defines the property value depending on the tag value.	All	"Process value" or "Left" properties
Script	Defines the property value depending on the return value.	All	"Process value" or "Left" properties
Resource list	Defines the property value depending on an entry from a text list or graphic list.	Text / Graphic	Properties "Text", "Tooltip" or "Graphic".
Flashing	Defines that the property flashes in configurable colors.	Colors	Properties "Foreground color" or "Border color".
Expression	Specifies the property value depending on several tag values. The tag values are linked by logical operators.	Depends on the screen object	"Size" or "Background color" properties

Examples of dynamizations

The table below shows typical application examples for each type of dynamization:

Dynamization type	Application example
Tag	Visualize the level. The "Process value" property of a bar graph is dynamized with a tag that contains the level from the PLC.
Script	Simulate the filling process. To simulate a movement of bottles on a conveyor belt, the properties "Left", "Top" and "Visible" are dynamized with scripts.
Resource list	Display the plant status. The meaning of a quality code is saved in a text list. Depending on the transferred numerical quality code, its meaning is displayed on the HMI device.
Flashing	Visualize limit violations. When the level of a tank drops below a limit, the visualized tank is to flash in two signal colors.
Expression	Visualization of machine states. Machine states of different plant objects are stored in tags of the type "Bool". Complex visualizations are derived from the combination of tag values.

Automatically filling in of property values for an object collection (Page 379)

4.5.2 Displaying dynamization of the properties

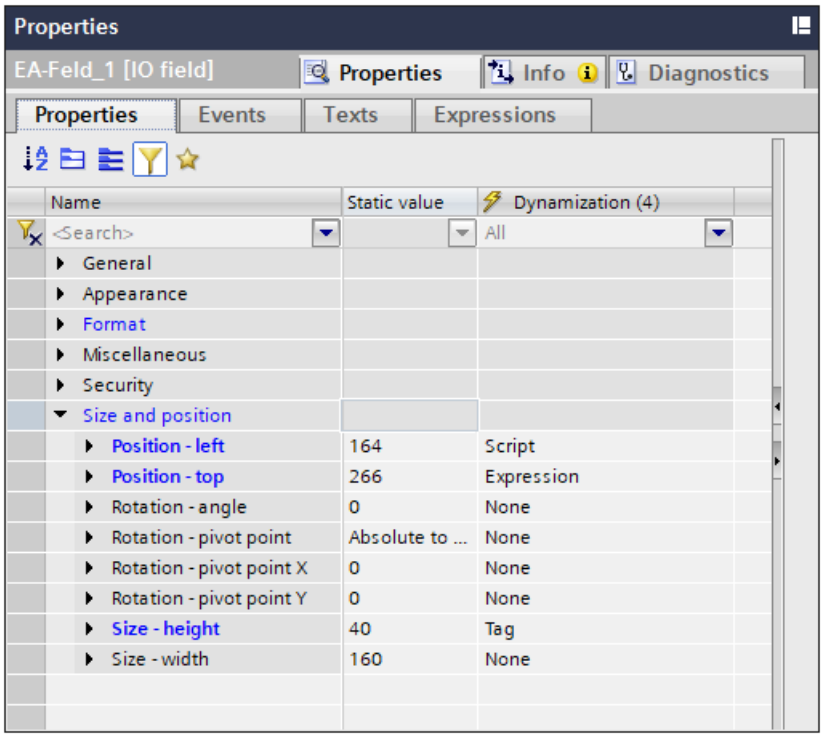
Introduction

You can see in the Inspector window of an object which object properties have been dynamized.

Displaying dynamization of the property

Dynamized properties are shown in dark blue font and in bold in the Inspector window in the "Name" column.

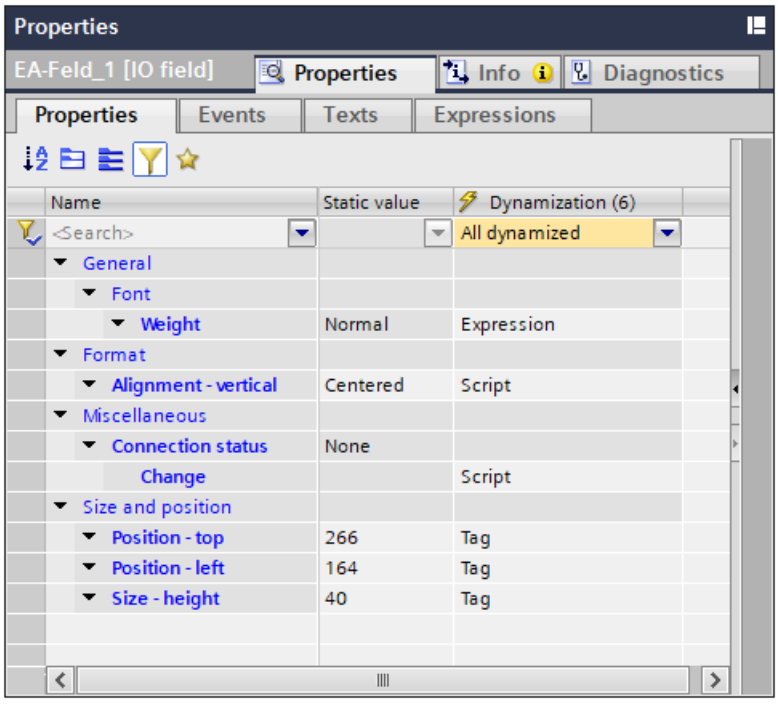
Groups containing a dynamized property are shown in dark blue font.



Filter dynamized properties

If you use the "Filter" function and select "All dynamized" in the "Dynamization" column, the following is displayed:

- All dynamized properties in dark blue font and bold.
- The groups in which a property is dynamized in dark blue font.



4.5.3 Find type of dynamization

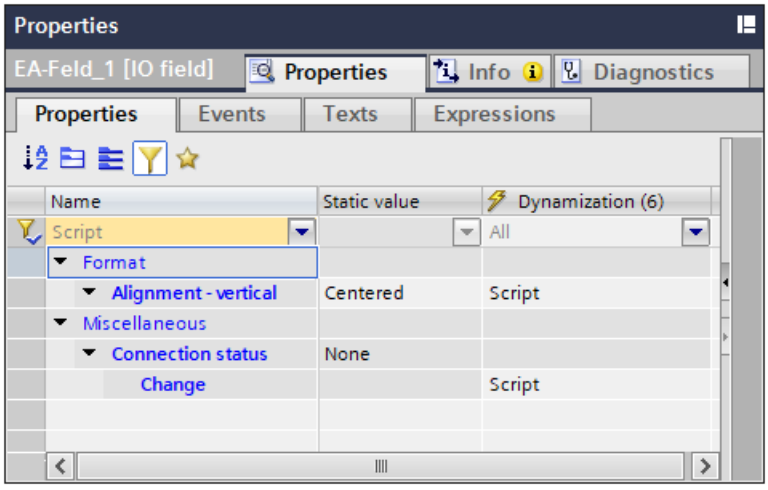
Introduction

You can search for the individual type of dynamization using the "Filter" icon .

Find type of dynamization by input

To search for a type of dynamization by entering the type of dynamization, follow these steps:

1. Click on the "Filter" icon.
2. Enter a type of dynamization.
3. Confirm your selection with the <Enter> key.

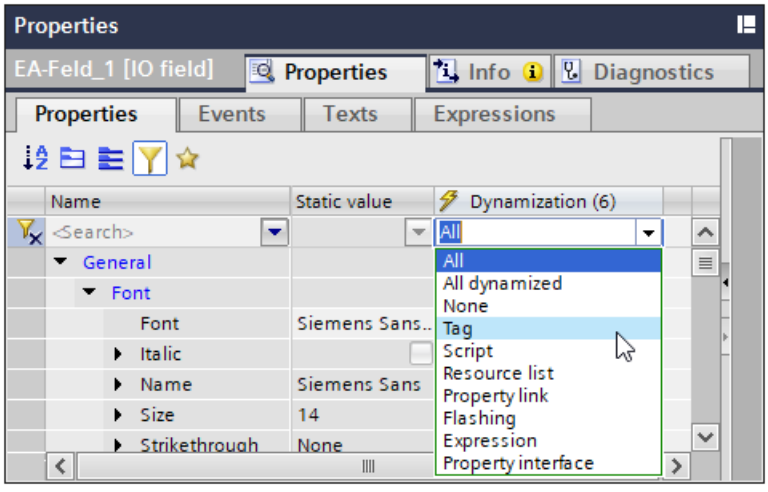


All properties with the selected type of dynamization are displayed.

Find type of dynamization by selection

To search for a type of dynamization by selecting the type of dynamization, follow these steps:

1. Click on the "Filter" icon.
2. Click the arrow in the first cell of the "Dynamization" column.
3. Select the desired type of dynamization from the drop-down list.



All properties with the selected type of dynamization are displayed.

4.5.4 Changing a dynamization for multiple objects

Introduction

You can change the dynamization of a property for several objects at the same time.

Changing a dynamization for multiple objects

To change the dynamization of a property for several objects at the same time, follow these steps:

1. Select several objects in the screen via multiple selection.
2. Select a property.
3. Dynamize the property, for example, by using a script.

The dynamization of the property is applied to all selected objects that have the property.

See also

Select multiple objects (Page 361)

4.5.5 Dynamizing object properties

4.5.5.1 Dynamizing an object property with a tag

Dynamizing an object property with a tag

Introduction

When you dynamize an object property with a tag, the object property is changed in runtime depending on the tag value.

Requirement

- A screen is open.
- An object is configured.
- You have configured a tag.
- The object property supports the dynamization type "Tag".

Procedure

To dynamize an object property using a tag, follow these steps:

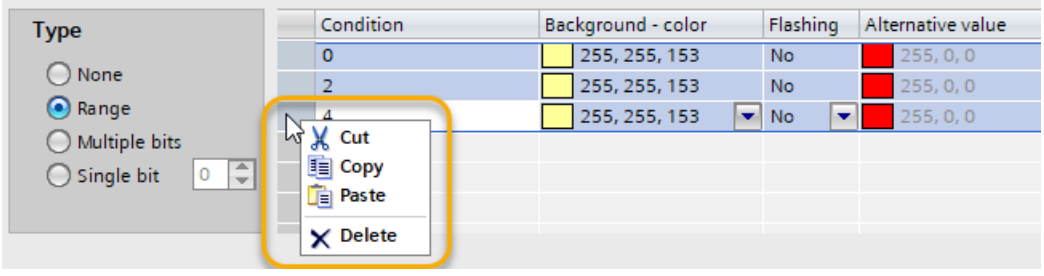
1. Select the object.
2. Under "Properties > Properties > Dynamization" select the object property in the Inspector window.
3. Select the "Tag" option.
4. Select the tag. Only the relevant tags are displayed in the selection dialog. If you want to see all tags, enable "Show all" in the selection dialog.
5. If required, enable the options "Indirect addressing" or "Read only" in the "Settings" area.
6. Define the type of tag:
   - None
   - Range
   - Multiple bits
   - Single bit
7. Define the properties for the respective type of tag.

The object property tag is dynamized with a tag. The tag value specifies the property value in runtime.

Transferring property conditions

With "Copy" and "Paste" you can transfer the conditions of an object property to the same or similar properties of another object:

1. Select one or more conditions in the "Tag > Type" table.
2. Select "Copy" in the shortcut menu.



3. Select a different object or a different object property in the screen editor.
4. Paste the copied conditions into the "Tag > Type" table.

Note the following:

- Any existing conditions are overwritten on pasting.
- The data types must be the same or similar, e.g. "Background - color" and "Background - alternative color".

- Inserting data is possible even if no tag is assigned to the property.
- When pasting data, if the number of copied conditions is greater than the possible number of conditions at the target object, only the maximum possible number of conditions will be pasted.

See also

Automatically filling in of property values for an object collection (Page 379)

Dynamizing an object property with a tag of the "Range" type

Introduction

When you dynamize an object property with a tag, the object property is changed in runtime depending on the tag value.

The following example shows the dynamization of a button. The button changes its alternative background color depending on the tag of the "Range" type.

Requirement

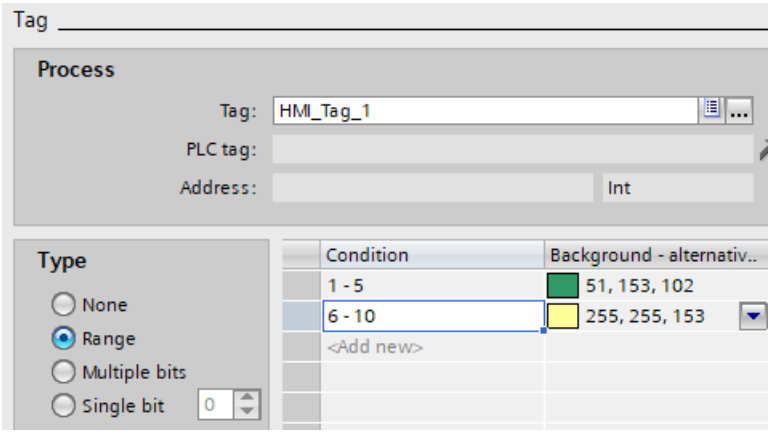
- A screen is open.
- An object, for example a button, is configured.
- You have configured a tag.
- The object property supports the dynamization type "Tag".

Selecting a tag of the "Range" type

To dynamize an object property with a tag of the "Range" type, follow these steps:

1. Select the object, for example, a button.
2. In the Inspector window under "Properties > Properties > General > Text > Background - Alternative color", dynamize an object property, such as "Background - Alternative color".
3. Select "Tag" in the "Dynamization" column.
4. Select a tag in the "Tag > Process" dialog.
5. Select "Range" as type".

6. Enter the ranges in the "Condition" column.
7. Define the alternative background color for each area in the "Background - Alternative Color" column.



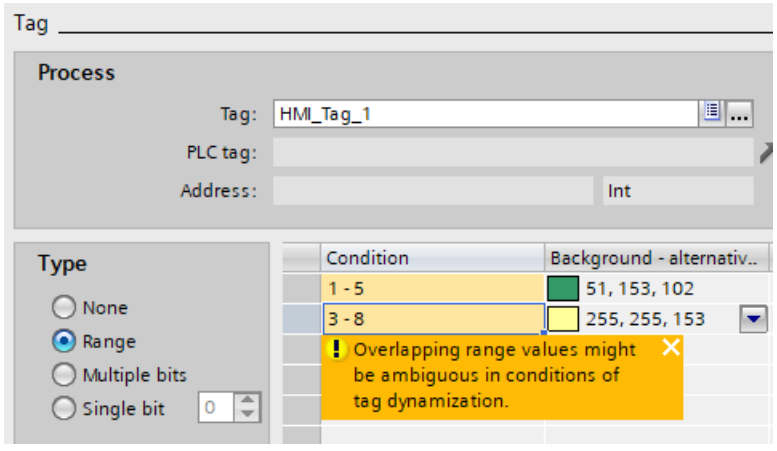
Result

The color of the button is changed accordingly depending on the position of the tag in the value range in runtime.

Overlapping ranges

If there is overlapping of values in the individual ranges, note that:

- Cells where range overlaps occur are highlighted in color.



- The overlaps are reported as a warning when compiling the project. Downloading to the device is possible.
- The first highlighted value is always used in runtime.

See also

Automatically fill in property values for tags (Page 472)

Dynamizing an object property with a tag of the "Multiple bits" type

Introduction

When you dynamize an object property with a tag, the object property is changed in runtime depending on the tag value.

The following example shows the dynamization of a button. The button changes its alternative background color depending on the tag of the "Multiple bits" type.

Requirement

- A screen is open.
- An object, for example a button, is configured.
- You have configured a tag.
- The object property supports the dynamization type "Tag".

Selecting a tag of the "Multiple bits" type

To dynamize an object property with a tag of the "Multiple bits" type, follow these steps:

1. Select the object, for example, a button.
2. In the Inspector window under "Properties > Properties > General > Text > Background - Alternative color", dynamize an object property, such as "Background - Alternative color".
3. Select "Tag" in the "Dynamization" column.
4. Select a tag in the "Tag > Process" dialog.
5. Select "Multiple bits" as the type.
6. Enter the bit number.
7. Define the alternative background color for each bit number in the "Background - Alternative color" column.

Result

When the tag has accepted the assigned bit number in runtime, the color of the button is changed accordingly.

See also

Automatically fill in property values for tags (Page 472)

Dynamizing an object property with a tag of the "Single bit" type

Introduction

When you dynamize an object property with a tag, the object property is changed in Runtime depending on the tag value.

The following example shows the dynamization of a button. The button changes its alternative background color depending on the tag of the "Single bit" type.

Requirement

- A screen is open.
- An object, for example a button, is configured.
- You have configured a tag.
- The object property supports the dynamization type "Tag".

Selecting a tag of the "Single bit" type

To make an object property dynamic with a tag of the "Single bit" type, follow these steps:

1. Select the object, for example, a button.
2. In the Inspector window under "Properties > Properties > General > Text > Background - Alternative color", dynamize an object property, such as "Background - Alternative color".
3. Select "Tag" in the "Dynamization" column.
4. Select a tag in the "Tag > Process" dialog.
5. Select "Single bit" as the type.
6. Select the bit position, for example, "3".
7. Define the properties for the "0" and "1" value of the condition.

Result

When the tag at "3" position has taken the value "1" in runtime, the color of the button is changed.

Automatically fill in property values for tags

Introduction

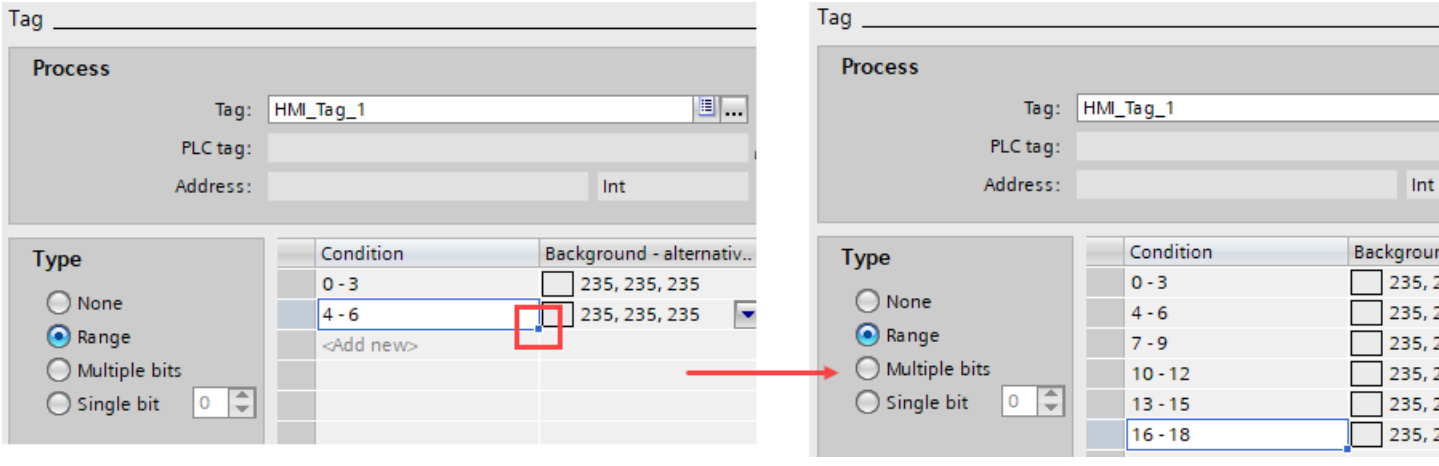
You can automatically fill in the properties of tags of the "Range" and "Multiple bits" types.

Automatically fill in property values for tags

To fill in the properties automatically, do the following:

1. Select a cell in the "Tag" dialog in the right part of the Inspector window.
2. Drag the blue border up or down. The value is applied to the target cells.

If you select multiple cells in the "Condition" column and there is a logical relationship between the values, the values of the destination cells are adapted according to the relationship.



See also

Dynamizing an object property with a tag of the "Range" type (Page 469)

Dynamizing an object property with a tag of the "Multiple bits" type (Page 471)

4.5.5.2 Dynamizing an object property with a script

Introduction

Object properties can be dynamized by scripts. The execution of the script is started by a trigger. A cycle or a tag is set as the trigger.

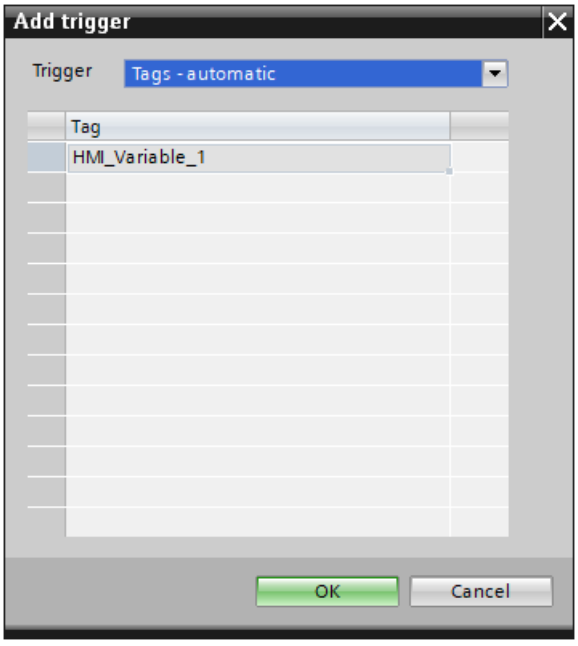
Requirement

- A screen is open.
- An object is configured.
- An object property supports the dynamization type "Script".

Procedure

To dynamize an object property using a "Script", follow these steps:

1. Select the object.
2. Dynamize the object property, e.g. "Background - color", under "Properties > Properties > Dynamization" in the Inspector window:
   - Select a dynamized property.
   - Select the option "Script".
     The editor for scripts is displayed.
   - If necessary, create a "Global definition".
     Click "Global definition".
     Write the code for the global definition.
   - Write the code for the script.
   - Insert a tag into the script.
     Referenced tags are automatically offered as triggers.
3. Select the trigger that triggers the dynamization in Runtime.
   The dialog for selecting a trigger is displayed.



Select

- a tag that is referenced in the script automatically (default)
  - or -
- a tag that is not referenced in the script
  - or -
- a cycle.

Result

The object property is dynamized with a script. The return value of the script specifies the property value in Runtime.

Note

The dynamization of an event is only monitored regarding an operator authorization if the triggering event, e.g. "Press button", is triggered by a user.

4.5.5.3 Dynamizing an object property with a resource list

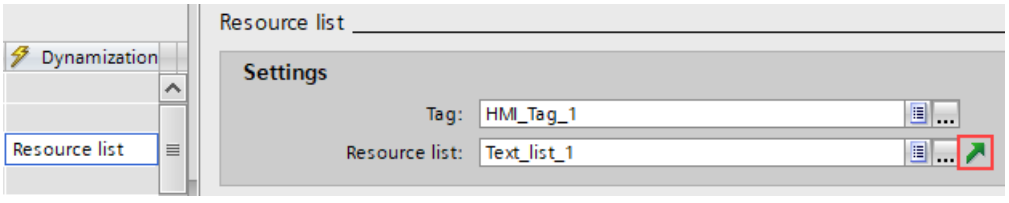
Requirement

- A screen is open.
- An object is configured.
- You have configured a tag.
- A text list or graphic list is configured.
- The object property supports the "Resource list" dynamization type.

Procedure

To dynamize an object property using a "Resource list", follow these steps:

1. Select the object.
2. In the Inspector window, select "Properties > Properties > General > Text".
3. Select "Resource list" in the "Dynamization" column.
4. Under "Settings > Resource list" in the "Resource list" dialog, select a text list, for example.
5. Click on the button in the "Resource list" line .
   The selected text list is opened directly for editing.



6. Select an entry in the "Text list entries" table as the default entry. The text from the default entry is displayed in the object.
   If you have not specified a default entry, the first entry in the "Text" column is displayed in the object.
   The same applies for a graphic list.

Result

The object property tag is dynamized with a resource list. The tag value specifies the entry from the configured text list or graphic list that is displayed in runtime.

See also

Show default entry of text and graphic list in the object (Page 409)

4.5.5.4 Dynamizing an object property with flashing

Introduction

You can display objects as flashing in runtime. You can configure the flashing characteristics for each color setting of an object that supports flashing in the Inspector window and select the colors, the condition, and the flash rate.

Note

Flashing in runtime does not change the color value of the property.

Requirement

- A screen is open.
- An object is configured.
- The object property supports the dynamization type "Flashing".

Dynamizing an object property with flashing

To dynamize an object property with flashing, follow these steps:

1. Select the object.
2. In the Inspector window under "Properties", select the property for which you want to define the flashing characteristics, for example, "Background - color".
3. Select "Flashing" in the "Dynamization" column. The "Flashing" page appears.
4. Select the flash colors. Flashing is only visible in runtime when there is a difference between the two colors.
5. Select the condition for the object flashing in runtime.
6. Select the flash rate.

The object property is dynamized with flashing using the dynamization type "Flashing". When the configured condition occurs in runtime, the object property flashes in the configured colors and at the set rate.

Condition and rate

The following options are available for the condition:

- "Never": You disable the flashing.
- "Always": You enable the flashing.
- "Range violation": The property flashes when the configured permissible range is violated.

Note

Flashing for a range violation only works if you have linked the object to a PLC tag. When the value of the PLC tag lies outside the defined range, the object will start flashing automatically.

The following options are available for the rate:

- "Slow"
- "Medium"
- "Fast"

Result

The object property is dynamized. When the configured condition occurs in runtime, the object property flashes in the configured colors and at the set rate.

4.5.5.5 Dynamization by expressions

Introduction

Properties can be dynamized depending on several tags. In an expression, tags are linked by logical operators. The result of the expression determines the dynamization. It is possible, for example, to link two tags of the type "Bool" with the operator AND. If both tags return the value TRUE, then the result of the expression is also TRUE and the property value is set accordingly.

The following applies to the input values for logical operations:

- Value 0 = FALSE
- Value not equal to zero = TRUE

Requirement

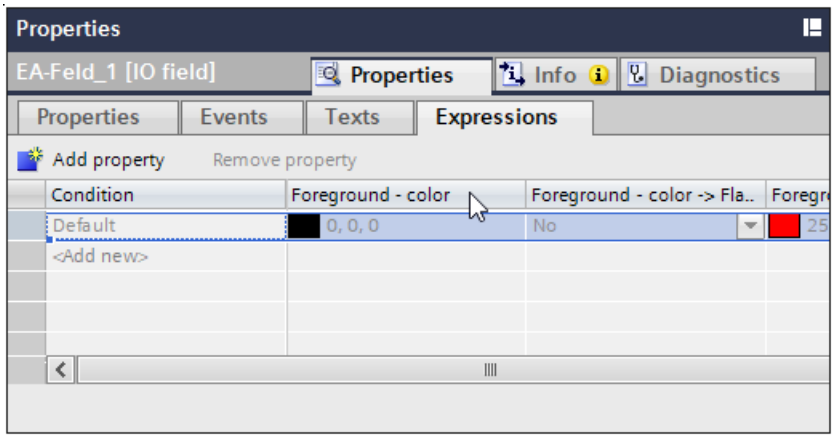
- A screen is open.
- An object is configured.

Dynamizing an object property with an expression

To dynamize an object property with an expression, follow these steps:

1. Select the object.
2. In the Inspector window, under "Properties", select the "Expressions" tab.

3. Select "Add property".
   This selects a property of the screen object to be dynamized with an expression.
   The property is displayed with the default values.

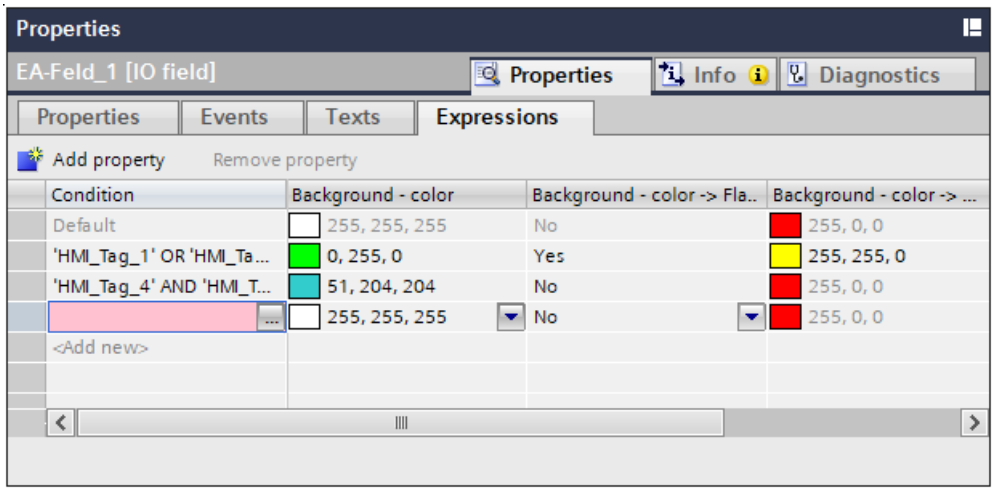


4. To specify dynamization with an expression for the property, click on "<Add new>" in the "Condition" column.
5. Click ... .
   The editor for expressions is displayed.

   - To insert a tag, click the tag icon.
     The selection dialog for tags is displayed.
   - To insert an operator at the cursor position, click AND, OR, NOT or XOR.
   - To insert a bracket at the cursor position, click on the symbols for brackets.

6. To save the expression, click .
7. Determine the properties to apply to the screen object when the expression returns the TRUE value.

8. If necessary, add further conditions for the currently selected property.



9. To dynamize another property of the selected object with an expression, click "Add property". Properties for which a dynamization has already been configured cannot be added a second time.

Result

The expression is evaluated when one of the tag values changes.

Properties change as soon as the result of the expression changes.

If none of the conditions returns TRUE, the default value is assumed.

If multiple conditions are defined, the first condition in the list that returns TRUE is applied.

Expressions that cannot be evaluated are skipped, e.g. because of a syntax error or a tag that cannot be accessed.

4.5.5.6 Examples

Dynamizing a graphic property with a tag

You can dynamize a property containing a graphic with a tag.

The following object properties can contain a graphic:

- Graphic (e.g. a list box)
- Graphic - pressed button (e.g. a button)
- Background graphic (one screen only)
- Marker graphic (e.g. an alarm control)
- Icon (e.g. a trend control)

Task

In this example, you can learn how to dynamize the "Graphic" property at the "Button" object with a tag of the type "Area".

You configure:

- Button
- HMI tag "MyTag"
- Graphic in the project graphics

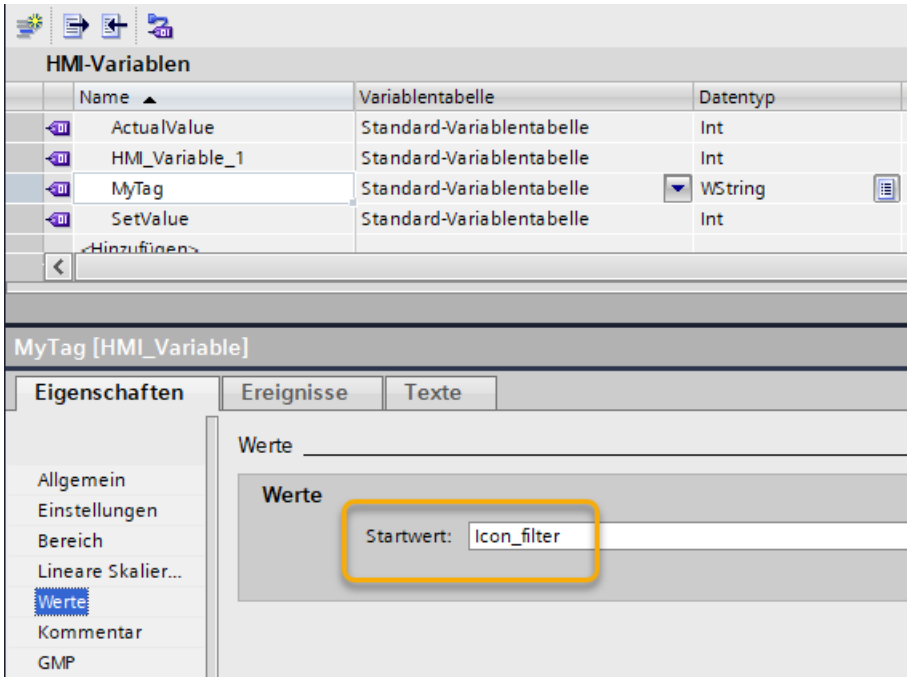
Requirement

- A project is open.
- A screen is configured.
- A button is configured in the screen.

Adding a graphic and configuring an HMI tag

Follow these steps to configure the HMI tag for dynamization of the graphic property:

1. In the project tree under "Languages and resources > Project graphics", add a graphic, e.g. "Icon_filter", from your storage location.
2. Configure a "MyTag" tag of the data type "WString" in the project tree under "HMI tags".
3. In the Inspector window of the "MyTag" tag under "Properties > Properties > Values", enter the name of the added "Icon_filter" graphic in the "Start value" input field.



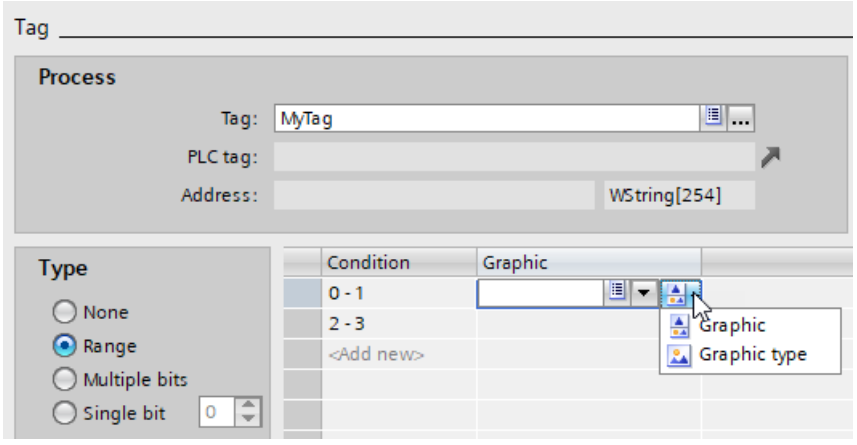
Dynamizing the "Graphic" property with the HMI tag

Follow these steps to dynamize the "Graphic" property at the "Button" object with the "MyTag" tag of the type "Area":

1. Click "Properties > Properties > General > Graphic" in the Inspector window of the screen editor. In the drop-down list of the "Dynamization" column, select the entry "Tag".

   The "Tag" dialog opens.

2. Click on the selection button ... under "Tag > Process > Tag".
   A dialog opens.
3. Add the "MyTag" tag.
4. Select the "Area" type under "Tag > Type". Define the conditions.
5. Select the graphic in the "Graphic" column.



6. Click on the selection button under "Tag > Type" in the "Graphic" column.
   A dialog opens.

   Select the graphic that you have stored in the project graphics.

7. Load the project into the device.

Result

All graphics in the project graphics are loaded into the runtime. You can use the name of the selected graphic in the tag. The graphic is displayed on the button in runtime.

If the "IntTag" tag is in the range "0 - 1" in runtime, the selected graphic is visible in the button.

Dynamizing a graphic property with a script

Introduction

You can dynamize a property containing a graphic with a script.

Task

In this example, you learn how to dynamize the "Graphic" property of the "Trend control" object with a script.

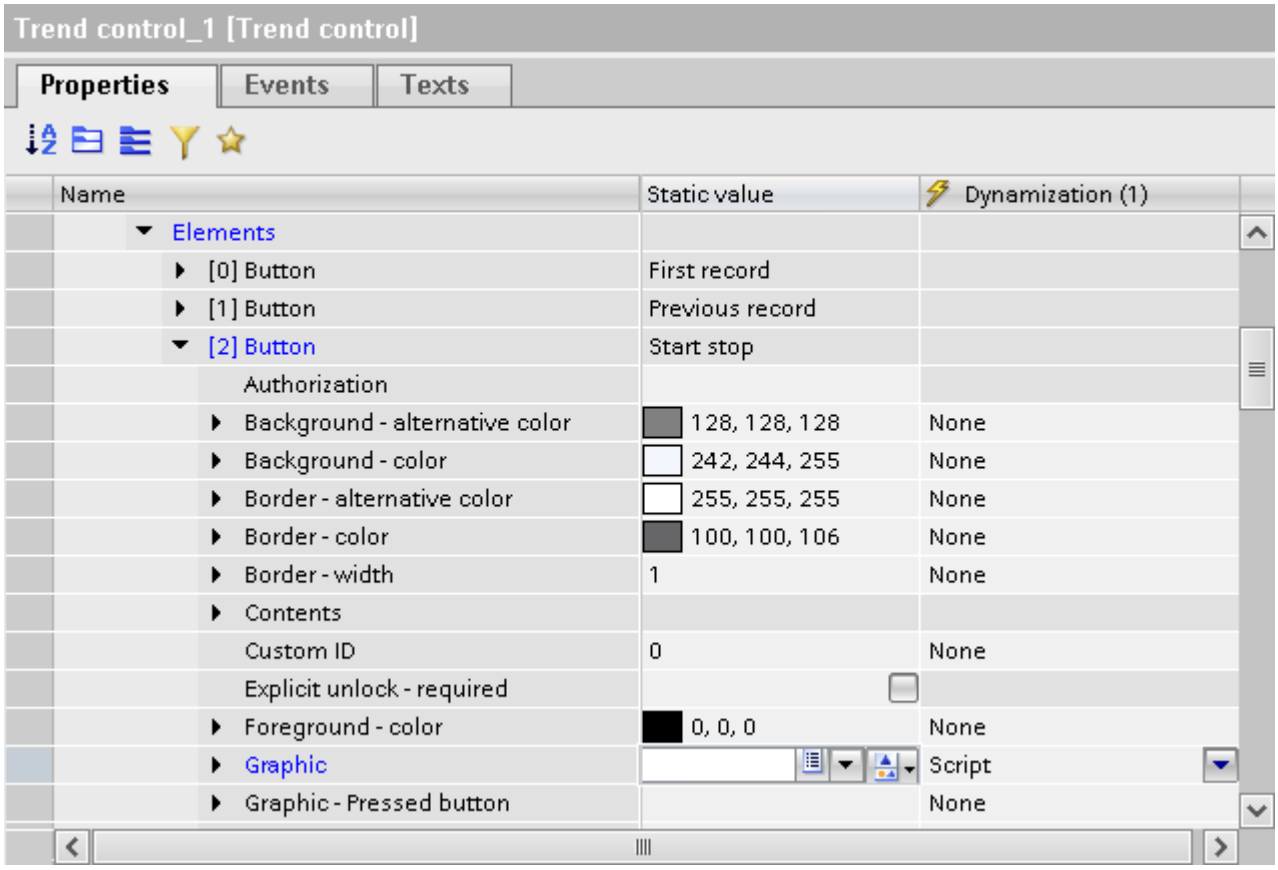
Requirement

- A project is open.
- A screen is configured.
- A trend control is configured in the screen.
- An HMI tag "MyTag" of the data type "Int" is configured with the start value "10".

Procedure

To dynamize the "Graphic" property of a trend control button with a script, follow these steps:

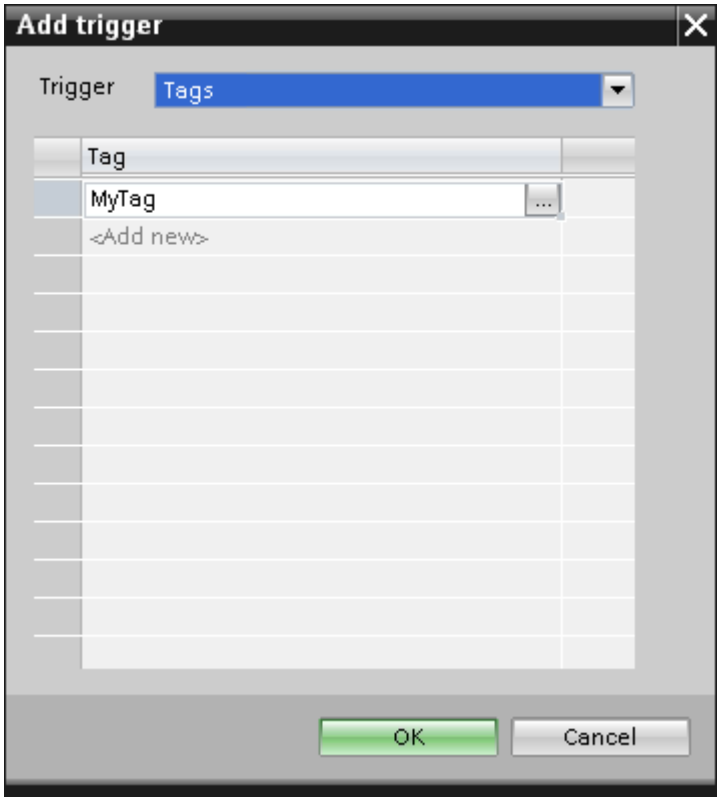
1. Select the trend control in the screen editor.
2. In the Inspector window, click on "Properties > Properties > Miscellaneous > Toolbar > Elements > [2] Button > Graphic". In the drop-down list of the "Dynamization" column, select the entry "Script".



The "Scripts" editor opens.

3. Click  .
A dialog opens.

4. Add the "MyTag" tag as a trigger of the script which initiates dynamization in runtime.



5. Add the following code in the "Scripts" editor:

Copy code

```
var value;
let tag = Tags("MyTag");
let tagValue = tag.Read();
HMIRuntime.Trace("Value of MyTag: " + tagValue);

switch (tagValue) {
case 10:
   value =
HMIRuntime.Resources.Graphics("GraphicCollection.Up_Arrow").Name;
   break;
case 20:
   value =
HMIRuntime.Resources.Graphics("GraphicCollection.Down_Arrow").Name;
   break;
}

return value;
```

Result

The graphic property is dynamized with a script. The return value of the script specifies the graphic of the trend diagram button in runtime.

If the "MyTag" HMI tag assumes the value "10" or "20" in runtime, the respective graphic is displayed in the button.

Dynamizing an object property with flashing using a script

Introduction

You can display objects as flashing in runtime. You can configure the flashing characteristics for each color setting of an object that supports flashing in the Inspector window and select the colors, the condition, and the flash rate.

Note

Flashing in runtime does not change the color value of the property.

Requirement

- A screen is open.
- An object is configured.
- An object property supports the dynamization type "Script".

Dynamizing an object property with flashing using a script

To dynamize an object property with flashing using a script, follow these steps:

1. Select the object.
2. In the Inspector window under "Properties", select the property for which you want to define the flashing characteristics, for example, "Background color".
3. In the "Dynamization" column, select the "Script" option. The right part of the Inspector window is displayed.
4. Enter a matching script.
   - To deactivate flashing, enter the following script:
     ```
     Screen.Items("Circle").PropertyFlashing("BackColor", false);
     ```
   - To activate flashing, enter the following script:
     ```
     Screen.Items("Circle").PropertyFlashing("BackColor", true);
     ```
   - To activate flashing and to define the properties, enter the following script:
     ```
     Screen.Items("Circle").PropertyFlashing("BackColor", true,
     HMIRuntime.Math.RGB(255, 0, 0), HMIRuntime.Math.RGB(0, 255, 0),
     UI.Enums.HmiFlashingRate.Fast);
     ```

Note

For dynamization of a faceplate, replace the term "Screen" with "Faceplate" in the script.

	**Efficiency tip**
You can find snippets for flashing in the shortcut menu of the "Scripts" editor under "Snippets > HMI Runtime > Screen"	

Result

The object property is dynamized with flashing with the dynamization type "Script". When the configured condition occurs in runtime, the object property flashes in the configured colors and at the set rate.

Dynamizing an object property with flashing with user-defined function

Introduction

You can display objects as flashing in runtime. You can configure the flashing characteristics for each color setting of an object that supports flashing in the Inspector window and select the colors, the condition, and the flash rate.

Note

Flashing in runtime does not change the color value of the property.

Requirement

- A screen is open.
- An object is configured.
- The object property supports the dynamization type "Flashing".

Dynamizing an object property with flashing with user-defined function

If you want to enable flashing via a user-defined function at an event, select the condition "Never" for the "Flashing" option at the relevant property under "Properties > Properties > Dynamization".

To dynamize an object property with flashing using a user-defined function, proceed as follows, for example:

1. Select the object that is to trigger flashing, e.g. a button.
2. In the Inspector window, under "Events", select the event to trigger flashing, e.g. "Press".
3. Select the "Convert function list to script" button.

4. To enable flashing, enter the following script, for example:
   `Screen.Items("flashObject").PropertyFlashing("BackColor", true);`
   - `flashObject` is an object that flashes when the user-defined function is triggered.
   - `BackColor` exemplifies the property that flashes.

   To activate flashing and to define the properties, enter the following script:
   - `Screen.Items("flashObject").PropertyFlashing("BackColor", true, HMIRuntime.Math.RGB(255, 0, 0), HMIRuntime.Math.RGB(0, 255, 0), UI.Enums.HmiFlashingRate.Fast);`

   "Flashing" can be applied to any property whose value is a color.

	**Efficiency tip**
You can find snippets for flashing in the shortcut menu of the "Scripts" editor under "Snippets > HMI Runtime > Screen"	

5. Select the object that you want to flash.
6. Select the property that is to flash, e.g. the background color.
7. Make the following setting for the property:
   - Condition: "Never"
   - If not already defined by the script, set different values for color and alternative color. Define the frequency.

The object property is dynamized with flashing by a user-defined function.

When the configured condition occurs in runtime, the object property flashes in the configured colors and at the set rate.

Note

For dynamization of a faceplate, replace the term "Screen" with "Faceplate" in the script.

Result

The object property is dynamized with flashing with a user-defined function. When the configured condition occurs in runtime, the object property flashes in the configured colors and at the set rate.

Dynamizing a screen property with a tag

You can dynamize the "Screen" property of a screen window with a tag. The tag can use the name or number of a screen.

Task

In this example, dynamize the "Screen" property of the "Screen window" object with a tag that uses a screen number.

You configure:

- Screen
- Screen window
- HMI tag "ScreenNumber"

Requirement

- A project is open.
- A screen is configured and set as the start screen.
- A screen window is configured in the start screen.

Configuring the HMI tag

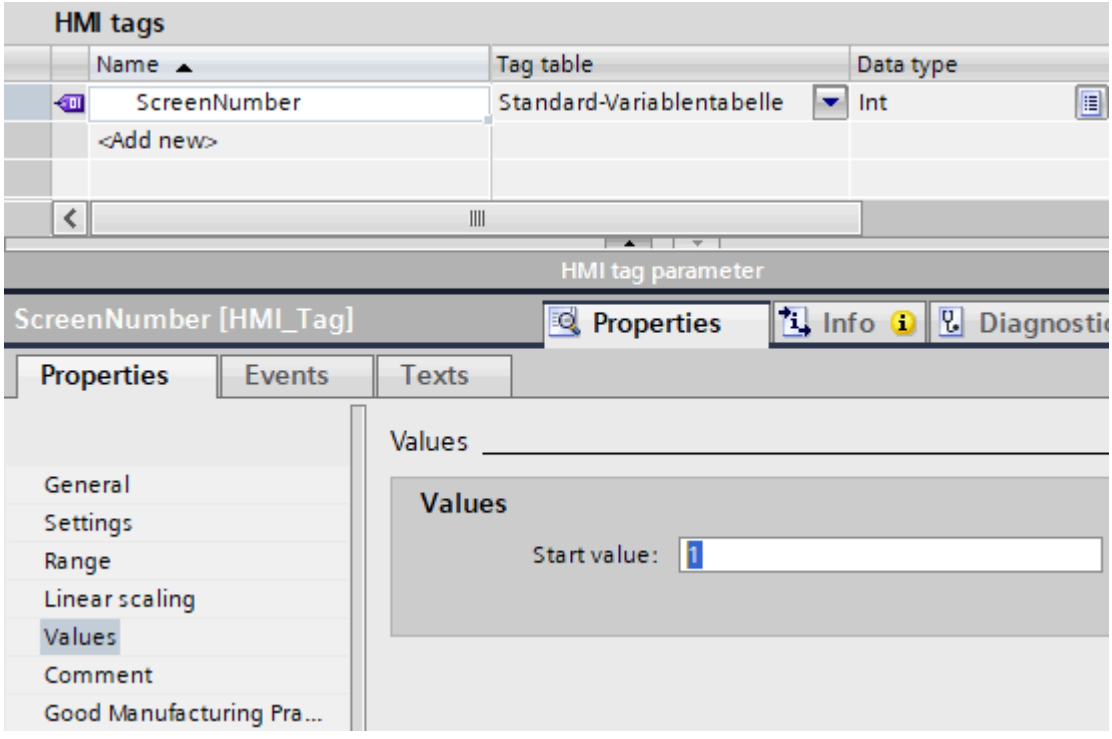
Follow these steps to configure the HMI tag for dynamization of the property:

1. Configure a "ScreenNumber" tag of the data type "Int" in the project tree under "HMI tags".

   Note

   The data type defines the type of screen referencing:
   - "Int": Dynamization uses the screen number of a screen.
   - "WString": Dynamization uses the name of a screen.

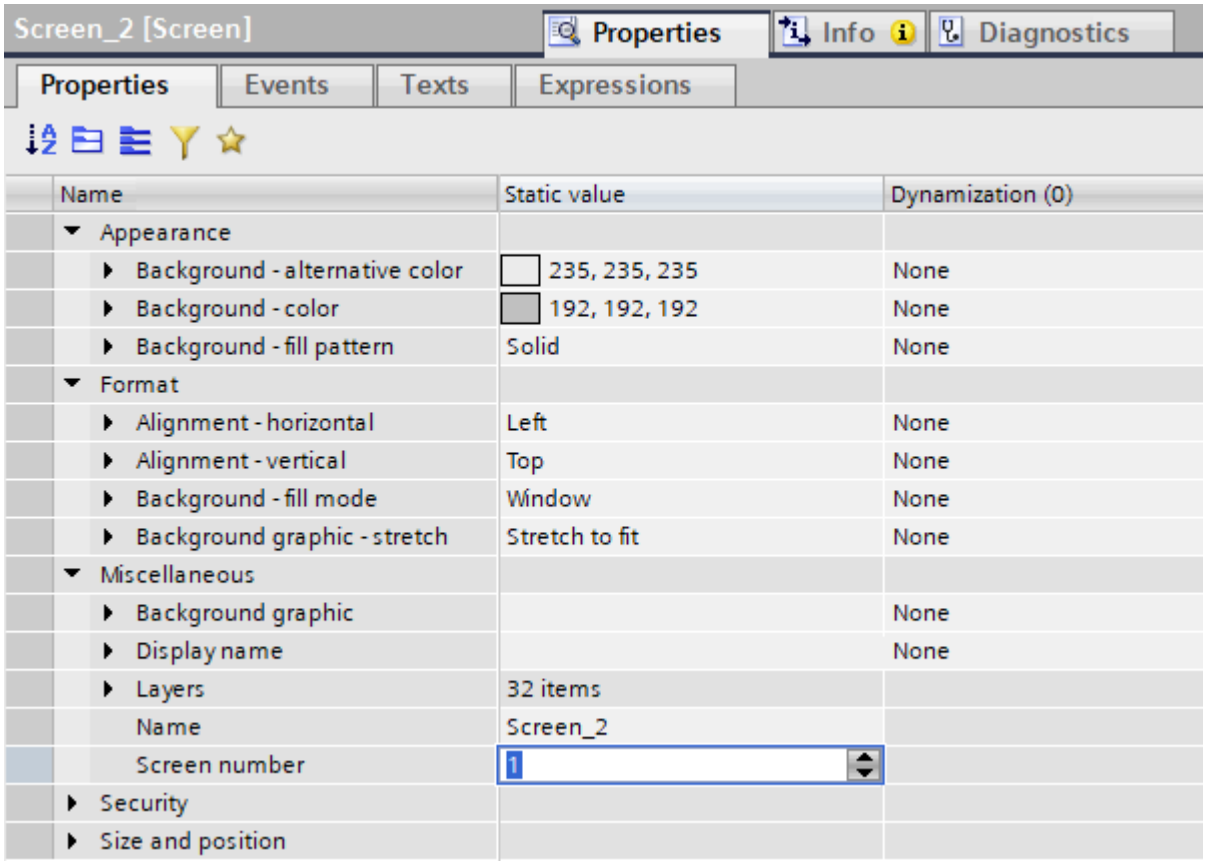
2. In the Inspector window of the "ScreenNumber" tag under "Properties > Properties > Values", enter the screen number "1" in the "Start value" input field.



Configuring a new screen

To configure a screen for display in the screen window, follow these steps:

1. Configure a new screen in the project navigation under "Screens".
2. In the Inspector window of the screen editor, enter the screen number "1" in "Properties > Properties > Miscellaneous > Screen number".



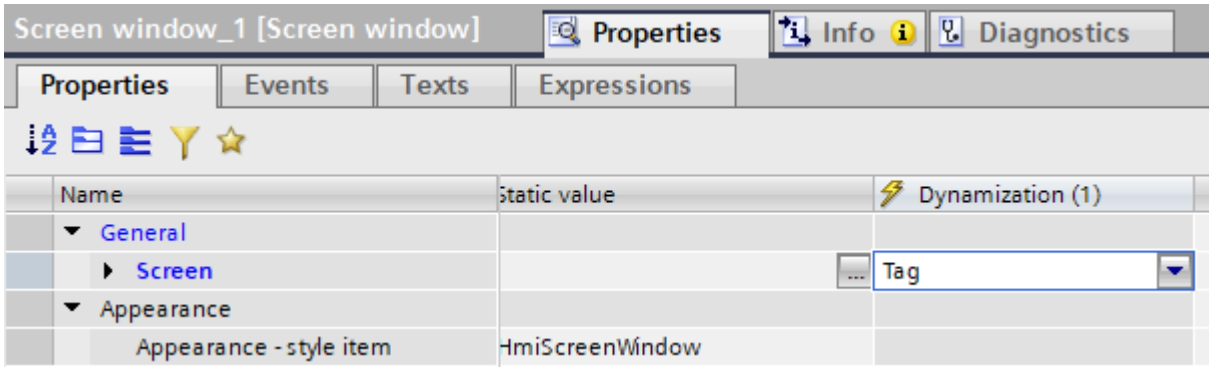
Note

The value of the screen number under all configured screens must be unique and greater than "0".

Dynamizing the "Screen" property with the HMI tag

Proceed as follows to dynamize the "Screen" property at the "Screen window" object with the tag "ScreenNumber":

1. In the screen editor of the start screen, select the object "Screen window".
2. In the Inspector window, click "Properties > Properties > General > Screen". In the drop-down list of the "Dynamization" column, select the entry "Tag".



The "Tag" dialog opens.

3. Click on the selection button ... under "Tag > Process > Tag".
   A dialog opens.
4. Add the "ScreenNumber" tag.
5. Download the project to the device.

Result

The screen with screen number "1" is displayed in runtime in the screen window.

If the integer value of the HMI tag "ScreenNumber" changes in runtime, the screen with the corresponding screen number is displayed in the screen window.

4.6 Trigger events

4.6.1 Basics on the events

Introduction

In runtime, an event triggers an action that you have configured on an object.

Basics on the events

You can configure one or multiple events on an object. You program a script on an event. The script defines an action that is executed in runtime when the operator triggers a specific event by operating the object.

The available events depend on the object being used.

Events

The following table shows the available events:

Event	Description
Activated	Mouse operation: Occurs when the operator presses the left or right mouse button. Touch operation: Occurs when the operator touches the screen with the finger. Keyboard operation: Occurs when the operator selects an object using the configured tab sequence. The "Activated" event is only used to detect whether an object was selected. The event does not trigger a password prompt. For this reason, do not use the "Activated" event if you want to configure access protection on the function call of the object.
Deactivated	Occurs when the operator takes the focus off an object by activating a different object. System functions or user-defined functions on the "Deactivated" event of an object are not executed with a screen change. The "Deactivated" event is only used to detect whether an object was deselected. The event does not trigger a password prompt. For this reason, do not use the "Deactivated" event if you want to configure access protection on the function call of the object.
Press	Mouse operation: Occurs after the "Activated" event when the operator presses the left or right mouse button. Touch operation: Occurs when the operator touches the screen with the finger. Keyboard operation: Occurs when an object has the focus, and the operator presses either the <Return> or <Space> key.
Release	Mouse operation: Occurs when the operator releases the left or right mouse button. Touch operation: Occurs when the operator takes the finger off the screen. When a motion is detected, the "Release" event is triggered at the limit of a different screen object. Keyboard operation: Occurs when the operator releases one of the buttons <Return> or <Space>.
Press key	Keyboard operation: Occurs when the operator presses a key on the keyboard. The event is not triggered if one of the buttons <Return> or <Space> is pressed.
Release key	Keyboard operation: Occurs when the operator releases a key on the keyboard.
Trigger hotkey	Occurs when the operator presses a hotkey on the keyboard.
Click left mouse button	Mouse operation: Occurs when the system detects a click with the left mouse button, i.e. shortly after the "Release" event. Touch operation: Occurs after the "Release" event has occurred and if less than a second has elapsed since the "Press" event.
Click right mouse button	Mouse operation: Occurs when the system detects a click with the right mouse button, i.e. immediately after the "Release" event. Touch operation: Occurs after the "Release" event has occurred and if more than a second has elapsed since the "Press" event.
Loaded	Occurs when a screen is fully loaded in runtime after a screen change.
Cleared	Occurs when the active screen is not loaded in runtime.
Connected	Occurs when the object has been successfully initialized and the data connection to the controller has been established.

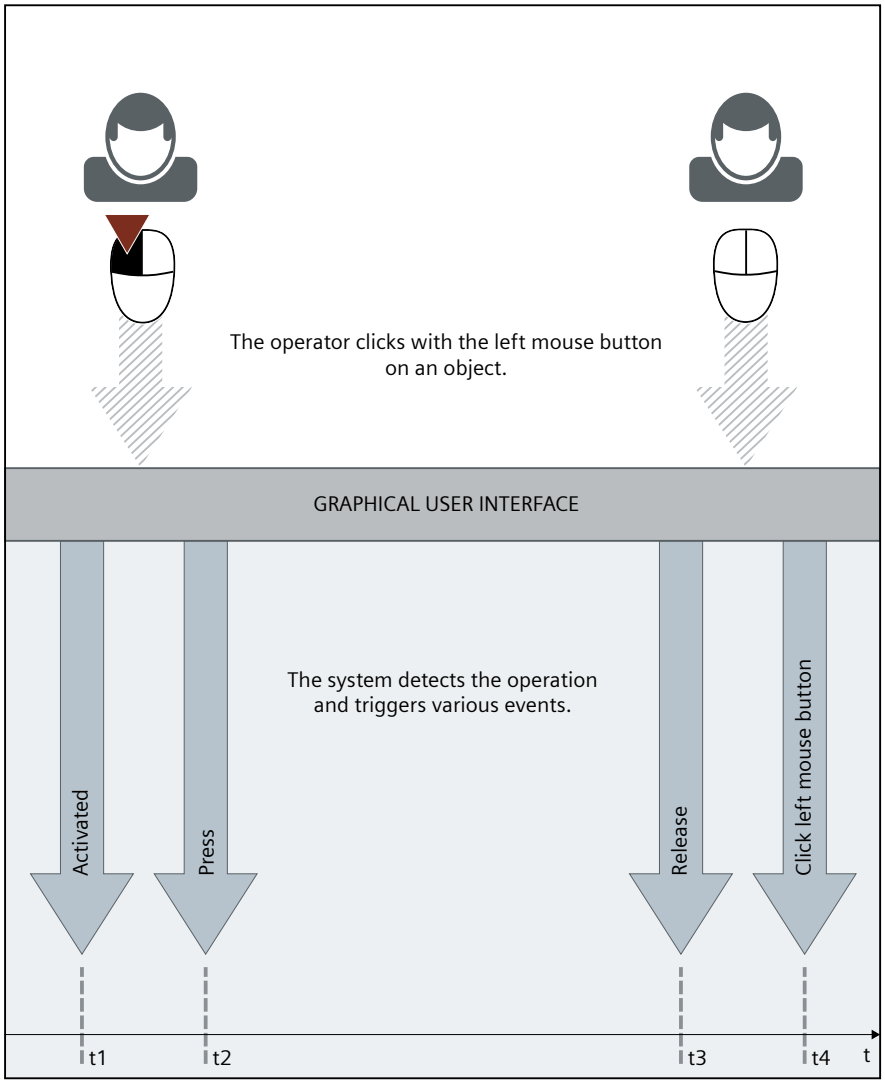
Event	Description
Status changed	Occurs when the state of the switch changes, for example, from "On" to "Off".
Command fired	Occurs when the operator has actuated a button in the toolbar or information bar.
Gesture detected	Occurs when the operator performs a touch gesture.
Play	Occurs when the video or audio file is being replayed.
Pause	Occurs when playing of the video or audio file is paused.
Playback finished	Occurs when the video or audio file has been played.
Selection changed	Occurs when the selection is changed.
Expand	Occurs when all plant objects under a node are displayed.
Expand all	Occurs when all plant objects are displayed.
Minimize	Occurs when all plants objects under a node are hidden.
Minimize all	Occurs when all plant objects are hidden.

Example

The figure below shows the event "Click left mouse button" as an example:

When you want to trigger an event by clicking with the left mouse button, follow these steps:

1. Click on the object with the left mouse button.
   The system detects the operation and triggers the "Activated" and "Pressed" events.
2. Release the left mouse button.
   The system detects the operation and triggers the events "Release" and "Click left mouse button".



4.6.2 Triggering "Activated" and "Deactivated" events

Introduction

You can trigger the event "Activated" and "Deactivated" through movement with the left or right mouse button, on the touchscreen or through keyboard operation.

When an object has the focus, the "Activated" event is automatically triggered before the "Pressed" event.

"Activated" event

You have the following options to trigger the "Activated" event:

- Mouse operation: Press the left or right mouse button.
- Touch operation: Touch the screen using your finger.
- Keyboard operation: Select an object using the configured tab sequence.

"Deactivated" event

You trigger the "Deactivated" event when you take the focus off an object by activating a different object.

In case of a screen change, the "Deactivated" event of an object is triggered but the system functions or user-defined functions on the "Deactivated" event are not executed.

The "Deactivated" event is only used to detect whether an object was deselected. The event does not trigger a password prompt. For this reason, do not use the "Deactivated" event if you want to configure access protection on the function call of the object.

4.6.3 Triggering a "Press" event

Introduction

You can trigger the "Press" event through movement with the left or right mouse button, on the touchscreen or through keyboard operation.

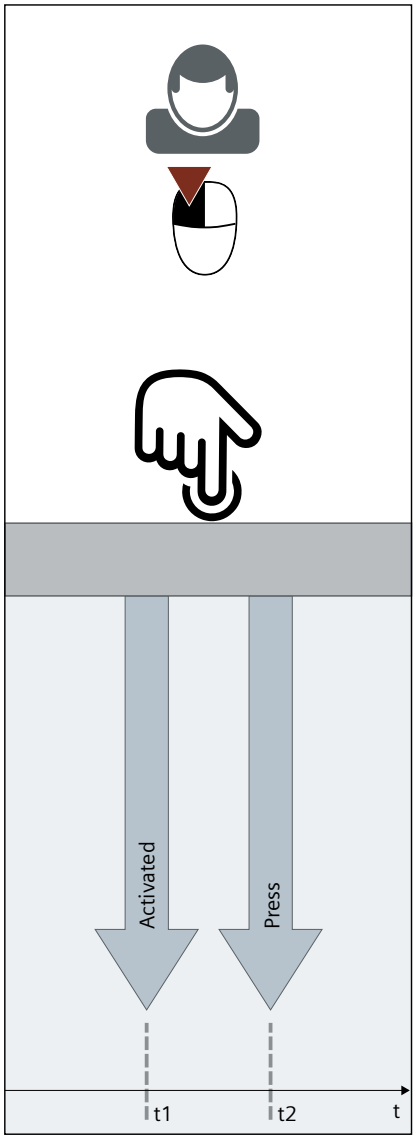
When an object has the focus, the "Activated" event is automatically triggered before the "Press" event.

"Press" event

You have the following options to trigger the "Press" event:

- Mouse operation: Occurs when you press the left or right mouse button.
- Touch operation: Occurs when you touch the screen with your finger.
- Keyboard operation: Occurs when an object has the focus, and you press either the <Return> or <Space> key.

The figure below shows the "Activated" and "Press" events:



4.6.4 Triggering a "Release" event

Introduction

You can trigger the event "Release" through movement with the left mouse button or on the touchscreen.

"Release" event by moving in the object with the mouse

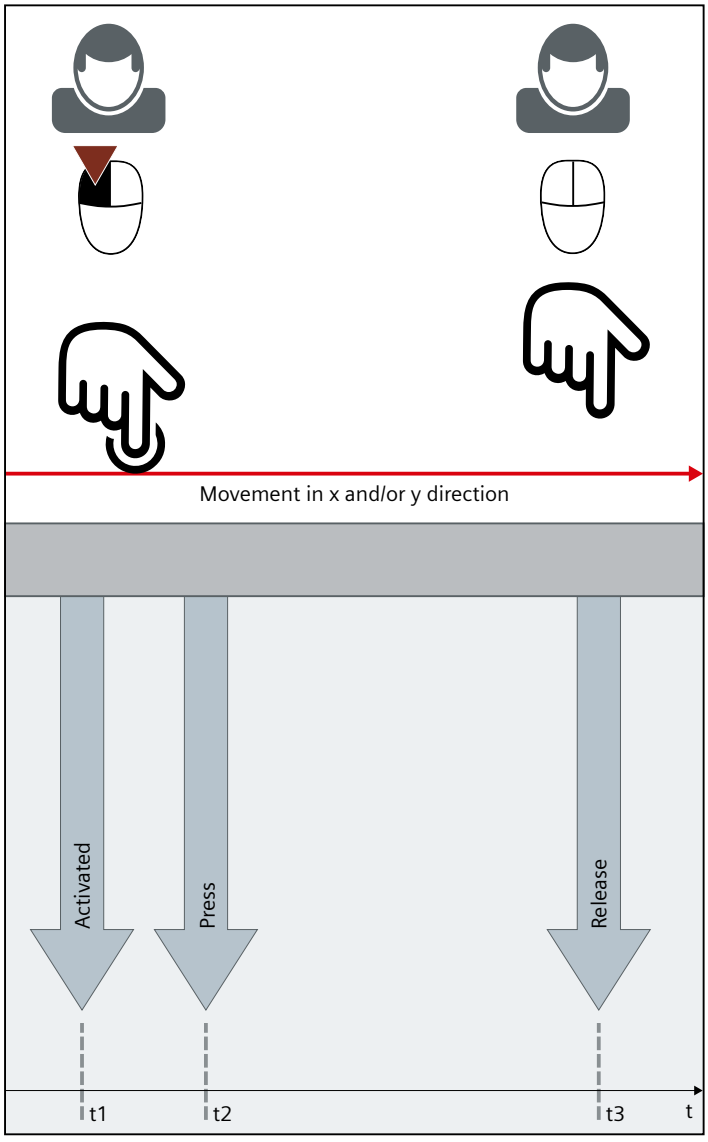
When you want to trigger the event "Release" through the mouse operation, follow these steps:

1. Click on the object with the left mouse button.
   Clicking triggers the events "Activated" and "Press".
2. Move with the mouse in the object in x and/or y direction.
3. Release the left mouse button.
   Releasing triggers the "Release" event.
   The "Click left mouse button" event is not triggered.

"Release" event by movement in the object using touch control

When you want to trigger the event "Release" through the touch operation, follow these steps:

1. Touch the object using your finger.
   Touching triggers the "Activated" and "Press" events.
2. Move with your finger in the object in x and/or y direction.
3. Release the finger.
   The releasing triggers the "Release" event.



"Release" event by moving over the object boundary with the mouse

When you want to trigger the event "Release" through the mouse operation, follow these steps:

1. Click on the object with the left mouse button.
   Clicking triggers the events "Activated" and "Press".
2. Move with the mouse in x and/or y direction beyond the object limit.
3. Release the left mouse button.
   Releasing triggers the "Release" event.
   The "Click left mouse button" event is not triggered.

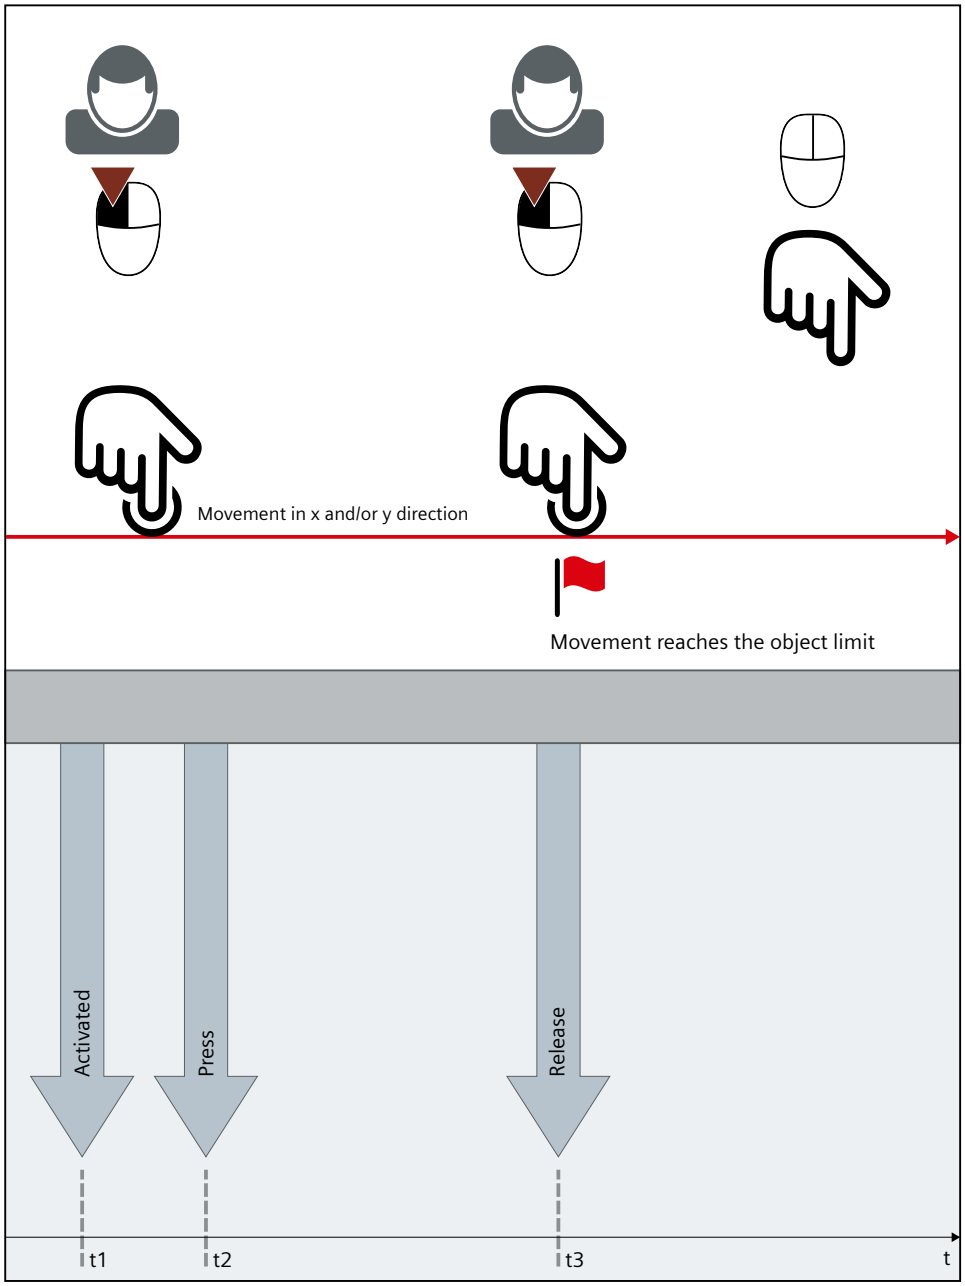
If you continue moving with the finger in the object instead of releasing it, no additional event is triggered.

After you release the finger or the mouse button outside of the object, no additional event is triggered.

"Release" event by movement over the object boundary using touch operation

When you want to trigger the event "Release" through the touch operation, follow these steps:

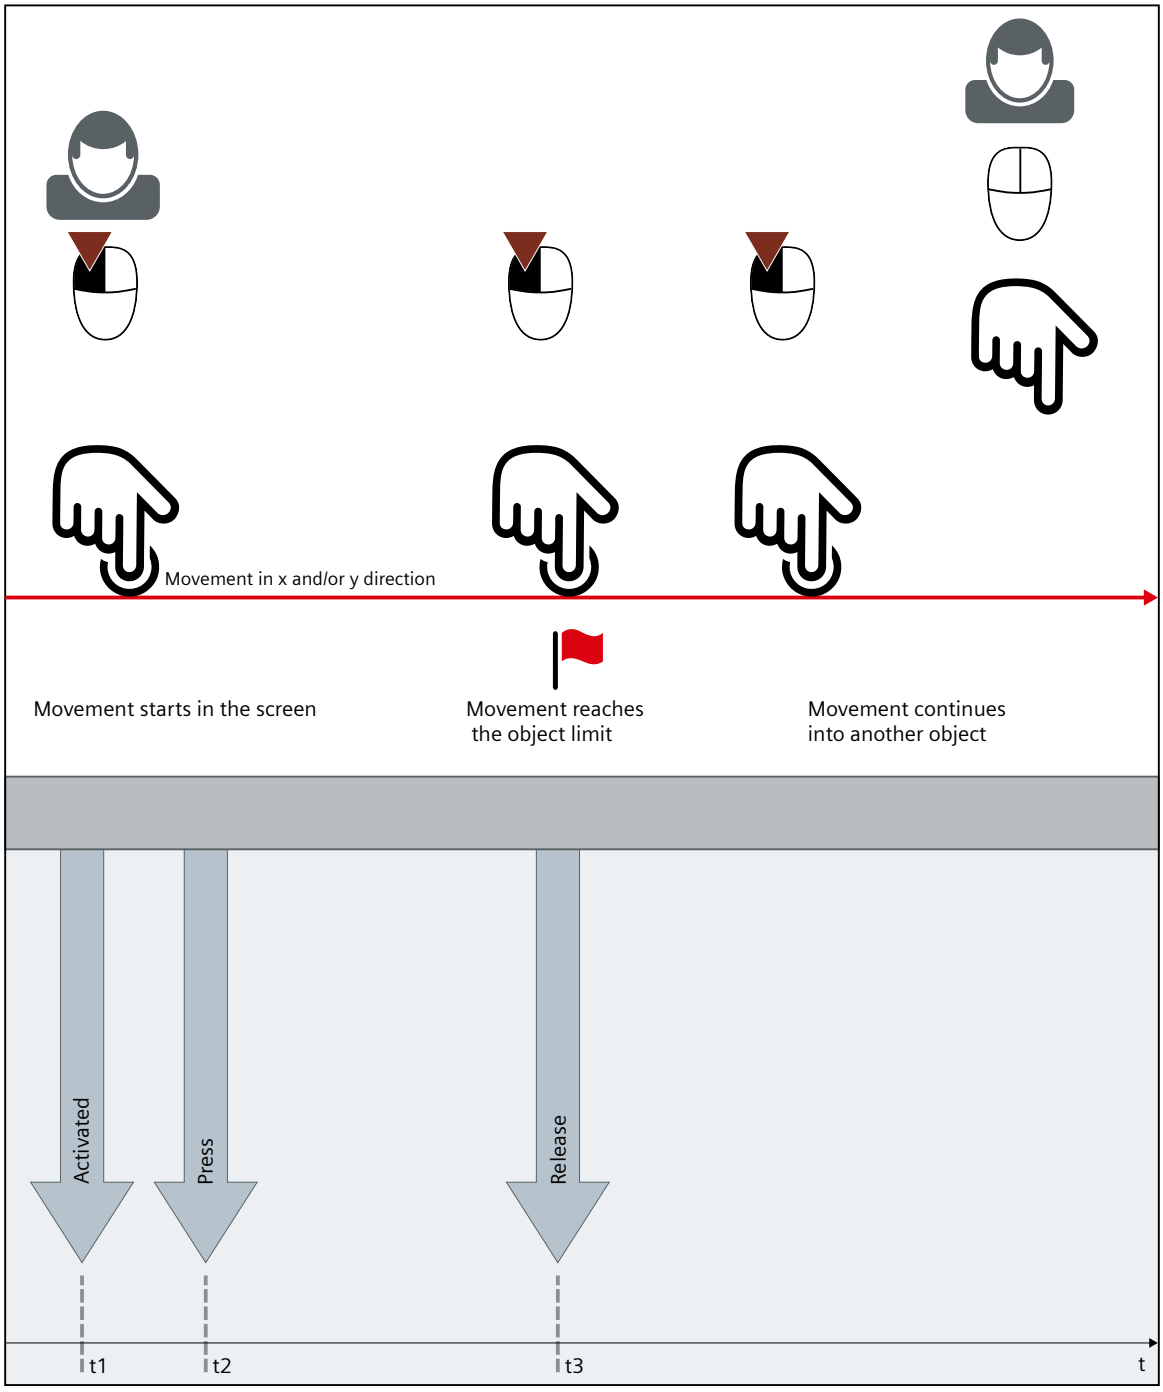
1. Touch the object using your finger.
   Touching triggers the "Activated" and "Press" events.
2. Move with your finger in the object in x and/or y direction beyond the object limit.
3. Release the finger.
   The releasing triggers the "Release" event.



"Release" event by movement into another object

Releasing the left mouse button or finger after reaching the object boundary triggers the "Release" event.

If you move with the left mouse button or finger in another object, no further event will be triggered.



Objects with a slide bar

When you click on objects with a slide bar, for example, slider or bar, with the left mouse button or touch them on the touchscreen, the movement of the slide bar is started. The "Release" event is not triggered at the object limit but only after the release.

The "Click left mouse button" event is not triggered.

4.6.5 "Press key" and "Release key" events:

Introduction

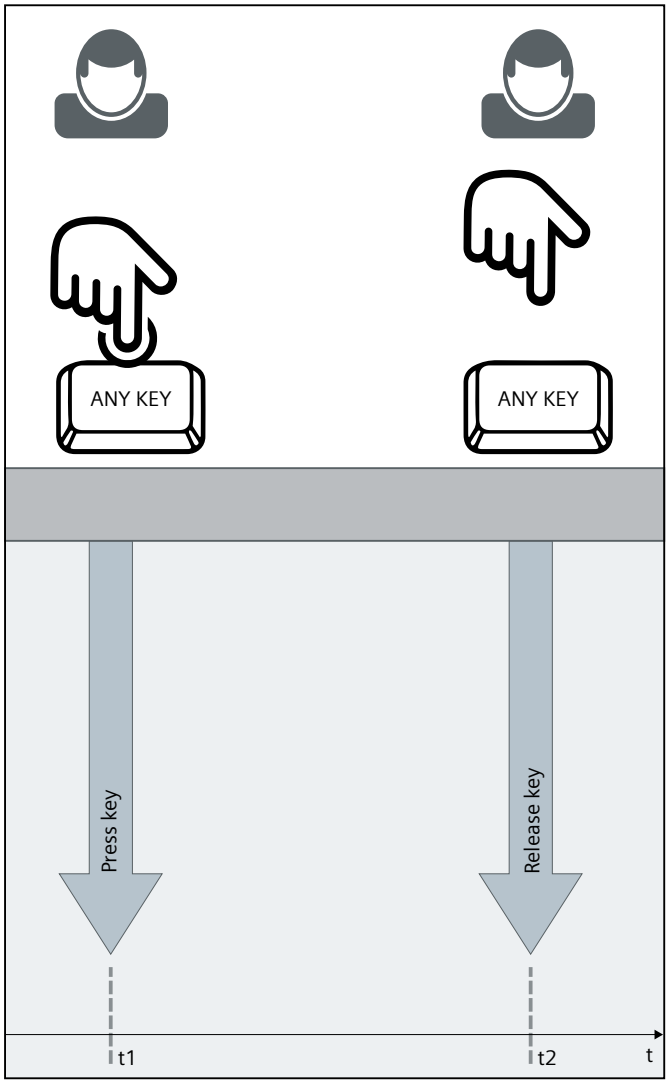
You can trigger the "Press key" and "Release key" events by keyboard action.

The behavior of the <Return> and <Space> keys differs from the behavior of the other keys on the keyboard.

Using key on the keyboard

If you want to trigger the "Release key" event by keyboard action, follow these steps:

1. Press a key on the keyboard.
   The "Press key" event is triggered.
2. Release the key.
   The "Release key" event is triggered.

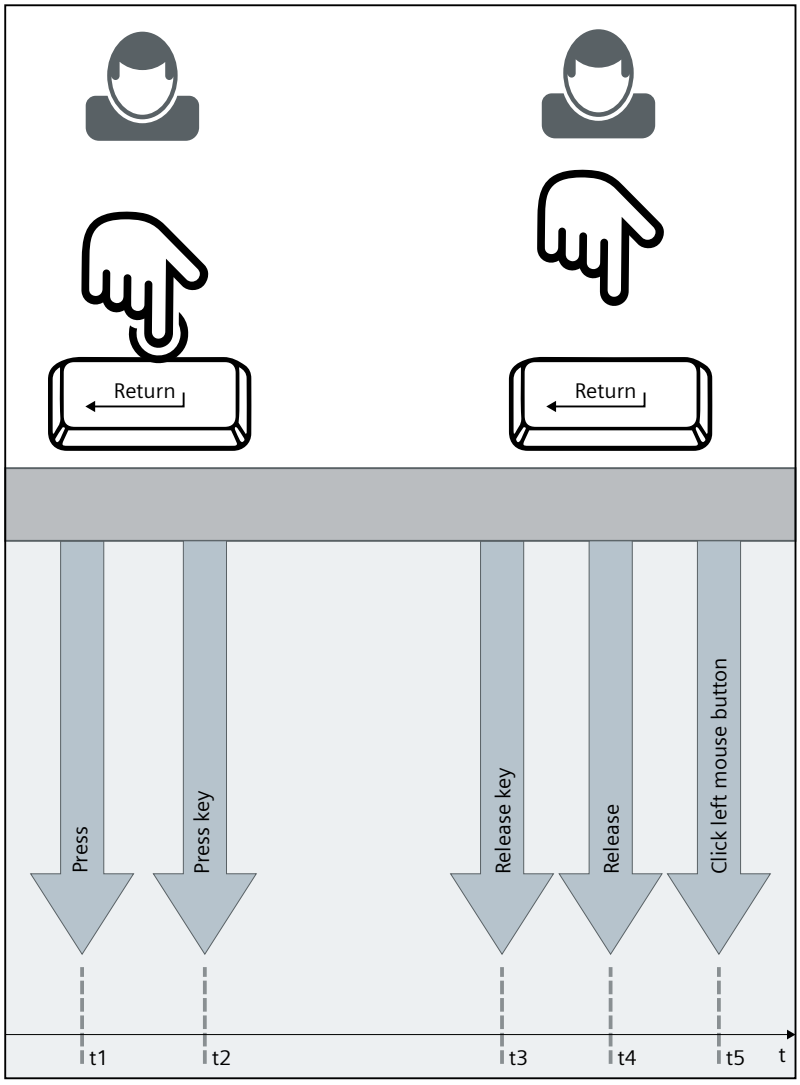


Using the <Return> or <Space> key

The keys <Return> and <Space> can trigger direct actions, for example, for button or rectangle.

When you want to trigger the events through the keys <Return> or <Space>, follow these steps:

1. Select an object on which you have configured an event.
2. Press the <Return> or <Space> key.
   The "Press" and "Press key" events are triggered.
3. Release the key.
   The "Release key", "Release" and "Click left mouse button" events are triggered.



Objects with selection elements

In the objects with selection elements, e.g. check box, the <Return> key behaves like any key.

You can use the <Space> key, for example to change the selection from "On" to "Off" or to trigger an event.

4.6.6 Trigger "Click left mouse button" event

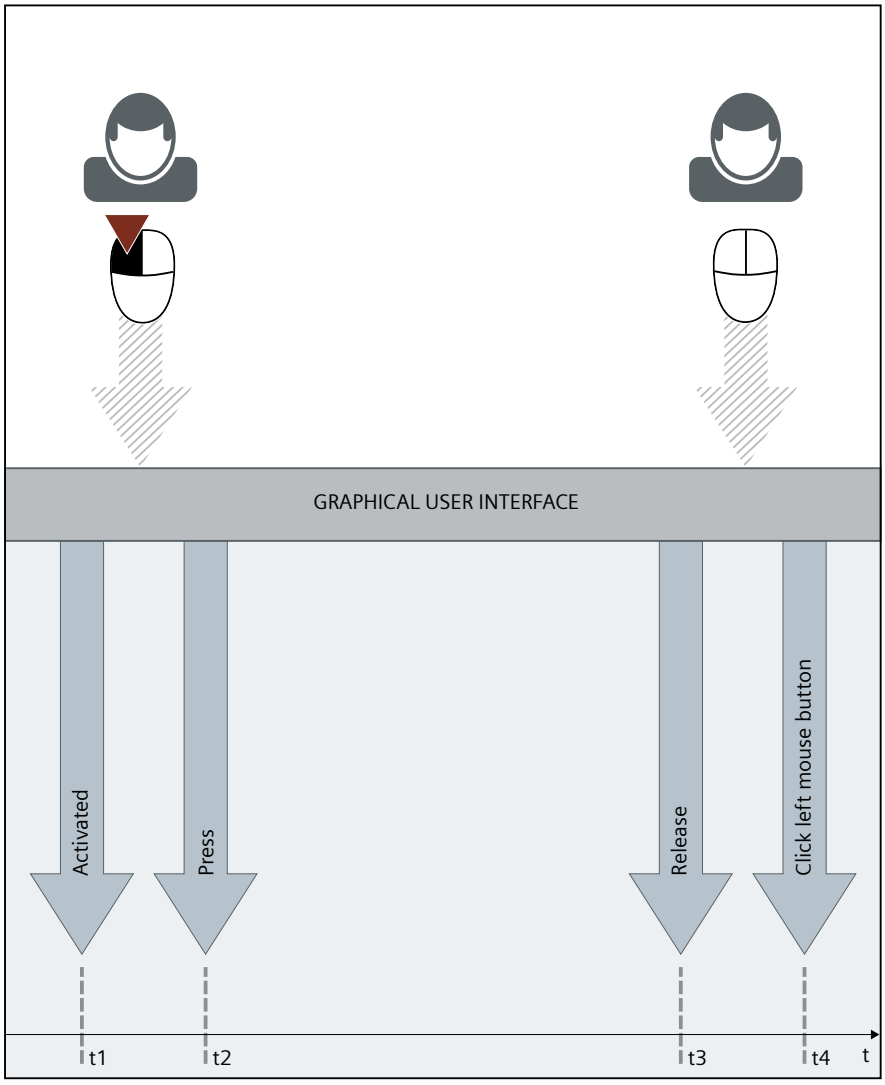
Introduction

You can trigger the event "Click left mouse button" by clicking with the left mouse button.

"Click left mouse button" event

When you want to trigger the "Click left mouse button" event through mouse action, follow these steps:

1. Click on the object with the left mouse button.
   Clicking triggers the events "Activated" and "Press".
2. Release the left mouse button.
   Releasing triggers the "Release" and "Click left mouse button" events.



4.6.7 Trigger "Click right mouse button" event

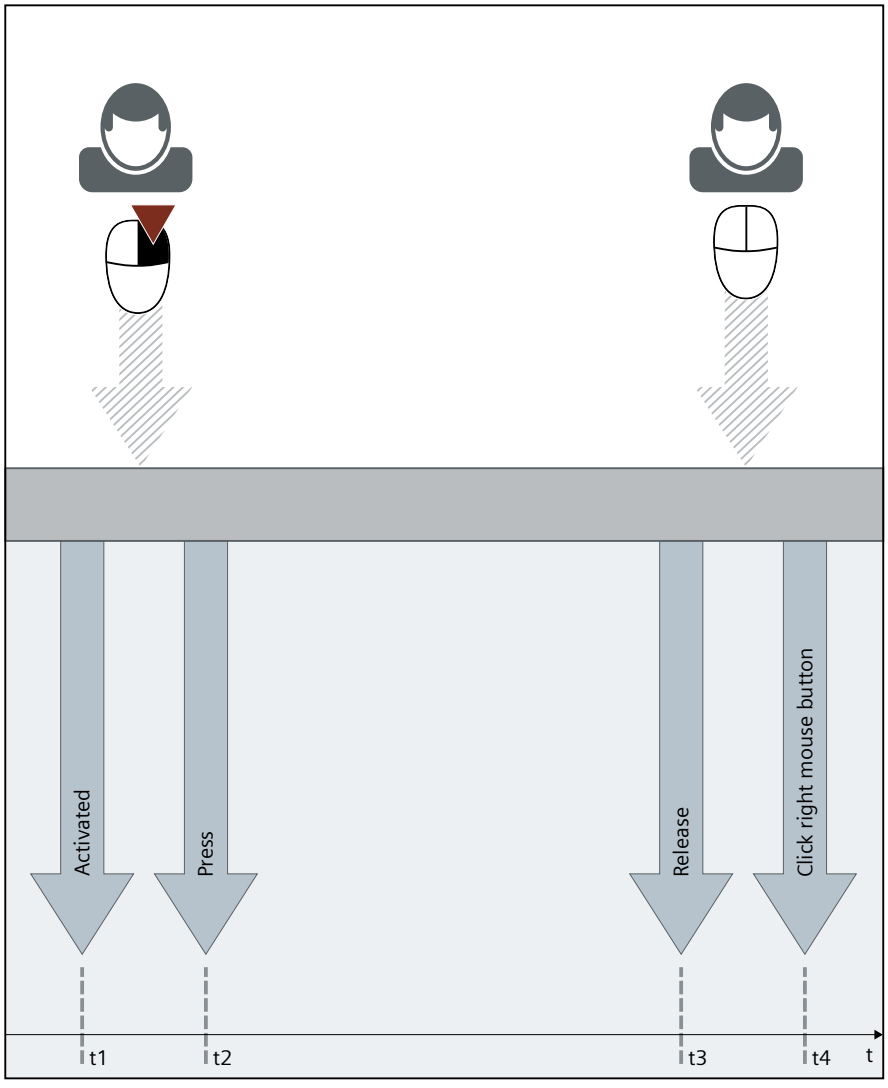
Introduction

You can trigger the event "Click right mouse button" by clicking with the right mouse button.

"Click right mouse button" event

When you want to trigger the event "Click right mouse button" through mouse operation, follow these steps:

1. Click on the object with the right mouse button.
   Clicking triggers the events "Activated" and "Press".
2. Release the right mouse button.
   Releasing triggers the "Release" and "Click right mouse button" events.



4.6.8 "Loaded" event

The "Loaded" event occurs when a screen is fully loaded after a screen change or runtime start.

4.6.9 "Cleared" event

The "Cleared" event occurs when the active screen is not loaded in runtime.

4.6.10 "Connected" event

The "Connected" event occurs when the data connection between an object, for example a trend control, and the controller has been established.

4.6.11 Triggering the "Status changed" event

Introduction

You can trigger the "Status changed" event by operating the "Switch" object.

Trigger "Status changed" event by mouse operation

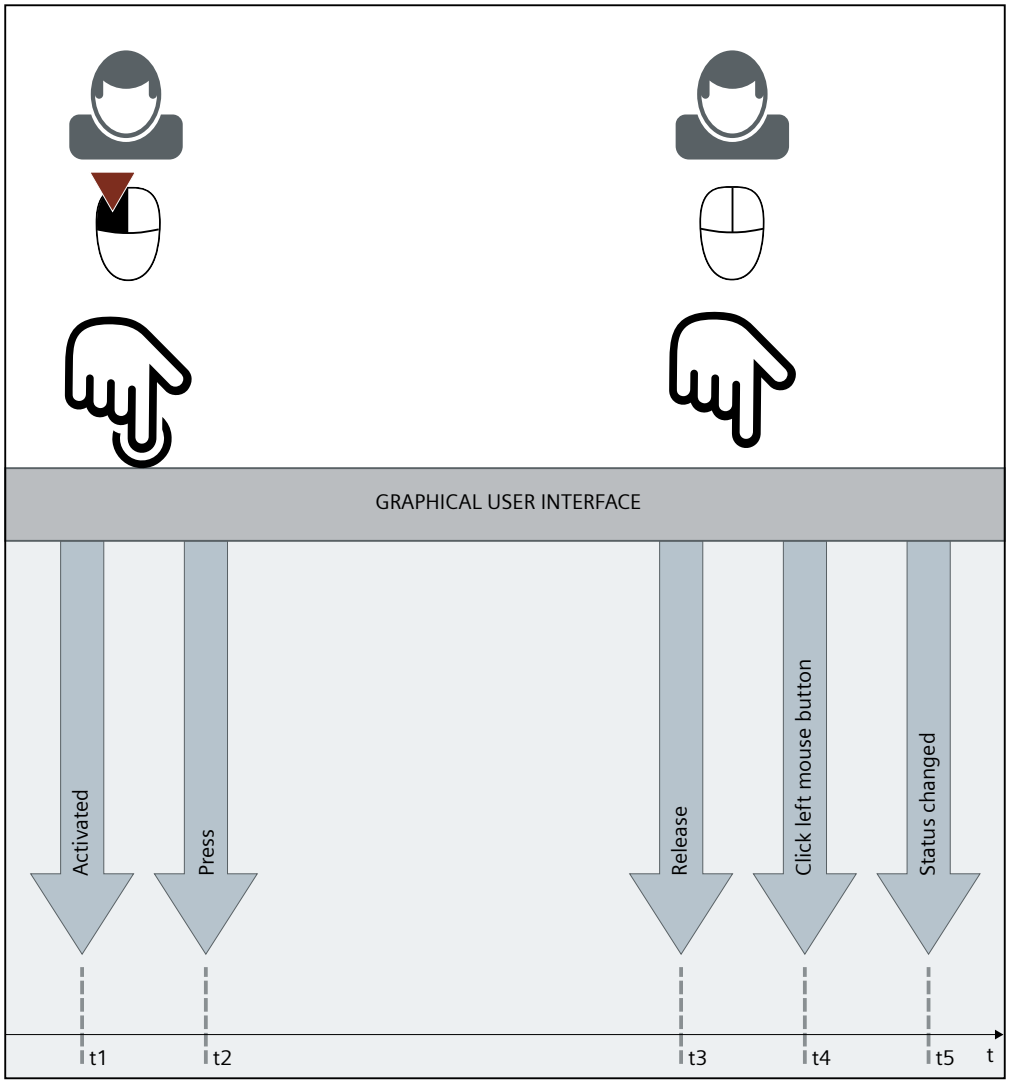
When you want to trigger the "Status changed" event through mouse operation, follow these steps:

1. Click with the left mouse button on the "Switch" object.
   Clicking triggers the events "Activated" and "Press".
2. Release the left mouse button.
   Releasing triggers the "Release", "Click left mouse button" and "Status changed" events.

Trigger "Status changed" event by touch operation

When you want to trigger the "Status changed" event using touch operation, follow these steps:

1. Touch the object using your finger.
   Touching triggers the "Activated" and "Press" events.
2. Release the finger.
   Releasing triggers the "Release", "Click left mouse button" and "Status changed" events.



4.6.12 Trigger "Command fired" event

Introduction

You can trigger the "Command fired" event by operating a button in the object, e.g. "Alarm control".

Trigger "Command fired" event by mouse operation

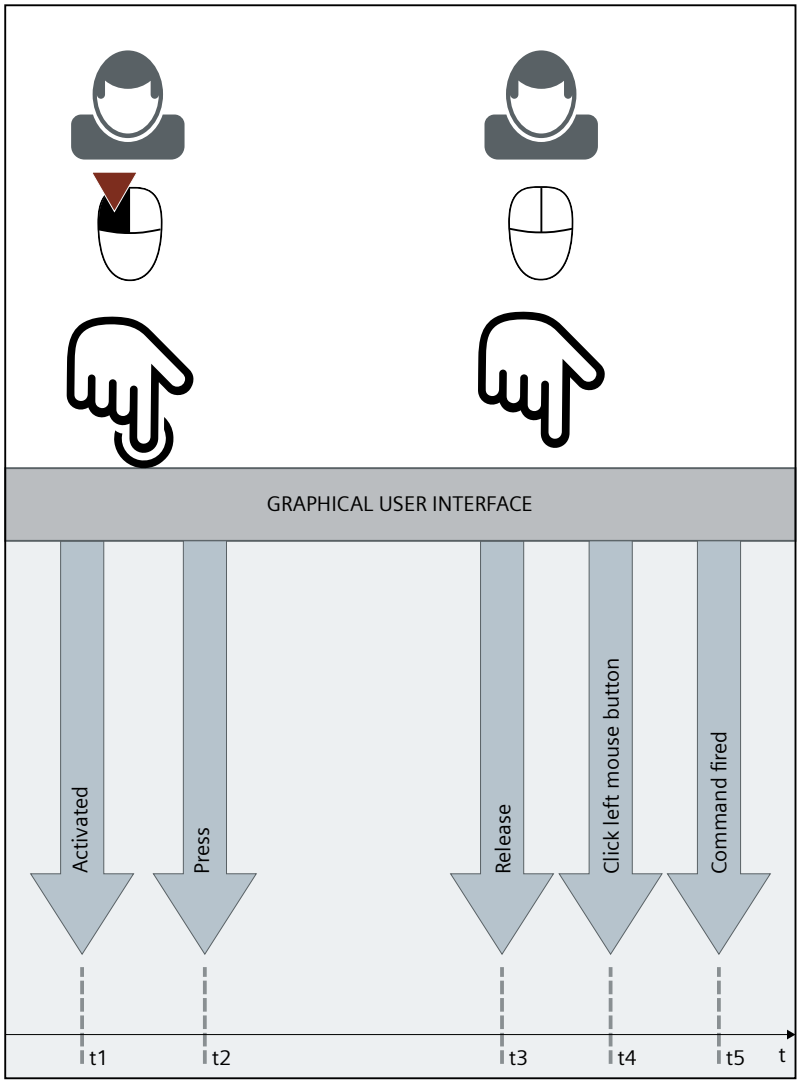
When you want to trigger the event "Command fired" through mouse operation, follow these steps:

1. Click on a button in the "Alarm control" object with the left mouse button.
   Clicking triggers the events "Activated" and "Press".
2. Release the left mouse button.
   Releasing triggers the "Release", "Click left mouse button" and "Command fired" events.

Triggering a "Command fired" event by touch operation

When you want to trigger the "Command fired" event through touch operation, follow these steps:

1. Touch a button in the "Alarm control" object with your finger.
   Touching triggers the "Activated" and "Press" events.
2. Release the finger.
   Releasing triggers the "Release", "Click left mouse button" and "Command fired" events.



4.6.13 Trigger "Gesture detected" event

Introduction

The "Gesture detected" event occurs when the operator has performed a touch gesture.

Distinguish gestures

The "Touch Area" object distinguishes between the following gestures:

- Right
- Left

- Up
- Down

Programming a J-script

To distinguish between the gestures, program a J-Script that evaluates the gesture.

1. Click  in the Inspector window under "Properties > Events > Gesture detected".
2. Copy the code example into the programming window.

Code example

```
export function Touch_area_1_OnGestureDetected(item, gesture) {
// value of tag ‚MyTag1‘ will be set depending on the detected gesture
if(gesture == UI.Enums.HmiGesture.SwipeRight)
{
UI.RootWindow.Screen = 'ScreenRight';
let tag1 = Tags('tag1');
tag1.Write(1); //write value '1234' to tag 'MyTag1'
}
if(gesture == UI.Enums.HmiGesture.SwipeLeft)
{
UI.RootWindow.Screen = 'ScreenLeft';
let tag1 = Tags('tag1');
tag1.Write(2); //write value '1234' to tag 'MyTag1'
}
if(gesture == UI.Enums.HmiGesture.SwipeUp)
{
UI.RootWindow.Screen = 'ScreenUp';
let tag1 = Tags('tag1');
tag1.Write(3); //write value '1234' to tag 'MyTag1'
}
if(gesture == UI.Enums.HmiGesture.SwipeDown)
{
UI.RootWindow.Screen = 'ScreenDown';
let tag1 = Tags('tag1');
tag1.Write(4); //write value '1234' to tag 'MyTag1'
}
if(gesture == UI.Enums.HmiGesture.Unknown)
{
let tag1 = Tags('tag1');
tag1.Write(0); //write value '1234' to tag 'MyTag1'
}
}
```

4.6.14 Triggering events through touch operation

Introduction

You can trigger events by touching the object on the touchscreen.

Note

Touch gestures and "Press" and "Release" events are not supported for client access of a PC with a touchscreen to a SmartServer.

Limit value

The time between touching and releasing the finger on the touchscreen decides which of the events is triggered.

If the time between touching and releasing (t3 – t2) the object is less than the specified limit value, releasing the pressed finger from the touchscreen triggers the event "Click left mouse button".

If the time between touching and releasing (t3 – t2) the object is greater than the specified limit value, releasing the pressed finger from the touchscreen triggers the event "Click right mouse button".

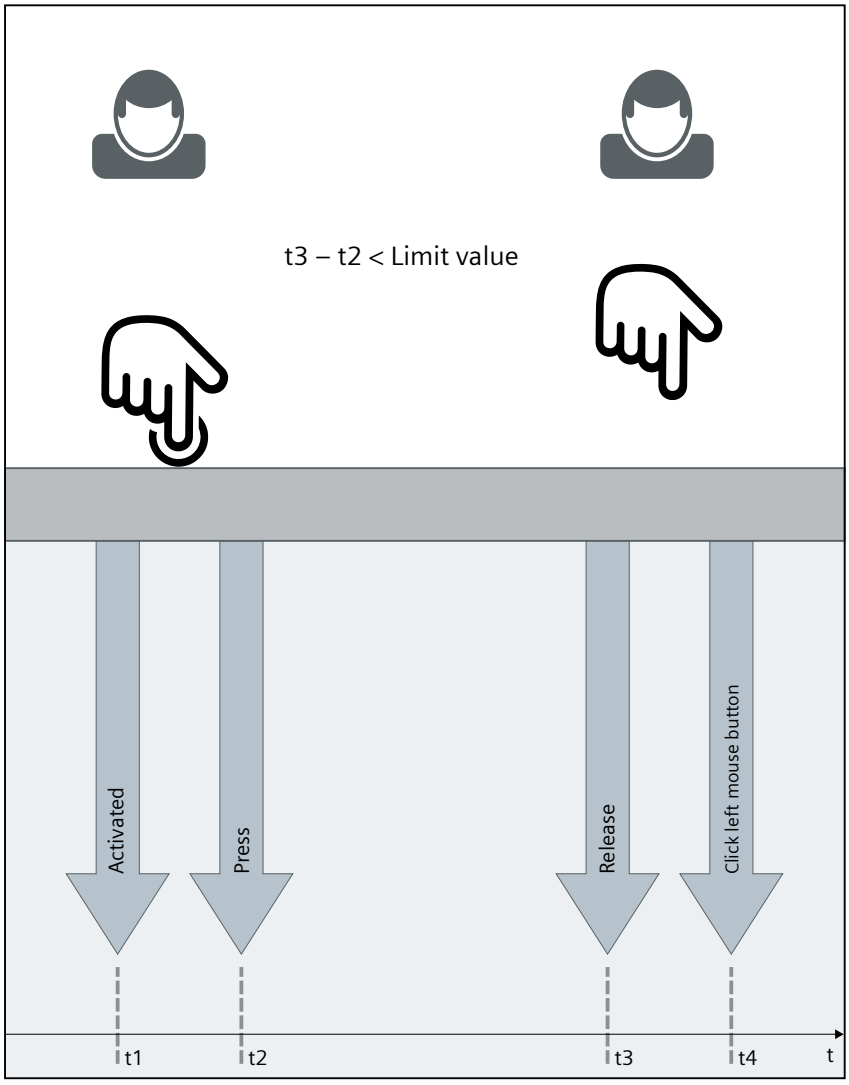
Note

If not specified by the operating system or the Web browser, the limit value is 1 000 ms.

Simulating clicking with the left mouse button

If you want to trigger the "Click left mouse button" event through touch operation, follow these steps:

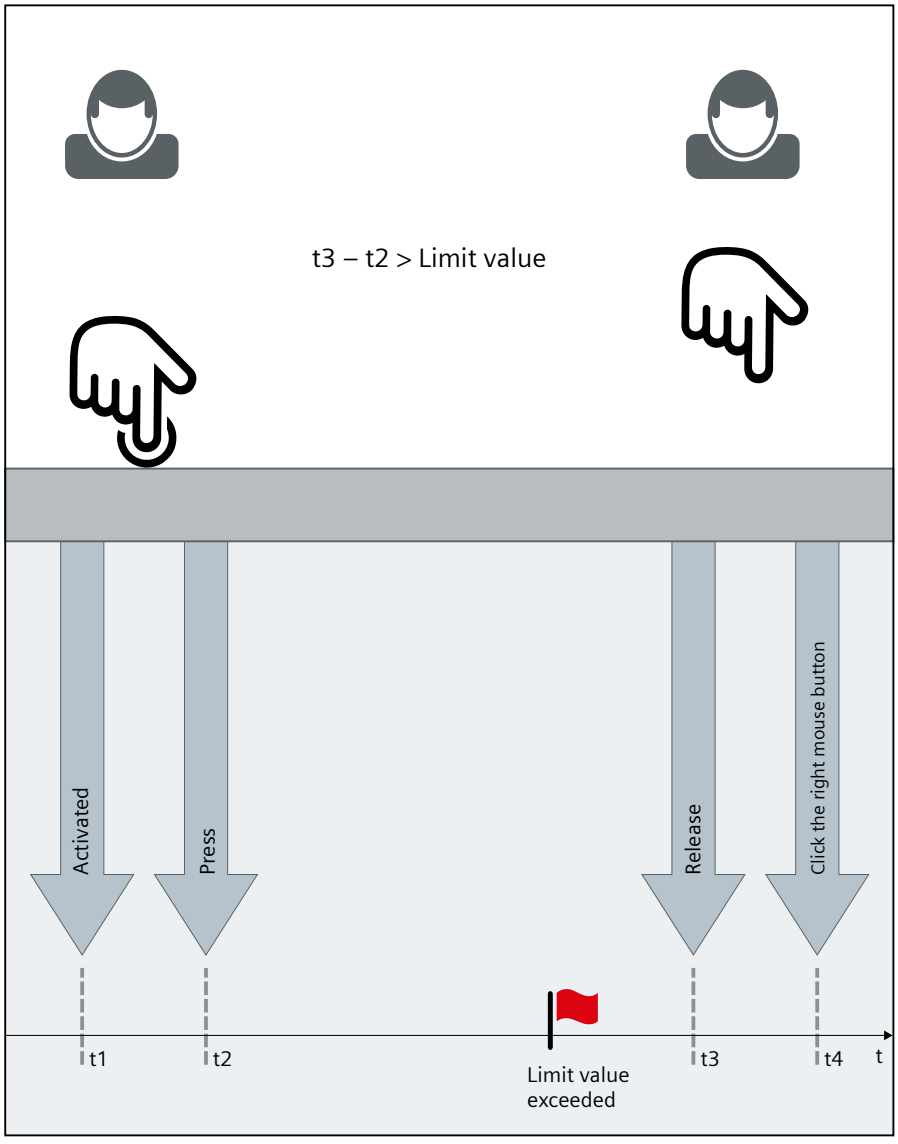
1. Touch the object using your finger.
   Touching triggers the "Activated" and "Press" events.
2. Release the finger within the limit value.
   Releasing triggers the "Release" and "Click left mouse button" events.



Simulating clicking with the right mouse button

If you want to trigger the "Click right mouse button" event through touch operation, follow these steps:

1. Touch the object using your finger.
   Touching triggers the "Activated" and "Press" events.
2. Release the finger after the limit value has expired.
   Releasing triggers the "Release" and "Click right mouse button" events.



4.6.15 Example: Configure the system function "Screen change"

Task

In this example you configure the system function "Screen change".

Requirement

- A project is open.
- A screen is configured.

Configure the system function "Screen change"

To configure a "Screen change" system function, follow these steps:

1. Create a screen "Screen1" and drag, for example, a button into the screen.
2. Create a screen "Screen2" and drag, for example, a circle into the screen.

Configuring "Screen1"

To add the "Click left mouse button" event to the button in "Screen1", follow these steps:

1. Select the button and click "Click left mouse button" under "Events".
2. Click "Add script". A "Script" window is opened.
3. Click on the first curly bracket in the script. The bracket turns green.
4. Under "Code templates > HMIRuntime > Screen", select the function "Change base screen".
5. Drag the function to the bracket. Enter "Screen2" in the script.
6. Click "OK".

Configuring "Screen2"

To add the "Click left mouse button" to the circle in "Screen2", follow these steps:

1. Select the circle and click "Click left mouse button" under "Events".
2. Click "Add script". A "Script" window is opened.
3. Click on the first curly bracket in the script. The bracket turns green.
4. Under "Code templates > HMIRuntime > Screen", select the function "Change base screen".
5. Drag and drop the function to the bracket, and write "Screen1" in the script.
6. Click "OK".

Loading the project and starting runtime

To load the project and start runtime, follow these steps:

1. Load the project under "Project > Device".
2. Start runtime.
3. Click on the button with the left mouse button. You switch to "Screen2".

Result

When you click on the circle with the left mouse button, you switch to "Screen1". When you click on the button with the left mouse button, you switch to "Screen2".

The system function "Screen change" has been configured.

4.6.16 Events on the "Media Player" object

4.6.16.1 Trigger "Pause" event

Introduction

You can trigger the "Pause" event by operating the "Pause button" in the "Media Player" object.

Triggering a "Pause" event by mouse operation

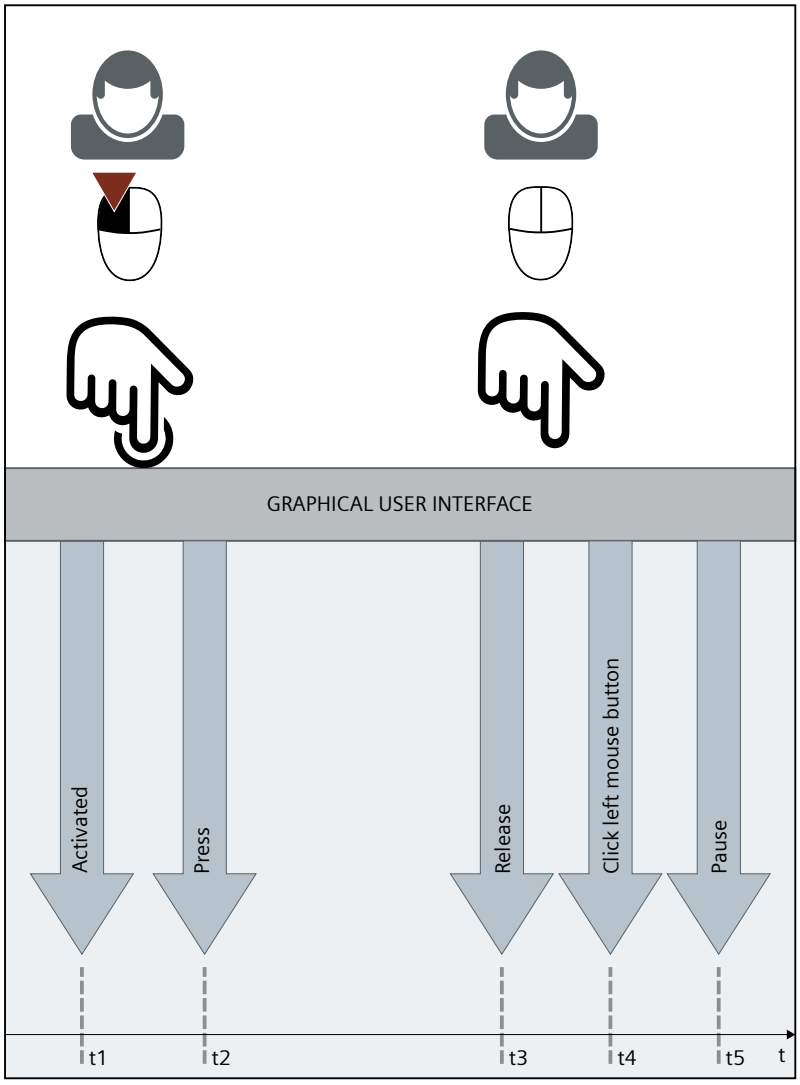
If you want to trigger the "Pause" event through mouse operation, follow these steps:

1. Click on the "Pause" button in the "Media Player" object with the left mouse button.
   Clicking triggers the events "Activated" and "Press".
2. Release the left mouse button.
   Releasing triggers the "Release", "Click left mouse button" and "Pause" events.

Triggering a "Pause" event by touch operation

If you want to trigger the "Pause" event through the touch operation, follow these steps:

1. In the "Media Player" object, touch the "Pause" button with your finger.
   Touching triggers the "Activated" and "Press" events.
2. Release the finger.
   Releasing triggers the "Release", "Click left mouse button" and "Pause" events.



4.6.16.2 Triggering a "Play" event

Introduction

You can trigger the "Play" event by operating the "Play" button in the "Media Player" object.

Trigger "Play" event by mouse operation

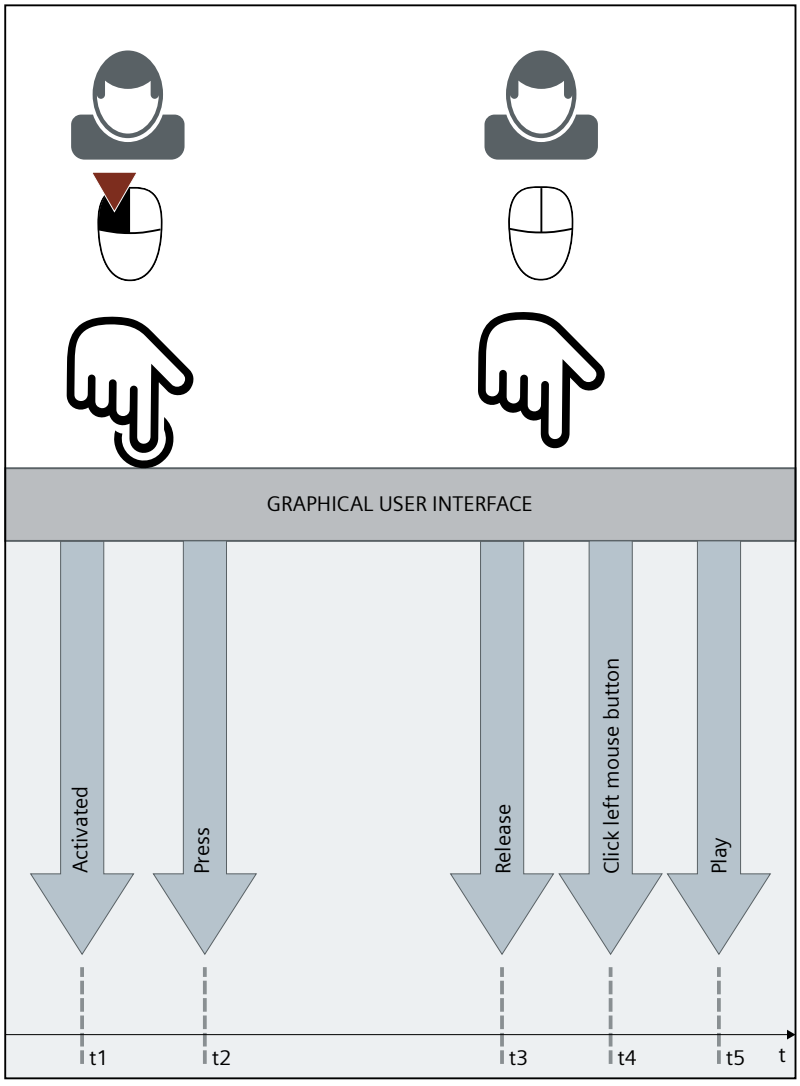
If you want to trigger the "Play" event by mouse operation, follow these steps:

1. Click on the "Play" button in the "Media Player" object with the left mouse button.
   Clicking triggers the events "Activated" and "Press".
2. Release the left mouse button.
   Releasing triggers the "Release", "Click left mouse button" and "Play" events.

Triggering a "Play" event by touch operation

If you want to trigger the "Play" event through the touch operation, follow these steps:

1. In the "Media Player" object, touch the "Play" button with your finger.
   Touching triggers the "Activated" and "Press" events.
2. Release the finger.
   Releasing triggers the "Release", "Click left mouse button" and "Play" events.



4.6.16.3 Triggering a "Playback finished" event

Introduction

You can trigger the "Playback finished" event by operating the "Stop" button in the "Media Player" object.

Triggering a "Playback finished" event by mouse operation

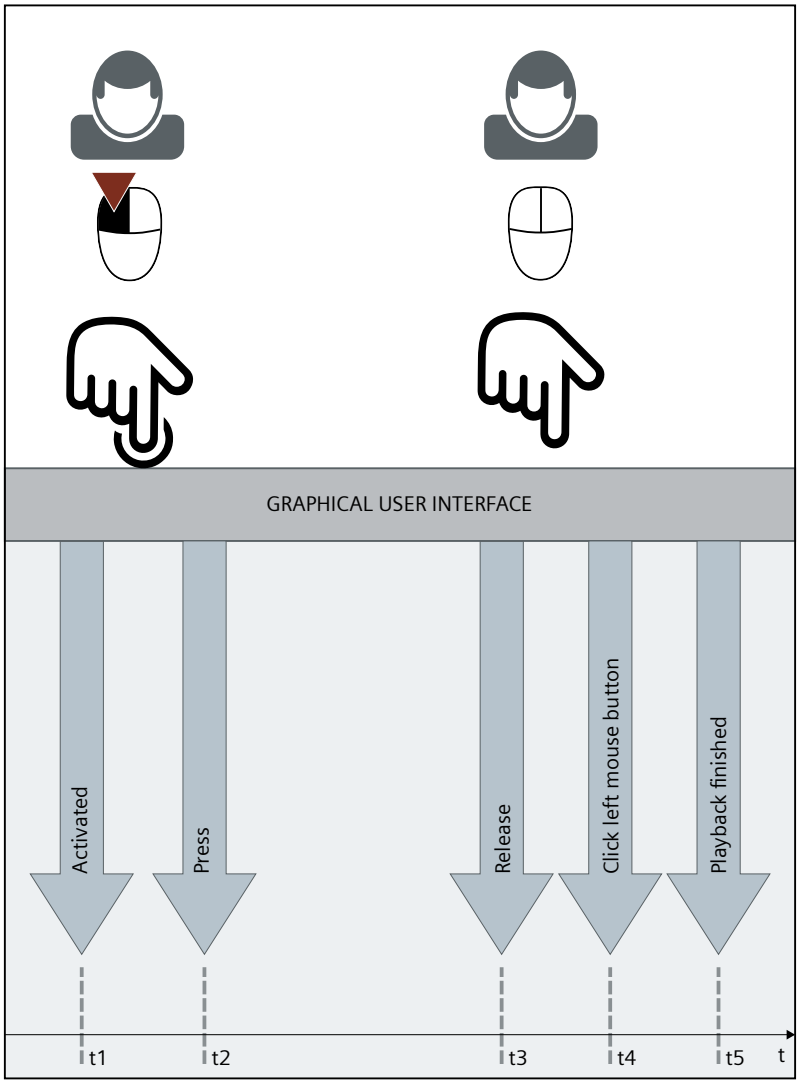
If you want to trigger the "Playback finished" event by mouse operation, follow these steps:

1. Click on the "Stop" button in the "Media Player" object with the left mouse button.
   Clicking triggers the events "Activated" and "Press".
2. Release the left mouse button.
   Releasing triggers the "Release", "Click left mouse button" and "Playback finished" events.

Triggering a "Playback finished" event by touch operation

If you want to trigger the event "Playback finished" by the touch operation, follow these steps:

1. In the "Media Player" object, touch the "Stop" button with your finger.
   Touching triggers the "Activated" and "Press" events.
2. Release the finger.
   Releasing triggers the "Release", "Click left mouse button" and "Playback finished" events.



4.6.17 Events at the "Plant overview" object

4.6.17.1 Triggering a "Selection changed" event

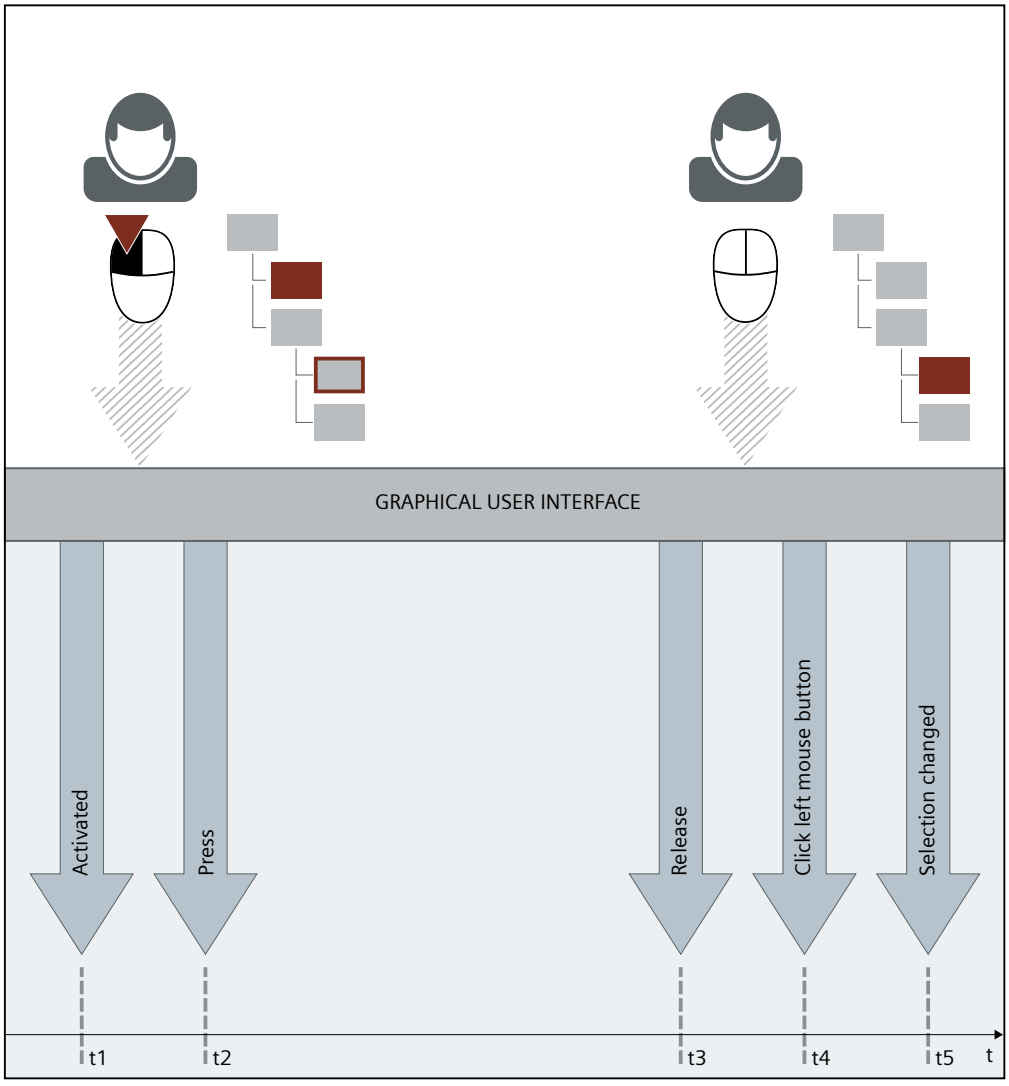
Introduction

You can trigger the "Selection changed" event in the "Plant overview" object by clicking the left mouse button.

Triggering a "Selection changed" event

If you want to trigger the "Selection changed" event through mouse operation, follow these steps:

1. Click on a node with the left mouse button.
   Clicking triggers the events "Activated" and "Press".
2. Release the left mouse button.
   Releasing triggers the "Release", "Click left mouse button" and finally "Selection changed" events.



4.6.17.2 Triggering an "Expand" event

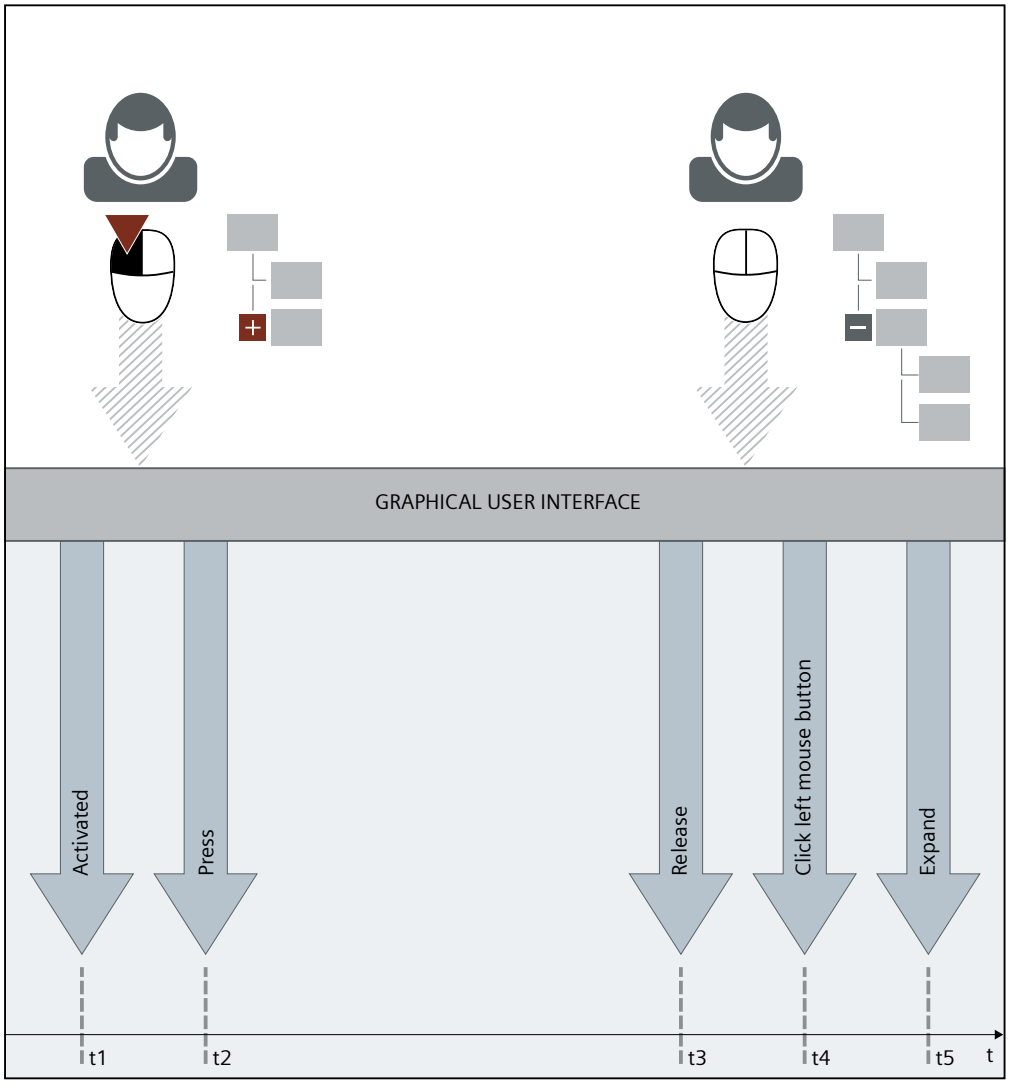
Introduction

You can trigger the "Expand" event in the "Plant overview" object by clicking the left mouse button.

Triggering an "Expand" event

If you want to trigger the "Expand" event by mouse operation, follow these steps:

1. Left-click on the symbol for "Expand".
   Clicking triggers the events "Activated" and "Press".
2. Release the left mouse button.
   Releasing triggers the "Release", "Click left mouse button" and finally "Expand" events.



4.6.17.3 Triggering an "Expand all" event

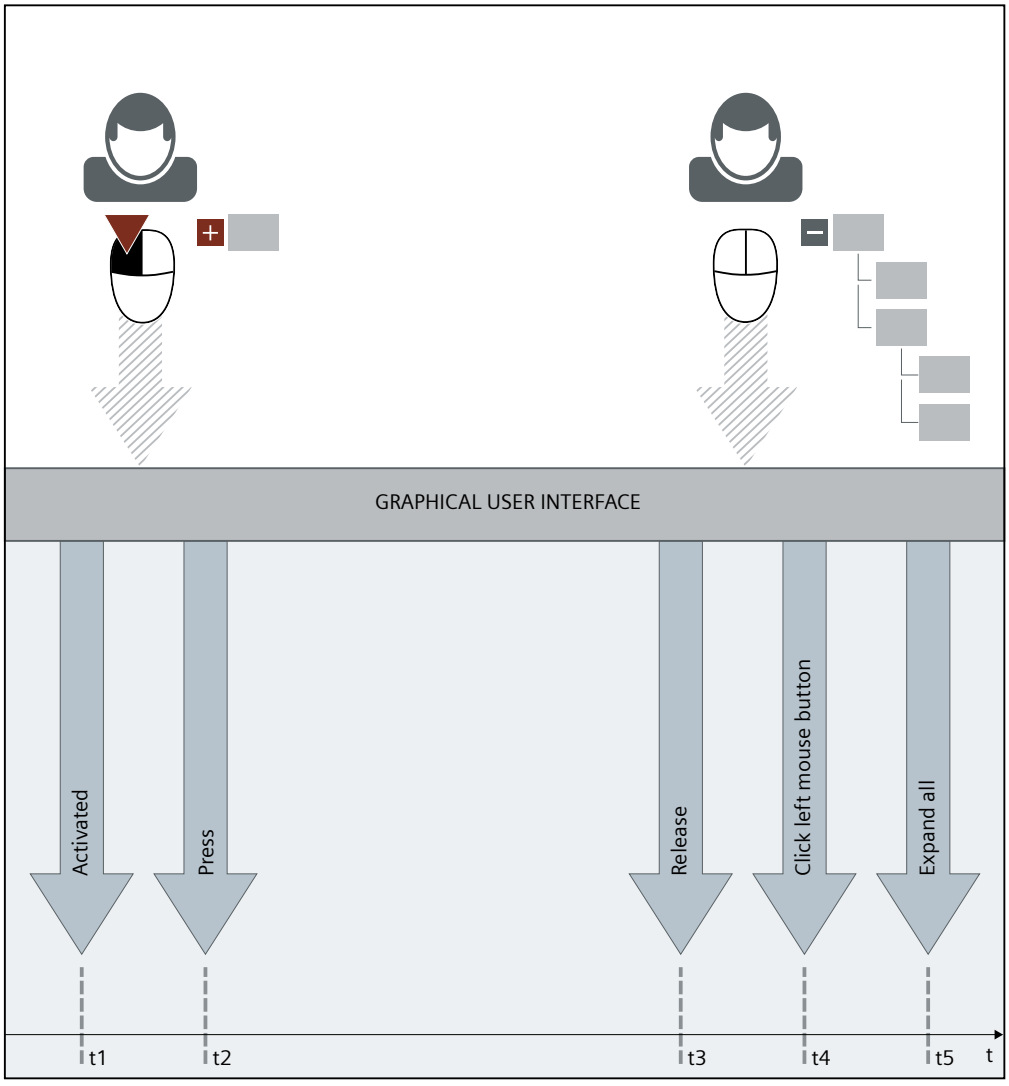
Introduction

You can trigger the "Expand all" event in the "Plant overview" object by clicking the left mouse button.

Triggering an "Expand all" event

If you want to trigger the "Expand all" event by mouse operation, follow these steps:

1. Left-click on the symbol for "Expand all".
   Clicking triggers the events "Activated" and "Press".
2. Release the left mouse button.
   Releasing triggers the "Release", "Click left mouse button" and finally "Expand all".



4.6.17.4 Triggering a "Minimize" event

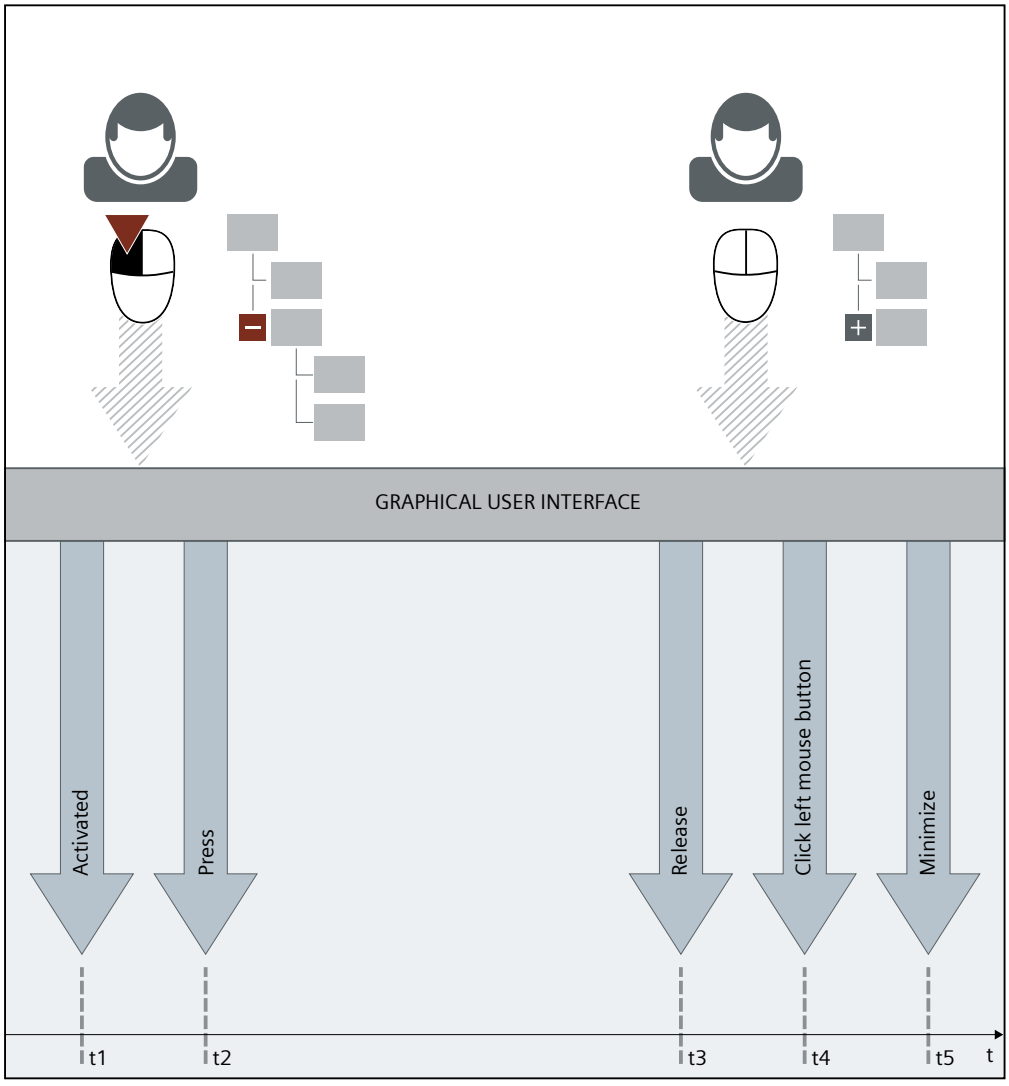
Introduction

You can trigger the "Minimize" event in the "Plant overview" object by clicking the left mouse button.

Triggering a "Minimize" event

If you want to trigger the "Minimize" event by mouse operation, follow these steps:

1. Left-click on the symbol for "Minimize".
   Clicking triggers the events "Activated" and "Press".
2. Release the left mouse button.
   Releasing triggers the "Release", "Click left mouse button" and finally "Minimize" events.



4.6.17.5 Triggering a "Minimize all" event

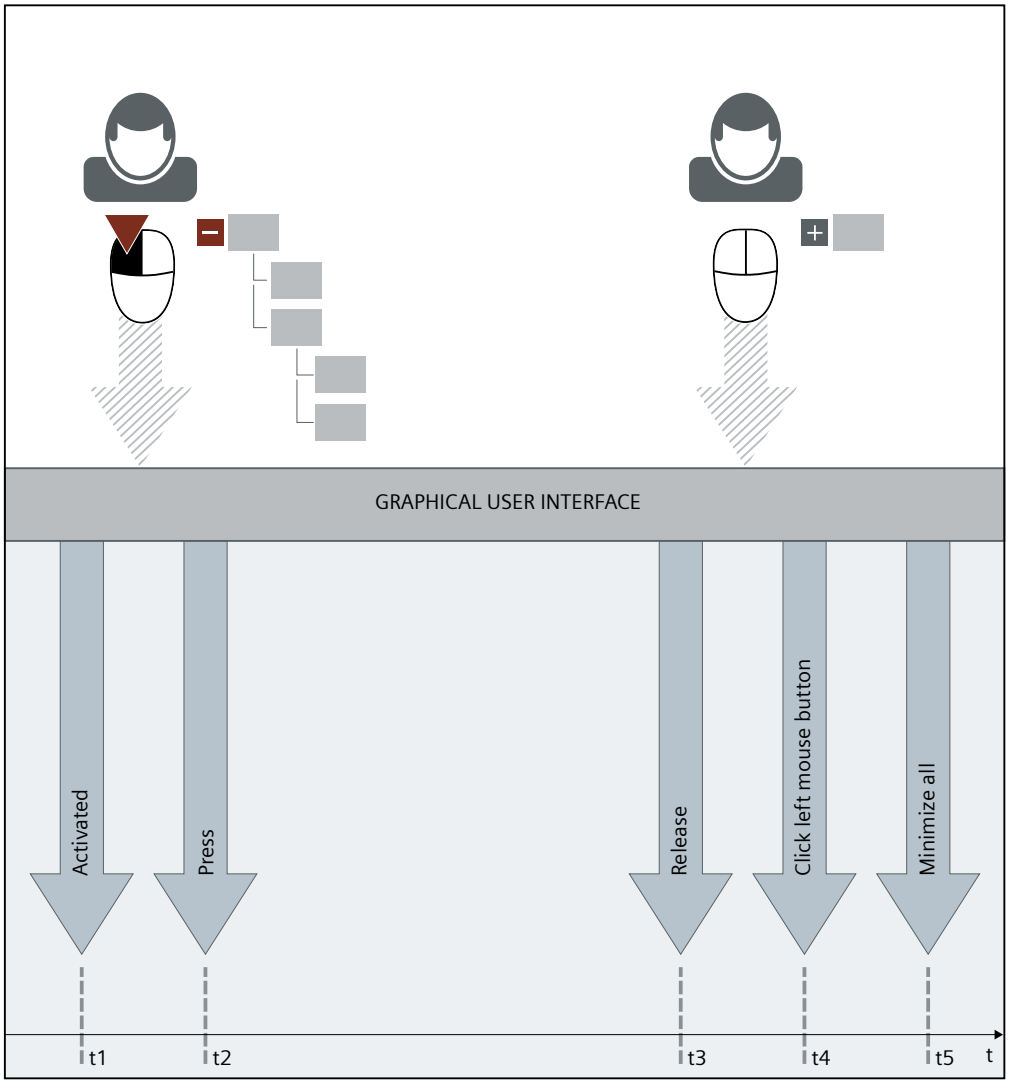
Introduction

You can trigger the "Minimize all" event in the "Plant overview" object by clicking the left mouse button.

Triggering a "Minimize all" event

If you want to trigger the "Release" event by mouse operation, follow these steps:

1. Left-click on the symbol for "Minimize all".
   Clicking triggers the events "Activated" and "Press".
2. Release the left mouse button.
   Releasing triggers the "Release", "Click left mouse button" and finally "Minimize all" events.



4.7 Configuring faceplates

4.7.1 Basics

4.7.1.1 Basics of faceplates

Introduction

Faceplates are user-defined groups of display and operating objects that are stored, managed and edited in the project library in a versioned manner. Faceplates are sometimes also referred to as "HMI blocks".

Faceplates support scripting and can therefore also open other faceplates in a pop-up window.

Depending on design and configuration, faceplates can be used universally and easily integrated into existing projects and employed several times.

Use

You use faceplates in order to create and re-use individually configured display and operating objects. You can edit faceplates centrally in the faceplate type. This reduces the configuration effort.

Depending on the application, a faceplate is a user-defined simple screen item or a detailed representation of a complex plant component.

Ideally, you should use faceplates for plant objects or parts that you use several times and that have identical data structures.

Note

Option to compile and load changes is lost

Please note the following instructions for compiling and loading changes:

- A dialog is often displayed when the option to compile only changes is about to be lost. The change can be confirmed or rejected.
  - If you confirm the change, the complete project must be compiled or loaded.
  - When you reject the change, the option to compile and load changes is retained.
- If you use the "Undo" button to undo a change that requires compiling or loading the entire project, the entire project must still be compiled or loaded.
- For the relevant changes and actions, an alarm is displayed in the Inspector window when the option to load changes is already lost. The entire project must be compiled and loaded.

Type/instance concept

Faceplates are based on a type/instance concept.

The faceplate type and its versions are managed centrally in the project library.

An instance of a version of a faceplate type is used in a screen as a faceplate container.

Faceplate type

- You create a faceplate type in the project library.
- More than one version of a faceplate type can be created.

Faceplate container

The faceplate container is an independent object in which a version of the faceplate type is instantiated.

- Each instance is connected to the faceplate version that has been used.
  This means that if you change a property or the data structure of a faceplate version, this property change immediately affects all faceplate instances that are based on the faceplate version.
- A faceplate container is used just like other display and operating objects in screens.
- If a version of a faceplate type has been instantiated in the container, the corresponding faceplate type is specified in the "Faceplate type of the instance" property.
- The tags and interface properties configured in the version of a faceplate type are linked in the faceplate container.

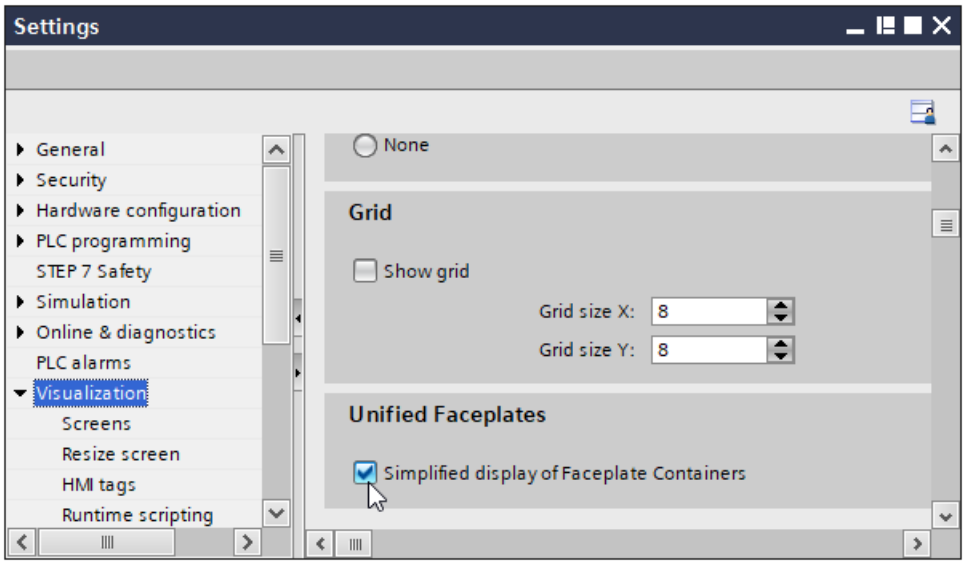
Example

If you use multiple valves within the project, you typically always use the same data structure to control and query the status of these valves. Therefore, it makes sense to use the same display and operating objects for the visualization of these valves.

1. In a faceplate type, you configure how the valve is displayed and which input and output tags the valve has in the form of tags.
2. If required, configure another faceplate type that contains the same data structure and functions as a pop-up window.
   This pop-up window can be called by the first faceplate type using a script.
3. For each valve in the system with the same data structure, instantiate the desired faceplate type and link its tags and PLC user data types with the corresponding valves in the system.

Improved performance when using a large number of faceplates

To improve performance during the engineering process when using numerous faceplates, activate the "Simplified display of Faceplate Containers" option under "Settings > Visualization > Unified Faceplate".



The faceplates are displayed in a simplified way when this option is activated in the engineering system. This change has no effect on the display in Runtime. In Runtime, faceplates are displayed in unrestricted quality.

4.7.1.2 Device dependency of faceplates

The functionality of the faceplate depends on the lowest device version of a faceplate type.

Devices

The following devices support faceplates:

- SIMATIC WinCC Unified PC
- SIMATIC Unified Comfort Panel

See also

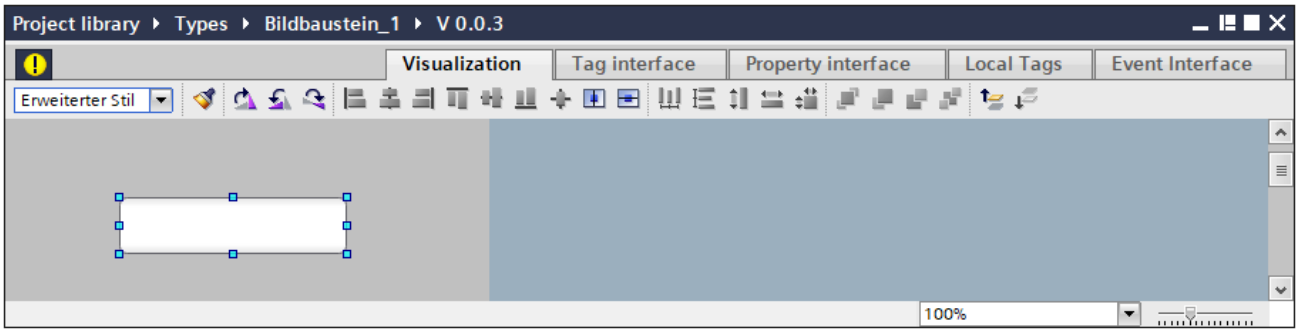
Lowest device version of a faceplate type (Page 529)

4.7.1.3 "Faceplate types" editor

Project library

You can create and edit faceplate types in the project library.

Layout



To view the tab of the editor, close the note .

Visualization

You can design the faceplate type in the "Visualization" tab.

You insert the following objects from the "Tools" task card:

- "Basic objects"
- "Elements"
- "Controls"
  The following controls are available:
  - Alarm control
  - Trend control
  - Faceplate container
    Empty container that you can later connect to a faceplate type.

You can find more information in the section Overview of screen objects (Page 269).

You can define the properties of the faceplate type and the objects in the Inspector window under "Properties > Properties". Here, you define display name, appearance and size, for example.

Assigning names to tags and properties

Note

Use unique names

The name of a tag or a property may be assigned across all tabs only once in a faceplate type.

Tags interface

On the "Tag interface" tab, you can configure the interface tags of the faceplate type and link the interface tags to HMI tags.

PLC user data types are supported on the interface.

Property interface

On the "Property interface" tab, you can configure the interface properties of the faceplate type.

The properties configured here are available for the instance of the faceplate type under "Miscellaneous > Interface".

You can create interface properties of the following data types:

- 64-bit integer
- Authorization
- Boolean
- Color
- Floating-point number
- Graphic
- Configuration string
- Multilingual text
- Resource list
- Unsigned 64-bit integer

Local tags

On the "Local Tags" tab, you can configure tags that are used exclusively within the faceplate type.

For example, you can use local tags in scripts within the faceplate type.

Event interface

In the "Event interface" tab, you configure events and associated parameters. You interconnect the events in the "Visualization" tab with the faceplate type or objects in the faceplate type.

On the faceplate container, the events are available under "Properties > Events". You can configure functions of the function list or scripts.

Interfaces of faceplate types can be copied

The entries of an interface in a faceplate type can be selected individually or copied in blocks as an entire interface and pasted again in another faceplate type.

This applies to:

- Tags interface
- Property interface
- Local tags
- Event interface

Pasting is also possible at the same place in the faceplate type.

To copy and paste, use the shortcut menu or the shortcut keys <Ctrl> + <C> and <Ctrl> + <V>.

To copy and paste all entries, select the entries by keeping the "Shift" key pressed or by using the keyboard shortcut <Ctrl> + <A> and copy via the shortcut menu or via the keyboard shortcut <Ctrl> + <C>. Insert the entries via the shortcut menu or the keyboard shortcut <Ctrl> + <V>.

4.7.1.4 Lowest device version of a faceplate type

Introduction

When you create the faceplate type, define the lowest device version for the faceplate type.

If you select the highest available device version, all functions are available. If you select a lower device version, some features are not available.

Note

Configured device version and lowest device version of the faceplate type

The configured device version of the HMI device in which an instance of the faceplate type is to be used must be equal to or higher than the lowest device version of the faceplate type.

The following changes in the project may cause error messages due to a device version that is too low:

- Changing the configured device version of the HMI device to a lower version
- Deleting a faceplate type
- Copying and pasting screens or faceplate containers between different HMI devices
- Copy screen with a faceplate container from the library to a screen

Note

TIA Portal version and device version of the faceplate type

A warning appears when you open a project that contains a faceplate type with a higher device version than the installed TIA Portal version in the project library or as an instance. It is possible to open the project, but the following restrictions apply:

- You cannot open or release the affected faceplate type.
- You cannot compile the project.
- If you open a screen that contains an instantiated faceplate type with a higher device version, the faceplate container is shown as empty.

Available functions depending on the device version

Function	Available as of version
Interface property of the "Resource list" data type	16.0.0.0
Interface property of the "Color" data type	16.0.0.0
Interface property of the "Configuration string" data type	17.0.0.0
Interface property of the "Authorization" data type	17.0.0.1 (Update 1)

Function	Available as of version
Interface property of the "Multilingual text" data type	18.0.0.0
Interface property of the "Graphic" data type	18.0.0.0
Alarm control	18.0.0.0
Trend control	18.0.0.0
Arrays from user data types	18.0.0.0
Arrays from values of simple data types	18.0.0.0
Link tags of the data type "DateTime" or "LTime" with the PLC tags.	18.0.0.0
Tags of the "PLCUDT" and "HMIUDT" data type	18.0.0.0
Using a faceplate type in another faceplate type	18.0.0.0
Interface events	18.0.0.0
Local tags	18.0.0.0
Using dynamic SVG graphics from the library in faceplates	18.0.0.0

4.7.1.5 Faceplates and TIA version upgrade

Version upgrade from V16 to V17 or higher

Note the following points when upgrading from version V16 to V17 or higher:

- As of V17, faceplates are located in the project library and are managed and used in types and versions.
- To prevent inconsistencies when linking data types, you must copy the user data types used in the PLC to the library before upgrading the version from V16 to V17 or higher.
  To do this, use drag-and-drop to move the PLC user data type to the library under "Project library > Types".
- When upgrading TIA Portal from V16 to V17 or higher, the names of existing faceplate types are automatically converted. In the higher version, the name of the faceplate type is given the version number "_0.0.1" as an extension. If, as a result, the permissible maximum total length of 128 characters is exceeded, an error message is displayed on the HMI device when the project is compiled.
  In this case, shorten the name of the faceplate type.
- The function rights "Function_right_01" to "Function_right_20" assigned to a faceplate in the V16 project are removed during the version upgrade.
- All master copies of faceplate types are removed during the version upgrade.
  Master copies of faceplate types are no longer supported as of V17.

4.7.2 Creating and managing faceplates

4.7.2.1 Creating a faceplate type in the project library

Introduction

Faceplate types are display and operating objects that are made up of several screen objects, such as I/O fields and controller blocks.

A faceplate type consists of one or more versions.

Requirement

The "Libraries" task card is open.

Procedure

1. Expand the "Types" folder in the project library.
2. Select the "Add new type" command.
   The "Add new type" dialog opens.
3. Select "HMI faceplate" and select "Unified Comfort Panel / WinCC Unified PC".
4. Enter a descriptive name in the "Name" field.

   Note

   The name must satisfy the following conditions:
   - Maximum character length: 128 characters
   - Unique name
   - No special characters:
     # $ +% . / : [ ] ' ~ " `
   - No JavaScript elements

5. Adapt the lowest device version.
   A new faceplate type with a preliminary faceplate version is created and shown in the project library.

Result

You have created a new faceplate type with a version. The preliminary faceplate version 0.0.1 is open in the editor and has the status "In progress".

See also

Basics of screens (Page 259)

4.7.2.2 Creating a faceplate type from a screen

As an alternative to creating a faceplate type in the project library, you can create a faceplate type directly from a screen of an HMI device. This can be useful, for example, if after configuring screen objects, you find that you want to reuse the screen objects and adapt tags and properties to the new application.

Note

- References to graphics in the "Graphic view" screen object are not transferred and must be inserted again.
- When tags are used for the dynamization, the reference is resolved as soon as a tag with the same name is created in the tag interface of the faceplate type.
- Configured function lists at events of screen objects are not transferred and have to be created again.

Note

Dynamic SVGs

If you create a faceplate type from a group of selected screen objects, dynamic SVG graphics are not included. To insert a dynamic SVG graphic into a faceplate, open the faceplate type in the editor and insert the SVG graphic from the library here.

Requirement

- A screen is configured and open.

Procedure

1. Select all the screen objects you want to use in the faceplate type by multiple selection in the screen.
2. Right-click to open the shortcut menu of the selected objects and select "Create faceplate". A new faceplate type is created in the project library that contains the copied screen objects and their configured properties.

Result

You have created a new faceplate type from a screen. The faceplate type contains the copied screen objects and their properties. The preliminary faceplate version is 0.0.1 and has the status "In progress".

4.7.2.3 Working with faceplate types and versions

Using the toolbar in the editor

Introduction

When you open the version of a faceplate type, the toolbar is displayed in the editor.

Toolbar

The toolbar provides information about the status of the opened version.

The toolbar allows access to the following functions, depending on the status of the opened version:

- Edit type
- Release version
- Discard changes and delete version
- Check if dependent types need to be adjusted.

Minimizing / showing the toolbar

To minimize the toolbar, click on or on "x".

To display the toolbar, click .

Editing a faceplate type

Introduction

When you open a released faceplate type for editing, a new version of the faceplate type is created based on the most recent version, "[Default]". When you edit an older version, the new version is based on the selected version.

Requirement

A faceplate type has been created.

Editing a faceplate type or version

You edit a released faceplate type or a type version as follows:

1. Select the faceplate type or the specific version you want to change.
2. Select "Edit type" from the shortcut menu.
   A new version of the faceplate type is created.
   The new version is opened in the "In progress" status.
   The new version is displayed in the editor.
3. Edit the newly created version.

Updating a faceplate type

Introduction

When a faceplate type is updated, all instances of the faceplate type are updated.

Requirement

- A faceplate type has been created and released.
- The "Libraries" task card is open.

Procedure

1. Select the faceplate type that you want to update.
2. Select "Update types" in the shortcut menu.
3. Select whether you want to update the types in a project or in the library.
   A dialog opens.
   - If "Project" is selected: Select the devices in which you want to perform the update.
   - If "Library" is selected: Select the library in which you want to perform the update.
4. Specify whether the unused type version is going to be deleted from the library.
5. Confirm your selection.

Note

Updating faceplate types in plant objects

Note that when faceplate types used in plant objects are updated, the interface assignment and dynamization within the plant object type is deleted if the interface tag or interface property was changed.

Result

You have updated all instances of the selected faceplate type in a library or in the project.

Renaming a faceplate type

Introduction

You can rename a faceplate type after it has been created. If you have referenced a version of a faceplate type in a script and you then rename the faceplate type, all references are automatically renamed.

Procedure

To enter a new name, select the faceplate type in the library.

1. Press <F2>.
   - or -
   In the shortcut menu, select "Rename".
2. Enter a new name.

The name is automatically checked for length, uniqueness and permitted characters. The name is reset to the previous name if the new name does not meet the requirements.

Opening a faceplate type or version write-protected

Introduction

You can open a faceplate type or an enabled type version write-protected. In write-protected mode, you can see all configurations within the type version but you cannot make any changes.

Requirement

At least one released type version is available in a library.

Procedure

To open a faceplate type in write-protected mode, select the faceplate type or a released version in the library.

When you open a faceplate type as read-only, the default version is always opened.

- Select "Open" from the shortcut menu.
  The toolbar is displayed and indicates that the faceplate type version is write-protected.

See also

Using the toolbar in the editor (Page 533)

Replacing a faceplate type

Introduction

The "Replace type" function replaces the used versions of a faceplate type in a project with a version of another faceplate type.

The source for replacing faceplate types is always a version. The target is always the enabled version of a faceplate type.

Requirement

- The "Libraries" task card is open.
- At least two faceplate types have been created and released.
- The faceplate type is used in the project.

Procedure

To replace all instances of the source type with the selected version of the target type, follow these steps:

1. Open the shortcut menu of the faceplate type or the version that you want to replace.
   If a faceplate type is selected for replacement, then the version defined as "Default" is used as the source version to be replaced.
2. Select "Replace type".
   The "Replace type" dialog is displayed.
   All compatible HMI devices and target types are displayed.
3. Select an HMI device.
4. Select a faceplate type.
5. Select a version of the target type.
6. Select "OK".
   A status message is displayed in the Inspector window in the "Info > General" tab.

Result

You have replaced the instantiated faceplate type with a different type.

Defining a version as the "default" version

When you add a faceplate type to a library, use types from a library, and release or update versions, the highest released version is used as the "default" version. You can specify another released version as the default version.

Requirements

- You have opened the project library or a global library.
- The desired version has been released.

Procedure

1. Select a version.
2. Open the shortcut menu.
3. Select "Set as "Default"".

Result

The newly set "Default" version is used instead of the highest released version when instantiating, creating, releasing and updating the type.

See also

Consistency status of types (Page 179)

Deleting a faceplate type or a version

Note the following when deleting faceplate types or versions:

- A faceplate type or a version can only be deleted if there are no dependencies on other types.
- When you delete a faceplate type, all versions of the type are deleted.
- When you delete all versions of a faceplate type, the type is also deleted.
- When you delete a version that has instances in the project, the instances are also deleted from the project.
- When you delete a type version with the "default" identifier and no additional versions of this type exist, the type is deleted.
- When you want to delete a type version with the "default" identifier and other versions of this type exist, the "default" identifier must first be assigned to a different version. Versions with the "default" identifier cannot be deleted if other versions of the type exist.
- If you delete a faceplate type or a version which exists in the "Types" folder in a global library, it remains in the global library.

Requirement

- The version that is to be deleted is released.
- The faceplate type that is to be deleted contains only released versions.

Procedure

1. To delete a faceplate version, select it and press <Del>.
   - or -
   Select "Delete" in the shortcut menu of the version.
   The "Confirm delete" dialog opens.
2. Confirm the delete operation.
   If the faceplate version is used in projects, the "Delete instances of the version" dialog appears, informing you that all instances of the version to be deleted will be removed.
3. Confirm the delete operation.

Note

If a deleted version is referenced in a script, an empty reference remains in the script after deletion. Remove it manually or insert a new reference.

Duplicating a faceplate type

Faceplate types in the project library can be duplicated. When you duplicate a faceplate type, the following applies to the duplicate:

- The duplicate is created in the same folder.
- The duplicate is created from the version of the type with the "default" identifier.
- The duplicate does not have an instance in the project.

Requirement

The faceplate type contains at least one released version.

Procedure

To duplicate a type in the project library, follow these steps:

1. Select the faceplate type or type version to duplicate.
2. Select "Duplicate type" from the shortcut menu.
   The "Duplicate type" dialog opens.

3. Enter the properties of the new type:
   - Enter a name for the new type in the "Name of type" field.
   - In the "Lowest device version" field, select the device version with which the type should be used.

     Note

     Only device versions that are the same as or higher than the original version can be selected.

   - Enter a version number for the new type in the "Version" field.
   - Enter the name of the editor who is responsible in the "Author" field.
   - Enter a comment on the type in the "Comment" field.
4. Confirm with "OK".
   The new faceplate type is generated with a released version.

Assigning a faceplate version number

A library is more clearly structured if types related by content have the same version number. The identical version number reflects the work progress. When you have completed the work on multiple associated faceplate types, you can assign the same version number to these types.

A log of the changes is created automatically. If you have versioned the faceplate types in the project library, you will find the log in the project tree under "Common data > Logs". If you have versioned the faceplate types in a global library, you will find the log in the "Common data > Logs" folder in the level below the global library.

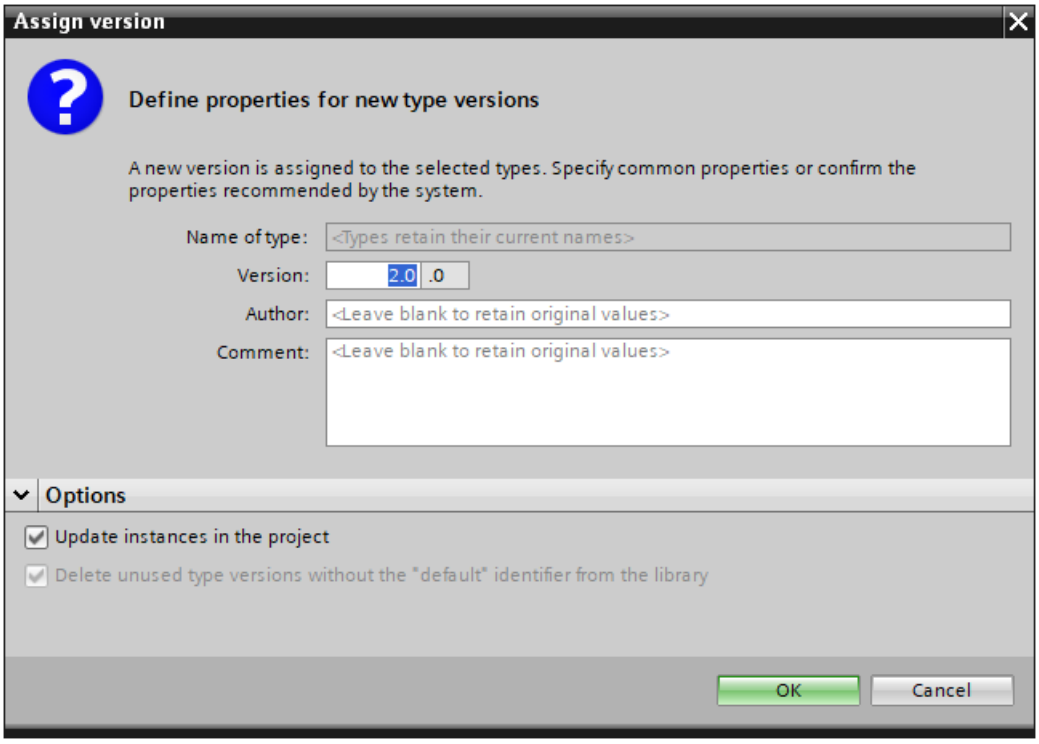
Requirement

- The "Libraries" task card is open.
- Faceplate types with "In progress" status have not been selected.

Procedure

To assign the same version to several faceplate types, follow these steps:

1. Select the faceplate types to which you want to assign a common version.
   Press and hold the <Ctrl> key and click on the faceplate types.
   If you have organized types in the library into folders, you can select one or more folders.
2. Select "Assign version" from the shortcut menu.
   The "Assign version" dialog opens.



3. If necessary, change the properties of the version:
   - In the "Version" field, determine the new version number. The version number must be higher than the highest version number of all selected types.
   - In the "Author" field, enter the person responsible for the version to be released.
   - In the "Comment" field, enter a comment on the version to be released.
4. Confirm with "OK".

Result

The selected versions of the faceplate types are changed as follows:

- A new version of all selected faceplate types is created with the specified version number.
- The properties are applied to all selected faceplate types. Lower versions used in the project remain unaffected by the changes. When you make no changes to the properties, the properties of the last released version or the version specified by the user as "default" of each faceplate type are applied.

- When a version is set as "default" by the user, the new version of the selected type is created from the default version with the specified version number. This newly created version will then have the "default" identifier.
- The version number of dependent types is incremented to the next free version number as long as the dependent types were not included in your selection. If you had selected a dependent type as well, the version number you specified will be assigned.

Note

Assigning a version number based on inconsistency

Updating the project library with versions of a global library or another TIA Portal instance can result in the project library having two faceplate versions with the same version number created by different authors. This leads to inconsistency and the project cannot be compiled. If this happens, change the version number of one of the duplicate versions.

See also

Consistency status of types (Page 179)

4.7.2.4 Editing the visualization of a faceplate type

You can edit the visualization on the "Visualization" tab of the editor.

The procedure corresponds to that for editing screens in the "Screens" editor.

Requirement

A faceplate type has been created.

Editing the visualization

1. Open a version of the faceplate type for editing.
   The visualization of the version is displayed on the "Visualization" tab in the editor.
2. Move objects from the "Toolbox" or "Libraries" task card to the "Visualization" tab of the faceplate version using drag-and-drop.
   Objects from the palettes "Controls" and "My Controls" are not available or only available to a limited extent.
   For dynamic SVG graphics, drag-and-drop pasting is only available as of version V18. If the device version is changed to a version < V18, you will get an error during the compile.

All the editing functions that you already know from configuring screens are available.

You can copy screen objects from one faceplate type to one or more other faceplate types without losing their attributes. If a copied property or tag does not exist in the target

faceplate type, the corresponding property or tag is highlighted in red and must be added in the target faceplate type.

Note

Screen objects can only be copied within a TIA Portal project. Copy operations between different TIA Portal instances are not supported.

Editing properties

Both the properties of the faceplate type and the properties of the objects used are edited in the Inspector window under "Properties > Properties".

1. Select the object.
   - If you want to adapt the properties of the faceplate type, click in a free area of the editor.
   - If you want to adapt the properties of a used object, click on it.
     The displayed handles indicate the selected object.
2. Open the shortcut menu and select "Properties".
   The Inspector window displays the properties of the object or faceplate type.
3. Edit the properties.

See also

Overview of screen objects (Page 269)

4.7.2.5 Configuring multilingualism for objects of a faceplate type

Introduction

The project languages are set in the "Project languages" editor. You specify which project language is to be the editing language and which the reference language.

Requirement

- A faceplate type has been created and opened for editing.
- At least one object is configured.

Procedure

1. Open the "Languages & Resources" menu command in the project tree.
   The lower-level elements are displayed.
2. Double-click on "Project languages".
   The possible project languages are displayed in the work area.

3. Enable the relevant project languages or disable the languages that you do not need.

Note

Copying multilingual objects

The copies of multilingual objects to a different project only include text objects in the project languages which are activated in the target project. Activate all project languages in the target project to include the corresponding text objects when transferring the copy.

Note

If you disable a project language, all text and graphic objects you have already created in this language are disabled from the current project. When the language is re-enabled, these are also re-enabled.

4. Go to the project library and open the faceplate type for whose objects you want to create multilingual texts.
5. Select the object for which you want to store a multilingual text.
6. Open the Inspector window under "Properties > Texts" and create the corresponding texts in the set languages.

Displaying multilingual texts in runtime

To activate the set languages in runtime, follow these steps:

1. Double-click on "Runtime settings" in the project tree.
2. Click on "Language & Font".
3. Enable the required languages.

See also

Exporting and importing library texts (Page 170)

4.7.2.6 Configuring tags in the faceplate type

Overview

Introduction

You configure interface tags or local tags in faceplate types. For each tag you define a data type. In addition to simple data types like Bool or Int, you can define arrays.

Tags of the data type "DateTime" or "LTime"

You can create tags of the data types "DateTime" or "LTime".

You can link interface tags of the "DateTime" or "LTime" data types, for example, with HMI tags of the data types "DateTime" or "LTime" on the faceplate container.

You can also link interface tags of the "DateTime" or "LTime" data types with the following data types of the S7-1500 PLC:

Data type of the interface tag	Data types of the PLC S7-1500
DateTime	Date
DateTime	Date_And_Time
DateTime	LDT
DateTime	DTL
LTime	Time
LTime	LTime
LTime	Time_Of_Day
LTime	LTime_Of_Day

Tags of the "Array" data type

You can define tags of the "Array" data type. The array index begins with 0.

Note

"WChar", "WString" and "HMIUDT"

Arrays of "WChar", "WString" and "HMIUDT" data types are not possible.

Configuring interface tags in the faceplate type

Introduction

In the faceplate type you can configure interface tags for dynamizing the properties of the objects contained in the faceplate type or embedding in scripts.

The interface tags of a faceplate type are linked exclusively via the faceplate container to the project tags.

Note

User data types

User data types, including with nested structures, are supported.

Note

Subsequent changes to interface tag names

Note that the values of interfaces that are already connected at the faceplate container are reset to their default values when you subsequently change names in the faceplate type.

Requirements

- The faceplate type has been created.
- The version is open for editing.
- The "Tag interface" tab is open in the editor.

Defining tags

Note

Only tags of the faceplate type are displayed within the editor.

1. Click on the button "Add Tag" or double-click the "Add" field.
2. Click on the tag name and assign a name. The name can be changed later.

   Note

   The tag name must satisfy the following conditions:
   - Maximum character length: 128 characters
   - Unique name
   - Beginning with a letter or underscore
   - No special characters:
     , ; . : ! ? " ' ^ ´ ` ~ - + = / \ ¦ @ * # $ % & § ° ( ) [ ] { } < >
   - No spaces
   - No JavaScript elements

3. Select the data type:
   - To select a simple data type, enter the name of the data type or select a data type from the selection list.
   - To select an array, click the arrow and select the data type.
     To determine the size of the array, enter a numerical value for the array upper limit.
     Example: 3 for an array with 4 elements [0 ... 3].
     To convert an array into a simple data type, delete the value for "Array limits".

     
     The WChar, Wstring and HMIUDT data types cannot be created as arrays.
   - To link a data structure, select "PLCUDT" for a PLC user data type or "HMIUDT" for an HMI user data type as the data type.
     Under "User data type structure", select a previously created user data type.

     Note

     User data types

     PLCUDT: You create PLC user data types on a PLC in project tree.

     HMIUDT: You create HMI user data types in the "Libraries" task card.

Changing tags

You can adapt the data type or the array limit of a tag retroactively.

To convert a simple data type into an array, select the arrow in the "Data type" column and specify the top array limit.

To convert an array into a simple data type, select the arrow in the "Data type" column and delete the top array limit.

Deleting an interface tag

To delete an interface tag, select the entry you wish to delete and click . Alternatively, delete the tag interface by pressing the <Del> key.

Changing the order of the interface tags in the editor

To change the order, select the respective entry and move it gradually up or down by clicking the buttons.

Result

You have configured the interface tags needed for the faceplate type.

The interface tags defined in the faceplate type are accessible in the corresponding faceplate instances and can be used for dynamization and for creating scripts within the faceplate type.

Configuring local tags in the faceplate type

Introduction

You can use local tags in a faceplate type to pass on information within the faceplate type. Elements of a faceplate can be dynamized, for example, as a function of the current properties of another element.

The local tags are not visible at an instance of the faceplate type and thus cannot be manipulated.

Requirements

- The faceplate type has been created.
- The version is open for editing.
- The "Local tags" tab is open in the editor.

Defining local tags

1. Double-click on the "<Add>" cell in the "Name" column.
2. If required, change the suggested name of the tag.

   Note

   The tag name must satisfy the following conditions:
   - Maximum character length: 128 characters
   - Unique name within the faceplate type
   - No special characters:
     : . # / % [ ] $ " ' * ? ~
3. Select the data type:
   - Simple data types: Enter the name of the data type or select a data type from the list.
   - Array: Select the "Array" data type. Click the arrow and define the data type and array limit.

Using a local tag

- To display a local tag and manipulate it in Runtime, connect the local tag, e.g. to an I/O field.
- To change the properties, e.g. color, of a screen object in Runtime as a function of the properties of another screen object, dynamize the properties using a local tag.
- If you use local tags in scripts, the events are assigned to the utilized screen objects.

Result

You have configured local tags for the faceplate type.

The local tags defined in the faceplate type are not accessible in the instances of the faceplate type.

4.7.2.7 Interface properties in faceplates

Overview

Introduction

You can define interface properties that you can use later in the faceplate type for the dynamization of properties. The following data types are available:

- 64-bit integer
- Authorization
- Boolean
- Color
- Floating-point number

- Graphic
- Configuration string
- Multilingual text
- Resource list
- Unsigned 64-bit integer

These data types can be instantiated in a faceplate container.

Note

Changing the names of interface properties

Note that the values of interfaces that are already connected at the faceplate container are reset to their default values when you subsequently change names in the faceplate type.

Description of the interface properties

Interface property	Description
64-bit integer	You can link properties that correspond to an integer with data type "64-bit integer". You can then assign corresponding elements with this numerical value within a screen in the faceplate instance. In this way you can assign different numerical values to objects in different faceplate instances.
Authorization	You can link properties of the "Authorization" type with authorizations. You can assign corresponding function rights in the faceplate instance. In this way, you can restrict the operator control of objects in different faceplate instances in different ways. If you specify the value "None" for the interface property on a faceplate instance, operator control is not restricted.
Boolean	You can link properties that correspond to a logical truth value (true and false) with data type "Boolean". You can assign corresponding elements with this value in the faceplate instance. In this way you can assign different values to objects in different faceplate instances.
Color	You can link properties of the type "Color" with the data type "Color". You can assign color values in the faceplate instance. In this way the objects can be displayed in different colors in different faceplate instances.
Floating-point number	You can link properties corresponding to a floating point number with the "Floating point number" data type. You can assign corresponding numerical values in the faceplate instance. In this way you can assign different numerical values to objects in different faceplate instances.
Graphic	You can associate properties that correspond to a graphic with the "Graphic" data type. You link graphics in the "Visualization" tab, for example, with the "Graphic view" and "Switch" screen objects. In the faceplate instance, you can assign graphics from the project's graphics collection or released type versions of the "Graphic" type from the project library. In this way you can assign different graphics to objects in different faceplate instances.
Configuration string	The data type "Configuration string" allows for the flexible assignment of values. A configuration string can include names or numbers, for example, that are addressed in scripts and can be transferred.

Interface property	Description
Multilingual text	You can link properties of the "Multilingual text" type with texts. In the faceplate instance, you can assign static texts, resource lists, tags or scripts. When entering static texts, use the key combination <Shift + Enter> to insert a line break. In the Inspector window you create texts for the projected languages under "Properties > Texts". In this way, you can configure different texts in different faceplate instances.
Resource list	You can link properties of the type "Resource list" with the "Resource list" data type. In the faceplate instance you can then assign elements from the graphic and text lists. In this way you can assign different text and graphic elements to objects in different faceplate instances.
Unsigned 64-bit integer	You can link properties that correspond to an unsigned 64-bit integer with the data type "Unsigned 64-bit integer". You can then assign corresponding numerical values in the faceplate instance. In this way you can assign different numerical values to objects in different faceplate instances.

Deleting interface properties

To delete an interface property, select the property you wish to delete and click .

Alternatively, press <Delete>.

See also

Creating a faceplate instance (Page 564)

Configure interface property

Requirement

- The faceplate type has been created.
- The version is open for editing.
- The "Property interface" tab is open.
- A screen is created in the HMI device.

Procedure

1. Click the "Add" field or click the button.
   A new interface property is created.
2. Change the values for the name, if required, and select the data type.

   Note

   The name must satisfy the following conditions:
   - Maximum character length: 128 characters
   - Unique name
   - Beginning with a letter or underscore
   - No special characters:
     , ; . : ! ? " ' ^ ´ ` ~ - + = / \ ¦ @ * # $ % & § ° ( ) [ ] { } < >
   - No spaces
   - No JavaScript elements
3. Switch to the "Visualization" tab.
4. Select the screen object that is to be linked to the interface property.
5. Open the "Properties > Properties" Inspector window.
6. Select the "Property interface" method in the "Dynamization" column.
7. Select the previously created interface property.
8. Release the version of the faceplate type and change to the project tree to interconnect the interfaces in the screen.
9. Open the screen and configure a faceplate container by dragging the faceplate type to the screen.
10. Open the Inspector window of the faceplate container and go to "Properties > Properties > Miscellaneous > Interface".
11. Select the created interface property. In the "Static value" column, assign a fixed value to the property. If you make several entries, separate the individual values with a semicolon.
    You can also assign values of the following categories to the property in the "Dynamization" column:
    - Tag
    - Script
    - Flashing (for colors)
    - Resource list (for text and graphic list elements)

    Note

    "Flashing" is not supported in Runtime.

	Tip for an efficient procedure
In the "Static value" column, you can copy and paste values via the shortcut menu of the text box.	

See also

Creating a faceplate instance (Page 564)

Example: Defining "Configuration string" and using it in a script

You can assign data values to interface properties with the "Configuration string" data type at the faceplate instance or using a script.

Requirement

- A faceplate type "Faceplate_1" has been created and opened for editing.
- A screen is created in the HMI device.

Note

Reference faceplate versions with full version numbers, such as: Faceplate_1_V_0_0_3.

Example of value assignment at the faceplate instance

1. Open the "Property interface" tab.
2. Create the following interface properties:
   - Label_Names
   - Label_Rotation
3. Assign the data type "Configuration string" to the interface properties.
4. Switch to the "Visualization" tab.
5. Configure three text boxes: "Text box_1", "Text box_2" and "Text box_3"
6. Configure a button with the text "Rotation" and one with the text "Read".
7. In the Inspector window of the "Rotation" button, open the "Events" tab.
8. Create the following script for the "Press" event:

```
export function Button1_OnDown(item, x, y, modifiers, trigger) {
   let myProperty = Faceplate.Properties.Label_Rotation;
   let angles = myProperty.split(";");
   Faceplate.Items("Text box_1").RotationAngle = angles[0];
   Faceplate.Items("Text box_2").RotationAngle = angles[1];
   Faceplate.Items("Text box_3").RotationAngle = angles[2];
}
```

9. In the Inspector window of the "Read" button, open the "Events" tab.

10. Create the following script for the "Press" event:

```
export function Button2_OnDown(item, x, y, modifiers, trigger) {
   let myProperty = Faceplate.Properties.Label_Names;
   let words = myProperty.split(";");
   Faceplate.Items("Text box_1").Text = words[0];
   Faceplate.Items("Text box_2").Text = words[1];
   Faceplate.Items("Text box_3").Text = words[2];
}
```

11. Release the faceplate type.
12. Change to the project tree.
13. Open a screen.
14. Create a faceplate instance by dragging the faceplate type from the project library to the screen.
15. Open the Inspector window of the faceplate instance and navigate to "Properties > Properties > Miscellaneous > Interface".
16. Navigate to the created interface properties and assign them meaningful values, such as:
    - Label_Names: "Label1;Label2;Label3"
    - Label_Rotation: "5;15;45"
17. Compile and load the project.

Result

When pressing the "Rotation" button, the text boxes of the faceplate are rotated by the values that were assigned to the interface property.

When pressing the "Read" button, the values assigned to the interface properties are read and the text boxes show the respective text.

Example of faceplate pop-up with value assignment via script

1. Open the "Property interface" tab.
2. Create the interface property "Title" and assign the "Configuration string" data type to it.
3. Switch to the "Visualization" tab.
4. Create a text box "Text box_1".
5. Open the Inspector window of the faceplate and switch to the "Events" tab.
6. Create the following script for the "Loaded" event:
   To do so, click on  "Convert function to script".

```
export function Faceplate_Typ_OnLoaded(item) {
     let myProperty = Faceplate.Properties.Title;
     Faceplate.Items("Text box_1").Text = myProperty;
}
```

7. Enable the faceplate.
8. Change to the project tree.

9. Open a screen.
10. Add a button "Button_1" on the screen.
11. Create a faceplate instance by dragging the faceplate to the screen.
12. Open the Inspector window of the button and switch to the "Events" tab.
13. Create the following script for the "Press left mouse button" event:
    To do so, click on "Convert function to script".

```
export function Button_1_OnTapped(item, x, y, modifiers, trigger) {
    let data = {Title:"Text in Popup"};
    let po = UI.OpenFaceplateInPopup("Faceplate_1_V_0_0_1",
"Popup", data, UI.ActiveScreen, false);
    po.Left = 100;
    po.Top = 150;
}
```

Note

Referencing the faceplate type

The type is referenced by the name of the type, as shown in the properties, e.g. "Faceplate_1_V_0_0_1".

Include the complete version number. The version number specified in the script is automatically updated when a new version of the type is released.

14. Compile and load the project.

Result

When you press the button in runtime, the faceplate opens as a popup. The title "Text in pop-up" is read from the script and displayed in the text box.

Creating a faceplate instance (Page 564)

4.7.2.8 Interface events in faceplates

Configuring an interface event in the faceplate type

Introduction

You use interface events to define events and associated parameters in the faceplate type. At the instance, you configure functions of the function list and scripts to the created event. This gives you the option of configuring various effects on the instances for an event defined in the faceplate type.

Various data types are available for the parameters associated with an interface event.

Requirement

- A screen is created in the HMI device.
- The faceplate type has been created.
- The version is open for editing.
- The "Event interface" tab is open.

Data types of parameters

The following data types are available for the parameters of interface events:

Data types	Description
Bool	Logical values (True/False)
Byte	Unsigned 8-bit value
Char	ASCII character
Color	Color
DateTime	Date/time information
DInt	Signed 32-bit value
DWord	Unsigned 32-bit value
HmiEventTrigger	The enumeration "HmiEventTrigger" can have the following values: • Unknown (0): Unknown • Touch (1): Triggered by touch HMI device • Left (16): Triggered by left mouse button. • Middle (17): Triggered by middle mouse button. • Right (18): Triggered by right mouse button. • Enter (256): Triggered by <Enter>. • Space (257): Triggered by <Space>. • Escape (258): Triggered by <Esc>.
HmiGesture	The enumeration "HmiGesture" can have the following values: • Unknown (0): unknown • SwipeLeft (1): Swipe left • SwipeRight (2): Swipe right • SwipeUp (3): Swipe up • SwipeDown (4): Swipe down
HmiKeyboardModifier	The enumeration "HmiKeyboardModifier" can have the following values: • None (0): None • Control (1): <Ctrl> • Shift (2): <Shift> • Alt (4): <Alt>
Int	Integer
LInt	Signed 32-bit value
LReal	64-bit floating-point number IEEE 754
LString	64-bit character sequence

Data types	Description
LWord	Unsigned 64-bit value
Real	32-bit floating-point number IEEE 754
SInt	Signed 8-bit value
String	32-bit character sequence
Time	Time information
UDInt	Unsigned 32-bit value
UInt	Unsigned integer
ULInt	Unsigned 64-bit value
USInt	Unsigned 8-bit value
Word	Unsigned 16-bit value

Configuring an interface event

1. On the "<Add>" or select the button  .
   A new interface event is created.
2. If required, change the values for the name.

   Note

   The name must satisfy the following conditions:
   - Maximum character length: 128 characters
   - Unique name
   - Beginning with a letter or underscore
   - No special characters:
     , ; . : ! ? " ' ^ ´ ` ~ - + = / \ ¦ @ * # $ % & § ° ( ) [ ] { } < >
   - No spaces
   - No JavaScript elements
3. Select "<Add>" below the interface event.
   A new parameter is created.
4. Change the value for the name.
5. Add more parameters if needed.
6. Switch to the "Visualization" tab.
7. Select the faceplate instance or a screen object with which the interface event is to be linked.
8. Open the "Properties > Events" Inspector window.
9. Select an event.
10. Click on  "Convert function to script".
    A script is created.
11. In the script, open the shortcut menu and select "Snippets > Faceplate > Raise a custom faceplate event".
    The following code is inserted:

```
let parameters = {Parameter_1:1, ColorParameter:0xff00ff00};
Faceplate.RaiseEvent("MyCustomEventName", parameters);
```

12. Adapt the names of the parameters in the script.
13. For the name of the interface event in the script, select the name that is created in "Event interface".
14. Release the type version of the faceplate.
15. Open the screen of the HMI device.
16. Create a faceplate instance of the released type version in the screen.
17. Select the faceplate instance.
18. Open the Inspector window under "Properties > Events".
19. Select the interface event in the event list.
20. Configure a function of the function list or a script to the event.

Editing an interface event

Note

Effects on the faceplate instance when the interface event is changed in the faceplate type

If you change the interface event, consider the following effects on the faceplate instance:

- If you have configured a script to the interface event and change the names of the parameters, you must manually update the parameters of the interface event used in it.
- If you have renamed the interface event, the name in the event list is updated automatically.
- If you have renamed the interface event or associated parameters and configured a script to the interface event, they are automatically updated in the script header.

1. Select the released type version.
2. Open the shortcut menu and select "Edit type".
   A new type version is created and opened for editing.
3. Select the "Event interface" tab.
4. Change the name of the interface event.
5. Change the name of the parameters.
6. Switch to the "Visualization" tab.
7. Select the faceplate instance or screen object linked with the interface event.
8. In the Inspector window, adapt the script under "Properties > Events":
   - Change the names of the parameters to match the changes in the "Event interface" tab.
   - Change the interface event names to match the changes in the "Event interface" tab.
9. Release the type version of the faceplate.
   Enable the "Update instances in project" option.
10. Confirm with "OK".
    The faceplate instance in the screen of the HMI device is updated.

11. If required, configure functions of the function list to the event again.
12. If required, adapt the names of the interface event parameters in the script.

Example: Configuring and using an interface event

With interface events, you define events in the faceplate type which you interconnect to instances with different functions of the function list or scripts.

Requirement

- A screen is created in the HMI device.
- A faceplate type "Faceplate_1" has been created and opened for editing.

Procedure

1. Switch to the "Event interface" tab of the faceplate type.
2. Click the "<Add>" field or select the  button.
   A new interface event is created.
3. Change the name of the interface event to "My_Interface_Event".
4. Select "<Add>" below the interface event.
   A new parameter is created.
   The data type of the parameter is "Int".
5. Change the name of the parameter to "Parameter_Int".
6. Select "<Add>" below the interface event.
   A new parameter is created.
7. Change the name of the parameter to "Parameter_Bool".
8. Change the data type of the parameter to "Bool".
9. Switch to the "Visualization" tab of the faceplate type.
10. Add a button.
11. Change the name of the button to "Button_1".
12. Select the "Button" screen object.
13. Open the Inspector window under "Properties > Events".
14. Create the following script for the "Click left mouse button" event:

```
export function Button_1_OnTapped(item, x, y, modifiers, trigger) {
    let parameters = {Parameter_Int:90,Parameter_Bool:true };
    Faceplate.RaiseEvent("My_Interface_Event", parameters);
}
```

15. Release the type version of the faceplate.
16. Create the HMI tags "HMI_Tag_Int" of "Int" data type in the HMI device.
17. Create the HMI tags "HMI_Tag_Bool" of "Bool" data type in the HMI device.
18. Open the screen of the HMI device.

19. Create a faceplate instance of the released type version in the screen.
20. Select the faceplate instance.
21. Open the Inspector window under "Properties > Events" and select the event "My_Interface_Event".
22. Click on "Convert function to script".
23. Create the following script:

```
export function Faceplate_container_1_OnMy_Interface_Event(item,
Parameter_Int, Parameter_Bool) {
    let tag1 = Tags("HMI_Tag_Int");
    let tag2 = Tags("HMI_Tag_Bool");
    tag1.Write(Parameter_Int);
    tag2.Write(Parameter_Bool)
}
```

24. Configure 2 I/O fields in the screen:
    - "IO field_Int": Link the "Process value" property of the I/O field with the tag "HMI_Tag_Int".
    - "IO field_Bool": Link the "Process value" property of the I/O field with the tag "HMI_Tag_Bool".
25. Compile and load the project.

Result

The values of the IO fields change as follows when the "Button_1" button is pressed in Runtime:

- "IO field_Int": 90
- "IO field_Bool": 1

4.7.2.9 Checking the version consistency and fixing inconsistencies

Introduction

To ensure the consistency of a version of a faceplate type, you have two options:

- You can run a consistency check yourself before releasing a faceplate version.
- An automatic consistency check is performed when the version is released.

In both variants, the created version is checked for missing or faulty references to screens or tags, for example. A message is displayed in case of an error.

Requirement

- A faceplate version has been created but has not been released yet.
- Objects have been configured.

Checking the consistency yourself

1. Select the version whose consistency you want to check.
2. Select "Check consistency" from the shortcut menu.
   The result of the consistency check is displayed in the Inspector window in the "Info > General" tab.

Remedying the inconsistency

To remedy any inconsistency, follow these steps:

1. Open the Inspector window under "Information > General".
   An error and an error description are displayed in the Inspector window.
2. Click the green arrow in the "Go to" column.
   You are navigated automatically to the error location.
3. Eliminate the error.
4. If necessary, perform another consistency check to check whether all errors have been resolved.

You have fixed all consistency errors. The consistency check of the version of the faceplate type shows no errors.

See also

Consistency status of types (Page 179)

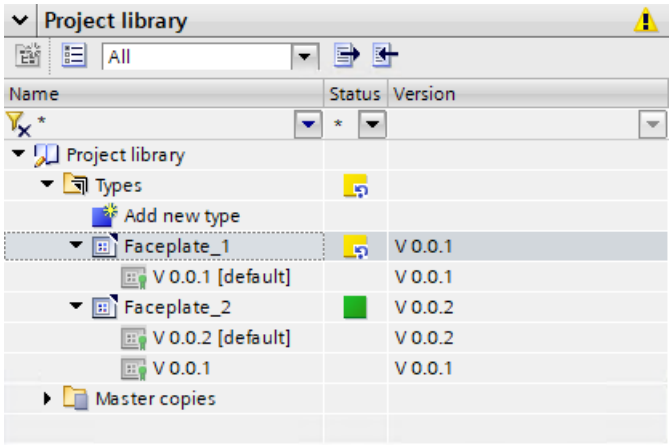
4.7.2.10 Checking the consistency at the faceplate type and fixing inconsistencies

Introduction

When editing versions of the faceplate types, incorrect referencing may unintentionally occur with the faceplate type and outdated instances if the default version of the dependent type is not used in the default version or a version other than the default version is instantiated in the device.

As soon as you release a version, a consistency check is automatically performed.

The "Status" column shows whether an inconsistency exists when referencing the faceplate type.



Resolving inconsistency through referencing of the non-default version of another faceplate type

Requirement

- A faceplate type has been created and released.
- The "Libraries" task card is open.
- The "Status" column in the project library displays the symbol .

Procedure

To correct an inconsistency which occurs through the referencing of a non-default version, follow these steps:

1. Open the shortcut menu of the inconsistent type.
2. Select the "Fix inconsistencies" menu item.
3. Select one of the following options:
   - "Adapt inconsistent type"
     A new version of the faceplate type is created and has the status "In progress".
     In the new version, the default version of the referenced faceplate type is automatically used.
   - "Set the currently referenced version as "default""
     The currently referenced version of the faceplate type is automatically set as the "default".

Remove inconsistency in the device through instantiating the non-default version

Requirement

- A faceplate type has been created and released.
- The "Libraries" task card is open.
- The "Status" column in the project library displays the symbol .

Procedure

To eliminate an inconsistency which occurs through the instantiation of a non-default version in the device, update the faceplate type (see section Updating a faceplate type (Page 534))

4.7.2.11 Releasing a faceplate version of a type

When you are finished editing a type version, release the version for productive use. Assign a version number for the release. You can also use multiple selection to release several versions at the same time.

If you have made structural changes to the type version to be released, such as changes at the interfaces, only the types that reference the changed type version and are affected by the change are set to the "In progress" status. To set all referencing types to the "In progress" status by default when they are released, select the check box "Set all dependent types to the 'In test' status" in the settings under "General > Library settings" in the "Release type" area.

Introduction

Only released versions of a faceplate type can be instantiated in a screen.

Requirement

- The "Libraries" task card is open or you are in the library view.
- The faceplate version that you want to release has the "In progress" status.
- The faceplate version is consistent.

Procedure

To release type versions, follow these steps:

1. Select the faceplate version you want to release.
2. Select the "Release version" command from the shortcut menu.
   The "Release type version" dialog box opens.
3. If necessary, change the properties of the version:
   - Enter a name for the faceplate type in the "Type name" field. If you have selected several versions for release, the "Name" field cannot be changed.
   - In the "Version" field, define a main and an intermediate version number for the version to be released. If you have selected several versions for release, the "Version" field cannot be changed and the last version number is used for the release.
   - In the "Author" field, enter the editor of the version to be released.
   - In the "Comment" field, enter a comment on the version to be released.

4. If necessary, change additional options of the faceplate version:
   - "Update instances in the project" option: Select the check box to update all instances in the project to the most recent version.
   - Option "Delete unused type versions without "Default" label from the library": Select the check box to delete all faceplate versions from the library that are not connected to any instance in the project. Versions with dependencies on other types are not deleted.
   - "Set dependent types to edit mode" option: If you have made incompatible changes to the type version to be released, such as changes at the interfaces, this check box is selected by default. Faceplate types that reference the changed type version are set to the "In progress" status by default. Clear the check box if you do not want to set the referencing types to the "In progress" status.
     If you have only made compatible changes to the type version to be released, this check box is cleared by default.
5. Confirm with "OK".

Result

- The selected faceplate version has been released.
- The properties are applied for the faceplate type itself, the version to be released, and for all future versions. Versions already released remain unaffected by the changes.
- The released faceplate version is given the "Default" identifier.
- If needed, all instances with the same original version are updated to the most recent version and the unused versions of the type are deleted.
- Depending on the changes you have made, releasing the type version has effects on types that reference this version:
  - If you have made incompatible changes to the type version to be released, such as changes at the interfaces, the types that directly reference the changed type version are set to the "In progress" state. The calling types still reference the last released version.
  - If you have only made compatible changes to the type version to be released, the types that directly reference the changed type version are not changed. The calling types reference the newly released version in this case.
- The icon in the "Status" column shows whether the references of the type are consistent with other types.

See also

Consistency status of types (Page 179)

Checking the version consistency and fixing inconsistencies (Page 559)

4.7.2.12 Creating a faceplate instance

Introduction

The faceplate type is stored in the project library. When you use the faceplate type in a screen, you create an instance of the faceplate type.

Note

Note that a faceplate is always configured for a particular class of HMI devices. For example, you cannot use a faceplate type that is configured for Runtime Advanced in a screen of a Unified HMI device.

Note

The number of faceplate instances in a screen is not limited. Note that the performance when opening or updating a screen is affected by the number of faceplate instances or the use of scripts in the faceplate instances.

Requirement

- A screen is open.
- The "Libraries" task card is open and the project library has been expanded.
- A faceplate type has been configured.
- The faceplate version you want to instantiate has been released.

Procedure using the project library

1. Drag the faceplate type or the desired version from the project library to the screen.
   The faceplate container with the faceplate instance is added to the screen.
   The version marked with "Default" is always used when you drag the faceplate type to the screen.
2. Open the Inspector window under "Properties > Properties > Miscellaneous > Interface".
3. Connect the faceplate tags to project tags.
4. Specify the values of the interface properties.
5. Open the Inspector window under "Properties > Events".
6. Specify functions of the function list or scripts of the interface events.
7. Open the Inspector window under "Properties > Properties > Format > Fit to size".
8. To adjust the size of the faceplate or the container window, choose between "Fit window to screen" and "Fit screen to window".

   Note

   If you do not select resize, screen objects or navigation elements may not be displayed or may not be displayed completely.

Procedure using the "Faceplate container" control

1. Open the "Toolbox > Controls" task card.
2. Drag the "Faceplate container" control to the screen.
   An instance of the "Faceplate container" control is configured. No faceplate type is linked.
3. Open the Inspector window of the faceplate container under "Properties > Properties > Miscellaneous".
4. Select the desired faceplate type under "Faceplate type" in the "Static value" column.
5. Open the Inspector window under "Properties > Properties > Miscellaneous > Interface".
6. Connect the faceplate tags to project tags.
7. Specify the values of the interface properties.
8. Open the Inspector window under "Properties > Events".
9. Specify functions of the function list or scripts of the interface events.
10. Open the Inspector window under "Properties > Properties > Format > Fit to size".
11. To adjust the size of the faceplate or the container window, choose between "Fit window to screen" and "Fit screen to window".

Note

If you do not select resize, screen objects or navigation elements may not be displayed or may not be displayed completely.

	**Tip for an efficient procedure**
In the "Static value" column, you can copy and paste values via the shortcut menu of the text box.	

Change the faceplate version in the container

You change the link to a faceplate version in the properties of the faceplate container under "Miscellaneous > Faceplate type". The selection window lists the released faceplate versions of all faceplates.

	**Tip for an efficient procedure**
• Under "Cross-references", you get a quick overview of all used objects within a faceplate container and the use of faceplate versions in screens. • You open the cross-references either in the Inspector window of the container under "Info > Cross-references" or via the shortcut menu of the respective object. • In the shortcut menu of the faceplate container, you can use the "Go to library version" function to jump directly to the referenced faceplate type in the project library.	

Result

- The faceplate type is instantiated in a faceplate container.
- The objects configured in the faceplate type are visible in the faceplate container.
- Interface tags and interface properties have been defined for the faceplate container.
- Functions of the function list and scripts are defined for the interface events of the faceplate container.
- If required, the properties of the faceplate container can be configured and dynamized in the inspector window.

4.7.2.13 Using a PLC user data type

Introduction

You can configure data blocks based on a PLC user data type (UDT). You can use tags that are based on this PLC user data type in faceplate instances.

The following advantages arise from reusing the PLC user data type:

- You minimize the configuration effort.
- You reduce the consumption of resources.
- They ensure unique and consistent naming of tags in data blocks and faceplate types and hereby significantly reduce the probability of configuration errors.

Note

Do not use more than one version of a PLC user data type in a faceplate type.

The following complex PLC data types are supported:

- User data types that are based on other user data types.
- User data types that use arrays comprising simple elements or user data types.

  Note

  Arrays whose limits are defined permanently with integer values or variably with user constants are supported.

- User data types that are based on a different user data type that, in turn, use arrays comprising simple elements or user data types.
- User data types that consist of further structured data types, e.g. CREF, PLCUDT, HMIUDT, NREF, IEC-specific parameters, and arrays comprising structured data types.

Note

Nesting is limited to 8 levels for structured user data types.

Depending on the size and nesting of the PLC user data types, the performance when assigning the PLC user data type and when opening the affected faceplate type may be impaired.

Requirement

- A SIMATIC S7-1200 or SIMATIC S7-1500 controller is configured.
- An HMI device has been configured.
- At least one PLC user data type has been configured.
- At least one PLC tag based on the PLC user data type has been configured.
- A faceplate type has been configured and opened for editing.
- A screen has been created.

Importing a device proxy into a project

If you import a device proxy into a project, the PLC user data types are not imported.

1. Create a user data type based on the PLC user data type in the project library of the source project.
2. Copy the user data type into the global library.
3. Apply the user data type to the project library of the project in which the HMI device is located.
4. Link the user data types with faceplate types as usual.

Procedure

1. Create a user data type that is based on the PLC user data type:
   - Drag-and-drop the PLC user data type from the device overview to the "Types" folder of the project library.
2. Create a PLC tag that is based on the PLC user data type:
   - Create a tag in the "PLC tags" editor.
   - Select a PLC user data type as the data type.

3. Connect an HMI tag to a PLC tag:
   - Create a tag in the "HMI tags" editor.
   - Under "Connection", select the external connection to the PLC.
   - Link the PLC tag that is based on a PLC user data type.
4. Create an interface tag in the faceplate type:
   - Go to the faceplate editor and open the "Tag interface" tab.
   - Create an interface tag.
   - Define the "PLCUDT" data type.
   - Under "User data type structure", select the PLC user data type.

   Alternatively, you drag-and-drop a version of the PLC user data type from the project library onto the "<Add>" field in the "Tag interface" tab.
   An interface tag with the data type "PLCUDT" is generated and linked with the version of the PLC user data type.
5. Release the faceplate type.
6. Create a faceplate instance:
   - Open the previously created screen and create an instance of the faceplate type.
   - Open the Inspector window of the faceplate instance.
   - Under "Properties > Properties > Miscellaneous > Interfaces", assign the HMI tags based on the PLC tags to the specific properties in the "Static value" column.

Note

Note that the version is not updated automatically in the faceplate type when you change the version of the referenced PLC user data type. Therefore, inconsistencies may occur if the linked version is not the default version. To clean up the inconsistency, you have the following options:

- In the shortcut menu of the inconsistent type, select the "Clean up inconsistencies" menu item. The type does not have to be released for this purpose.
- Open the faceplate version for editing and update the version of the linked PLC user data type manually in the task card "Tags interfaces" and enable the faceplate type.

When a PLC user data type is set to the "In test" state, the faceplate type referencing this PLC user data type is set to the "In progress" state. After release of the PLC user data type in the library, you may experience consistency problems in the faceplate type. In this case, update the PLC user data type reference in the tag interface to the current version.

Result

You are using tags that are based on a PLC user data type in a faceplate instance.

4.7.2.14 Using an HMI user data type

Introduction

You have the possibility to use HMI user data types in faceplates.

The use of HMI user data types provides the following advantages:

- You minimize the configuration effort.
- You reduce the consumption of resources.
- You ensure the unique and consistent naming of tags and thus significantly reduce the probability of configuring errors.

Requirement

- A SIMATIC S7-1200 or SIMATIC S7-1500 controller is configured.
- An HMI device has been configured.
- At least one HMI user data type has been configured.
- A faceplate type has been configured and opened for editing.
- A screen has been created.

Procedure

1. Create an interface tag in the faceplate type:
   - Go to the faceplate editor and open the "Tag interface" tab.
   - Create an interface tag.
   - Define the "HMIUDT" data type.
   - Under "User data type structure", select the HMI user data type.

   Alternatively, you drag-and-drop a version of an HMI user data type from the project library onto the "<Add>" field in the "Tag interface" tag. An interface tag with the data type "HMIUDT" is generated and linked with the version of the HMI user data type.
2. Create an object:
   - Drag an object, e.g. an I/O field, from the "Toolbox" task card to the "Visualization" tab.
   - Under "Properties > Properties > General > Process value", select "Tag" in the Dynamization field and assign an element to the interface tag.
   - Release the faceplate type.
3. Create a faceplate instance:
   - Open the previously created screen and create an instance of the faceplate type.
   - Open the Inspector window of the faceplate instance.
   - Assign the appropriate HMI tag under "Properties > Properties > Miscellaneous > Interfaces".

Result

You are using tags that are based on an HMI user data type in a faceplate instance.

4.7.2.15 Using a faceplate type in another faceplate type

Introduction

You can use a faceplate type in another faceplate type. In this way you assemble multiple faceplate types and increase the reusability of the faceplates.

The faceplate type used in another faceplate type is called an inner faceplate type. The faceplate type in which another faceplate type is used is called the outer faceplate type.

You can link the interface tags and interface properties configured in the inner faceplate type with interface tags and interface properties of the outer faceplate type. Local tags of the inner faceplate type cannot be linked to tags of the outer faceplate type.

Requirement

- A screen is created in the HMI device.

Procedure

Note

Reference to the same faceplate type is not supported

No other version of the same faceplate type can be used in a faceplate type.

1. Create a faceplate type in the library, e.g. "Faceplate_1".

   Note

   Smallest required device version

   The smallest required device version of the outer faceplate type must be equal to or larger than that of the inner faceplate type.

2. Configure interface tags and interface properties in the faceplate type, e.g. "Interface_Tag_Faceplate_1" and "Interface_Property_Faceplate_1".
3. Configure screen objects in the "Visualization" tab.
4. Link the screen objects with interface tags and interface properties.
5. Release the faceplate type.
6. Create another faceplate type, for example, "Faceplate_2".
7. Configure interface tags and interface properties in the faceplate type, e.g. "Interface_Tag_Faceplate_2" and "Interface_Property_Faceplate_2".
8. Switch to the "Visualization" tab of the outer faceplate type, e.g. "Faceplate_2".

9. Drag and drop the inner faceplate type, e.g. "Faceplate_1", from the library into the "Visualization" tab.
   Alternatively, you can configure the "Faceplate container" control and link the "Faceplate type" property to the inner faceplate type.
10. Select the inner faceplate type.
11. Open the Inspector window under "Properties > Properties > Miscellaneous > Interface".
12. Link the interface tags and interface properties of the inner faceplate type or the faceplate container to the interface tags and interface properties of the outer faceplate type.
    If you use interface tags of the "PLCUDT" or "HMIUDT" data type, only compatible interface tags are displayed in the selection window.
13. Release the outer faceplate type.
14. Open the screen of the HMI device.
15. Drag and drop the outer faceplate into the screen.
16. Connect the faceplate tags to project tags.
17. Specify the values of the interface properties.
18. Open the Inspector window under "Properties > Events".
19. Specify system functions of the function list or scripts of the interface events.

4.7.2.16 Copying faceplate types and faceplate instances to other projects

Introduction

Faceplate types can be transferred to other projects.

Requirements

- The target project contains the devices on which faceplates can be used.
- Faceplate types: If PLC user data types are used in the faceplate type, the same PLC user data types must be available in the target project.
- Faceplate instances: It must also be possible to integrate the tags of the used faceplate types into the target project.
- Both projects (source and target) are open in different instances of TIA Portal.

Note

Dependencies

Hierarchical dependencies exist between user data types, faceplate type and faceplate instances:

1. Faceplate instances use faceplate types.
2. Faceplate types use user data types where necessary.

Therefore, note the order:

1. Configure PLC user data types.
2. Copy the faceplate type.
3. Copy the faceplate instances.

Configuring PLC user data types

1. Switch to the project from which you want to copy the faceplate type.
2. Check the faceplate type to be copied for any used PLC user data types.
3. Go to the target project.
4. In the target project, configure the PLC user data types required in the faceplate type that is to be copied.

Copying a faceplate type

1. Switch to the project from which you want to copy the faceplate type.
2. Select the desired faceplate type.
3. Copy the desired faceplate type.
4. Go to the target project.
5. Select the "Types" folder in the project library.
6. Insert the faceplate type into the target project.
7. Integrate the required PLC user data types into the new faceplate type.

Copying via "Global libraries"

Alternatively, you can make the faceplate type available for other projects by copying it to a global library.

To copy a faceplate type to another project via a global library, follow these steps:

1. Switch to the project from which you want to copy the faceplate type.
2. Copy the faceplate type.
3. Open the "Global libraries" pane and paste the copied faceplate type there.
4. Go to the target project.

5. Open the "Global libraries" pane.
6. Copy the previously pasted faceplate type from the global library to the project library.

Note

Name redundancy

In case of a name redundancy, the name of the copied faceplate type is given a version number in the form "-[number]", e.g. "Faceplate_1".

7. Integrate the required PLC user data types into the new faceplate type.

Copying a faceplate instance

1. Switch to the project from which you want to copy the faceplate instance.
2. Select the desired faceplate instance.
3. Copy the desired faceplate instance.
4. Go to the target project.
5. Open the screen in which the faceplate instance is to be inserted.
6. Paste the faceplate container.
   The faceplate type is created in the project.
7. Link the required tags in the faceplate container with those in the project.

Basics of faceplates (Page 524)

4.7.3 Connecting faceplate types to OPC UA

OPC UA is a standardized manufacturer-independent software interface for data exchange in automation engineering.

You can use data values from an OPC UA connection in faceplate types.

Requirement

- A OPC UA connection is configured.

Procedure

To use data values from an OPC UA connection, you must assign the data types to the corresponding Unified data types. You can find the assignment of OPC UA and Unified data types in the table below:

OPC UA data type	Unified Faceplates data type
Int32	DInt
Boolean	Bool
Byte	USInt
DateTime	DateTime
Double	LReal
Float	Real
Int16	Int
SByte	SInt
String	WString*
UInt16	UInt
UInt32	UDInt32

*Only possible as a local tag, data type for interface tags not available.

Data types that are not listed in the table are not supported by Unified Faceplates.

For more information on OPC UA, refer to the Runtime - Open Platform Communications (OPC) documentation.

4.7.4 Dynamizing faceplates

4.7.4.1 Basics for the dynamization of faceplates

General

Both the properties of the faceplate type and the properties of the objects used in the "Visualization" tab are dynamized in the Inspector window under "Properties > Properties".

You link functions of the function list and scripts to the faceplate type or objects of the faceplate type in the "Visualization" tab in the Inspector window under "Properties > Events".

Use

You can dynamize events and properties of faceplates at two levels.

1. Dynamizing a faceplate type
2. Dynamizing a faceplate instance

Dynamizing a faceplate type

Note

Using tags

Only use tags that are defined within the faceplate type.

You can dynamize properties of objects or events in the faceplate type on the "Visualization" tab of the "Faceplate types" editor. You configure the individual objects as in the "Screens" editor.

- To dynamize properties, the following methods are available in the editor:
  - Tag
  - Script
  - Flashing (for colors)

    Note

    "Flashing" is not supported in Runtime.

  - Property interface
    With this method, you use the interface properties configured in the "Property interface" tab.

  Depending on the property, only certain methods are available.
- You dynamize events by using functions of the function list or scripts.
  Faceplates support various methods. For more information on supported methods, see the AUTOHOTSPOT section.
- You do not have access to the tags and scripts of the project within the faceplate type. You must therefore configure interface tags in the faceplate type that you link with the tags of the project in the faceplate instance.
- Each faceplate instance created with the faceplate version has the same objects with identical dynamization.
  You can edit this dynamization exclusively in the "Faceplate types" editor.

Dynamizing a faceplate instance

You configure the events or dynamic properties individually on the faceplate container. This dynamization refers exclusively to the faceplate container.

Properties of the objects used in the faceplate type cannot be dynamized directly. For this purpose, interface tags, interface properties or interface events must be defined in the faceplate type, via which a dynamization is triggered.

See also

Basics of dynamizing screens (Page 462)

4.7.4.2 Dynamizing a faceplate type

Introduction

You dynamize screen objects in the faceplate type in the Inspector window editor.

To trigger the reaction to events in the faceplate instance, you can, for example, use the interface tags that were created beforehand in the faceplate type.

You can connect the dynamic properties of the faceplate container with a tag or a script that provides the property with values in Runtime.

Creating scripts in the faceplate type works the same way as creating scripts on objects in screens.

Support of system functions

The use of system functions within faceplates is not fully supported. The following system functions are available in the function list and in scripts:

Function list		Script
Alarm system		
	CreateOperatorInputInformation	HMIRuntime.Alarming.SysFct.CreateOperator-InputInformation
	CreateSystemInformation	HMIRuntime.Alarming.SysFct.CreateSystemIn-formation
	CreateSystemAlarm	HMIRuntime.Alarming.SysFct.CreateSystemA-larm
Resource		
	LookUpText	HMIRuntime.Resources.SysFct.LookUpText
Tag		
	UpdateTag	HMIRuntime.Tags.SysFct.UpdateTag
	IncreaseTag	HMIRuntime.Tags.SysFct.IncreaseTag
	InvertBitInTag	HMIRuntime.Tags.SysFct.InvertBitInTag
	ResetBitInTag	HMIRuntime.Tags.SysFct.ResetBitInTag
	ShiftAndMask	HMIRuntime.Tags.SysFct.ShiftAndMask
	SetBitInTag	HMIRuntime.Tags.SysFct.SetBitInTag
	SetTagValue	HMIRuntime.Tags.SysFct.SetTagValue
	DecreaseTag	HMIRuntime.Tags.SysFct.DecreaseTag

The available system functions can be displayed grouped by areas or sorted alphabetically.

You can find more information at AUTOHOTSPOT.

Requirement

A faceplate type has been created.

Dynamizing events

Note

Using tags

Use tags that have been defined within the faceplate type under "Tag interface" or "Local tags".

You link the tags defined in the faceplate type with the project tags in the faceplate instance.

1. Select the faceplate type or an object in the faceplate type.
2. Open the Inspector window under "Properties > Events".
3. Select an event.

   Note

   "Cleared" event

   The "Cleared" event is triggered when the faceplate is already resolved. Therefore, access to interface tags and local tags of the faceplate type is not possible.

4. Select a function from the function list or create a script.

Note

Global definition in the faceplate type

All definitions in the "Global definition" area of the "Scripts" editor in the faceplate type are used in all instances of the faceplate type. When you define a tag in the "Global definition" area, for example, any value changes of this tag can be seen in all instances of the faceplate type.

Tip for an efficient procedure
You are supported by snippets when creating scripts; you access these snippets from the shortcut menu under "Snippets > Faceplates".

Dynamizing object properties

1. Select the relevant object.
2. Open the Inspector window of the object and select "Properties".

3. In the "Dynamization" column of the Inspector window, select the menu of the property that you want to dynamize.
4. Select the method:
   - Tag
   - Script
   - Property interface
   - Flashing (for colors)

Note

The availability of methods is dependent on the selected property.

"Flashing" is not supported in Runtime.

See also

Introduction to runtime scripting (Page 969)

System functions (Page 909)

4.7.4.3 Dynamizing a faceplate instance

Introduction

You dynamize properties of the faceplate instance in exactly the same way as you dynamize properties of another object in the "Screens" editor.

In the "Screens" editor, you can connect the dynamic properties of the faceplate container with a tag or a script that provides the property with values in Runtime.

You have previously created the tags and scripts in the project.

In the Inspector window under "Properties > Events" you will find the interface events defined in the faceplate type.

Requirement

A faceplate container with a faceplate instance is inserted in the screen.

Note

Requirement for triggering the "Enabled" event in Runtime

To trigger the "Enabled" event at the faceplate container, you must enable the options "Display frame" and "Show heading" in the properties of the control under "Window settings".

Dynamizing events

1. Select the faceplate container.
2. Open the Inspector window under "Properties > Events".
3. Select an event.
4. Select a function from the function list or create a script.

	**Tip for an efficient procedure**
You are supported by snippets when creating scripts; you access these snippets from the shortcut menu under "Snippets > Faceplates".	

Dynamizing object properties

1. Select the faceplate instance.
2. Open "Properties" > "Properties" in the Inspector window of the faceplate instance.
3. In the "Dynamization" column, select the menu of the property you want to dynamize.
4. Select the required method:
   - Tag
   - Script
   - Resource list (for strings)
   - Flashing (for colors)

   Note

   "Flashing" is not supported in Runtime.

   Depending on the property, only certain methods are available.

See also

Basics for the dynamization of faceplates (Page 574)

Basics of dynamizing screens (Page 462)

4.7.4.4 Accessing properties of the faceplate container with a script

Procedure

To read or write faceplate container properties from a faceplate type, use the `Parent` property of the `Faceplate` object in a script.

You can access the following properties of the faceplate container, for example:

- Position
- Height and width

- Visibility
- Interface tags
- Interface properties

Example: Reading the position of the faceplate container

```
HMIRuntime.Trace(Faceplate.Parent.Top);
HMIRuntime.Trace(Faceplate.Parent.Left);
```

Read out the alarm with the RTIL Trace Viewer.

Example: Changing the position of the faceplate container via a button

```
export function Button_1_OnTapped(item, x, y, modifiers, trigger) {
// Read Faceplate container coordinates
   let containerTop = Faceplate.Parent.Top;
   let containerLeft = Faceplate.Parent.Left;

// Write Faceplate container coordinates. Increment with 100 pixels
   Faceplate.Parent.Top = containerTop + 100;
   Faceplate.Parent.Left = containerLeft + 100;
}
```

Example: Read connected tags

```
let TagNameSystem;
TagNameSystem = Faceplate.Parent.Properties.TagProperty_1.Tag;
HMIRuntime.Trace("System Tag Name: " + TagNameSystem);
```

Read out the alarm with the RTIL Trace Viewer.

See also

Tracing with the RTIL Trace Viewer (Page 1023)

4.7.4.5 Configure faceplate as pop-up

Introduction

A faceplate can be opened in Runtime as pop-up window by means of a script.

Note

Only faceplate versions used in the HMI device are available in Runtime.

- Use the faceplate version in the HMI device as faceplate container or in a script as reference. The reference is not resolved if you dynamically generate the name of the faceplate version to be opened as a popup with a script.
- If there is no faceplate version with the name, an empty container is opened.

You have the option of calling a pop-up window either inside or outside a faceplate type:

- Outside a faceplate type: You transfer all interface tags and interface properties in the script.
- Inside a faceplate type: The interface tags and interface properties of the pop-up are applied from the faceplate type in which the pop-up window is triggered.

	**Tip for an efficient procedure**
The "OpenFaceplateInPopup" and "Close" methods are available as a snippet. The available snippets are displayed in the shortcut menu of the "Scripts" editor.	

Requirement

- A screen is open.

Open and close pop-up windows outside a faceplate type

To configure a faceplate as a pop-up window, for example, to an event of a screen object, follow these steps:

1. Create a faceplate type.
2. Create faceplate tags, for example, "Interface_Tag_1".
3. Create interface properties, for example, "Color_Property_1" (color data type) and "ResourceList_Property_1" (resource list data type).

   Note

   Interface property of the "Multilingual text" data type

   Interface properties of the "Multilingual text" data type cannot be passed to a faceplate that is called as a popup window outside of a faceplate type.

4. Configure the visualization of the faceplate.
5. Interconnect the tags and properties.
6. Release the version of the faceplate type.

7. Open the screen of the HMI device.
8. Configure the screen object that is to trigger the event, for example, a button.
9. Open the Inspector window under "Properties > Events".
10. Select an event.
11. Click on "Convert function to script".
    A function is generated.
12. Assign tags and interface properties to the faceplate interface. In the example, the "data" parameter is used.
    To specify text lists, use the prefix "@Default", for example, "@Default.Text_list_1".

    Note

    Graphic lists are not supported.

13. Create a global definition for the faceplate pop-up.
    Example:
    ```
    //JEx: "Faceplate in Popup"
    var po;
    ```
14. Use the "OpenFaceplateInPopup" method.
    - Define the type of the pop-up window, for example, "Faceplate_1".

      Note

      The version of the faceplate type preset as "Default" is automatically displayed in Runtime.

      Note

      Note that you must replace spaces and dots in the faceplate name with underscores when referencing faceplate versions.

      Reference faceplate versions with full version numbers, such as: Faceplate_1_V_0_0_3.

    - Define the title of the pop-up window, for example, "Popup".
    - Specify the parameter of the interface, for example, "data".
    - Optional: The pop-up window is closed automatically when the specified screen is exited. Default: 0. The pop-up window remains open until it is closed manually or Runtime is terminated.
      In the example, the pop-up window is closed as soon as the active screen is exited.
    - Optional: Specify whether the pop-up window is hidden.
      Default: false. The pop-up window is visible.
15. If required, specify where the pop-up window is opened.
16. Configure a "Close pop-up" button.
17. Open the Inspector window of the button under "Properties > Events".
18. Select an event.
19. Click on "Convert function to script".
    A function is generated.
20. Use the "Close" method.

Example code for calling the faceplate pop-up outside a faceplate type

```
//JEx: "Faceplate in Popup"
//TagsRequired: "HMI_Tag_1"
//FPlateRequired: "Faceplate_1", "Interface_Tag_1", "Color_Property_1",
"ResourceList_Property_1"
export function Button_1_OnTapped(item, x, y, modifiers, trigger) {
let data = {Interface_Tag_1:
{Tag:"HMI_Tag_1"},Color_Property_1:0xff00ff00,ResourceList_Property_1:"@De
fault.Text_list_1"};
po = UI.OpenFaceplateInPopup("Faceplate01_V_0_0_3", "Popup", data,
UI.ActiveScreen, false);
po.Left = 100;
po.Top = 150;
}
```

Example code for closing the faceplate pop-up outside a faceplate type

```
//JEx: "Close Faceplate in Popup"
//FPlateRequired: "Faceplate01_V_0_0_3", "po"
export function Button_2_OnTapped(item, x, y, modifiers, trigger) {
if (po)
{
po.Close();
po = undefined;
}
}
```

Calling a pop-up window within a faceplate type

To configure a faceplate as a pop-up window, for example, to an event of a screen object within a different faceplate type, follow these steps:

1. Create a faceplate type, for example, "Faceplate_1".
   The event that opens the pop-up window is configured in this faceplate type.
2. Create another faceplate type, for example, "Popup_1".
   This faceplate type is opened as a pop-up window.
3. Create the same interface tags in both faceplate types, for example, "Interface_Tag_1".
4. Create the same interface properties in both faceplate types, for example, "Color_Property_1" and "ResourceList_Property_1" (resource list data type).

   Note

   The name and data type of the interface tags and interface properties must match. The order may be changed. Missing interface tags or interface properties are not transferred.

5. Configure a screen object that is to open the pop-up window, e.g. a button, in the "Visualization" tab of "Faceplate_1".
6. Configure additional objects to visualize the two faceplate types.
7. Interconnect the tags and properties of both faceplate types.

8. Select the screen object which is to open the pop-up window.
9. Open the Inspector window under "Properties > Events".
10. Select an event.
11. Click on "Convert function to script".
    A function is generated.
12. Use the "OpenFaceplateInPopup" method.
    - Define the type of the popup window with the desired version, for example, "Popup_1_V_0_0_1".
      The correctly detected reference to the faceplate type is highlighted in green.
    - Define the title of the pop-up window, for example, "Popup".
    - Optional: The pop-up window is closed automatically when the specified screen is exited.
      Default: `independentWindow = false`.
      The pop-up window is closed when the faceplate or the screen is exited.
      In the example, the pop-up window remains open until the pop-up window is closed manually or Runtime is exited.
    - Optional: Specify whether the pop-up window is hidden.
      Default: `invisible = false`.
      The pop-up window is visible.
13. If required, specify where the pop-up window is opened.
    ```
    po.Left = 100;
    po.Top = 150;
    ```
14. Switch to the faceplate type "Popup_1".
15. Configure a "Close pop-up" button.
16. Open the Inspector window of the button under "Properties > Events".
17. Select an event.
18. Select the "Convert function to script" button.
    A function is generated.
19. Use the "Close" method.
20. Release both type versions.

Example code for calling the faceplate pop-up within a faceplate type

```
//JEx: "Faceplate in Popup within another Faceplate"
//FPlateRequired: "Popup_1"
export function Button_1_OnTapped(item, x, y, modifiers, trigger) {
po = Faceplate.OpenFaceplateInPopup("Popup_1_V_0_0_1", "Popup", true,
false);
po.Left = 100;
po.Top = 150;
}
```

Example code for closing the faceplate pop-up within a faceplate type

```
//JEx: " Close Faceplate in Popup within another Faceplate"
//FPlateRequired: "Popup_1_V_0_0_1"
export function Button_2_OnTapped(item, x, y, modifiers, trigger) {
Faceplate.Close();
}
```

Result

When the configured event is triggered in Runtime, the pop-up window opens or closes.

4.7.5 Example: Creating and using faceplates

4.7.5.1 Example: Configuring faceplates

Procedures overview

The example is divided into the following steps:

1. Create HMI tags.
2. Configure faceplate types:
   - A faceplate type that is instantiated in the screen.
   - A faceplate type that is opened as a pop-up from within the faceplate.
   - A faceplate type that is instantiated in the faceplate.
3. Configure interface tags in the faceplate types.
4. Configure local tags in faceplate types.
   Instead of tags: Use PLC user data types and thus minimize configuration work.
5. Instantiate inner faceplate type in outer faceplate type,
6. Configure interface properties in faceplate types.
7. Create an interface event.
8. Create a script to modify tags.
9. Creating the local scripts,
10. Configure the screen and instantiate the faceplate type.
11. Display project in Runtime.

Example: Creating faceplate types (Page 588)

Example: Configuring interface tags in faceplate types (Page 591)

Instead of tags: Using PLC user data type in the faceplate type (Page 594)

Example: Creating a local script for opening the pop-up (Page 600)

4.7.5.2 Example: Introduction

The example works with two motors and their data.

You configure a screen that displays data of the motor "Engine 01" in a faceplate instance.

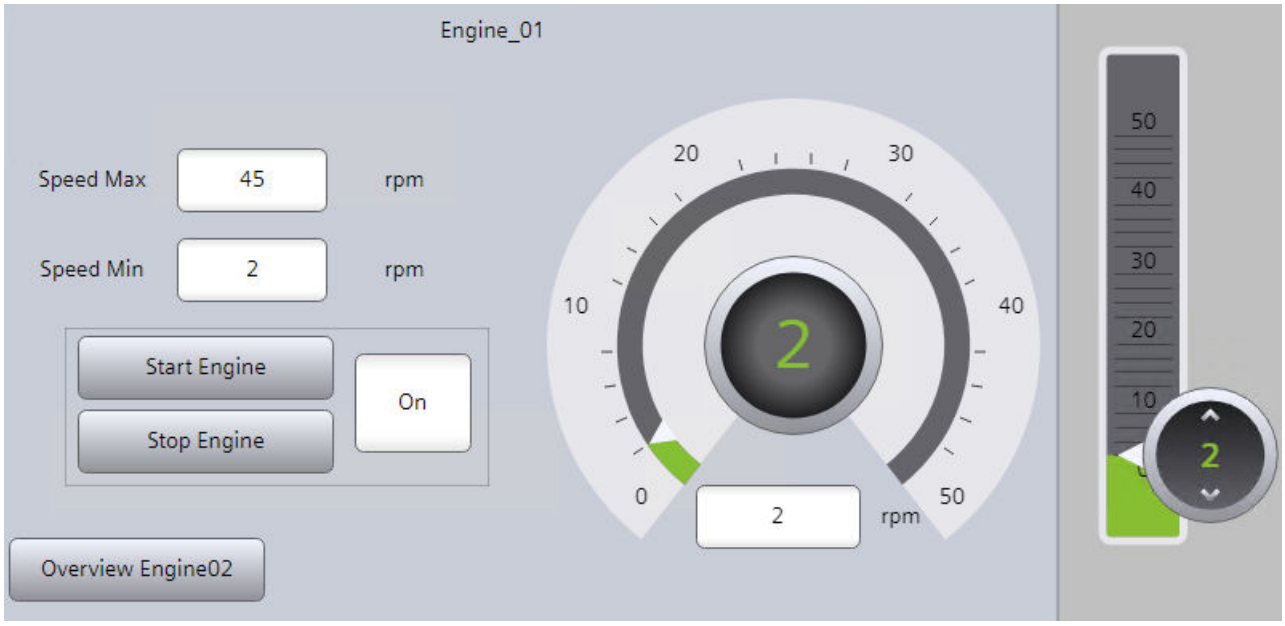
A second faceplate is instantiated in this faceplate, which has two buttons and a text box.

Press "Start Engine" and "Stop Engine" to change the speed of the motor to 2 or 0 rpm.

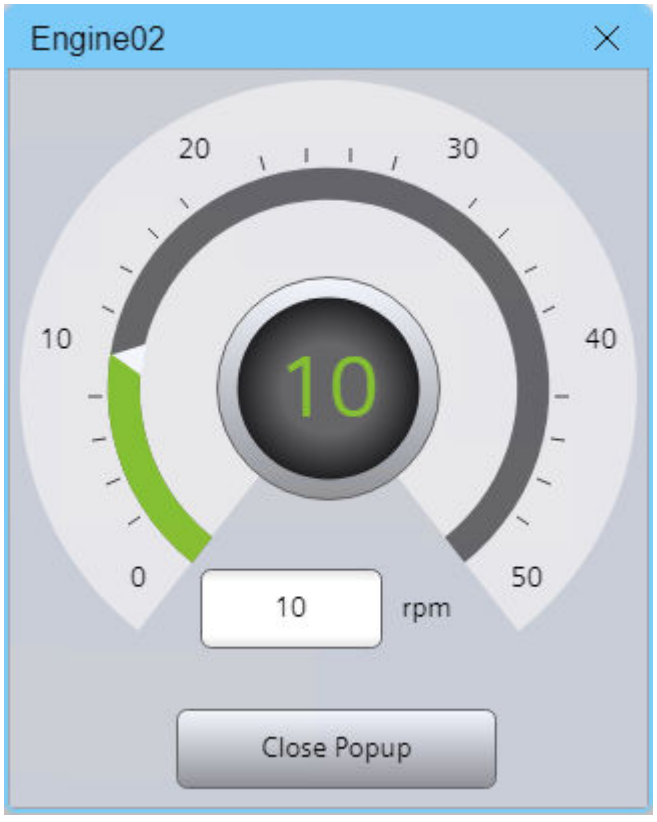
After pressing, the output field indicates whether the motor is in the status "On" or "Off".

Use the slider to adapt the speed.

If the speed exceeds a specified value, the output field under speed control changes its color from white to red.



By pressing another button within the faceplate type, you open a new faceplate type as a pop-up that displays the speed of the motor "Engine 02".



4.7.5.3 Example: Create HMI tags

Task

You create the HMI tags required for the project.

Requirement

- A project has been created.
- An HMI device has been configured.

Procedure

1. Open the "Standard tag table" editor under "HMI Tags" in the project tree.
2. Create the following tags in the "HMI tags" tab:

Tag name	Data type
Engine01_CurrentRPM	Int
Engine01_SpeedMax	Int
Engine01_SpeedMin	Int
Engine02_CurrentRPM	Int

3. Assign valid values to the tags in the Inspector window under "Properties > Properties > Values".

Result

You have configured the HMI tags required for the example.

4.7.5.4 Example: Creating faceplate types

Task

1. To create a faceplate type that is instantiated in the start screen. This faceplate type displays the "Engine 01" data in Runtime. Clicking a button opens another faceplate type as a popup.
2. You create a faceplate type that is opened as a pop-up from the faceplate type created in the first step when a button is clicked. This faceplate type displays the current speed of "Engine 02" in Runtime.
3. To create a faceplate type that is embedded in the faceplate from the first step and starts and stops the motor "Engine 01".

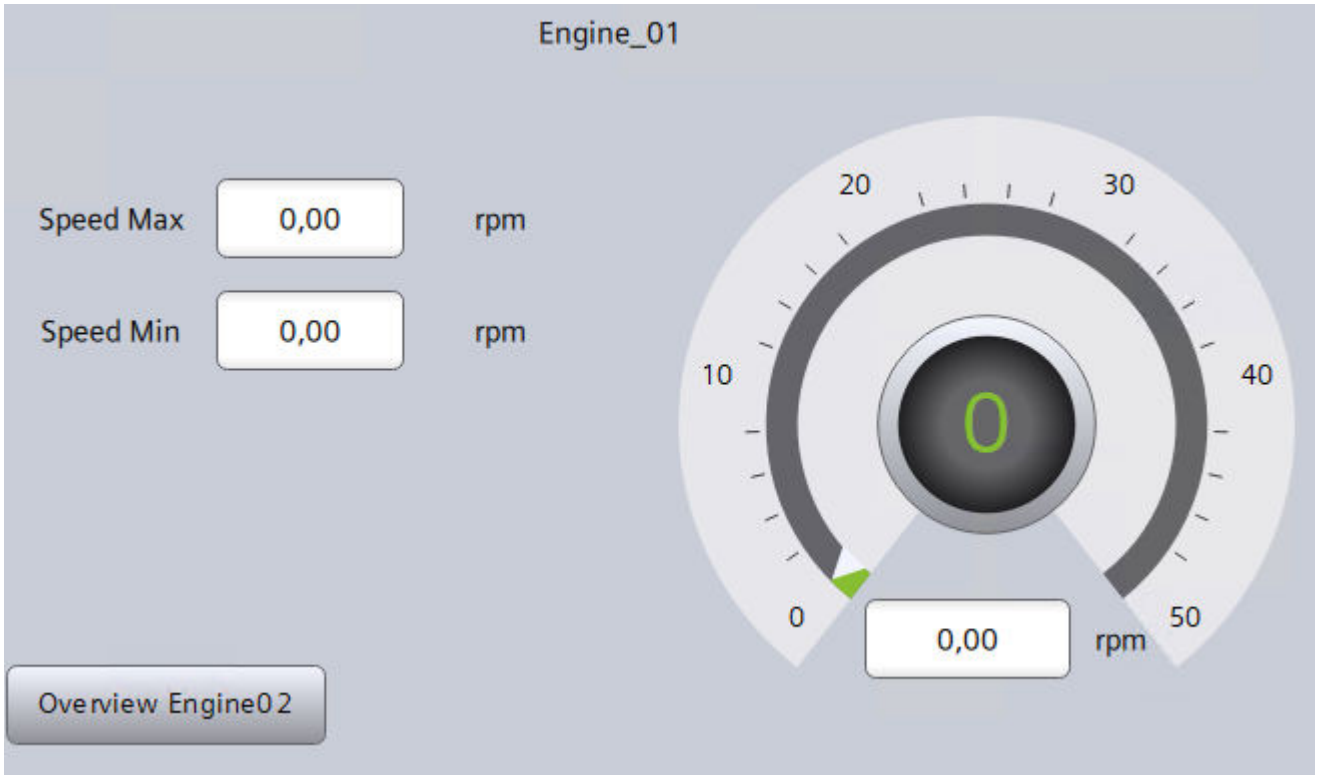
Requirement

- A project has been created.
- An HMI device has been configured.

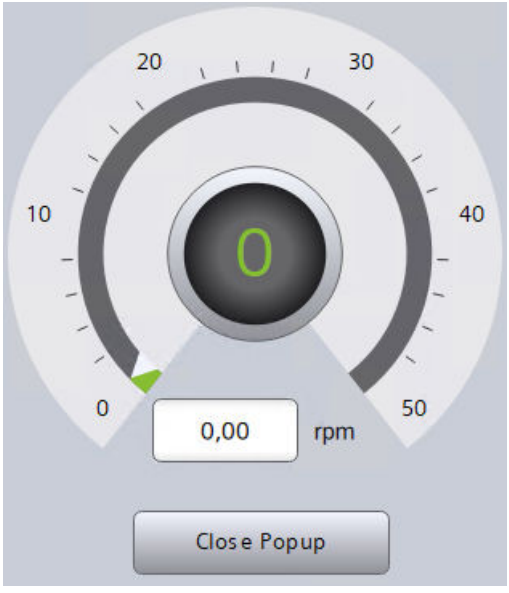
Procedure

1. To create the first faceplate for "Engine 01"", create a new faceplate type in the project library and name it accordingly, for example, "FP_Engine01".
   A version 0.0.1 of the faceplate type is being created and has the status "In progress".
   The version is opened in the "Visualization" tab.
2. Drag the required objects from the "Toolbox" task card to the faceplate type. The objects required for the example are listed and described in the table below.

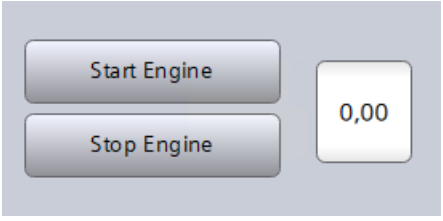
3. Arrange the objects according to your needs. This may look like this, for example:



4. To create the second faceplate type for "Engine 02", repeat steps 1 and 2. Name the faceplate type, for example, "FP_Engine02".
5. Arrange the objects according to your needs. This may look like this, for example:



6. To create the third faceplate type for "Engine StartStop", repeat steps 1 and 2. Name the faceplate type, for example, "FP_StartStop".
7. Arrange the objects according to your needs. This may look like this, for example:



Objects in the faceplate types

Faceplate type	Object	Object name	Meaning/Properties
FP_Engine01	Rectangle	Rectangle_1	Limitation and background of the display area
	Gauge	Gauge_1	Instrument display of the current motor speed
	Text box	Text box_1	Text "Engine_01"
	Text box	Text box_2	Text "Speed Max"
	Text box	Text box_3	Text "Speed Min"
	Text box	Text box_4	Text "rpm"
	Text box	Text box_5	Text "rpm"
	Text box	Text box_6	Text "rpm"
	IO field	IO field_1	Display of the HMI tag "Engine01_Speed-Min"
	IO field	IO field_2	Display of the HMI tag "Engine01_Speed-Max"
	IO field	IO field_3	Display of the current motor speed.
	Button	Button_1	Pressing the button opens a pop-up that shows the speed for Engine 02.
FP_Engine02	Rectangle	Rectangle_1	Limitation and background of the display area
	Gauge	Gauge_1	Instrument display of the current motor speed
	Text box	Text box_1	Text "rpm"
	IO field	IO field_1	Display of the current motor speed.
	Button	Button_1	Pressing the button closes the pop-up.
FP_StartStop	Rectangle	Rectangle_1	Limitation and background of the display area
	Button	Button_1	When the button is pressed, the speed of Engine 01 is set to the value 2.
	Button	Button_2	When the button is pressed, the speed of Engine 01 is set to the value 0.
	IO field	IO field_1	Display of the current motor status "On" or "Off".

Result

The required faceplate types have been created and are in the status "In progress". The objects required in the faceplate types are configured.

See also

Creating a faceplate type in the project library (Page 531)

Working with faceplate types and versions (Page 533)

4.7.5.5 Example: Configuring interface tags in faceplate types

Task

To configure tags in the faceplate type with which you can dynamically control properties and which are required for data exchange in the project.

Requirement

The faceplate types required for the example are created and are in the "In progress" state.

Configuring interface tags

Note

Interface tags are required for the exchange of values between the faceplate and the project.

When used in screens, access to individual object properties in faceplates is possible exclusively via faceplate tags.

When you follow the example with PLC user data types, use the PLC user data type accordingly. Note that the PLC user data type must exist in the project library in this case.

1. Open the faceplate type "FP_Engine01".
2. In the editor, switch to the "Tags Interface" tab.
3. Configure the required tags. To do this, click the button  or on "Add".
   The tags required for the various faceplate types are listed in the table below.
4. Repeat steps 1 to 3 for the faceplate types "FP_Engine02" and "FP_StartStop".

Interface tags of the faceplate types

Faceplate type	Tag	Data type	Source	Target
FP_Engine01	Engine01_CurrentRPM	Int	Current speed Engine 01 (Actual value)	IO field (Faceplate)
	Engine01_SpeedMax	Int	Specification of the maximum speed	IO field (Faceplate)
	Engine01_SpeedMin	Int	Specification of the minimum speed	IO field (Faceplate)
	Engine02_CurrentRPM	Int	Current speed Engine 02 (Actual value)	IO field (Faceplate)
FP_Engine02	Engine02_CurrentRPM	Int	Current speed Engine 02 (Actual value)	IO field (Faceplate)
FP_StartStop	Engine01_CurrentRPM	Int	Current speed Engine 01 (Actual value)	IO field (FP_Engine01)

Assigning interface tags in the faceplate types

To assign tags to the created objects in the faceplate types, follow these steps:

1. Open the Faceplate type in the "Visualization" tab.
2. Select the object to which you want to assign a tag.
3. Open the Inspector window under "Properties > Properties > General".
4. Under "Process value" in the "Dynamization" column, set the value "Tag".
   A screen for selecting the tag is shown on the right-hand side of the Inspector window.
5. Assign the corresponding tag to the "Process value" property. You will find the tag assignment in the table.
   If the tag is linked in the project, the object displays the corresponding values in Runtime.

Note

When you follow the example with PLC user data types, use the PLC user data type accordingly.

Tag assignment

Faceplate type	Object	Object name	Tag assignment
FP_Engine01	Gauge	Gauge_1	Engine01_CurrentRPM
	IO field	IO field_1	Engine01_SpeedMax
	IO field	IO field_2	Engine01_SpeedMin
	IO field	IO field_3	Engine02_CurrentRPM
FP_Engine02	Gauge	Gauge_1	Engine02_CurrentRPM
	IO field	IO field_1	Engine02_CurrentRPM
FP_StartStop	IO field	IO field_1	Engine01_CurrentRPM

See also

Instead of tags: Using PLC user data type in the faceplate type (Page 594)

Using a PLC user data type (Page 566)

4.7.5.6 Example: Configure local tags in faceplate types.

Task

You configure a local tag in the faceplate type "FP_StartStop". Clicking the "Button_1" or "Button_2" buttons changes the local tag to "On" or "Off". The I/O field "IO field_1" displays the value of the local tag.

Requirement

- The faceplate type "FP_StartStop" has been created.
- The faceplate type is in the "in progress" status.

Configuring the local tags

Note

Local tags are used to exchange values within the faceplate. When used in screens, access to individual object properties in faceplates is not possible via local tags.

1. Open the faceplate type "FP_StartStop".
2. In the editor, go to the "Local tags" tab.
3. Configure the tag "OnOff" as a WString. To do this, click the button  or on "Add".

Assigning local tags in the faceplate types

1. Open the "Visualization" tab.
2. Select the I/O field "IO field_1".
3. Open the Inspector window under "Properties > Properties > General".
4. Under "Process value" in the "Dynamization" column, set the value "Tag". A screen for selecting the tag is shown on the right-hand side of the Inspector window.
5. Assign the local tag "OnOff" to the "Process value" property. If the tag is linked in the project, the object displays the corresponding values in Runtime.

   Note

   When you follow the example with PLC user data types, use the PLC user data type accordingly.

Assigning values to local tag

To assign values to the configured local tag when the buttons are clicked, follow these steps:

1. Select the button "Button_1".
2. Open the Inspector window under "Properties > Events".
3. Select the event "Click left mouse button" and click the button.
   A new script is created.
4. Define the following script:
```
export function Button_Start_OnTapped(item, x, y, modifiers,
trigger){
  let tag1 = Tags("Engine01_CurrentRPM").Read();
  if(tag1 == 0){
    HMIRuntime.Tags.SysFct.SetTagValue("OnOff", "On");
  }
}
```
5. Repeat steps 2 and 3 for the "Button_2" button.
6. Select the event "Click left mouse button" and click the button.
   A new script is created.
7. Define the following script:
```
export function Button_Start_OnTapped(item, x, y, modifiers,
trigger){
  HMIRuntime.Tags.SysFct.SetTagValue("OnOff", "Off");
}
```

Note

The scripts are extended in the course of this example to meet the still missing requirements.

Result

You have configured a local tag and assigned it to an I/O field. When the buttons are clicked, a value is assigned to the local tag.

4.7.5.7 Instead of tags: Using PLC user data type in the faceplate type

Introduction

You have configured multiple motors of the same type. To do so, use data blocks based on a PLC user data type.

Task

You use the existing PLC user data type in the faceplate type.

You link the tags of the data blocks defined in the PLC user data type with those in the faceplate instance.

Requirement

- A SIMATIC S7-1200 or SIMATIC S7-1500 controller is configured.
- A PLC user data type suitable for the motor type is configured.
- At least one PLC tag based on the PLC user data type has been configured.
- The "Unified Faceplate Types" is opened with the created faceplate type.

Procedure

1. Drag the desired PLC user data type that you want to use in the project from the project tree into the project library under "Types".
2. Adapt the faceplate type so that the PLC user data type for the motors is also used in this faceplate type.
   - Switch to the "Tags interface" tab.
   - Select "PLCUDT" as the data type.
   - Under "User data type structure", select the defined PLC user data type.
     The PLC user data type supplies the faceplate type with the corresponding tags.
   - Switch back to the "Visualization" tab.
   - Keep in mind that tags are accessed in the faceplate type via the PLC user data type. This affects, for example, the use of faceplate tags in dynamized object properties and in local scripts.
3. Release the faceplate type.
4. From the faceplate type, create the same number of faceplate instances as the number of motors you have configured.
5. Link the tags from the data blocks and faceplate instances with each other.
   - The tag names in data blocks and faceplate instance are hierarchically structured.
   - This means that the tags from the individual faceplate instances can always be assigned uniquely to the tags of the respective data block.
   - When the PLC user data type contains tags that you do not require in the visualization, ignore these tags.

See also

Using a PLC user data type (Page 566)

4.7.5.8 Example: Instantiate the inner faceplate type in the outer faceplate type

Task

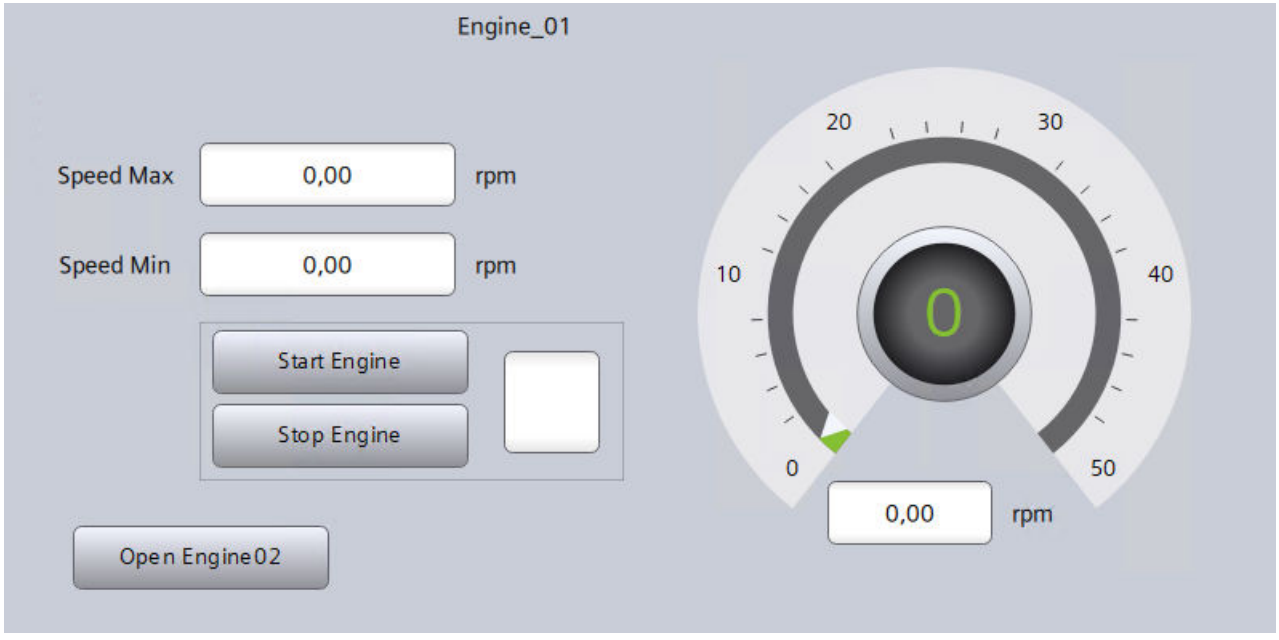
Insert the faceplate type "FP_StartStop" in the faceplate type "FP_Engine01".

Requirement

- The faceplate types "FP_StartStop" and "FP_Engine01" are created.
- The faceplate types are in the "In progress" status.

Procedure

1. Release the faceplate type "FP_StartStop".
2. Open the faceplate type "FP_Engine01" in the "Visualization" tab.
3. Drag-and-drop the "FP_Start_Stop" faceplate type into the "FP_Engine01" faceplate type at the desired location. This may look like this, for example:



Assigning interface tags to the inner faceplate type

To assign tags to the inner faceplate type "FP_StartStop" from the outer faceplate type "FP_Engine01", follow these steps:

1. Open the faceplate type "FP_Engine01" in the "Visualization" tab.
2. Select the faceplate instance from "FP_StartStop".
3. Open the Inspector window under "Properties > Properties > Miscellaneous > Interface".
4. Assign the tag "Engine01_CurrentRPM" to the "Engine01_CurrentRPM" interface.

Result

An inner faceplate type is created in an outer faceplate type and the interface tags are assigned.

See also

Using a faceplate type in another faceplate type (Page 570)

Using a PLC user data type (Page 566)

Instead of tags: Using PLC user data type in the faceplate type (Page 594)

4.7.5.9 Example: Configuring interface properties in faceplate types

Task

Design the background color of the I/O field "IO field_3" (display box for the speed (actual value)) with interface properties. If a specified speed is exceeded, the background color of the I/O field should change from white to red.

Requirement

- The faceplate type "FP_Engine01" is configured.
- The faceplate type "FP_Engine01" is open for editing.

Configure interface property

1. Change to the "Property interface" tab in the editor.
2. Click the button  or on "Add".
3. Assign the name "BackgroundColor".
4. Select the "Color" data type:
5. Go to the "Visualization" tab.

Assign interface property

1. Select the I/O field "IO field_3".
2. Open the Inspector window under "Properties > Properties > Appearance".
3. Under "Background - color", in the "Dynamization" column, set the value to "Property interface".
   A screen for selecting the interface property is shown on the right side of the Inspector window.
4. Assign the interface property "BackgroundColor" to the "Background - color" property.

Result

You have configured an interface property that allows you to customize the background color in the faceplate instance.

The value of the interface property "BackgroundColor" adapts the background of the I/O field "IO field_3" in Runtime.

See also

Interface properties in faceplates (Page 548)

4.7.5.10 Example: Create an interface event

Task

You configure an interface event in the faceplate type "FP_StartStop". To set the speed to 0, use the interface event in the faceplate instance that is used in the faceplate type "FP_Engine01".

Requirement

- The faceplate type "FP_StartStop" is configured.
- The faceplate type "FP_StartStop" is open for editing.

Configuring an interface event

1. In the editor, go to the "Event interface" tab.
2. Click on the button or on the entry "Add".
   A new interface event is created.
3. Assign the name "Engine_Stop".
4. Click on the entry "Add" below the interface event.
   A new parameter is created. The data type of the parameter is "Int".
5. Assign the name "Stop".

Assigning an interface event

1. Select the "Button_2" button.
2. Open the Inspector window under "Properties > Events".
3. Select the event "Click left mouse button" and click on the button  .
4. Define the following script:

```
export function Button_Stop_OnTapped(item, x, y, modifiers,
trigger) {
   let parameters = {Stop:0};
   Faceplate.RaiseEvent("Stop_Engine", parameters);
   HMIRuntime.Tags.SysFct.SetTagValue("OnOff", "Off");
}
```

5. Release the faceplate type "FP_StartStop".

Calling an interface event in instance

1. Open the faceplate type "FP_Engine01".
2. Select the faceplate instance of the "FP_StartStop" faceplate type.

3. Open the Inspector window under "Properties > Events".
4. Select the "Stop_Engine" event and click the button .
5. Define the following script:

```
export function Faceplate_container_1_OnStop_Engine(item, Stop) {
   HMIRuntime.Tags.SysFct.SetTagValue("Engine01_CurrentRPM",
Stop);
}
```

Result

You have configured an interface event with which you can set the speed to the value 0.

4.7.5.11 Example: Using e script to change tags

Task

To increase the speed via the interface tag "Engine01_CurrentRPM", expand the script that runs when the "Button_1" button is clicked.

Requirement

- The faceplate type "FP_StartStop" is configured.
- The interface tag "Engine01_CurrentRPM" has been configured.
- The faceplate type "FP_StartStop" is open for editing.

Configuring a script

1. In the editor, switch to the "Visualization" tab.
2. Select the button "Button_1".
3. Open the Inspector window under "Properties > Events".
4. Select the event "Click left mouse button" and click on .
5. Define the following script:

```
export function Button_Start_OnTapped(item, x, y, modifiers,
trigger) {
   let tag1 = Tags("Engine01_CurrentRPM").Read();
   if (tag1 == 0) {
      HMIRuntime.Tags.SysFct.SetTagValue("Engine01_CurrentRPM", 2);
       HMIRuntime.Tags.SysFct.SetTagValue("OnOff", "On");
   }
}
```

Result

You have configured a script with which the speed is set to a value of 2 when you click the "Button_1" button.

4.7.5.12 Example: Creating a local script for opening the pop-up

Task

You create a script that runs when a button is clicked and transfers values to tags. Clicking the button in the faceplate type opens an additional faceplate type as a pop-up.

Requirement

- The faceplate types "FP_Engine01" and "FP_Engine02" are created.
- The "FP_Engine02" faceplate type is released in the version 0.0.1.

  Note

  If necessary, adapt the script below according to your released version.

  Replace spaces and periods with underscores.

- The faceplate type "FP_Engine01" is open for editing.

Procedure for creating the script: Opening the faceplate pop-up in the faceplate type

1. In the editor, switch to the "Visualization" tab.
2. Select the "Button_1" button.
3. Open the Inspector window under "Properties > Events".
4. Select the entry "Click left mouse button" and click on the button  .
5. Define the following script:

```
export function Button_1_OnTapped(item, x, y, modifiers, trigger) {
   let po = Faceplate.OpenFaceplateInPopup("FP_Engine02_V_0_0_1",
"Engine02", true, false);
   po.Left = 100;
   po.Top = 150;
   po.Visible = true;
}
```

   Note

   When you follow the example with PLC user data types, note the deviating tag names.

Result

You have configured a script at the button in the faceplate type that opens an additional faceplate as a pop-up.

See also

Dynamizing a faceplate type (Page 576)

Configure faceplate as pop-up (Page 581)

4.7.5.13 Example: Create local script to close the pop-up

Task

You create a script that runs when a button is clicked and closes the faceplate pop-up in which the button is located.

Requirement

- The faceplate types "FP_Engine01" and "FP_Engine02" are created.
- The faceplate type "FP_Engine02" is open for editing.

Procedure for creating the script: Closing the faceplate pop-up

1. In the editor, switch to the "Visualization" tab.
2. Select the button.
3. Open the Inspector window under "Properties > Events".
4. Select the entry "Click left mouse button" and click on the button  .
5. Define the following script:

```
export function Button_1_OnTapped(item, x, y, modifieres, trigger)
{
   Faceplate.Close();
}
```

Result

To close the faceplate pop-up, you have configured a script on the button in the faceplate type.

4.7.5.14 Example: Configure the screen and instantiate the faceplate type.

Task

You insert an instance of the faceplate type "FaceplateEngine01" in a screen and link the tags of the faceplate instance with tags in the project.

Requirement

- A screen has been created.
- The "Screens" editor is open.

Creating a faceplate instance

1. Release all created faceplate types.

   Note

   To avoid error messages about inconsistency, start with the inner faceplate when releasing the faceplates. In the example, this is "FP_StartStop". Then release the faceplate that will be instantiated in the script. In the example, this is "FP_Engine02". To finish, release "FP_Engine01".

2. Drag and drop the "FP_Engine01" faceplate type into the "Screens" editor.
   Alternatively, drag the "Faceplate container" object into the editor and link the container with the faceplate type.
3. Define the properties of the faceplate container.
4. Under "Interface", assign the appropriate tag to all existing interface tags.
   Assign a value for the "BackgroundColor" interface property.

Assigning tags

1. Select the faceplate instance or the faceplate container.
2. Open the Inspector window under "Properties > Properties > Miscellaneous > Interface".
3. Assign the appropriate HMI tag to all existing interface tags.

Assigning interface properties

1. Select the faceplate instance or the faceplate container.
2. Open the Inspector window under "Properties > Properties > Miscellaneous > Interface".
3. Under "BackgroundColor", in the "Dynamization" column, set the value to "Script".
4. Create the following script:

```
export function
Faceplate_Container_1_Properties_BackgroundColor_Trigger (item) {
   var value;
   let ProcessValue = Tags("Engine01_CurrentRPM").Read();
   if (ProcessValue > 40) {
      value = HMIRuntime.Math.RGB(255,0,0)
   }
   else {
      value = HMIRuntime.Math.RGB(255,255,255)
   }
   return value;
}
```

The background color of the I/O field "IO field_3" in faceplate type "FP_Engine01" is white up to a speed of 40. When this speed is exceeded, the background color changes to red.

Inserting a slider

1. Drag and drop a slider from the "Toolbox" task card into the screen.
2. Select the slider and open the Inspector window under "Properties > Properties > General".
3. Assign the "Engine01_CurrentRPM" tag to the "Process value" property.

Result

The faceplate type is instantiated on a screen in a faceplate container.

You have linked the interface tags with project tags.

You have assigned a dynamic value to the "BackgroundColor" property of the I/O field "IO field_3".

You have configured a slider that can be used to adapt the speed "Engine01_CurrentRPM" in Runtime.

This completes the integration of the faceplate type into the project.

See also

Creating a faceplate instance (Page 564)

4.7.5.15 Example: Displaying a project in runtime.

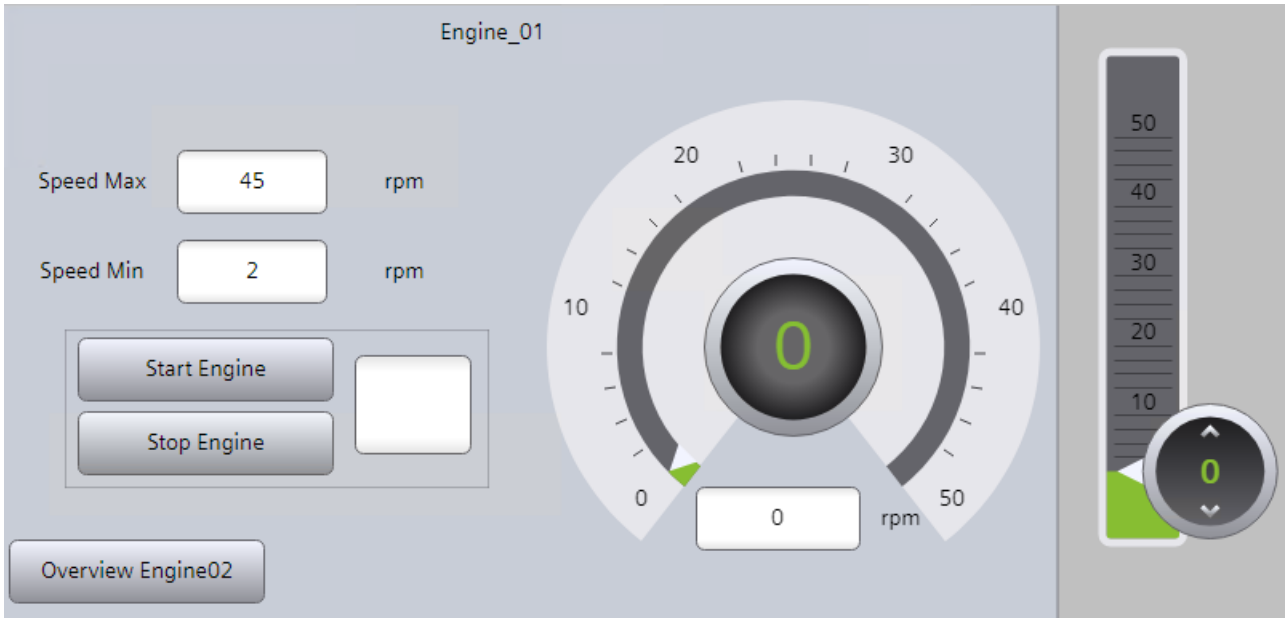
Procedure

1. Compile and upload the project to the HMI device.
2. Open the Runtime on the HMI device.

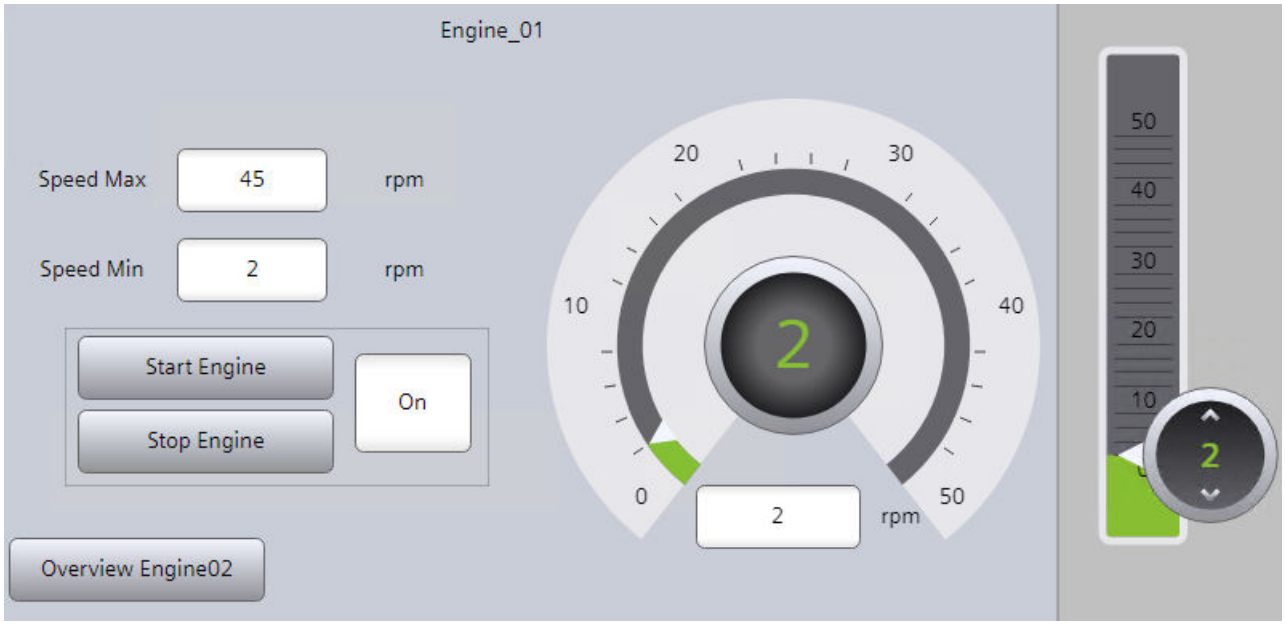
Result

When you have implemented the project as shown in the example, you will see the following elements in Runtime that display the values you have specified:

1. Start screen:



2. After pressing the button to start the motor:



3. After pressing the button to open the pop-up:

Engine_01
Speed Max
45
rpm
Speed
Overvi
Engine02
10
rpm
Close Popup

Configuring tags

5

5.1 Basics

5.1.1 Basics of tags

Introduction

Process values are forwarded in runtime using tags. Process values are data which is stored in the memory of one of the connected automation systems. They represent the status of a plant in the form of temperatures, fill levels or switching states, for example. Define external tags for processing the process values in WinCC.

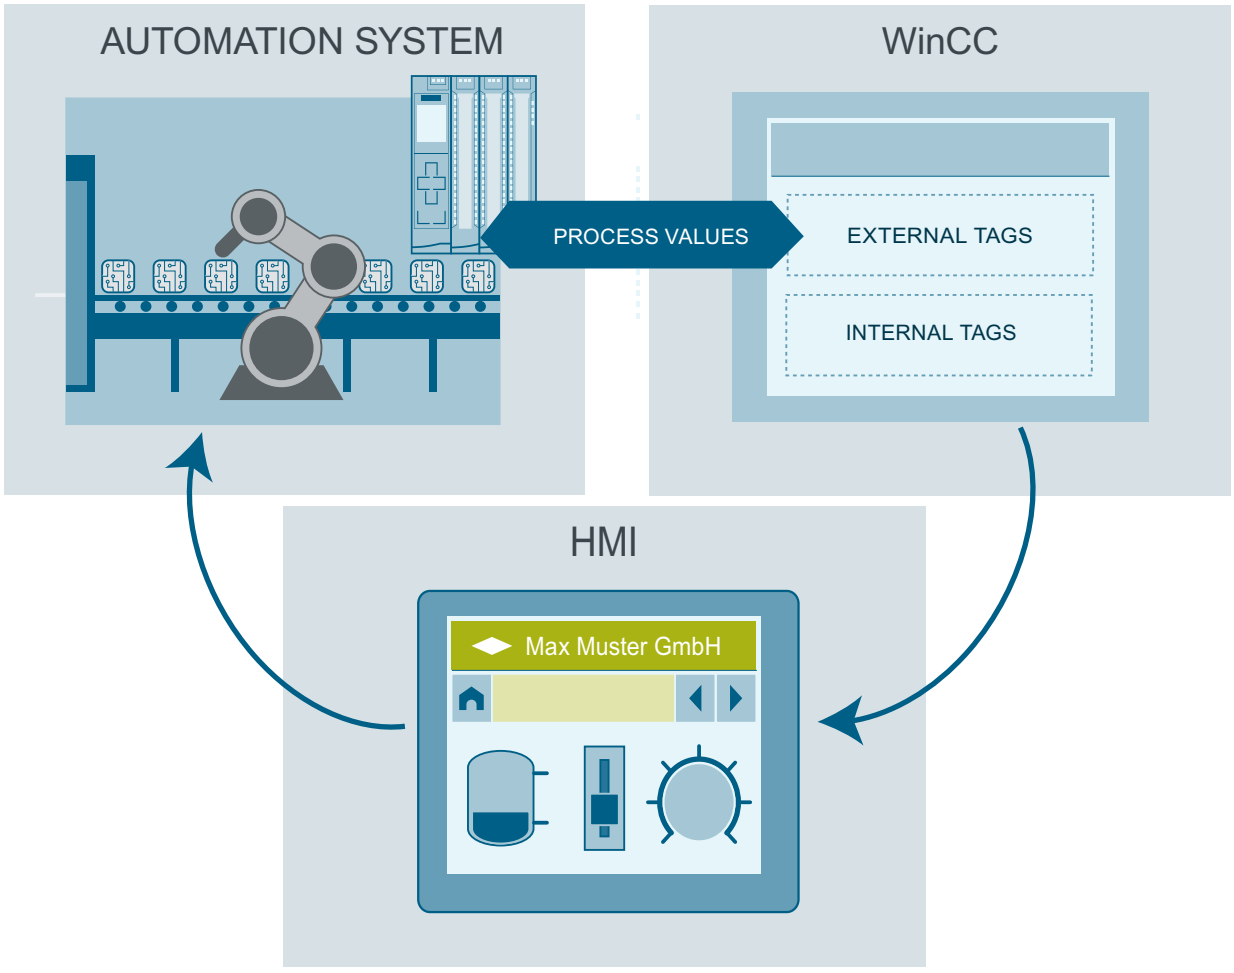
WinCC works with two types of tag:

- External tags
- Internal tags

The external tags form the link between WinCC and the automation systems. The values of external tags correspond to the process values from the memory of an automation system. The value of an external tag is determined by reading the process value from the memory of the automation system. It is also possible to rewrite a process value in the memory of the automation system.

Internal tags do not have a process link and only convey values within the WinCC. The tag values are only available as long as runtime is running.

In WinCC, you can visualize and change process values, which are transferred using tags, on your HMI device.



Tags in WinCC

For external tags, the properties of the tag are used to define the connection that the WinCC uses to communicate with the automation system and form of data exchange.

Tags that are not supplied with values by the process - the internal tags - are not connected to the automation system. In the tag's "Connection" property, this is identified by the "Internal tag" entry.

You can create tags in different tag tables for greater clarity. You then directly access the individual tag tables in the "HMI tags" node in the project tree. The tags from all tag tables can be displayed with the help of the table "Show all tags".

With structures you bundle a number of different tags that form one logical unit. Structures are project-associated data and are available for all HMI devices of the project. You use the "Types" editor in the project library to create and edit a structure.

External tags (Page 610)

Internal tags (Page 615)

5.1.2 Overview of HMI tag tables

Introduction

HMI tag tables contain the definitions of the HMI tags that apply across all devices. A tag table is created automatically for each HMI device created in the project.

In the project tree there is an "HMI tags" folder for each HMI device. The following tables can be contained in this folder:

- Default tag table
- User-defined tag tables
- Table of all tags

In the project tree you can create additional tag tables in the "HMI tags" folder and use these to sort and group tags and constants. You can move tags to a different tag table using a drag-and-drop operation or with the help of the "Tag table" field. Activate the "Tags table" field using the shortcut menu of the column headings.

In WinCC you can display the locations of use for all tags. Use the "Cross-references" command in the shortcut menu or the F11 key to call the "Cross-references" editor for a selected tag table. In the editor you can see all objects that the respective tag uses and you can jump directly to the location of use of the tag.

Default tag table

There is one default tag table for each HMI device of the project. It cannot be deleted or moved. The default tag table contains HMI tags and, depending on the HMI device, also system tags. You can declare all HMI tags in the standard tag table or, as necessary, in additional user-defined tag tables.

User-defined tag tables

You can create multiple user-defined tag tables for each HMI device in order to group tags according to your requirements. You can rename, gather into groups, or delete user-defined tag tables. To group tag tables, create additional subfolders in the HMI tags folder.

Show all tags

The "HMI tags" tab in the "All tags" table shows an overview of all HMI tags and system tags of the HMI device in question. This table cannot be deleted, renamed or moved. The "Tags table" column shows you in which tag table a tag is included. Using the "Tags table" field, the assignment of a tag to a tags table can be changed.

The "All tags" table contains an additional tab "System tags". The system tags are created by the system and used for internal management of the project. The names of the system tags begin with the "@" character. System tags cannot be deleted or renamed. You can evaluate the value of a system tag, but cannot modify it.

Discrete alarms, analog alarms and logging tags

The following tables are also available in an HMI tag table:

- Discrete alarms
  In the "Discrete alarms" table, you configure discrete alarms to the HMI tag selected in the HMI tag table. When you configure a discrete alarm, multiple selection in the HMI tag table is not possible. You configure the discrete alarms for each HMI tag separately.
- Analog alarms
  In the "Analog alarms" table, you configure analog alarms to the HMI tag selected in the HMI tag table. When you configure an analog alarm, multiple selection in the HMI tag table is not possible. You configure the analog alarms for each HMI tag separately.
- Logging tags
  In the "Logging tags" table, you configure logging tags to the HMI tag selected in the HMI tag table. When you configure a logging tag, multiple selection in the HMI tag table is not possible. You configure the logging tags for each HMI tag separately.

With the help of these tables you configure alarms and logging tags for the currently selected HMI tag.

5.1.3 External tags

Introduction

External tags allow the data exchange between the components of an automation system, for example, between an HMI device and a PLC.

An external tag is the image of a defined memory location in the PLC. You have read and write access to this storage location from both the HMI device and from the PLC.

As external tags map a storage location in the PLC, the applicable data types depend on the PLC that is connected to the HMI device.

If you write a PLC control program in STEP 7, the PLC tags created in the control program will be added to the PLC tag table. If you want to connect an external tag to a PLC tag, access the PLC tags directly via the PLC tag table and connect them to the external tag.

Data types

All simple data types available on the connected PLC are available at an external tag in WinCC. If the data type of the PLC tag is not available in WinCC, a compatible data type is automatically used at the HMI tag. Interconnected PLC data types and arrays are not supported.

If you use PLC data types, the data type is adopted by WinCC. You can change the data type at the HMI tag, if necessary.

Central tag management in STEP 7

You can connect also connect DB instances of user-defined PLC data types (UDT) to the HMI tags.

The PLC data type and the corresponding DB instances are created and updated centrally in STEP 7. In WinCC, you can use the following sources as the PLC tag (DB instances):

- Data block elements that use a UDT as data type
- Data block instances of a UDT

The data type is taken from STEP 7 and is not converted to an HMI data type. The access type is always "Symbolic access". Depending on the release for WinCC in STEP 7, elements and structured elements of the PLC data type are applied to WinCC.

Note

Accessing PLC data types

Access to PLC data types is only available in conjunction with SIMATIC S7-1500.

Synchronization with PLC tags

A variety of options for synchronizing external tags with the PLC tags are available in the runtime settings under "Settings for tags".

When you perform synchronization, you have the option of automatically applying the tag names of the PLC to external tags and reconnecting the existing tags.

The generated tag name is derived from the position of the data value in the hierarchical structure of the data block.

Update of tag values

For external tags, the current tag values are transmitted in runtime via the communication connection between WinCC and the connected automation systems and then saved in the runtime memory. Next, the tag value will be updated to the set cycle time. For use in the runtime project, WinCC accesses tag values in the runtime memory that were read from the PLC at the previous cycle time. As a result, the value in the PLC can already change while the value from the runtime memory is being processed.

See also

Creating external tags (Page 626)

5.1.4 Addressing external tags

Introduction

The options for addressing external tags depend on the type of connection between WinCC and the PLC in question. A distinction must be made between the following connection types:

- Integrated connection
  Connections of devices which are within a project and were created with the "Devices & Networks" editor are referred to as integrated connections.
- Non-integrated connection
  Connections of devices which were created with the "Connections" editor are referred to as non-integrated connections. It is not necessary that all of the devices be within a single project.

The connection type can also be recognized by its icon.

	Integrated connection
	Non-integrated connection

Addressing with integrated connections

An integrated connection offers the advantage that you can address a tag both symbolically and absolutely.

For symbolic addressing, you select the PLC tag via its name and connect it to the HMI tag. The valid data type for the HMI tag is automatically selected by the system.

During the symbolic addressing of a data block with optimized access and standard access, the address of an element in the data block is dynamically assigned and is automatically adopted in the HMI tag in the event of a change. You do not need to compile the connected data block or the WinCC project for this step.
For data blocks with optimized access, only symbolic addressing is available.

For symbolic addressing of elements in a data block, you only need to recompile and reload the WinCC project in case of the following changes:

- If the name or the data type of the linked data block element or global PLC tag has changed.
- If the name or the data type of the higher level structure node of a linked element in the data block element or global PLC tag has changed.
- If the name of the connected data block has changed.

Symbolic addressing is currently available with the following PLCs:

- SIMATIC S7-1500
- SIMATIC ET 200 CPU
- SIMATIC S7-1500 software controller

Symbolic addressing is also available if you have an integrated link.

You can also use absolute addressing with an integrated connection. You have to use absolute addressing for PLC tags from a SIMATIC S7-300/400 PLC. If you have connected an HMI tag with a PLC tag and the address of the PLC tag changes, you only have to recompile

the control program to update the new address in WinCC. Then you recompile the WinCC project and load it onto the HMI device.

In WinCC, symbolic addressing is the default method. To change the default setting, select the menu command "Options > Settings > Visualization > HMI tags".

The availability of an integrated connection depends on the PLC used. The following table shows the availability:

Controller	Integrated connection	Comments
S7-300/400	Yes	The linking of tags is not checked in runtime. If the tag address changes in the PLC and the HMI device is not compiled again and loaded, the change is not registered in runtime.
S7-1500	Yes	A validity check of the tag connection is performed in runtime during symbolic addressing. If an address is changed in the PLC, the change is registered and an error message is issued. In the case of absolute addressing, the behavior described for the S7-300/400 applies.
SIMATIC ET 200 CPU	Yes	A validity check of the tag connection is performed in runtime during symbolic addressing. If an address is changed in the PLC, the change is registered and an error message is issued. In the case of absolute addressing, the behavior described for the S7-300/400 applies.
SIMATIC S7-1500 software controller	Yes	A validity check of the tag connection is performed in runtime during symbolic addressing. If an address is changed in the PLC, the change is registered and an error message is issued. In the case of absolute addressing, the behavior described for the S7-300/400 applies.

Create an integrated connection in the "Devices & Networks" editor. If the PLC is contained in the project and integrated connections are supported, you can then also have the connection created automatically. To do this, when configuring the HMI tag, simply select an existing PLC tag to which you want to connect the HMI tag. The integrated connection is then automatically created by the system.

Addressing with non-integrated connections

In the case of a project with a non-integrated connection, you always configure a tag connection with absolute addressing. Select the valid data type yourself. If the address of a PLC tag changes in a project with a non-integrated connection during the course of the project, you also have to make the change in WinCC. The tag connection cannot be checked for validity in runtime, an error message is not issued.

A non-integrated connection is available for all supported PLCs.

Symbolic addressing is not available in a non-integrated connection.

With a non-integrated connection, the control program does not need to be part of the WinCC project. You can perform the configuration of the PLC and the WinCC project independently of each other. For configuration in WinCC, only the addresses used in the PLC and their function have to be known.

5.1.5 Indirect addressing

Absolute address multiplexing

For Unified Runtime PCs and Panels, absolute address multiplexing was enabled for HMI tags with S7 1200/1500 and S7 300/400 connections. You can configure the tags as placeholders for the address in the S7 1200/1500 and S7 300/400 PLCs. With a single tag you access a large number of memory locations in the address range of the PLC.

Product requirements

- You determine an absolute multiplex address via:
  - Address dialog
  - Text input
  - Copy/paste string
  - Openness
  - Excel Export/Import
- Address multiplexing is provided for integrated and non-integrated connections.
- You can use any internal or external tag with a numeric data type from the same device as the index tag.
- Address multiplexing is possible for all elementary data types.
- There is no support for the arrays on S7 1200/1500 and S7 300/400.
- Address multiplexing must not be provided for any structured data type.
- When using the global search, you can find the corresponding multiplex address and jump to it.
- You get a replacement text in the PLC tag property if the tag is used as multiplexing.
- You can work with multiplexed tags in the runtime.

Design requirements

- Implement tag multiplexing based on the classic HMI tag for the Unified devices.
- Consider and support existing NFR aspects of the HMI tag, specifically performance, delta compile, quantity structures, user friendliness, and testability.

5.1.6 Internal tags

Introduction

Internal tags do not have any connection to the PLC.

Principle

Internal tags are stored in the memory of the HMI device. Therefore, only this HMI device has read and write access to the internal tags. You can create internal tags to perform local calculations, for example.

You can use the HMI data types for internal tags. Availability depends on the HMI device being used.

The following HMI data types are available:

HMI data type	Data format
Bool	Binary tag
Byte	Unsigned 8-bit value
DateTime	Date/time format
DInt	Signed 32-bit value
DWord	Unsigned 32-bit value
Int	Signed 16-bit value
LInt	Signed 32-bit value
LReal	Floating-point number 64-bit IEEE 754
LTime	Signed duration
LWord	Unsigned 64-bit value
Real	Floating-point number 32-bit IEEE 754
SInt	Signed 8-bit value
UDInt	Unsigned 32-bit value
UInt	Unsigned 16-bit value
ULInt	Unsigned 64-bit value
USInt	Unsigned 8-bit value
WChar	Text tag, 16-bit character set
Word	Unsigned 16-bit value
WString	Text tag, 16-bit character set
Array	Data structure

See also

System tags (Page 616)

5.1.7 System tags

Introduction

System tags are internal tags that are required for internal management of the project.

Principle

The system tag names always start with the "@" character. You may not delete or rename these tags. You cannot change the value of a tag.

Note

You must not create any tags whose name starts with a @.

By default, the following system tags are available for the WinCC Unified devices:

System tag	Data type	Meaning
@CurrentLanguage	UDInt	Contains the current runtime language.
@DeltaActivationState	UDInt	Contains the current phase when loading changes.
@DiagnosticsIndicatorTag	UDInt	Specifies the diagnostic status. The diagnostic status contains the collective status of all relevant PLCs. The worst status of all PLCs is always used in this case. "@DiagnosticsIndicatorTag" can have the following values: • Uncertain (0) • Good (1) • Maintenance (2) • Error (3)
@LocalMachineName	WString	Contains the name of the local computer. "@LocalMachineName" is a local system tag of the current session. This means the system tag cannot be used as the trigger of a Scheduled task, for example.
@ServerMachineName	WString	Contains the name of the PC on which Runtime is running.
@SystemActivationState	UDInt	Signals whether Runtime is active and can have the following values: • System startup in progress (1) • System started (activated) (2) • System stopped (3) • System shutdown in progress (4) • System restart in progress (5)

System tag	Data type	Meaning
@SystemHealthIndex	UDInt	Shows the current status of the Runtime system. When the "@SystemHealthIndex" value is 0, the Runtime system is in optimal health. Runtime is in the state expected by the Engineering System. There are no messages that may have a negative impact on the "@SystemHealthIndex". The greater the "@SystemHealthIndex" value, the less healthy the state of the Runtime system.
@UserName	WString	Contains the currently logged-on user. "@UserName" is a local system tag of the current session. This means the system tag cannot be used as the trigger of a Scheduled task, for example.

Shutdown behavior (Page 7827)

5.1.8 Updating the tag value in runtime

Introduction

Tags contain process values which change while runtime is running. Value changes are handled differently at internal and external tags.

Principle

When runtime starts, the value of a tag is equal to its start value. Tag values change in runtime.

In runtime, you have the following options for changing the value of a tag:

- A value change in an external tag in the PLC.
- By input, for example, in an I/O field.
- A value assignment in a script.

Updating the value of external tags

The value of an external tag is updated as follows:

- Cyclic in operation
  If you select the "Cyclic in operation" acquisition mode, the tag is updated in runtime while it is displayed in a screen or is logged. The acquisition cycle determines the update cycle for tag value updates on the HMI device. You can either choose a default acquisition cycle or define a user-specific cycle.
- On demand
  If you select the "On demand" acquisition mode, the tag is not updated cyclically. It will only be updated on demand using the "UpdateTag" system function, for example, or by a script.

See also

Defining the acquisition cycle for a tag (Page 635)

5.1.9 Limits and start values of a tag

Introduction

You can configure start values and restrict the value ranges with limits for numerical tags.

Use the limits to warn the operator when the value of a tag enters a critical range, for example.

Use the start values to assign a default value to an I/O field that is specified as start value in the linked tag.

Tags limits

You can specify a value range defined by a high limit and a low limit for numerical tags.

You configure four limit values that limit the value range. Using the limits Upper 2 and Lower 2 , you specify the maximum and minimum value for the value range. The limits Upper 1 and Lower 1 specify the threshold values at which the normal range is exceeded or undershot.

Limit	Application
Upper 2	Specifies the maximum value.
Lower 2	Specifies the minimum value.

If the operator enters a value for the tag that is outside the configured value range, the input is rejected. When the tag value leaves the value range, the function list is processed.

Note

If you want to output an analog alarm when a limit is violated, configure the respective tag in the "Analog alarms" tab. You can also configure the analog alarm in the "HMI alarms" editor. The values for output of an analog alarm depend on the configured tag limits.

Note

Limitation

Tags with the following data types do not support limits:

- Array and array elements
- Byte
- Char
- DWord, LWord and Word

Start value of a tag

You can configure a start value for numeric tags and tags for date/time values. The tag will be preset to this value when runtime starts. In this way, you can ensure that the tag has a defined status when runtime starts.

The start value cannot have the data type Raw or TextRef.

For external tags, the start value will be displayed on the HMI device until it is overwritten by the PLC or by input.

If no start value was configured, the tag contains the value "0" when starting runtime.

Use the "Persistence" setting to specify whether the value of the tag is to be retained when runtime is closed. The value saved will be used as the start value when you restart runtime.

See also

Defining limits for a tag (Page 637)

5.1.10 Data logging

Introduction

Data logging is used to collect, process and log process data from an industrial system. When you analyze the logged process data, you can extract important business and technical information regarding the operational state of the system.

The process values to be logged are compiled, processed and saved in the log database in runtime. Current or previously logged process values can be output in runtime as a table or trend. In addition, it is possible to print out logged process values as a report.

Use

You can use data logging for the following tasks:

- Early detection of danger / fault states
- Increase of productivity
- Enhancement of product quality

- Optimization of maintenance cycles
- Documentation of process value trends

Configuration

You configure the logging of process values in the "Logs" editor. You create a data log and an alarm log. The data log stores process values in logging tags. When you configure the data log, select the storage location, the logging period and the size of the log. You also specify the settings for the logging segments.

You configure trend views and process controls for displaying process data in runtime in the "Screens" editor. These views allow you to output the process data in the form of trends and tables.

Logging tags

You can log the values of internal and external tags. Use the logging tags for logging tag values. In logging tags, you specify how the values of the corresponding tags are written to the log.

You can create a logging tag for each HMI tag in the tag tables. You define the logging tags in the "HMI Tags" editor under "Logging tags". You specify for each logging tag to which log the tag is written.

With the default logging type "On change", the process value is compared to the saved value and the new value is only written to the log if the process value has changed.

To preserve memory, you can activate "smoothing" for the logging tags. By doing so, insignificantly small changes are filtered out prior to writing and the number of logged values is reduced.

Another way to save storage space is to use "Compression" for the logging tags. You select one of the 8 compression modes that calculate the values to be stored.

You create logging tags for internal and external tags. When logging the PLC tag values, the time stamp contains the time at which the value occurred in the PLC.

Note

Supported data type for logging external tags

When logging external PLC tags, all data types are supported except "Raw", "TextRef", "Struct" and "Array". The data type "TextRef" must not be used within the "Faceplate container" object.

5.1.11 Basics of tag management

Basics of tag management

You can always rename, copy or delete tags.

When a tag is renamed, the new name must be unique for the whole device.

Note

The connection to the tags can be interrupted in runtime under the following conditions during renaming:

- HMI tag is used in a type, for example, to dynamize an object property via a script.
- One or more instances of the type are used in the project.
- Project is in runtime.
- After the renaming, execute the command "Compile > Software (only changes)".

Solution: Exit runtime and rename the tag. Execute the "Compile > Software (rebuild all)" command.

If you use the "Copy" command to copy a tag to the clipboard, the references are copied along with the tag.

If you use the "Insert" command to add a tag to another device, the tag will be added without the connected references. Only the object name of the reference will be inserted. If a reference of the same name and valid properties exists in the target system, the existing reference will then be connected to the copied tag.

If you copy a tag, some of the objects linked to the tag are copied as well. The following objects are copied:

- Logging tags
- Cycles
- Alarms

If you add the copied tag to another device, the tag is added together with the linked objects.

Before you delete a tag, check in the "Cross-references" editor where the tag is used and what impact the deletion of the tag will have on your project.

5.1.12 Basics of user data types

Introduction

With user data types you bundle a number of different tags that form one logical unit. You create a user data type as a type and use instances of this type in the project. User data types are project-associated data and are available for all HMI devices of the project.

WinCC also supports the connection of PLC data types (UDTs) as user data types.

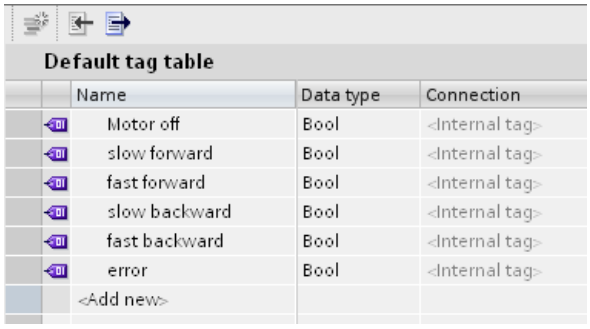
User data types also differ in their applicability with a specific communication driver. User data types are available for the following communication drivers:

- SIMATIC S7-300/400
- SIMATIC S7-1500

Create user data types and user data type elements in the project library.

Principle

For example, the different conditions of a motor can be described using 6 unique Boolean tags.



Default tag table

	Name	Data type	Connection
	Motor off	Bool	<Internal tag>
	slow forward	Bool	<Internal tag>
	fast forward	Bool	<Internal tag>
	slow backward	Bool	<Internal tag>
	fast backward	Bool	<Internal tag>
	error	Bool	<Internal tag>
	<Add new>		

If the overall condition should be described with a single tag, this tag can be created based on a user data type. For each of the individual Boolean tags you create a user data type element in the user data type.

This user data type can then be assigned complete to a faceplate for the motor. The created and released version of user data type is displayed at the tag in the "Data type" selection field.

The configured properties of a user data type are used in the instances of the user data type. If required, you change individual properties directly at the point of use, e.g. at a tag. Changing a property at the tag does not affect the user data type created.

5.1.13 Export and import of tags

Introduction

With Export and Import, you have the option to export tags from one project and import them into another project. There is also the option to create larger numbers of tags outside of WinCC, edit them and subsequently import into any WinCC project.

You export and import tags with the "Import" and "Export" buttons in the "HMI Tags" editor. When importing the tag data to WinCC, pay attention to the structure required in the import file.

Tag data structure

The tag data file must be in "*.xlsx" data format for the tag import and must be structured according to specific rules.

The import file in Microsoft Excel consists of a number of worksheets:

- HMI Tags (tags)
- SubstituteValueUsage (substitute value)

Each tag is on a separate row in the import file. The import file with the tag data must have the following format:

Example of the worksheet "HMI Tags"

	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R
1	Name	Path	Connection	PLC tag	DataType	HMI DataTy	Length	Address	Access Me	Start valu	Quality Co	Persisten	Substitute	Tag value	Update M	Coding	Comment	High High
2	Tag_1	Default table	HMI_Connection_1	Data_block_1.Static_1	Real	Float	4	%DB1.DBD(	<No Value	<No Value	True	False	25	<No Value	Client/Ser	Binary	<No Value	NoLimit
3	Tag_2	Default table	<No Value>	<No Value>	Int	Int	2	<No Value>	<No Value	<No Value	False	False	<No Value	<No Value	Client/Ser	Binary	<No Value	NoLimit

Table 5-1 Meaning of the entries

List entry	Meaning
Name	Indicates the configured name of an HMI tag.
Path	Specifies which folders in the project tree contain the tag. The folder structure is represented by ",": "FolderName1,FolderName2,TagName".
PLC Tag	Specifies which PLC tag is linked to the HMI tag.
Connection	Indicates the name of the connection.
Date type	Specifies the data type of the PLC tag. The data types allowed depend on the communication driver being used. See the "Communication" section of the documentation for additional information on the data types permitted for the various communication drivers.
HMI Data type	Specifies the data type of the HMI tag. The data types allowed depend on the communication driver being used. See the "Communication" section of the documentation for additional information on the data types permitted for the various communication drivers.
Length	Specifies the length of the tag in bytes. This entry is only useful for data types with a dynamic length, for example, strings. This entry remains empty for other data types.
Access Method	Specifies the type of access.
Address	Specifies the tag address in the PLC. The tag address must exactly match the one used in WinCC, for example, "%DB1.DBW0". The tag address is empty for internal tags.
Start Value	Specifies the start value of a tag.
Quality code	Provides information on the quality of the connection.
Persistency	Indicates whether the value is to be retained after the end of runtime.
Substitute Value	Indicates the substitute value. The substitute value is used when a process value with errors is read.
ID tag	The update ID updates the value of a tag with the aid of a function or a PLC job. The update ID must be unique within an HMI device.
Update Mode	Indicates whether the tag is to be updated locally or for the entire project.
Acquisition mode	Indicates the acquisition mode.
Acquisition cycle	Indicates the acquisition cycle used.
Limit Upper 2 type	Indicates whether the limit value "Upper 2" is monitored by a constant or not at all.
Limit Upper 2	Displays the limit value "Upper 2".
Limit Lower 2 type	Indicates whether the limit value "Lower 2" is monitored by a constant or not at all.
Limit Lower 2	Displays the limit value "Lower 2".
End value PLC	Specifies the end value of the PLC tag.
Start value PLC	Specifies the start value of the PLC tag.
End value HMI	Specifies the end value of the HMI tag.
Start value HMI	Specifies the start value of the HMI tag.

Example of the worksheet "SubstituteValueUsage"

	A	B
1	HMI Tag name	Substitute Value Usage
2	Tag_1	StartValue
3	Tag_1	ConnectionError

Table 5-2 Meaning of the entries

List entry	Meaning
HMI Tag name	Specifies the tag for which a substitute value has been defined. The tag must be available in the "HMI-Tags" worksheet.
Substitute Value Usage	Indicates the substitute value. The substitute value can be used in the following situations: • As start value • After communication error • Upper 2 limit value • Lower 2 limit value

Note

"No value" in the table

Entries in the table which have the value "No value" delete the corresponding values in an existing tag of the same name.

Importing and exporting tags (Page 641)

5.2 Configuring tags

5.2.1 Working with tag tables

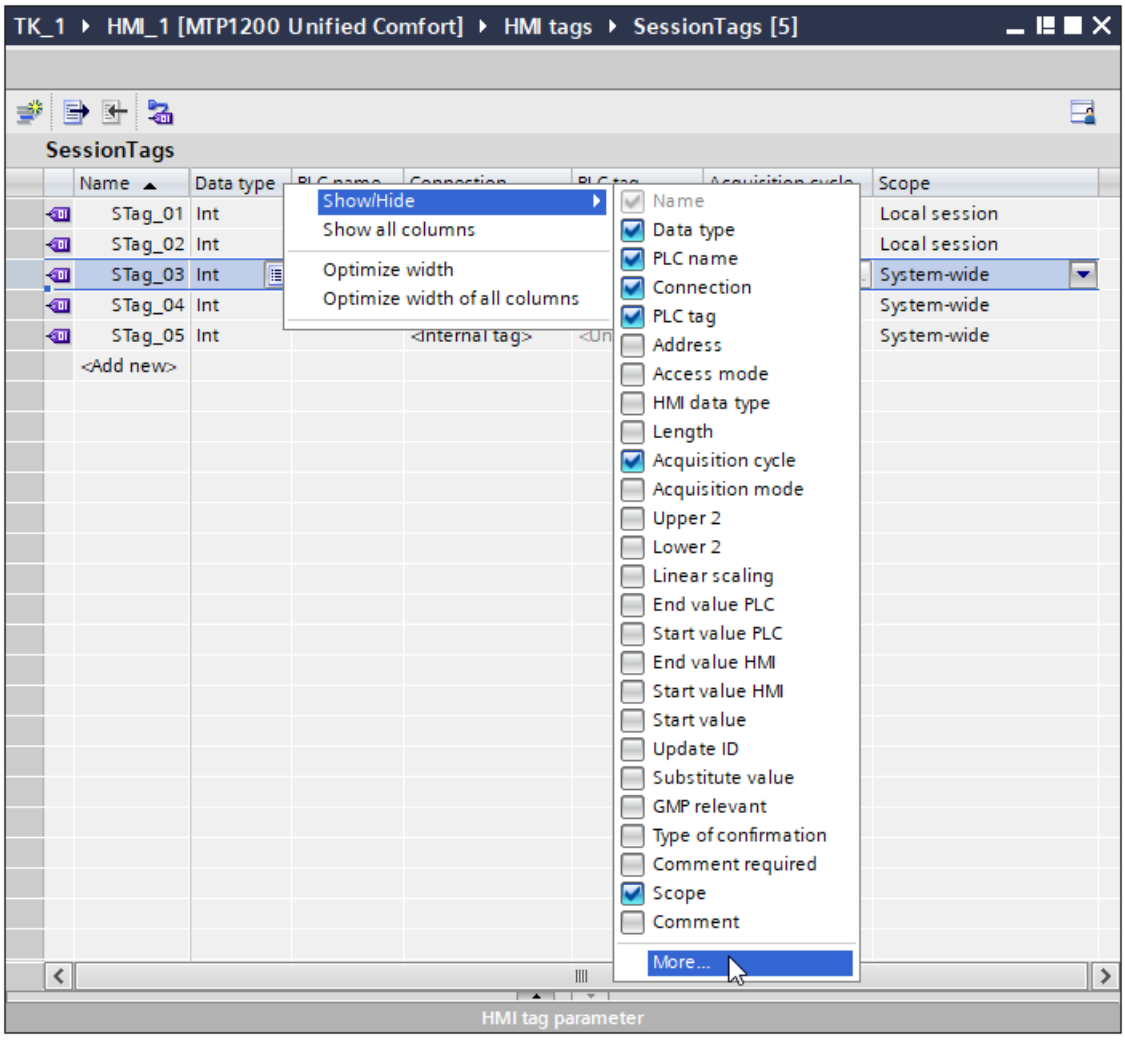
Tags are displayed in tag tables.

Here you create tags, edit their properties and export them.

Adapting the view of the table

The shortcut menu of a column header allows you to

- adjust the width of individual or all columns
- show or hide individual columns



To arrange columns, drag a column header to a different position.

To have your individually designed view displayed again the next time you call up the tag table, click "Save window settings".

To insert a tag above a selected line, click "Lines above ...".

To sort the Table, click on a column header.

Creating internal tags (Page 629)

Creating OPC tags (Page 628)

5.2.2 Creating external tags

Introduction

You can access an address in the PLC via a PLC tag using an external tag. The following options are available for addressing:

- Symbolic addressing
- Absolute addressing

If possible, use symbolic addressing when configuring a tag. Symbolic addressing enables high-performance data access and is therefore less prone to errors. The system monitors the assignment of the storage address and the locations of use are automatically updated when changes occur.

You create tags either in the standard tag table or in a tag table you defined yourself.

Requirement

- The project is open.
- A connection to the PLC is configured.
- The Inspector window is open.

Procedure

To create an external tag, proceed as follows:

1. Open the "HMI tags" folder in the project tree and double-click the standard tag table. The tag table opens.
   Alternatively, create and then open a new tag table.
2. In the "Name" column, double-click "Add" in the tag table.
   A new tag is created.
3. Select the "Properties > Properties >General" category in the Inspector window and, if required, enter a unique tag name in the "Name" field.
   The tag name must be unique throughout the device.

4. Select the connection to the required PLC in the "Connection" box.
   If the connection you require is not displayed, you must first create the connection to the PLC. You create the connection to a SIMATIC S7 PLC in the "Devices & Networks" editor. You create the connection to external PLCs in the "Connections" editor.
   If the project contains the PLC and supports integrated connections, you can also have the connection created automatically. To do this, when configuring the HMI tag, simply select an existing PLC tag to which you want to connect the HMI tag. The integrated connection is then automatically created by the system.
5. If you are working with an integrated connection, click the ... button in the "PLC tag" field and select an already created PLC tag in the object list. Click  to confirm the selection.

   Alternatively, use the autocomplete to select a PLC tag for an integrated connection.
   If you select a PLC tag from the autocomplete list, it is entered in the input path. The elements of the PLC tags are displayed in the autocomplete list. If you have selected a PLC tag that can be connected to the HMI tags, the PLC tag is connected to the HMI tags.
6. If you are working with a non-integrated connection, enter the address from the PLC in the "Address" field. To enter the address, make sure that the access mode "Absolute access" is configured.
   The "PLC tag" field remains empty.
7. Configure the other properties of the tag in the inspector window.
   You can also configure all tag properties directly in the tag table. To view hidden columns, activate the column titles using the shortcut menu.

Tips for an efficient procedure

- You also create new tags directly at the location of use, for example, on an I/O field. To do this, click "Add new" in the object list.
  You then configure the new tag in the Inspector window.
- You can also create external HMI tags by dragging and dropping data block elements or global PLC tags into an HMI tag table.

Result

An external tag has been created and linked to a PLC tag or an address in the PLC.

Basics of tags (Page 607)

External tags (Page 610)

Addressing external tags (Page 612)

5.2.3 Creating OPC tags

Requirement

- A connection to an OPC UA server has been set up.
- When the connection to the OPC UA server is secured via a certificate, the application instance certificate of the WinCC Unified clients must be in the "Trusted" folder of the OPC UA server.

Procedure

To create an external tag, proceed as follows:

1. Open the "HMI tags" folder in the project tree and double-click the tag table. The tag table opens.
   Alternatively, create and then open a new tag table.
2. In the "Name" column, double-click "Add" in the tag table.
   A new tag is created.
3. Select the "Properties > Properties >General" category in the Inspector window and, if required, enter a unique tag name in the "Name" field.
   The tag name must be unique throughout the device.
4. If required, select the "Display name" field to enter a name to be displayed in runtime.
5. Select the connection to the desired OPC UA server in the "Connection" field.
   If the connection you require is not displayed, you must first create the connection to the OPC UA server. You establish the connection to an OPC UA server in the "Connections" editor.
6. Click in the "Address" field and follow these steps:
   - In the left area, browse through the address space of the OPC UA server to the node below which the required tag is located.
   - Select the tag in the right area.
   - Confirm your selection.

Result

The new HMI tag is connected to the tag of the OPC UA server. It is available for configuring HMI screens.

After loading the project into a Runtime:

- Runtime has read and write access to the connected OPC UA tag.
- Changes to the tag value on the OPC UA server are automatically passed on to the runtime.

See also

Defining connection settings to the OPC UA server (Page 7045)

5.2.4 Creating internal tags

Introduction

You must at least set the name and data type for internal tags. Select the "Internal tag" item, rather than a connection to a PLC.

For documentation purposes, it is a good idea to enter a comment for every tag.

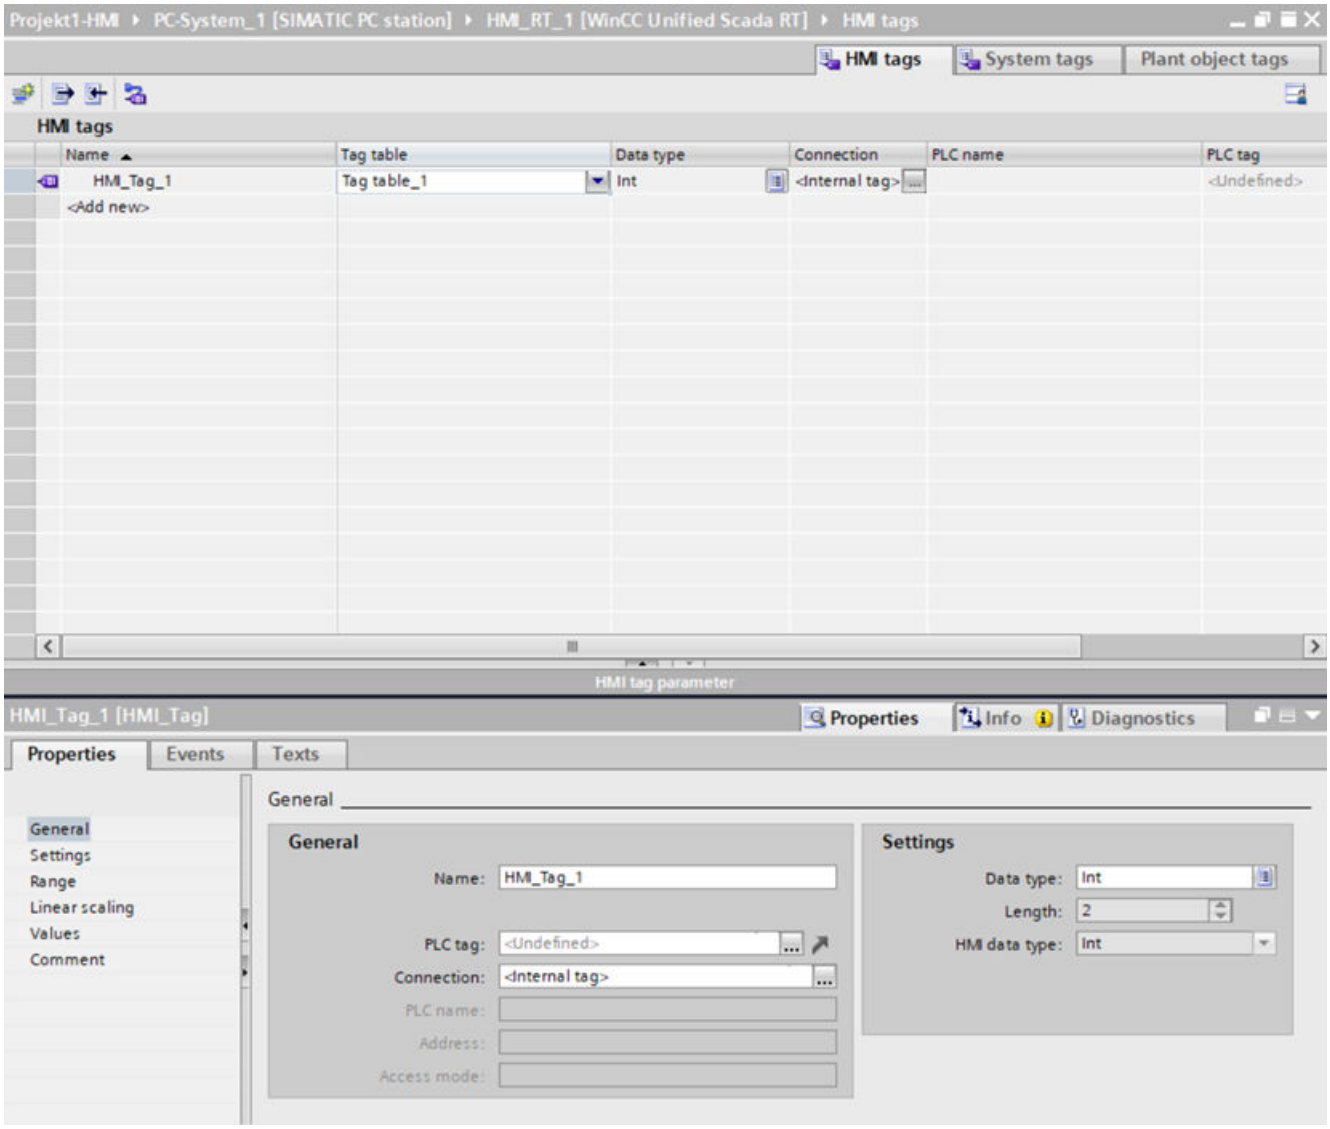
Procedure

1. Open the "HMI tags" folder in the project tree and double-click the entry "Standard tag table". The tag table opens.
   Alternatively, create and then open a new tag table.
2. In the "Name" column, double-click "Add" in the tag table. A new tag is created.
3. If the Inspector window is not open, select the "Inspector window" option in the "View" menu.
4. Select the "Properties > Properties >General" category in the Inspector window and, if required, enter a unique tag name in the "Name" field.

Note

This tag name must be unique throughout the project. The tag name must not contain the special characters line feed, carriage return or quotation marks.

5. If required, select the "Display name" field to enter a name to be displayed in runtime.
   The name to be displayed is language-specific and can be translated for the required runtime languages. The display name is available for Basic Panels, Panels and Runtime Advanced.



6. Select "Internal tag" as the connection in the "Connection" field.
7. Select the required data type in the "Data type" field.
8. In the "Length" field, you can specify the maximum number of characters to be stored in the tag in accordance with the selected data type.
   The length is automatically defined by the data type for numerical tags.
9. As an option, you can enter a comment regarding the use of the tag. To do so, click "Properties > Properties > Comment" in the Inspector window and enter a text.

	Tips for effective configuring
• You also configure the tag properties directly in the tag table. To view hidden columns, activate the column titles using the shortcut menu. • You also create new tags directly at the location of use, for example, on an I/O field. To do this, click "Add new" in the object list. You then configure the new tag in the Inspector window.	

Result

An internal tag is created. You can now use this in your project.

In additional steps you can configure the tag, for example, by setting the start value and limits.

See also

Basics of tags (Page 607)

Internal tags (Page 615)

Configuring discrete alarms (Page 734)

Configuring analog alarms (Page 738)

5.2.5 Configuring multiple tags

Introduction

In a tag table, you create a large number of identical tags by automatically filling the rows of the table below a tag. The tag names are incremented automatically when filling in automatically.

You can also use the auto fill function to fill table cells below a tag with a single tag property and thus modify the corresponding tags.

If you apply the automatic filling in to already filled cells of a tab table, you will be asked whether you want to overwrite the cells or insert new tags.

If you do not want to overwrite already configured tags, activate insert mode. Activate insert mode by keeping the <Ctrl> key pressed during insertion. Already existing entries in the tag table are moved down if insert mode is activated.

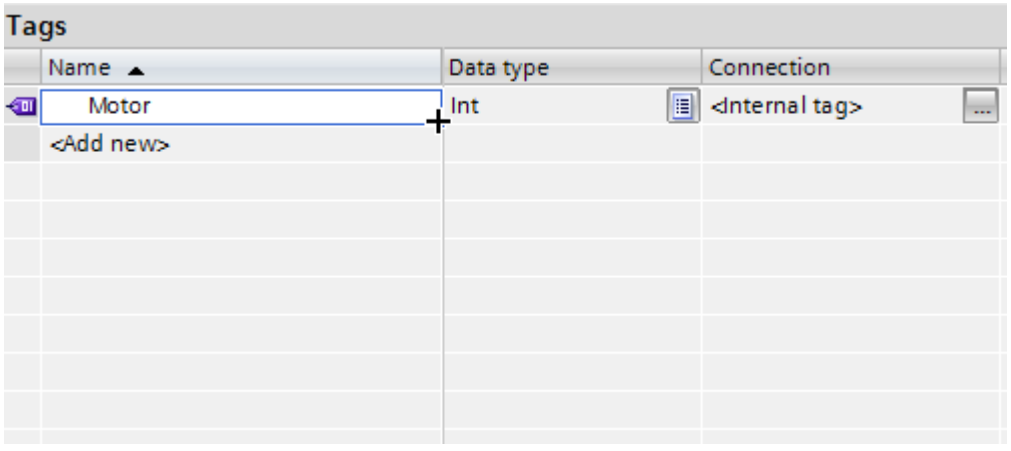
	Tips for effective configuring
You can configure multiple tags simultaneously and use them in the screen. If you use drag and drop to drag multiple tags from the detail view to the screen, an I/O field is created for each tag that is connected to the respective tag.	

Requirement

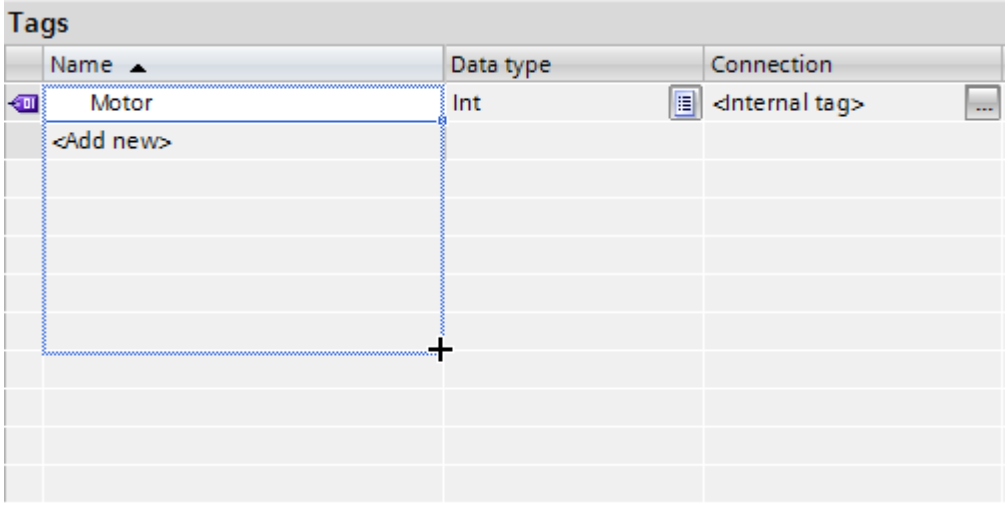
- The project is open.
- A tag table is open.
- The tag which is to serve as a template for other tags is configured.

Procedure

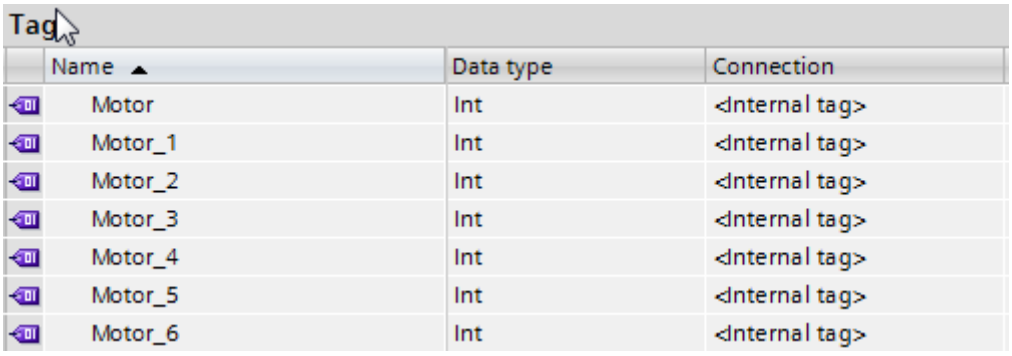
1. If you want to create new tags, mark in the "Name" column the tag that should be used as a template for the new tags.
   If you want to copy a property of a tag to the tags below it, select the cell which contains this property.
   The selected cell will be highlighted in color and a small blue square will appear in its bottom right corner. When you move the mouse over this square, the cursor will change to a black cross.



2. Hold down the mouse button and drag this square over the cells below that you wish to fill automatically.
   The marking will be extended to cover this area.



3. Now release the mouse button. All of the marked cells are filled automatically.
   New tags will be created in all empty rows in the marked area.



4. In the tag table, select all the tags that you want to configure at the same time.
   If the selected property is identical for all the tags, the setting for this property will appear in the Inspector window.
   The associated field will remain blank otherwise.
5. You can define the shared properties in the Inspector window or directly in the tag table.

Result

Depending on which cells were selected, the function may automatically fill individual properties or create and configure new tags.

5.2.6 Adapting the data type of a tag

Introduction

When you create a tag, you assign one of the possible data types to the tag. This data type depends on the type of data for which you would like to use the tag.

The data types available depend on the connected communication partner, such as a PLC.

Note

If you modify the data type of an existing, external tag, the previously defined tag address is identified as invalid. This reason for this is that the PLC address changes when the data type is modified.

Format adjustment

WinCC sets the data type of an external tag according to the data type of the connected PLC tag. If the data type of the PLC tag is not available in WinCC, a compatible data type is automatically used at the HMI tag. As required, you can specify that WinCC uses a different data type and converts the format of the data type of the PLC tag and the data type of the HMI tag.

In WinCC, you have access to the following data types:

HMI data type	Description	Value range
Bool	Binary tag	0 to 1
SInt	Signed 8-bit value	-128 ... +127
USInt	Unsigned 8-bit value	0 ... 255
Int	Signed 16-bit value	-32768 ... +32767
UInt	Unsigned 16-bit value	0 ... 65535
DInt	Signed 32-bit value	-2147483648 ... +2147483647
UDInt	Unsigned 32-bit value	0 ... 4294967295
LInt	Signed 64-bit value	-9223372036854775808 to +9223372036854775807
ULInt	Unsigned 64-bit value	0 to 18446744073709551615
Real	32-bit floating-point number IEEE 754	+-3.402823e+38
LReal	64-bit floating-point number IEEE 754	+-1.79769313486231e+308
Byte	Bit array of 8 bits	8-bit
Word	Bit array of 16 bits	16-bit
DWord	Bit array of 32 bits	32-bit
LWord	Bit array of 64 bits	64-bit
String	Text tag, 8-bit character set	-
WString	Text tag, 16-bit character set	-
WChar	Text tag	-
DateTime	Date/time format	01.01.1601 00:00 ... 31.12.9999 23:59:59
LTime	Signed 64-bit integer value	-9223372036854775808 ... +9223372036854775807 100ns

For format adaptation, select the desired PLC data type at the respective external tag. The suitable standard data type is then selected automatically in the "HMI data type" field for use in WinCC. Change the format adaptation as required.

Data types without format adaptation

The data types are shown 1:1 without format adaptation.

SIMATIC S7-300/400 data types without format adjustment

PLC data type	Description
Bool	No format adaptation
String	No format adaptation

5.2.7 Defining the acquisition cycle for a tag

Introduction

The value of an external tag can be changed in runtime by the PLC to which the tag is linked. To ensure that the HMI device is informed of any changes in tag values by the PLC, the values must be updated on the HMI. The value is updated at regular intervals while the tag is displayed in the process screen or is logged. The interval for regular updates is set with the acquisition cycle.

Requirement

- You have created the tag for which you want to define an acquisition cycle.
- The Inspector window with the tag properties is open.

Procedure

To configure an acquisition cycle for a tag, follow these steps:

1. In the Inspector window, select "Properties > Properties > Settings".
2. Select the acquisition mode for the tag:
   - "Cyclic in operation": The tag is updated at regular intervals as long as it is displayed or archived in the screen.
   - "On demand": Updating is performed only on demand, for example, with the "UpdateTag" system function or a script.
3. If you have selected the "Cyclic in operation" acquisition mode, specify the desired cycle time in the "Acquisition cycle" field.
   You have the option of selecting a user-defined cycle.

Note

For structured HMI tags, the acquisition mode can be selected for the respective structured HMI tag as well as their individual subordinate elements.

When the acquisition mode of structured HMI tags is changed, it is applied to all subordinate elements. This means changing the acquisition mode may overwrite subordinate elements.

Tips for an efficient procedure

Configure the acquisition cycle directly in the work area of the tag table. To view hidden columns, activate the column titles using the shortcut menu.

Result

The configured tag is updated in runtime with the selected acquisition cycle.

See also

Updating the tag value in runtime (Page 617)

Defining cycles (Page 224)

5.2.8 Specify tag persistency

Introduction

In Runtime Unified you have the option to define tag persistency for internal tags. The last values of these persistent tags are used after Runtime has been started.

A separate database, in which the last values of the persistency tags are stored, is used for tag persistency. These values are available again after restarting runtime or restarting or switching off the HMI device.

You activate tag persistency in the runtime settings of the respective HMI device by specifying the database storage location.

Note

Complete loading of a runtime project

Tag persistency can only be used when you enable the option "Keep current values of tags and pending alarms in runtime" in the "Load preview" dialog.

When you disable the option "Keep current values of tags and pending alarms in runtime" in the "Load preview" dialog, the database for the tag persistency is emptied. The persistency tags apply the defined start value. If no initial value is defined, the valid default value is used for the data type.

Requirement

- The tag for which you want to set the persistency is created.
- The Inspector window with the properties for this tag is open.

Procedure

1. In the Inspector window, select "Properties > Properties > Settings".
2. Activate the option "Persistency for internal tags" under "Persistency".
3. Download the full project.

Result

The last value of the configured tag is stored in the tag persistency database.

See also

Creating internal tags (Page 629)

Initial download of a project (Page 7185)

Storage system (Page 7173)

Storage system (Page 7138)

5.2.9 Defining limits for a tag

Note

Limitation

Tags with the following data types do not support limits:

- Array and array elements
- Byte
- Char
- DWord, LWord and Word

Introduction

For numerical tags, you can specify a value range by defining a low and high limit as well as the threshold values.

Requirement

- The tag for which you want to set the limits is created.
- The Inspector window with the properties for this tag is open.

Procedure

To define limits for a tag, proceed as follows:

1. In the Inspector window, select "Properties > Properties > Range". If you want to define one of the limits as a constant value, select "Constant" using the button. Enter a number in the relevant field.
   If you want to define one of the limits as a tag value, select "HMI tag" using the button. Use the object list to define the tag for the limit.
2. To set additional limits for the tag, repeat step 1 with the appropriate settings.

	Tips for an efficient procedure
You also configure the limits directly in the tag table. To view hidden columns, activate the column titles using the shortcut menu.	

Result

You have set a value range defined by the limits for the selected tag.

See also

Limits and start values of a tag (Page 618)

5.2.10 Specify "Local session" scope

Introduction

Internal tags apply "system-wide" by default.

The scope of an internal tag can be changed to "Local session". In a multi-user environment, session-related data is processed independently in each local session.

The use of local session tags in Unified Collaboration and in the web client is supported.

Example scenarios for local session tags

- Individual navigation in screen windows or in different menu structures
- Session-related blocking/unblocking of the user
- Session-related position, alignment and rotation of objects in a screen.

Restrictions

Note

A configuration of tags that contradicts the restrictions, leads either to an error in the engineering system or to an error in runtime.

The "Local session" scope

- is only available for internal tags.
- is only available for tags with elementary data type. Arrays or structure tags cannot be limited to a local session.

Local session tags

- are only accessible within the respective user session
- can only be used in local scripts. Using it in a global script will result in an error.
- cannot be used as a trigger of a task
- cannot be used as a trigger of alarm or for dynamization of an alarm list
- cannot be used to dynamize objects through a resource list
- cannot be used to specify a limit value, substitute value or start value of another tag

- cannot be used as logging tag
- cannot be logged
- do not support the properties
  - GMP (Good Manufacturing Practice)
  - Persistence
- cannot be used in Openness applications

End of a session

- The values of the local session tags are not saved and are lost.

Procedure

1. Open a HMI tag table.
2. Display the "Scope" column.
3. Create an internal tag or select an already created internal tag.
4. In the "Scope" column, select the "Local session" entry.
   You can also make this setting in the Inspector window under "Properties > Properties > Settings".

Result

You have created a tag that can take on different values in different sessions.

This tag can, for example, be addressed by the same script in different sessions. The dynamization of an object can be controlled by the same tag, which takes different values in different sessions.

Changing the version of a device

- Delete the local session tags before changing the device/device version
- Create the tags again after the change.

Note

Local session tags only as of V18

If the version of the device is smaller than V18, the tag automatically becomes "system-wide" because the limited scope is not supported.

5.2.11 Synchronizing tags

Introduction

To synchronize the PLC and HMI tags, WinCC offers the following options:

- Synchronizing tags with or without name matching between PLC and WinCC
  The following options are available for this:
- Link tags with addresses in the PLC
  This procedure is suitable, for example, if changes were made to the connection between the HMI device and the PLC and the tag connections were lost in the process. The function can also be used if you have configured the control program and HMI project separately.

Requirement

- External HMI tags have been created.
- PLC tags have been created.
- An HMI connection to a PLC in the project has been established.

Procedure

To synchronize HMI tags with PLC tags, follow these steps:

1. In the project tree, select the directory that contains the tags in question.
2. Select "Synchronize with the PLC tag" from the shortcut menu.
   A dialog opens.

3. Select the option you want to use.
   If you want to synchronize the tags without name matching, disable "Replace WinCC tag name with PLC tag name".
   If you want to reconnect HMI tags with absolute access, select "Data type and absolute address match".
4. Confirm with "Synchronize".
   The system searches for a suitable PLC tag according to the selected option.

Result

The external HMI tags are synchronized with the PLC tags.

If you have selected the option "Data type and absolute address match", the tag connection is established as soon as a suitable PLC tag is found.

If you have selected a different option, the WinCC tags are updated accordingly and the PLC tag names are applied in WinCC.

See also

Settings for tags (Page 7140)

Settings for tags (Page 7175)

5.2.12 Importing and exporting tags

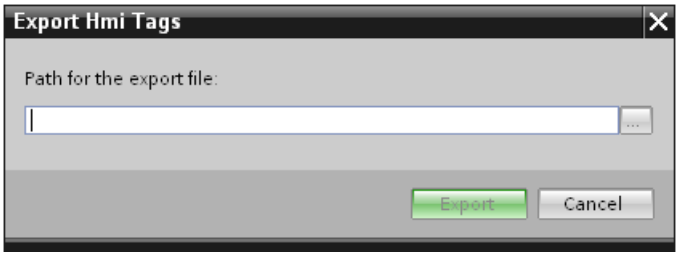
Introduction

WinCC gives you the option of exporting tags to an .xlsx file and reimporting them into the project once you are done editing them. You export and import tags in the "HMI Tags" editor

For importing the tags, the xlsx import file must be structured according to the requirements. You will find more detailed information on the import file under "Export and import of tags (Page 622)".

Exporting tags

1. Click the  button in the "HMI Tags" tab.
   The "Export" dialog box opens.



2. Click "..." and specify in which file the data are saved.
3. Click "Export".
   The export will start.

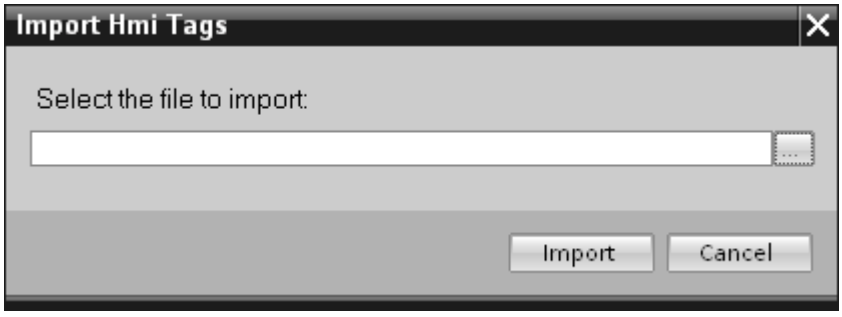
Note

It is not possible to export HMI tags of the data type "UDT" which contain structured elements via Excel for subsequent editing.

After export, only the higher-level HMI tag appears in Excel. Its lower-level elements cannot be edited.

Importing tags

1. Click "HMI tags" in the project tree.
2. Double-click "Show all tags". The "HMI tags" editor opens.
3. Click  in the "HMI Tags" tab.
4. The "Import" dialog box opens.



5. Click "..." and select the file that you want to import.
6. Click "Import".
   The import starts

Result

The relevant tags have been created in WinCC. Alarms relating to the import operation are displayed in the output window. A log file is saved in the source directory of the import files. The log file has the same name as the respective import file but with the "*.xml" extension.

Check when importing the data whether there are any links to objects, for example, dynamic parameters such as tags.

- If an object with the same name already exists, the existing object is used.
- If no object of the same name yet exists, create an object with the relevant name or create a new link.

Note

The syntax of the import file is checked during xlsx file import. The meaning of the properties or dependencies between the properties is not checked.

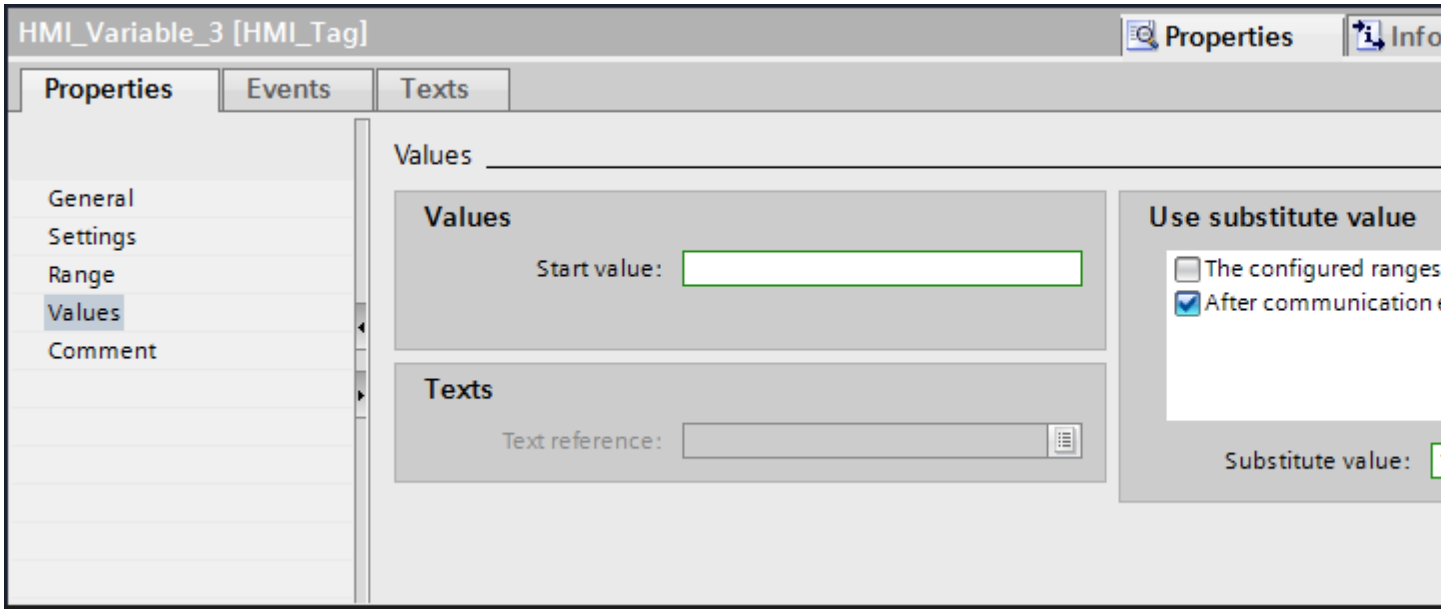
5.2.13 Defining a substitute value

Introduction

You can define a specific value as a substitute value for a tag.

In the "Use substitute value" area you define when WinCC should use this substitute value. The current process value is then not accepted from the automation system.

You can define a substitute value for the following cases:



- The configured ranges have been violated
  If you have set limit values for the tag, WinCC sets the substitute value as soon as the process value violates a limit.
- In the event of a communications error
  WinCC sets the substitute value when the connection to the automation system is disturbed and there is no valid process value.

Requirement

- The tag table is open.
- The Inspector window with the tag properties is open.
- The HMI tag is linked to a PLC tag

Procedure

To configure a substitute value, follow these steps:

1. Select the desired tag in the tag table, and select "Properties > Properties > Values" in the Inspector window.
2. In the "Use substitute value" segment, select when you want WinCC to use this substitute value in the tag.
3. Enter the required substitute value in the "Substitute value" field.

Result

The configured tag is populated with the substitute value in runtime once the selected condition is fulfilled.

Note

If you have set a high or low limit in an I/O field, you cannot enter any value outside these limits.

WinCC ignores incorrect entries and therefore does not set a substitute value. The substitute value is only set by WinCC when an incorrect process value is read.

5.2.14 Connecting a tag to another PLC

Introduction

In WinCC, you can change the PLC connection of a tag at any time. This is needed when you change the configuration of your plant, for example.

Depending on the PLC selected, you may need to modify the configuration of the tag. The tag properties which must be changed will be highlighted in color.

Requirement

- The external tag, whose connection you wish to change, must already exist.
- The connection to the PLC must already exist.
- The Properties window for this tag is open.

Procedure

To change the PLC connection of a tag, proceed as follows:

1. In the Inspector window select "Properties > Properties > General."
2. Select the new connection in the "Connection" field.
   The tag properties that you must change will be highlighted in color in the tag table and in the Inspector window.
3. Change all highlighted properties of the tag to suit the requirements of the new PLC.

Result

The external tag is connected to the new PLC.

5.3 Configuring user data types

5.3.1 Creating an HMI user data type

Introduction

You create an HMI user data type in the project library.

Requirement

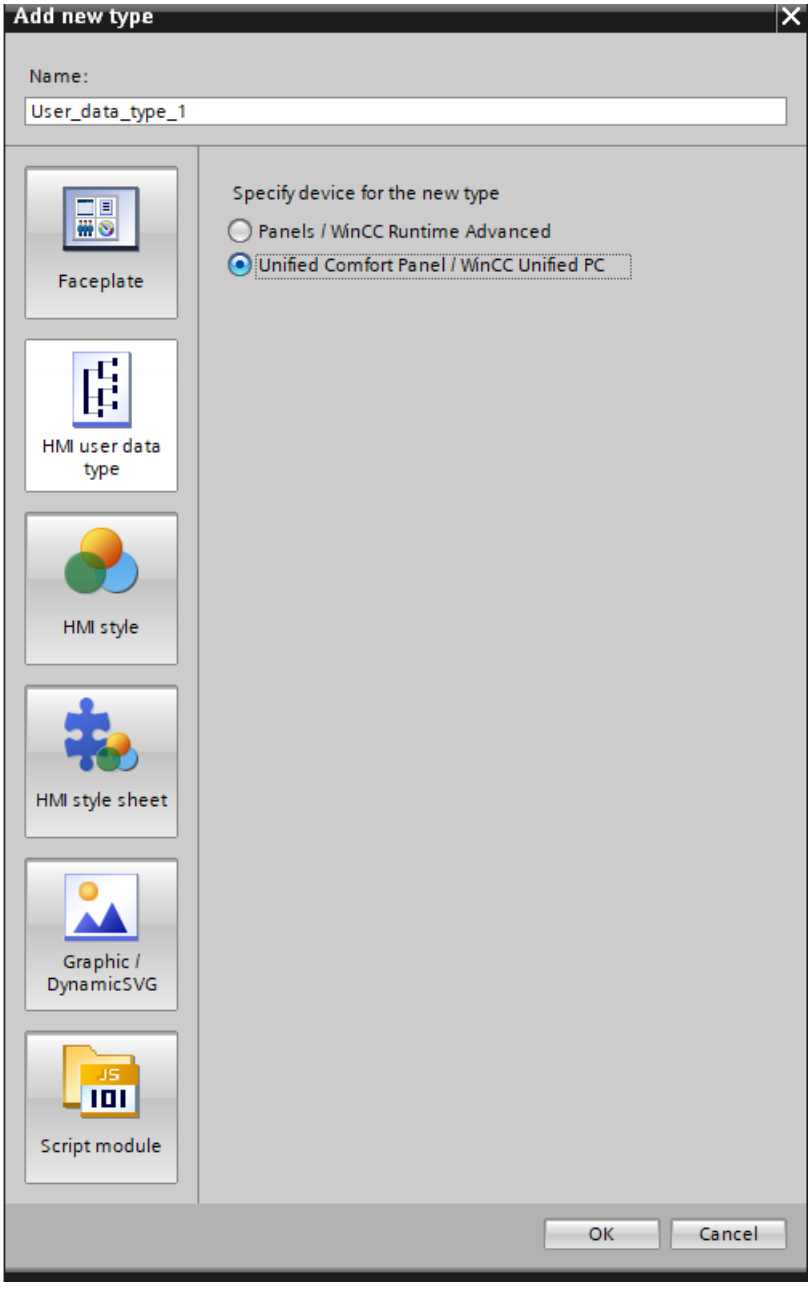
- A project is open.
- The "Libraries" task card is displayed or the library view is open.

Procedure

To create an HMI user data type, follow these steps:

1. Click the "Libraries" task card.
2. Click the "Project library" entry.
   The folder structure of the project library is open.

3. Click "Add new type" in the "Types" folder.
   A dialog opens.



4. Click the "HMI user data type" button in the dialog box.
5. In the "Specify device for the new type" area, select the HMI device on which the HMI user data type is used.
6. Enter a descriptive name in the "Name" field.
7. Click "OK" to apply your settings. The HMI user data type is created. The library view opens.

Result

An HMI user data type with the configured properties is created. Version 0.0.1 of the HMI user data type is created and receives the status "in work".

Create the required user data type elements in the next step.

Before you use the version of an HMI user data type, for example at a tag, the version must be released.

5.3.2 Creating HMI user data type elements

Introduction

You add or delete user data type elements in the "HMI user data types" table.

Requirement

- The library view is open.
- An HMI user data type is created and opened in the editor.

Procedure

1. Select a communication driver for the HMI user data type.
   - If you select the <Internal communication> entry, you can only assign the HMI user data type to the internal tags as the data type.
   - If a connection to a PLC is selected as the communications driver, you can only assign the HMI user data type to tags with a connection to this PLC as the data type.
   - The configured communication driver applies to all user data type elements of an HMI user data type. In an HMI user data type, you can define for each user data type element whether the configured driver is used for the PLC or internal communication.
2. Double-click "Add" in the "Name" column of the table. A new user data type element is added to the HMI user data type.
3. Assign a name.
4. Select the required data type in the "Data type" field.
5. Create as many user data type elements as you need.
6. You configure the user data type elements in the "Properties" group of the Inspector window.

	Tips for an efficient procedure

You can also configure the properties of the user data type elements directly in the table. To view hidden columns, activate the column titles using the shortcut menu.

If you want to transfer a property of a user data type element to other user data type elements, follow these steps:

1. Select the cell that contains the property.
   The selected cell will be highlighted in color and a small blue square will appear in its bottom right corner.
2. When you move the mouse over this square, the cursor will change to a black cross.
3. Hold down the mouse button and drag the cursor up or down over the cells that you want to fill out automatically.
   The marking will be extended to cover this area.
4. Now release the mouse button.
   The "Autocompletion" dialog opens.
5. Select the "Overwrite attributes of the user data type element" option.

Result

You have added elements to version 0.0.1 of the HMI user data type. The version 0.0.1 has the status "in work".

To use the version in the project, release the version.

5.3.3 Adding a PLC user data type to the project library

Introduction

You can use PLC data types in the HMI device.

Requirement

- A project is open.
- A PLC data type is configured in the PLC.
- The project view is open.
- The project library is open.

Procedure

1. Drag the PLC data type to the "Types" directory of the project library with a drag-and-drop operation.
   The "Add type" dialog opens.
2. Specify a type name and a version and click "OK" to confirm.
   In version 0.0.1, the PLC user data type appears in the project library.

Result

You have added the PLC user data type of the project library.

Version 0.0.1 of the PLC user data type was created and receives the status "default".

5.3.4 Managing versions of user data types

Introduction

All HMI user data types have at least one version. When an HMI user data type is created, a version is created at the same time; this version has the status "in work". You can edit the user data type in this status as required. When the editing is complete, you release the version of the HMI user data type. The latest released version is always used at the default.

Requirement

- An HMI user data type is created.
- The HMI user data type has the version 0.0.1. and the status "in work".
- The "Libraries" task card or the library view is open.

Releasing a version

1. Select the version 0.0.1 of the HMI user data type in the project library.
2. Select "Release version" in the shortcut menu.
   A dialog opens.
3. If necessary, change the properties of the version:
   - Enter a name for the type in the "Type name" field.
   - In the "Version" field, define a main and an intermediate version number for the version to be released.
   - To clean up version management of the type, enable "Delete unused type versions from the library".

You have released version 0.0.1 of the HMI user data type.

Editing a version

1. Select, for example, the released version 0.0.1 of an HMI user data type in the project library.
2. Select "Edit type" from the shortcut menu.

The library view opens. The new version 0.0.2 of the HMI user data type was created.

The version has the status "in work".

Restoring the last version of the HMI user data type

The last released version of the HMI user data type is version 0.0.2.

You edit the HMI user data type. A new version of the HMI user data type, 0.0.3, is generated and receives the status "in work".

1. Select the version of the HMI user data type in the project library.
2. Select "Discard changes and delete version" in the shortcut menu.

Alternatively

1. If you have opened a version for editing, click "Discard changes and delete version" in the toolbar.
   The version is deleted.

All changes to the HMI user data type since the last release operation are discarded. The HMI user data type is released again and has version 0.0.2.

Deleting user data type

If you delete a user data type, all instances and master copies of this user data type are deleted as well. The same is true for HMI tags that use an HMI user data type and for PLC user data types.

To delete a user data type, follow these steps:

1. In the project library, under "Types", select the user data type you want to delete.
2. Select "Delete" from the shortcut menu.

See also

Setting a user data type version as default (Page 650)

5.3.5 Setting a user data type version as default

When you add a user data type to a library, use data types from a library, and release or update versions, the highest released version is used as the default. This version has the "default" identifier. Alternatively, you can specify a different released version as default.

Requirements

- You have opened the project library or a global library.
- The desired type version is released.

Procedure

1. Select a version.
2. Right-click to call up the shortcut menu.
3. Select the shortcut menu command "Set as 'default'".

Result

When instantiating, creating, releasing and updating, the default user data type version is used instead of the highest released version. The default user data type version is also used when you create newer user data type versions.

The icon in the "Status" column shows whether the references of the type are consistent with other types:

- Green: The references of the user data type are consistent. The version of the user data type labeled "Default" references the "Default" user data type version of the dependent type.
- Yellow: The references of the user data type are inconsistent. The version of the user data type labeled "Default" does not reference the "Default" user data type version of the dependent type.

5.3.6 Creating tags with a HMI user data type

Introduction

When a tag is created, you assign the version of an HMI user data type as a data type. In the "Tag" editor you can create internal tags or tags with a link to a PLC. A tag provides all HMI user data type versions that use the same communication driver as the tag itself.
You can only use an HMI user data type in combination with a PLC when you have selected absolute addressing.

Requirement

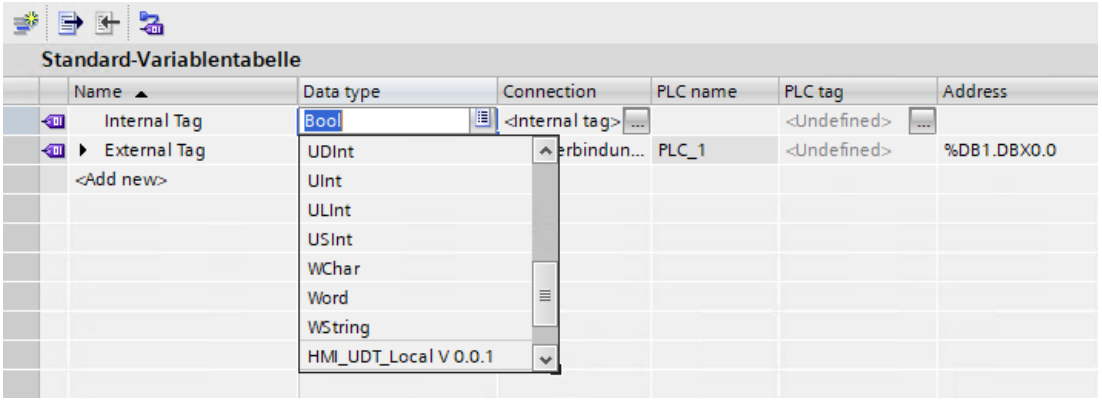
- An HMI user data type with a user data type element is created.
- The HMI user data type is released.
- The tag table is open.
- The Inspector window with the tag properties is open.

Procedure

To create a tag of the "User data type" data type, follow these steps:

1. In the "Name" column, double-click "Add" in the tag table. A new tag is created.
2. Enter a unique tag name in the "Name" field.
3. Select the connection to the required PLC in the "Connection" box.

4. Select the desired version of the HMI user data type in the "Data type" field.
   The selected connection determines which HMI user data types are displayed.
   For internal tags, only HMI user data type versions of the <Internal user data type> type are available.



Note

For tags with a connection to a PLC, only those HMI user data types that have a link to a PLC are available.

5. In the "Address" field, enter the address of the PLC that you want to access with the external tag. The specified address must always point to the start data bit, for example, <DB1.DBX0.0>.

Result

You have created a tag of the "User data type" data type. In additional steps you can configure the tag, for example, by setting the start value and limits.

If you wish to change the properties of an HMI user data type tag, you must change the properties of the HMI user data type elements.

Properties, such as "Start value" and "Linear scaling", can also be changed in the HMI user data type instances used.

5.4 Logging tags

5.4.1 Basics

5.4.1.1 Basics of data logging

Introduction

Data logging is used to collect and log process data from an industrial system. This allows you to analyze error statuses and document your process.

From the archived process data, you extract important business and technical information about the operating status of a plant in an evaluation.

Logging concept

WinCC Unified is optimized for event-driven logging. The process values are saved by configured events and selected processing mechanisms in the data log. Event-driven logging does not depend on the logging mode.

In the past, we have used query-driven logging. This method saved the values at fixed cycles without additional processing in the log. You can map query-driven logging by using the "Cyclic" logging mode and by not configuring any smoothing or compression. The procedure is not recommended.

Event-driven logging offers the following advantages compared to query-driven logging:

- High accuracy
  Note that logging can only be as precise as the data acquisition at the PLC.
- High performance because fewer values must be logged

If you need a query-driven representation of the values for data evaluation, we recommend that you use event-driven logging and then interpolate the missing values.

Configuration

You configure the logging tags in the "Logging tags" tab in the "HMI tags" editor.

You use logging tags in the following controls in Runtime:

- Trend control
- f(x) trend control
- Process control

Use

You can use data logging for the following tasks:

- Early detection of danger and fault conditions
- Increase of productivity
- Increase of product quality
- Optimization of maintenance cycles
- Documentation of process value trends

Size of a log entry in the data log (Page 654)

5.4.1.2 Size of a log entry in the data log

The size of a log entry depends on the database type used.

The following values result for the data log:

	SQLite	**Microsoft SQL**
Additional memory requirement per segment	Approx. 0.5 MB	Approx. 5 MB
Size of a log entry	Approx. 50 bytes	Approx. 50 bytes

See also

Basics of data logging (Page 653)

How it works (Page 839)

5.4.1.3 Logging modes and logging process

Logging begins when Runtime starts. The process values to be logged are acquired, processed, and saved in the data log. Current or previously logged process values can be output in runtime.

Three logging modes are available for logging tags:

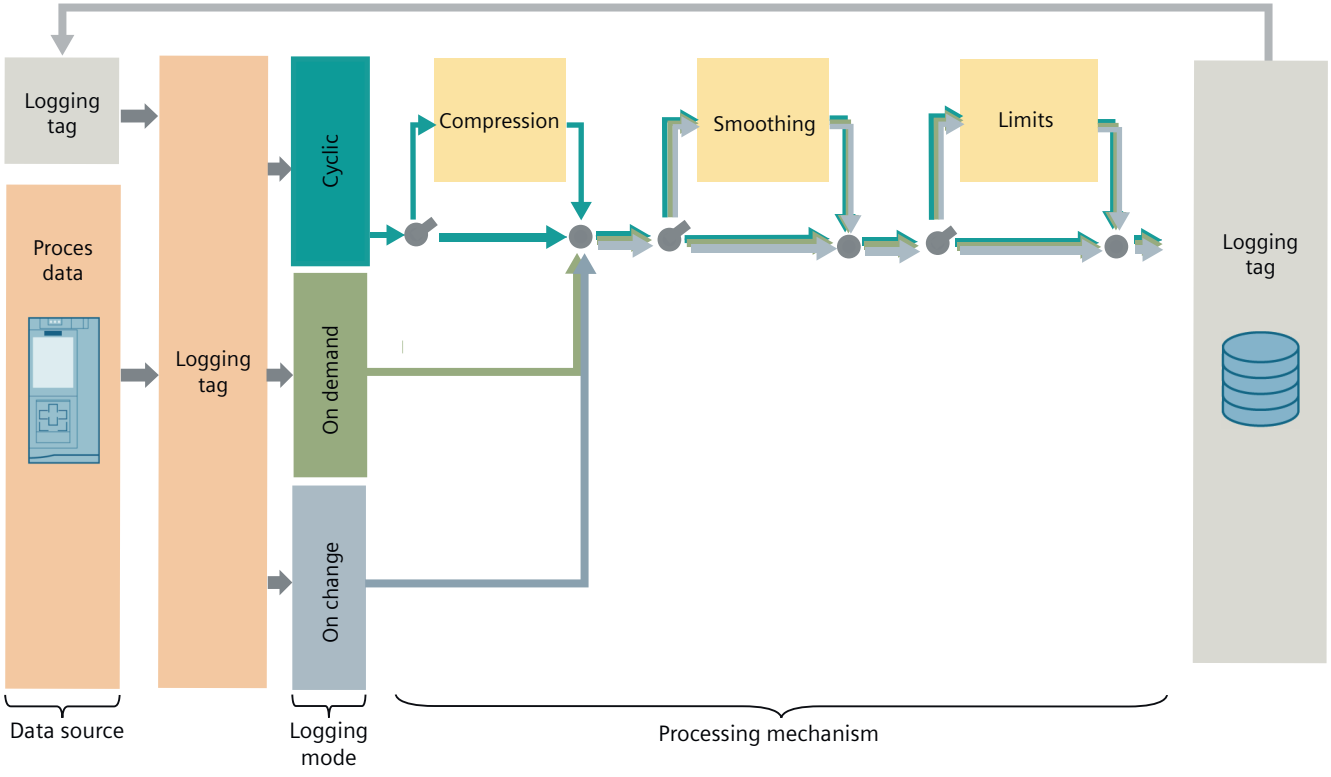
- On change: When the process value changes, it is logged.
- On demand: When the tag trigger is triggered, the process value is logged.
- Cyclic: Logging is carried out according to a defined cycle.

The amount of logged data can be reduced due the following processing mechanisms:

- Limits
- Smoothing
- Compression
  When you select an existing logging tag as source, the values are compressed with the selected compression mode.

Data logging ends when runtime is terminated.

Logging process



"On change" logging mode

When the process value changes, the process value is saved in the data log in the "On change" logging mode while runtime is running. You can also define a tag trigger.

- The acquisition cycle of the external tags controls when the process value is read from the memory of the connected PLC.
  The external tags in WinCC correspond to a process value in the memory of a connected PLC.
- When the process value changes, the runtime component of the logging system processes the process value.
- If you have configured smoothing, the value is calculated accordingly.
- The processed process value is written to the data log.

For defined tag triggers, the tag is also logged when the trigger occurs.

"On demand" logging mode

- The process value is read from the PLC when the request by the tag trigger occurs.
  The external tags in WinCC correspond to a process value in the memory of a connected PLC.
- If you have configured smoothing, the value is calculated accordingly.
- The processed process value is written to the data log.
- With each new request by the tag trigger, the process value is read, processed and logged again from the memory of the connected PLC.

"Cyclic" logging mode

The process values are recorded in constant cycles and stored in the data log. You have the option of using a predefined cycle or a user-defined cycle.

The process value is only logged if it differs from the previous value. If every value is to be logged, no smoothing and no compression must be configured for the logging tag.

Note

Depending on the configuration, the database can grow very quickly. This can occur, for example, when you select a short cycle without smoothing and without compression.

- The acquisition cycle of the external tag controls when the process value is read from the memory of the connected PLC.
  The external tags in WinCC correspond to a process value in the memory of a connected PLC.
- If you have configured smoothing or compression, the value is calculated accordingly.
- The logging cycle determines when the processed process value is written to the log database.

Note

The logging cycle is independent of the acquisition cycle of the external tag. It does not make sense to set the logging cycle shorter than the acquisition cycle.

5.4.2 Configuring logging tags

Introduction

You manage the logging tags at various locations:

- You have the following options in the "HMI tags" editor:
  - Create logging tags
  - Edit logging tags
  - Delete logging tags
- You have the following options in the "Logs" editor:
  - Edit logging tags
  - Delete logging tags

Note

Logging tags are deleted

Logging tags are deleted with the following actions and must be recreated:

- The logging tag is assigned to an array element. The data type of the array is changed.
- The logging tag is assigned to a user data type element. The data type of the user data type element is changed, and a new version is released without updating the associated instances. The new version of the user data type is assigned to the tag manually in the "HMI tags" editor.

Note

Local session tags

Local session tags cannot

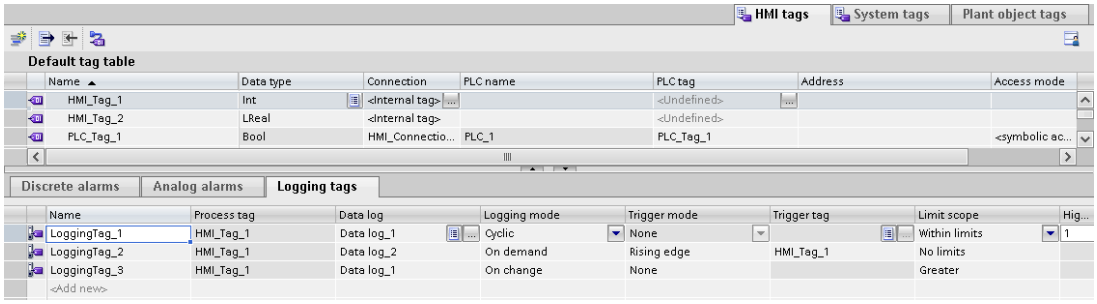
- be used as a trigger
- be used as an logging tag
- be logged.

Requirement

- The "HMI tags" editor is open.
- The logging tag tab is expanded.
- You have created a tag.

Procedure

1. Select an existing tag in the tag table.
2. In the table of the "Logging tag" editor table, double-click "<Add>" in the "Name" column.
   A new logging tag is created.
   The logging tag is linked to the selected tag. The data type of the logging tag corresponds to the data type of the higher-level tag.



3. Assign a data log to the new logging tag. Every logging tag can be assigned to another log.
4. Specify the logging mode.
5. When the "Cyclic" logging mode is set, define the logging cycle and the factor under "Properties > Properties > Cycle".
   The product of logging cycle and factor determines the time interval between two logs. For example, if you define "1 second" as the time basis and "5" as the time factor, the process values are logged every 5 seconds.
   The factor is a multiplier for the duration of the configured logging cycle.
   The factor is used to reduce the number of cycle times. Cycle times that you configure are used for the acquisition cycle and the logging cycles to acquire and then log the measured values. As the different measured values are acquired and logged with different cycle times, different times must also be defined. The factor reduces the number of defined times. This means that times with factor are used several times. A logging cycle of 120 s with factor = 1 corresponds to a logging cycle of 60 s with factor = 2. Both measured values are logged every 120 s.
6. Define the tag trigger depending on the logging mode.
7. Define the limit values.
8. Define the smoothing.
9. If you have selected the "Cyclic" logging mode, define the compression.

	Tips for an efficient procedure
You can also configure the properties of the logging tags directly in the logging tags table. To view hidden columns, activate the column titles using the shortcut menu.	

Copying logging tags

You can copy logging tags within an HMI device. To do this, use the shortcut menu or the shortcuts <Ctrl + C> and <Ctrl + V>.

You copy logging tags, for example, from:

- "HMI tags" editor
- "Logs" editor
- Data source of a control in which logging tags are used

You insert logging tags, for example, at the following locations:

- "HMI tags" editor
- Data source of a control in which logging tags are used

Note

If you hare using cascading logging tags by having defined a source under "Compression", the reference becomes invalid due to the copy process. Redefine the source for the inserted logging tag.

Configuring smoothing (Page 663)

Configuring compression (Page 667)

5.4.3 Configuring multiple logging tags

Introduction

You can create multiple logging tags at the same time in the "HMI tags" editor. Then you adapt the properties of multiple logging tags by automatic filling. This will shorten the configuration time.

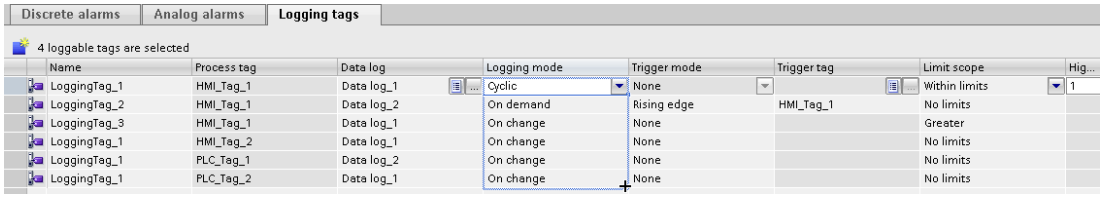
You edit and delete the logging tags in the "HMI tags" editor or in the "Logs" editor.

Requirement

- Multiple tags are configured.
- A tag table is open.

Procedure

1. Select multiple tags of the tag table.
   If you have already configured logging tags, all logging tags that are assigned to the selected tags are displayed.
2. Select the button "Add new logging tag to each selected loggable tag".
   A tag is added to each selected tag that can be archived.
3. When you want to transfer a property of a logging tag to other logging tags, select the cell that contains this property.
   The selected cell will be highlighted in color and a small blue square will appear in its bottom right corner.
4. When you move the mouse over this square, the cursor will change to a black cross.
5. Hold down the mouse button and drag the cursor up or down over the cells that you want to fill out automatically.
   The marking will be extended to cover this area.



6. Now release the mouse button.
   All of the marked cells are filled automatically.

Tips for an efficient procedure

For a better overview, you can sort the columns of the logging tag table in ascending or descending order. To do this, click on the column title. To view hidden columns, activate the column titles using the shortcut menu.

Result

- You have created multiple logging tags.
- You have defined the properties of the logging tags through automatic filling.
  If properties for individual logging tags cannot be applied, the previous values are retained.

5.4.4 Configuring tag triggers

Introduction

When you use the "On demand" and "On change" logging modes, you have the option of defining a tag trigger. In the "On demand" logging mode, you log the tags regardless of the value change, and you can trigger logging, for example, at the end of a process or a shift. When the defined bit of the trigger tag changes according to the defined mode, the tag is logged.

Requirement

- You have created a logging tag.
- The logging mode "On demand" or "On change" is defined for the logging tag.

Procedure

1. Select an existing logging tag in the "Logging tags" tab.
2. In the Inspector window under "Properties > Properties", select the "Tag trigger" area.

   Note

   Local session tags cannot be used as triggers.

3. Specify a trigger mode:
   - None: The tag trigger is not used.
   - Rising edge: When the bit changes from 0 to 1, the trigger is triggered.
   - Falling edge: When the bit changes from 1 to 0, the trigger is triggered.
   - Rising and falling edge: When the bit changes from 0 to 1 or from 1 to 0, the trigger is triggered.
4. Define the trigger tag.
5. Specify the bit that is to be considered.

Tips for an efficient procedure

You can also configure the tag trigger directly in the logging tags table. To view hidden columns, activate the column titles using the shortcut menu.

Result

You have defined a tag trigger that triggers logging.

See also

Configuring logging tags (Page 657)

5.4.5 Configuring limit values

Introduction

You have the option of archiving tag values outside or within a defined limit scope. To do this, define a valid range and the corresponding limit values. In runtime, the process values are evaluated after the configured limit scope and only the process values within the defined range are logged.

Limit scope

The following limit scopes are available:

Limit scope	Description	Example
No limits	No limit values are defined for logging.	Limit values are not taken into consideration.
Greater	The process values that are greater than the lower limit value are logged.	Low limit =3; Logged values = 4, 5, 6
Less	Only the process values that are less than the high limit are logged.	High limit =6; Logged values = 3, 4, 5
Greater or equal	Only process values that are equal to or greater than the lower limit are logged.	Low limit =3; Logged values = 3, 4, 5, 6
Less or equal	Only the process values that are equal to or less than the high limit are logged.	High limit =6; Logged values = 3, 4, 5, 6
Within limits	Only the process values that are within the two configured limits are logged.	Low limit = 3, high limit = 6; Logged values = 4, 5
Within or equal	Only the process values that are within the two limits or equal to one of the limit values are logged.	Low limit = 3, high limit = 6; Logged values = 3, 4, 5, 6
Outside limits	Only the process values that are outside of the two configured limits are logged.	Low limit = 3, high limit = 6; Logged values = 1, 2, 7, 8
Outside or equal	Only the process values that are outside the two limits or that correspond to one of the limit values are logged.	Low limit = 3, high limit = 6; Logged values = 1, 2, 3, 6, 7, 8

Requirement

- You have created a logging tag.

Procedure

1. Select an existing logging tag in the "Logging tags" tab.
2. In the Inspector window under "Properties > Properties", select the "Limit values" area.
3. Specify the limit values. You have the following options:
   - Use constants.
     Select "Constant" using the selection button.
     Enter a number in the relevant field.
   - Use HMI tags.
     Select "HMI tag" using the selection button.
     Open the selection dialog. Only tags that correspond to the data type of the logging tag are displayed. Local session tags are not permitted.
     Select a tag.
   - Apply the limit values of the associated HMI tag.
     Activate "Use tag limits".
     The limit values of the HMI tag are used and grayed out in the corresponding fields.

	**Tips for an efficient procedure**
You can also configure the limits directly in the logging tags table. To view hidden columns, activate the column titles using the shortcut menu.	

Result

You have specified a value range for the selected logging tag that is defined by the limit values.

See also

Configuring logging tags (Page 657)

5.4.6 Configuring smoothing

Introduction

You can compress the data volume of the logged data using smoothing to reduce the memory space required. Smoothing reduces the noise in the collected data.

The process values are only logged in accordance with certain predefined criteria.

Note

Smoothing

If the value "No smoothing" is set in the properties of the logging tag under "Smoothing > Mode", the values are nevertheless smoothed.

Example:

A logging tag changes its value as follows: "100" > "101" > "101".

Even if "No smoothing" is set in the properties of the tag, the values [100, 101] are logged.

Requirement

- You have created a logging tag.

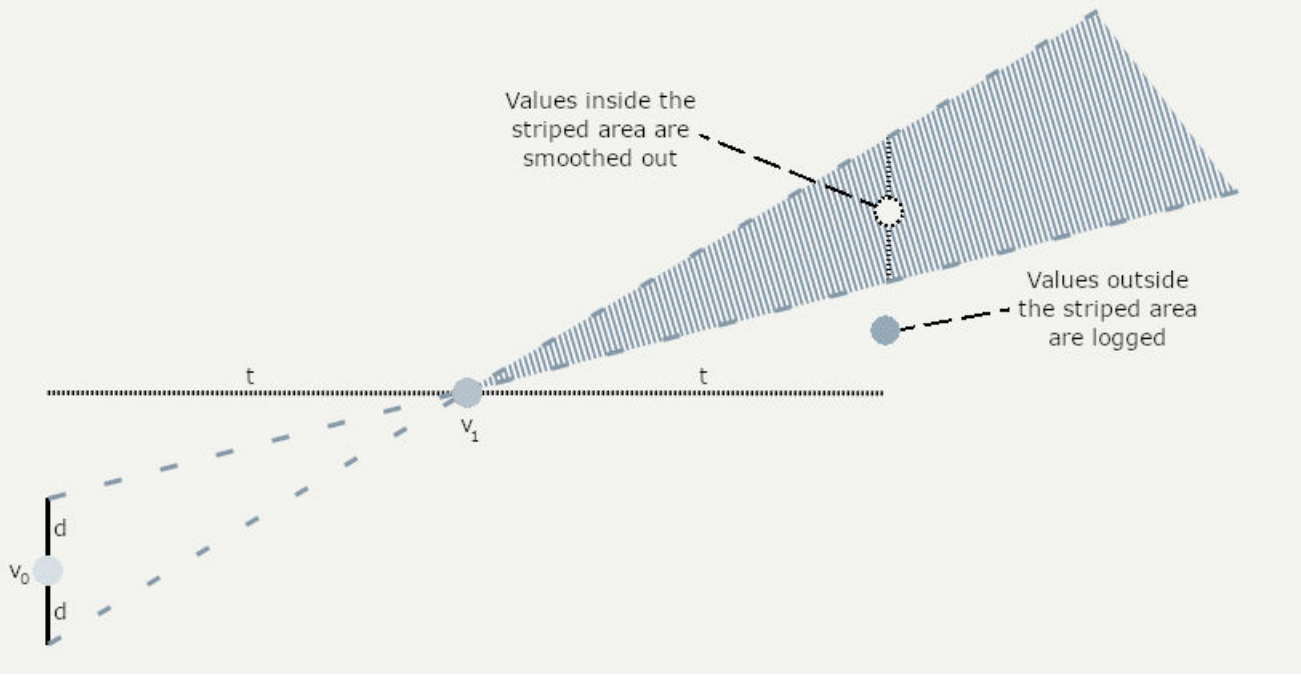
Procedure

Select one of the following modes:

- No smoothing
  The values are logged without smoothing.
- Comparing values
  Values are logged when the value changes and/or the quality code is changed. No logging is triggered when only the time stamp changes.

- Value
  You specify a limit value that defines the maximum permitted distance between the values. All value changes occurring within the defined interval from the last logged value are not logged.

- Relative value
  You specify a percentage deviation that defines the maximum interval between the values. All value changes occurring within the defined interval relative to the last logged value are not logged.
  Example:
  - You define a deviation of 10%, the last logged value is 100.
  - The value 105 is not logged because the value change is less than 10%. On the other hand, the value 130 is logged because the value change is more than 10% and is therefore relevant for logging.
- Swinging door
  The Swinging Door algorithm is a combination of value-based and time-based smoothing. The swinging door algorithm evaluates values on the basis of the defined rate of change and only logs them if the following value is outside the calculated range. The compression rate depends on the maximum tolerated deviation. The deviation is set as an absolute value.



t	Time interval between received values
d	Configured deviation
v_0	Previously logged value
v_1	Current value

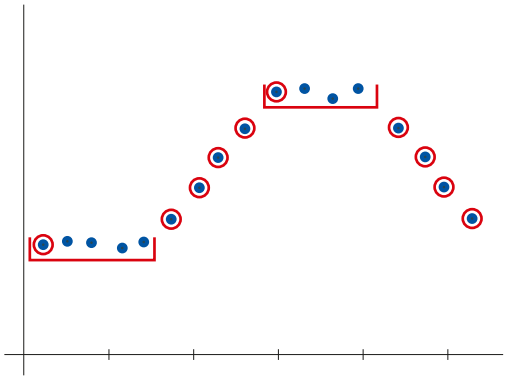
The starting point for calculating the next logging time is the last value logged.
Using the set deviation, you can influence the precision with which the values are saved. The greater the deviation, the fewer values are logged. Values for which "Deviation is within the tolerated deviation" is true are not taken into account.
With the maximum time, you specify the time after which a new value will definitely be logged. This specifies additional reference values for the logged data even if no significant changes occur during this time. With the minimum time, you specify the time interval after which the next value for logging is calculated. All measured values within the minimum time are not logged.

	Tips for an efficient procedure
You can also configure smoothing directly in the logging tags table. To view hidden columns, activate the column titles using the shortcut menu.	

Example – Smoothing with the value

You specify a constant value for the deviation. All values that are within the defined deviation and have not changed significantly are not logged.

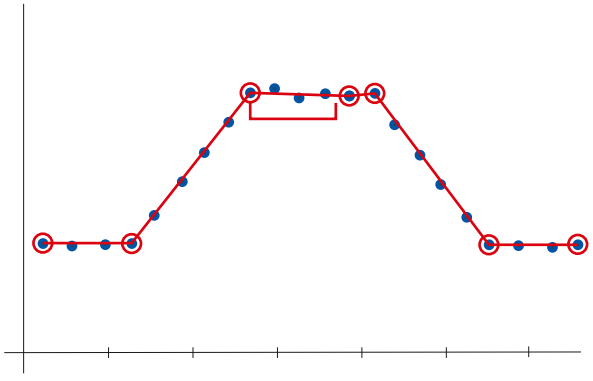
Only the values outside the deviation are written to the log.



Example – Swinging door with deviation and maximum time

You define the deviation and the maximum time after which the next value is written to the log.

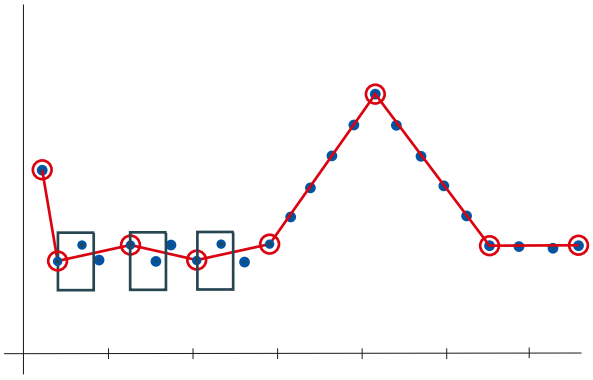
Once the first value has been saved, the following values are evaluated in the pre-defined rate of change. If the value is within the rate of change, it is not logged. If the value is outside the deviation, it is logged. In addition, the values that do not have a significant change compared to the previous logging value are logged at regular defined intervals.



Example – Swinging door with deviation and minimum time

You define the deviation and the minimum time after which the next value is to be evaluated in runtime.

Once the first value has been saved, the next value for logging in runtime is calculated after the preset time. If the value is within the rate of change, it is not logged. If the value is outside the deviation, it is logged.



See also

Configuring logging tags (Page 657)

5.4.7 Configuring compression

Introduction

In the "Cyclic" logging mode, you can compress the data volume of the logged data using compression to reduce the memory space required.

If you have selected "Cyclic" as logging mode, runtime logs the tag values according to the logging cycle, the defined smoothing and the defined compression.

Various compression modes are available.

Supported data types

The following table shows which compression mode supports which data types. You can see from the table in which data type the source data is converted by compaction. A "==" means that the source data type remains unchanged.

	Compression mode								
Data type	**No compression**	**Minimum**	**Maximum**	**Minimum with time stamp**	**Maximum with time stamp**	**Total**	**Average**	**Time average sloped step by step**	**End**
Bool	==	Not supported	Not supported	Not supported	Not supported	Not supported	LReal	LReal	==
SInt	==	==	==	==	==	LInt	LReal	LReal	==
USInt	==	==	==	==	==	ULInt	LReal	LReal	==
Int	==	==	==	==	==	LInt	LReal	LReal	==
UInt	==	==	==	==	==	ULint	LReal	LReal	==
DInt	==	==	==	==	==	LInt	LReal	LReal	==
UDInt	==	==	==	==	==	ULInt	LReal	LReal	==
LInt	==	==	==	==	==	Not supported	Not supported	Not supported	==
ULInt	==	==	==	==	==	Not supported	Not supported	Not supported	==

DateTime	==	Not supported	Not supported	Not supported	Not supported	Not supported	Not supported	Not supported	==
Char	==	Not supported	Not supported	Not supported	Not supported	Not supported	Not supported	Not supported	==
Byte	==	Not supported	Not supported	Not supported	Not supported	Not supported	Not supported	Not supported	==
Word	==	Not supported	Not supported	Not supported	Not supported	Not supported	Not supported	Not supported	==
DWord	==	Not supported	Not supported	Not supported	Not supported	Not supported	Not supported	Not supported	==
LWord	==	Not supported	Not supported	Not supported	Not supported	Not supported	Not supported	Not supported	==

Note

Note the following when configuring the cycle and the compression:

- You can overload the processor if you use short cycles and compression. Make sure that the computing power of the processor is sufficient to calculate the values to be logged for each cycle.
- Depending on the configuration, the database can grow very quickly. This can occur, for example, when you select a short cycle in combination with the smoothing mode "No smoothing" and the compression mode "No compression".

Requirement

- You have created a logging tag.
- The "Cyclic" logging mode is defined for the logging tag.

Procedure

1. Select one of the following modes:

Compression mode	Description
No compression	Every value is logged. Logging receives a time stamp of the interval end. Examples: • If you have not defined any smoothing, every value is logged. • If you have defined the "Compare values" smoothing mode, the value is only logged when the value changes and/or the quality code is changed.
Minimum	The minimum of the values determined within the logging interval, including the start value, is logged. The logging receives a time stamp of the interval start.
Maximum	The maximum of the values determined within the logging interval, including the start value, is logged. The logging receives a time stamp of the interval start.
Minimum with time stamp	The minimum of the values determined within the logging interval, including the start value, is logged. Unlike in the "Minimum" mode, in this mode the logged minimum value receives the time stamp of its occurrence.
Maximum with time stamp	The maximum of the values determined within the logging interval, including the start value, is logged. Unlike in the "Maximum" mode, in this mode the logged maximum value receives the time stamp of its occurrence.
Total	The total of all values determined within the specified logging interval is logged without the start and end values.
Average	The average value of all values determined within the specified logging interval is logged without the start and end values.
Time average sloped step by step	The time-weighted average value of all values determined within the specified logging interval without start and end value is logged.
End	The last value determined within the specified logging interval is logged. The logging receives a time stamp of the interval start. Examples: • If you have not defined any smoothing, the zero value and the quality code "NoData" will be logged when there are no value changes. • If you have defined the "Compare values" smoothing mode, the value is only logged when the value changes and/or the quality code is changed.

Note

Each value is logged when you select "No smoothing" for the smoothing mode in combination with the compression mode "No compression". This will quickly increase the log size.

2. You have the option of defining a delay. The delay value defines the latest possible time up to which the compression value is logged after the end of a logging cycle. If the time stamp of a value is after the delay value, the value is not logged.
3. Under "Source", you can select an existing logging tag whose values are to be compressed with the selected compression mode.

Tips for an efficient procedure

You can also configure compression directly in the logging tags table. To view hidden columns, activate the column titles using the shortcut menu.

Result

You have configured compression for a logging tag.

Configuring logging tags (Page 657)

5.5 Displaying tags

5.5.1 Basics

5.5.1.1 Outputting the tag values

Overview

With WinCC you can output tag values in the HMI screen with different screen objects and change them.

- The I/O field is used for the input and output of process values.
- Bars are used for graphic display of the process values in form of a scale.
- Sliders are used for the input and output of process values within a defined range.
- The gauge is used to display the process values in form of an analog gauge.

In runtime you can also output tag values as table or as trend. You can use either process values or logged values as source for the tag values.

- Use a trend for the graphic display of tag values. Trends allows you to display the change in motor temperature, for example.
- Use a table to compare tag values. In the table you can, for example, compare fill levels of supply tanks.

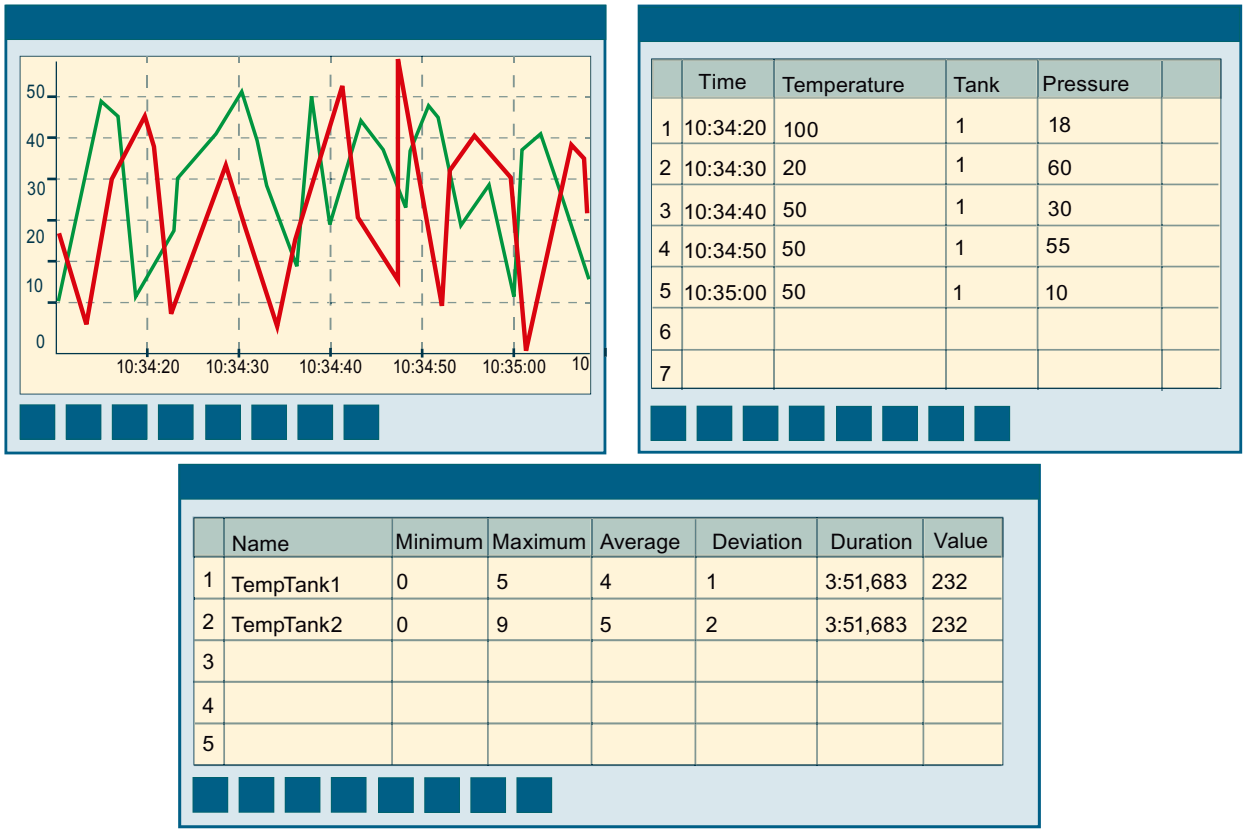
Controls for displaying tag values

To display tag values as a trend, use the trend control. The versions of trend views are available:

- "Trend control": You display a tag value over time, for example, the change in temperature. You can compare the current values and logged values or monitor the change in current values on the HMI device.
- "Function trend control": You display a tag value against a second tag value, for example, the engine speed against the heat produced.

You can use the "Trend companion" to create statistics, for example, from the displayed values. Furthermore, you can use the trend companion as reading assistance for the trend control.

To display tag values in a table, use the process control.



Displayed values

When configuring the trend control, specify which tag values are to be displayed.

- "Online": The trend is continued with current individual values from the PLC.
- "Log": In runtime, the trend control displays the values of a tag from a data log. The trend shows the logged values in a particular window in time. The operator can move the time window in runtime to view the desired information from the log.

Data types

Tags of the data type "Word" or "Int" and array tags of the data type "Word" or "Int" are permitted for display in a curve.

5.5.1.2 Outputting tag values as trends

Introduction

You have the option of displaying the values of tags graphically in runtime with the help of the following controls:

- You can visualize the trend control to display currently pending process values or logged values in runtime as trends over time.
- You use the function trend control to visualize currently pending process values or logged values in runtime as trends in relation to other tags.

The axis designations are different for the two trend views:

- The trend control has a "Time axis" and a "Value axis"
- The function trend control has an "X axis" and a "Y axis"

You can display up to nine trends in both the function trend control and the trend control.

Structure of a trend control

Configure the trend control appearance in the Inspector window: You define the number of trend areas and configure the trends it contains.

You can configure multiple trends, value axes and time axes for each trend area. You can alter the appearance, labeling and assignment in the Inspector window for each individual trend, value axis and time axis created.

Configure trend areas

You can divide the display area into multiple trend areas, if necessary. Each area functions like a standalone trend control. This allows you to show temperature changes or values from different days, for example, as trends and compare them. The "Range proportion" specifies how much space is provided for a given area in the trend control.

Each range proportion is calculated on the basis of the total number of range components. If you have configured a total of three trend areas, for example, a range proportion of "1" will

result in three trend areas of equal size. To increase the range proportions in relation to each other, increase the range proportion of one or more trend areas.

Configuring axes

You configure the axes of the trend control for each trend area in the properties of the trend areas.

The following properties are set by default with a value axis:

- The value range is based on the current values of the assigned trend
- The value axis scale is linear and based on the value range
  Alternatively, you can configure a logarithmic scale:
  - In logarithmic scaling, only positive values are displayed.
  - In negative logarithmic scaling, only negative values are displayed.

If you configure a value axis for the trend control, you can also set up axis segments. You assign a value range and a display name to each axis segment.

In the function trend control, the value axis corresponds to both the "X axis" and the "Y axis".

Configuring trends

You configure the axes for each trend area:

- The time and value axes in the trend control
- The different value axes in the function trend control

By default, the data area is based on the current values of the associated trend.

You can also configure the visualization of limits and values with "Uncertain status" for a trend. If a trend exceeds or falls below a configured limit, the trend is colored.

Configuring the time axis and time range (trend control)

The time range for trend display is configured with time axes. In a trend control, you can create multiple time axes that you can assign to one or more trend areas.

If you configure several time axes to a trend control, the sequence of the time axes in the Inspector window corresponds to the sequence in the trend control. If multiple time axes run along the same side of a trend control, the first time axis in the list is at the bottom left. The last time axis is at the top right.

5.5.1.3 Representing multiple trends

Introduction

If you display several trends simultaneously in the trend control, assign each trend its own value and time axis. Alternatively, you can assign a shared time and/or value axis to several trends.

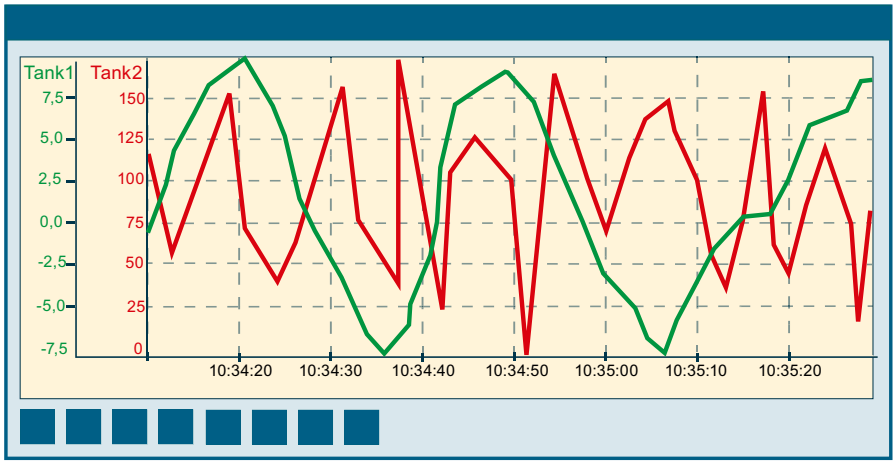
You configure the axes of a trend control for each individual trend in the Inspector window under "Properties > Trend areas".

The axes are assigned to the configured trends in the Inspector window under "Properties > Trend areas > Trends".

Representation using different axes

If the values to be displayed in a trend control differ greatly, a common value axis makes no sense. If you assign each trend its own value axis, they should also display different scales. Individual axes can be hidden if required.

The figure below shows two trends with different value axes using a trend control as an example:

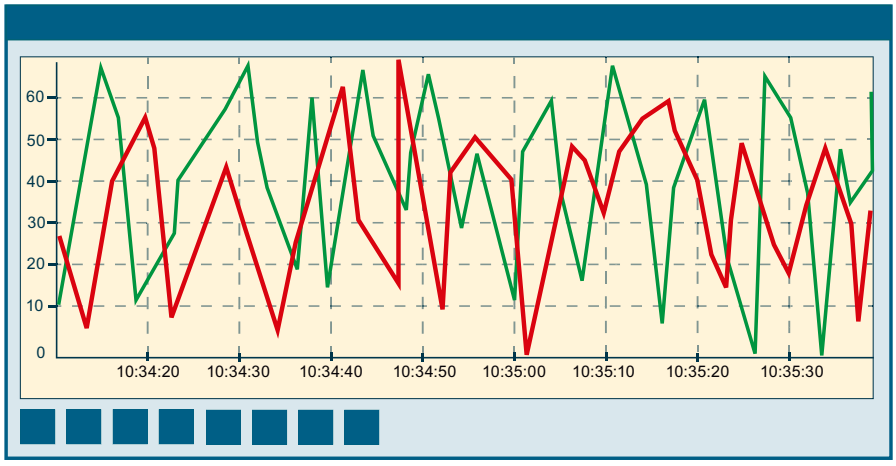


Representation using common axes

If the comparability of the trend directions is important, common axes in a trend control is sensible. Connected trend views can have a common time axis.

If you configure trends with a shared time axis, use tags with the same update cycle for the data supply.

In the case of different updating cycles, the length of the time axis is not identical for all tags. Since the trends are updated at different times due to the different updating cycles, a minimal different in the end time for the time axis occurs on each change. As a result, the trends displayed skip slightly to and fro on each change.



5.5.1.4 Basics of time range

Time range

The time range is the range from which the values at the HMI device are shown. The time range is determined by the start time and the end time. The time range is always in the past. If the end time is later than the current system time, the current system time is used as a temporary end time.

A distinction is made between the following time ranges:

- Static time range
- Dynamic time range

Static time range

The static time range is determined by fixed start and end times. The values are displayed within this time range.

Dynamic time range

The dynamic time range is determined by a period of time beginning with a fixed start time. The end time thus corresponds to the conclusion of the time period.

You set the time period as follows:

- Duration, e.g. 30 minutes
- The number of measurement points multiplied by the update cycle also produces a duration.

Configuring time range

Configure the time range for all controls. Configure the time range in the time column or in the time axis for the process control and the trend control. For the function trend control, configure the time range directly at the trend.

You select one of three options for the time range:

- "Time span": You define the time range using a starting time and a following time span. You set the time interval with the settings "Time range base" and "Time range factor", for example, 30 minutes.
- "Start time and end time": You define the time range using a starting time and an end time.
- "Measuring points": You define the time range using a starting time and a number of measuring points.

5.5.1.5 Representing trend directions

Introduction

In a trend control, you display a trend direction with one of the following modes:

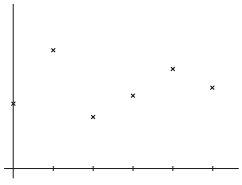
- Dots
- Interpolated
- Stepped
- Values

Select "Properties > Trend areas > Trends > Trend mode" to configure the trend display in the Inspector window.

Dots

Values are shown as dots. The display of the points can be configured as you wish.

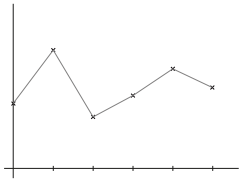
The following image shows the trend direction with the format pattern "Dots":



Interpolated

The trend curve is interpolated on a linear basis from the values. The display of the lines and points can be configured as you wish.

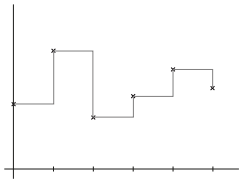
The following image shows the trend direction with the format pattern "Interpolated":



Stepped

The trend curve is interpolated as a stepped curve from the values. The display of the lines and points can be configured as you wish.

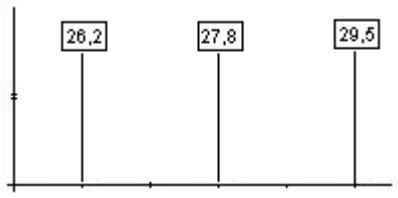
The following image shows the trend direction with the format pattern "Stepped":



Values

The values are displayed as text at each time stamp or each main grid line of the time axis. A unit can be displayed additionally for the values.

The figure below shows the trend direction with the format pattern "Values":



5.5.1.6 Outputting tag values in tabular format

Introduction

To display tag values in tables in runtime, add a process control to a screen. A time stamp is displayed for each value. The values are displayed in value columns, and the time stamps in time columns. Assign the time column to one or several value columns. You have the option of configuring a time column and nine value columns in the process control.

If you assign multiple value and/or time columns to a process control, the sequence of columns in the Inspector window corresponds to the sequence in the process control. If you assign the same time column to multiple value columns, the value columns in the list are automatically grouped according to the assigned time column.

- The time range for the table display is configured using the time column. A table has a common time column for multiple value columns. The first column [0] in the process view of the process control is the time column.
- You configure the values of the process control using value columns. You can display several value columns in a table, for example to compare the fill levels of several containers. Each value column is connected to the time column.

Configuration options in the process control

You can configure the following properties in the process control in line with your requirements:

- Configure the appearance of the process control:
  - Colors
  - Time base
  - Window settings of the control
- Configure the columns of the process control in the Inspector window.
  - Configure the time range using the time columns. A table can have a common time column for multiple value columns as well as separate time columns.
  - Configure the display of the tag values using the value columns. Each value column is connected to a time column. The value columns can have a common time column.
- Configure the appearance of the table
- Configure the toolbar and information bar of the process control.
- If required, configure data export from the process control.

5.5.1.7 Configuring tag evaluation

Introduction

Also configure a trend companion if you want to evaluate data from the trend control in runtime. You can also configure the trend companion as "Ruler".

You connect the trend companion to one of the following controls:

- Trend control
- Function trend control

Set a "Display mode" in the trend companion. The display mode determines which data is shown in the trend companion.

The contents of the trend companion are shown in columns. The available columns depend on the connected control. A block is assigned to each column. You define the alignment and appearance of the column headers using the blocks. By default, the format of the connected control, for example the time display, is used for the display format.

Configuration options in the trend companion

You can configure the following properties in the trend companion in line with your requirements:

- Configure the view of the trend companion in the Inspector window:
- Select the "Mode" of the trend companion under "Properties > General".
- Configure the display, labeling and sequence of the columns.

Display modes

Three different display modes are available in the trend companion:

- Ruler mode
  The ruler window shows the coordinate values of the trends on the ruler or values of a selected row in the table.
- Statistics area mode
  The statistics area window shows the values of the lower limit and upper limit of the trends between two rulers or the selected area in the table. You can only connect the statistics area window to the trend control or the process control.
- Statistics mode
  The statistics window displays the statistical evaluation of the trends. The statistics include:
  - Minimum
  - Maximum
  - Average
  - Standard deviation
  - Integral

All windows can also display additional information on the connected trends or columns, such as time stamps.

5.5.2 Configuring a trend control

Introduction

For the graphic display of tag values in runtime, add a trend control to a screen. The trend control allows you to display current and logged values for a specific time window, for example. For the display of data logs in runtime, you can move the time window to view the logged values.

The list of elements in a group always starts with 0, for example trend [0] is the first trend that has already been created in the object. For a clearer display of multiple trends, you can configure different names, line types and colors.

Requirement

- Data log with backup has been configured.
- The HMI tag for temperature measurement has been configured, for example "MotorTemperature".
- The HMI tag for velocity measurement has been configured, for example "MotorSpeed".
- A screen has been configured.

Configuring the trend area and axes

1. Add the "trend control" object to the screen from the "Toolbox" task card.
2. Go to "Properties" and set the required height, width and position of the object.
3. Open the "Trend areas" group under "Properties".
   The index numbers of the trend areas created for the object are displayed.
4. Expand the index number of the first trend area.
   The properties of the first trend area are displayed.

   Note

   To add another trend area, go to "Properties > Trend areas > [0] trend areas > Trends" and click the selection button in the "Static value" column. In the dialog, click "Add".

5. Define the colors for displaying the trend area and the reference lines.
6. Configure the time axis and value axis settings under "Bottom time axis" and "Left value axis".

Configuring trends

1. Go to "Trend areas > [0] trend areas > Trends" and click on the selection button in the "Static value" column.
   A dialog opens.
2. Click "Add" in the "Index" column.
   This adds another trend. Close the dialog.
3. Expand the index number of the first trend [0]. The trend settings are displayed.
4. Specify the name of the first trend under "Display name", for example "Speed".
5. Select the entry "Online" under "Data source Y > Source".
6. Under "Tag" enter the tag "MotorSpeed".
7. Configure the line color for the trend, for example, blue.
8. Expand the index number of the second trend [1]. The trend settings are displayed.
9. Specify the name of the second trend under "Display name", for example "Temperature".
10. Specify "Online" as the source type under "Data source" and enter the name of the tag "MotorTemperature".
11. Configure the line color for the trend, for example, red.

Result

The trend control is now configured. In runtime, you monitor value changes over time on the basis of two trends. One trend shows the temperatures measured and the other trend the velocity.

Configure an additional value display if you want to evaluate the data of the trend control in runtime. You can also configure the value display as a "Ruler".

Trend control (Page 315)

Configuring trend control for plant objects (Page 7085)

5.5.3 Configuring the function trend control

Introduction

You use the function trend control to represent the values of a tag as a function of another tag. This means that you can present temperature trends as a function of the velocity, for example.

You can also compare the trend to a setpoint trend.

Requirement

- Data log with backup has been configured.
- The HMI tag for temperature measurement has been configured, for example "MotorTemperature".
- The HMI tag for velocity measurement has been configured, for example "MotorSpeed".
- A screen has been configured.

Configuring function trend areas and axes

1. Add the "trend control" object to the screen from the "Toolbox" task card.
2. Go to "Properties" and set the required height, width and position of the object.
3. Open the "Function trend area" group under "Properties".
   The index numbers of the function trend areas created for the object are displayed.
4. Expand the index number of the first function trend area.
   The properties of the first function trend area are displayed.

   Note

   To add another function trend area, go to "Properties > Function trend area > [0] function trend area > Function trends" and click on the selection button in the "Static value" column. In the dialog, click "Add".

5. Enter a meaningful name for the function trend area, for example, "SpeedToTemperature".
6. Open the temperature value axis settings under "Left value axis".
7. Define the value range for temperature, for example, by entering a maximum scale value of 350 degrees and a minimum scale value of 0 degrees.
8. Open the velocity value axis settings under "Bottom value axis".
9. Define the value range for speed, for example, by entering a maximum scale value of 1400 rpm and a minimum scale value of 0 rpm.

Note

Available scaling types

The f(x) trend view supports the "Linear" scaling type.

Configuring trends

1. Go to "Function trend area > [0] function trend area > Function trends > [0] function trend".
2. Specify "Online" as the source type under "Data source X", and enter the name of the process tag "MotorTemperature" under "Tag".
3. Specify "Online" as the source type under "Data source Y", and enter the name of the process tag "MotorSpeed" under "Tag".
4. Specify the time range of 1 second under "Properties > Function trend area > Function trends".

Result

The function trend control is now configured. In runtime, you monitor value changes on the basis of two trends. One trend shows the temperatures and the other trend the speed. In the function trend control, you can, for example, monitor how the temperature of the motor increases as the velocity increases.

Configure an additional value display if you want to evaluate the data of the trend control in runtime. You can also configure the value display as a "Ruler".

Function trend control (Page 319)

5.5.4 Configuring bit-triggered trends

By setting a trigger bit in the "Trend transfer" tag, the HMI device either reads in a trend value or an entire trend buffer. This is defined in the configuration. Bit-triggered trends are usually used to represent fast changing values.

To trigger bit-triggered trends, appropriate external tags must be created in the "Tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

Explanation of terms

Trend buffer

External array tag, the values of which are displayed as a trend. The number of array elements must be the same as the number of the measuring values of the trend. The tag is only available if the archive has not been selected as the "Source settings".

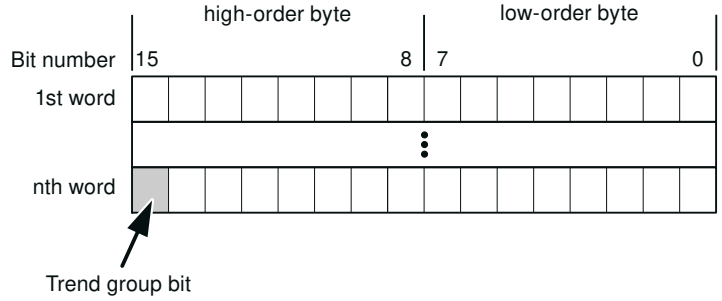
Trend request

When you open a screen with one or more trends on the HMI device, the HMI device sets the associated bits in the trend request area. After deselecting the screen, the HMI device resets the corresponding bits in the trend request area.

The trend request area can be used in the PLC to evaluate which trend is currently displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

Trend transfer 1

This area is used to trigger trends. In your control program, set the bit assigned to the trend in the trend transfer area and the trend group bit. The trend group bit is the last bit in the trend transfer area. The HMI device detects the triggering and reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.



The trend transfer area must not be changed by the control program until the trend group bit has been reset.

Switch buffer

An external array tag with trend values as a second buffer that can be set when configuring a trend. While the HMI device reads the values from buffer 1, the PLC writes to buffer 2. If the HMI device reads buffer 2, the control writes to buffer 1. This prevents the trend values from being overwritten by the PLC while the HMI device is reading the trend.

Trend transfer 2 (required only with switch buffers)

Trend transfer 2 is required for trends that are configured with switch buffers. It is structured in the same way as trend transfer 1.

Trigger bit

Each trend is assigned a specific bit for communication between the HMI device and the PLC. If you assign trigger bit "4" to a trend, for example, the trend is identified by bit 4 in the trend request and in the trend transfers.
Do not use the group bit as trigger bit. The HMI device uses the group bit to detect the trigger signal. The position of the group bit in the trend transfer depends on the selected PLC.

Requirement

The following data blocks of the PLC were configured in STEP 7:

- Trend buffer (trend tag of the Array type)
- Trend request
- Trend transfer 1

A screen is configured.

Configuring the bit-triggered trend without a switch buffer

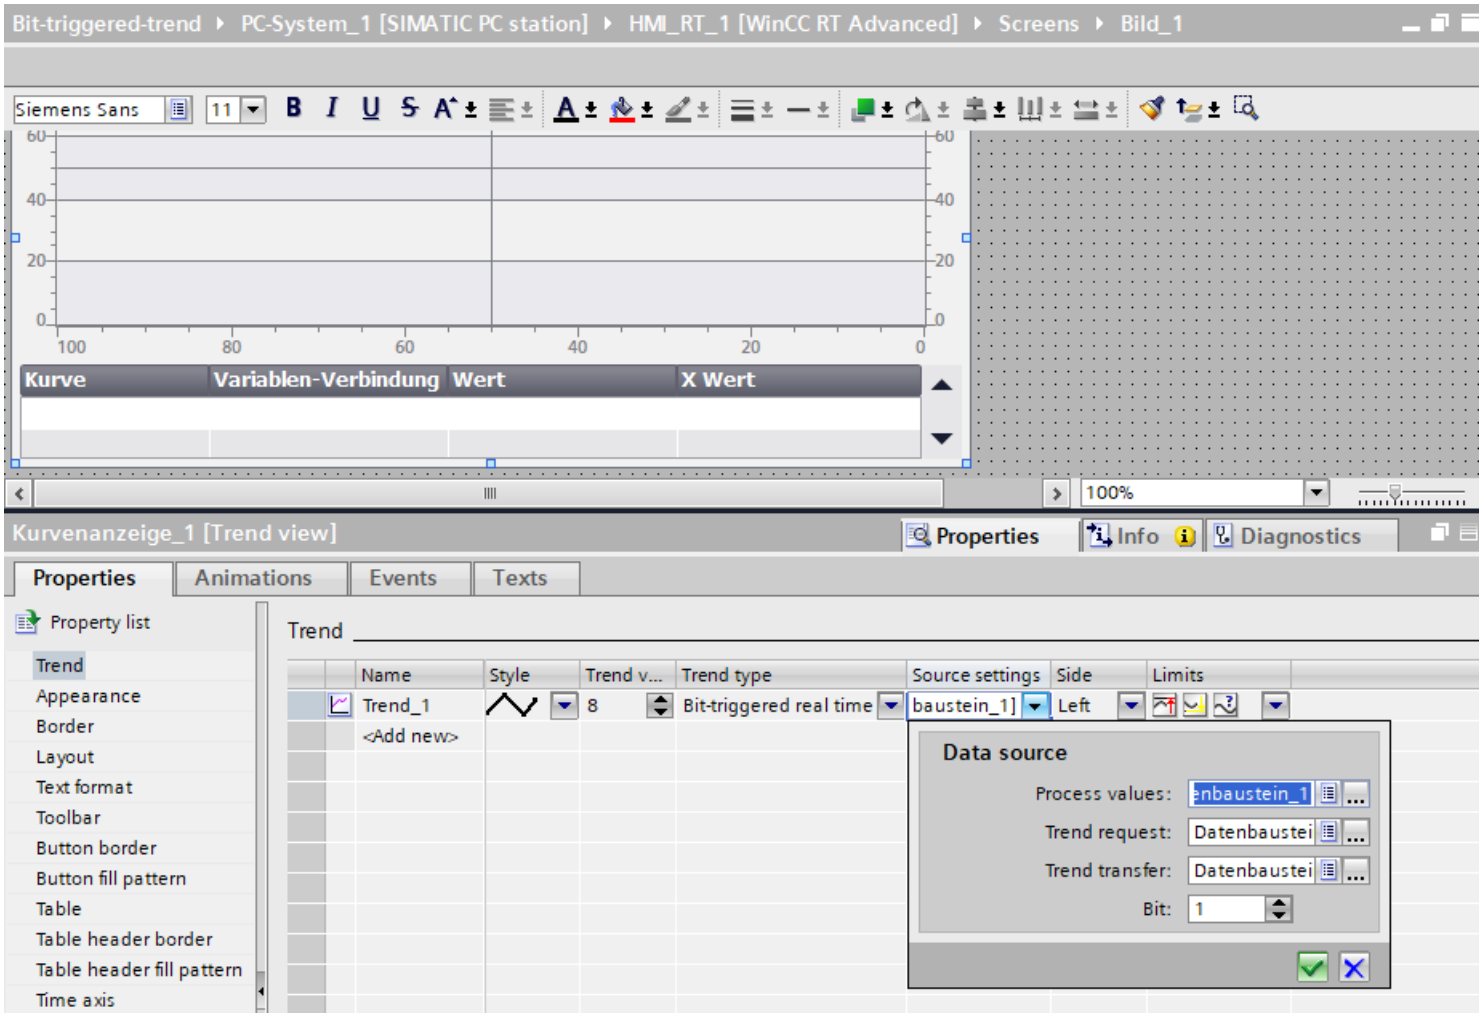
1. Add the "Trend control" object to the screen from the "Toolbox" task card.

2. Set the desired height, width and position for the object under "Properties > Layout" in the Inspector window.
3. Expand the "Time axis" group under "Properties" and select the "Points" axis mode under "Settings". Under "Range", specify how many values are to be displayed on the X axis. Under "Label", select the scale labeling of the intermediate values, the step size and the number of graduation lines.
4. Under "Properties", expand the "Trend" group.
5. In the "Name" column, click the "Add new" entry and specify the name for the trend. If needed, change the style of the trend (color, line, mode).
6. In the "Trend values" column, specify the number of values. This number depends on how many array tags you have assigned for the "Trend buffers".

7. In the "Trend type" column, select the "Bit-triggered real time" variant.
8. Set in the column "Source settings > Data source" the tags for:
   - Process values
   - Trend request
   - Trend transfer

   Then enter the bit position in "Trend request" and "Trend transfer".

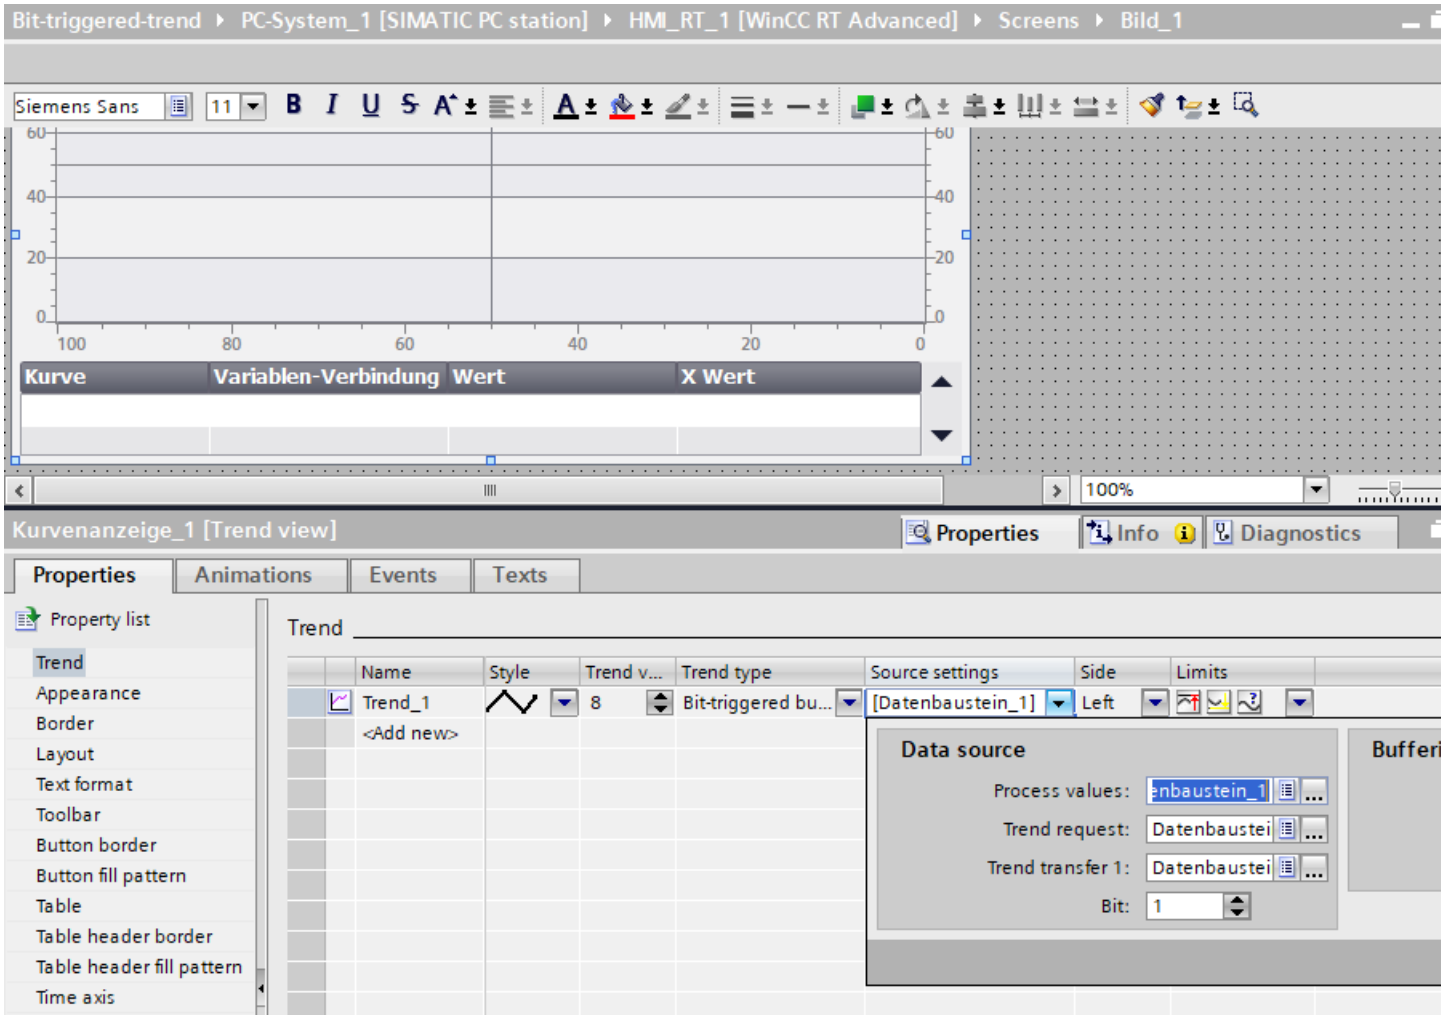


Configuring the bit-triggered trend with switch buffer

The procedure is first the same as before for the configuration of a bit-triggered trend without switch buffer (steps 1-6).

1. Select the variant "Bit-triggered buffer" in the "Trend type" column.
2. Select in the column "Source settings > Data source" the tags for:
   - Process values
   - Trend request
   - Trend transfer 1

   Then enter the bit position in "Trend request" and "Trend transfer".
3. Check the "Activate buffer" check box and select the tags for:
   - Buffer tag
   - Trend transfer 2



5.5.5 Configuring the process control

Introduction

To display tag values in tables in runtime, add a process control to a screen. The time column shows the time at which the value was reached. The value columns show the values at a given time stamp.

You can use the process control to display the incoming temperature values of a motor in a table in runtime, for example.

Requirement

- HMI tag for temperature measurement has been configured, for example "MotorTemperature"
- Cycle for regular display updates has been configured
- The screen is open
- The Inspector window is open

Configuring the process control

1. Add the required process control to the screen from the "Tools" task card.
2. Enter the label for the process control, for example "MotorTemperatureView", under "Properties" in the Inspector window.
3. Go to "Properties > Process view > Columns > [0]" and configure the time column with the time ranges for the table.
4. Under "Sort order", define the order in which the columns of the process control are shown.
5. Configure the "Time range" and "Format" of the time display in the time column, for example "Time span".
6. Set the start time, the basis and the factor for the time range, for example 10 minutes.
7. If the values in the time column are to be updated automatically, enable "Update".
8. Go to "Properties > Process view > Columns > [1]" and configure the properties for the value column.
9. Enter the name of the column, for example "Temperature".
10. Configure the type "Online" for current values under "Data source" and enter the tag "MotorTemperature" under "Tag".
11. Configure the display of content and the headers for the given value column.
12. Configure the toolbar and information bar of the process control.
13. If required, configure the security settings of the process control.

Result

The process control is now configured and displays the temperature of the motor at the measured time in runtime.

See also

Process control (Page 335)

Configuring reordering of the columns (Page 392)

5.5.6 Configuring the trend companion

Introduction

The trend companion allows you to display statistical data, for example mean values for the trend control with temperature trends. The calculation of statistical data gives the user access to trends and value changes over time. As well as calculating statistical data, you can use the trend companion as a viewing aid for trend values at a ruler position.

Requirement

- Trend control or function trend control has been configured in the screen
- Cycle for regular display updates has been configured
- The screen is open
- The Inspector window is open

Procedure

1. Add the required trend companion to the screen from the "Toolbox" task card.
2. Select the relevant control under "Properties > Data source" in the Inspector window to connect the trend companion to the selected control.
3. To display the trend companion below the selected control, select the option "Dock to data source".
4. Select the "Trend companion mode" of the trend companion under "Properties", for example "Statistic result".
5. Configure the appearance of the selected mode under "Properties > Statistic mode appearance":
   - Change the colors, row height and fonts in the trend companion if required.
   - Configure the headers under "Properties > Statistic mode appearance > Header settings" if required.

6. Configure the trend companion columns under "Properties > Statistic mode appearance > Columns":
   – Change the display, labels or order of columns if required.
7. Configure the view of the trend companion in the Inspector window:
   – Change the display, labeling and colors of the trend companion if required, or use the colors of the control to which the trend companion is docked.
   – Configure the information bar and the toolbar of the trend companion.

   Note

   The "Print" button [3] is reserved for future versions

Configuring selection

If, for example, a user wants to export values from a row, they must select the row. You specify the selection range and colors for selection during configuration. You define the settings for selection for each display mode.

1. In the Inspector window, go to "Properties > Trend ruler appearance" and select the "Selection mode" for the selection range, for example "Multiple elements".
2. Select the color mode for selection, for example rows.
3. If required, select the "Border color" and "Border width" to be displayed around the selection area.
4. Choose the colors for selection as required.

Result

The trend companion is configured. The statistical values calculated are displayed in the trend companion in runtime.

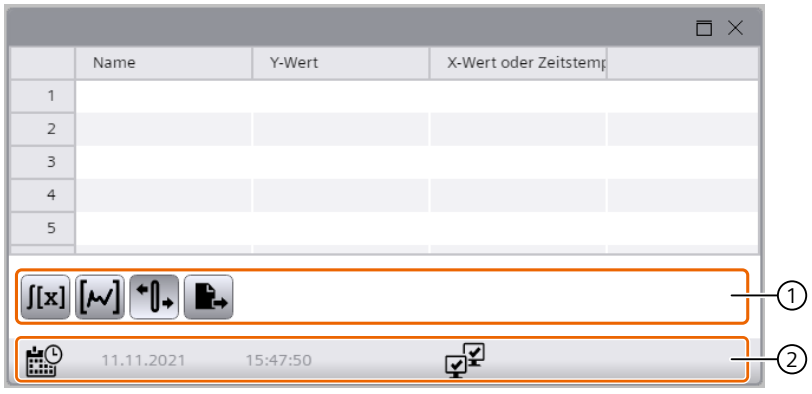
Trend companion (Page 323)

Configuring reordering of the columns (Page 392)

5.5.7 Configuring the toolbar and information bar

Introduction

You can operate the controls in runtime using the buttons in the toolbar. The information bar displays the status messages of the control. During configuration, you define the contents of the toolbar and information bar.



① Toolbar
② Information bar

Requirement

- You have opened the screen which contains at least one object, for example, the trend companion.
- The Inspector window is open.

Configuring the toolbar

To configure the toolbar, follow these steps:

1. In the Inspector window under "Properties > Miscellaneous > Toolbar", configure the general properties of the toolbar, such as background color or visibility.
2. In the Inspector window, under "Properties > Properties > Miscellaneous > Toolbar > Elements > Button > Visibility", enable the buttons that you need in Runtime.
3. Configure the button display, for example, background color, border and size.
4. Under "Properties > Properties > Miscellaneous > Toolbar > Elements > Button > Authorization", select the authorization that is required in Runtime to operate the button.
5. When a button is not operated in Runtime, disable "Allow operator control". You can reactivate a disabled a button by using a script in runtime, for example.

Configuring the information bar

To configure the information bar, follow these steps:

1. In the Inspector window under "Properties > Properties > Miscellaneous > Information bar", configure the general properties of the information bar, such as background color or visibility.
2. In the Inspector window under "Properties > Properties > Miscellaneous > Information bar > Elements > State display > Visibility", enable the elements that you need in Runtime.
3. Configure the display of the respective element.
4. Select the authorization that is required in Runtime to operate the element.
5. When an element is not operated in Runtime, disable "Allow operator control". You can enable a disabled element again, for example, with a script in Runtime.

5.5.8 Defining the data source

Introduction

Using the data source, you define the sources from which the values are displayed on the HMI device in runtime. The following sources are available:

- Current process values from tags
- Archived values from logging tags

To set up data supply for the controls over a tag, enter the name of the tag in the "Static value" column under "Data source > Tag".

Requirement

- An online tag or logging tag is configured
- Value column or trend has been created
- The Inspector window is open

Displaying current process values

Proceed as follows to display current process values:

1. Click "Properties > Process view > Columns" in the Inspector window to define the data source for a process control.
   The first column is always reserved for the time column. You enter the data source for value columns [1] to [N].
2. Click "Properties > Trend areas > Trends" in the Inspector window to define the data source for a trend control.
   For the function trend control, click on "Properties > Function trend area > Function trends".
3. Configure the "data source":
   - Select the entry "Online" as "Source type".
   - When you configure the trend of an function trend control, enter one tag each for "Data source X" and "Data source Y".
   - When you configure the trend of a trend control or a value column, enter the corresponding tag under "Tag".
   - Select the update cycle.

Note

Using UDTs

In the "Static value" column under "Tag" first enter the name of the data type and then the name of the element separated by a period, for example, "PLCDatatypeName.ElementName".

Displaying values from a log

Proceed as follows to display values from a log:

1. Click "Properties > Process view > Columns" in the Inspector window to define the data source for a process control.
   The first column is always reserved for the time column. You enter the data source for value columns [1] to [N].
2. Click "Properties > Trend areas > Trends" in the Inspector window to define the data source for a trend control.
   For the function trend control, click on "Properties > Function trend area > Function trends".
3. Configure the "data source":
   - Select the entry "Logs" as "Source".
   - When you configure the trend of an function trend control, enter one tag each for "Data source X" and "Data source Y".
   - When you configure the trend of a trend control or a value column, enter the corresponding tag under "Tag".

Note

Using logging tags

In the "Static value" column under "Tag" first enter the name of the HMI tag and then the name of the associated logging tag separated by a period, for example, "HMITag_1:LoggingTag_1".

5.6 Reference

5.6.1 Quality codes of HMI tags

Introduction

The "Quality Code" is required to evaluate the status and quality of a tag. The quality of the entire value transfer and value processing of the respective HMI tag is summarized in the indicated Quality Code. For example, it is possible to determine from the Quality Code whether the current value is a start value or substitute value.

The quality codes are prioritized. If several codes occur at the same time, the Quality Code reflecting the lowest quality is displayed.

Evaluation of Quality Codes

You can evaluate the Quality Code in a number of different ways:

- Evaluation with JScript functions
- Evaluation using the "Quality Code changed" event of an I/O field.

Structure

The Quality Code has the following binary structure:

High byte: Specific information for WinCC Unified								Low byte: Quality code according to PROFIBUS PA or OPC DA							
Flags				Enhanced substatus				Quality		Substatus				Limits	
Bit 15	Bit 14	Bit 13	Bit 12	Bit 11	Bit 10	Bit 9	Bit 8	Bit 8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1

Quality (bit 7 and bit 8)

Quality represents the basic values of the quality levels. Making use of the substatus and limits gives rise to intermediate values over and above the quality stage concerned.

Bit 8	Bit 7	
0	0	Bad - The value is not useful. The reasons are indicated by the sub-status.
0	1	Uncertain - The quality of the value is less than normal, but the value may still be useful. The reasons are indicated by the sub-status.
1	0	Good (Non-Cascade) - The quality of the value is good. Possible alarm conditions may be indicated by the sub-status.
1	1	Good (Cascade) - The quality of the value is good and may be used in control.

Flags (bit 12 to bit 15)

Flags contain information on the interpretation of the Quality Code.

Bit 12	Source quality	0: The data quality has been determined and assigned by external data source.
Bit 13	Source time	1: The data timestamp has been produced and assigned by external data source.
Bit 14	Time corrected	1: The data timestamp applied by external data source has been corrected by the system. Thus, Bit 13 "Source time" is not set. Time correction happens if the external timestamp is older than the timestamp of the last known value.
Bit 15	reserved	

Sub-status and extended sub-status

The quality alone is not enough. Substatuses divide the individual qualities. The Quality Code is binary-coded. The value must be converted to hexadecimal format for the analysis of the Quality Code.

Externally generated quality code of tags

If bit 12 is not set, the Quality Code was generated from an external source in accordance with PROFIBUS PA. The table begins with the worst Quality Code and ends with the best Quality Code. The best Quality Code has the lowest priority, while the worst Quality Code has the highest priority. If several statuses occur for one tag in the process, the poorest code is passed on.

Code (hex)	Quality		Q	Q	S	S	S	S	L	L
0x23	Bad	Device passivated - Diagnostic alerts inhibited	0	0	1	0	0	0	1	1
0x3C	Bad	Function check - Local override	0	0	1	1	1	1	1	1
0x04	Bad	Configuration Error - Set if the value is not useful because there is some inconsistency regarding the parameterization or configuration, depending on what a specific manufacturer can detect.	0	0	0	0	0	1	-	-

Code (hex)	Quality		Q	Q	S	S	S	S	L	L
0x1C	Bad	Out of Service - The value is not reliable because the block is not being evaluated, and may be under construction by a configurer. Set if the block mode is O/S.	0	0	0	1	1	1	-	-
0x73	Uncertain	Simulated value - Start	0	1	1	1	0	0	1	1
0x74	Uncertain	Simulated value - End	0	1	1	1	0	1	-	-
0x84	Good (Non-Cascade)	Active Update event - Set if the value is good and the block has an active Update event.	1	0	0	0	0	1	-	-
0x24	Bad	Maintenance alarm - More diagnostics available.	0	0	1	0	0	1	-	-
0x18	Bad	No Communication, with no usable value - Set if there has never been any communication with this value since it was last "Out of Service".	0	0	0	1	1	0	-	-
0x14	Bad	No Communication, with last usable value - Set if this value had been set by communication, which has now failed.	0	0	0	1	0	1	-	-
0x0C	Bad	Device Failure - Set if the source of the value is affected by a device failure.	0	0	0	0	1	1	-	-
0x10	Bad	Sensor failure	0	0	0	1	0	0	-	-
0x08	Bad	Not Connected - Set if this input is required to be connected and is not connected.	0	0	0	0	1	0	-	-
0x00	Bad	non-specific - There is no specific reason why the value is bad. Used for propagation.	0	0	0	0	0	0	-	-
0x28	Bad	Process related - Substitute value	0	0	1	0	1	0	-	-
0x2B	Bad	Process related - No maintenance	0	0	1	0	1	0	1	1
0x68	Uncertain	Maintenance demanded	0	1	1	0	1	0	-	-
0x60	Uncertain	Simulated value - Set when the process value is written by the operator while the block is in manual mode.	0	1	1	0	0	0	-	-
0x64	Uncertain	Sensor calibration	0	1	1	0	0	1	-	-
0x5C	Uncertain	Configuration error	0	1	0	1	1	1	-	-
0x58	Uncertain	Sub-normal	0	1	0	1	1	0	-	-
0x54	Uncertain	Engineering Unit Range Violation - Set if the value lies outside of the set of values defined for this parameter. The Limits define which direction has been exceeded.	0	1	0	1	0	1	-	-
0x50	Uncertain	Sensor conversion not accurate	0	1	0	1	0	0	-	-
0x4B	Uncertain	Substitute (constant)	0	1	0	0	1	0	1	1
0x78	Uncertain	Process related - No maintenance	0	1	1	1	1	0	-	-
0x4C	Uncertain	Initial Value - Value of volatile parameters during and after reset of the device or of a parameter.	0	1	0	0	1	1	-	-
0x48	Uncertain	Substitute value - Predefined value is used instead of the calculated one. This is used for fail safe handling.	0	1	0	0	1	0	-	-
0x44	Uncertain	Last Usable Value - Whatever was writing this value has stopped doing so. This is used for fail safe handling.	0	1	0	0	0	1	-	-
0x40	Uncertain	Non-specific - There is no specific reason why the value is uncertain. Used for propagation.	0	1	0	0	0	0	-	-
0xE0	Good(Cascade)	Initiate Fail Safe (IFS) - The value is from a block that wants its downstream output block (e.g. AO) to go to Fail Safe.	1	1	0	1	1	0	-	-

Code (hex)	Quality		Q	Q	S	S	S	S	L	L
0xD8	Good (Cascade)	Local Override (LO) - The value is from a block that has been locked out by a local key switch or is a Complex AO/DO with interlock logic active. The failure of normal control must be propagated to a function running in a host system for alarm and display purposes. This also implies "Not Invited".	1	1	0	1	1	0	-	-
0xD4	Good (Cascade)	Do Not Select (DNS) - The value is from a block which should not be selected, due to conditions in or above the block.	1	1	0	1	0	1	-	-
0xCC	Good (Cascade)	Not Invited (NI) - The value is from a block which does not have a target mode that would use this input.	1	1	0	0	1	1	-	-
0xC8	Good (Cascade)	Initialization Request (IR) - The value is an initialization value for a source (back calculation input parameter), because the lower loop is broken or the mode is wrong.	1	1	0	0	1	0	-	-
0xC4	Good (Cascade)	Initialization Acknowledge (IA) - The value is an initialized value from a source (cascade input, remote-cascade in, and remote-output in parameters).	1	1	0	0	0	1	-	-
0xA0	Good (Non-Cascade)	Initiate fail safe	1	0	1	0	0	0	-	-
0x98	Good (Non-Cascade)	Unacknowledged Critical Alarm - Set if the value is good and the block has an unacknowledged Alarm with a priority greater than or equal to 8.	1	0	0	1	1	0	-	-
0x94	Good (Non-Cascade)	Unacknowledged Advisory Alarm - Set if the value is good and the block has an unacknowledged Alarm with a priority less than 8.	1	0	0	1	0	1	-	-
0x90	Good (Non-Cascade)	Unacknowledged Update event - Set if the value is good and the block has an unacknowledged Update event.	1	0	0	1	0	0	-	-
0x8C	Good (Non-Cascade)	Active Critical Alarm - Set if the value is good and the block has an active Alarm with a priority greater than or equal to 8.	1	0	0	0	1	1	-	-
0x88	Good (Non-Cascade)	Active Advisory Alarm - Set if the value is good and the block has an active Alarm with a priority less than 8.	1	0	0	0	1	0	-	-
0xA8	Good (Non-Cascade)	Maintenance demanded	1	0	1	0	1	0	-	-
0xA4	Good (Non-Cascade)	Maintenance required	1	0	1	0	0	1	-	-
0xBC	Good (Non-Cascade)	Function check - Local override	1	0	1	1	1	1	-	-
0xC0	Good(Cascade)	OK - No error or special condition is associated with this value.	1	1	0	0	0	0	-	-
0x80	Good (Non-Cascade)	OK - No error or special condition is associated with this value.	1	0	0	0	0	0	-	-

Internally generated quality code of tags

If bit 12 is set, the Quality Code was generated from the HMI system. The table begins with the worst Quality Code and ends with the best Quality Code. The best Quality Code has the lowest priority, while the worst Quality Code has the highest priority. If several statuses occur for one tag in the process, the poorest code is passed on.

Code (Hex)	Quality		Q	Q	S	S	S	S	L	L
0x70n	Bad	Disabled	0	0	0	0	-	-	-	-
0x300	Bad	Unusable value - A logged value has been identified to be incorrect, but a respective correction value is not available. The corresponding sub-status is set to 'non-specific'.	0	0	0	0	0	0	0	0
0x23	Bad	Device passivated - Diagnostic alerts inhibited	0	0	1	0	0	0	1	1
0x3F	Bad	Function check - Local override	0	0	1	1	1	1	1	1
0x04	Bad	Configuration Error - Set if the value is not useful because there is some inconsistency regarding the parameterization or configuration, depending on what a specific manufacturer can detect.	0	0	0	0	0	1	-	-
0x1C	Bad	Out of Service - The value is not reliable because the block is not being evaluated, and may be under construction by a configurer. Set if the block mode is O/S.	0	0	0	1	1	1	-	-
0x73	Uncertain	Simulated value - Start	0	1	1	1	0	0	1	1
0x74	Uncertain	Simulated value - End	0	1	1	1	0	1	-	-
0x84	Good (Non-Cascade)	Active Update event - Set if the value is good and the block has an active Update event.	1	0	0	0	0	1	-	-
0x24	Bad	Maintenance alarm - More diagnostics available.	0	0	1	0	0	1	-	-
0x18	Bad	No Communication, with no usable value - Set if there has never been any communication with this value since it was last "Out of Service".	0	0	0	1	1	0	-	-
0x14	Bad	No Communication, with last usable value - Set if this value had been set by communication, which has now failed.	0	0	0	1	0	1	-	-
0x0C	Bad	Device Failure - Set if the source of the value is affected by a device failure.	0	0	0	0	1	1	-	-
0x10	Bad	Sensor failure	0	0	0	1	0	0	-	-
0x08	Bad	Not Connected - Set if this input is required to be connected and is not connected.	0	0	0	0	1	0	-	-
0x100	Bad	Aggregated value - The value has been calculated out of multiple values with less than the re-quired number of good sources. This includes data aggregation by means of data compression algorithms. The corresponding sub-status is set to 'non-specific'.	0	0	0	0	0	0	0	0
0x00	Bad	non-specific - There is no specific reason why the value is bad. Used for propagation.	0	0	0	0	0	0	-	-
0x28	Bad	Process related - Substitute value	0	0	1	0	1	0	-	-
0x74n	Uncertain	Disabled - The provider of the value, e.g. logging tag for logged value, has been disabled and the previous value was GOOD or UNCERTAIN. In case of GOOD the corresponding sub- status is set to 'last usable value'. In case of UNCERTAIN the corresponding sub-status is taken from the last sub-status.	0	1	0	0	-	-	-	-

Code (Hex)	Quality		Q	Q	S	S	S	S	L	L
0x158	Uncertain	Aggregated value - The value has been calculated out of multiple values with less than the required number of good sources to be GOOD as well as less than required number of bad sources to be BAD. This includes data aggregation by means of data compression algorithms. The corresponding sub-status is set to 'sub-normal'.	0	1	0	1	1	0	0	0
0x2B	Bad	Process related - No maintenance	0	0	1	0	1	0	1	1
0x68	Uncertain	Maintenance demanded	0	1	1	0	1	0	-	-
0x60	Uncertain	Simulated value - Set when the process value is written by the operator while the block is in manual mode.	0	1	1	0	0	0	-	-
0x64	Uncertain	Sensor calibration	0	1	1	0	0	1	-	-
0x5C	Uncertain	Configuration error	0	1	0	1	1	1	-	-
0x58	Uncertain	Sub-normal	0	1	0	1	1	0	-	-
0x54	Uncertain	Engineering Unit Range Violation - Set if the value lies outside of the set of values defined for this parameter. The Limits define which direction has been exceeded.	0	1	0	1	0	1	-	-
0x50	Uncertain	Sensor conversion not accurate	0	1	0	1	0	0	-	-
0x4B	Uncertain	Substitute (constant)	0	1	0	0	1	0	1	1
0x78	Uncertain	Process related - No maintenance	0	1	1	1	1	0	-	-
0x4C	Uncertain	Initial Value - Value of volatile parameters during and after reset of the device or of a parameter.	0	1	0	0	1	1	-	-
0x48	Uncertain	Substitute value - Predefined value is used instead of the calculated one. This is used for fail safe handling.	0	1	0	0	1	0	-	-
0x44	Uncertain	Last Usable Value - Whatever was writing this value has stopped doing so. This is used for fail safe handling.	0	1	0	0	0	1	-	-
0x40	Uncertain	Non-specific - There is no specific reason why the value is uncertain. Used for propagation.	0	1	0	0	0	0	-	-
0x3C0	Good(Cascade)	Corrected value - A logged value has been corrected. The corresponding sub-status is set to 'non-specific'.	1	1	0	0	0	0	0	0
0x2C0	Good(Cascade)	Manual input - A logged value has been created manually. The corresponding sub-status is set to 'non-specific'.	1	1	0	0	0	0	0	0
0x1C0	Good(Cascade)	Aggregated value -The value has been calculated out of multiple (GOOD) values. This includes data aggregation by means of data compression algorithms. The corresponding sub-status is set to 'non-specific'.	1	1	0	0	0	0	0	0
0xE0	Good (Cascade)	Initiate Fail Safe (IFS) - The value is from a block that wants its downstream output block (e.g. AO) to go to Fail Safe.	1	1	1	0	0	0	-	-
0xD8	Good (Cascade)	Local Override (LO) - The value is from a block that has been locked out by a local key switch or is a Complex AO/DO with interlock logic active. The failure of normal control must be propagated to a function running in a host system for alarm and display purposes. This also implies "Not Invited".	1	1	0	1	1	0	-	-
0xD4	Good (Cascade)	Do Not Select (DNS) - The value is from a block which should not be selected, due to conditions in or above the block.	1	1	0	1	0	1	-	-
0xCC	Good (Cascade)	Not Invited (NI) - The value is from a block which does not have a target mode that would use this input.	1	1	0	0	1	1	-	-

Code (Hex)	Quality		Q	Q	S	S	S	S	L	L
0xC8	Good (Cascade)	Initialization Request (IR) - The value is an initialization value for a source (back calculation input parameter), because the lower loop is broken or the mode is wrong.	1	1	0	0	1	0	-	-
0xC4	Good (Cascade)	Initialization Acknowledge (IA) - The value is an initialized value from a source (cascade input, remote-cascade in, and remote-output in parameters).	1	1	0	0	0	1	-	-
0x6C0	Good(Cascade)	Initial value - The local data source has been initialized with the configured initial value. The corresponding sub-status is set to 'non-specific'.	1	1	0	0	0	0	0	0
0c4C0	Good(Cascade)	Last usable value - The local data source has been initialized with the last usable value, if pre-sent inside a local persistency. The corresponding sub-status is set to 'non-specific'.	1	1	0	0	0	0	0	0
0xA0	Good (Non-Cascade)	Initiate fail safe	1	0	1	0	0	0	-	-
0x98	Good (Non-Cascade)	Unacknowledged Critical Alarm - Set if the value is good and the block has an unacknowledged Alarm with a priority greater than or equal to 8.	1	0	0	1	1	0	-	-
0x94	Good (Non-Cascade)	Unacknowledged Advisory Alarm - Set if the value is good and the block has an unacknowledged Alarm with a priority less than 8.	1	0	0	1	0	1	-	-
0x90	Good (Non-Cascade)	Unacknowledged Update event - Set if the value is good and the block has an unacknowledged Update event.	1	0	0	1	0	0	-	-
0x8C	Good (Non-Cascade)	Active Critical Alarm - Set if the value is good and the block has an active Alarm with a priority greater than or equal to 8.	1	0	0	0	1	1	-	-
0x88	Good (Non-Cascade)	Active Advisory Alarm - Set if the value is good and the block has an active Alarm with a priority less than 8.	1	0	0	0	1	0	-	-
0xA8	Good (Non-Cascade)	Maintenance demanded	1	0	1	0	1	0	-	-
0xA4	Good (Non-Cascade)	Maintenance required	1	0	1	0	0	1	-	-
0xBC	Good (Non-Cascade)	Function check - Local override	1	0	1	1	1	1	-	-
0xC0	Good(Cascade)	OK - No error or special condition is associated with this value.	1	1	0	0	0	0	-	-
0x80	Good (Non-Cascade)	OK - No error or special condition is associated with this value.	1	0	0	0	0	0	-	-

Limit

The Quality Codes can be further subdivided by limits. Limits are optional.

	Q	Q	S	S	S	S	L	L
O.K. - The value is free to move.	-	-	-	-	-	-	0	0
Low limited - The value has acceded its low limits.	-	-	-	-	-	-	0	1
High limited - The value has acceded its high limits.	-	-	-	-	-	-	1	0
Constant (high and low limited) - The value cannot move, no matter what the process does.	-	-	-	-	-	-	1	1

Quality Codes in Communication with OPC

When connecting to a OPC UA server, the OPC UA status code is shown in a quality code.

Quality Code in WinCC	Status code according to OPC
0x48	0x40
0x4C	0x40
0x5C	0x40
0x60	0x40
0x80...0xD4	0xC0
0xD8	0xC0

5.6.2 Data types

5.6.2.1 Data types for SIMATIC S7-300/400

Overview

The following table shows the data types for SIMATIC S7-300/400 with the corresponding HMI data types and value ranges in WinCC.

Data type	Value range
Array of Char	• Array of Char is mapped in HMI to a tag of the String data type • The maximum array of Char is 254 characters. • With SIMATIC S7-300 – Read access: 222 characters – Write access: 212 characters • 0 ... 224 (ASCII) • Characters from the Windows 1252 code page
Bool	0 (FALSE), 1 (TRUE)
Byte	0 ... 255
Char	0 ... 255 (ASCII)

Data type	Value range
Counter	0 ... 999
Date	1990-01-01 ... 2168-12-31
DInt	–2147483648 ... +2147483647
DWord	0 .. 4294967295
Int	–32768 ... 32767
Real	±1.17549E-38 to ±3.40282E+38 and 0.0
S5Time	0 ... 2h46m30s0ms
String	• The maximum length of a string is 254 characters. • With SIMATIC S7-300 – Read access: 220 characters – Write access: 210 characters • ASCII • Characters from the Windows 1252 code page
Time [1]	-24d20h31m23s648ms ... +24d20h31m23s647ms
Time_Of_Day	00:00:00 ... 23:59:59.999
Timer	-0ms ... 2h46m30s0ms
Word	0 ... 65535

1: If the value is set via the HMI, then the granularity is in 100 nanosecond intervals. In contrast, the granularity of WinCC Advanced, WinCC Comfort and WinCC Professional is milliseconds.

5.6.2.2 Data types for SIMATIC S7-1200

Overview

The following table shows the data types for SIMATIC S7-1200 with the corresponding HMI data types and value ranges in WinCC.

Data type	Value range
Array of Char	• Array of Char is mapped in HMI to a tag of the String data type • The maximum array of Char is 254 characters. • 0 ... 255 (ASCII) • Characters from the Windows 1252 code page
Array of WChar	• Array of WChar is mapped in HMI to a tag of the String data type • The maximum array of WChar is 255 characters. • Characters from the Unicode code page
Bool	0 (FALSE), 1 (TRUE)
Byte	0 ... 255
Char	0 ... 255 (ASCII)
Date	1990-01-01 ... 2168-12-31
DInt	–2147483648 ... +2147483647
DTL	1970-01-01-00:00:00.0 ... 2262-04-11-23:47:16.854775807

Data type	Value range
DWord	0 ... 4294967295
Int	-32768 ... +32767
LReal	±1.79769313486231E+308 ... ±2.22507385850720E-308 and 0.0
Real	±1.17549E-38 ... ±-3.40282E+38 and 0.0
SInt	-128 ... +127
String	• The maximum length of a string is 254 characters. • ASCII • Characters from the Windows 1252 code page
Time [1]	-24d20h31m23s648ms ... +24d20h31m23s647ms
Time_Of_Day, TOD	00:00:00 ... 23:59:59.999
UDInt	0 ... 4294967295
UInt	0 ... 65535
USInt	0 ... 255
WChar	UNICODE
Word	0 ... 65535
WString	UNICODE
PLCUDT	-

1: If the value is set via the HMI, then the granularity is in 100 nanosecond intervals. In contrast, the granularity of WinCC Advanced, WinCC Comfort and WinCC Professional is milliseconds.

5.6.2.3 Data types for SIMATIC S7-1500

Overview

The following table shows the data types for SIMATIC S7-1500 with the corresponding HMI data types and value ranges in WinCC.

Data type	Value range
Array of Char	• Array of Char is mapped in HMI to a tag of the String data type • The maximum array of Char is 254 characters. • 0 ... 255 (ASCII) • Characters from the Windows 1252 code page
Array of WChar	• Array of WChar is mapped in HMI to a tag of the String data type • The maximum array of WChar is 255 characters. • Characters from the Unicode code page
Bool	0 (FALSE), 1 (TRUE)
Byte	0 ... 255
Char	0 ... 255 (ASCII)
Counter	0 ... 65535
Date	1990-01-01 ... 2168-12-31
Date_And_Time, DT	1990-1-1-0:0:0.0 ... 2089-12-31-23:59:59.999

Data type	Value range
DInt	–2147483648 ... +2147483647
DTL	1970-01-01-00:00:00.0 ... 2262-04-11-23:47:16.854775807
DWord	0 ... 4294967295
Int	-32768 ... +32767
LDT	1970-01-01-00:00:00.000000000 ... 2263-04-11-23:47:16.854775808
LInt	-9223372036854775808 ... +9223372036854775807
LReal	±1.79769313486231E+308 ... ±2.22507385850720E-308 and 0.0
LTime [1]	• Value range: -9223372036854775808 to 9223372036854775807 • Unit: ns • Resulting time interval: -106751d23h47m16s854ms775us808ns ... +106751d23h47m16s854ms775us807ns For more information on setting an LTime value via the HMI, refer to section IO field (Page 284).
LTime_Of_Day, LTOD	00:00:00.000000000 ... 23:59:59.999999999
LWord	0 ... 18446744073709551615
Real	±1.17549E-38 ... ±-3.40282E+38 and 0.0
S5Time	0ms ... 2h46m30s0ms
SInt	-128 ... +127
String	• The maximum length of a string is 254 characters. • ASCII • Characters from the Windows 1252 code page
Time [1]	-24d20h31m23s648ms ... +24d20h31m23s647ms
Time_Of_Day, TOD	00:00:00 ... 23:59:59.999
Timer	-24d20h31m23s648ms ... +24d20h31m23s647ms
UDInt	0 ... 4294967295
UInt	0 ... 65535
ULInt	0 ... 18446744073709551615
USInt	0 ... 255
WChar	UNICODE
Word	0 ... 65535
WString	UNICODE
PLCUDT	-

1: If the value is set via the HMI, then the granularity is in 100 nanosecond intervals. In contrast, the granularity of WinCC Advanced, WinCC Comfort and WinCC Professional is milliseconds.

5.6.2.4 User-defined PLC data types (UDT)

Overview

You can connect with the HMI tags and DB instances of user-defined PLC data types (UDT).

The PLC data type and the corresponding DB instances are created and updated centrally in STEP 7. In WinCC, you can use the following sources as PLC tag (DB instances):

- Data block elements that use a UDT as data type
- Instance data blocks of a UDT

The data type is taken from STEP 7 and is not converted into an HMI data type. The access type is always "Symbolic access".

Elements of a PLC data type

You have access to the following elements in WinCC with a structured PLC data type:

- Elements that have been released for WinCC in STEP 7.
- Elements whose data types are supported in WinCC.

Note

Invalid elements of a PLC data type in WinCC

Invalid elements generate an error in WinCC.

If you disable the "Accessible from HMI" option for the corresponding elements of the associated PLC data type in STEP 7, these elements are excluded in WinCC.

Naming conventions

The following characters are invalid in the name of the PLC data type and generate an error in WinCC:

- Period: "."
- Square brackets: "[" and "]"

Properties

The properties of the PLC data type and its elements are adopted in WinCC. Depending on the data type used, the properties are read-only or can be written to in WinCC.

If you change the connection of the PLC data type in WinCC, all elements of the PLC data type are deleted and the properties of the newly connected PLC tag are used.

In WinCC, you have access to STEP 7 comments on elements of the PLC data type.

You have limited access to properties in WinCC for the following elements of PLC data types:

- Elements of the data type "Struct"
- PLC data type

- Multidimensional arrays
- Array of complex data types except "DTL"

Mapping of the data type "DTL"

If a PLC data type contains elements of the data type "DTL", these elements are mapped in WinCC without lower-level elements. The data type "DTL" turns into "DateTime" in WinCC.

Tags with elements of the "DTL" data type

Tags that use the "DTL" data type element by element can only be used as read-only with symbolic addressing, e.g. with SIMATIC S7 1500. With absolute addressing, write access is also possible.

Configuring alarms

6

6.1 Basics

6.1.1 Alarm system

Introduction

Alarms display events, operating states or faults that occur or predominate in your plant. You can use alarms for diagnostic purposes for fault rectification, for example, and they help you rapidly to identify the cause of a fault. You can adjust your processes through targeted intervention so that compliant products continue to be produced despite the fault, or the process is stabilized and the fault only causes a minimal loss of production.

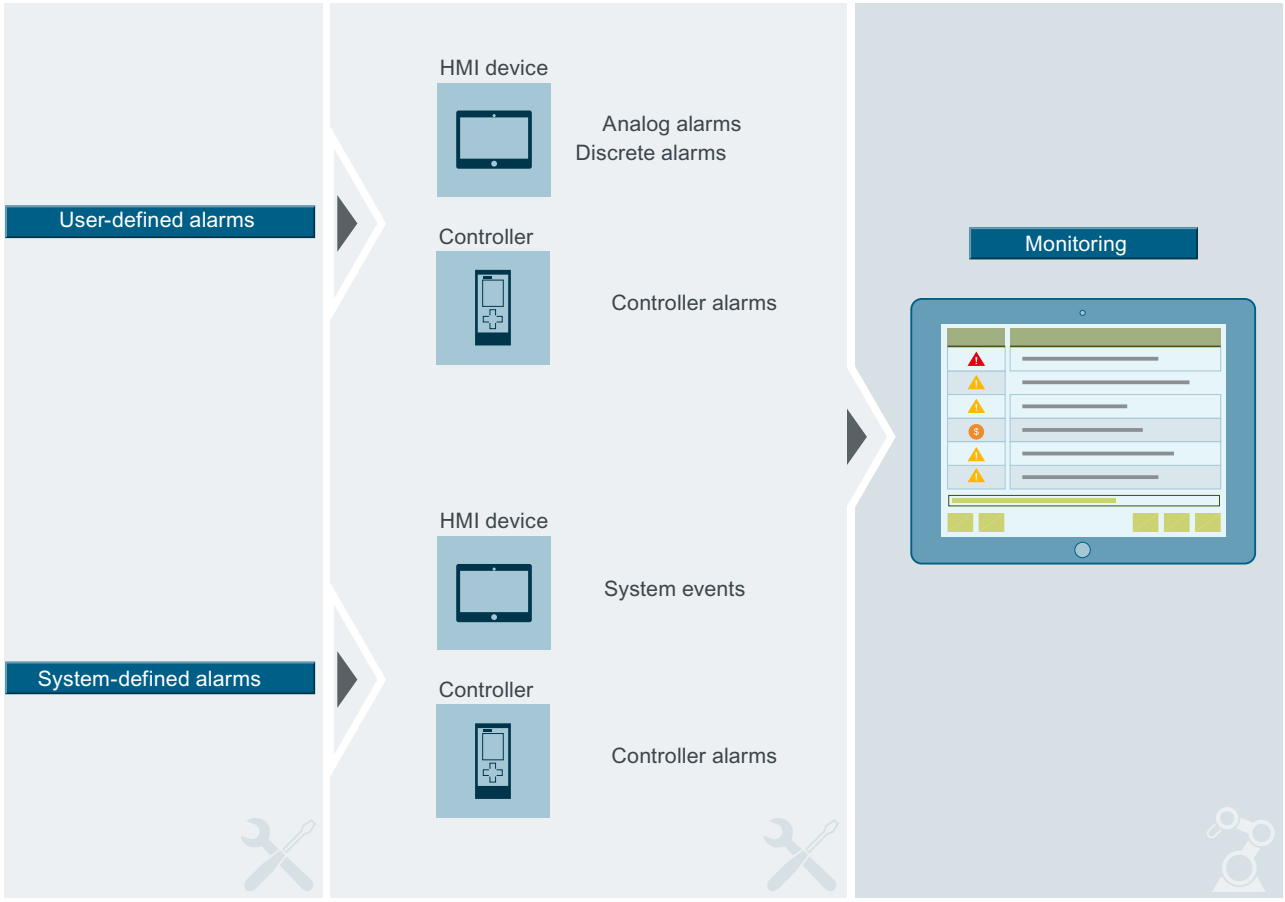
WinCC has a whole range of technical tools for implementing an alarm system. You use these tools to set up an alarm system that meets all requirements under currently applicable national and international standards and guidelines.

By means of the alarm system, events from the monitoring function in WinCC are displayed in form of alarms, acknowledged by the operator and logged, if necessary. To do this, alarms must be configured that are separated into alarm classes.

Alarm system

The alarm system distinguishes between the following alarms:

- User-defined alarms:
  - Analog alarms: Show limit violations (value changes), are used for monitoring the plant.
  - Discrete alarms: Show status changes, are used for monitoring the plant.
  - User-defined controller alarms: are configured in STEP 7, show status values of the controller, are used to monitor the plant.
- System-defined alarms:
  - System alarms: belong to the HMI device and are used to monitor it.
  - System-defined controller alarms: consist of system diagnostic alarms and system errors and are used to monitor the controller.



The detected alarm events are displayed on the HMI device.

Note

Note the following restrictions for controller alarms.

- WinCC only supports controller alarms of a SIMATIC S7-1500 controller.
- WinCC only supports controller alarms that are automatically updated by the central alarm management in the controller.

Tips for an efficient procedure

- When you configure an alarm system, you need to take account of the abilities of future users.
- Alarm systems must be designed to use and allow for characteristic aspects of human perception.
- Important alarms must be highlighted so that they are noticed rapidly. The display of important information should be redundant to make it easier to see.
- Supplementary information about individual alarms ensures that faults are localized and cleared quickly.
- Information should if possible be directed at more than one sense (for example, visible and sound signals). Only alarm systems that meet these criteria will help the user to monitor and control the plant.

6.1.2 Alarms

6.1.2.1 User-defined alarms

Analog Alarms

Description

Analog alarms indicate limit violations. You have defined in advance a limit value for the trigger tag and the trigger mode. An analog alarm is triggered depending on which mode you have defined, for example, when the value is higher than, lower than or the same as the defined value.

Example

The speed of a motor must not be too high or too low. You can configure analog alarms to monitor the speed of the motor. If the high or low limit for the speed of the motor is violated, an alarm is output on the HMI device containing the following alarm text, for example: "Motor speed is too low".

Configuring analog alarms (Page 738)
Configuring optional parameters for discrete alarms and analog alarms (Page 745)
Discrete alarms (Page 710)
User-defined controller alarms (Page 710)
System events (Page 712)
System-defined controller alarms (Page 712)
Alarm system (Page 707)

Discrete alarms

Description

Discrete alarms indicate status changes in a plant. A discrete alarm is triggered when the value of a specific bit of an internal or external tag changes.

Example

Imagine that the state of a valve is to be monitored during operation. The two possible valve states are "opened" and "closed". In this case, a discrete alarm is configured for each valve state. A discrete alarm containing the following alarm text is output, for example, when the state of this valve changes: "Valve closed".

Analog Alarms (Page 709)

User-defined controller alarms (Page 710)

System events (Page 712)

System-defined controller alarms (Page 712)

Alarm system (Page 707)

User-defined controller alarms

Example of an alarm

"The temperature in Tank 2 is too high."

Description

A user-defined controller alarm, e.g. a program alarm, created by the control project engineer in STEP 7. The PLC status values, such as time stamp and process values, are mapped in the controller alarm. If controller alarms are configured in STEP 7, accept them into the integrated WinCC operation as soon as a connection is established to the PLC. In STEP 7, the controller alarm is assigned to an alarm class. You import this alarm class with the controller alarm as a common alarm class.

Note

Automatic update of new or modified controller alarms on the HMI device

If controller alarms are configured in STEP 7 and an HMI connection to a SIMATIC S7-1500 controller (firmware version 2.0 or higher) is established, controller alarms are sent to the HMI device. After changes of the controller alarms, the HMI device configuration must no longer be transferred. The prerequisite is that the option "Central alarm management in the PLC" is enabled in the properties of the controller. In addition, the option "Automatic update" must be enabled in the runtime settings of the HMI device under "Alarms > Controller alarms".

Note

WinCC only supports controller alarms of a SIMATIC S7-1500 controller. In addition, WinCC only supports controller alarms that are automatically updated by the central alarm management in the controller.

Controller alarms for HMI devices

If a controller is connected with one or more HMI devices, the configuration engineer assigns display classes to the controller alarms in STEP 7. The display classes determine the allocation to the HMI device. You activate the display classes that are to be available for each HMI device. In this case, only the controller alarms from this display class will be displayed on the HMI device. Up to 17 display classes are possible.

Discrete alarms (Page 710)

System events (Page 712)

System-defined controller alarms (Page 712)

Alarm system (Page 707)

6.1.2.2 System-defined alarms

System events

Example of an alarm

"Memory is full!"

Description

A system event indicates the system status and communication errors between the HMI device and system. System events are output in runtime in the configured alarm control. System events are output in the language currently set on your HMI device.

The time format (AM/PM or 24-hour format) is based on the selected language. If no translation of the alarm texts exists in this language, English is used as replacement and the corresponding time format is displayed.

Discrete alarms (Page 710)

User-defined controller alarms (Page 710)

System-defined controller alarms (Page 712)

Alarm system (Page 707)

System-defined controller alarms

Example of an alarm

"CPU maintenance required"

Description

System-defined controller alarms are installed with STEP 7 and are only available if WinCC is operated in the STEP 7 environment.

System-defined controller alarms are used to monitor states and events of a controller. System-defined controller alarms consist of system diagnostic alarms and system errors (RSE)

Note

Automatic update of system diagnostic alarms on the HMI device

If an HMI connection to a SIMATIC S7-1500 controller (firmware version 2.0 or higher) is established, system diagnostic alarms are sent to the HMI device and automatically updated. The prerequisite is that the option "Central alarm management in the PLC" is enabled in the properties of the controller. In addition, the options "Automatic update" and "System diagnostics" must be enabled in the runtime settings of the HMI device under "Alarms > Controller alarms".

Note

Note the following restrictions:

- WinCC only supports system diagnostic alarms of a SIMATIC S7-1500 controller.
- WinCC only supports system diagnostic alarms that are automatically updated by the central alarm management in the controller.

User-defined controller alarms (Page 710)

System events (Page 712)

Alarm system (Page 707)

6.1.3 Alarm states

Description

Every alarm has an alarm state. The alarm states are made up of the following events:

- **Incoming**
  The condition for triggering an alarm is fulfilled. The alarm is displayed, such as "Boiler pressure too high".
- **Outgoing**
  The condition for triggering an alarm is no longer fulfilled. The alarm is no longer displayed as the boiler was vented.
- **Acknowledged**
  The operator has acknowledged the alarm.

Alarms without acknowledgment

The following table shows the alarm states for alarms that do not have to be acknowledged:

Icon	Status	Status text	Description
	Active	Incoming	The condition for an alarm is fulfilled. The alarm does not have to be acknowledged.
	Inactive	Normal	The condition for an alarm is no longer fulfilled. The alarm is no longer pending.

Alarms with acknowledgment

The following table shows the alarm states for alarms that have to be acknowledged:

Icon	Status	Status text	Description
	Active	Incoming	The condition for an alarm is fulfilled.
	Inactive, Not acknowledged	Incoming/Outgoing	The condition for an alarm is no longer fulfilled. The operator has not acknowledged the alarm.
	Inactive, Then acknowledged	Incoming/Acknowledged	The condition for an alarm is no longer fulfilled. The operator has acknowledged the alarm after this time.
	Active, acknowledged	Incoming/Outgoing /Acknowledge	The condition for an alarm is fulfilled. The operator has acknowledged the alarm.
	Inactive, Previously acknowledged	Incoming/Acknowledge/Outgoing	The condition for an alarm is no longer fulfilled. The operator acknowledged the alarm while the condition was still fulfilled.

Note

The display text for the states of an alarm is language-specific and configuration-specific.

Locked alarms

You lock an alarm, for example, to prevent an error alarm from impairing the effectivity of your system.

- Locked: The alarm was locked. The alarm assumes its final state without additional state transitions.
- Not locked: The alarm is unlocked. The alarm is visible again in its last state.

Suppressed alarms

You suppress the display of specific alarms, for example, to avoid an excessive burden of information for the plant operator.

- Suppressed manually: The alarm was suppressed manually.
- Suppressed by design: The alarm was suppressed automatically.

Alarm components and properties (Page 722)

6.1.4 Acknowledgment model

Overview

The acknowledgment model and the state machine for predefined alarm classes have already been set. You can only set the acknowledgment model and the state machine for user-defined alarm classes. All alarms included in this alarm class are then acknowledged according to this acknowledgment model and the state machine.

The following state machines are available for HMI alarm classes:

- Alarm with single-mode acknowledgment
  This alarm must be acknowledged as soon as the event that triggers the alarm occurs. The alarm remains pending until it is acknowledged.
  The following predefined alarm classes use this state machine: "SystemAlarm", "SystemWarning", "Critical", "Warning", "OperatorInputRequest", "Alarm", "Acknowledgement"
- Alarm with optional single-mode acknowledgment
  This alarm does not require acknowledgement once the event that triggers the alarm has occurred. The alarm is pending until the condition that triggered the alarm is no longer fulfilled.
- Alarm with acknowledgment and confirmation
  The alarm must be acknowledged as soon as the event that triggers the alarm has occurred or the alarm is reset. The alarm also requires a confirmation when the event that triggered the alarm is no longer present. The alarm remains pending until it is acknowledged and confirmed.
  The following predefined alarm classes use this state machine: "AlarmWithReset", "CriticalWithReset", "WarningWithReset".
- Alarm without acknowledgment
  This alarm comes and goes without having to be acknowledged.
  The following predefined alarm classes use this state machine: "SystemNotification", "Notification", "No Acknowledgement".
- Alarm without outgoing status with acknowledgment
  This alarm must be acknowledged as soon as the event that triggers the alarm occurs. The alarm remains pending until it is acknowledged.
  The following predefined alarm classes use this state machine: "SystemAlarmWithoutClearEvent", "SystemWarningWithoutClearEvent".
- Alarm without outgoing status without acknowledgment
  This alarm is displayed until the event that triggered the alarm is no longer pending. The alarm is then no longer displayed in the alarm control.
  The following predefined alarm classes use this state machine: "Information", "Systeminformation", "OperatorInputInformation".
- Alarm without state
  This alarm only has the temporary status "Incoming" and can be seen in the log.

The following state machines are available for HMI alarm classes that are linked to common alarm classes:

- Alarm with single-mode acknowledgment
- Alarm without acknowledgment

Acknowledging and confirming alarms

- Group acknowledgment of alarms in the alarm control
  The alarm control has a "Group acknowledgment" button. This button triggers the acknowledgment of all visible alarms that require acknowledgment and are pending in the alarm control.
- Single acknowledgment of alarms in the alarm control
  The alarm control has a "Single acknowledgment" button. This button triggers the acknowledgment of individual alarms selected in the alarm control.
- Single confirmation of alarms with acknowledgment and confirmation in the alarm control.
  The alarm control has a "Single confirm" button. The alarm with the state machine "Alarm with acknowledgment and confirmation" is individually confirmed with this button after it has been acknowledged with group acknowledgment or single acknowledgment beforehand and is outgoing.

Note

If the "Show recent" button is pressed, the most recent alarm is always shown first. Group acknowledgment is only executed for the visible alarms.

6.1.5 Alarm classes

Introduction

Many alarms occur in a plant. These are all of different importance. You can assign the alarms of your project to alarm classes to clearly show the operator which of the alarms are most important.

Description

Every alarm must be assigned to an alarm class when you create new alarms. The alarm class hereby defines the appearance and the acknowledgment model of the alarm (single-mode acknowledgment, acknowledgment and confirmation, no acknowledgment).

A new alarm class with mandatory acknowledgment is generated in WinCC. Predefined alarm classes are available for each device.

Examples of how to use alarm classes

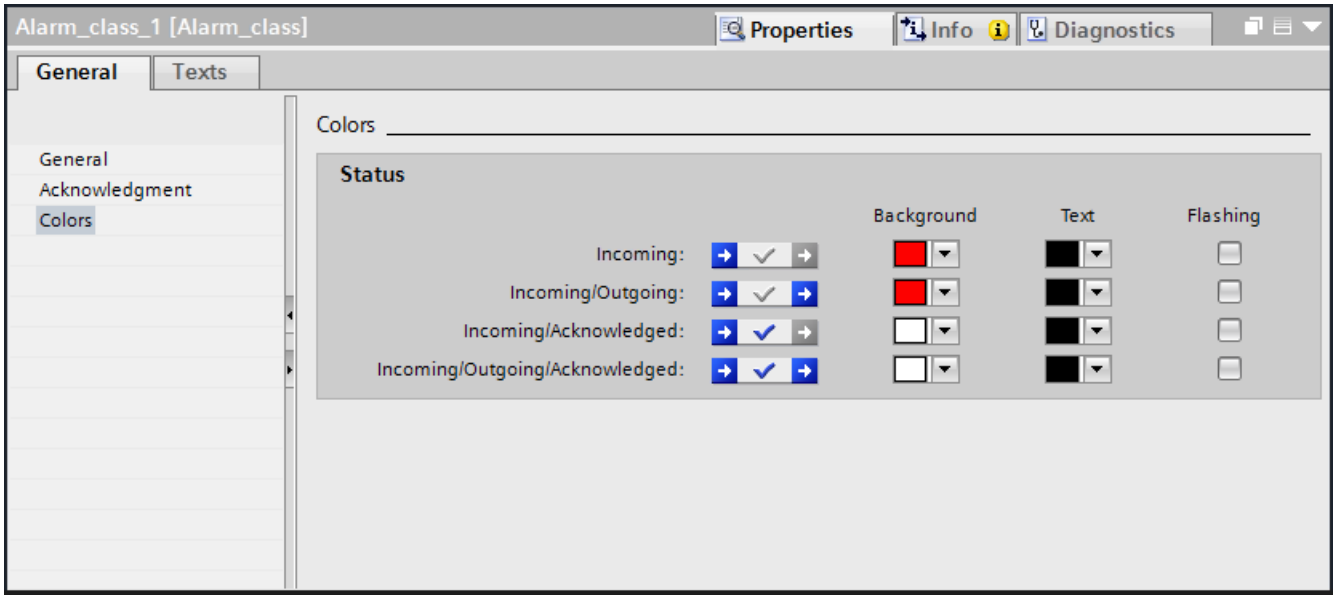
- The alarm class of the alarm "Fan 1 speed in upper tolerance range" is "Warning". The alarm is displayed with a yellow background. The alarm requires acknowledgment.
- The alarm "Speed of fan 2 has exceeded upper warning range" is assigned to the "Alarm" alarm class. The alarm is displayed with a red background and flashes at high frequency in runtime. The alarm is displayed until the alarm is gone and the operator has acknowledged it.

Using alarm classes

Use the following alarm classes to define the state machines and appearance of alarms for your project:

- Predefined alarm classes
  You cannot delete predefined alarm classes and edit them only to a limited extent. Predefined alarm classes are available under "HMI alarms > Alarm classes".
- Custom alarm classes
  You can create new alarm classes under "HMI alarms > Alarm classes", configure how you want the alarms to be displayed, and define an acknowledgment model for alarms of this alarm class. The possible number of custom alarm classes depends on which runtime is used in your project.
- Common alarm classes
  Common alarm classes are displayed under "Common data > Alarm classes" in the project tree and can be used for the alarms of an HMI device. Common alarm classes are used in STEP 7 for controller alarms. If required, create additional common alarm classes in WinCC. Common alarm classes are divided into predefined and user-defined common alarm classes. The predefined common alarm classes are "Acknowledgement" (for alarms with acknowledgment) and "No Acknowledgement" (for alarms without acknowledgment).

For each alarm class (including predefined alarm classes), you can configure the font color, background color and flashing for the alarm states "Incoming", "Incoming/outgoing", "Incoming/acknowledged", "Incoming/outgoing/acknowledged":



Predefined alarm classes

The following predefined alarm classes are available under "Alarm classes" in the "HMI alarms" editor.

System events:

- "SystemInformation"
  Alarms of this alarm class have no "Outgoing" state and do not require acknowledgment. This alarm class is only used for logging.
- "SystemNotification"
  Alarms in this alarm class do not require acknowledgment.
- "SystemWarning"
  Alarms in this alarm class must be acknowledged.
- "SystemWarningWithoutClearEvent"
  Alarms of this alarm class have no "Outgoing" state and must be acknowledged.
- "SystemAlarm"
  Alarms in this class must be acknowledged.
- "SystemAlarmWithoutClearEvent"
  Alarms of this alarm class have no "Outgoing" state and must be acknowledged.

Standard alarms:

- "Acknowledgement"
  Alarms in this class must be acknowledged. The alarm class "Acknowledgement" is linked to the predefined common alarm class "Acknowledgement".
- "No Acknowledgement"
  Alarms in this alarm class do not require acknowledgment. The alarm class "No Acknowledgement" is linked to the predefined common alarm class "No Acknowledgement".

- "Information"
  Alarms of this alarm class have no "Outgoing" state and do not require acknowledgment. This alarm class is only used for logging.
- "OperatorInputInformation"
  Alarms of this alarm class have no "Outgoing" state and do not require acknowledgment. The alarm class "OperatorInputInformation" is designed to show the reports that are relevant for an audit. This alarm class is only used for logging.
- "Notification"
  Alarms in this alarm class do not require acknowledgment. The alarm class "Notification" alarm class is designed to show irregular states and routines in the process.
- "OperatorInputRequest"
  Alarms in this alarm class must be acknowledged.
- "Warning"
  Alarms in this alarm class must be acknowledged.
- "WarningWithReset"
  Alarms in this alarm class must be acknowledged. This alarm class must also be reset. The locked alarm is unlocked during the reset.
- "Alarm"
  Alarms in this class must be acknowledged. The alarm class "Alarm" is designed to show critical or dangerous states or limit violations in the process.
- "AlarmWithReset"
  Alarms in this alarm class must be acknowledged. This alarm class must also be reset. The locked alarm is unlocked during the reset.
- "Critical"
  Alarms in this alarm class must be acknowledged. The alarm class "Critical" is designed to show critical faults in the plant, for example, "Motor temperature too high". This alarm and its alarm states are included in the log.
- "CriticalWithReset"
  Alarms in this alarm class must be acknowledged. This alarm class must also be reset. The locked alarm is unlocked during the reset. The alarm class "CriticalWithReset" is designed to show critical faults in the plant, for example, "Motor temperature too high".

Note

The alarm classes whose names contain "System" are designed to show the states of the device and the controllers, for example, to provide information on operating errors or faults in communication.

Note

The predefined alarm classes are write-protected and cannot be deleted. You can, however, change the preset background and foreground colors and font colors if necessary. If required, you can also change the name of the predefined alarm classes "Acknowledgement" and "No Acknowledgement". The name of the linked predefined common alarm classes "Acknowledgement" and "No Acknowledgement" is not changed. You cannot change the name of the linked predefined common alarm classes, not even under "Common data > Alarm classes". Common alarm classes are automatically added for the non-intergrated mode.

Custom alarm classes

The properties of this alarm class are defined in the configuration. You assign a name, a state machine, a priority and, if necessary, a log to the alarm class. You also define the display of the user-defined alarm using text and background colors.

6.1.6 Acknowledging alarms

Introduction

To make sure that an alarm was noticed by the plant operator, configure this alarm so that it is displayed until acknowledged by the operator. Alarms that indicate critical or hazardous states in the process have to be acknowledged.

The acknowledgment of an alarm is an event that is logged and reported. Acknowledging an alarm in the "Incoming" state changes the alarm state from "Incoming" to "Acknowledged". When the operator acknowledges an alarm, they confirm that they have processed the state that triggered the alarm.

Acknowledging an alarm

The operator acknowledges in runtime an alarm via the alarm control buttons.

See also

Alarm system (Page 707)

Acknowledgment model (Page 715)

Alarm classes (Page 717)

Alarm states (Page 714)

Alarm components and properties (Page 722)

6.1.7 Alarm components and properties

Overview

The following table shows the basic components of alarms that you can configure in WinCC:

Alarm class	Alarm number	Time	Date	State machine	Alarm text	Info text	Trigger tag	Limit value
Warning	1	11:09:14	06.08.2017	Alarm with single-mode acknowledgment	Maximum speed reached	This alarm is ...	speed_1	27

Alarm class

The alarm class of an alarm determines whether the alarm has to be acknowledged.

The alarm class defines the following for an alarm:

- State machine/acknowledgment model
- Appearance in runtime (e.g. color)
- Log in which an alarm is logged
- Priority

Alarm number

An alarm is identified by an alarm number (ID). The alarm number is assigned by the system for internally managing an alarm. You can change the alarm number to a sequential alarm number, if necessary, to identify alarms associated in your project.

An alarm number must only be used once on a device.

Note

Discrete alarms and analog alarms can receive an identical alarm number from the system. The alarm number can be customized on request.

Note

When adapting alarm numbers, observe the inter-project uniqueness of the alarm number.

The system event number overrides a custom alarm number. If using the system event number for a custom alarm, change the custom alarm number accordingly.

Time and date

Every alarm has a time stamp that shows the time and date at which the alarm was triggered.

State machine

An alarm has the state machine or the acknowledgment model of the alarm class.

The state machine is how an alarm is displayed in various states and processed from by the system.

Alarm states

An alarm always has a specific alarm state in runtime. The operator analyzes the process execution based on the alarm states.

Alarm text

The alarm text describes the cause of the alarm.

The alarm text can contain output fields for current values. The values you can insert depend on the runtime in use. The value is retained at the time at which the alarm status changes.

Info text

You can configure a separate info text for each alarm; the operator can display this info text in runtime.

Trigger tag

A tag is assigned to each alarm as trigger. The alarm is raised when this trigger tag meets the defined condition, e.g. when its state changes or it exceeds a limit.

Limit value

Analog alarms indicate limit violations. Depending on the configuration, WinCC outputs the analog alarm as soon as the trigger tag exceeds or undershoots the limit value.

Computer

Operator input alarms have the "Computer" column in the alarm lists. The computer name is displayed for local alarms and the IP address for alarms from the web client.

Users

The user acknowledges the alarm. If an empty user name is transferred to an alarm, the alarm displays no user name.

Duration

The time interval between the triggering of the alarm and its last state change in nanoseconds.

Alarm states (Page 714)

Alarm classes (Page 717)

Acknowledging alarms (Page 721)

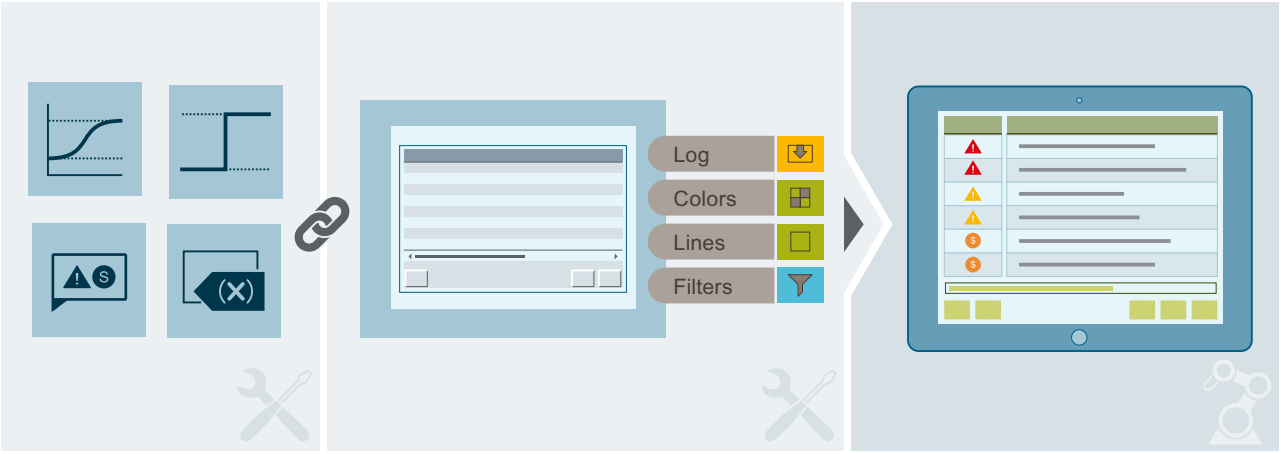
6.2 Configuring alarms

6.2.1 Workflow for configuring alarms

Steps to configure alarms

You configure alarms in the following stages:

1. Configuring alarm classes
   In the "HMI alarms" editor, adapt the predefined alarm classes or configure your own alarm classes. You use the alarm class to define the state machine of an alarm and how the alarm is displayed in runtime.
2. Creating trigger tags
   Create trigger tags in the "HMI tags" editor and configure the trigger bit for discrete alarms or the range limits for analog alarms.
3. Creating alarms
   Create user-defined alarms in the "HMI alarms" editor and assign the alarm classes and the tags to be monitored.
   Under "Runtime settings > Alarms", adapt the status texts or activate the use of controller alarms.
4. Configuring the display of alarms
   Configure an alarm control in the "Screens" editor.
5. Logging alarms
   In the "Logs" editor, create an alarm log and assign the log to an alarm class in the "HMI alarms" editor.



Additional configuration tasks

Additional tasks could be necessary for configuring alarms, depending on the requirements of your project:

- Adapting status texts
  You specify the status texts under "Runtime settings > Alarms".
- Editing system events
  You edit system events in the "HMI alarms" editor or under "Languages & Resources > Project texts". In the "Category" column you can recognize a system event by the name "HMI system event".
- Activating controller alarms
  For integrated operation of a project in STEP 7, specify the controller alarms to be displayed on your HMI device in the alarm settings.

Note

WinCC only supports controller alarms of a SIMATIC S7-1500 controller. In addition, WinCC only supports controller alarms that are automatically updated by the central alarm management in the controller.

6.2.2 Creating alarm classes

Introduction

Create alarm classes to define the type of acknowledgment, the display of the alarm in runtime for an alarm. You assign the individual alarms to the alarm classes.

Create alarm classes in the "Alarm classes" tab of the "HMI alarms" editor. Some default alarm classes are already created for every project. You can create additional custom alarm classes. The alarm class also specifies if and how the operator has to acknowledge alarms of this alarm class.

System alarm classes are write-protected and cannot be deleted. You can, however, change the preset background and foreground colors and font colors if necessary. All system alarm classes have the word "System" in their name and are to be used for system-defined alarms.

Note

Alarm colors are editable depending on the state machine. Some colors are not editable for certain state machines.

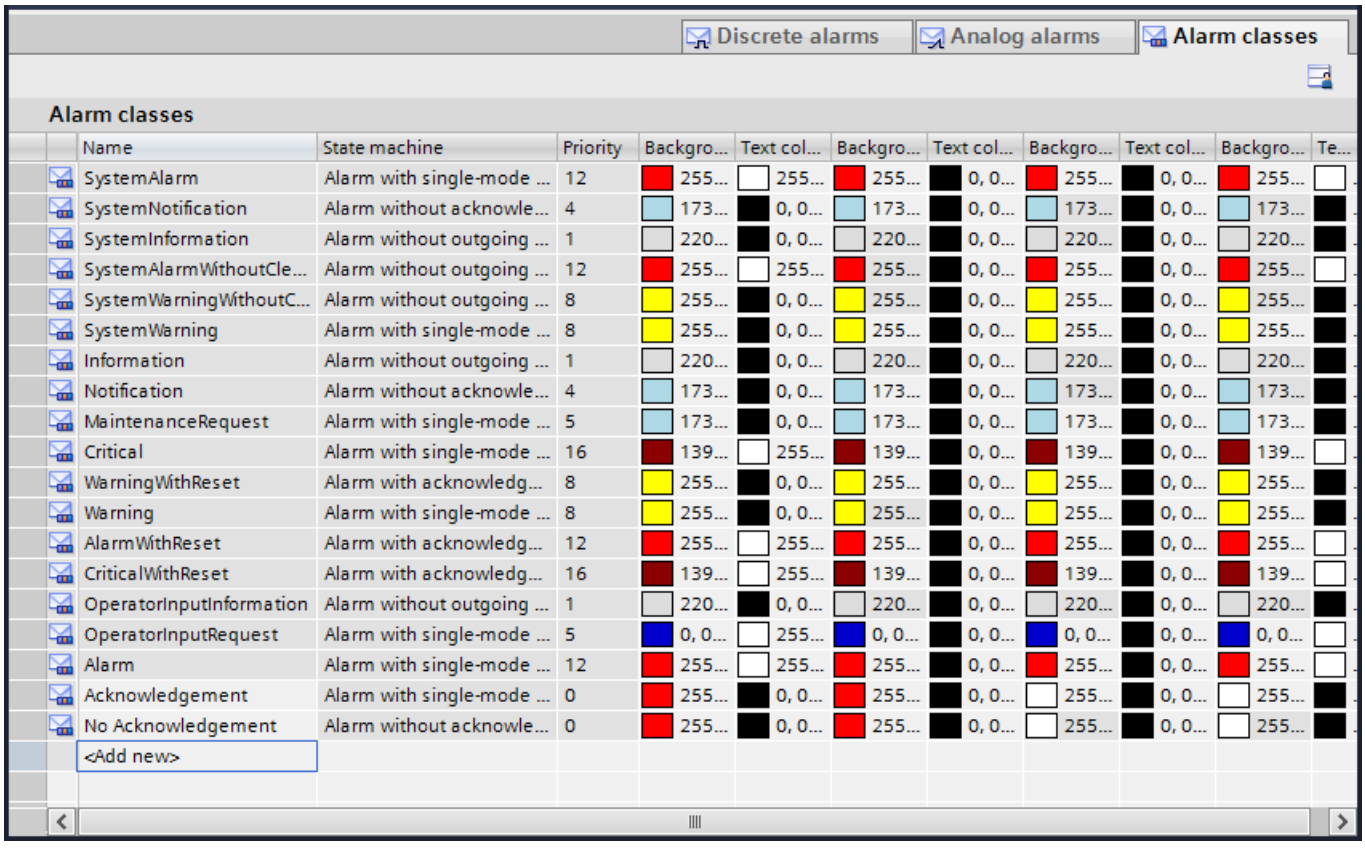
Requirement

- The "HMI alarms" editor is open.
- The Inspector window is open.

Procedure

To create an alarm class, proceed as follows:

1. Click the "Alarm classes" tab.
   A table of the pre-defined alarm classes is shown below:



2. Double-click "<Add>" in the table.
   A new alarm class is created. Each new alarm class is automatically assigned a static ID.
   The properties of the new alarm class are shown in the Inspector window.
3. Configure the alarm class under "Properties > General" in the Inspector window:
   - Enter a name for the alarm class.
   - Set the priority of the alarm class.
4. In the Inspector window, set the state machine of the alarm class.
   See Configuring alarm acknowledgment (Page 749).
5. You can also change the default background color as well as the text color and the settings for flashing under "Properties > Colors" in the Inspector window.
   These settings define how alarms from this alarm class are displayed in runtime.

Note

For alarm colors to be displayed in runtime, the "Use alarm colors" option must be enabled in the properties of the alarm control in the Inspector window. This option is enabled by default.

"Acknowledgment" alarm class

A alarm of the "Acknowledgment" alarm class passes through the following alarm states:

- Incoming
  When the alarm occurs.
- Incoming/Outgoing
  When the alarm is outgoing.
- Normal
  After resetting the value on the PLC and through acknowledgment of the operator.

"No Acknowledgement" alarm class

An alarm of the "No acknowledgment" alarm class passes through the following alarm states:

- Incoming
  When the alarm occurs.
- Normal
  When the alarm is outgoing.

"AlarmWithReset" alarm class

An alarm of the "No acknowledgment" alarm class passes through the following alarm states:

- Incoming
  When the alarm occurs.
- Incoming/outgoing or incoming/acknowledged
  When the alarm is outgoing.
- Incoming/acknowledged/outgoing or incoming/outgoing/acknowledged
  After resetting of the alarm by the operator.
- Normal
  After performing all actions.

Configuring analog alarms (Page 738)

6.2.3 Using common alarm classes

Introduction

Common alarm classes are displayed under "Common data > Alarm classes" in the project tree and can be used for the alarms of an HMI device. Common alarm classes are used in STEP 7 for controller alarms. If required, create additional common alarm classes in WinCC. Common alarm classes are divided into predefined and user-defined common alarm classes. The predefined common alarm classes are "Acknowledgement" (for alarms with acknowledgment) and "No Acknowledgement" (for alarms without acknowledgment).

When you create an HMI device, the system creates an alarm class for each existing common alarm class under "HMI alarms > Alarm classes" which is linked to the common alarm class. If you have created an HMI device and create a common alarm class, the system creates an alarm class for the created common alarm class under "HMI alarms > Alarm classes" which is linked to the common alarm class. If you change all properties for a created common alarm class, the system changes the properties "State machine" and "Priority" of the linked alarm class according to your changes to the "Acknowledgment" and "Priority" properties of the common alarm class. However, your changes to the "Name" and "Display name" properties of the common alarm class have no effect on the properties of the linked alarm class. When you delete a common alarm class, the linked alarm class is also deleted.

Note

By the "Common alarm class" property of an alarm class, you can see whether the alarm class is linked with a common alarm class and, if so, with which common alarm class. To see the property in the "HMI alarms" editor in the "Alarm classes" tab, enable there the "Common alarm class" column using the shortcut menu of the column titles. To see the property in the Inspector window, select an alarm class under "HMI alarms > Alarm classes" and click "General" in the Inspector window.

State machine

Common alarm classes have one of the following state machines:

- Alarm with single-mode acknowledgment
- Alarm without acknowledgment

You configure the state machine directly in the "Alarm classes" editor. Configuration at the linked HMI alarm class in the "HMI alarms" editor is not possible.

Note

For the state machine "Alarm without acknowledgement", the background color configured for the state is ignored in the "Arrived/Gone" state.

Requirements

- You have created a project.

Creating common alarm class

To create a common alarm class, proceed as follows:

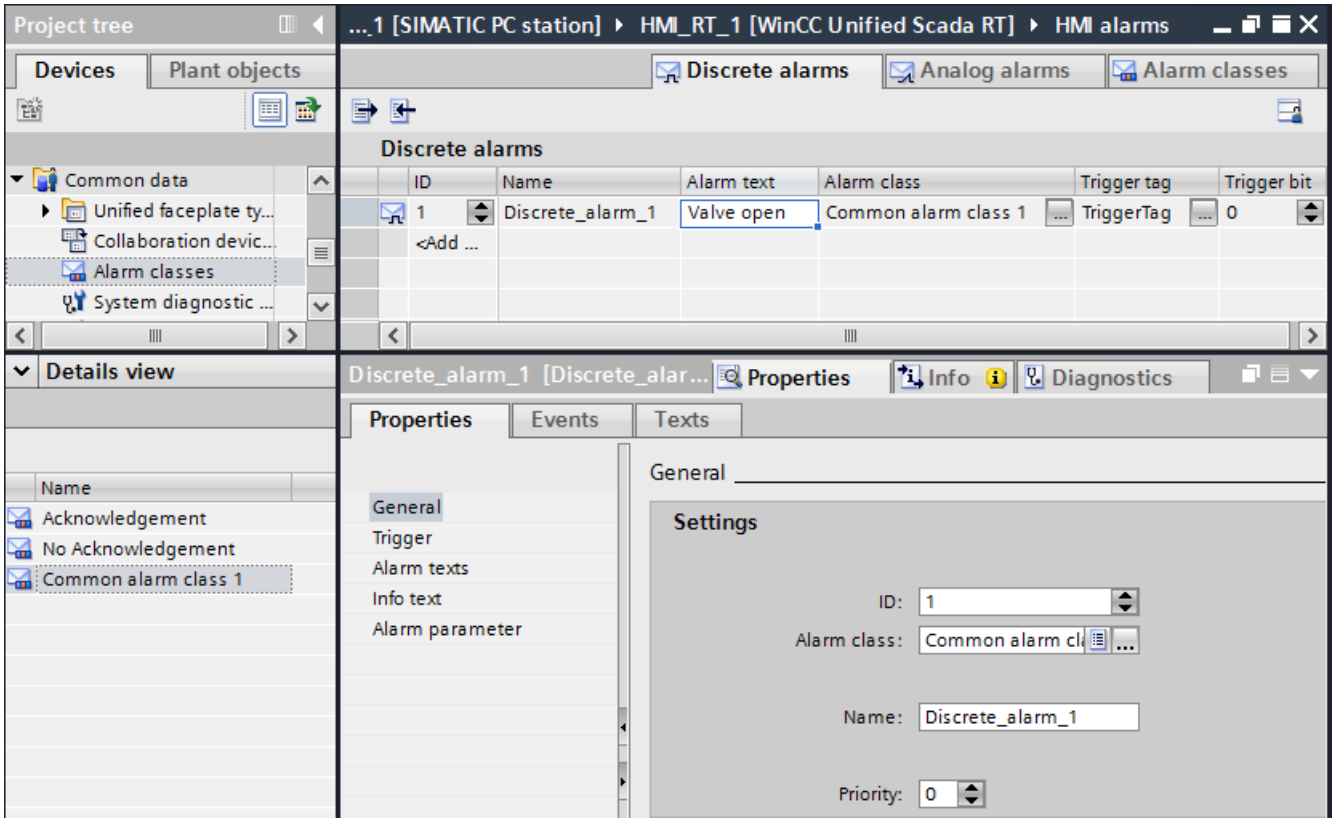
1. Double-click "Common data > Alarm classes" in the project tree.
   The "Alarm classes" editor opens in the working area.
2. To create a common alarm class, double-click in the first empty line of the table editor.
3. Specify the name, display name and priority of the common alarm class and enable the mandatory acknowledgment, if required.
   A common alarm class is created. The system also creates an alarm class under "HMI alarms > Alarm classes", which is linked to the common alarm class. The linked alarm class gets from the system the same name and priority as the common alarm class. If you have enabled the mandatory acknowledgment for the common alarm class, the linked alarm class gets the state machine "Alarm with single-mode acknowledgment" from the system, otherwise the state machine "Alarm without acknowledgment". The defined display name of the common alarm class has no effect on the properties of the linked alarm class.
4. If required, change the name of the alarm class that is linked to the common alarm class under "HMI alarms > Alarm classes".
   If you change the name of the linked alarm class, the common alarm class name is not changed by the system.

Assign alarms to a common alarm class

Proceed as follows to assign an analog or discrete alarm to a common alarm class:

1. In the "HMI alarms" editor, select the alarm that you want to assign to the common alarm class.
2. Click "General" in the Inspector window.
3. Click "Common data > Alarm classes" in the project tree. Alternatively, click "HMI Alarms" in the project tree.
   In the first case, the common alarm class is selected in the detail view. In the second case, the detail view shows the alarm class, which is linked to the common alarm class.

4. Select the common alarm class or alternatively the linked alarm class in the detail view.
5. Drag the common alarm class or alternatively the linked alarm class to the "Alarm class" field or "Alarm class" column in the working area of the Inspector window of the alarm.
   In both cases, the alarm is assigned to the alarm class which is linked to the common alarm class.



Changing a common alarm class

To change a common alarm class, proceed as follows:

1. Double-click "Common data > Alarm classes" in the project tree.
   The "Alarm classes" editor opens in the working area.
2. If necessary, change the name of the created common alarm class.
   The changed name of the common alarm class has no effect on the name of the alarm class which is linked to the common alarm class.
3. If necessary, change the display name of the common alarm class.
   The changed display name of the common alarm class has no effect on the properties of the linked alarm class.

4. If required, enable or disable the mandatory acknowledgment of the common alarm class. If you enable the mandatory acknowledgment, the system changes the state machine of the linked alarm class to "Alarm with single-mode acknowledgment". If you disable the mandatory acknowledgment, the system changes the state machine of the linked alarm class to "Alarm without acknowledgment".
5. If necessary, change the priority of the common alarm class.
   The system changes the priority of the linked alarm class according to your change to the priority of the common alarm class.

Note

You can only change the display names for a predefined common alarm class. The changed display name of a predefined common alarm class has no effect on the properties of the alarm class which is linked to the predefined common alarm class.

Deleting a common alarm class

To delete a common alarm class, proceed as follows:

1. Double-click "Common data > Alarm classes" in the project tree.
   The "Alarm classes" editor opens in the working area.
2. Select the created common alarm class that you want to delete.
3. Select the "Delete" entry from the shortcut menu.
   The system deletes the common alarm class and the alarm class linked with the common alarm class.
4. If an analog or discrete alarm has been assigned to the deleted linked alarm class, assign another alarm class to the alarm. Otherwise a compile error will be generated.

Note

You cannot delete predefined common alarm classes and the alarm classes that are linked with them.

6.2.4 Configuring state texts of alarms

Introduction

The texts for the states of alarms in runtime are displayed in the alarm view in the "Status Text" column. You specify the state texts of alarms in the runtime settings.

Note

If no alarm state texts are defined, an error is generated during compiling.

Requirement

- The alarm view has been configured.

Procedure

To configure the state texts of alarms, follow these steps:

1. Open the "Runtime settings" of the HMI device.
2. Specify the state texts of alarms in runtime under "Alarms > State texts":

Field	Description
Incoming	Text for incoming alarms when changing to the operating state to be reported The condition for an alarm is fulfilled.
Incoming/outgoing	Text for an outgoing alarm The condition for an alarm is no longer fulfilled.
Incoming/acknowledged	Text for an acknowledged and outgoing alarm The condition for an alarm is no longer fulfilled.
Incoming/acknowledged/outgoing	The condition for an alarm is no longer fulfilled. Text for an incoming, acknowledged and outgoing alarm.
Incoming/outgoing/acknowledged	The condition for an alarm is no longer fulfilled. Text for an incoming, outgoing and acknowledged alarm
Removed	Text for alarms in "Removed" state. Only controller alarms can have this state. The state text is only displayed in the alarm log. If the HMI connection between HMI device and controller is disconnected and then re-established, the status text is displayed.
Normal	The condition for an alarm is no longer fulfilled. The alarm is no longer pending. The alarm is acknowledged if required by the alarm class. The alarm is reset by single confirm if required by the alarm class.

3. Change the status texts as required. Keep in mind that these texts are not language specific. In Runtime, always the text configured in engineering is always displayed, independent of the current Runtime language.

4. Select the alarm view in the "Screens" editor.
5. To display the column "Status text" in the Alarm view, select the property "Visibility" in the Inspector window under "Properties > Alarm view > Columns > [...] Status text alarm column".

Configuring an alarm control (Page 753)

6.2.5 Configuring discrete alarms

6.2.5.1 Configuring discrete alarms

Introduction

Discrete alarms triggered by the PLC indicate status changes in a plant. A discrete alarm is triggered by a specific value (bit) of a tag.

Imagine, for example, that the state of a valve is to be monitored during operation. The two possible valve states are "opened" and "closed". In this case, a discrete alarm is configured for each valve state. A discrete alarm containing the following alarm text, for example, is output when the state of this valve changes: "Valve closed".

Note

By default, each new discrete alarm is assigned the alarm class "Alarm". You can then alter the alarm class as required.

Requirement

- The "HMI alarms" editor is open.
- The Inspector window is open.

Procedure

To configure a discrete alarm, proceed as follows:

1. Click the "Discrete alarms" tab.
2. To create a new discrete alarm, double-click on "<Add>" in the table.
   A new discrete alarm is created.

3. Assign a name for the discrete alarm.

Note

The name of a discrete alarm can contain up to 128 characters.

4. To configure the alarm, select "Properties > General" in the Inspector window:
   - Edit the name of the alarm as required.
   - Select the alarm class.
   - Configure the priority of the alarm (a value of between "0" and "16").

Note

You can use the priority to sort or filter the alarms in the alarm control. With sorting by priority, you can ensure that the most important alarm (high priority) is shown in the display area in a single-line alarm control.

If you filter the alarm control by priority "16", only the alarms with priority "16" will appear.

For alarms with priority "0", the priority of the alarm class applies.

The priority of the alarm when displayed in runtime takes precedence over the priority of the alarm class.

Tips for an efficient procedure

- Large machines and plants have a large number of alarm sources that can trigger various types of alarms. It makes sense to structure the alarm system so that the user can keep track of this wide range. One suitable method available here is alarm prioritization. The criteria for assigning the priority value and/or the alarm class are importance and urgency. The priority of the alarm can also be based on the potential impact (system downtime, loss of production, production delay, etc.). If multiple alarms are output, the system can suggest the order in which they should be handled on the basis of priorities.
- You create discrete alarms together with the trigger tags and edit them in the "HMI tags" editor. You create tags in the usual way. Then click <Add> in the table on the "Discrete alarms" tab at the bottom of the work area. A new discrete alarm is created for the tag. If you have selected the wrong data type, the tag will be highlighted in the discrete alarm. If you delete, move or copy objects in the "HMI tags" editor, these changes also take effect in the "HMI alarms" editor. The configured discrete alarms are created in the "HMI tags" editor and displayed in the "HMI alarms" and "HMI tags" editors.
  If you are using an array as a data type for managing alarms, you can assign a discrete alarm to the individual array elements. The alarms assigned to the array elements are displayed under "Discrete alarms" or when you select the array. The alarms have the position within the array as an extension, e.g. "HMI_Tag_1[2]".
- Supplementary information about individual alarms ensures that faults are localized and cleared quickly.

6.2.5.2 Configure trigger

You can define trigger properties for discrete alarms. You can specify a trigger tag, a trigger bit and a trigger mode for an alarm.

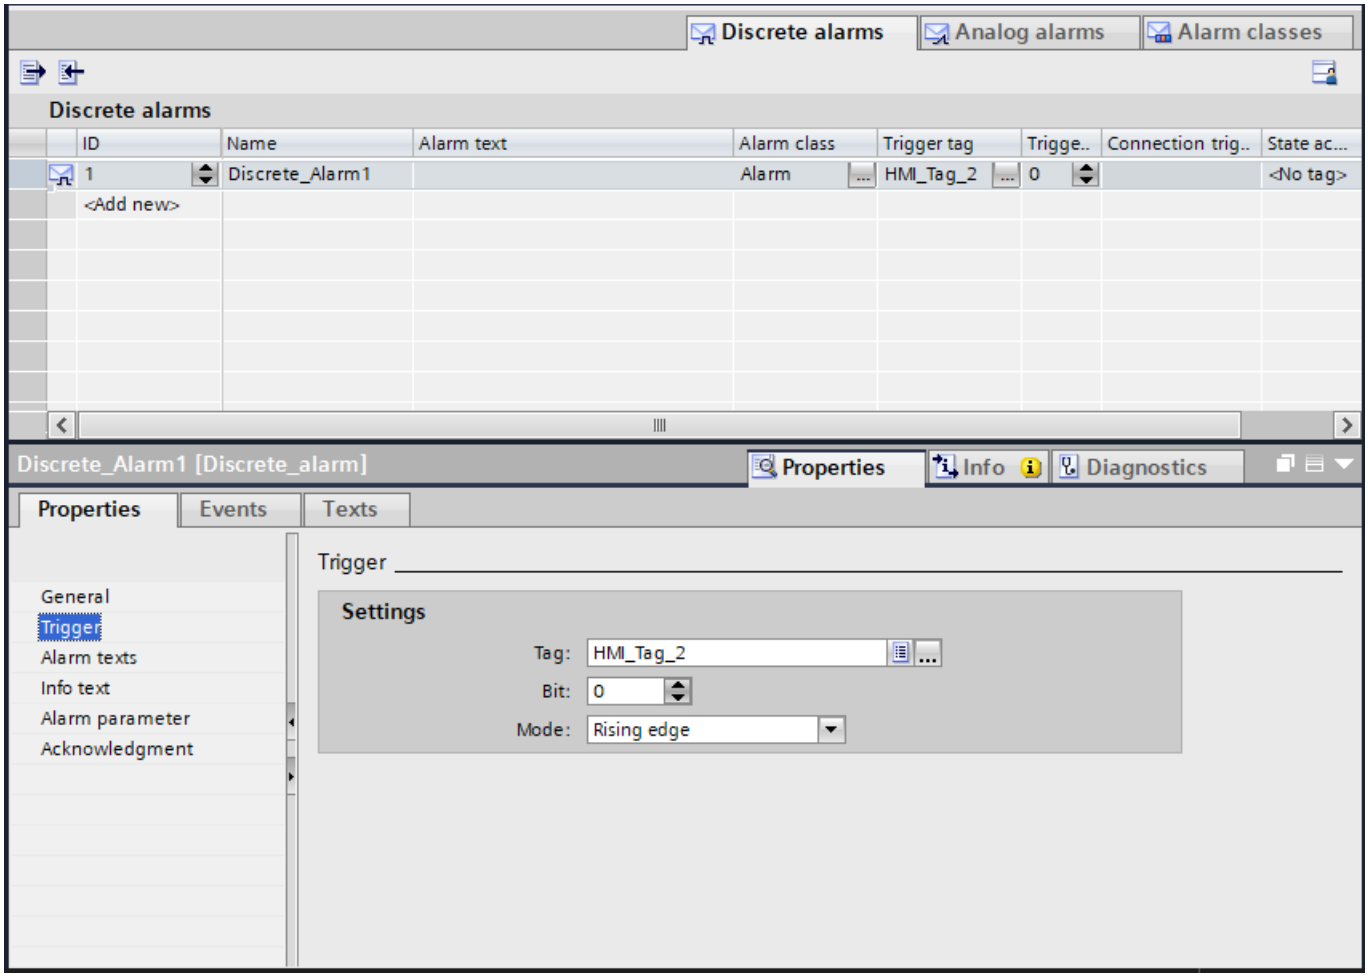
Requirement

- The "HMI alarms" editor is open.
- A discrete alarm has been created.

Procedure

To define trigger properties, follow these steps:

1. Select the discrete alarm.
2. Click on "Trigger" under "Properties" in the Inspector window.
   The "Trigger" window opens.
3. Select the tag and the bit that are to trigger the alarm. You can also specify whether to trigger the alarm at a rising or falling edge.



Note

Restrictions for trigger bits

Each use of a trigger tag requires a different trigger bit. The availability of trigger bits depends on the data type of the trigger tag.

Result

Trigger tag, trigger bit and trigger mode have been specified for the selected discrete alarm.

6.2.5.3 Sending alarm acknowledgments to the PLC

Requirement

- The "HMI alarms" editor is open.
- The required alarm has been created and assigned to an alarm class requiring acknowledgment.

Core statement

To configure that acknowledgment of an alarm is sent to the PLC, follow these steps:

1. In the "HMI alarms" editor, click the "Discrete alarm" tab and select the discrete alarm.
2. In the Inspector window, select "Properties > Properties > Acknowledgment".
3. Under "Status tag", select the tag and the bit set by the alarm acknowledgment function.
4. Under "Control tag", select the tag and the bit set by the alarm acknowledgment function.

Note

The HMI device and PLC only have read access to the acknowledgment tag memory area.

Result

If the operator acknowledges the alarm in Runtime, the operating step is forwarded to the PLC.

6.2.6 Configuring analog alarms

6.2.6.1 Configuring analog alarms

Introduction

You configure analog alarms to display limit violations. You have defined in advance a limit value for the trigger tag and the trigger mode. An analog alarm is triggered depending on which mode you have defined, for example, when the value is higher than, lower than or the same as the defined value.

If the speed of a motor drops below a certain value, for example, an analog alarm is triggered. This alarm could contain the following text: "Motor speed is too low".

Note

By default, each new analog alarm is assigned the alarm class "Alarm". You can then alter the alarm class as required.

Requirement

- The "HMI alarms" editor is open.
- The Inspector window is open.

Procedure

To configure an analog alarm, proceed as follows:

1. Click the "Analog Alarms" tab.
2. To create a new analog alarm, double-click in the table on "<Add>".
   A new analog alarm is created.
3. To configure the alarm, select "Properties > General" in the Inspector window:
   - Edit the name of the alarm as required.
   - Select the alarm class.
   - Configure the priority of the alarm (a value of between "0" and "16").

Note

You can use the priority to sort or filter the alarms in the alarm control. With sorting by priority, you can ensure that the most important alarm (high priority) is shown in the display area in a single-line alarm control.

If you filter the alarm control by priority "16", only the alarms with priority "16" will appear.

For alarms with priority "0", the priority of the alarm class applies.

The priority of the alarm when displayed in runtime takes precedence over the priority of the alarm class.

Tips for an efficient procedure

- Large machines and plants have a large number of alarm sources that can trigger various types of alarms. It makes sense to structure the alarm system so that the operator can keep track of this wide range. One suitable method available here is alarm prioritization. The criteria for assigning the priority value and/or the alarm class are importance and urgency. The priority of the alarm can also be based on the potential impact (system downtime, loss of production, production delay, etc.). If multiple alarms are output, the system can suggest the order in which they should be handled on the basis of priorities.
- You create analog alarms together with the trigger tags and edit them in the "HMI tags" editor. You create tags in the usual way and configure the range values of the tags. Then click <Add> in the table on the "Analog alarms" tab at the bottom of the work area. A new analog alarm is created for the tag. If you have selected the wrong data type, the tag will be highlighted in the analog alarm. If you delete, move or copy objects in the "HMI tags" editor, these changes also take effect in the "HMI alarms" editor. The configured analog alarms are created in the "HMI tags" editor and displayed in the "HMI alarms" and "HMI tags" editors.
- Supplementary information about individual alarms ensures that faults are localized and cleared quickly.

6.2.6.2 Configure trigger

Trigger properties can be defined for analog alarms. You can specify a trigger tag, a trigger bit and a trigger mode for an alarm.

Requirement

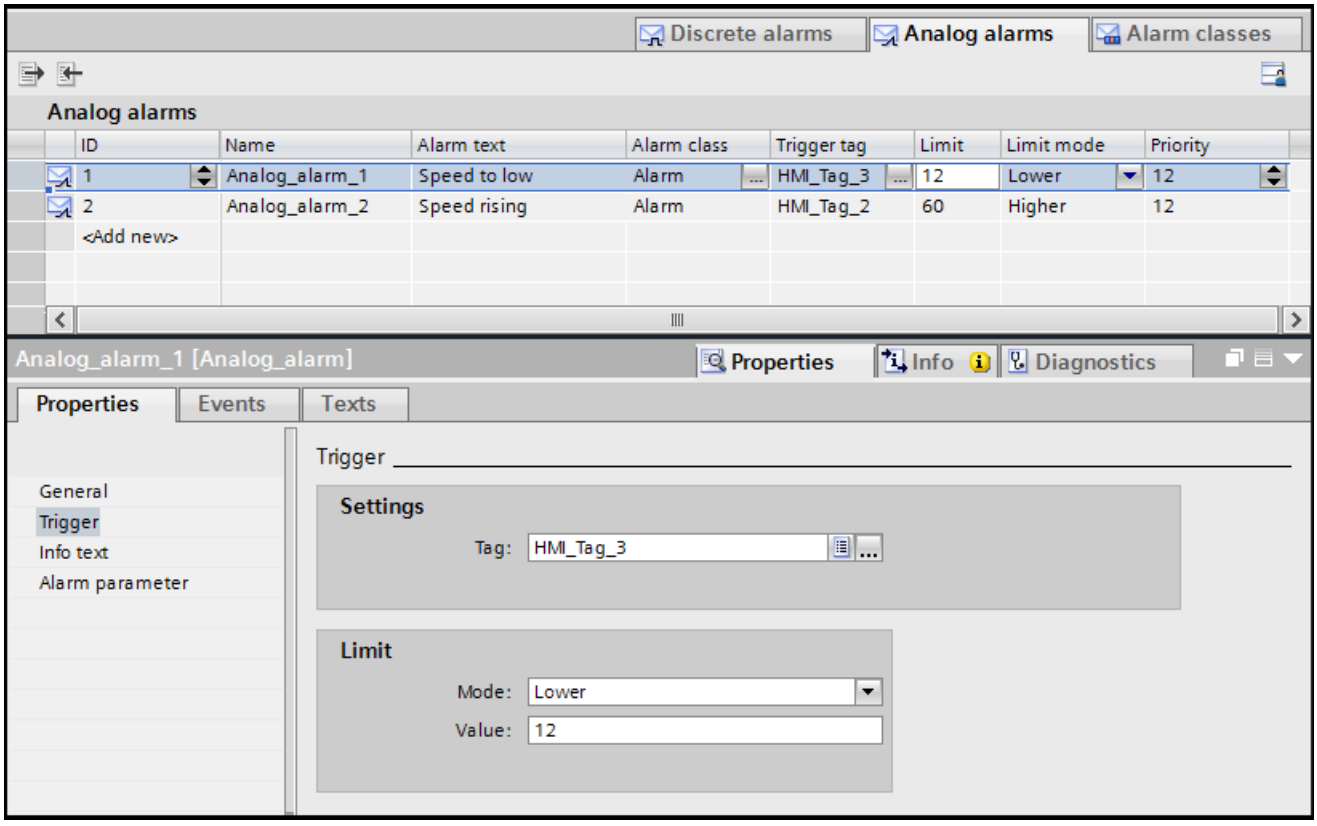
- The "HMI alarms" editor is open.
- A discrete alarm has been created.

Requirement

To define trigger properties, follow these steps:

1. Select the discrete alarm.
2. Click on "Trigger" under "Properties" in the Inspector window.
   The "Trigger" window opens.
3. Specify the trigger tags and limits. Use one of the following data types: "Int", "Real", "LReal", "SInt", "USInt", "UInt", "UDInt" and "ULInt".

4. Select the trigger mode in the "Mode" field:
   - "Less": The alarm is triggered if the limit is undershot.
   - "Greater": The alarm is triggered if the limit is exceeded.
   - "Equal": The alarm is triggered when the limit is reached.
   - "Not equal": The alarm is triggered if the limit is not reached.
   - "Less or equal": The alarm is triggered if the limit is undershot or reached.
   - "Greater or equal": The alarm is triggered if the limit is exceeded or reached.
5. You can create additional limits for the alarm, if necessary. Note the following information:
   - A tag is monitored using only one alarm type. You should therefore create either analog alarms **or** discrete alarms for a tag.
   - If the object included in the selection does not yet exist, create it in the object list and change its properties later.



Note

Do not use trigger tags for anything else.

Result

Trigger tags and limits have been defined for the selected analog alarm.

6.2.7 Integrating OPC UA server alarm instances

You have the option of integrating alarm instances from an OPC UA server into your Runtime project. Proceed as described in the section Integrating OPC UA server alarm instances into a Unified client (Page 7046).

6.2.8 Configuring alarm texts

Introduction

For an alarm, you can configure up to ten alarm texts: one alarm text and up to nine additional texts. If required, you can insert output fields for displaying alarm parameters in each alarm text. Each alarm text contains up to 512 characters.

Requirement

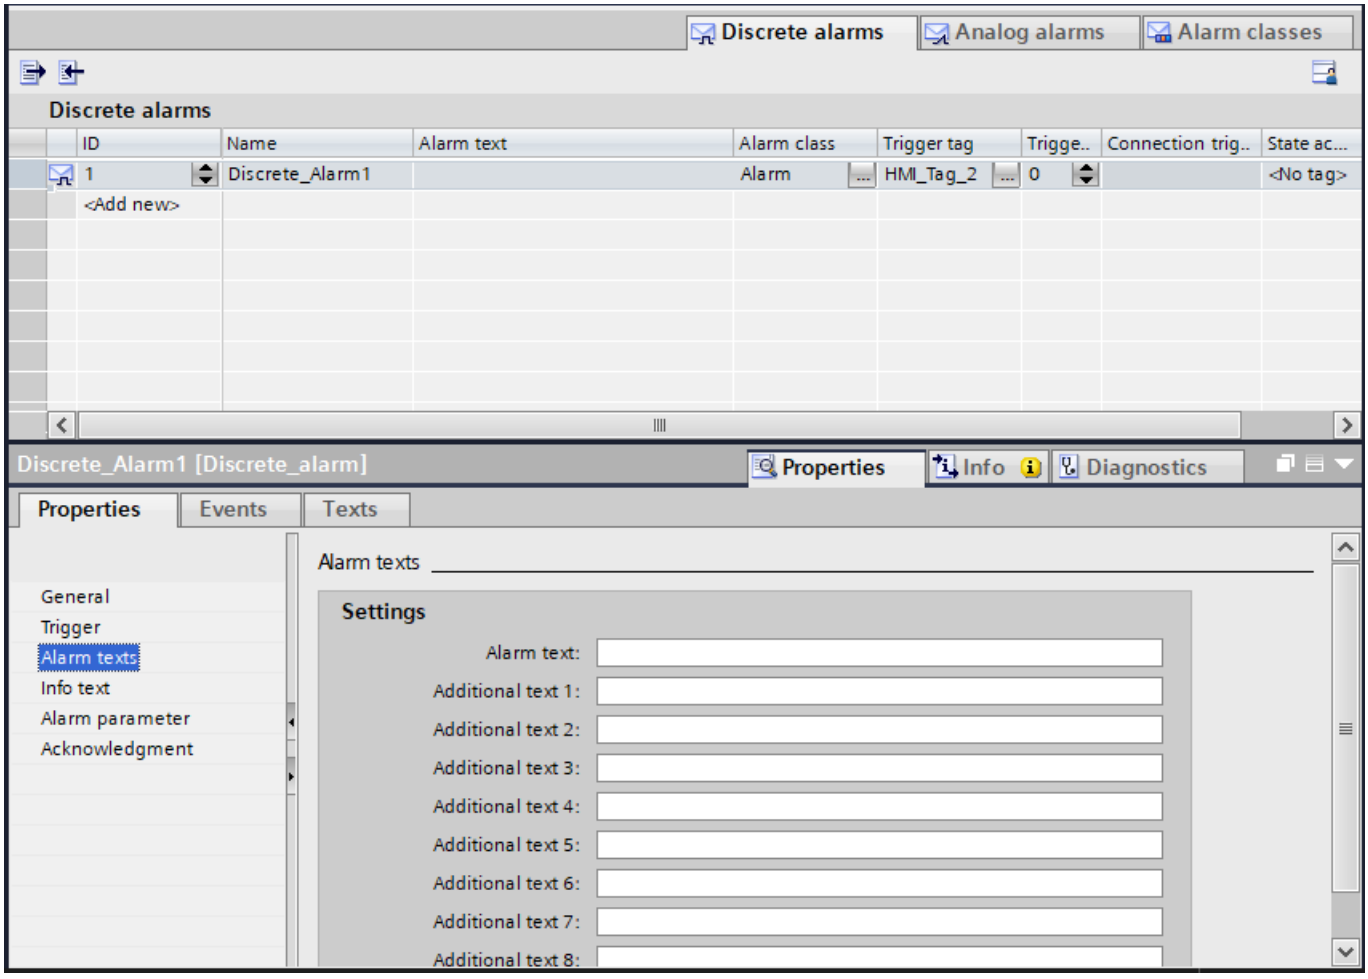
- An alarm has been created.
- The alarm control has been configured.

Procedure

To configure alarm texts, follow these steps:

1. Select the discrete or analog alarm in the "HMI alarms" editor.
2. Enter an alarm text under "Properties > Properties > Alarm texts > Settings > Alarm text" in the Inspector window.
3. If necessary, insert parameter output fields in the alarm text via the "Insert parameter field" shortcut menu command.
4. Enter additional alarm texts in the fields for additional texts under "Properties > Properties > Alarm texts" in the Inspector window.
5. If necessary, insert parameter output fields in the other alarm texts using the "Insert parameter field" shortcut menu command.

6. Select the alarm control in the "Screens" editor.
7. To display the alarm texts in runtime, enable the required columns of the columns numbered 10 to 19 in the Inspector window under "Properties > Properties > Alarm control > Columns".



Note

If necessary, you can insert a parameter field with a right-click on the text box. You can assign a process and a file format to the parameter.

Note

Formatting of the text

If you use the clipboard to copy a text into an alarm or additional text, formatting may become invalid. You can delete the formatting with the command "Delete formatting". You can execute the command via the shortcut menu by right-clicking on the corresponding text.

Result

Alarm texts have been defined for the selected alarm.

6.2.9 Configuring info texts

You can write info texts for analog alarms and discrete alarms that can be displayed in runtime by using the "Info text setup" button of the alarm control.

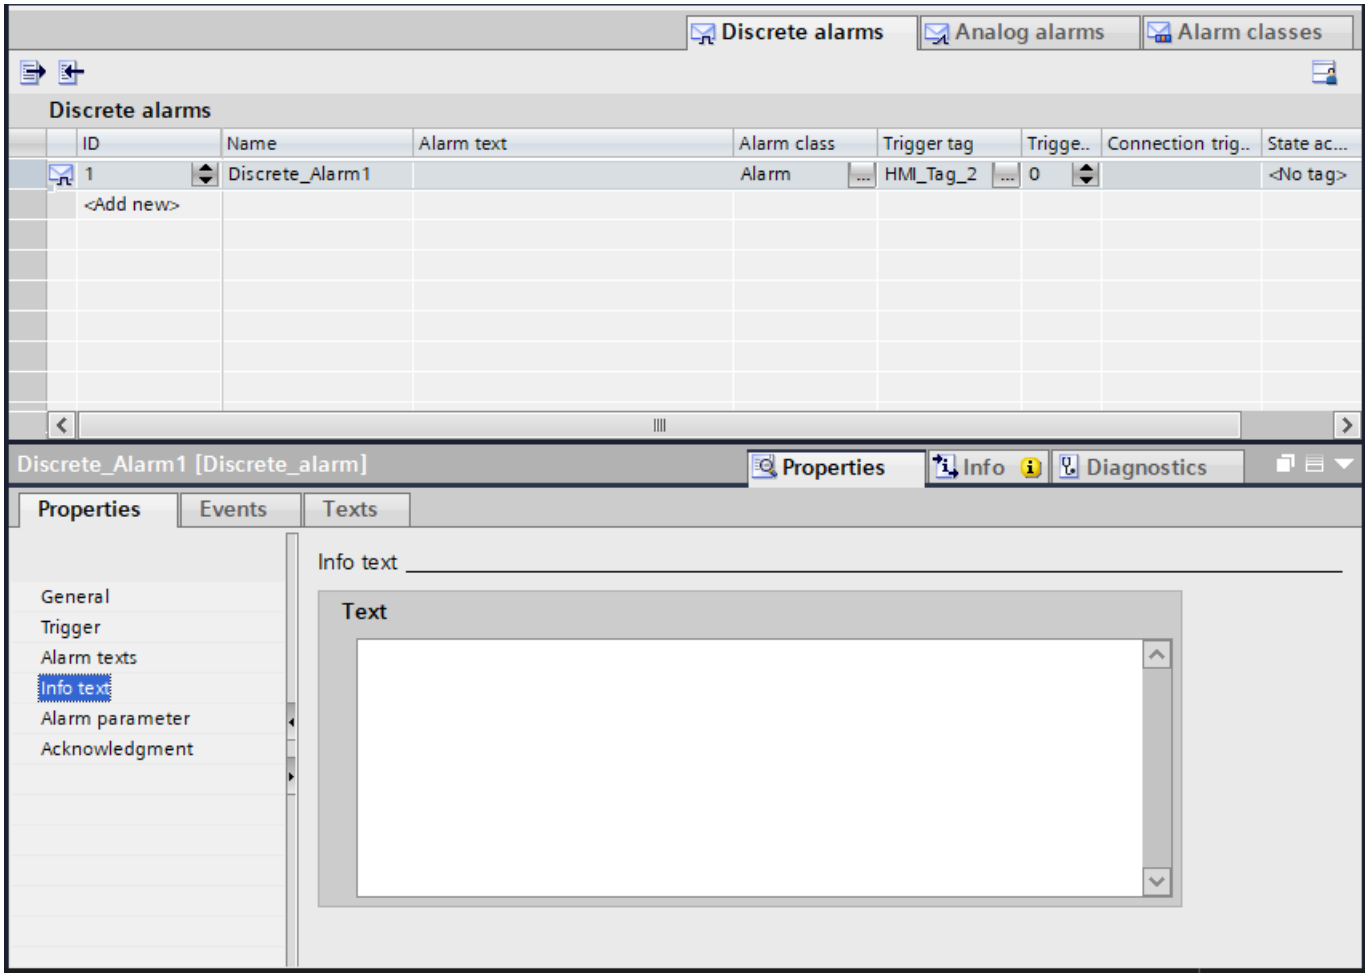
Requirement

- The "HMI alarms" editor is open.
- A discrete alarm has been created.

Procedure

To define alarm texts, follow these steps:

1. Select the analog or discrete alarm.
2. Click on "Info text" under "Properties" in the Inspector window.
   The "Info text" window opens.
3. Enter the info text.



Result

An info text has been defined for the selected alarm.

6.2.10 Parameter output in a discrete or analog alarm

Introduction

To display alarm parameters, insert an appropriate output field in a discrete or analog alarm. You can select the parameters configured in "Properties > Properties > Alarm parameters" for use as alarm parameters.

Requirement

- The "HMI alarms" editor is open.
- The discrete alarm or analog alarm is selected.

Procedure

To output a parameter in the alarm text, follow these steps:

1. Place the cursor at the required position in the alarm text.
2. To output an alarm parameter, select "Insert parameter field" from the shortcut menu.
   A dialog box opens.
3. Select the desired parameter.
4. Moreover, you can specify the following data for alarm parameters:
   - The tag that provides the parameter values.
     The tag configured for the parameter under "Properties > Properties > Alarm parameters" is entered by default. If you select a different tag, WinCC updates the parameter configuration in "Properties > Properties > Alarm parameters" accordingly.
   - Display type, text list, length, number of decimal places and alignment of the output field
   - To display leading zeros in the output field, enable "Leading zeros".
5. Confirm the dialog to save your entries.

6.2.11 Configuring optional parameters for discrete alarms and analog alarms

Setting the alarm context

In a large plant system, it makes sense to save information about the alarm origin such as the physical, geographical or logical grouping of plant units that is defined by the site. This helps users in identifying the causes of the alarm and the source of the fault.

You configure the information on alarm sources in the "Origin" field of the "Alarm context" area.

The "Area" field is a static field and contains information about the device.

Creating info texts for alarms

To configure an info text for the alarm and thus support users, follow these steps:

1. Select a discrete alarm or an analog alarm.
2. Select "Properties > Info text" in the Inspector window and enter the required text.
3. To insert a line break in the info text, press "Shift+Enter" at the corresponding text location.
4. To create multi-lingual info texts, enter the respective texts in the predefined project languages in the Inspector window and, if necessary, in the reference language.

Enabling parameters for a discrete or analog alarm

To output process values in an output field in the alarm text, assign tags to the parameter blocks. Proceed as follows:

1. Select the alarm.
2. In the Inspector window, click "Properties > Alarm parameters".
3. Select a tag for the alarm parameter.
4. You can enter multiple alarm parameters if required.
   Insert the activated process values as a selection box in an alarm text.

Note

You can configure up to 10 tags as alarm parameters for discrete alarms and analog alarms.

All available data types are supported.

Configuring alarm acknowledgment (Page 749)

Translating texts directly (Page 233)

Exporting project texts (Page 235)

Analog Alarms (Page 709)

Discrete alarms (Page 710)

6.2.12 Configuring multilingual alarm texts

Requirements

- The "HMI alarms" editor is open.
- An alarm has been created.

Procedure

1. Select one or more alarms for which you want to configure multilingual alarm texts.
2. You can view the alarm texts already configured in the set project languages under "Properties > Texts".
3. If available, enter the alarm texts in the required project languages.
   The alarm texts will then be displayed in the set runtime language in runtime.

Note

All alarm texts are managed together with other project texts under "Languages & Resources > Project texts".

If you cannot configure the project texts in multiple languages yourself, export them to an Excel file and have them translated. You can then import the texts to your project.

Working with multiple languages (Page 231)

Importing project texts (Page 237)

Translating texts directly (Page 233)

Selecting the reference language and editing language (Page 229)

6.2.13 Editing system events

Basics

A system event indicates the system status and communication errors between the HMI device and system. System events are output in runtime in the configured alarm control. System events are output in the language currently set on your HMI device.

The time format (AM/PM or 24-hour format) is based on the selected language. If no translation of the alarm texts exists in this language, English is used as replacement and the corresponding time format is displayed.

Example of an alarm:

"Memory is full!"

Editing system events

You edit system events in the "HMI alarms" editor or under "Languages & Resources > Project texts". In the "Category" column you can recognize a system event by the name "HMI system event". You can export the system events together with the other texts under "Project texts" and have them translated.

System event parameters

System events can contain encrypted parameters. The parameters are of relevance when troubleshooting because they provide a reference to the source code of the runtime software. These parameters are output after the "Error code: text"

6.2.14 Filtering controller alarms via display classes

Introduction

Controller alarms are configured in STEP 7. Controller alarms are available in WinCC running in a STEP 7 environment.

If a PLC is connected to multiple HMI devices, the project engineer assigns display classes to the controller alarms in STEP7. The display classes determine the allocation to the HMI device. You can activate the display classes for your HMI device that are to be displayed on

it. In this case, only the controller alarms from this display class will be displayed on the HMI device. Up to 17 display classes are possible.

Note

WinCC only supports controller alarms of a SIMATIC S7-1500 controller. In addition, WinCC only supports controller alarms that are automatically updated by the central alarm management in the controller.

Requirement

- The connection was established to the PLC.
- Alarms were configured in STEP 7.

Filtering controller alarms via display classes

To filter controller alarms by display classes, proceed as follows:

1. Click "Runtime settings > Alarms" in the project tree under your HMI device.
   One or several connections to a PLC are shown in "Contoller alarms".
2. Select the display classes whose controller alarms you want to display for the connection.

User-defined controller alarms (Page 710)

Alarm system (Page 707)

6.2.15 Configuring alarm acknowledgment

Introduction

The alarm classes define how the alarms from an alarm class are to be acknowledged. When you assign an alarm to an alarm class, you define the state machine and the acknowledgment model for that alarm.

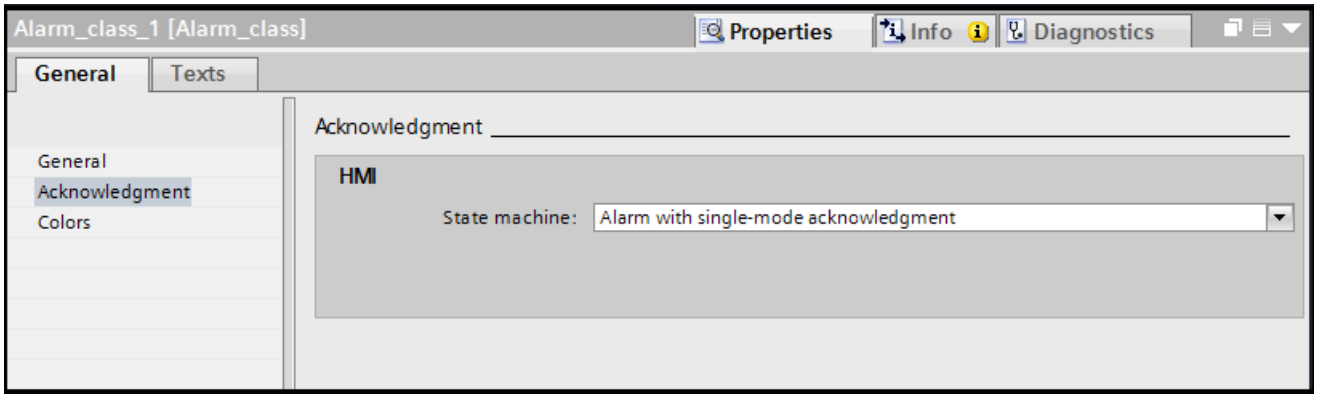
Requirements

- The "HMI alarms" editor is open.
- The required alarm class has been created.
- The required alarm has been created.

Procedure

To configure the acknowledgement of an alarm, follow these steps:

1. In the "HMI alarms" editor, click the "Alarm class" tab and select the alarm class.
2. You select the desired state machine under "Properties > General > Acknowledgment" in the Inspector window.



Note

The buttons relevant for acknowledgment, "Group acknowledgment", "Single acknowledgment" and "Single confirm", are enabled in the alarm view by default and can be operated in runtime.

Configuring the state machine of common alarm classes

The "Alarm class" tab also shows alarm classes that are linked to common alarm classes. The "General > Common alarm class" property is set for these alarm classes.

Alarm classes with such a link have one of the following state machines:

- Alarm with single-mode acknowledgment
- Alarm without acknowledgment

It is not possible to change the state machine in the "HMI alarms" editor. If necessary, change the state machine in the editor for common alarm classes.

6.3 Exporting and importing alarms

6.3.1 Exporting alarms

Introduction

WinCC makes an export function available for alarms.

Requirements

- The WinCC project for export is open.
- Alarms have been created in the project.
- The "HMI alarms" editor is open.

Exporting alarms

To export alarms from a WinCC project, follow the steps below:

1. Click the  button in the "Discrete alarms" or "Analog alarms" tab.
   The "Export HMI alarms" dialog box opens.
2. Click "..." and specify the file in which data is saved.
3. Specify whether you want to export "Discrete alarms" and/or "Analog alarms".
4. Click "Export".
   The export starts. When the export is complete, a message on completion of the export is displayed.
5. Confirm the message on completion of the export with "OK".

Result

The exported data has been written to an xlsx file. The xlsx file has been stored in the specified folder.

If you have only exported discrete alarms, the xlsx file has the worksheet "DiscreteAlarms". If you have only exported analog alarms, the xlsx file has the worksheets "AnalogAlarms" and "Limits". If you have exported discrete alarms and analog alarms, the xlsx file has the worksheets 'DiscreteAlarms", "AnalogAlarms" and "Limits".

Each alarm is in a separate row in the xlsx file.

Note

The list entries with the "FieldInfo" designation specify whether the alarm text contains dynamic parameters. The settings are separated by a semicolon ";".

6.3.2 Importing alarms

Introduction

WinCC makes an import function available for alarms. Alarms are identified by their alarm ID. An existing alarm is overwritten by the data from the import file if the alarm ID already exists in the project on import. A new alarm is created in the project if the alarm does not yet exist in the project on import.

Requirements

- An xlsx file with alarms has been created.
- The xlsx file has the same structure as an xlsx file that is created when alarms are exported.
- The IDs and names that were assigned for messages in the xlsx file are unique throughout the project.
- The WinCC project for import is open.
- The "HMI alarms" editor is open.

Importing alarms

To import alarms into a WinCC project, follow the steps below:

1. Click the  button in the "Discrete alarms" or "Analog alarms" tab.
   The "Import HMI alarms" dialog box opens.
2. Click "..." and select the file that you want to import.

3. Click "Import".
   The import starts. An xml log file is created on import. When the import is complete, a message on completion of the import is displayed.

   Note

   To open the created xml log file, click the link "Click here to view the log file". It is advisable to open the xml log file, especially if the import was completed with warnings.

4. Confirm the message on completion of the import with "OK".

6.4 Configuring an alarm control

6.4.1 Configuring an alarm control

Introduction

The alarm control is configured for a screen. Current or logged alarms are displayed in the alarm control in runtime. More than one alarm can be displayed simultaneously, depending on the configured size. Configure the criteria for alarm filtering.

You can also configure multiple alarm controls with different contents and in different screens.

Note

Text alignment in cells of the alarm control

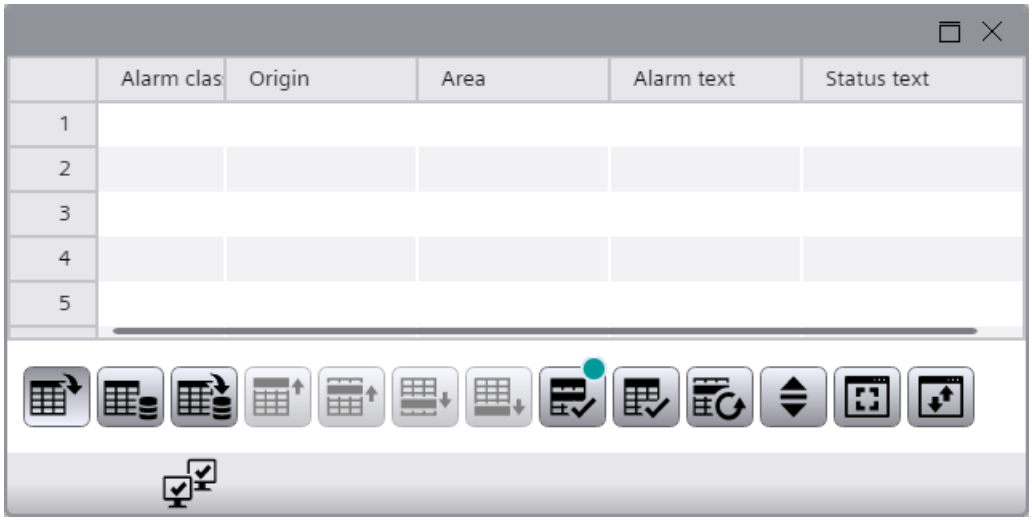
The "Spacing" and "Text trimming" properties only have an effect in the "Graphic and Texts", "Graphic or Text" and "Graphic" modes.

Requirement

- A screen is open.
- The "Toolbox" task card is open.

Procedure

1. Insert an "Alarm control" object from the "Tools" task card into the screen.



2. Go to "Properties" and set the required height, width and position of the alarm control.
3. Under "Properties > Miscellaneous > Alarm control" you can define the layout and color composition of the alarm control as well as the design of the header and the contents of the table grid.
4. To ensure that the most current alarm is always displayed and highlighted in the alarm control in runtime, activate the "Miscellaneous > Alarms - Show current" property.
   The visible area of the alarm control is moved in runtime if necessary. Users cannot select alarms individually or sort them by column. Alarms that have been filtered out of the alarm control are not displayed.
   If you configure the "Alarms - show current" button as visible and operable, users can pause and start this behavior in runtime as required. The alarm control always starts with the behavior configured via "Miscellaneous > Alarms - show current".
5. Under "Alarm source" you specify which alarms the alarm control displays in runtime by default.
   Depending on your task or the requirements in your company, you can select from the following display options:
   - "Not configured": The alarm control does not show any alarms.
   - "Pending alarms": The alarm control shows the currently pending alarms.
   - "Logged alarms": The alarm control shows the logged alarms.
   - "Logged alarms updated": The alarm control shows the logged alarms that are updated at specified intervals.
   - "Alarm definition": The alarm control shows all alarms configured in the engineering system, regardless of whether or not they have occurred.

   Depending on your selection, the alarm control display already changes in the engineering system. The buttons relevant for the settings are shown as being active, while buttons that are not relevant are grayed out. These settings are applied for runtime.

6. Define which alarms are displayed in runtime by default in the alarm lists for pending alarms and for defined alarms.
   - In the selection list under "Miscellaneous > Current alarms", select which alarms are displayed as pending alarms.
   - In the selection list under "Miscellaneous > Displayed alarms", select which alarms are displayed as defined alarms.

   Depending on your task or the requirements in your company, you select one or more display options depending on the status of the alarms:
   - "None": The alarm control shows all alarms.
   - "Not suppressed": The alarm control only shows the non-suppressed alarms.
   - "Locked": The alarm view only shows the locked alarms.
   - "Suppressed by design": The alarm view only shows the alarms suppressed by design.
   - "Shelved": The alarm control only shows the shelved alarms.

   Your selection is displayed by default in the alarm control when you start runtime.

   Note

   If you do not make a selection, the alarm control shows all alarms.

   Note

   You can change the display at any time in runtime even if you have selected a different display option in the engineering system under "Alarm source" or "Active alarms".

7. If necessary, select the authorization needed to operate the alarm control in runtime.
8. Under time zone you set the desired time zone by entering a decimal value for the time zone.
   - "0" and positive numerical values: The values correspond to the index values of the Microsoft time zones.
   - "-1": The local time zone of the device

   Note

   In runtime you also have the option of setting the time zone via a selection list.

Result

Alarms of various alarm classes are output in the alarm control during runtime. To change the control in runtime, click the configured buttons on the alarm control toolbar.

Using alarm colors

To display the colors configured for an alarm in the alarm control, proceed as follows in the engineering system:

1. Activate the property "Format > Use alarm color" in the properties of the alarm control.
2. Activate the "Use alarm color" property under "Alarm control > Columns" for each column that is to use the configured alarm color.

6.4.2 Display all information about an alarm

Introduction

When configuring an alarm view, you have the possibility to provide the operator with a pop-up in Runtime that shows further information about an alarm selected in Runtime.

The following system function is available for this purpose:
Alarm.GetSelectedAlarmAttributes() (Page 1480).

Requirement

- The alarm view has been configured.

Procedure

1. In the Inspector window, select the "Selection changed" event.
2. Call the "GetSelectedAlarmAttributes" function in a script.
   All attributes of the alarm are read out.
3. Display the attributes in Runtime in a pop-up.

The output of the attributes can also be triggered by a button.

A snippet "Get all alarm properties of the selected alarm from the alarm control" is available under "HMI Runtime > Screen" in the script editor.

Result

The "Show current" button (Autoscroll) must be switched off.

The operator selects an entry in Runtime in the alarm view.

A pop-up with the attributes of the alarm is displayed.

The function also outputs attributes for archived alarms and alarms of the alarm statistics.

6.4.3 Configuring the toolbar

Introduction

You operate the alarm control in runtime using the buttons in the toolbar. During configuration, you define the contents of the toolbar.

The following buttons are visible in the alarm control by default:

- "Show active alarms"
- "Show logged alarms"
- "Show and update logged alarms"
- "Alarm statistics - view"
- "First line"
- "Previous line"
- "Next line"
- "Last line"
- "Single acknowledgment"
- "Group acknowledgment"
- "Single confirm"
- "Alarms - show current"
- "Alarm statistics - configuration"

- "Selection display"
- "Sorting setup"

The following buttons are not visible in the alarm view by default and must be made visible via "Properties > Miscellaneous > Toolbar > Elements". To these additional buttons in the object, activate the "Visibility" property in the settings of the corresponding button.

- "Show defined alarms"
- "Alarm annunciator"
- "Move to next acknowledgeable alarm"
- "Previous page"
- "Next page"
- "Info text setup"
- "Comments setup"
- "Statistics setup"
- "Disable alarm"
- "Enable alarm"
- "Shelve alarm"
- "Unshelve alarm"
- "Copy lines"
- "Time base setup"
- "Display options setup"
- "Disabled alarms setup"
- "Export"
- "Select context"

Requirement

- The alarm control is selected in the screen.
- The Inspector window is open.

Configuring the toolbar

1. Configure the general properties of the toolbar, such as alignment or background color, in the Inspector window under "Properties > Properties > Miscellaneous > Toolbar".
2. In the Inspector window, enable the buttons you need in runtime, e.g. "Export" or "Print", under "Properties > Properties > Miscellaneous > Toolbar > Elements".
3. Configure the display of the respective button, e.g. background color, border, and maximum and minimum size.

4. If needed, you can define a tooltip for the buttons.
5. If a button is not to be operated in runtime, deselect "Operator control - allow".
   You can reactivate a deactivated a button using a script in runtime, for example.

Note

The order and functionality of the buttons are defined in the system and cannot be changed.

Custom ID

The custom ID can be used if you want to specifically access a certain button with an ID to be set via scripting.

You set this property under "Properties > Properties > Miscellaneous > Toolbar > Elements > Button".

Start behavior for "Alarms - Show current"

The "Alarms - Show Current" button starts with the behavior configured in "Properties > Miscellaneous > Show Current".

If you configure the button as operable, users can change the behavior in runtime. By clicking the button they pause the display of the current alarms or start it again as required.

Show logged alarms (Page 765)

6.4.4 Configuring the information bar

Introduction

The information bar displays status messages of the alarm control. During configuration, you configure the content of the information bar.

Requirement

- The alarm control is selected in the screen.
- The Inspector window is open.

Configuring the information bar

1. In the Inspector window, configure the general properties of the Information bar such as the font or the background color under "Properties > Properties > Miscellaneous > Status bar".
2. In the Inspector window, select the elements you need in runtime, such as date, time, connection status, etc. under "Properties > Properties > Miscellaneous > Information bar > Elements".
3. To adjust the size of an element in the information bar, select "User-defined".
4. Enter the width and height in pixels.
5. To set the order of the elements, select the element in the list and move it to the desired position.

Custom ID

The custom ID can be used if you want to specifically access a certain button with an ID to be set via scripting.

You set this property under "Properties > Properties > Miscellaneous > Toolbar > Elements > Button".

6.4.5 Configuring columns and sorting

Introduction

You configure the order in which the columns of the alarm control are displayed in runtime.

Requirement

- The alarm control is selected in the screen.
- The Inspector window is open.

Configuring columns

1. Click "Properties > Alarm control > Columns" in the Inspector window.
2. Enable the "Visibility" property for the relevant columns.

3. Under "Alarm text block" select the content that is to be displayed in the column, e.g. "Alarm class".
4. Under "Alarm column [n] > Header > Text", enter the desired column name that is to be displayed in the alarm control.

Note

For the column names to be configured as multilingual, you must enter the name of the column under "Alarm column [n] > Header > Text".

You will then see the configured text in the Inspector window under "Texts" and can store additional languages.

If you only enter the name under "Alarm column [n] > Name", multilingual configuration is not possible.

Configuring the sorting

To sort alarms in the alarm control by column, follow these steps:

1. Select "Properties > Alarm control" > Allow sorting" so that sorting is generally possible in the alarm control in runtime.
2. Under "Properties > Alarm control > Columns" open the alarm column by which you want to initially sort the alarms, e.g. the "Priority" column.
3. Select the sorting order "1".
4. Select the desired sorting direction, e.g. "Ascending".
   - The number "1" with the arrow pointing upwards for ascending sort order is displayed in runtime in the column with sorting order "1".
   - If the sorting order "Ascending" is enabled in the alarm control, each click in the column header toggles the sorting between the ascending and descending mode.
5. To allow sorting for this column, enable "Alarm column [n] > Allow sorting".

Note

You can configure any sorting order.

If the "Show recent" property was selected under "Properties", the latest alarms are always shown first.

6.4.6 Configuring filters in the alarm control

Introduction

You can filter the display of alarms in the alarm control. You configure a static value, a tag or a script for the filter. You can configure this function in the alarm control in the "Screens" editor. To filter the alarms in Runtime, click "Selection display" in Runtime.

You can filter by all parameters, such as ID, name, alarm class, priority, etc.

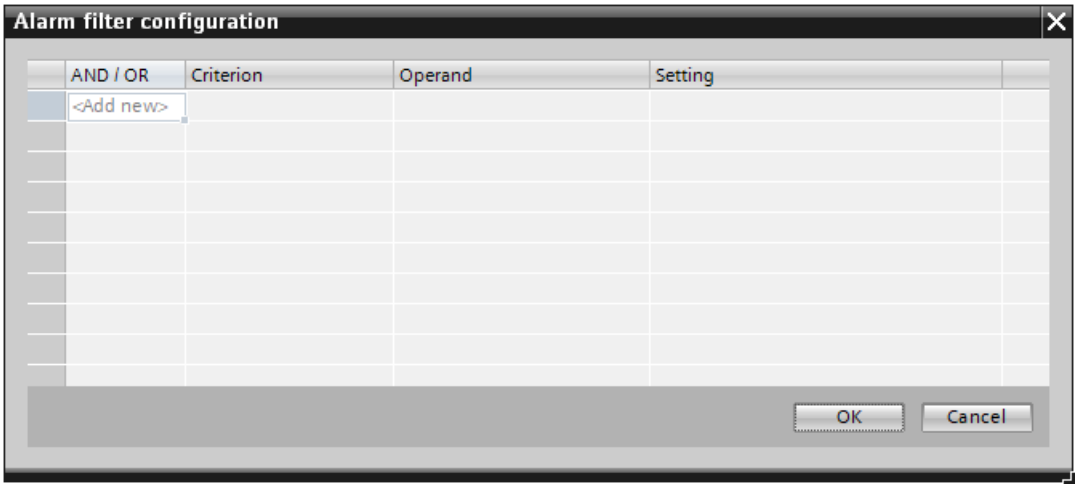
This operating instruction introduces the process for configuring a filter using an example.

Requirement

- The alarm control is selected in the screen.
- The Inspector window is open.

Procedure

1. In the Inspector window under "Properties > Filter", click on the "..." button in the "Static value" column.
   The "Alarm filter configuration" dialog box opens.



2. Click "<Add>" in the "AND/OR" column to create a filter.
3. In the "Criterion" column, open the selection list and select the entry "Alarm class".
4. In the "Operand" column, open the selection list and select the entry "Equal to".
5. Enter the value "Alarm" in the field of the "Setting" column.
6. Click the "OK" button.

Note

The following characters cannot be used in the Settings column:

- Quotes
- Single quotation marks

Tips for an efficient procedure

You can also create filter criteria directly in runtime and use them as filters. To operate the filter in runtime, enable the "Visibility" property under "Properties > Toolbar > Elements > Control bar button Selection display [26]".

Examples of alarm filters

Example	Criterion	Condition	Setting	Description
Filter by alarm class	Alarm class	=	Alarm	Displays the alarms that are members of the "Alarm" alarm class.
Filter by priority	Priority	Greater than	4	Displays the alarms with a priority greater than 4.
Filter by alarm text	Alarm text	Contains	Motor_12	Displays the alarms that contain the alarm text "Motor_12".
Filter by time	Last modification	Less than or equal to	Wednesday, 15 April 2020 17:00	Displays the alarms that occurred after 5 pm (17:00) on 15 April 2020.

Filter by time

When filtering by time, the start and stop values are not adjusted automatically when the time base of the alarm control is changed.

Example

At a PC location with time zone "UTC + 1h", the alarm control has the "Local time zone" time base. If you filter for the time 10:00 to 11:00 and then change the time base to "UTC", you need to change the start value and stop value of the filter to 9:00 and 10:00 to display the same alarms as before.

6.4.7 Configuring alarm export

Introduction

To export alarms to a "*.csv" file in runtime, click on the "Export" button in the alarm control. You configure the "Export" button in the alarm control in the "Screens" editor.

Requirement

- The screen with the configured alarm control is open.
- The Inspector window is open.

Procedure

To configure the export of alarms, proceed as follows:

1. Select the alarm control and enable the "Visibility" property in the Inspector window under "Properties > Toolbar > Elements > Export button [29]".

You define the export settings such as the file name, the scope of the export and the format in runtime in the "Export data" dialog.

6.4.8 Configuring the printing of alarms

Introduction

Click "Print" in the alarm control to print alarms in runtime. You configure the "Print" button in the alarm control in the "Screens" editor.

Requirement

- The screen with the configured alarm control is open.
- The Inspector window is open.

Procedure

To configure the printing of alarms, follow these steps:

1. Select the alarm control and enable the "Visibility" property in the Inspector window under "Properties > Toolbar > Elements > Print button [28]".

6.4.9 Show logged alarms

Overview

When an alarm log is created, an alarm control also shows logged alarms in runtime.

The buttons relevant for logging, "Show logged alarms" and "Show and update logged alarms", are activated in the alarm control by default and can be operated in Runtime.

You show logged alarms in runtime using these buttons.

Alarm control (Page 309)

6.4.10 Configuring alarm statistics

Introduction

The alarm statistics in the alarm control shows statistical calculations for logged alarms. The alarm statistics also shows a selection of the configured alarm blocks. If there is dynamic content, the alarm blocks show the data of the alarm last arrived. The columns of the alarm statistics can be arranged individually.

The alarm statistics shows the following statistical calculation types:

- Frequency of an alarm
  The system counts the number of occurrences of an alarm with "active" status in the log. If the alarm number is not found, this alarm number is not included in the statistics.
- Total display time of an alarm in seconds
  You can calculate the following time periods between alarm states:
  - Sum active active
  - Sum active inactive
  - Sum active acknowledged
- Average display time of an alarm in seconds
  You can calculate the following time periods between alarm states:
  - Average active active
  - Average active inactive
  - Average active acknowledged

There is a column available in the alarm statistics for each type of calculation.

The calculation of the time of acknowledgment includes the "acknowledged" alarm status. This "acknowledged" alarm state includes the acknowledgment by the controller.

Requirement

- The alarm control is selected in the screen.
- The Inspector window is open.

Setting up columns of the alarm statistics

To set up the alarm statistics columns, proceed as follows:

1. In the Inspector window, click "Properties > Miscellaneous > Alarm statistic view > Columns".
2. Select the "Visibility" option for the desired columns.

Settings for calculating the alarm statistics

You can configure the following options:

Setting	Description
Start time	Start time for the calculation.
Time range start	• Now The current time is displayed as the start time of the calculation. • Fixed The start time of the calculation can be changed as required.
Time range base	Unit of time for the calculation. The following settings are available: • Undefined The default time unit "Minute" is used with this setting. • Millisecond • Second • Minute • Hour • Day • Month • Year
Time range factor	The time range factor depends on the "Time range base" setting. For example, if the number 4 is set for the time range factor and "Minutes" is set for the time range base, all alarms that are logged within this period will be evaluated.

To configure the settings for the alarm statistics, proceed as follows:

1. In the Inspector window, click "Properties > Miscellaneous > Alarm statistics settings".
2. Specify the desired properties.

6.4.11 Configuring the display of system diagnostic alarms

Introduction

System diagnostic alarms are installed with STEP 7 and are used for monitoring states and events of a controller. To display system diagnostic alarms in an alarm control in runtime, configure first in STEP 7 and then in WinCC.

Note

WinCC only supports system diagnostic alarms of a SIMATIC S7-1500 controller. In addition, WinCC only supports system diagnostic alarms that are updated by the central alarm management in the controller.

Requirement

- There is an HMI connection between the HMI Device and a SIMATIC S7-1500 controller (as of firmware version 2.0).

Configuring the display of system diagnostic alarms in STEP 7

To configure the display of system diagnostic alarms in runtime in STEP 7, proceed as follows:

1. Open the "Device configuration" of the controller in the project tree.
2. In the "Device view" tab, select the CPU on the rack.
3. Select "Properties > General > System diagnostics" in the Inspector window.
   You will see that the option "Select system diagnostics for this device" is selected and cannot be cleared. Because the system diagnostics of the controller is always enabled.
4. Activate the option "Central alarm management in the PLC" in the Inspector window under "Properties > General > PLC alarms".
   The automatic update of system diagnostic alarms on the HMI device is enabled in the controller.
5. Open the "Common data" folder in the project tree and double-click "System diagnostic settings".
   The system diagnostic settings are opened. You can see the predefined categories of the system diagnostic alarms in the table under "Category":
   - "Error"
   - "Maintenance demanded"
   - "Maintenance required"
   - "About"
6. In the table under "Category", select the alarm categories that are to be displayed in the alarm control in runtime.
7. In the table under "Alarm class", assign common alarm classes to the alarm classes.
8. Right-click the controller in the project tree and select "Compile > Hardware (rebuild all)" in the shortcut menu.

Configuring the display of system diagnostic alarms in WinCC

To configure the display of system diagnostic alarms in WinCC in runtime, proceed as follows:

1. Open the "Runtime settings" of the HMI device in the project tree.
2. Select the option "Automatic update" under "Alarms > Controller alarms".
   The automatic update of system diagnostic alarms on the HMI device is enabled in the HMI device.
3. Select the option "System diagnostics" under "Alarms > Controller alarms".
   The display of system diagnostic alarms is enabled in runtime.
4. Configure an alarm control.

Result

The alarm control displays of the system diagnostic alarms of the controller in runtime.

See also

Sending and automatically updating complete alarm from the controller to the HMI device (Page 796)

Configuring automatic update of controller alarms on the HMI device (Page 797)

System-defined controller alarms (Page 712)

Workflow for configuring alarms (Page 724)

6.5 Logging alarms

6.5.1 Basics of alarm logging

Introduction

An alarm log is used to log alarms that occur in the monitored process. You can use alarm logging to analyze error states and to document the process. When you analyze the logged alarms, you can extract important business and technical information regarding the operational state of the plant.

Alarms of connected and appropriately configured PLCs are also logged and made available in all configured languages.

How it works

Each alarm is assigned to an alarm class. To ensure clarity with large amounts of data, alarm classes can be prioritized and configured differently. Under "HMI alarms", you assign logs to the alarm classes.

Alarm logs are created by the system in runtime. For example, when a fault or a limit violation occurs, the corresponding alarm you configured in the "HMI alarms" editor is output in runtime. Each alarm event is logged, for example, the status change of the alarm from "incoming" to "acknowledged".

Content of the alarm log

Alarms and their properties in all configured languages are saved in the alarm logs. The time stamp of a logged alarm is always specified in standard UTC format (Universal Time Coordinated).

Displaying logged data

You display the logged data in runtime in the alarm control. To display logged data, use the "Show logged alarms" button in the alarm control.

See also

Show logged alarms (Page 765)

Creating a data log and an alarm log (Page 848)

How it works (Page 839)

Log basics (Page 837)

Storage locations of logs (Page 843)

Editing log contents with scripts and system functions (Page 850)

Size of a log entry in the alarm log (Page 770)

6.5.2 Size of a log entry in the alarm log

The size of a log entry depends on the following factors:

- Number of configured languages
  You configure the languages to be logged in the Runtime settings of the HMI device. When more than one language is defined, memory is required for each additional language to store the language entry.
- Alarm texts and additional texts
  - Length of the alarm texts and additional texts
  - Memory requirement of individual characters
    Symbols and complex characters have greater memory requirements.
- Database type used

Calculation

The size of a log entry is calculated as follows:

Basic entry without alarm text + memory requirement of all texts + (number of configured languages-1)*memory requirement of an additional language entry

The text lengths and the memory requirements of the individual characters depend on the respective language. The following formula can be used to easily estimate the memory requirement of all texts:

Number of configured languages*total length of the alarm text and the additional texts*memory requirement of a character

The individual values depend on the database type used.

	SQLite	Microsoft SQL
Additional memory requirement per segment	-	Approx. 3.5 MB
Basic entry without alarm texts	Approx. 300 bytes	Approx. 2000 bytes
Memory requirement of an additional language entry	Approx. 100 bytes	Approx. 200 bytes
Memory requirements of a character	At least 1 byte	At least 2 bytes

See also

How it works (Page 839)

Multilingual logging of alarms (Page 772)

Basics of alarm logging (Page 769)

6.5.3 Assign alarm class

Introduction

You assign one alarm log each to predefined and user-defined alarm classes. In this way, you can categorize alarms in different logs.

Note

Assign alarm class

If you do not assign an alarm class to an alarm log, you will receive an error message when you compile the project.

Assign at least one alarm class to each alarm log.

Requirement

- An alarm log has been created in the "Logs" editor.

Procedure

1. Double-click on the "HMI alarms" entry in the project tree.
   The "HMI alarms" editor is opened.
2. Select the "Alarm classes" tab.
   The list of alarm classes is displayed.
3. Double-click on an entry in the "Log" column.
   The selection button is displayed.
4. Select an alarm log.

See also

Basics of alarm logging (Page 769)

Creating a data log and an alarm log (Page 848)

6.5.4 Multilingual logging of alarms

Introduction

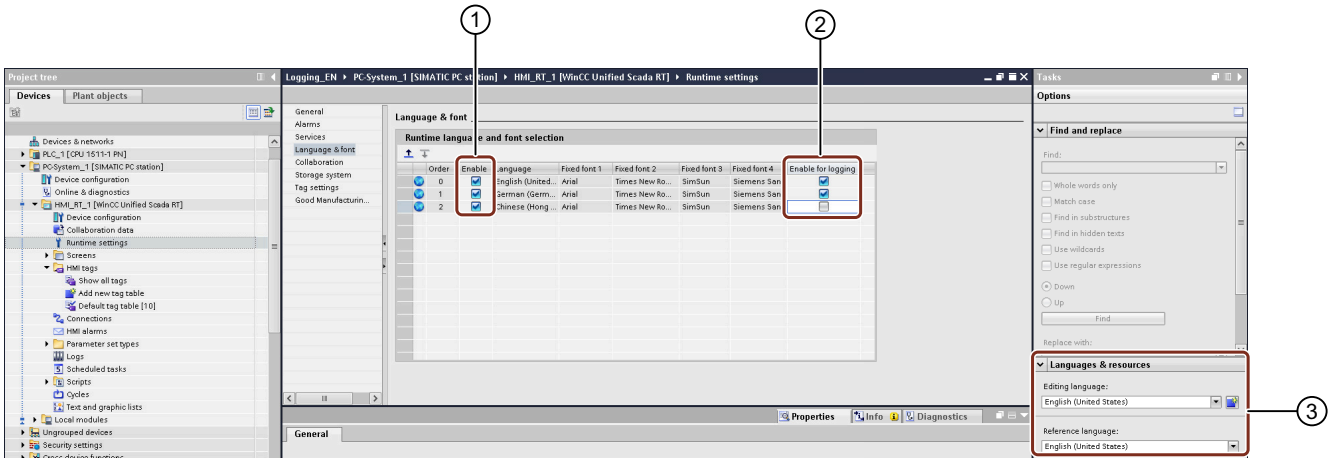
You can log alarm texts in different languages. To do this, select the option in the runtime settings of the HMI device.

Requirement

- The languages in which the alarm texts are to be logged are created as project languages.

Procedure

1. Open "Runtime settings" in the project tree below the HMI device.
2. Select "Language & Font".
3. To activate a language for runtime, select the check box in the "Activate" column.
   This option must be activated to log alarm texts in the corresponding language.
4. To log the alarm texts in a language, select the check box in the "Enable for logging" column.



① Activate available languages in Runtime
② Enabling languages for logging
③ Adding project languages

See also

Basics of alarm logging (Page 769)

Size of a log entry in the alarm log (Page 770)

6.6 Displaying and using alarms

6.6.1 Operating the alarm control and displaying it in runtime

Introduction

In runtime, the "Alarm control" object displays alarms that occur during the process in a plant. Alarms indicate events and states on the HMI device which have occurred in the system, in the process or on the HMI device itself. A state is reported when it occurs. Use the alarm control functions to work with incoming alarms. An alarm could trigger one of the following alarm events:

- Incoming
- Outgoing
- Acknowledge

The configuration engineer defines which alarms must be acknowledged by the operator.

Alarm control

The alarm control shows selected alarms or alarm events from the alarm buffer or alarm log. Whether alarm events have to be acknowledged or not is specified in your configuration. You can configure the order in which the alarms are displayed. At the first position, the current, or the oldest alarm will be displayed.

In the alarm control, you have the option to display various lists that filter and sort according to specific properties. To display the alarm lists in the alarm control and switch the alarm control in runtime, click the associated button in the alarm control toolbar.

Button	Description	Description
	Show active alarms	Shows the pending alarms.
	Show logged alarms	Shows the logged alarms. The view is not updated immediately when new incoming alarms occur.
	Show and update logged alarms	Shows the logged alarms. The display is updated immediately when new incoming alarms occur.
	Show defined alarms	Shows the alarms configured in the engineering system.

Note

The maximum number of alarms that can be displayed in an alarm control in runtime depends on the selected view. Note the information in the performance features.

Roles and authorizations

When working with the alarm control, you can assign roles and authorizations that determine who can configure and operate in the engineering system and runtime.

In the Engineering System under "Security Settings > Settings" you have the option to set the user name and password for the open project with which the project is now protected with "Protect this project". Under "Security settings > Users and roles" you create users under the "Users" tab, to whom you can assign roles as well as rights. In addition to the predefined roles, you can also define additional roles under the "Roles" tab and then assign them to a user.

Operator control with the mouse

Selecting and controlling alarms

- Click on an alarm.
- Click on a button in the toolbar.

The function of the button is applied to the alarm.

Reordering columns

You have the option of changing the column order configured in the engineering system. You can find additional information in the section Rearranging columns in runtime (Page 393).

Sorting alarms by column

You have the option of sorting the alarms by column. You can find additional information in the section Sorting alarms in runtime (Page 775).

Operator control with keyboard

Press <Shift + Enter> until the alarm control has the focus. Then select the alarm to be processed and control it using the toolbar.

Use the following keys:

Keyboard shortcut	Function
PAGE UP	Navigates up the alarm control row by row.
PAGE DOWN	Navigates down the alarm control row by row.
SHIFT + PAGE UP	View the alarm control column by column to the left.
SHIFT + PAGE DOWN	Navigates the alarm control column by column to the right.
CTRL + UP	Sets the selection as the start of row.
CTRL + DOWN	Sets the selection as end of row.
CTRL + RIGHT	Sets the selection as start of column.
CTRL + LEFT	Sets the selection as end of column.
HOME	Sets the selection as the start of row.
END	Sets the selection as end of row.

6.6.2 Sorting alarms in runtime

Introduction

In runtime, you can sort the alarms in the alarm control by column header.

Sorting alarms:

- In descending order by date, time, and alarm number. The most recent alarm is displayed at the top.
- Ascending:
  The sequence for ascending order is:
  - Incoming
  - Incoming/acknowledged
  - Incoming/acknowledged/outgoing
  - Incoming/outgoing/acknowledged
  - Shelved
  - Suppressed
- No sorting
  When the alarm control is sorted by columns, an arrow and a number are shown on the right in the column header. The arrow indicates the ascending or descending sort order. The number beside the arrow indicates the sort order of the column headers.

Standard sorting of alarms

- By priority
  If the "Priority" column is defined in the alarm view, sorting is based on alarm priority. As a result, in a single-line alarm control, only the top-priority alarm appears in the alarm window. A lower-priority alarm will not be displayed, even if it is has a more recent date. The alarms are displayed in chronological order.
- If one of the following columns in the alarm view is configured, sorting on a Unified Comfort Panel is according to the specified order.

1. Priority
2. Modification time
3. Raise time
4. Alarm state

If none of the columns are configured, sorting occurs according to the "Time" column.

Requirement

- In the Engineering System, "Allow sorting" is enabled in the alarm control for the respective columns.
- The "Visibility" and "Allow operator control" settings are activated for the following alarm control buttons in the Engineering System:

	Sorting setup
	Show recent

- "Show recent" is paused in runtime.

Sort alarms by clicking on the column header

To sort alarms in the alarm control by column header, proceed as follows:

1. In runtime, click the column header of the alarm control you want to sort by.
   An arrow and a number are displayed in the column representing the order and method of sorting.

Sorting alarms via button

To sort alarms in the alarm control by "Sorting setup" button, proceed as follows:

1. In runtime, click the "Sorting setup" button in the alarm control.
   The window for sorting opens.
2. Use the drop-down list to select a column and define whether you want to sort in ascending or descending order.
3. Apply your criteria via the "OK" button.
   The alarm control is sorted according to your criteria. The current sorting of the columns is indicated by an arrow and a number.

Note

To ensure that changes to existing sort criteria in the button are applied without errors, it is recommended that you first reset the changes using the "Clear sort criteria" button.

6.6.3 Filtering alarms in runtime

Introduction

In runtime, you can use criteria to define which alarms you want to display in the alarm control. In the example below, only alarms that contain the alarm text "Motor on" are displayed. You use the "Selection display" button in the alarm control for this purpose.

Requirement

- The "Visibility" and "Allow operator control" settings are activated for the following alarm control buttons in the engineering system:

	Selection display

Procedure

To filter alarms in the alarm control, proceed as follows:

1. Click "Selection display" in Runtime.
   The "Selection" dialog opens.
2. Under "Criterion" select the criterion "Alarm text".
3. Enter the alarm text "Motor on" in the "Settings" column.

Note

The following characters cannot be used in the Settings column:

- Quotes
- Single quotation marks

Result

The alarm control only shows those alarms that contain the words "Motor on" in the alarm text. If necessary, define additional filter criteria by selecting the required condition in the "AND/OR" column and the respective criterion in the "Criterion" column.

Shelving alarms (Page 788)

Lock alarms (Page 791)

Alarm control (Page 309)

6.6.4 Displaying logged alarms in runtime

Introduction

You can use the "Show logged alarms" and "Show and update logged alarms" alarm lists to display logged alarms.

Requirements

- An alarm log has been configured.
- All the archived data that you intend to display in runtime must be stored locally on the archive server. The alarm log does not allow access to backup files held elsewhere, such as on another computer in the network.
- The "Visibility" and "Allow operator control" settings are activated for the following alarm view buttons in the engineering system:

	Show logged alarms
	Show and update logged alarms

Procedure

1. To display only logged alarms, click on the "Show logged alarms" buttons in the alarm view:

   

   The alarm view shows the logged alarms. The view is not updated immediately when new incoming alarms occur.
   Each page shows a maximum of 1 000 alarms. Use the "Previous page" and "Next page" buttons for scrolling.

2. To show logged and current alarms, click on the "Show and update logged alarms" button in the alarm view.

   

   The alarm view shows the logged alarms. The view is updated immediately when new active alarms occur.
   The alarm view shows a maximum of 100 alarms.

Limitation for the "Show logged alarms" alarm list

For log alarms with identical time stamps, log alarms may, in rare cases, be skipped when scrolling forward and backward.

To display the skipped alarms, scroll again in the opposite direction.

Example

- The alarm log contains several thousand log alarms. Ten alarms in the log have an identical time stamp. The first five of these alarms are displayed at the end of the current page.
  The alarm view is sorted in ascending order by time stamp.
- Click on "Next page".
  You see the next 1 000 alarms whose time stamp is higher than the time stamp of the last alarm displayed on the previous page.
  The remaining five alarms with identical time stamps are skipped when changing to the next page.
- Click on "Previous page".
  You can now see all ten alarms with identical time stamps, as well as the next 990 alarms with a lower time stamp.

Note

If there are more than 1 000 log alarms with identical time stamps, not all the skipped alarms can be displayed by scrolling in the opposite direction.

6.6.5 Displaying alarm statistics

Introduction

The alarm statistics represent statistical calculations of logged alarms.

You can use a button in the alarm control to export the alarm statistics to an Excel file.

Note
Filter

A filter set in the alarm control is not effective in the alarm statistics.

Note
Display options

Display options selected via the "Display options setup" button in the alarm control are not effective in the alarm statistics.

Requirement

- Alarms are logged.
- For the following button of the alarm control, the "Visibility" and "Allow operator control" are enabled in the engineering system:

	Alarm statistics

Procedure

To display the alarm statistics in Runtime, proceed as follows:

1. Click the "Alarm statistics" button in the alarm control.

Result

The alarms to be displayed in the alarm statistics are specified in the engineering system. Depending on the engineering system, the following columns are displayed:

Column	Description
Number	Configured number of the alarm.
Frequency	Frequency of an alarm. The system counts the number of occurrences of an alarm with "active" status in the log. If the alarm number is not found, this alarm number is not included in the statistics.
Sum active active	Total display time of an alarm in seconds. The time period between the alarm states "active" and "active" is calculated.
Sum active inactive	Total display time of an alarm in seconds. The time period between the alarm states "active" and "inactive" is calculated.
Sum active acknowledged	Total display time of an alarm in seconds. The time period between the alarm states "active" and "acknowledged" is calculated.
Average active active	Average display time of an alarm in seconds. The time period between the alarm states "active" and "active" is calculated.
Average active inactive	Average display time of an alarm in seconds. The time period between the alarm states "active" and "inactive" is calculated.
Average active acknowledged	Average display time of an alarm in seconds. The time period between the alarm states "active" and "acknowledged" is calculated.

The calculation of the time of acknowledgment includes the "acknowledged" alarm state. This "acknowledged" alarm state includes the acknowledgment by the controller.

Note

For the calculation, alarms in the "acknowledged" and "inactive" states are only used if a suitable alarm with "active" state is found in the result set beforehand.

If an alarm from the controller is pending and Runtime is disabled and enabled several times, the alarm is entered into the log several times with the state "active". The alarm will also be included multiple times in the evaluation.

See also

Exporting alarms (Page 787)

6.6.6 Operating alarm statistics

Introduction

Using the statistics setup, you can change the settings for calculating the alarm statistics. The following settings are available:

Setting	Description
Time range start	• Now The current time is displayed as the start time of the calculation. • Fixed The start time of the calculation can be changed as required.
Start time	Start time for the calculation. If the "Now" option is selected under "Start time range", the start time cannot be changed.
Time range base	Unit of time for the calculation. The following settings are available: • Undefined The default time unit "Minute" is used with this setting. • Millisecond • Second • Minute • Hour • Day • Month • Year
Time range factor	The time range factor depends on the "Time range base" setting. For example, if the number 4 is set for the time range factor and "Minutes" is set for the time range base, all alarms that are logged within this period will be evaluated.

Requirement

- Alarms are located in the alarm log.
- For the following button of the alarm control, the "Visibility" and "Allow operator control" are enabled in the engineering system:

	Statistics setup

- The alarm statistics are selected in the alarm control.

Procedure

To display the statistics setup in Runtime, follow these steps:

1. Click the "Statistics setup" button in the alarm control.
   Setup opens.
2. Change the settings as required.
3. Click "OK".

Result

The calculation of the alarm statistics is displayed according to the changed settings.

6.6.7 Acknowledging alarms

Introduction

You acknowledge pending alarms in runtime depending on the configuration of your project and the defined alarm classes. The number of alarms to be acknowledged can be taken from the counter next to the "Single confirm" button or the Information bar, if this has been configured accordingly in the engineering system for the alarm control. According to the acknowledgement concept, different variants are available.

Note

If an operator authorization is configured for the operator controls, the alarms can only be acknowledged by authorized users.

Acknowledgment variants

You acknowledge individual alarms or multiple alarms together in runtime. The following options are possible:

- Single acknowledgment
  Acknowledgment of an alarm using the "Single acknowledgment" button
- Group acknowledgment
  Acknowledgment of all pending, visible alarms that require acknowledgment in the alarm control using the "Group acknowledgment" button in the alarm control.
- Acknowledgment and confirmation
  When an alarm requires acknowledgment and confirmation, you acknowledge that the alarm is incoming or outgoing. Once the alarm has gone out, you reset the alarm with the "Single confirm" button of the alarm control.

Requirement

- The "Visibility" and "Allow operator control" settings are activated for the following alarm control buttons in the engineering system:

	Single acknowledgment
	Group acknowledgment
	Single confirm
	Show recent

Procedure

To acknowledge an alarm in runtime, follow these steps:

1. Click the "Show current" button in the alarm control.
2. Select the alarm.
3. Click "Single acknowledgment" in the alarm control.

Result

Depending on the state machine of the alarm class, the alarm receives the state "Acknowledged". The alarm can also receive the state "outgoing" if the event for triggering an alarm is no longer pending.

6.6.8 Group acknowledgement of alarms

Introduction

The acknowledgement of all pending, visible alarms in the alarm window that need to be acknowledged is known as a group acknowledgement. In runtime, use the "Group acknowledgment" button in the alarm control for this purpose.

Requirement

- The "Visibility" and "Allow operator control" settings are activated for the following alarm control buttons in the engineering system:

	Group acknowledgment

Procedure

For group acknowledgement of alarms in runtime, follow these steps:

1. Read the alarm texts of the pending alarms and perform corrective actions, if necessary.
2. Click the "Group acknowledgment" button in the alarm control.

Result

All pending alarms with the following properties have been acknowledged:

- Requires acknowledgement
- Visible

6.6.9 Exporting alarms

Introduction

In runtime you export the data directly from the alarm control, for example, for further processing or analysis. You use the "Export" button in the alarm control for this purpose.

Requirement

- The "Visibility" and "Allow operator control" settings are activated for the following alarm control buttons in the engineering system:

	Export

Procedure

To export data from the alarm control in runtime, follow these steps:

1. Click the "Export" button in the alarm control.
2. Under "File name" specify the file name of the export file.
3. Under "Scope of data export" specify which data is to be exported from the alarm control.
4. Under "Format" select the format of the export file.
5. Confirm with "OK".

Result

The export file appears in the browser download and can be downloaded.

6.6.10 Shelving alarms

Introduction

You shelve an alarm, for example, to prevent an error alarm from impairing the effectivity of your system. In runtime, use the "Shelve alarm" button in the alarm control for this purpose.

Note

If an operator authorization is configured for these control elements, the alarms can only be shelved by authorized users.

Requirement

The following setups have been made in the engineering system:

- The "Show defined alarms" alarm list is configured in such a way that shelved alarms are displayed.
- The "Visibility" and "Allow operator control" settings are activated for the following alarm control buttons in the engineering system:

	Show defined alarms
	Shelve alarm
	Disabled alarms setup

Shelving alarms

To shelve an alarm in runtime, follow these steps:

1. Select the alarm list "Show defined alarms" in the alarm control.
2. Select the alarm.
3. Click the "Shelve alarm" button.

Displaying shelved alarms

To display the currently shelved alarms in runtime, follow these steps:

1. Select the alarm list "Show defined alarms" in the alarm control.
2. Click the "Disabled alarms setup" button.
3. Activate the option for shelved alarms.

6.6.11 Unshelving an alarm

Introduction

An alarm that you have shelved can be released at any time. In runtime, use the "Unshelve alarm" button in the alarm control for this purpose.

Note

If an operator authorization is configured for these control elements, the alarms can only be shelved by authorized users.

Requirement

The following setups have been made in the engineering system:

- The "Show defined alarms" alarm list is configured in such a way that shelved alarms are displayed.
  Alternatively: If the "Visibility" and "Allow operator control" settings are enabled for the "Disabled alarms setup" button, you can change the alarm list configuration in Runtime with this button.
- The "Visibility" and "Allow operator control" settings are activated for the following alarm control buttons in the engineering system:

	Show defined alarms
	Unshelve alarm
	Disabled alarms setup

Displaying shelved alarms

To display the currently shelved alarms in runtime, follow these steps:

1. Select the alarm list "Show defined alarms" in the alarm control.
2. Click the "Disabled alarms setup" button.
3. Activate the option for shelved alarms.

Revoke shelved alarms

To unshelve an alarm in runtime, follow these steps:

1. Select the alarm list "Show defined alarms" in the alarm control.
2. Select the alarm.
3. Click "Unshelve alarm".

Filtering alarms in runtime (Page 778)

6.6.12 Lock alarms

Note

No locking and unlocking of PLC alarms

Locking and unlocking of PLC alarms for an S7-1500 PLC is not supported.

Introduction

You can disable alarms to avoid an excessive burden of information for the plant operator. If only selected alarms are displayed, the operator can concentrate on the important alarms.

You can enable the disabled alarms at any time. In runtime, you use the buttons "Disable alarm" and "Enable alarm" in the alarm control for this purpose.

Disabled alarms are automatically visible again when Runtime restarts.

Requirement

The following setups have been made in the engineering system:

- The "Show defined alarms" alarm list is configured in such a way that disabled alarms are displayed.
  Alternatively: If the "Visibility" and "Allow operator control" settings are enabled for the "Disabled alarms setup" button, you can change the alarm list configuration in runtime with this button.
- The user is authorized to disable and enable alarms
- The "Visibility" and "Allow operator control" settings are enabled for the following alarm control buttons:

	Show defined alarms
	Disable alarm
	Enable alarm
	Disabled alarms setup

Note

The "Disable alarms" and "Enable alarms" authorizations must be configured directly one under the other. This is necessary because the authorization level used automatically for the "Enable alarms" authorization is directly below the "Disable alarms" authorization.

Properties of disabled alarms

The following applies to disabled alarms:

- A disabled alarm is not logged.
- If a disabled alarm is reenabled, it is checked by the system and, if the cause still exists, displayed again.

Displaying disabled alarms

To display an alarm in runtime, follow these steps:

1. Select the alarm list "Show defined alarms" in the alarm control.
2. Click the "Disabled alarms setup" button.
3. Enable the option for disabled alarms.

Disable alarms

To disable an alarm in runtime, follow these steps:

1. Select the alarm list "Show defined alarms" in the alarm control.
2. Select the alarm.
3. Click the "Disable alarm" button.
   The alarm is removed from the alarm list.

Enable alarms

To enable an alarm in runtime, follow these steps:

1. Select the alarm list "Show defined alarms" in the alarm control.
2. Select the alarm.
3. Click the "Enable alarm" button.

6.6.13 Printing alarms in runtime

Introduction

In runtime you print the data directly from the alarm control, for example, for further logging or analysis. You use the "Lock" button in the alarm control for this purpose.

Requirement

- The "Visibility" and "Allow operator control" settings are activated for the following alarm control buttons in the engineering system:

	Print

Procedure

To print an alarm in runtime, follow these steps:

1. Filter the alarm control using the alarm control controls, if necessary.
2. Click the "Print" button in the alarm control.
   Depending on the browser settings, the print preview appears in a new browser tab.
3. Click "Print".

Result

The alarms displayed in the alarm window are output on the printer.

6.7 Display security events

6.7.1 Display security events on the HMI device

Introduction

In addition to the existing alarms in WinCC, you can also view security events on the HMI device.

Security events are, for example, an attack on a device over the network or a change of the protection level for communication between the controller and the HMI device.

Security events are detected by the controller and passed on to the HMI device. Security events are displayed in the alarm log on the HMI device.

It is not necessary to configure or activate the security event functionality within the controller. Security events are automatically detected by the controller.

Configuring the display of security events

The following steps are necessary to display security events on the HMI Device:

- Selection of controller alarms
- Creation of an alarm log for controller alarms

You can find more detailed information on configuration here: Configuring the display of security events (Page 795)

Notes

- WinCC only supports security events of a SIMATIC S7-1500 controller.
- WinCC only supports security events that are automatically updated by the central alarm management in the controller.
- Security events always use the "System information" alarm class.

See also

Configuring the display of security events (Page 795)

Sending and automatically updating complete alarm from the controller to the HMI device (Page 796)

Logging alarms (Page 769)

Alarm system (Page 707)

Alarms (Page 709)

6.7.2 Configuring the display of security events

Requirement

- There is an HMI connection between the HMI Device and a SIMATIC S7-1500 controller (as of firmware version 2.0).
- The option "Central alarm management in the PLC" is selected (the automatic update of security events on the HMI device is enabled in the controller).

Procedure

1. Open the "Runtime settings" of the HMI device.
2. Select the option "Automatic update" under "Alarms > Controller alarms".
   The automatic update of security events on the HMI device is enabled in the HMI device.
3. Select the option "Security events" under "Alarms > Controller alarms".
   The display by security events in runtime is enabled.

   Note

   The "Security events" option is cleared by default and must be selected for each HMI connection.

4. Create a new alarm log in the "Log" editor under "Alarm logs".
5. Open an HMI screen.
6. Create an alarm control.

Result

The security events are displayed in the alarm log in runtime.

See also

Display security events on the HMI device (Page 794)

Configuring automatic update of controller alarms on the HMI device (Page 797)

Show logged alarms (Page 765)

6.8 Sending complete alarm from the controller to the HMI device

6.8.1 Sending and automatically updating complete alarm from the controller to the HMI device

Basics

In addition to alarms in WinCC, you can configure controller alarms in STEP 7 and display them on your HMI device.

If controller alarms are configured in STEP 7, an integrated HMI connection to a SIMATIC S7-1500 controller is established and an alarm is triggered on the controller, the controller alarms are automatically sent to the HMI devices and updated automatically in case of alarm changes (e.g. change to alarm text). This will save you time because you do not have to load configuration changes of the alarms to the HMI device separately. The HMI device does not need to exit Runtime operation when the alarms are changed.

The following controller alarms can be sent to the HMI device:

- Program alarms
- ProDiag alarms
- GRAPH alarms
- System diagnostic alarms

The controller alarms can be sent completely to the HMI device if corresponding settings are configured in the controller and on the HMI device. On the HMI Device, the option "Automatic update" under "Runtime settings > Alarms > Controller alarms" must be selected for the respective connection. You can find additional information on the settings at Configuring automatic update of controller alarms on the HMI device (Page 797).

Device dependency

If the controller and the HMI device are configured accordingly, the controller alarms from the following controller are sent automatically and completely to the HMI device when they occur:

- SIMATIC S7-1500 (firmware version 2.0 and higher)

Language settings

For alarms to be displayed in the correct language on the HMI device, the same three languages or fewer must be configured for the alarms in the controller and on the HMI device. You might have to coordinate the language selection with the configuration engineer.

If different languages are configured on the HMI device and in the controller, the HMI device in operation shows the text "###Text missing###" instead of the controller alarms.

Notes

- If the "Only information" option was activated for a program alarm in STEP 7, the program alarm uses the "Information" alarm class.
- Controller alarms that are automatically updated by the central alarm management in the controller cannot be shelved or manually suppressed.
- If a security event occurs, the alarm class "system information" is used.
- The alarm number of an alarm corresponds to the alarm ID in the controller.

6.8.2 Configuring automatic update of controller alarms on the HMI device

Introduction

The "Automatic update" option is selected by default for a connection between a SIMATIC S7-1500 controller (firmware version 2.0 or higher) and an HMI device.

Requirement

- There is an HMI connection between the HMI Device and a SIMATIC S7-1500 controller (as of firmware version 2.0).
- The option "Central alarm management in the PLC" is selected in the properties of the controller (the automatic update of controller alarms on the HMI device is enabled in the controller).
- Controller alarms were configured in STEP 7.
- An alarm control is configured on the HMI device.
- The same three languages (or fewer) are configured in the controller and on the HMI device for alarms.

Procedure

1. Open the "Runtime settings" of the HMI device.
   One or more connections to controllers are displayed under "Alarms > Controller alarms".
2. Activate the "Automatic update" option for the respective connection for which you want to display the controller alarms.
   The "Automatic update" option must be selected separately for each connection.

Note

If the language of an alarm text is not available on the HMI device, the alarm text '##Text missing##' is displayed.

Result

In runtime, the controller alarms are displayed in the alarm control.

6.9 Reference

6.9.1 Terminology used for alarms

WinCC	DIN 19235	DIN EN 62682	Description
Analog alarm		Absolute alarm	An alarm that is triggered with a limit value is exceeded.
Discrete alarm		Discrete alarm	An alarm that is triggered when digital signals match a specified pattern during an ongoing process.

WinCC	DIN 19235	DIN EN 62682	Description
Suppressed by design		Suppressed by design	An alarm is not signaled based on a condition.
Event		Event	An event represents a requested or unrequested status change.
Initial alarm	Initial alarm	Initial alarm	An alarm that is selected first after the last acknowledgment from several alarms.
Outgoing		Inactive	The condition for triggering an alarm is no longer fulfilled.
Outgoing alarm	Outgoing alarm	Inactive alarm	The alarm is no longer displayed because the triggering condition is no longer fulfilled.
Incoming		Active	The condition for triggering an alarm is fulfilled.
Locked alarm	Locked alarm	Locked alarm	An alarm that is blocked by interlocking.
Alarm group	Group of alarms	Alarm group	A group of alarms with a shared assignment. This assignment can be, for example, the process area or the equipment group.
Incoming alarm	Incoming alarm	Active alarm	An alarm that is displayed when the triggering condition is fulfilled.
Alarm log		Alarm log	A long-term archive for alarm logging.
Alarm filter			Criteria that limit the display of alarms in the alarm view.
Alarm list		Alarm list	A display that lists the signaled alarms with selected information (e.g. date, priority and alarm type).
Alarm type		Alarm type	An alarm attribute that allows for a distinction between the alarm condition (e.g. alarm with low or high process value).
Alarm procedures	Alarm procedures	Alarm procedures	An alarm procedure monitors the plant. The alarms of the individual alarm procedures are triggered in various ways.
Alarm	Alarm	Alarm	Acoustic or visual information about the malfunction.

WinCC	DIN 19235	DIN EN 62682	Description
Alarm view	Alarm view	Alarm view	The alarm view displays alarms that occur during the process in a plant.
Alarm class	Alarm class	Alarm class	A group of alarms with a shared set of management requirements (e.g. safety requirements).
Alarm priority	Alarm priority	Alarm priority	The relative significance that is assigned to an alarm in an alarm system that represents the urgency of the alarm.
Alarm report		Alarm report	A report of the logged or pending alarms.
New value alarm	New value alarm		An alarm processing that selects an alarm from several alarms whose status has changed since the last acknowledgment.
Acknowledgment	Acknowledgment	Acknowledgment	Operator activity that confirms the acknowledgment of the alarm.
Feedback	Feedback		The feedback confirms a command, a status or a condition. The feedback also indicates whether a change or a status change has occurred.
Deadband		Deadband	The deadband suppresses the noise component in the settled controller state of the PID controller.
Suppressed alarm	Suppressed alarm	Suppressed alarm	An alarm that is blocked by interlocking.
Alarm annunciator	Alarm annunciator	Alarm annunciator	A device or device group that alerts the operator about changes in the process conditions.

6.9.2 System events

6.9.2.1 Basics of System Events

System events

System events on the HMI device provide information about internal states of the HMI device and PLC.

The following overview illustrates when a system event occurs and how to eliminate the cause of the error.

Note

System events are output in an alarm control. System events are output in the language currently set on your HMI device.

Parameters of system events for HMI devices

System events are nested tag-based events. They are defined in a SystemData template for S7 Plus in the template for the S7 Plus HMI connection. Whenever engineering creates an S7 Plus HMI connection, a nested event is also created.

As of version V18, system events must have a constant ID of the event. Therefore, each component gets its own range of numbers.

Note

The ID of the event must be constant.

6.9.2.2 S7Plus system events

S7Plus system events

The most important system events are listed below.

ID	Name	Effect/cause	Solution
537526273	PLCDisconnectAlarm	The connection to a S7-1200/1500 PLC could not be established. Possible causes: • General connection problems (cable not plugged in, PLC switched off, network component interrupted). • Failed authentication on the PLC side (wrong or invalid password). • Connection certificate error (wrong or invalid connection certificate). • Connection resources are exhausted. 1. Error from the lower-level communication level. • Error on HMI side • Error on PLC side or network – Not connected – Access denied – Authentication failed 2. General error with the connection certificate. • OpenSSL has encountered an error while checking the connection certificate. The detail error message contains the OpenSSL error code. 3. The connection certificate used has expired. • The alarm text contains the name of the certificate. 4. The connection certificate used has been revoked. 5. The connection certificate has not been trusted, but manual trust is possible. 6. The connection certificate has not been trusted, manual trust is not possible.	Check that the S7-1200/1500 PLC and/or HMI station has no problems. Check if the cable is plugged in, the PLC is switched on and the network component is not interrupted. Check if the password is correct and valid. Check if the IP address is correct and pinging the IP address is possible. Check the S7Online access point. Check the validity of the certificate.
537526274	PLCInStopAlarm	The S7-1200/1500 PLC is not in RUN mode. The HMI station is connected to the PLC, but the internal PLC program is not executed.	Check that the S7-1200/1500 PLC has no problems. Bring the S7-1200/1500 into the RUN mode.

ID	Name	Effect/cause	Solution
537526275	FtaDisabledNotification	System diagnostic alarms have been configured for the S7-1200/1500 PLC, but the PLC does not support full-text alarms.	Check the PLC configuration. Upgrade the S7-1200/1500 PLC to a company version that supports full text messages, or deselect the "Automatic update" setting.
537526276	PlcResOverloadNotification	The S7-1200/1500 PLC communication resources for HMI tags are overloaded. The communication resources required for cyclic monitoring are more than the PLC has available. Instead, cyclic read requests are used for the resources that are not available. This leads to increased communication load. Time delays on HMI and PLC are to be expected. The alarm is triggered by an overload of 50% which is caused by the local HMI station.	Check the number of tags used simultaneously with the resources of the S7-1200/1500 PLC for cyclic jobs. Check if other HMI stations are connected to the S7-1200/1500 PLC.

6.9.2.3 Parameter set system events

2000 - System events parameter sets

The most important system events are listed below.

ID	Alarm text	Effect/causes
536920065	Parameter set [Name/ID]: Transfer to PLC successfully completed	The parameter set was successfully written from the memory to the PLC.
536920066	Parameter set [Name/ID]: Transfer to PLC aborted with error	The message appears in the following situations: • A parameter set type with the name or ID does not exist in Runtime. Transfer to the PLC has been aborted. • A parameter set with the name or ID does not exist in Runtime. Transfer to the PLC has been aborted.
536920067	Parameter set [Name/ID]: Transfer from PLC successfully completed	The parameter set was successfully loaded into memory by the PLC.
536920068	Parameter set [Name/ID]: Transfer from PLC aborted with error	The possible causes are as follows: • If a parameter set with the name or ID exists in Runtime, the values of the parameter set in the memory are overwritten with the values read by the PLC. • The transfer of PLC failed during the unsuccessful PLC connection.
536920069	Parameter set [Name/ID] not available:	A parameter set type with the name or ID is not available in Runtime.
536920070	Parameter set [Name/ID] not available	A parameter set with the name or ID is not available in memory.

ID	Alarm text	Effect/causes
536920071	Parameter set [Name/ID]: Import failed	The possible causes are as follows: • The path specified for the import file cannot be accessed. • The header in the import file is incorrect. • Specified import parameters are not available in the import file. • Checksum validation failed if checksum was activated during import.
536920072	Parameter set [Name/ID]: Import successfully completed	The parameter set was successfully imported from a file.
536920073	Parameter set [Name/ID]: Export failed	The path specified for the export file cannot be accessed.
536920080	Parameter set [Name/ID]: Export successfully completed	The parameter set was successfully exported to a file.
536920081	Invalid checksum: Import failed	Checksum validation failed due to a change in the import file.
536920082	Import successfully completed	All parameter sets were imported successfully.
536920083	Import failed	The path specified for the import file cannot be accessed. None of the parameter sets present in the import file were imported.
536920084	Import partially completed	Not all parameter sets present in the import file could be imported. A possible cause is that the values of the elements cannot be imported, e.g. the value is not within the value range of the elements or the value does not correspond to the configured data type or data format.
536920085	Export successfully completed	All parameter sets available in Runtime have been exported to the file.
536920086	Export failed	The path specified for the export file cannot be accessed.

6.9.2.4 Reporting system events

Reporting system events

The most important system events are listed below.

ID	Alarm text	Effect/causes	Solution
538640385	Initialization of the reporting service failed	Initialization of the reporting service fails.	Contact Siemens customer service.
538640386	Report Data Provider cannot be started	The data provider for reports could not be started.	Contact Siemens customer service.

ID	Alarm text	Effect/causes	Solution
538640387	The report cannot be started for the job [name].	The Report Creator for report jobs cannot be started.	Check the report job settings. If you use the "ExecuteReport" system function, check the name of the report job and the parameters passed when calling the function.
538640388	An error occurred during communication with the database server	The reporting database cannot be found or access is not possible for other reasons.	Check whether the reporting database is available at the storage location configured in the Runtime settings in engineering. Example for panel: • Is the SD card plugged in? • Does the folder specified as storage location in the Runtime settings exist? • Has the folder been specified in the correct notation?
538640389	The creation of the report job [name] failed	The Report Creator is missing information about the report job. A possible reason for this are problems with processing the report template.	Check the report job settings and the report template.
538640390	Report failed	Report Creator reports an error while generating the report.	Check the detailed error message for the report: Control "Reports" > "Reports" tab > "Status" column.

6.9.2.5 Scripting system events

Scripting system events

The most important system events are listed below.

ID	Alarm text	Effect/cause	Solution
537329665	Script debugger is activated	The script debugger for screens is enabled in the Runtime Manager.	The alarm is cleared when the script debugger for screens is disabled in the Runtime Manager.
537329666	Script debugger is activated	Script debugger for the scheduled tasks is enabled in Runtime Manager.	The alarm is fixed when the script debugger for the scheduled tasks is disabled in the Runtime Manager.
537329667	The alarm text is specified by the user via the script.	This alarm is triggered by the CreateOperatorInputInformation system function. The alarm text always comes in the language selected by the user.	--

ID	Alarm text	Effect/cause	Solution
537329668	The alarm text is specified by the user via the script.	This alarm is triggered by the CreateSystemAlarm system function. The alarm text always comes in the language selected by the user.	--
537329669	The alarm text is specified by the user via the script.	This alarm is triggered by the CreateSystemInformation system function. The alarm text always comes in the language selected by the user.	--

6.9.2.6 Communication system events

Communication system events

The most important system events are listed below.

Drivers	ID	Alarm text	Effect/cause	Solution
AllenBradleyEIP	538574849	PLCDisconnectAlarm	The connection to the Allen-Bradley PLC could not be established.	Check if: • The cable is connected • The PLC is switched on. • The network component is not interrupted.
	538574850	Computer1 [Name]: Partner is not fully operational	The PLC is not fully operational.	
Omron EIP	538574851	PLCDisconnectAlarm	The connection to the Omron PLC could not be established.	Check if: • The cable is connected • The PLC is switched on. • The network component is not interrupted.
	538574852	Computer1 [Name]: Partner is not fully operational	The PLC is not fully operational.	

Drivers	ID	Alarm text	Effect/cause	Solution
Mitsubishi MC	538574853	PLCDisconnectAlarm	The connection to the Mitsubishi MC PLC could not be established.	Check if: • The cable is connected • The PLC is switched on. • The network component is not interrupted.
	538574854	Computer1 [Name]: Partner is not fully operational	The PLC is not fully operational.	
Mitsubishi IQ	538574855	PLCDisconnectAlarm	The connection to the Mitsubishi IQ PLC could not be established.	Check if: • The cable is connected • The PLC is switched on. • The network component is not interrupted.
	538574856	Computer1 [Name]: Partner is not fully operational	The PLC is not fully operational.	
StdModbusTCP	538574857	PLCDisconnectAlarm	The connection to the Modbus PLC could not be established.	Check if: • The cable is connected • The PLC is switched on. • The network component is not interrupted.
	538574864	Computer1 [Name]: Partner is not fully operational	The PLC is not fully operational.	

6.9.2.7 VCS system events

VCS system events

The most important system events are listed below.

ID	Alarm text	Effect/cause	Solution
537264129	Computer1 (@2%s@): Manager (@1%s@) is not connected.	The alarm appears when the execution of the VCS (Visual Core Service) module is restricted. The VCS module is responsible for all processes needed to display process pictures. The possible causes are as follows: • The processes crashed. • The processes could not be started.	

6.9.2.8 Runtime system events

IOWA system events

The most important system events are listed below.

ID	Alarm text	Effect/causes	Solution
536870913	Computer1[@1%s@]: System starting	The system is started. The alarm is triggered as soon as the system starts booting and cleared when this process is completed.	The alarm is cleared automatically when the system is booted, i.e. when all managers listed in the progs file are booted (except managers that are started manually).
536870914	Computer1 [@1%s@]: System shutting down	The system is stopped. The alarm is triggered as soon as the system starts shutting down, and cleared when the system is restarted.	The alarm is cleared automatically when the system starts up again.
536870915	Computer1[@S1%s@]: Delta activation in progress	The alarm indicates that a delta download is in progress. The alarm is set when the delta download is started and remains active until the delta activation is completed.	The alarm disappears automatically as soon as the delta download is completed. No action is required by the operator.
536870916	Computer1 [@S1%s@]: Delta rollback in progress	The alarm appears when the delta activation has failed and a rollback of the changes has been triggered. It remains active while the rollback is executed and is reset afterwards.	The alarm disappears automatically as soon as the rollback and therefore the failed delta download is completed. No action is required by the operator.
536870917	Computer1 [@1%s@]: Low work memory	The alarm indicates that the free physical work memory (RAM) will soon be exhausted.	Increase the work memory (RAM) or reduce the load.
536870918	Computer1 [@1%s@]: Very low work memory	The alarm indicates that the free physical work memory (RAM) is critical.	Increase the work memory (RAM) or reduce the load.

ID	Alarm text	Effect/causes	Solution
536870919	Computer1 [@1%s@]: Low hard disk space	The alarm indicates that the free memory space will soon be exhausted.	Delete the data that is not required.
536870920	Computer1 [@1%s@]: Very low hard disk space	The alarm indicates that the free memory space is no longer sufficient.	Delete the data that is not required.
536870921	Computer1 [@2%s@]: Manager [@1%s@] is not connected.	The alarm indicates that the connection to the Service Manager has been lost.	Check the network connection or the status of the manager. The system attempts to establish a connection on its own.
536870922	Computer1 [@2%s@]: Service [@1%s@] is not being executed.	The alarm indicates that the connection to a service instance has been lost.	Check the network connection or the status of the manager. The system attempts to establish a connection on its own.
536870923	Online backup in progress	The alarm is displayed when the online backup operation is performed. It remains set until the online backup is completed.	The alarm disappears automatically when the online backup is completed or aborted with an error. No action is required by the operator.
536870924	SystemManagerAlarm	The alarm indicates that the System Manager has its lost connection to the Event Manager.	Check the network connection or the status of the manager. The system attempts to establish a connection on its own.
536870925	RedundancyLossAlarm	The alarm indicates that there is currently no established connection to the redundant partner. This may be because the connection to the other host has been lost or because the connection has not yet been established (other host not running, network problem).	Check the network connection and whether the other host was started with the correct configuration. The system attempts to establish a connection on its own.
536870926	RuntimeVersionDifferent	The alarm appears when a redundantly configured system is started with two different Runtime versions on the two hosts. The "RuntimeVersion" configuration entry is different on the peers, which means that different software versions are installed on the two hosts.	Check the Runtime version value in the configurations on both devices and ensure that the correct software versions are being used. Update the incorrect hosts to the correct Runtime version.
536870927	Computer1 [@S1%s@]: Connection ID: @S7%u@, Connection status: @2%u@	The alarm indicates that the status of the connection between the driver and the PLC has changed.	
536870928	Computer1 [@S1%s@]: @5%t#4T@	The alarm appears when a configuration error has been detected by a component.	The component should describe the problem in detail so that the user can make the required changes in the configuration.

ID	Alarm text	Effect/causes	Solution
536870929	Computer1 [@S1%s@]: Successful rollback after failed activation.	The alarm is displayed when a delta download attempt fails and the changes are not activated.	There can be several reasons why the delta download process fails. The detailed reason should help identify the problem. Common problems include configuration issues within the delta project, incompatibility with the currently running project, requirements for a delta download are not met (such as a mandatory manager not running), another process is running that is preventing the delta download from running.
536870930	Computer1 [@S1%s@]: Delta rollback failed	The alarm is displayed when a problem is detected in a component during a delta download and a rollback is initiated. However, this rollback also fails for unexpected reasons. Consequently, this may result in a project that is in an inconsistent state.	The project may be in an inconsistent state. Perform a full download to return to a consistent project.
536870931	Computer1 [@S1%s@]: Saving of configuration changes has failed.	The alarm is displayed when saving configuration changes fails. Writing the changes was unsuccessful and the changes are lost after shutdown.	Check whether the required write rights have been granted for the project folder.
536870932	Computer1 [@S1%s@]: Merging of the RDF files has failed: @2%s@	The alarm indicates that the Runtime configuration data consolidation (RDF merge) failed.	Verify that the required authorizations have been granted for the project folder and that the files in the project are not locked by other processes.
536870933	Computer1 [@S1%s@]: Delta activation has failed. The file system is damaged.	The alarm is activated when a delta download was successfully activated, but the delta build number could not be added to the permanent list of activated deltas.	Verify that the required authorizations have been assigned to the project folder and that the files in the project are not locked by other processes, especially the delta list file in the deltas subdirectory.
536870934	Computer1 [@S1%s@]: A leap in time of @2%1.3f@ seconds was determined.	The alarm indicates that a time jump has occurred. Do not change the system time.	Check the device battery and system time.

ID	Alarm text	Effect/causes	Solution
536870935	Runtime Collaboration: @2%t#<RuntimeCollaborationFailureReason.1>@ during the connection of computer [@S1%s@] with system @5%u@ [@6%s@] to @4%s@.	The alarm indicates an unsuccessful connection attempt of the Dist Manager to another system with the cause of the error specified in the alarm text. There can be several reasons why a connection attempt fails. Common problems that can occur: Target system not available, certificate problems, wrong system ID or name configured for the target, time synchronization problem.	The alarm text, which includes the reason for the error and information about the connection attempt, should help identify the problem. - If the target system is not available: Check if the target system is running with correct configurations (Dist and, if necessary, Proxy Manager are started), check for network errors (check if the device itself is reachable, the ports used are open) - Certificate problems: Check if both client and server system have correct and valid certificates. Incorrect system ID or name: The client system has a mismatched configuration to the target system (server), where either the system ID or name differs from the actual ID or name of the system. - Time synchronization problem: The system time difference between the two systems is greater than the maximum allowed difference.
536870936	Computer1 [@2%s@]: Loading of the configuration data created in Runtime has failed: @3%s@	The alarm indicates that configuration data created through Runtime engineering or by the Runtime itself could not be loaded. This data is stored in Runtime configuration files within the Runtime project and is read when Runtime is restarted.	Usually indicates a serious problem. Problems with the storage medium itself or with corrupted files.
536870937	Computer1 [@S1%s@]: 'LoggingOverloadError' event was activated.	Outdated	Instead, use StorageSystemWriteDataLostAlarm_[StorageApplicationAbbreviation].
536870938	Computer1 [@S1%s@]: User name: @S2%s@, Tag name: @2%s@, Old value: @3%v@, New value: @4%v@, Unit: @5%s@, Cause: @6%s@	A value was changed by the user.	Audit Trail value change documentation.

ID	Alarm text	Effect/causes	Solution
536870939	Computer1 [@S1%s@]: User name: @S2%s@, Tag name: @2%s@, Old value: @3%v@, New value: @4%v@, Unit: @5%s@, Cause: @6%s@	A value change by the user has not occurred.	Audit Trail value change documentation.
536870940	Computer1 [@S1%s@]: Online backup has failed	The alarm is triggered when an online backup was requested, but the operation fails.	The backup may fail for several reasons, which can be found in the detailed description. A mandatory manager may not be running, or may have been stopped during the backup, or there may be an access rights problem in the target directory. Certain components may have also implemented their own logic for online backup that fails.
536870941	Computer1 [@S1%s@]: The certificate for @2%s@ was not found in the certificate memory. Details: @3%s@	The alarm is triggered when a component cannot use certificates due to problems. Either no certificate is configured or there is a problem with the public and/or private keys.	Check the configured certificates used by this component.
536870942	Computer1 [@S1%s@]: The certificate for @2%s@ will expire soon. Expiration date: @3%s@. Details: @4%s@	The alarm is triggered when a component is using a certificate that is about to expire. The exact time depends on what the specific component has defined as soon to expire. Usually, this alarm is expected to be triggered about 1 week before the expiration date.	Update the certificates used by the respective component.
536870943	Computer1 [@S1%s@]: The certificate for @2%s@ has expired. Expiration date: @3%s@. Details: @4%s@	The alarm is triggered when a component attempts to use an expired certificate.	Update the certificates used by the respective component.
536870944	SystemDistributionManagerAlarm	The alarm indicates that the connection to the Distribution Manager has been lost.	Check the network connection or the status of the manager. The system attempts to establish a connection on its own.

ID	Alarm text	Effect/causes	Solution
536870945	Computer1 [@2%s@]: Driver [@1%s@] Overload warning.	The alarm indicates that the driver can no longer continuously process the number of value changes it receives from the PLC. This state occurs either only temporarily, or can also exist permanently. In this case, received values are temporarily stored by the driver and processed at a later time.	If this occurs only temporarily, it is enough to wait. If this occurs more frequently, then using another driver can share the load between the two drivers and thus prevent the problem. It could also be an indication that the event manager can no longer handle the number of value changes. In this case, the driver is storing the value changes, which in turn can cause an overload condition with this driver.
536870946	Computer1 [@2%s@]: Driver [@1%s@} Overload has occurred.	The alarm indicates that the driver can no longer handle the number of value changes it receives from the PLC. This condition either occurs only temporarily, or may continue permanently. In this case, it cannot be excluded that values are lost.	If this occurs only temporarily, it is enough to wait. If this occurs more frequently, then using another driver can share the load between the two drivers and thus prevent the problem. It could also be an indication that the event manager can no longer handle the number of value changes. In this case, the driver is storing the value changes, which in turn can cause an overload condition with this driver.
536870948	Computer1 [@2%s@]: Manager [@1%s@] is not connected.	The alarm indicates that the driver has lost the connection to the Event Manager.	Check the network connection or the status of the manager. The system attempts to establish a connection on its own.
536870949	DiskSpaceWarning	The alarm indicates that the configured limit for free space on the external storage medium has been exceeded.	Delete the data that is not required. Expand the external storage medium.
536870950	DiskSpaceAlarm	The alarm indicates that the free space on the external storage medium is no longer sufficient.	Delete the data that is not required. Expand the external storage medium.
536870951	RemovableStorageMediumAlarm	The alarm indicates that a removable device has been removed.	The alarm can be disabled for permanently installed data storage media.
536870952	High limit violated for tag @1%s@. Computer name: @S1%s@	High limit violation for a tag value range.	The tag value is above the defined value range - check the cause.
536870953	Low limit violated for tag @1%s@. Computer name: @S1%s@	Low limit violation of a tag value range.	The tag value is below the defined value range - check the cause.
536870954	MissingCRLAlarm	The alarm is triggered when the component that monitors CRLs cannot find the CRLs for CA certificate file(s). The subject names of all relevant CAs are specified in the alarm.	Specify the missing CRLs.
536870955	ExpiredCRLAlarm	The alarm is triggered by the component that monitors CRLs when expired CRLs have been provided. The subject names of all relevant CAs are specified in the alarm.	Renew the CRLs used.

ID	Alarm text	Effect/causes	Solution
536871425	Computer1 [@5%s@]: @3%t#2T@	The connection to the S7 PLC was interrupted.	Check the S7 PLC and/or driver for problems. Check if the IP address of the PLC is correct and pinging the IP address is possible.
536871426	Computer1 [@2%s@]: Partner is not fully operational.	The S7 PLC is in Stop mode. The driver is connected to the PLC, but the internal PLC program is not executed.	Check the S7 PLC for problems and bring the S7 to the "Run" mode if necessary.
536871681	PlcDisconnectedAlarm_OPCUA	The connection to the OPC UA server was interrupted.	Check the OPC UA server and/or driver for problems. Check the connection between the OPC UA server and/or driver, especially if it is not blocked by a firewall.
536871937	Computer1 [@3%s@]: @1%s@ (@2%s@): has no connection to the logging system.	AlarmLogging service has lost the connection to the database. This is probably due to an internal error of the database. If this situation continues for too long, the buffers for values may become full, resulting in data loss.	Check the status of the database server. In some cases, starting/restarting the database may solve the problem. Otherwise, the database log files can help to find the cause.
536871938	Computer1 [@4%s@]: @1%s@ (@2%s@ - @3%s@): Log is full.	At least one storage medium used by the AlarmLogging service is full, so new value changes cannot be saved. If this situation continues for too long, the buffers for values may become full, resulting in data loss.	Check the status of the connected storage media and free some space on the devices that are (almost) full. Changing the log configuration can help reduce the amount of disk space needed by limiting the maximum amount of space a particular log can use before deleting data.
536871939	Computer1 [@4%s@]: @1%s@ (@2%s@ - @3%s@): Insufficient resources of the logging system.	The database used by the AlarmLogging service is still running, but has reported that it has run out of resources (e.g. work memory, disk space). No more writing is possible. (Only applicable with Process Historian.)	Check the storage medium if it is out of space. The database server logs can also help to find out the cause of the problem. Storage space problems can be caused by a high load that the system cannot handle.
536871940	Computer1 [@3%s@]: @1%s@: A write buffer overflow has occurred in log @2%s@. Data will be lost.	In the AlarmLogging service, the buffers are full and therefore some data has already been lost. Possible causes: • Infrastructural problem (e.g. connection lost, hard disk full, see other system events in this case). • Generally, a high load that cannot be handled by the system. With redundant deployment, if only one host has this problem temporarily, the data from the other host is synchronized once the problem is resolved.	Correct the root cause of the problem. If the problem is infrastructural, follow the instructions in the appropriate system event. If there is none, the cause is probably too much load on the system or write speed degradation (for example, slowing down of a storage medium). Check the hardware elements, reduce the system load, or if it is a persistent problem, the hardware configuration may not be sufficient for the current project.

ID	Alarm text	Effect/causes	Solution
536871941	Computer1 [@2%s@]: @1%s@: The passive logging system has lost the connection to the active logging system.	The redundant databases used by the AlarmLogging service have lost connection to each other (triggered only on the passive host). Possible causes: • The active database is completely shut down. • A problem with the network connection. If the StorageSystemPassiveSynchronizing alarm is also triggered, it means that the problem is corrected and the alarm is cleared as soon as synchronization is completed. (Only applicable with Process Historian.)	Check the status of the active database. If it does not run, try restarting it or analyze its log files to learn more about the problem. If the database is running, ensure that the network connection between the two hosts is working.
536871942	Computer1 [@2%s@]: @1%s@: Synchronizing data	Logged data synchronization is in progress between the active and passive databases. Redundancy failover during this state may result in loss of logged data. (Only applicable with Process Historian.)	This system event does not signify an error; it is normal behavior when the two redundant databases are synchronizing data. Therefore, no action is required. As long as this system event is pending, you should not initiate redundancy failover, otherwise the logged data may be lost.
536871943	Computer1 [@2%s@]: @1%s@: Failover error	AlarmLogging service: An error occurred while the database was trying to switch roles between the active and passive databases. (Only applicable with Process Historian.)	Analyze the Process Historian log files to learn more about the reason for the failure. If other system events are also triggered, they may also be related.
536871944	Computer1 (@3%s@): @1%s@ (@2%s@) No connection to the logging system backend	AlarmLogging service: The backend of the database was shut down. It is either completely down or the corresponding network connection has problems. (Only applicable with Process Historian.)	Check the status of the database backend. If it does not work, try restarting it or analyze the log files to learn more about the problem. Otherwise, ensure that the network connection is working.
536871945	Computer1 [@3%s@] - @1%s@: An overflow of the transaction buffer and write buffer has occurred in log @2%s@ of the passive partner. Data may be lost. Avoid a manual failover of the redundancy partner while this alarm is active.	In the passive AlarmLogging service, the buffers are full and therefore some data has already been lost. Possible causes: • Infrastructural problem (e.g. connection lost, hard disk full, see other system events in this case). • Generally, a high load that cannot be handled by the system. If the connection between the redundant services is interrupted, this can also cause this problem. If the active service has no problems, this alarm does not mean real data loss. (Only applicable with Process Historian.)	Correct the root cause of the problem. If the problem is infrastructural, follow the instructions in the appropriate system event. If there is none, the cause is probably too much load on the system or write speed degradation (for example, slowing down of a storage medium). Check the hardware elements, reduce the system load, or if it is a persistent problem, the hardware configuration may not be sufficient for the current project. If the connection to the active service has been lost, but it is working without any problems, it is important not to initiate redundancy failover after the connection is restored while this alarm is still present to avoid real data loss.

ID	Alarm text	Effect/causes	Solution
536871946	Computer1 [@3%s@] - @1%s@: (@2%s@) Connection to the long-term logging system is lost.	AlarmLogging service has its lost connection to the long-term storage system. This is probably due to an internal database error or a network problem. (Only applicable with Process Historian.)	Check the status of the long-term database server. Starting/restarting the server may solve the problem. If it is running, ensure that the network connection is working. Otherwise, the database logs may help find the cause.
536871947	Computer1 [@4%s@] - @1%s@ (@2%s@ - @3%s@): Long-term logging system is out of hard disk space.	At least one storage medium used by the AlarmLogging service long-term storage system is full, so new value changes cannot be saved. (Only applicable with Process Historian.)	Check the status of the connected storage media on the long-term storage system and free up some space on the devices (almost) full. Changing the log configuration can help reduce the amount of disk space needed by limiting the maximum amount of space a particular log can use before deleting the data.
536871948	Computer1 [@3%s@] - @1%s@: (@2%s@): Long-term logging system no longer has any system resources.	The long-term storage system used by the AlarmLogging service is still running, but has reported that it is out of resources (e.g. memory, disk space). No more writing is possible. (Only applicable with Process Historian.)	Check the long-term storage media to see if they are running out of space. The database server logs can also help to find out the cause of the problem. Storage space problems can be caused by a high load that the system cannot handle.
536871949	Computer1 [@2%s@] - @1%s@: The passive and the active long-term logging system are no longer synchronized.	The redundant long-term databases used by AlarmLogging service have lost connection to each other (triggered only on the passive host). Possible causes: • The active database is completely shut down. • A problem with the network connection. (Only applicable with Process Historian.)	Check the status of the active long-term storage system. If it is down, try to restart it or analyze its logged files to learn more about the problem. If the database is running, ensure that the network connection between the two hosts is working.
536871950	Computer1 [@2%s@] - @1%s@: Synchronizing long-term logging system	AlarmLogging service: Synchronization of logged data between the active and passive long-term storage systems is in progress. Redundancy failover during this state may result in loss of logged data. (Only applicable with Process Historian.)	This system event does not signify an error; it is normal behavior when the two redundant databases are synchronizing data. Therefore, no action is required. As long as this system event is pending, you should not initiate redundancy failover, otherwise the logged data may be lost.
536871951	Computer1 [@2%s@] - @1%s@: Failover error in the long-term logging system.	AlarmLogging service: An error occurred when the long-term storage system tried to switch roles between the active and passive databases. (Only applicable with Process Historian.)	Analyze the Process Historian log files to learn more information about the reason for the failure.

ID	Alarm text	Effect/causes	Solution
536871952	Computer1 [@3%s@] - @1%s@: (@2%s@) A general error has occurred. Check the traces for additional information.	AlarmLogging service: An unknown error occurred during the execution of a database operation.	Analyze previous traces to learn more about the problem. One possible scenario that can cause this problem is the unexpected removal of a storage medium. In this case, reinstall the storage medium and restart Runtime. Otherwise, contact Siemens support for assistance.
536871953	Computer1 [@6%s@] - @1%s@ (@2%s@ - @3%s@): Logging medium cannot be reached. @5%t#4T@	AlarmLogging service: When trying to create a database or reconnect to a storage medium, a storage medium was not available or authorizations were lacking.	Check if the configuration (path of the log) is valid for all logs and if all required storage media are connected and working. If authorizations are available, ensure they are set correctly for the file system.
536871954	Computer1 [@2%s@]: The logging system @1%s@ has detected a more recent database version that is not compatible with the current runtime version. Update the runtime version on your device or use a device with the same runtime version as the database version.	AlarmLogging service: The Runtime software used is older than the databases used. Probably the database was moved from a device with newer software to a device with older software.	Move the database to a device with the same or a newer version of the Runtime software, or upgrade the software version of the device.
536871955	Computer1 [@2%s@]: @1%s@: Synchronizing the logging data of the redundant partners.	The redundant AlarmLogging services synchronize data with each other. This is normal behavior that only serves as an indication that the historical data on both hosts is not quite up-to-date.	No action is required, but as long as this system event persists, it is recommended not to shut down any of the hosts. If this alarm has persisted since the last start-up/restart of one of the hosts, do not restart or shut down the longer running host or data loss may occur.

ID	Alarm text	Effect/causes	Solution
536871956	Computer1 [@2%s@]: @1%s@: Error during background synchronization. Check the traces for additional information.	AlarmLogging service: An error occurred during data synchronization.	Check the additional information of the alarm to identify and eliminate the cause of the error. The synchronization is repeated at regular intervals so that it can be performed shortly after the cause has been eliminated.
536872193	Computer1 [@3%s@]: @1%s@ (@2%s@): has no connection to the logging system.	AlarmPersistency service has its lost connection to the database. Possible cause: Internal error of the database. If this situation continues for too long, the buffers for values may become full, resulting in data loss.	Check the status of the database. Otherwise, the log files may help find the cause.
536872194	Computer1 [@4%s@]: @1%s@ (@2%s@ - @3%s@): Log is full.	At least one storage medium used by the AlarmPersistency service is full, so new value changes cannot be saved. If this situation continues for too long, the buffers for values may become full, resulting in data loss.	Check the status of the connected storage media and free up some space on the devices (almost) full.
536872195	Computer1 [@4%s@]: @1%s@ (@2%s@ - @3%s@): Insufficient resources of the logging system.	Not applicable.	
536872196	Computer1 [@3%s@]: @1%s@: A write buffer overflow has occurred in log @2%s@. Data will be lost.	In the AlarmPersistency service, the buffers are full and therefore some data has already been lost. Possible causes: • Infrastructural problem (e.g. connection lost, hard disk full, see other system events in this case). • Generally, a high load that cannot be handled by the system. With redundant deployment, if only one host has this problem temporarily, the data from the other host is synchronized once the problem is resolved.	Correct the root cause of the problem. If the problem is infrastructural, follow the instructions in the appropriate system alarm. If there is none, the cause is probably too much load on the system or write speed degradation (for example, slowing down of a storage medium). Check the hardware elements, reduce the system load, or if it is a persistent problem, the hardware configuration may not be sufficient for the current project.

If the problem is infrastructural, follow the instructions in the appropriate system event. If there is none, the cause is probably too much load on the system or write speed degradation (for example, slowing down of a storage medium). Check the hardware elements, reduce the system load, or if it is a persistent problem, the hardware configuration may not be sufficient for the current project.

536872969	Computer1 [@3%s@] - @1%s@: An overflow of the transaction buffer and write buffer has occurred in log @2%s@ of the passive partner. Data may be lost. Avoid a manual failover of the redundancy partner while this alarm is active.	Not applicable.	
536872970	Computer1 [@3%s@] - @1%s@: (@2%s@) Connection to the long-term logging system is lost.	Not applicable.	
536872971	Computer1 [@4%s@] - @1%s@ (@2%s@ - @3%s@): Long-term logging system is out of hard disk space.	Not applicable.	
536872972	Computer1 [@3%s@] - @1%s@: (@2%s@): Long-term logging system no longer has any system resources.	Not applicable.	
536872973	Computer1 [@2%s@] - @1%s@: The passive and the active long-term logging system are no longer synchronized.	Not applicable.	

ID	Alarm text	Effect/causes	Solution
536872974	Computer1 [@2%s@] - @1%s@: Synchronizing long-term logging system	Not applicable.	
536872975	Computer1 [@2%s@] - @1%s@: Failover error in the long-term logging system.	Not applicable.	
536872976	Computer1 [@3%s@] - @1%s@: (@2%s@) A general error has occurred. Check the traces for additional information.	ContextLogging service: An unknown error occurred during the execution of a database operation.	Analyze previous traces to learn more about the problem. A possible cause can be the unexpected removal of a storage medium. In this case, reinstall the storage medium and restart Runtime. Otherwise, contact Siemens support for assistance.
536872977	Computer1 [@6%s@] - @1%s@ (@2%s@ - @3%s@): Logging medium cannot be reached. @5%t#4T@	ContextLogging service: When trying to create a database or reconnect to the storage medium, no storage medium was available or authorizations were lacking.	Check if the configuration (path of the log) is valid for all logs and if all required storage media are connected and working. If authorizations are available, ensure that the file system authorizations are set correctly.
536872978	Computer1 [@2%s@]: The logging system @1%s@ has detected a more recent database version that is not compatible with the current runtime version. Update the runtime version on your device or use a device with the same runtime version as the database version.	ContextLogging service: The Runtime software used is older than the databases used. Probably the database was moved from a device with newer software to a device with older software.	Move the database to a device with the same or a newer version of the Runtime software or update the software version of the device.

ID	Alarm text	Effect/causes	Solution
536872979	Computer1 [@2%s@]: @1%s@: Synchronizing the logging data of the redundant partners.	The redundant ContextLogging services synchronize the data with each other. This is normal behavior that only indicates that the historical data on both hosts is not quite up to date.	No action is required, but as long as this system event persists, it is recommended not to shut down any of the hosts. If this alarm has persisted since the last start-up/restart of one of the hosts, do not restart or shut down the longer running host or data loss may occur.
536872980	Computer1 [@2%s@]: @1%s@: Error during background synchronization. Check the traces for additional information.	ContextLogging service: An error occurred during data synchronization.	Check the additional information of the alarm to identify and eliminate the cause of the error. The synchronization is repeated at regular intervals so that it can be performed shortly after the cause has been eliminated.
536873217	Computer1 [@3%s@]: @1%s@ (@2%s@): has no connection to the logging system.	AuditTrail service has its lost connection to the database. Possible cause: • Internal database error. If this situation continues for too long, the buffers for values may become full, resulting in data loss.	Check the status of the database server. Start/restart database. The log files of the database can also help to find the cause.
536873218	Computer1 [@4%s@]: @1%s@ (@2%s@ - @3%s@): Log is full.	At least one storage medium used by the AuditTrail service is full, so new value changes cannot be saved. If this situation continues for too long, the buffers for values may become full, resulting in data loss.	Check the status of the connected storage media and free up some space on the devices (almost) full. Changing the log configuration can help reduce the amount of disk space needed by limiting the maximum amount of space a particular log can use before deleting the data.
536873219	Computer1 [@4%s@]: @1%s@ (@2%s@ - @3%s@): Insufficient resources of the logging system.	Not applicable.	
536873220	Computer1 [@3%s@]: @1%s@: A write buffer overflow has occurred in log @2%s@. Data will be lost.	In the AuditTrail service, the buffers are full and therefore some data has already been lost. Possible cause: • Infrastructural problem (e.g. connection lost, hard disk full, see other system events in this case). • Generally, a high load that cannot be handled by the system. With redundant deployment, if only one host has this problem temporarily, the data from the other host is synchronized once the problem is resolved.	Correct the root cause of the problem. If the problem is infrastructural, follow the instructions in the appropriate system event. If there is none, the cause is probably too much load on the system or write speed degradation (for example, slowing down of a storage medium). Check the hardware elements, reduce the system load, or if it is a persistent problem, the hardware configuration may not be sufficient for the current project.

Check the additional information of the alarm to identify and eliminate the cause of the error. The synchronization is repeated at regular intervals so that it can be performed shortly after the cause has been eliminated.

Archiving data 7

7.1 Log basics

Introduction

The following types of logs are available for HMI devices:

- Data log
  A data log is used to log process data from an industrial plant. You can find more detailed information about this in section Logging tags (Page 653).
- Alarm log
  An alarm log is used to log alarms that occur in the monitored process. You can find more detailed information about this in section Logging alarms (Page 769).
- Context log
  The context log is used to save user-defined and system-generated contexts of plant objects. The context log is only available for Unified PC and is stored according to the settings in the "WinCC Unified Configuration" tool.
  The context log is not segmented and has no limit with regard to size or time period.

Database types

The following database types are supported by various HMI devices:

HMI device	Supported database type
SIMATIC Unified Comfort Panel	SQLite
SIMATIC WinCC Unified PC	SQLite
	Microsoft SQL

Note

Microsoft SQL for Unified PC

- Unified PCs use SQLite as the default database type. To use Microsoft SQL, the system provides an installation option with a setup package. Logging with SQLite is not possible after the installation of Microsoft SQL.
  Existing SQLite files are retained, but they cannot be accessed in runtime.
- For SQLite, the segmented backup is not supported.

Database for simulation

SQLite is always used for simulations on the Unified PC. Exception: Runtime is installed on the same Unified PC and Microsoft SQL is configured for runtime. The configuration of the storage location is ignored during the simulation. Instead, a relative path is used in the project folder.

Protection against loss of data

When the database cannot be reached for brief periods, a temporary buffer of 8 MB is available. The buffer is used, for example, during a system overload caused by large amounts of data or when changing the storage medium.

If the power supply is unintentionally interrupted, runtime is suddenly and unexpectedly shut down. In this case, a loss of data may occur for up to 4 seconds. If the system was overloaded by large amounts of data, the loss of data can be even higher.

The data already logged is retained and is available unchanged and completely after the power supply has been restored and the system has been rebooted. Logging can be continued with the same database.

NOTICE
Loss of data due to interrupted power supply and removed storage medium Loss of data will occur when the power supply is interrupted and there is no connection to the storage medium at the same time.

Protection against manipulation

Logs can contain sensitive and confidential content, such as performance parameters or product data, that must be protected from unintentional or unauthorized modification.

In addition to physical protection measures, such as barriers, the Unified PC logs can also be protected using standard tools such as access rights for folders.

On Microsoft SQL servers, you protect the log databases by using the Windows group "Simatic HMI" (read/write) and "Simatic HMI Viewer" (read). Only members of these groups have direct access to the databases.

Startup behavior

The startup behavior of the logs at runtime start is defined in the "Reset Logs" section of the "Load Preview" dialog box when the project is loaded.

The following options are available:

- "No reset": Existing logged data is retained. This setting adds the data to be logged to an existing log.
- "Reset all": Existing logged data is deleted.

Restoring log segments

You have the option of restoring log segments of tag and alarm logs in runtime with the Runtime Manager. You can visualize the restored data in a trend control, for example.

You can find more information on this in the help of the Runtime Manager.

Specifying runtime settings (Page 7134)

Specifying runtime settings (Page 7170)

7.2 How it works

Introduction

Segmented logs are used for logging.

Each log consists of a configurable number of segments. The segments are filled one after the other.

When the maximum size or the maximum period of a log is reached, the oldest segment is deleted.

When the maximum size or the maximum period of a segment is reached, a new segment is created. The newly created segment is filled further.

Size of a log

You have the option of defining the size of a log both time-dependent and disk space dependent:

- Log time period: When the maximum period is reached, the oldest segment is deleted.
  If you specify the value "0" for "Log time period", the oldest segment is deleted when the maximum log size in megabytes is reached.
  The limitation of the log by a time period is thus disabled.
- Maximum log size in megabytes: When the maximum log size is reached, the oldest segment is deleted.
  If you specify the value "0" for "Maximum log size (MB)", the oldest segment is deleted when the maximum time period of the log is reached.
  The limitation of the log by log size is thus disabled.

When you define both properties, the oldest segment is deleted as soon as the defined period or the maximum log size has been reached.

Note

Performance problems with disabled segmentation

If you specify the value "0" for the time period of the log and the maximum log size, the value for "Single segment time period" and for "Maximum segment size in megabytes" must also be "0". The segmentation is thus disabled. All data is written to one segment. Disabled segmentation results in performance problems when accessing the log. You cannot create a backup when segmentation is disabled. Log contents can only be deleted with the system functions "ClearTagLog" or "ClearAlarmLog".

The database can grow uncontrolled, as the log is not limited in size and time period.

Define at least the log period or the maximum log size in megabytes.

When you define logs, keep the following rules in mind:

- The time period of a segment must not exceed the time period of the log.
- The maximum size of the segment must not exceed the maximum size of the log.

Note

Recommended log size

The following limits are recommended for the log size:

- At least 3 individual segments
- Max. 5000 segments (database type "Microsoft SQL")
- When the database type "SQLite" is used, the maximum number of segments is only limited by the underlying file system.

Backups and segments that were restored from backups with the Runtime Manager are not taken into account when the system checks the database size.

Size of a segment

According to the log, you can define the size of a segment both time-dependent and disk space dependent:

- Segment time period: When the segment reaches the specified time, the current segment is closed and a new segment is created and filled with data.
  When you specify the value "0" for the "Single segment time period", the single segment is filled until the maximum segment size has been reached. Time-based segmenting is thus disabled.
- Maximum segment size in megabytes: When the segment reaches the specified size, the current segment is closed and a new segment is created and filled with data.
  When you specify the value "0" for the "Maximum segment size (MB)", the single segment is filled until the maximum single segment time period has been reached. Size-based segmentation is thus disabled.

When you define both properties, the current segment is closed and a new segment is created as soon as the defined time or the maximum segment size has been reached.

Note

Performance problems with disabled segmentation

When you specify the value "0" for the "Segment time period" and for "Maximum segment size in megabytes", segmentation is disabled. All data is written to one segment. Disabled segmentation results in performance problems when accessing the log. You cannot create a backup when segmentation is disabled. Log contents can only be deleted with the system functions "ClearTagLog" or "ClearAlarmLog".

For SQLite, the segment size of a log is always an integer multiple of 4 MB. This means the actual segment size is 8 MB when you configure a segment size of 7 MB.

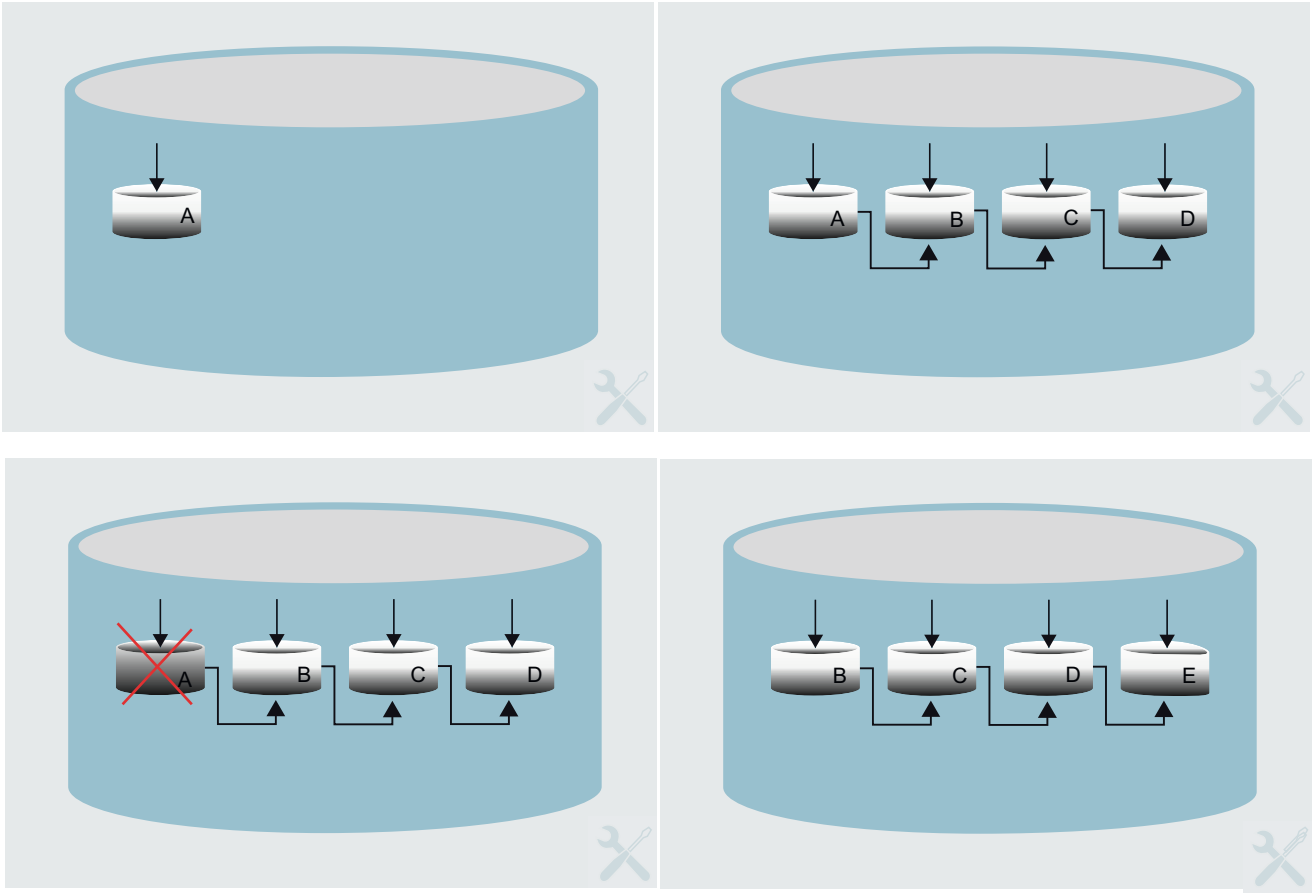
For Microsoft SQL, the smallest segment size is 3 MB.

Segment start time

You define the segment start time. The start time defines the time as of which log segments are written to the log.

Response to segment change

The individual segments are filled one after the other in runtime. Once a segment is totally full, the next segment is created and filled.



1. The process values are written continuously to the first segment.
2. When the configured size of the segment is reached or the period is exceeded, a new segment is created and filled.
3. When the maximum log size or the maximum period of a log is reached, the oldest segment is deleted.

To avoid losing process data as a result of deleting, you can configure a backup for the log.

Note

If you change the segmentation settings and load the project in runtime, a new segment is created.

Example

The following information has been configured:

Property	Value
Log time period	1 week
Maximum log size (MB)	700 MB
Segment time period	1 day
Maximum segment size (MB)	100 MB
Segment start time	Friday, 23 May 2020 18:00

With the configuration suggested in the table, log segments are written to the log starting on 23 May 2020 at 18:00 hours.

The next time-dependent segment changes take place cyclically after one day as of the configured time. The segment will also change if the configured size of 100 MB is exceeded in the course of one day.

When the maximum log size of 700 MB or the configured time period of one week is reached, the oldest segment is deleted.

Backup

You can swap out data from the log database as a backup with the database type "Microsoft SQL".

When you create a log you can configure a backup.

The data is swapped out in segments. A segment is always swapped out during a segment change when a new segment is started.

The larger the segment, the more time a backup requires. When the backup of a segment is complete, you can delete the segment.

Note

Creating backups

The backup is created with a delay of approx. 10 minutes.

If data is changed in a segment for which a backup has already been created, a new backup will be created approx. 10 minutes later.

7.3 Storage locations of logs

Introduction

You adapt the main database storage locations for tag and alarm logging in the runtime settings of the HMI device. Different options are available depending on the HMI device.

For Unified PCs, you have the option of storing the storage location in the "WinCC Unified Configuration" tool under "Archive Settings".

Note

Default setting for the database storage location

The storage location "Default" is configured as default setting in the Runtime settings and in the "Logs" editor. If you do not change these options, the database is saved according to the setting in the "WinCC Unified Configuration" tool.

Storage location of a log

You adjust the storage location of the main database of the tag logs and alarm logs in the runtime settings of the HMI device.

The following options are available depending on the HMI device:

HMI device	Supported main database storage locations for logging
Unified Comfort Panel	• SD-X51 Many read and write processes are being executed during logging. Therefore, you should use memory cards rather than USB flash drives. • USB-X61 • USB-X62 • Off: Logging is disabled. You have the option of specifying a path on the storage medium.
Unified PC	• Default: In the "WinCC Unified Configuration" tool, you store the path at which the logs are saved under "Archive Settings". • Local: Select a path on the local file system, on an external storage medium or a network folder. We do not recommend using network folders, because the power supply can be interrupted at any time. • Project folder: The logs are saved in a subfolder of the Runtime project folder. • Off: Logging is disabled.

When you define a storage location in the runtime settings of the HMI device, and thus enable logging, you can specify the database storage location for individual tag and alarm logs in the "Logs" editor under "Storage medium".

It must be ensured that the "WCCILScsService" service user under which Runtime is running has read and write rights to the directory in which the logs are stored. You have the following options here:

- Configure the directory for the logs with the "WinCC Unified - Configuration" tool and configure the storage of logs in this directory or its subdirectories in the engineering system.
- In the engineering system, configure the storage of logs in directories for which no restriction of the access rights is configured in the operating system. However, this means that the logs are then not protected from access by third parties.

Note

If you want to access a large number of log values within a short time, it is advisable to set the maximum memory of the SQL server to at least 4 GB in the "WinCC Unified – Configuration" tool.

Changing the storage location of the main database

Note

Data loss when changing the location of the main database

If you have already saved data in a log and then change the location of the main database and reload the project, you can no longer access the already logged data in runtime.

Changing the location of individual logs in the "Logs" editor is possible without data loss as long as the location of the main database remains unchanged.

In the following cases, access to already logged data is lost:

- Unified PC:
  - If you use the storage medium "Standard" as the storage location of the main database in the runtime settings of the Unified PC and change the storage location of the databases in the Werkzeug "WinCC Unified - Configuration" tool
  - If you use the storage medium "Local" as the storage location of the main database in the runtime settings of the Unified PC and change the folder
  - If you change the file path of the log in the file system of the Unified PC, e.g. rename folders with a file explorer
- Unified Comfort Panel:
  - If you change the storage medium or folder of the main database location in the runtime settings of the Unified Comfort Panel
  - If you change the file path of the log on the external storage medium, e.g. rename folders with a file explorer

Naming conventions

The log names must be unique in an HMI device. Even if different storage locations are selected for different logs, the log name must be unique.

Syntax examples for storage locations

Location of local file system on the Unified PC:

- <C:\My_File_Folder\My_Archives\Machine_1>: Saves the log on the local hard disk drive "C:" in the subdirectory "My_File_Folder\My_Archives\Machine_1"

Memory card storage location on the Unified Comfort Panel:

- </media/simatic/data-storage /My_Archives/TagLogs>: Saves the log in the subdirectory "My_Archives\TagLogs"

File name

The segments are stored according to the syntax <Unique name of the runtime project>_<Abbreviation of the logging service>_<System ID>_<Start date of the segment>_<Start time of the segment (UTC)> for example, as follows:

- Microsoft SQL: "HMI_RT_1_TLG200_20201106_135307.mdf" and "HMI_RT_1_TLG200_20201106_135307_log.ldf"
- SQLite: "HMI_RT_1_TLG200_20201106_135307.db3"

When you use the "Microsoft SQL" database type, you can create a backup. The backup files of the segments are stored with the syntax <Unique name of the Runtime project>_<Abbreviation of the logging service>_<System ID>_<Start date of the segment>_<Start time of the segment (UTC)> under the configured path, for example as follows:

- "HMI_RT_1_TLG200_20201106_135307.bak"
- "HMI_RT_1_TLG200_20201106_135307_diff.bak"
  The file with the extension "_diff.bak" is created when the backup was already created and value changes occurred later, for example, by manually adding values.

External storage medium

You have the option of saving the logs on an external storage medium. To avoid the loss of data, the storage medium must be properly removed.

NOTICE
Data loss due to improper removal of the storage medium When the storage medium is not removed correctly, logging is interrupted. As soon as you connect a storage medium and restart runtime, logging can be continued with existing databases. Data that occur between improper removal of the storage medium and the start of runtime are not logged.

The procedure for ejecting the storage medium differs depending on the HMI device:

- Unified Comfort: You use the system function "EjectStorageMedium".
- Unified PC: Eject the storage medium using the PC operating system.

Next, you remove the storage medium and connect a different storage medium.

Data that occurs during the change process are written to a buffer. Logging is continued in a new segment after the change has been completed.

Logs on different storage media

Note

Storage medium for Unified Comfort

The storage location of the main database of a logging type and the configured storage medium of all associated logs must be identical.

Tag persistency

In runtime, you have the option of specifying tag persistency for internal tags. A separate database, in which the last values of the persistent tags are stored, is used for tag persistency.

When the databases for data logs or alarm logs and the database for tag persistency are stored on the same storage medium and the medium is changed while runtime is running, tag persistency can be affected.

Note

Use different storage media for tag persistency and logging.

Parameter set types

With Unified Comfort, you have the option of saving parameter set types on external storage media.

When the databases for data logs or alarm logs and the parameter set types are stored on the same storage medium and the medium is changed while runtime is running, the parameter set types can be affected.

Note

Use different storage media for parameter set types and logging.

7.4 Creating a data log and an alarm log

Introduction

You create data logs and alarm logs for the HMI device in the "Logs" editor. In addition to the name, storage location and backup, you define the size of the log and its segments.

The size of the log and the segments can be defined both time-dependent and disk space dependent. The size of a log is calculated according to the log type as follows:

- Data log: Number of entries * Size of entries
  In addition to the value of a logging tag, its time stamp and quality code are logged.
- Alarm log: Number of entries times the approximate size of the entries
  The size of an entry depends on the alarm text, whether it contains parameter boxes and in which languages the alarm text is logged.

Note

Make sure that the log size does not exceed the free disk space and the system limits. The system does not validate the selected settings. A high number of linked log segments can lead to prolonged waiting periods in the system when starting and ending runtime.

Requirement

- An HMI device has been created.
- A database storage location for data logs and alarm logs is stored in the runtime settings.

Procedure

To create data logs or alarm logs, follow these steps:

1. Double-click the "Logs" entry in the project tree below the HMI device.
   The "Logs" editor opens.
2. Double-click "<Add>" in the "Name" column of the "Data logs" or "Alarm logs" tab.
   A new log is created.
3. Specify the name of the log.
   You can assign any name to the log. The name must contain at least one letter or one number.
   You can create several logs for each HMI device.
   The name must be unique for the respective HMI device.

4. Select the storage location of the log in the "Storage medium" field:
   – "Local": Enter the storage path for the log under "Storage directory".

   Note

   Logging on network drives

   Do not save databases directly on a network drive. Power supply can be interrupted at any time. This means there is no guarantee for reliable operation of logs.

   Save the logs on the local hard drive or an external storage medium, for example, a USB stick.

   In connection with SQLite, loss of data can occur for an external storage medium without journaling file system in case of an unintentional system crash.

   – "Default": Accepts the settings that you have defined in the runtime settings of the HMI device under "Storage system".

   Note

   Data loss when changing the location of the main database

   If you have already saved data in a log and then change the location of the main database and reload the project, you can no longer access the already logged data in runtime.

   Changing the location of individual logs in the "Logs" editor is possible without data loss as long as the location of the main database remains unchanged.

5. In the "Log time period" field, define the maximum time period for logging in the format <day>.<hour>:<minute>:<second>[.<millisecond>].
6. Define the maximum size in megabytes in the "Maximum log size (MB)" field.

   Note

   We recommend the following number of segments:
   - Without backup: 3 segments
   - With backup: 4 segments

7. In the "Segment" area, define the time period for a single segment in the format <day>.<hour>:<minute>:<second>[.<millisecond>].
8. Define the maximum segment size.

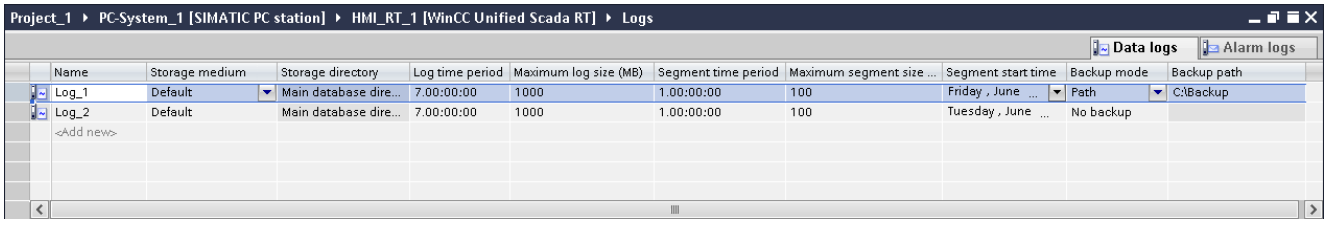
9. Define the start time.
   The start time defines the time as of which log segments are written to the log.
10. Set whether data is to be backed up and specify the path for the backup under "Backup > Backup mode".

Note

Configuring a backup

Backups can only be created when you use the "Microsoft SQL" database type. You configure the database type in the runtime settings of the HMI device.

The backup is created with a delay of approx. 10 minutes.
If data is changed in a segment for which a backup has already been created, a new backup will be created about 10 minutes later.
When you subsequently change the primary path, the new backup file is written to the new storage path after loading. The previous backup files remain in the previous storage location.



Tips for an efficient procedure

Configure the properties of a log directly in the "Logs" editor table. To view hidden columns, activate the column titles using the shortcut menu.

Result

- The log is created.
- The log database in the configured folder is created after the project is started in runtime.

See also

Configuring logging tags (Page 657)

Basics of alarm logging (Page 769)

How it works (Page 839)

7.5 Editing log contents with scripts and system functions

Using snippets

In the shortcut menu of the "Scripts" editor, you will find various snippets for logging. You have the following options, for example:

- Read data logs and alarm logs
- Export data logs and alarm logs

- Correct entries in data logs
- Comment entries in data logs

Delete log contents

You can delete the contents of an alarm log or data log using the "ClearTagLog" or "ClearAlarmLog" system functions. The log itself is retained, the alarm or logging data stored in it is deleted. This procedure can be useful, for example, after a test phase has been completed when existing logs are to be emptied.

Configuring parameter sets

8

8.1 Basics

8.1.1 Basics of parameter control

Introduction

The parameter control is a comprehensive function for the control of parameter sets for configuration engineers, operators and recipe creators. The parameter control brings you the following benefits:

- You can apply the structure of a user data type for one or more parameter set types.
- You can change the structure of one or more parameter set types automatically via a new user data type version.
- You can exchange a large number of parameters manually or automatically between HMI device and PLC to set up a machine for a production.
- You can create parameter sets simply and uniformly for products to be manufactured in the works during engineering or during ongoing operation.
- By structuring the associated parameters/setpoints, you can easily transfer parameters.

Elements of the parameter control

- Parameter set type
  A parameter set type with parameter set type items determines the structure that is used for parameter sets on a machine. You create a parameter set type with parameter set type items on the basis of a released HMI or PLC user data type that has user data type elements.
- Parameter set type item
  Element of a parameter set type that is based on a user data type element. A parameter set type item has the same name and data type as the corresponding user data type element.
- Parameter record
  Set of parameters with concrete values that can be activated on a machine.
- Parameters
  Element of a parameter set that is based on a parameter set type item. A parameter has the same display name and data type as well as the same unit of measure as the corresponding parameter set type item. A parameter has a concrete value that can be activated on a machine.

Tools of the parameter control

- "Parameter set types" editor
  In the "Parameter set types" editor, you create parameter set type items on the basis of an HMI or PLC application data type. In addition, you configure the properties of parameter set types and parameter set type items in the editor.
- Parameter set control
  The parameter set control is a control with which you can display and manage parameter sets in runtime and exchange them with the PLC.

Parameter set memory

Part of the parameter control is the parameter set memory. The parameter set memory can be configured depending on the device.

Parameter control in the Engineering System

Perform the following tasks in Engineering System for the parameter control:

- You create a parameter set type to specify the structure of parameter sets.
- You change a parameter set type to change the structure of parameter sets.
- You assign a tag of the data type user data type to a parameter set type to transfer parameter sets between HMI device and PLC in runtime.
- You create local scripts in screen objects or tasks to transfer parameter sets in runtime between the HMI device and PLC.
- You assign control tags to a parameter set type to automatically transfer or delete parameter sets between HMI device and PLC in runtime.
- You configure a parameter set control to display parameter sets, manage them and exchange them with the PLC through the Control in runtime.
- In a screen, you configure an individual input mask to display, manage and exchange parameter sets with the PLC without using the control "Parameter set control".

Parameter control in runtime

The following options are available in runtime with the parameter control:

- You create, change and delete parameter sets in a parameter set control to manage parameter sets for different productions.
- Alternatively, create, change and delete parameter sets in an individual input mask to manage them for different productions.
- You export parameter sets from the parameter set memory into a "*.tsv" file to edit them in a text editor.

  Note

  A "*.tsv" file is a text file that uses the tabulator as a list separator.

- You import parameter sets from a "*.tsv" file into the parameter set memory.

- You transfer parameter sets manually or automatically to the control system to set up machines with values for different productions.
- You read parameter sets manually or automatically from the PLC to call up currently used values of production machines for later use.
- You automatically delete parameter sets from the parameter set memory.

See also

Configuring parameter sets (Page 863)

Using parameter sets in runtime (Page 885)

Configuring user data types (Page 645)

8.1.2 Limitations

Unsupported data types in the parameter data set

Structure data types are not supported in a parameter data set:

- Struct, Array of Struct
- ErrorStruct
- CREF
- NREF

Restrictions on the PLC user data type

Observe the following restrictions when creating the PLC user data type:

- The user data type may have a maximum of 1000 elements.
- No user data type item may have the data type Time_Of_Day.
- The ARRAY data type is supported.
  The use of a user data type is not supported in an ARRAY.
- The user data type may have a maximum of 8 levels.

8.1.3 "Parameter set types" editor

Introduction

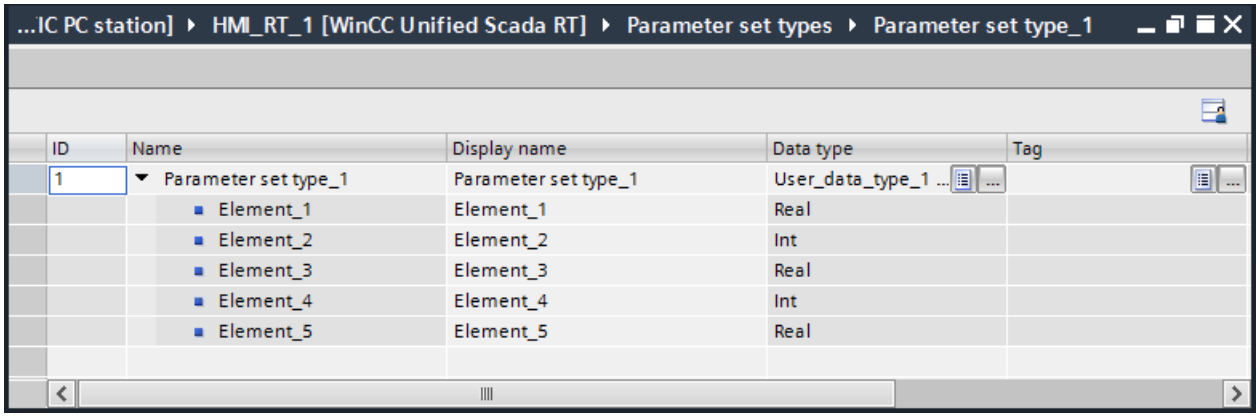
In the "Parameter set types" editor, you create a parameter set type with elements on the basis of an HMI or PLC application data type. In addition, you configure the properties of parameter set types and parameter set type items in the editor.

Note

Alternatively create the parameter set type items on the basis of a user data type in the Inspector window. In addition, you configure the properties of parameter set types and parameter set type items also alternatively in the Inspector window.

Structure of the "Parameter set types" editor

The "Parameter set types" editor is a tabular editor. The editor always contains only a single parameter set type and, if applicable, its elements. To view hidden columns, activate the column titles using the shortcut menu.



Properties of parameter set types

In the "Parameter set types" editor, you can configure the following properties:

Property	Description
ID	Number of a parameter set type. The ID uniquely identifies a parameter set type within the HMI device. The ID appears in the parameter set control in runtime.
Name	Name of a parameter set type. The name uniquely identifies a parameter set type within the HMI device.
Display name	Display name of a parameter set type. The display name appears in the parameter set control in runtime. You can configure display names in multiple languages. The property is optional. If you do not set a display name, the value from the "Name" property appears in the parameter set control in runtime.
Data type	Enabled HMI or PLC user data type with which you define the structure of a parameter set type.

Property	Description
Tag	External HMI tag of the data type HMI or PLC user data type. In runtime you transfer parameter sets between HMI device and PLC via the HMI tag.
Edit tag	Local session HMI tag used to manage the values of a parameter set in a screen. Edit tags can be read from or written to the PLC. The HMI tag must not contain any information about the range (Upper 2, Lower 2). The property is optional.
Parameter ID	Control tag with numerical data type. The control tag is used to define an ID of a parameter set which is the target of one of the following control jobs in runtime: • Control job with job ID "6": Reading a parameter set from the PLC and storing it in the parameter set memory. • Control job with job ID "7": Loading a parameter set from the parameter set memory and writing it to the PLC. • Control job with job ID "8": Deleting a parameter set from the parameter set memory. The property is optional.
Job ID	Control tag with numerical data type. The control tag is used to define a control job which is applied to a parameter set in runtime. In runtime, you can apply the following control jobs to a parameter set: • Control job with job ID "6": Reading a parameter set from the PLC and storing it in the parameter set memory. • Control job with job ID "7": Loading a parameter set from the parameter set memory and writing it to the PLC. • Control job with job ID "8": Deleting a parameter set from the parameter set memory. The property is optional.
Author	Author of a parameter set type. The property is optional. By default, the property is pre-assigned with the logged-on Windows user. By default, the column is hidden.
Version	Version of a parameter set type. The property is optional. By default, the property is pre-assigned with the date and time of creation of the parameter set type. By default, the column is hidden.
Storage medium	For Unified PC, the storage medium is internal. The parameter set type is saved in the system default directory. For Unified Comfort Panel, you choose between the internal storage medium and various external storage media.
Memory folder	Internal storage medium: System standard folder in runtime, in which the parameter set memory is located. The folder refers to the folder of the runtime project. The property is write-protected. External storage medium: Freely selectable memory folder.

Properties of parameter set type items

In the "Parameter set types" editor, you can configure the following properties for parameter set type items:

Property	Description
Name	Name of a parameter set type item. The name uniquely identifies a parameter set type item. The name is write-protected and identical to the name of the corresponding user data type element.
Display name	Display name of a parameter set type item and a corresponding parameter in a parameter set. The display name appears in the table of the parameter set control in runtime. You can configure display names in multiple languages. The property is pre-assigned with the value from the "Name" property.
Data type	Data type of a parameter set type item and a corresponding parameter in a parameter set. The name is write-protected and identical to the data type of the corresponding user data type element.
Start value	Start value of a parameter set type item. The start value is used to pre-assign a corresponding parameter in a newly created parameter set in runtime. If you have not set a start value in a user data type element with numerical data type or bit sequence data type, the corresponding parameter set type item receives "0" as the start value. When parameter set type items with the data type ARRAY are used, only the start value for the items of the array can be defined. The property is optional for parameter set type items with string data types.
Minimum value	Minimum permissible value of a parameter set type item and a corresponding parameter in a parameter set. The minimum value of a parameter set type item may not be below the minimum value of the data type of the parameter set type item. When parameter set type items with the data type ARRAY are used, only the minimum value for the items of the respective lowest level can be defined. The property is optional and is disabled for parameter set type items with string data types and bit sequence data types.
Maximum value	Maximum permissible value of a parameter set type item and a corresponding parameter in a parameter set. The maximum value of a parameter set type item may not be above the maximum value of the data type of the parameter set type item. When parameter set type items with the data type ARRAY are used, only the maximum value for the elements of the respective lowest level can be defined. The property is optional and is disabled for parameter set type items with string data types and bit sequence data types.

Property	Description
Value required	If the check box of the property "Value required" is selected in a parameter set type item, a corresponding parameter must have a value in a parameter set. Otherwise, a corresponding parameter must have no value in a parameter set. The check box of the property is selected by default for parameter set type items with numerical data types. In this case, you cannot clear the check box. The check box of the property is cleared by default for parameter set type items with string data types. In this case, however, you can select the check box if required. When parameter set type items with the data type ARRAY are used, only the check box for the items of the respective lowest level can be defined.
Unit of measure	Unit of measure of a parameter set type item and a corresponding parameter in a parameter set. The unit of measure appears in the table of the parameter set control in runtime. When parameter set type items with the data type ARRAY are used, only the unit of measurement for the items of the respective lowest level can be defined. The property is optional.

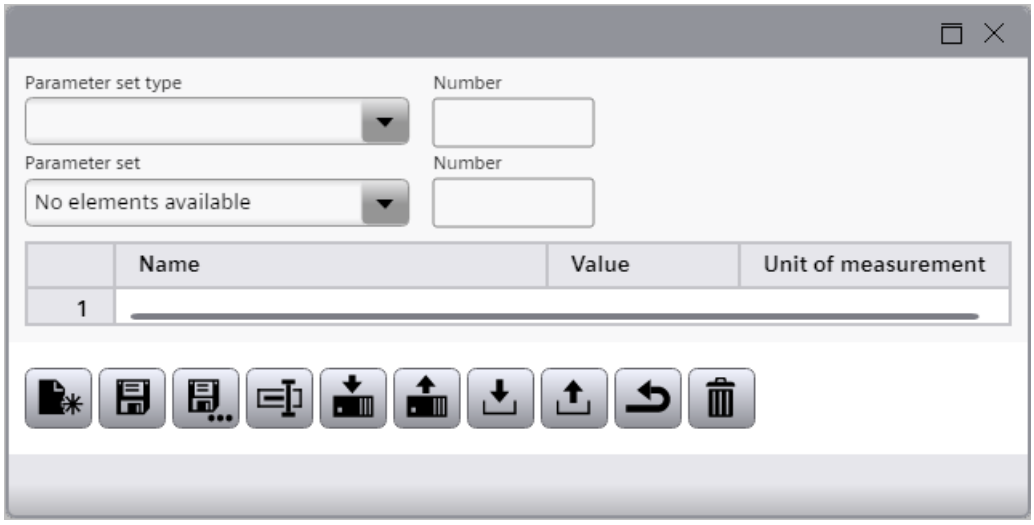
8.1.4 Parameter set control

Use

You can use the "Parameter set control" object to display and manage parameter sets in runtime and to exchange them with the controller.



Layout

You can change the settings for the position, geometry, style, color, and font of the object in the Inspector window. Under "Miscellaneous", adapt the following properties:

- "Editing mode": Defines the activation status of the toolbar buttons.
- "Toolbar": Defines the buttons of the parameter set control.
- "Information bar": Specifies the representation of the information bar.
- "Parameter view": Specifies the display of the parameter table in the object.

Using a parameter set type

If you only want to use a particular parameter set type with its parameter sets in runtime, select the desired parameter set type under "Properties > General > Fixed parameter set type".

Configuring the time zone

To configure the time zone, follow these steps:

Under "Properties > Miscellaneous > Time zone", set the desired time zone by entering a numerical value.

The numerical value stands for a time zone, for example:

- "-1" stands for UTC-1h (Central European Time, standard time)
- "1" stands for UTC-12h (International Date Line West)
- "2" stands for UTC-11h (Hawaii)

Defining the editing mode

To specify the editing mode and to enable or disable the buttons, follow these steps:

Under "Properties > Miscellaneous > Editing mode", configure the activation status of the toolbar buttons "Create", "Save", "Save as", "Rename" and "Delete". These toolbar buttons are used to edit parameter sets.

You can select between the following settings:

- "None": Deactivates all buttons.
- "Update": Activates the "Save" and "Rename" buttons.
- "Create": Activates the "Create" and "Save as" buttons.
- "Delete": Activates the "Delete" button.

Configuring reordering of the columns

Configure whether operators can reorder the table columns in runtime using drag-and-drop. More information is available in the section Configuring reordering of the columns (Page 392).

Dynamization of graphic properties with tags or scripts

You can dynamize the following properties containing a graphic with a tag or with a script:

- Graphic
- Icon

Configuring the information bar

To configure the information bar, follow these steps:

1. Configure the general properties of the information bar, such as the font and background color, under "Properties > Miscellaneous > Information bar".
2. To adjust the height of the "Status text" element, specify the height under "Properties > Miscellaneous > Information bar > Elements > [0] Element".

The "Status Text" element is the only status line element of the parameter set control. Status messages are displayed in this element in runtime.

Toolbar

You can define the buttons of the parameter set control in runtime and their operator authorizations in the Inspector window under "Properties > Miscellaneous > Toolbar > Elements". By default, all buttons are displayed in the toolbar. To hide specific buttons, deactivate the "Visibility" property in the settings of the corresponding button.

"Toolbar": Defines the buttons of the parameter set control.

Note

Visibility of buttons in runtime

Buttons for which the "Visibility" option is deactivated during the configuration cannot be made visible again in runtime by a script. After loading into a device, the array of available items contains only those buttons that are configured as visible.

The following buttons are available for the parameter set control:

	Button	Function
	Create	Creates a new parameter set.
	Save	Saves a parameter set.
	Save as	Saves an existing parameter set under a new name and new ID.
	Rename	Renames the selected parameter set.
	Write to PLC	Writes the values of the selected parameter set to the PLC.
	Read from PLC	Writes the values of the selected parameter set from the PLC.
	Import	Imports parameter sets from a "*.tsv" file.
	Export	Exports parameter sets to a "*.tsv" file.
	Cancel	Cancels the process.
	Delete	Deletes the selected parameter set.

Note

A "*.tsv" file is a text file that uses the tabulator as a list separator.

8.2 Configuring parameter sets

8.2.1 Creating a parameter set type with elements via an HMI user data type

Introduction

You have created an HMI user data type with elements. You can assign the user data type to one or more parameter set types and this way apply the elements of the user data type for the parameter set type or types. A parameter set type with elements determines the structure that is used for parameter sets on a machine. Because you do not have to create the elements of the user data type again separately for the parameter set type(s), efficiency and reusability are a given.

Note

Observe the following restrictions when creating the HMI user data type:

- The user data type may have a maximum of 1000 elements.
- No user data type item may have the data type Textref, Time_Of_Day, or Raw.

Note

You can also create a parameter set type with elements via a PLC user data type that is created in a SIMATIC S7-1200/1500 control system.

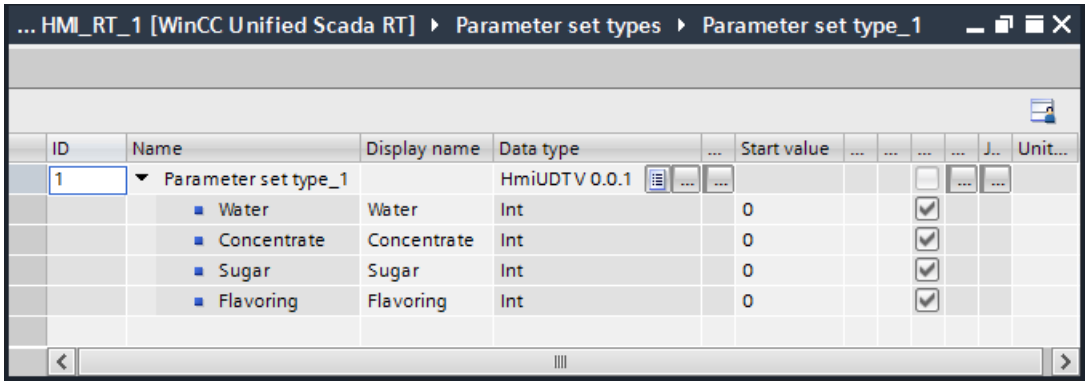
Requirement

- An HMI device has been created.
- An HMI user data type with a user data type element is created.
- The communication driver SIMATIC S7-300/400 or SIMATIC S7-1200/1500 is set for the HMI user data type.
- The HMI user data type is released.

Creating a parameter set type with elements via an HMI user data type

Proceed as follows to create a parameter set type with elements via an HMI user data type:

1. Open the "Parameter set types" folder in the project tree of the HMI device.
2. Double-click "Add new parameter set type".
   A parameter set type with unique standard name and unique ID is created. The "Parameter set types" editor opens.
3. Select the released HMI user data type in the "Data type" column in the "Parameter set types" editor.
   In the editor, parameter set elements which are based on the user data type elements are added to the parameter set type.



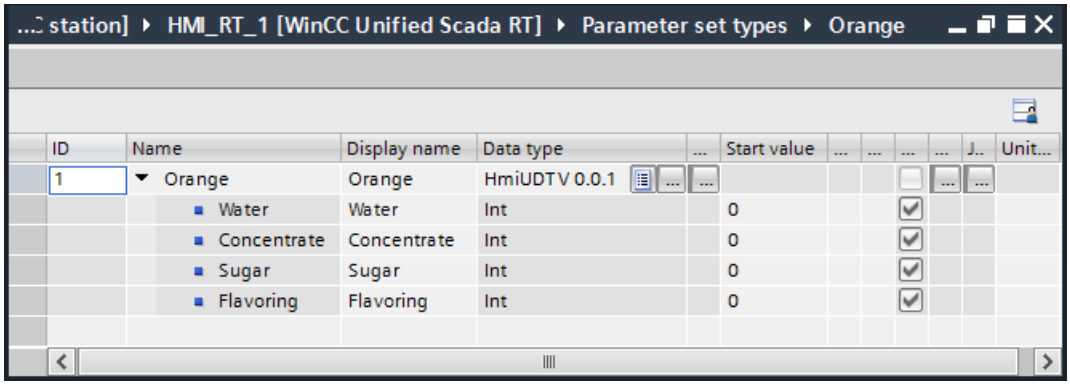
Note

The parameter set type items have the same name and data type as the user data type elements. The name and data type of the parameter set type items are write-protected in the editor.

Configuring a parameter set type

To configure the created parameter set type, proceed as follows:

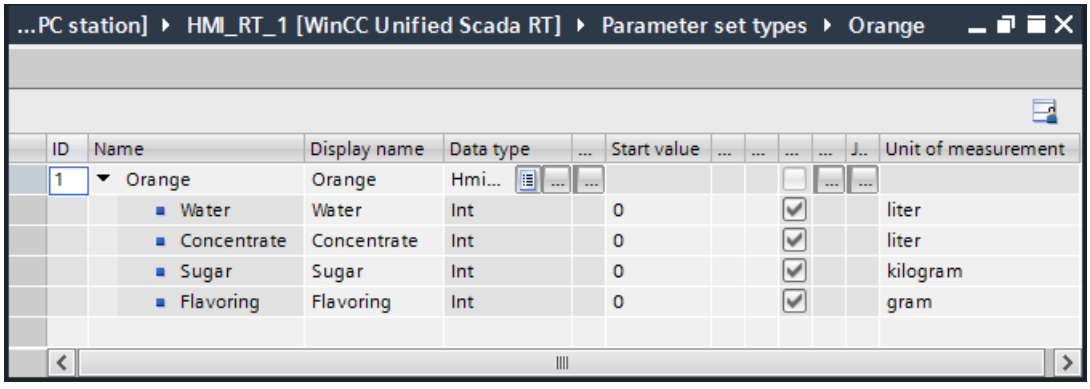
1. Enter a meaningful name for the parameter set type in the "Name" column in the "Parameter set types" editor
   The name uniquely identifies the parameter set type within the HMI device.
2. Enter a language-dependent name for the parameter set type in the "Display name" column.
   The display name appears in the parameter set control in runtime.
3. If required, enter an own number for the parameter set type in the "ID" column.
   The ID uniquely identifies the parameter set type within the HMI device. The ID appears in the parameter set control in runtime.



Configuring parameter set type items

To configure the created parameter set type items, proceed as follows:

1. In the "Display name" column of the "Parameter set types" editor configure a language-dependent name for the parameter set type items and corresponding parameters in a parameter set.
   The display name appears in the table of the parameter set control in runtime.
2. Configure a unit of measure In the "Unit of measure" column for parameter set type items and corresponding parameters in a parameter set.
   The unit of measure appears in the table of the parameter set control in runtime.
3. Configure a start value in the "Start value" column for parameter set type items.
   The start value is used to pre-assign the corresponding parameters in a newly created parameter set in runtime.



Result

You have created a parameter set type with elements via an HMI user data type.

Changing a parameter set type with elements (Page 870)

Configuring the parameter set view (Page 880)

Assigning a tag of the data type HMI user data type to a parameter set type (Page 873)

8.2.2 Creating a parameter set type with elements via a PLC user data type

Introduction

You have created a PLC user data type with elements. You can assign the user data type to one or more parameter set types and this way apply the elements of the user data type for the parameter set type or types. A parameter set type with elements determines the structure that is used for parameter sets on a machine. Because you do not have to create the elements of the user data type again separately for the parameter set type(s), efficiency and reusability are a given.

Note

Observe the following restrictions when creating the PLC user data type:

- The user data type may have a maximum of 1000 elements.
- No user data type item may have the data type Time_Of_Day.
- The ARRAY data type is supported.
  The use of a user data type is not supported in an ARRAY.
  The user data type may have a maximum of 8 levels.

Note

You can also create a parameter set type with elements via an HMI user data type for which the SIMATIC S7-300/400 or SIMATIC S7-1200/1500 communication driver is set.

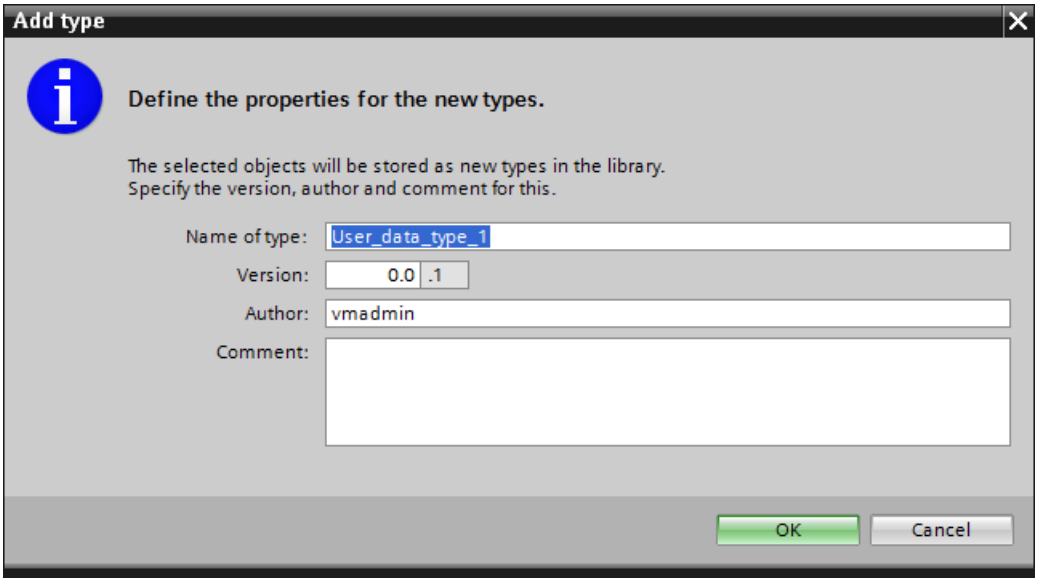
Requirement

- The HMI device has been created.
- A PLC user data type with user data type elements is created in a SIMATIC S7-1200/1500 PLC.
- The "Libraries" task card is open.
- The project library is open.

Adding a PLC user data type to the project library

To add a PLC user data type to the project library, follow these steps:

1. Open the PLC's folder in the project tree.
2. Open the folder "PLC data types" in the folder of the controller.
   The created PLC user data type is displayed in the "PLC data types" folder.
3. Move the PLC user data type to the "Types" folder in the project library.
   The "Add type" dialog opens.



4. Make the following settings in the dialog:
   - Enter a unique name for the PLC user data type under "Type name".
   - Enter a valid version number for the PLC user data type under "Version".
   - Enter the author responsible for the PLC user data type under "Author".
   - Enter a comment for the PLC user data type under "Comment".
5. Click the "OK" button.
   The PLC user data type is added with a released version to the "Types" folder in the project library.

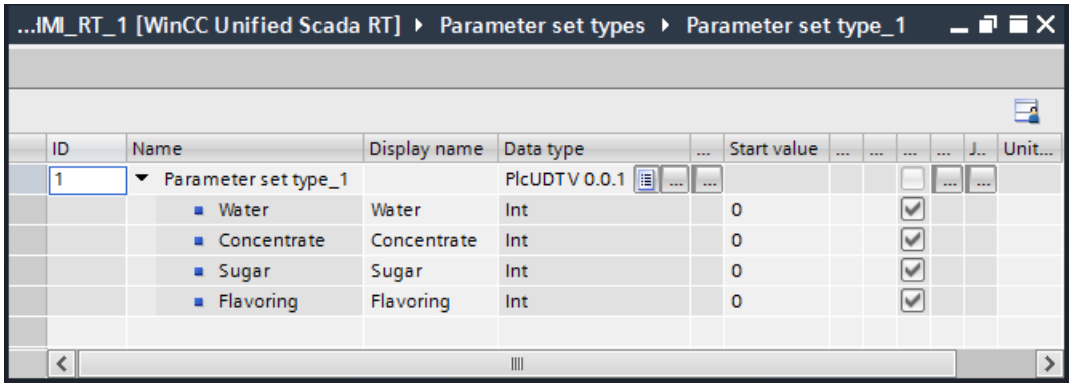
Note

When you use other user data types within the user data type that are not yet available in the library, these user data types are also applied to the library.

Creating a parameter set type with elements via a PLC user data type

Proceed as follows to create a user data type with elements via a PLC user data type:

1. Open the "Parameter set types" folder in the project tree.
2. Double-click "Add new parameter set type".
   A parameter set type with unique standard name and unique ID is created. The "Parameter set types" editor opens.
3. Select the released PLC user data type in the "Data type" column in the "Parameter set types" editor.
   In the editor, parameter set elements which are based on the user data type elements are added to the parameter set type.



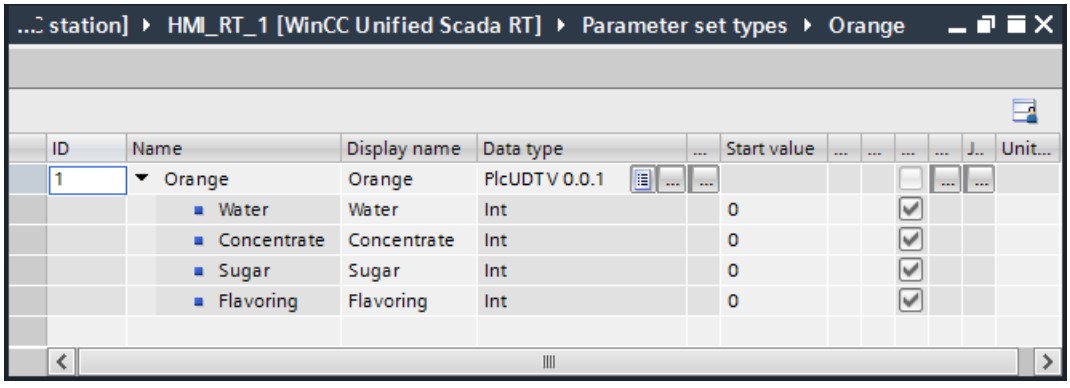
Note

The parameter set type items have the same name and data type as the user data type elements. The name and data type of the parameter set type items are write-protected in the editor.

Configuring a parameter set type

To configure the created parameter set type, proceed as follows:

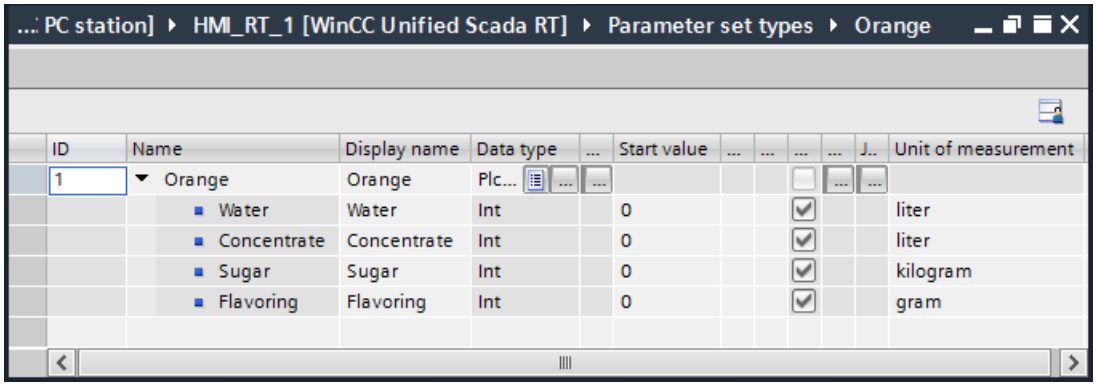
1. Enter a meaningful name for the parameter set type in the "Name" column in the "Parameter set types" editor
   The name uniquely identifies the parameter set type within the HMI device.
2. Enter a language-dependent name for the parameter set type in the "Display name" column.
   The display name appears in the parameter set control in runtime.
3. If required, enter an own number for the parameter set type in the "ID" column.
   The ID uniquely identifies the parameter set type within the HMI device. The ID appears in the parameter set control in runtime.



Configuring parameter set type items

To configure the created parameter set type items, proceed as follows:

1. In the "Display name" column of the "Parameter set types" editor configure a language-dependent name for the parameter set type items and corresponding parameters in a parameter set.
   The display name appears in the table of the parameter set control in runtime.
2. Configure a unit of measure In the "Unit of measure" column for parameter set type items and corresponding parameters in a parameter set.
   The unit of measure appears in the table of the parameter set control in runtime.
3. Configure a start value in the "Start value" column for parameter set type items.
   The start value is used to pre-assign the corresponding parameters in a newly created parameter set in runtime.



Result

You have created a parameter set type with elements via a PLC user data type.

8.2.3 Changing a parameter set type with elements

Introduction

You have created one or more parameter set types with elements via a user data type. A parameter set type with elements determines the structure that is used for parameter sets on a machine. You have the following options to change parameter set types with elements:

- You can change one or more parameter set types automatically via a new version of the user data type.
- You can change a parameter set type manually via a new version of the user data type.
- You can change a parameter set type via another user data type.

Requirement

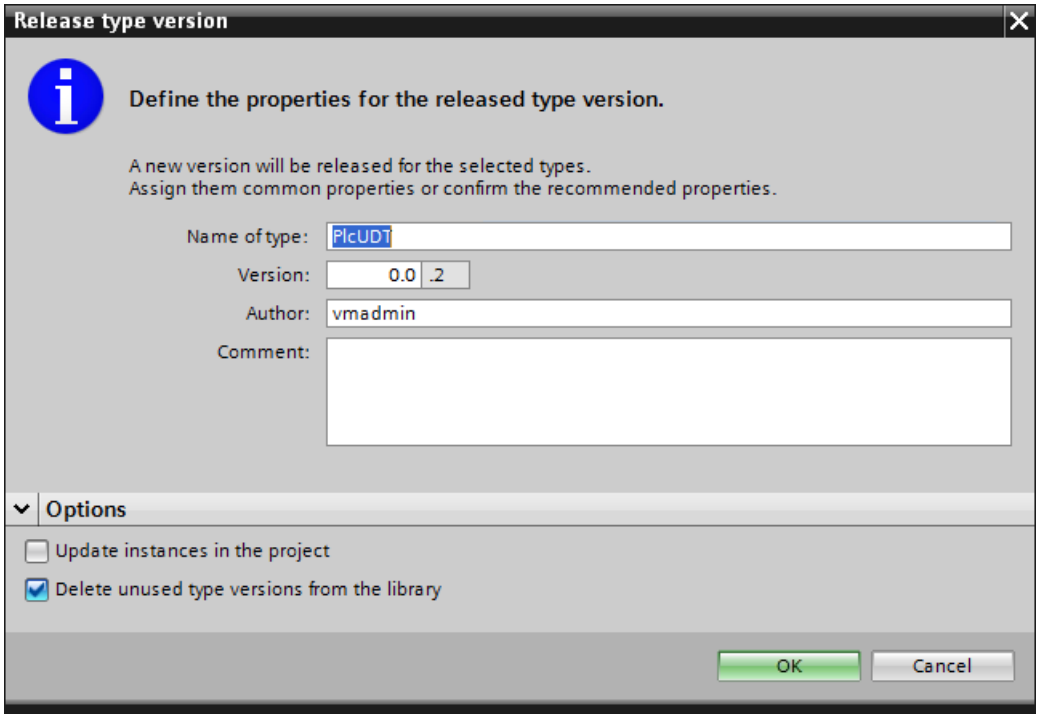
- One or more parameter set types with elements are created on the basis of an HMI or PLC user data type.

Changing parameter set types automatically via a new version of the user data type

To change parameter set types with elements automatically via a new version of the user data type, follow these steps:

1. Select the released user data type in the project library.
2. Select "Edit type" in the shortcut menu.
   In the case of an HMI user data type the "HMI user data types" editor is opened and a new user data type version with the "In process" status is generated in the project library. In the case of a PLC user data type the "Edit type" dialog is opened.
3. In the case of a PLC user data type click "OK" in the "Edit type" dialog.
   The "PLC data type" editor opens. A new user data type version with the "Testing" status is generated in the project library.
4. Change the user data type in the case of an HMI user data type in the "HMI user data types" editor and in the case of a PLC user data type in the "PLC data types" editor.

5. Select the new user data type version in the project library.
6. Select "Release version" in the shortcut menu.
   The "Release type version" dialog box opens.



7. If necessary, change the properties of the version:
   - Enter a unique name for the user data type in the "Type name" field.
   - Enter a valid version number for the version to be released in the "Version" field.
   - Under "Author" enter the editor of the version to be released.
   - Under "Comment" enter a comment on the version to be released.
8. If you want to revise the version management of the user data type, enable the "Delete unused type versions from the library".

9. To automatically change the parameter set type or types via the new user data type version, activate the option "Update instances in the project".
10. Click the "OK" button.
    The parameter set type or types are changed in the following way via the user data type version:
    - An element that you have not changed in the user data type, also remains in the parameter set type with all its settings.
    - An element that you have added new to the user data type is also added to the parameter set type.
    - The element that you have deleted from the user data type is also deleted from the parameter set type.
    - If you have changed the name of an element in the user data type, the parameter set type of the element's name is changed as well. All other properties of the element remain unchanged such as the start value or the display name.
    - If you have changed the data type of an element in the user data type, the parameter set type of the element's data type is changed as well. Other properties of the elements remain unchanged.

      Note

      An element whose data type you have changed is treated like a new element in runtime. Consequently the values of the element are deleted in the existing parameter sets and the start values are assigned as default to the element.

    - If you have changed a numerical data type of an element into a string data type in the user data type, the minimum and maximum values previously specified of the element are also removed.

Changing the parameter set type manually via a new version of the user data type

Proceed as follows to change a parameter set type with elements manually via a new version of the user data type:

1. Execute Steps 1 to 8 and 10 of the description above.
2. Open the "Parameter set types" folder in the project navigation.
3. Double-click a created parameter set type.
   The "Parameter set types" editor opens.
4. Select the new user data type version in the "Data type" column in the "Parameter set types" editor.
   The parameter set type is changed via the new user data type version as described in Step 10 of the above description.

Changing parameter set type via another user data type

Proceed as follows to change a parameter set type with elements manually via another user data type:

1. Open the "Parameter set types" folder in the project navigation.
2. Double-click a created parameter set type.
   The "Parameter set types" editor opens.
3. Select another released user data type in the "Data type" column in the "Parameter set types" editor.
   The structure of the parameter set type is created completely new in accordance with the structure of the other user data types.

Creating a parameter set type with elements via an HMI user data type (Page 863)

Creating a parameter set type with elements via a PLC user data type (Page 866)

8.2.4 Assigning a tag of the data type HMI user data type to a parameter set type

Introduction

To exchange parameter sets between an HMI device and PLC in runtime, assign an external HMI tag to a parameter set type created via an HMI user data type in the Engineering System. To this purpose the HMI tag uses the HMI user data type as the data type with which you created the parameter set type.

Note

You can also assign an external HMI tag to a parameter set type that was created via a PLC user data type. In doing so the HMI tag uses the PLC user data type as the data type with which you created the parameter set type.

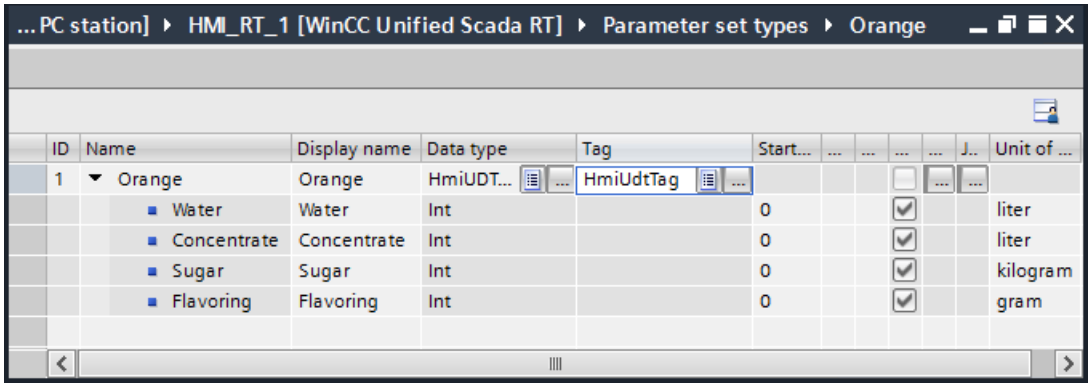
Requirement

- An HMI user data type is created in the HMI device.
- The SIMATIC S7-300/400 or SIMATIC S7 1200/1500 communication driver is set for the HMI user data type.
- User data type elements are added to the HMI user data type.
- The HMI user data type is released.
- A parameter set type with elements is created on the basis of the HMI user data type.
- An external HMI tag is created that uses the HMI user data type as the data type.

Procedure

To assign an external HMI tag of the data type HMI user data type to a parameter set type, proceed as follows:

1. Open the "Parameter set types" folder in the project tree.
2. Double-click the created parameter set type.
   The "Parameter set types" editor opens. The Inspector window opens.
3. Select the created HMI tag of the data type "HMI user data type" in the column "Tag" in the "Parameter set types" editor.



Result

You have assigned an external HMI tag of the data type "HMI user data type" to a parameter set type.

See also

Transferring and deleting parameter sets automatically (Page 876)

Transferring parameter sets (Page 897)

8.2.5 Assigning a tag of the data type "PLC user data type" to a parameter set type

Introduction

To exchange parameter sets between an HMI device and PLC in runtime, assign an external HMI tag to a parameter set type created via a PLC user data type in the Engineering System. In doing so the HMI tag uses the PLC user data type as the data type with which you created the parameter set type.

Note

You can also assign an external HMI tag to a parameter set type which was created via a HMI user data type. To this purpose the HMI tag uses the HMI user data type as the data type with which you created the parameter set type.

Requirement

- An HMI device has been created.
- A PLC user data type with user data type items is created in a SIMATIC S7-1200/1500 PLC.
- A parameter set type with elements is created on the basis of the PLC user data type.
- An external HMI tag is created that uses the PLC user data type as the data type.

Note

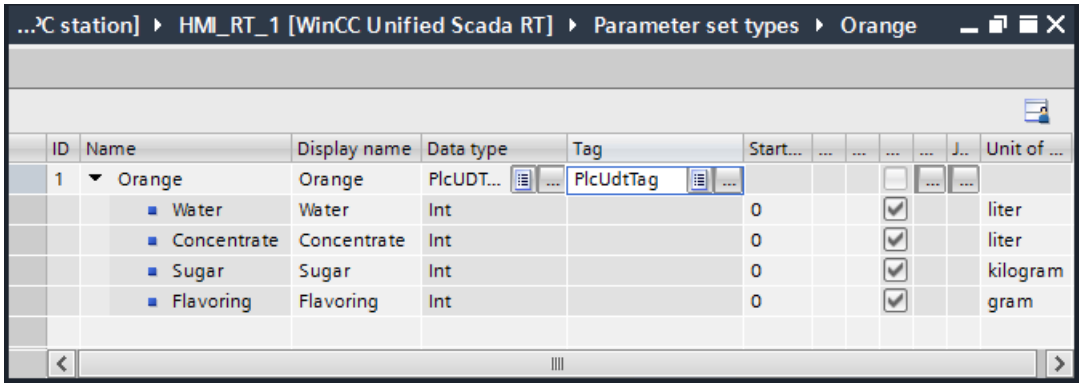
You have the following possibilities to create an external HMI tag of the data type "PLC user data type":

- Assign a PLC tag to an HMI tag, whereby the PLC tag is based on a PLC user data type.
- Assign a PLC data block that is based on a PLC user data type to an HMI tag.
- Assign a PLC data block element that is based on a PLC user data type to an HMI tag.

Procedure

To assign an external HMI tag of the data type "PLC user data type" to a parameter set, follow these steps:

1. Open the "Parameter set types" folder in the project tree.
2. Double-click the created parameter set type.
   The "Parameter set types" editor opens. The Inspector window opens.
3. Select the created HMI tag of the data type "PLC user data type" in the "Tag" column in the "Parameter set types" editor.



Result

You have assigned an external HMI tag of the data type "PLC user data type" to a parameter set type.

See also

Creating a parameter set type with elements via a PLC user data type (Page 866)

Transferring and deleting parameter sets automatically (Page 876)

Transferring parameter sets (Page 897)

8.2.6 Transferring and deleting parameter sets automatically

Introduction

In the Engineering System you assign control tags to a parameter set type with elements. The control tags serve to automatically transfer or delete parameter sets between an HMI device and PLC in runtime. In the process either the control program or the HMI device controls the automatic transfer or deleting via control requests.

Requirement

- A parameter set type with elements is created on the basis of an HMI or PLC user data type.
- An external HMI tag that uses the HMI or PLC user data type as the data type is assigned to the parameter set type.
- Two control tags with numerical data type are created, for example, "ParameterSetIDTag" and "JobIDTag".

Note

If you want to automatically transfer or delete parameter sets by means of the control program, create 2 external control tags. If you want to automatically transfer or delete parameter sets by means of the HMI device, however, create 2 internal control tags.

Note

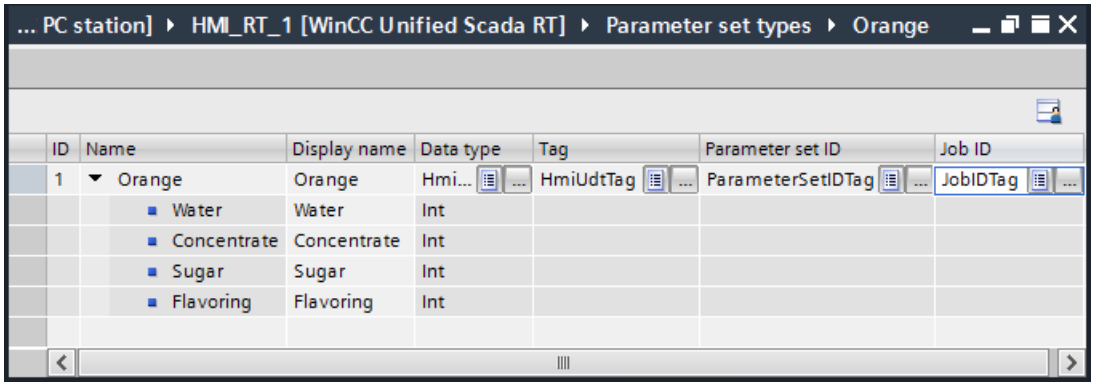
The control tags must use a signed data type.

- The "Toolbox" task card is open.

Assigning control tags to a parameter set type with elements

Proceed as follows to assign control tags to a parameter set type with elements in the Engineering System:

1. Open the "Parameter set types" folder in the project tree.
2. Double-click the created parameter set type.
   The "Parameter set types" editor opens. The Inspector window opens.
3. Select the control tag "ParameterSetIDTag" in the "Parameter set ID" column in the "Parameter set types" editor.
4. Select the "JobIDTag" control tag in the "Job ID" column.



Note

Please observe each of the following rules to not obtain any errors when compiling the project:

- If you set a control tag in the "Parameter set ID" column of the "Parameter set types" editor, you also set a control tag in the "Job ID" column.
- Do not set the same control tag in the columns "Parameter set ID" and "Job ID" in the "Parameter set types" editor.
- If you assign a control tag to a parameter set type in the "Parameter set types" editor, do not assign the same control tag to another parameter set type.

Reading a parameter set from the PLC

Proceed as follows to automatically read a parameter set from the PLC and store it in the parameter set memory in runtime:

1. Automatically set the control tag "ParameterSetIDTag" to an ID of an existing parameter set.
2. Automatically set the control tag "JobIDTag" to the control job ID "6".
   The control job is executed. In the case of success the control tag "JobIDTag" is set to the value "0", otherwise to the value "-1".

Note

If you set a non-existing parameter set ID and the control job ID to "6", a new parameter set is created with the parameter set values available in the PLC.

Writing a parameter set to the PLC

To automatically load a parameter set from the parameter set memory in runtime and write it into the PLC, follow these steps:

1. Automatically set the control tag "ParameterSetIDTag" to an ID of an existing parameter set.
2. Set the control tag "JobIDTag" automatically to the control job ID "7".
   The control job is executed. In the case of success the control tag "JobIDTag" is set to the value "0", otherwise to the value "-1".

Deleting a parameter set

To automatically delete a parameter set from the parameter set memory in runtime, follow these steps:

1. Automatically set the control tag "ParameterSetIDTag" to an ID of an existing parameter set.
2. Set the control tag "JobIDTag" automatically to the control job ID "8".
   The control job is executed. In the case of success the control tag "JobIDTag" is set to the value "0", otherwise to the value "-1".

Result

You have assigned control tags to a parameter set type with items in the engineering system and automatically transferred and deleted parameter sets between the HMI device and PLC via the control tags in runtime.

Transferring parameter sets via scripts (Page 879)

Managing parameter sets (Page 885)

Transferring parameter sets (Page 897)

8.2.7 Transferring parameter sets via scripts

Introduction

In runtime, you can transfer parameter sets via local scripts between the HMI device and PLC. To do so configure the local scripts in the Engineering Systems at events of screen objects or at the "Update" event of tasks.

Note

You can also use system functions in the function list or in scripts to transfer parameter sets between HMI device and PLC:

- With the system function "ReadAndSaveParameterSet" or "ReadAndSaveParameterSet", a parameter set is read from the PLC and saved in the parameter set memory.
- With the system function "LoadAndWriteParameterSet" or "LoadAndWriteParameterSet", a parameter set is loaded from the parameter set memory and written to the PLC.

Code examples for transferring parameter sets

To load a parameter set from the parameter set memory and write it into the PLC, use the following code example:

```
let ps1 = HMIRuntime.ParameterSetTypes('MyPST1').ParameterSets(1);
ps1.LoadAndWrite(true);
```

To read a parameter set from the PLC and store it in the parameter set memory, use the following code example:

```
let ps1 = HMIRuntime.ParameterSetTypes('MyPST1').ParameterSets(1);
ps1.ReadAndSave(HMIRuntime.ParameterSetTypes.Enums.hmiOverwrite.Disabled, true);
```

	**Tip for an efficient procedure**
You can find the code examples in the shortcut menu of the "Scripts" editor under "Snippets > HMI Runtime > Parameter Set".

8.2.8 Configuring the parameter set view

Introduction

To display, manage and exchange parameter sets with the PLC in runtime, use a parameter set control. You configure a parameter set control in the engineering system.

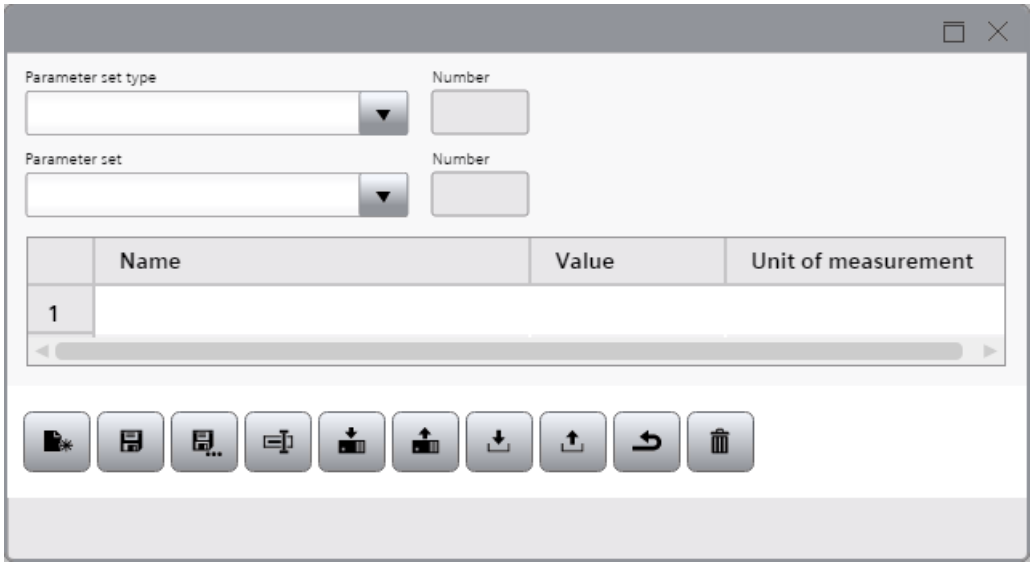
Requirement

- At least one parameter set type with elements has been created.
- A screen is open.
- The "Toolbox" task card is open.

Procedure

To configure a parameter set control, proceed as follows:

1. Insert the "Parameter set control" object from the "Tools" task card into the screen.



2. Set the desired height, width and position for the parameter set control in the Inspector window under "Properties > Size and Position".
3. If you only want to use a particular parameter set type with its parameter sets in runtime, select the desired parameter set type under "Properties > General > Fixed parameter set type".

   Note

   The parameter set type is only visible in the parameter set control in runtime when the extended style is used in the runtime settings under "General > Screen".

   Note

   A tag that you use as a dynamization tag of the fixed parameter set type in the parameter set control must have the data type "String" or "WString".

4. Change the labels of the fields, if required.
5. If required, change the display of the parameter table under "Properties > Miscellaneous > Parameter view".

   Note

   To change the visibility of columns, click on "Columns" under "Properties > Miscellaneous > Parameter view". In the extended parameter control display, you can enable or disable the visibility of individual columns under "Visibility". Changing the visibility via the preset value in the "Blocks" property is not supported.

6. In "Properties > Miscellaneous > Editing mode", configure the activation status of the toolbar buttons "Create", "Save", "Save as", "Rename" and "Delete" as required.
   These toolbar buttons are used to edit parameter sets.

7. If you want to hide specific buttons in the toolbar, deactivate the "Visibility" property under "Properties > Miscellaneous > Toolbar > Elements" in the settings of the corresponding button.
8. Under "Properties > Miscellaneous > Time zone", change the time zone as required by entering a different numerical value.
   The numerical value stands for a time zone, for example:
   - "-1" stands for UTC-1h (Central European Time, standard time)
   - "1" stands for UTC-12h (International Date Line West)
   - "2" stands for UTC-11h (Hawaii)

8.2.9 Assigning an edit tag to a parameter set item

Introduction

To adjust the values of the parameter sets in the HMI device and the PLC in runtime, you can assign a local session HMI tag to a parameter set type in the Engineering System.

The edit tag enables you to manage the values of a parameter set in a screen. To do this, you use system functions or scripts to transfer values between the HMI device and the PLC.

Requirement

- An HMI device has been created.
- An HMI or PLC user data type with user data type items is created in a SIMATIC S7-1200/1500 PLC.
- A parameter set type with parameter set items based on the HMI or PLC user data type is created.
- A local session HMI tag with the same number of items and the same data type is created. The HMI tag must not contain any information about the range (Upper 2, Lower 2).

Procedure

	**Tip for an efficient procedure**
To create the same structure for the edit tag as for the parameter set tag, copy the corresponding data type in the library. Change the connection to "Internal connection" in the copy. In this way, you make the data type available for a local session edit tag.	

To assign a local session HMI tag to a parameter set, follow these steps:

1. Open the "Parameter set types" folder in the project tree.
2. Double-click the created parameter set type.
   The "Parameter set types" editor opens.
3. In the "Parameter set types" editor, select a local session HMI tag in the "Edit tag" column.

Result

You have assigned a local session HMI tag to a parameter set type.

8.2.10 Configuring parameter sets without parameter set control

Introduction

In one or more screens, you configure an individual input mask as an extension or replacement of the parameter set control. You create the input mask from I/O fields and other display and operating objects. System functions or scripts are used to configure the parameter set functionality, such as saving parameter sets.

Use

Configuring directly in screens allows you to display and manage parameter sets according to your needs. You can spread parameter sets containing lots of entries across several screens to create a better overview. For example, you can configure a separate screen with the corresponding input masks for the parameter sets for each area of the plant.

You can visually map your machine in a screen using graphical screen objects. This enables you to display parameter settings clearly by positioning I/O fields directly next to machine elements such as axes or guide rails. This is how you produce a direct relationship between the values and the machine.

You configure system functions and scripts with which you call up system information, create and manage parameter sets or adapt active parameter sets via edit tags.

Requirement

- The parameter set type is created.
- The "Screens" editor is open.

Procedure

To configure a screen with which you can display and manage parameter sets, follow these steps:

1. Configure a screen and create the I/O fields for the recipe input mask in it.
   You can create multiple screens to suit the size and complexity of the recipe.
2. Configure the I/O fields with the tags that you have connected to the parameter set items.
3. Configure I/O fields for the parameter set type and parameter set selection.
4. Configure the system functions for editing parameter sets on the configured operator controls.
   Operator controls are configured buttons in the screen or function keys on the HMI device. In the "Scripts" editor, you will find snippets with the system functions under "HMI Runtime > Parameter set".

Alternative procedure

1. Configure a parameter set control as a selection list for parameter set types and parameter sets.
2. Hide the buttons that are not required in the parameter set control.
3. Configure the system functions for editing parameter sets on the configured operator controls.

Result

A screen that offers the possibility to display and manage parameter sets has been created.

With the use of scripts and the use of system functions, you have the following possibilities:

- Reading the name of a parameter set
- Reading the name of a type of parameter set
- Reading a selected parameter set
- Writing a parameter set to the PLC
- Trigger event on parameter set
- Display of system information of the status display in a separate screen

8.3 Using parameter sets in runtime

8.3.1 Managing parameter sets

Introduction

You manage parameter sets for different productions in a parameter set control in runtime. You have the following options for managing parameter sets:

- Create new parameter sets
- Copy parameter sets
- Change parameter sets
- Delete parameter sets
- Rename parameter sets

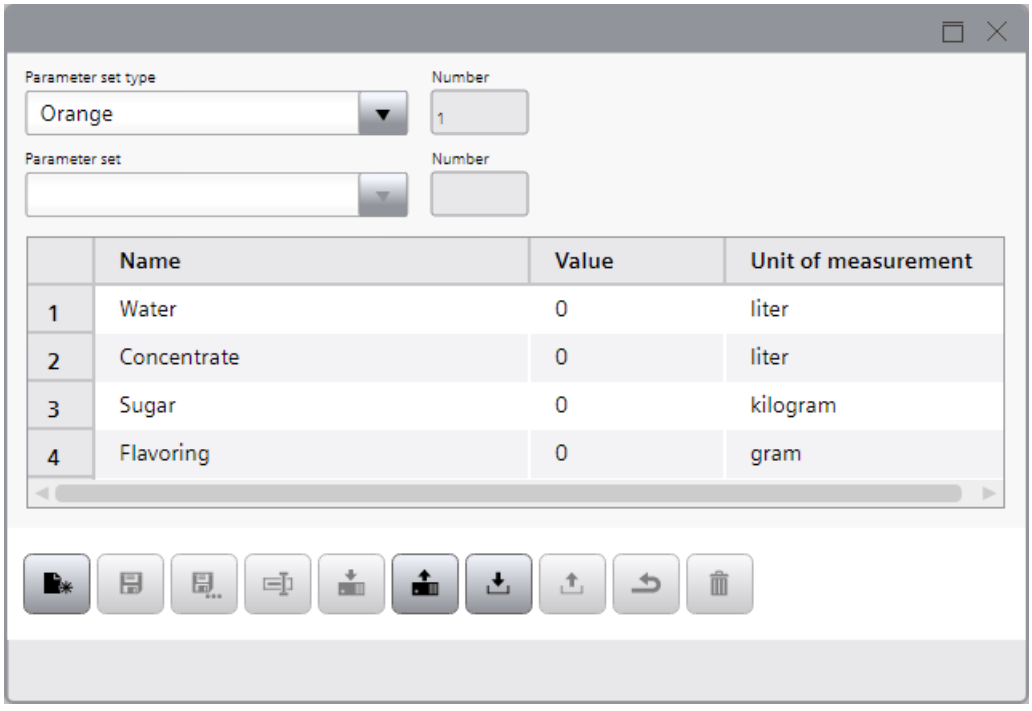
Requirement

- At least one parameter set type with elements has been created.
- A parameter set control has been configured.
- The project is in runtime.

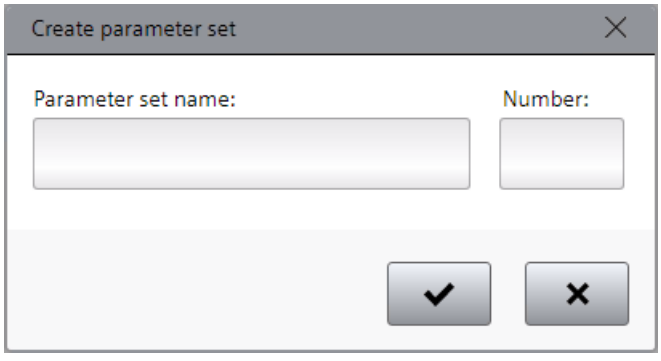
Creating a new parameter set

To create a new parameter set, proceed as follows:

1. In the "Parameter set type" field, select the parameter set type for which you want to create a new parameter set.
   The elements of the selected parameter set type are displayed in the table.

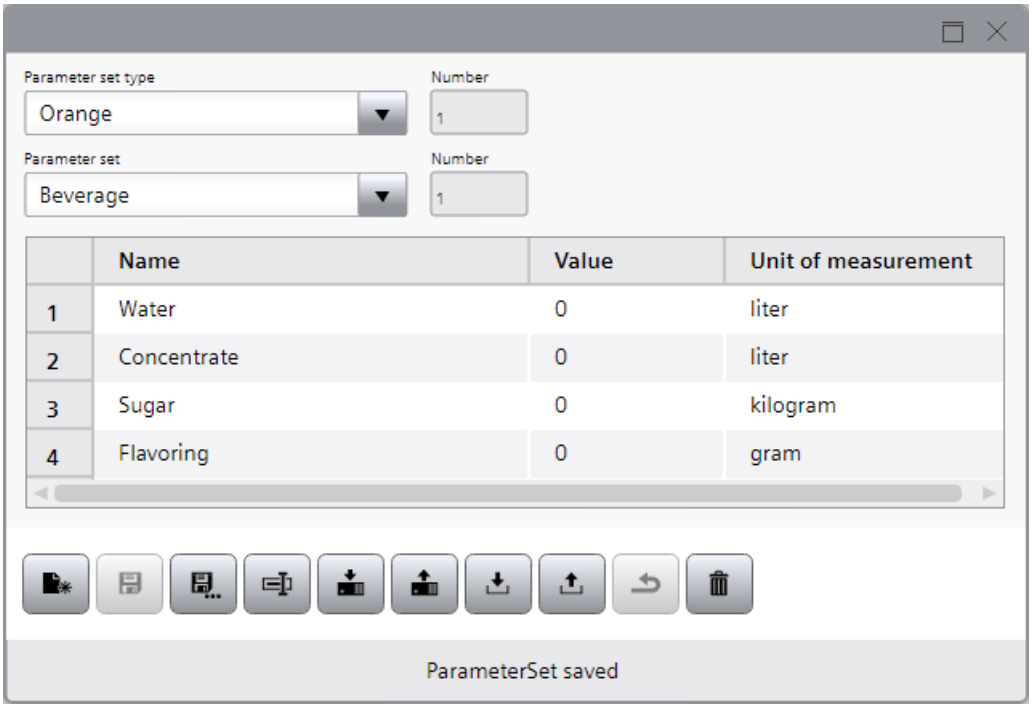


2. Click the "Create" button.
   The "Create parameter set" dialog opens.



3. Enter a unique parameter set name under "Parameter set name".
4. Enter a unique parameter set ID under "Number".

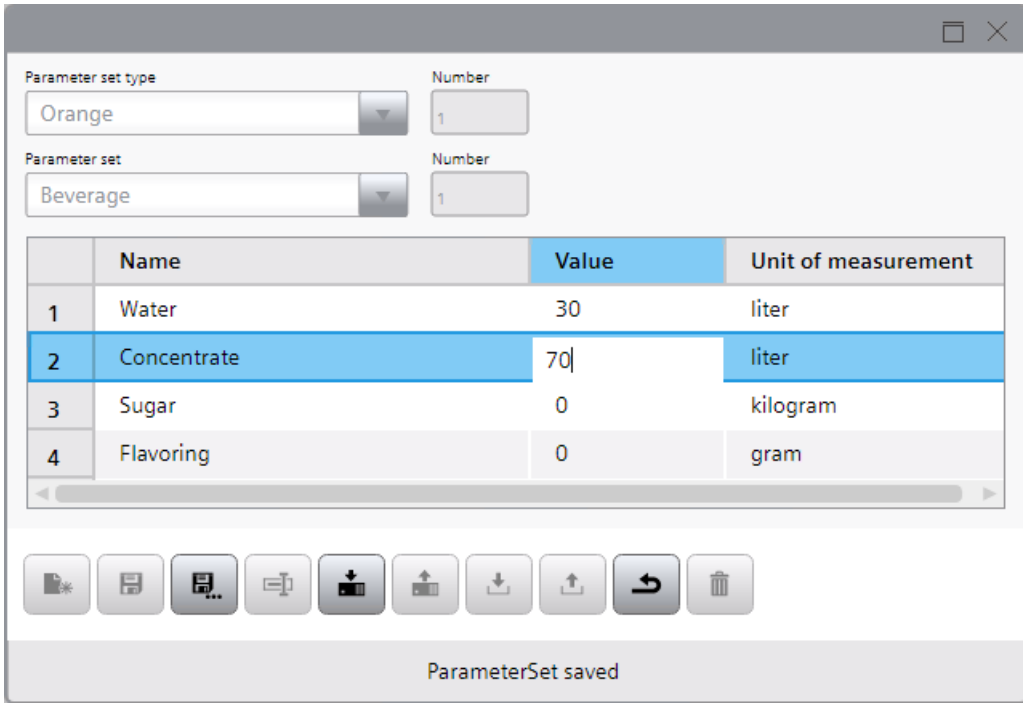
5. Confirm the dialog.
   A new parameter set has been created and saved. The parameters of the new parameter set are displayed in the table. The parameters have the same values in the columns "Name" and "Unit of measurement" as the elements of the previously selected parameter set type. The defined start values are applied for the "Value" column. If you have not defined start values, the corresponding default values are used.



Note

If you do not make any entries in the "Create parameter set" dialog and confirm the dialog, a new parameter set is also created and saved. In this case the new parameter set, however, has a unique parameter set name and a unique parameter set ID which were both automatically assigned by the system.

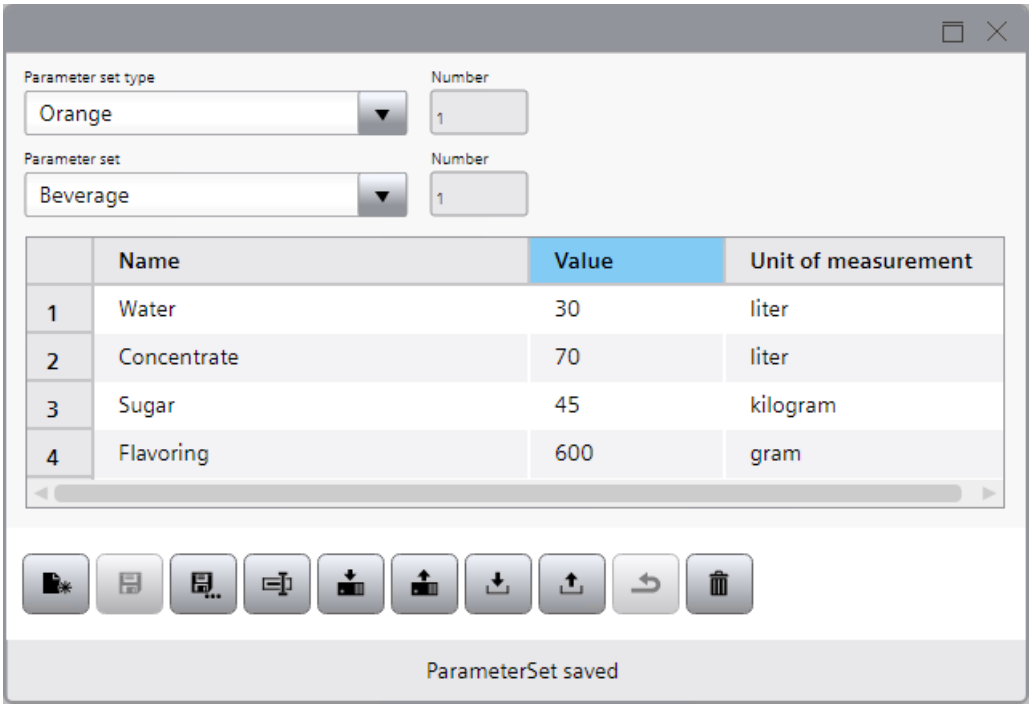
6. Enter values for the parameters in the "Value" column.
   Depending on the configuration, the parameters already contain start values.



Note

The character ' is not permitted in the value of a parameter set.

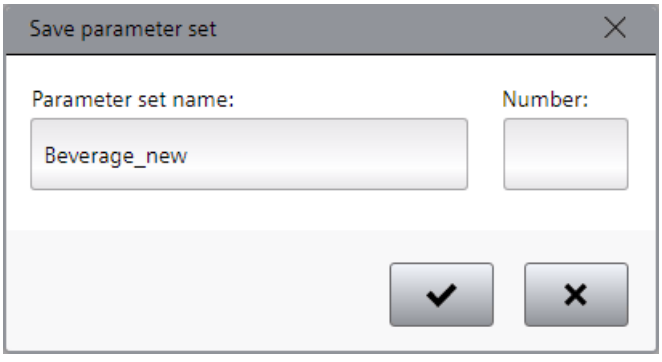
7. Click the "Save" button.



Copying a parameter set

To copy a parameter set, proceed as follows:

1. In the "Parameter set type" field, select the parameter set type in which you want to copy an existing parameter set.
   The elements of the selected parameter set type are displayed in the table.
2. In the "Parameter set" field, select the parameter set you want to copy.
   The parameters of the selected parameter set are displayed in the table.
3. Click the "Save as" button.
   The "Save parameter set" dialog opens. A unique parameter set name is pre-assigned to the "Parameter set name" field.



4. Enter a different unique parameter set name under "Parameter set name" as required.

5. Enter a unique parameter set ID under "Number" as required.
6. Confirm the dialog.

Note

If you do not enter a parameter set ID in the "Save parameter set" dialog and confirm the dialog, a unique parameter set ID is automatically assigned to the new parameter set.

Changing the parameter set

To change a parameter set, proceed as follows:

1. In the "Parameter set type" field, select the parameter set type in which you want to change an existing parameter set.
   The elements of the selected parameter set type are displayed in the table.
2. In the "Parameter set" field, select the parameter set you want to change.
   The parameters of the selected parameter set are displayed in the table.
3. Edit the values of the parameters in the "Value" column.
4. Click the "Save" button.

Deleting a parameter set

To delete a parameter set, proceed as follows:

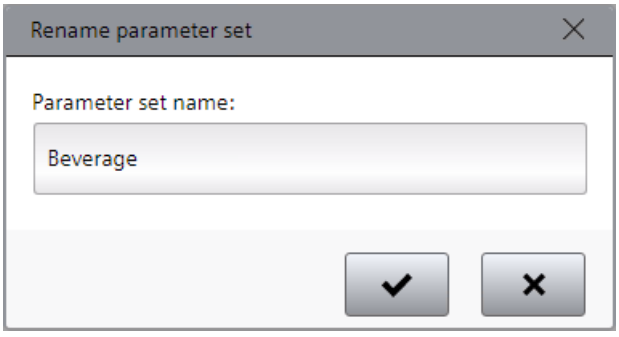
1. In the "Parameter set type" field select the parameter set type in which you want to delete an existing parameter set.
   The elements of the selected parameter set type are displayed in the table.
2. In the "Parameter set" field, select the parameter set you want to delete.
   The parameters of the selected parameter set are displayed in the table.
3. Click "Delete".

Renaming a parameter set

To rename a parameter set, proceed as follows:

1. In the "Parameter set type" field, select the parameter set type in which you want to rename an existing parameter set.
   The elements of the selected parameter set type are displayed in the table.
2. In the "Parameter set" field, select the parameter set you want to rename.
   The parameters of the selected parameter set are displayed in the table.

3. Click the "Rename" button.
   The "Rename parameter set" dialog opens.



4. Enter a different unique name for the parameter set under "Parameter set name".
5. Confirm the dialog.

8.3.2 Exporting and importing parameter sets

Introduction

In a parameter set control in runtime you export parameter sets from the parameter set memory to a "*.tsv" file to be able to edit them a text editor. In a parameter set control in runtime you furthermore import parameter sets from a "*.tsv" file into the parameter set memory. A "*.tsv" file is a text file that uses the tabulator as a list separator.

Note

To export and import the parameter sets, you can also use the system functions in the function list or in the scripts:

- With the system function "ExportParameterSets" or "ExportParameterSets", the parameter sets are exported from the parameter set memory to a "*.tsv" file.
- With the system function "ImportParameterSets" or "ImportParameterSets", the parameter records are imported from a "*.tsv" file into the parameter set memory.

If the parameter `OutputStatus` is set to `True`, a status message is output in an alarm control configured in the screen.

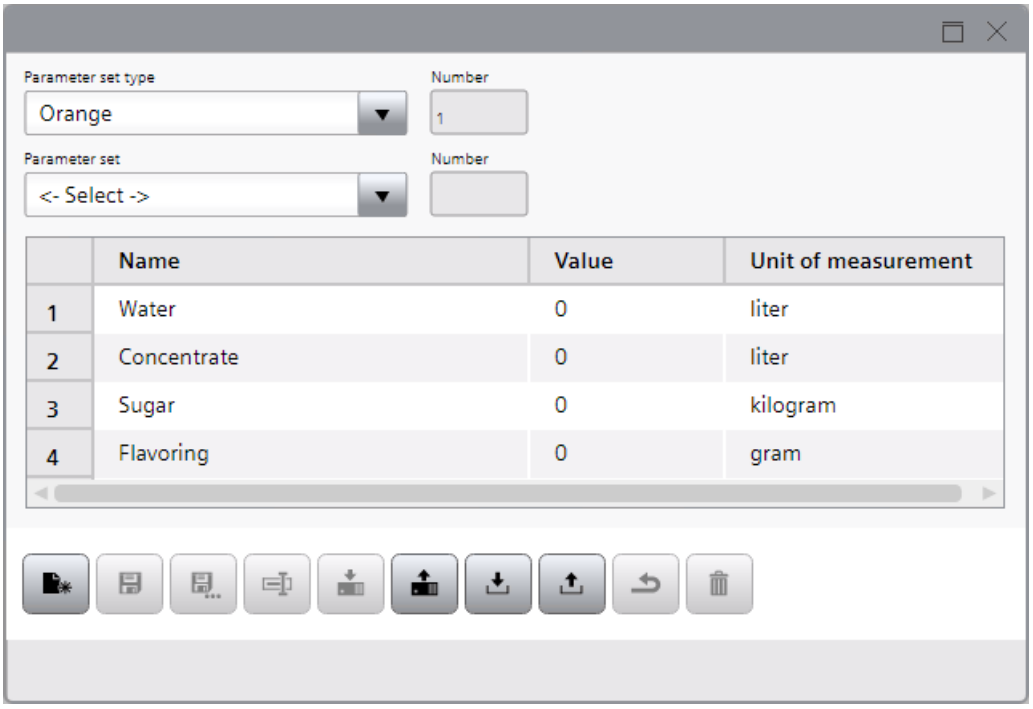
Requirement

- At least one parameter set type with elements has been created.
- A parameter set control has been configured.
- The project is in runtime.

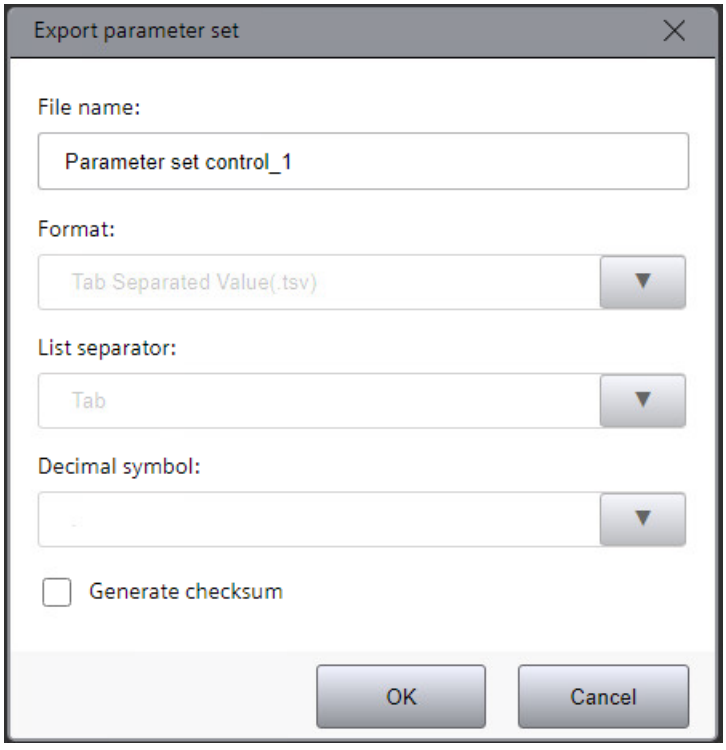
Exporting parameter sets of a parameter set type

Follow these steps to export the parameter sets of a parameter set type:

1. In the "Parameter set type" field, select the parameter set type whose parameter sets you want to export.

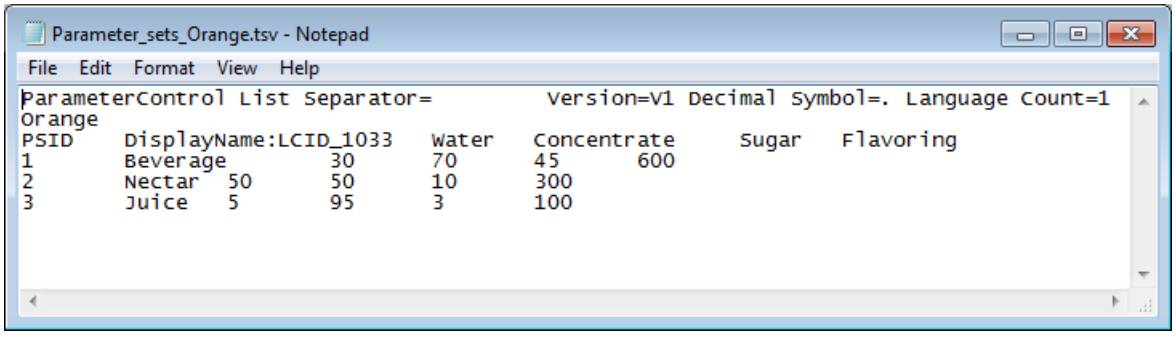


2. Click the "Export" button.
The "Export parameter set" dialog box opens. The name of the parameter set control is pre-assigned in the "File name" field.



3. If appropriate, change the name of the file to which you want to export the parameter sets under "File name".

4. Enable "Generate checksum" to export the parameter data set with a checksum.
   Parameter data sets with a checksum cannot be imported if they have been manipulated in the meantime.
5. Confirm the dialog.
   The parameter sets are exported to a ".tsv" file.
   This file is stored according to the download settings.
   The file has the following structure:
   - The first line contains the file header. The file header consists of identifier, delimiter, version of the exported file, decimal symbol and information on the number of languages in which the name of the parameter sets is stored.
     The line must not be changed. Otherwise, it is not possible to import parameter sets.
   - The second line contains the name of the parameter set type.
   - The third row contains the headers for parameter sets. LCID of the language and the names of the parameter set type items are listed.
     The header for parameter sets must not be changed.
   - From the fourth line on the parameter sets are listed.



Edit exported file

1. You can customize the file to meet your needs:
   - Change the values of existing parameters.
   - Add parameter sets.

   To be able to import the parameter sets after editing, note the following information:

   Note
   - The parameters must be valid for the defined data type.
   - The parameters must be within the limits defined in the parameter set type item.
   - ID and name of the individual parameter sets must be unique.

2. Save the changes.

Importing parameter sets into a parameter set type

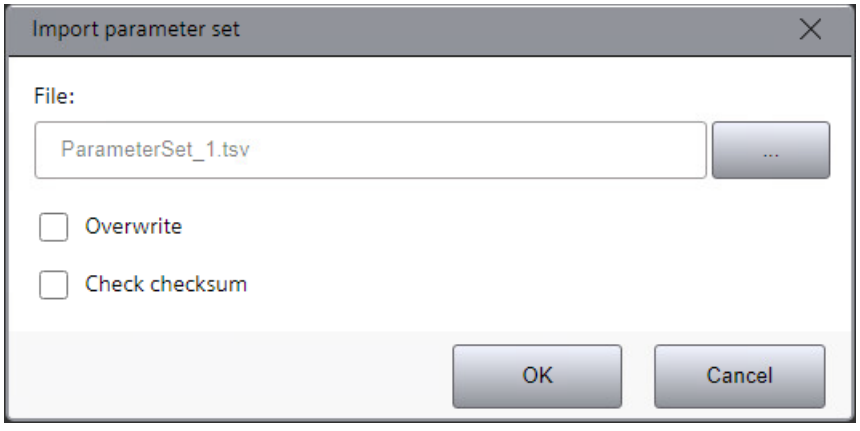
To be able to import parameter sets, note the following requirements:

Note

- The import file must have the same file header and the same header for parameter sets as the export file. Otherwise, it is not possible to import parameter sets.
- There is no parameter set with the same display name in any of the configured languages.
- The numerical values in the import file are within the permitted value range of the corresponding configured data type.

To import parameter sets into a parameter set type, follow these steps:

1. In the "Parameter set type" field, select the parameter set type into which you want to import the parameter sets.
2. Click the "Import" button.
   The "Import parameter set" dialog box opens.



3. Select the file from which you want to import the parameter sets.
4. To overwrite parameter sets in the parameter set control that have the same ID as the imported parameter sets, activate the "Overwrite" option.

   Note

   If you deactivate overwriting and if a parameter set with the same ID or the same parameter set name exists in the parameter set control, the import of parameter sets is not possible.

   Any added parameter sets whose IDs and parameter set names deviate from the existing parameter sets are imported regardless of the "Overwrite" option.
5. Enable "Check checksum" when importing a parameter data set exported with the "Generate checksum" option.
6. Confirm the dialog.
   The parameter sets are imported to the parameter set type.

8.3.3 Transferring parameter sets

Introduction

You have assigned an external HMI tag of the data type HMI or PLC user data type to a parameter set type. In a parameter set control in runtime you transfer the values of parameter sets to the PLC via the HMI tag. The parameter set values are used to set up machines for different productions.

In a parameter set control in runtime you furthermore read active parameter sets from the PLC into the parameter set control via the HMI tag. The read parameter set values are stored in the parameter set memory. By reading from the PLC, you call up currently used values from production machines for later use.

Note

You can also use system functions in the function list or in scripts to transfer parameter sets between HMI device and PLC:

- With the system function "ReadAndSaveParameterSet" or "ReadAndSaveParameterSet", a parameter set is read from the PLC and saved in the parameter set memory.
- With the system function "LoadAndWriteParameterSet" or "LoadAndWriteParameterSet", a parameter set is loaded from the parameter set memory and written to the PLC.

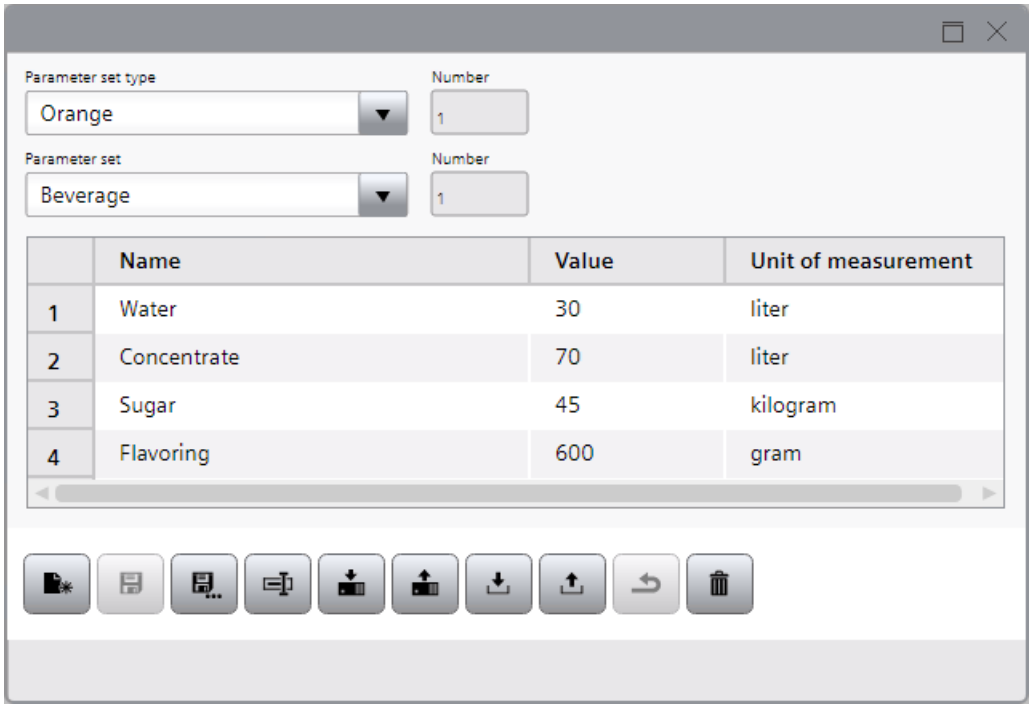
Requirement

- A parameter set type with elements has been created.
- An external HMI tag of the data type HMI or PLC user data type is assigned to the parameter set type.
- A parameter set control has been configured.
- The project is in runtime.
- At least one parameter set has been created in the parameter set type.

Transferring a parameter set to the PLC

To transfer a parameter set to the PLC, follow these steps:

1. In the "Parameter set type" field, select the parameter set type.
2. In the "Parameter set" field, select the parameter set whose values you want to transfer to the PLC.



3. Click the "Write to PLC" button.

Reading a parameter set from PLC

To read a parameter set from the PLC, follow these steps:

1. In the "Parameter set type" field, select the parameter set type.
2. In the "Parameter set" field, select the parameter set whose values you want to read from the PLC.

Note

If do you not select a parameter set in the in the "Parameter set" field, a new parameter set is created in the parameter set control while reading from the PLC.

3. Click the "Read from PLC" button.

Note

A parameter set cannot be read from the PLC if minimum and/or maximum values are defined for a parameter set type item and the value in the parameter set to be transferred is outside this range. An alarm is triggered.

Result

You have transferred the values of parameter sets between the HMI device and PLC.

Using system functions

9

9.1 Working with function lists

9.1.1 Basics of the function list

Introduction

A function list performs one or more functions when the configured event occurs.

The following are available:

- System functions
- Functions which you configure in global modules
- Functions which you configure in script modules

Principle

The function list is configured for an event of the following objects:

- Screen
- Screen object
- Task

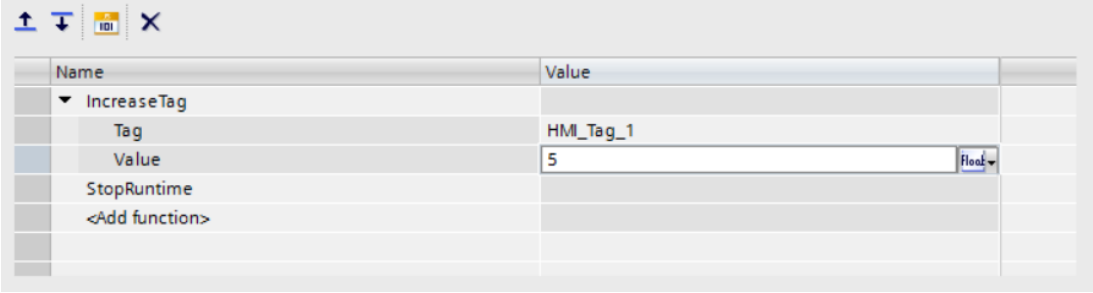
You can configure exactly one function list for each event. Which events are available depends on the selected object. Events occur only when the project is in runtime.

Events include:

- Execution of a task
- Pressing of a button

The function list is opened in the Inspector window under "Properties > Events" as soon as an object has been selected.

Layout



The function list is divided into two columns. In the "Name" column you see the names of the functions and the corresponding parameters.

In the Values column you assign values to the parameters. You use different parameter types depending on the parameter.

The following buttons are located above the function list:

Button	Function
	Move function up
	Move function down
	Display parameters
	Hide parameter
	Convert function list to script
	Delete function list

If the function list cannot be edited, the buttons are locked. This is the case, for example, with reference projects.

See also

Editing a function list (Page 906)

System functions (Page 909)

"Scripts" editor (Page 981)

9.1.2 Input support

The function list supports you in:

- Function input
- Input of parameter values
- Troubleshooting

Function input

You have several options for entering a function in the function list:

- Enter the complete or partial name of the function.
  Autocomplete is supported.
- Select the "<Add function>" field and open the selection menu.
  The available functions are sorted by category.
- Select the "<Add function>" field and select the list icon.
  The available functions are displayed in alphabetical order.

The system functions provided in the function list differ depending on the object selected. For example, system functions of the "Screen" category are only available for screens and screen items.

Input of parameter values

The parameters required in functions are displayed in the function list and differ depending on the function selected.

You assign a value to each parameter.

The parameter type determines which values the parameter can accept.

The parameter type is either fixed by default or you can choose between several types.

Which parameter types are available depends on the respective parameter.

The following parameter types are implemented in the function list:

- Integer
- UInteger
- Double
- Bool
- String
- Color
- HMI tag: Specify a configured HMI tag. Autocomplete is supported.
- Screen object: Specify a configured screen item in the current screen. Autocomplete is supported.
- Selection: Sets the current screen as value. If this type is selected, the value cannot be edited.
- Text list
- Screen window
- Runtime language

Note

HMI tags and screen items can be renamed without updating the function list. Objects of the WinCC Unified object model are referenced in the function list.

Optional parameters are marked with "(optional)".

Parameters of functions that you have configured in global modules are always optional.

Assigning parameters via drag-and-drop operation

For some objects you can assign the objects to parameters of the function list using drag-and-drop operation.

You assign the following objects from the detail view to function list parameters using the drag-and-drop feature:

- HMI tag
- PLC tag
  If you assign a PLC tag by drag-and-drop operation, a connected HMI tag is created automatically. The HMI tag is linked to the parameter.
- Screen
  In addition, you can assign screens from the project tree to parameters in the function list using the drag-and drop features.
- Text list

Troubleshooting

The project data is tested in the background during the configuration.

To inform you of errors, missing or incorrect entries in the function list are highlighted in red:

- At least one function is not completely supplied with parameters.
- At least one function is contained which is not supported by the selected HMI device, for example, by changing the device type.

Note

Missing screen items and HMI tags can be created later. Objects of the WinCC Unified object model are referenced in the function list.

Alarms during the compiling and loading of a project are displayed in the Inspector window in the "Info > Compile" tab.

The function list supports you by displaying missing or incorrect entries directly for editing:

- To go directly to the function list, select the green arrow  .

See also

"Scripts" editor (Page 981)

System functions (Page 909)

9.1.3 Configuring a function list

Restrictions for events

- "Activated" and "Deactivated" events:
  If the focus is on the affected screen item, scripts are executed at the "activated" and "deactivated" events.
- "Press key" and "Release key" events:
  The events "Press key" and "Release key" can only be queried when a keyboard is connected.

Requirement

One of the following objects is configured:

- Screen
- Screen item
- Task

Procedure

1. Select the object.
2. Go to "Properties > Events" in the Inspector window.
   The function list opens.
3. Select an event.
4. Select "<Add function>" in the function list.
5. Enter the function.
   If the desired function has parameters, the parameters are displayed.
6. Define the parameter values.
7. To add more functions, repeat steps 4.) to 6.).
8. Save the project.

Result

- The function list is configured.
- In addition, to the configured event, the status of the function list is displayed in the Inspector window.
- The function list is executed from top to bottom when the configured event occurs in runtime.

9.1.4 Editing a function list

Editing function lists

The function list is executed from top to bottom. You have the following options for editing function lists:

	"Move function up"
	"Move function down"
	"Convert function list to script"
	"Delete function list"

Requirement

- The function list is open.
- At least one function is configured at an event.

Changing the order of functions

You move a function within the function list as follows:

1. Select the name of the function or an associated parameter.
2. Select the "Move function up" or "Move function down" button.
   If the function is already at the first or last position in the list, pressing the button has no effect.

Replacing a function

1. To replace a function, enter the name of another function in the input field. All parameter settings of the replaced function are deleted.

Converting a function list to a local script

1. To convert the function list to a local script, use the "Convert function list to script" button.
2. The "Scripts" editor opens. Adapt the script to your requirements.

The function list can be converted to a local script even if the parameter specifications are incorrect or incomplete. The parameter specifications must be adjusted accordingly in the script.

Note

This action can only be revoked using the  "Undo" button.

Delete function list

1. To delete the entire function list of an event, select the "Delete function list" button.

Deleting functions

To delete a single function, follow these steps:

1. Select the name of the function.
2. Press <Del>.

See also

"Scripts" editor (Page 981)

9.1.5 Using a screen item to specify the value of a parameter

Introduction

For some parameters, you can assign "Screen item" as parameter type.

For example, enter the "Value" parameter of the "IncreaseTag" function via the I/O field in runtime.

Note

The assigned screen item must have the property "Process value".

Possible screen items are, for example:

- I/O field
- Bar
- Slider
- Radio button

The value entered in the screen item must correspond to the data type expected by the system function.

If the data types do not match, convert the value using an additional tag.

Requirement

- A screen is configured.
- A suitable screen object (e.g. I/O field) is configured.
- A suitable system function (e.g. "IncreaseTag") is created in the function list.

Procedure

To assign a parameter to a screen item and convert the value entered in the screen item, proceed as follows:

1. Assign the desired screen item to the parameter.
2. Select the screen item.
3. Go to "Properties > General > Process value" in the Inspector window.
4. Select "Tag" in the "Dynamization" column.
   The tag selection range is displayed.
5. Select the selection button ....
6. Select the "Add" button.
7. Assign a meaningful name.
8. Specify the required tag data type.
   The "Value" parameter, for example, requires a numeric data type.

9.1.6 Adapt the function list to changed scripts

You use functions that you have defined for global modules in the function list. These functions and associated parameters are referenced.

If you edit used functions after creating the function list, you must manually transfer some changes to the function list:

- Adding of a parameter
- Deleting of a parameter
- Deleting of a function

Note

If you rename functions or parameters, these changes are automatically transferred to the function list.

Requirement

- A function is defined in a global module.
- The function is used in a function list.

Procedure

1. Make at least one of the following changes to the function:
   - Add a parameter
   - Delete a parameter
   - Delete a function
2. Go to the relevant function in the function list.
3. Double-click to apply the change marked in red.

See also

"Scripts" editor (Page 981)

9.2 System functions

9.2.1 LogOff

Description

Logs off the current user on the HMI device.

Use in the function list

Logoff()

The system function "Logoff" has no parameters.

Use in scripts

You can find more information on using the "LogOff" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.LogOff() (Page 6842)

9.2.2 UpdateTag

Description

Reads the current value of the tags with the specified update ID from the PLC. An update ID can be used for several tags.

Note

Tags of the STRUCT data type are not supported.

Use in the function list

UpdateTag (Update ID)

The system function "UpdateTag" has the following parameters:

Parameter	Description
Update ID	Specifies the Update ID.

Use in scripts

You can find more information on using the "UpdateTag" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.UpdateTag() (Page 1390)

9.2.3 InsertElectronicRecord

Description

This system function is used to log user actions in the Audit Trail that are not automatically logged in the Audit Trail. You can also use this system function to require the user to enter an acknowledgment or an electronic signature and a comment for the operator action. A requirement for the use of the system function is that the GMP-compliant configuration is activated under "Runtime settings > GMP".

If you use the "InsertElectronicRecord" system function in a function, the debugger may open if you cancel your input by clicking "Cancel". To compensate for this reaction, you can use the "On Error Resume Next" statement in a function. With this instruction, the next instruction is executed after a runtime error. If you use the "On Error Resume Next" statement, output of system alarms is also suppressed.

Use in the function list

InsertElectronicRecord (name, category, operation type, old value, new value, confirmation type, reason)

The "InsertElectronicRecord" system function has the following parameters:

Parameters	Description
Name	Name of the modified object
Category	Category or class name of the modified object
Operation type	Specifies the type of change. 1: New value 2: Modified value 3: Deleted value
Old value	Value before the change
New value	Value after the change
Confirmation type	Specifies how the action must be confirmed 0 = (None): No confirmation required, an entry is created in the Audit Trail 1 = (Acknowledgement): Acknowledgment, the user must acknowledge the action; an entry is created in the Audit Trail 2 = (Digital Signature): Electronic signature; a dialog window opens in which the user must enter the electronic signature - an entry is created in the Audit Trail
Reason (optional)	May include a comment explaining the reason for the change.

Use in scripts

You can find more information on using the "InsertElectronicRecord" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.InsertElectronicRecord() (Page 1133)

9.2.4 ExecuteReport

Description

Executes a report automatically and independently of the general report cycle. The execution can be triggered through a specific event, for example, change of a tag value, occurrence of a specific message or exceeding a tag limiting value.

Use in the function list

ExecuteReport (name report order)

The system function "ExecuteReport" has the following parameters:

Parameter	Description
Report task name	Specifies the name of the report to be executed.

Use in scripts

You can find more information on using the "ExecuteReport" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.ExecuteReport() (Page 1302)

9.2.5 EjectStorageMedium

Description

Ejects an inserted storage medium. The function checks whether the storage medium is currently being accessed. If no current read or write process is taking place, the storage medium can be removed without data loss.

Note

The "EjectStorageMedium" system function is only available for WinCC Unified Comfort Panel. The system outputs a compiler warning if the function is used through manual input or through a device replacement in SIMATIC WinCC Unified PC.

The system function only works correctly in runtime if you use the storage medium in question for logging.

Use in the function list

EjectStorageMedium (storage device)

The system function "EjectStorageMedium" has the following parameters:

Parameter	Description
Storage device	System variable name of the storage medium with path specification (e.g. /USB storage card)

Use in scripts

You can find more information on using the "EjectStorageMedium" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.EjectStorageMedium() (Page 1164)

9.2.6 IncreaseTag

Description

Adds the specified value to the tag value: X = X + a

If you configure the system function for events of an alarm without the tag being used in the current screen, it is not ensured that the actual tag value is being used in the PLC.

For the system function to be executed, the value of the tags must be current and valid, which means the quality code must correspond to Good (cascade).

The following conditions must be met for external tags:

- the connection to the PLC is set up and
- the acquisition mode of the tags is "Cyclic in operation" and
- the tag is used at the "Process value" property of an object.

Note

The system function is executed with the last known process value. Since this process value cannot be kept up to date in all cases, it is prohibited to write it from multiple sources (e.g. from the HMI device via scripts and from the PLC). This ensures that the value that is changed actually corresponds to the process value.

Use in the function list

IncreaseTag (Tag, Value)

The system function "IncreaseTag" has the following parameters:

Parameter	Description
Tag	Tag to which the specified value is added. The following data types are not supported: Byte, Word, DWord, LWord.
Value	Value to be added.

Note

Converting a value

The system function uses the same tag as input and output values. If you are using this system function to convert a value, follow these steps:

1. Create an auxiliary tag.
2. Assign the tag value to the auxiliary tag with the "SetTagValue" system function.

Use in scripts

You can find more information on using the "IncreaseTag" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.IncreaseTag() (Page 1384)

9.2.7 CreateParameterSet

Description

Creates a new parameter set. with the default values defined in the Engineering System.

Use in the function list

CreateParameterSet (parameter set type, Language, ParameterSetTypeName, Processing status)

The system function "CreateParameterSet" has the following parameters:

Parameter	Description
Parameter set type	Specifies the name or the ID of the parameter set type. If the name or ID of the parameter set type does not exist, execution is terminated.
Parameter set ID (optional)	ID of the parameter set that is created. If an ID is not entered, a unique ID is assigned automatically.
Parameter set name (optional)	Name of the parameter set that is created. If a name is not entered, a unique name is assigned automatically.
Output status	Defines the output status: True = Alarms are output. False = Alarms are not output. If the output status is set to "True", alarms are generated and displayed (if configured).
Processing status (optional)	Indicates the execution status of a function: 2 = Function is being executed. 4 = Function successfully executed. 12 - Function was canceled.

Using scripts

You can find more information on the "CreateParameterSet" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.CreateParameterSet() (Page 1245)

9.2.8 CreateScreenshot

Description

Creates and saves a screenshot. The .jpg and .jpeg image formats are supported. If images already exist in the specified file path, they will be overwritten. If the specified file path cannot be accessed, an error message is displayed.

Note

The system function "CreateScreenshot" is only available for WinCC Unified Comfort Panel. The system outputs a compiler warning if the function is used through manual input or through a device replacement in SIMATIC WinCC Unified PC.

Use in the function list

CreateScreenshot (path of storage medium)

The system function "CreateScreenshot" has the following parameters:

Parameter	Description
Storage media path	Path name of the screenshot.

Use in scripts

You can find more information on using the "CreateScreenshot" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.CreateScreenshot() (Page 1164)

9.2.9 CreateOperatorInputInformation

Description

Creates an alarm of the class "OperatorInputInformation".

Use in the function list

CreateOperatorInputInformation (alarm text, range, parameter value 1, parameter value 2, parameter value 3, parameter value 4, parameter value 5, parameter value 6, parameter value 7)

The system function "CreateSystemInformation" has the following parameters:

Parameter	Description
Alarm text	Specifies the alarm text. The alarm text can only be defined in one language in the system function.
Area (optional)	Specifies the scope of the alarm.
Parameter value 1 (optional)	Value of the first alarm parameter.
Parameter value 2 (optional)	Value of the second alarm parameter.
Parameter value 3 (optional)	Value of the third alarm parameter.
Parameter value 4 (optional)	Value of the fourth alarm parameter.
Parameter value 5 (optional)	Value of the fifth alarm parameter.
Parameter value 6 (optional)	Value of the sixth alarm parameter.
Parameter value 7 (optional)	Value of the seventh alarm parameter.

Use in scripts

You can find more information on using the "CreateOperatorInputInformation" system function in JavaScript functions in the WinCC Unified object model.

See also

Creating alarms with multilingual alarm texts (Page 1015)

SysFct.CreateOperatorInputInformation() (Page 1101)

9.2.10 CreateSystemInformation

Description

Creates an alarm of the class "SystemInformation".

The alarm class "SystemInformation" only has the status "Incoming" and is therefore only displayed under "Logged alarms" in the alarm control and not under "Pending alarms".

Use in the function list

CreateSystemInformation (alarm text, range, parameter value 1, parameter value 2, parameter value 3, parameter value 4, parameter value 5, parameter value 6, parameter value 7)

The system function "CreateSystemInformation" has the following parameters:

Parameter	Description
Alarm text	Specifies the alarm text. The alarm text can only be defined in one language in the system function.
Area (optional)	Specifies the scope of the alarm.
Parameter value 1 (optional)	Value of the first alarm parameter.
Parameter value 2 (optional)	Value of the second alarm parameter.
Parameter value 3 (optional)	Value of the third alarm parameter.
Parameter value 4 (optional)	Value of the fourth alarm parameter.
Parameter value 5 (optional)	Value of the fifth alarm parameter.
Parameter value 6 (optional)	Value of the sixth alarm parameter.
Parameter value 7 (optional)	Value of the seventh alarm parameter.

Use in scripts

You can find more information on using the "CreateSystemInformation" system function in JavaScript functions in the WinCC Unified object model.

See also

Creating alarms with multilingual alarm texts (Page 1015)

SysFct.CreateSystemInformation() (Page 1104)

9.2.11 CreateSystemAlarm

Description

Creates an alarm of the class "SystemAlarm".

Use in the function list

CreateSystemAlarm (alarm text, range, parameter value 1, parameter value 2, parameter value 3, parameter value 4, parameter value 5, parameter value 6, parameter value 7)

The system function "CreateSystemInformation" has the following parameters:

Parameter	Description
Alarm text	Specifies the alarm text. The alarm text can only be defined in one language in the system function.
Area (optional)	Specifies the scope of the alarm.
Parameter value 1 (optional)	Value of the first alarm parameter.
Parameter value 2 (optional)	Value of the second alarm parameter.
Parameter value 3 (optional)	Value of the third alarm parameter.
Parameter value 4 (optional)	Value of the fourth alarm parameter.
Parameter value 5 (optional)	Value of the fifth alarm parameter.
Parameter value 6 (optional)	Value of the sixth alarm parameter.
Parameter value 7 (optional)	Value of the seventh alarm parameter.

Use in scripts

You can find more information on using the "CreateSystemAlarm" system function in JavaScript functions in the WinCC Unified object model.

See also

Creating alarms with multilingual alarm texts (Page 1015)

SysFct.CreateSystemAlarm() (Page 1103)

9.2.12 ExportParameterSets

Description

Exports parameter sets from the parameter set memory to a file.

Use in the function list

ExportParameterSets (parameter set type ID, parameter set ID, file name, overwrite, output status, processing status (optional), generate checksum)

The system function "ExportParameterSets" has the following parameters:

Parameter	Description
Parameter set type ID	Specifies the name or the ID of the parameter set type. If the name or ID of the type does not exist, execution is terminated.
Parameter set ID	Specifies the name or the ID of the parameter set. The following cases are differentiated: • If the parameter set ID is set to 0, all parameter sets available in the memory are exported. • If the specified name or the ID does not exist in the imported file, the execution is canceled. • If the specified name or the ID does not exist in the imported file, this specific parameter set is imported. In the following cases the import is aborted and an alarm appears: • No parameter set available • Name or ID does not exist in the import file
File name	Specifies the file path of the file to be imported. In the following cases the execution is canceled and an alarm is generated: • Invalid file path • Error during file access
Overwrite	Specifies whether the existing file is overwritten: 0 = Overwriting is not allowed. 1 = Overwriting is allowed. An alarm is generated and displayed if an error occurs during file access. This can occur, for example, when the existing file cannot be overwritten even though overwriting is allowed.
Output status	Specifies the output status: True = Alarms are output. False = Alarms are not output.
Processing status (optional)	Indicates the execution status of a function: 2 = Function just executed 4 = Function successfully executed 12 = Function was canceled
Generate checksum	Specifies whether a checksum is generated for the parameter set to be exported: True = Checksum is generated. False = Checksum is not generated.

Use in scripts

You can find more information on using the "ExportParameterSets" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.ExportParameterSets() (Page 1248)

9.2.13 GoToPLC

Description

Switches from a diagnostics indicator to the system diagnostics control.

Use in the function list

GoToPLC (Screen object path)

The system function "GoToPLC" has the following parameters:

Parameter	Description
Screen object path	Path to the screen object System Diagnostics Control, for example, "./Screen window_1/Diagnostic control_1"

Using scripts

You can find more information on the "GoToPlc" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.GoToPlc() (Page 6835)

9.2.14 ImportParameterSets

Description

Imports parameter sets from a file into the parameter set memory.

Use in the function list

ImportParameterSets (file name, parameter set ID, overwrite, output status, processing status (optional), check checksum)

The system function "ImportParameterSets" has the following parameters:

Parameter	Description
File name	Specifies the file path of the file to be imported. In the following cases the execution is canceled and an alarm is generated: • Invalid file path • Error during file access
Parameter set ID	Specifies the name or the ID of the parameter set. The following cases are differentiated: • If the parameter set ID is set to 0, all parameter sets are imported from the file. • If the name or the ID does not exist in the imported file, the execution is canceled. • If the specified name or the ID does not exist in the imported file, only this specific parameter set is imported. In the following cases the import is aborted and an alarm appears: • Invalid file head. • No parameter set available. • Parameter set name or parameter set ID does not exist in the file.
Overwrite	Specifies whether the values in the memory are overwritten with the values from the import file: 0 = Overwriting is not allowed. 1 = Overwriting is allowed. If the name / ID of the specified parameter set exists, the values in the memory are overwritten with the parameter set values from the import file if overwriting is allowed. If it may not be overwritten, the data in the memory is not renewed.
Output status	Specifies the output status: True = Alarms are output. False = Alarms are not output. If the output status is set to "True", alarms are generated and displayed (if configured).
Processing status (optional)	Indicates the execution status of a function: 2 = Function is being executed. 4 = Function successfully executed. 12 = Function was canceled.
Check checksum	Specifies whether the checksum of the import file is verified: True = Checksum is generated. False = Checksum is not generated.

Use in scripts

You can find more information on using the "ImportParameterSets" system function in JavaScript functions in the WinCC Unified object model.

See also

Exporting and importing parameter sets (Page 891)

SysFct.ImportParameterSets() (Page 1254)

9.2.15 InvertBitInTag

Description

Inverts the bit with the specified number in the tag:

- If the bit in the tag has the value 1 (True), it will be set to 0 (False).
- If the bit in the tag has the value 0 (False), it will be set to 1 (True).

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime.

While the function is running, the operator and controller have only read access to the specified tag until it is transferred to the controller again.

For the system function to be executed, the value of the tags must be current and valid, which means the quality code must correspond to Good (cascade).

The following conditions must be met for external tags:

- the connection to the PLC is set up and
- the acquisition mode of the tags is "Cyclic in operation" and
- the tag is used at the "Process value" property of an object.

Note

The system function is executed with the last known process value. Since this process value cannot be kept up to date in all cases, it is prohibited to write it from multiple sources (e.g. from the HMI device via scripts and from the PLC). This ensures that the value that is changed actually corresponds to the process value.

Use in the function list

InvertBitInTag (Tag, Value)

The system function "InvertBitInTag" has the following parameters:

Parameter	Description
Tag	The tag in which the specified bit is inverted.
Bit number	The number of the bit that is inverted. When this system function is used in a user function, the bits in the given tag will be counted from right to left independent of the controller that is used. Numbering starts with 0.

Use in scripts

You can find more information on using the "InvertBitInTag" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.InvertBitInTag() (Page 1384)

9.2.16 IsAlarmJumpPossible

Description

The function checks whether the alarm selected in the alarm control is a process diagnostics alarm. If so, the specified screen object is enabled; otherwise, it is disabled.

Use in the function list

IsAlarmJumpPossible (Alarm control, Screen object path)

The "IsAlarmJumpPossible" system function has the following parameters:

Parameter	Description
Alarm control	Path of the alarm control with selected alarm.
Screen object path	Path of the screen object

Use in scripts

You can find more information on using the "IsJumpableAlarm" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.IsJumpableAlarm() (Page 1561)

9.2.17 LoadParameterSet

Description

Loads parameter sets from the parameter set memory into the edit tag.

Use in the function list

LoadParameterSet (Parameter set type, Parameter set, Output status, Processing status (optional))

The system function "LoadParameterSet" has the following parameters:

Parameter	Description
Parameter set type	Specifies the name or the ID of the parameter set type. If the name or ID of the parameter set type does not exist, execution is terminated.
Parameter set	Specifies the name or the ID of the parameter set. If the name or ID of the parameter set does not exist, execution is terminated.
Output status	Defines the output status: True = Alarms are output. False = Alarms are not output.
Processing status (optional)	Indicates the execution status of a function: 2 = Function is being executed. 4 = Function successfully executed. 12 - Function was canceled.

Using scripts

You can find more information on the "LoadParameterSet" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.LoadParameterSet() (Page 1257)

9.2.18 LoadAndWriteParameterSet

Description

Loads parameter sets from the parameter set memory and writes them to the PLC.

Use in the function list

LoadAndWriteParameterSet (parameter set type ID, parameter set ID, output status, processing status (optional))

The system function "LoadAndWriteParameterSet" has the following parameters:

Parameter	Description
Parameter set type ID	Specifies the name or the ID of the parameter set type. If the name or ID of the parameter set type does not exist, execution is terminated.
Parameter set ID	Specifies the name or the ID of the parameter set. If the name or ID of the parameter set does not exist, execution is terminated.

Parameter	Description
Output status	Specifies the output status: True = Alarms are output. False = Alarms are not output. If the output status is set to "True", alarms are generated and displayed (if configured).
Processing status (optional)	Indicates the execution status of a function: 2 = Function is being executed. 4 = Function successfully executed. 12 - Function was canceled.

Use in scripts

You can find more information on using the "LoadAndWriteParameterSet" system function in JavaScript functions in the WinCC Unified object model.

See also

Transferring parameter sets via scripts (Page 879)

Transferring parameter sets (Page 897)

SysFct.LoadAndWriteParameterSet() (Page 1256)

9.2.19 GetDHCPState

Description

Reads out the DHCP setting of the network adapter.

Note

The "GetDHCPState" system function is only available for WinCC Unified Comfort Panel. The system outputs a compiler warning if the function is used through manual input or through a device replacement in SIMATIC WinCC Unified PC.

Use in the function list

GetDHCPState (Adapter name, Status, IPV6 (optional))

The system function "GetDHCPState" has the following parameters:

Parameter	Description
Adapter name	Specifies the name of the network adapter. The following entries are possible: • X1 = Static network adapter name 1 • X2 = Static network adapter name 2 • Manual input
Status	Tag to which the status is written: 0 = DHCP is disabled. 1 = DHCP is enabled.
IP V6 (optional)	Tag to which the IPv6 address is written.

Use in scripts

You can find more information on using the "GetDHCPState" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.GetDHCPState() (Page 1166)

9.2.20 GetBrightness

Description

Reads out the brightness value.

Note

The "GetBrightness" system function is only available for WinCC Unified Comfort Panel. The system outputs a compiler warning if the function is used through manual input or through a device replacement in SIMATIC WinCC Unified PC.

Use in the function list

GetBrightness (Value)

The system function "GetBrightness" has the following parameters:

Parameter	Description
Value	The tag to which the brightness value is written.

Use in scripts

You can find more information on using the "GetBrightness" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.GetBrightness() (Page 1165)

9.2.21 GetIPV4Address

Description

Reads out the IPv4 settings of the network adapter.

Note

The "GetIPV4Address" system function is only available for WinCC Unified Comfort Panel. The system outputs a compiler warning if the function is used through manual input or through a device replacement in SIMATIC WinCC Unified PC.

Use in the function list

GetIPV4Address (Adapter name, IP address, Subnet mask, Default gateway (optional), DNS server 1 (optional), DNS server 2 (optional))

The system function "GetIPV4Address" has the following parameters:

Parameter	Description
Adapter name	Specifies the name of the network adapter. The following entries are possible: • X1 = Static network adapter name 1 • X2 = Static network adapter name 2 • Manual input
IP address	Tag to which the IP address is written.
Subnet mask	Tag to which the subnet mask of the IPv4 address is written.
Default gateway (optional)	Tag to which the IP address of the default gateway is written.
DNS server 1 (optional)	Tag to which the IP address of DNS server 1 is written.
DNS server 2 (optional)	Tag to which the IP address of DNS server 2 is written.

Use in scripts

You can find more information on using the "GetIPV4Address" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.GetIPV4Address() (Page 1168)

9.2.22 GetNetworkInterfaceState

Description

Reads out the status of the network adapter.

Note

The "GetNetworkInterfaceState" system function is only available for WinCC Unified Comfort Panel. The system outputs a compiler warning if the function is used through manual input or through a device replacement in SIMATIC WinCC Unified PC.

Use in the function list

GetNetworkInterfaceStatus (Adapter name, Status)

The system function "GetNetworkInterfaceState" has the following parameters:

Parameter	Description
Adapter name	Specifies the name of the network adapter. The following entries are possible: • X1 addresses PROFINET (X1) Port 0 • X 1.0 addresses PROFINET (X1) Port 0 • X 1.1 addresses PROFINET (X1) Port 1 • X2 = addresses Ethernet (X2) • Manual input
Status	Tag to which the state of the network adapter is written: 0 = Network adapter is disabled. 1 = Network adapter is enabled.

Use in scripts

You can find more information on using the "GetNetworkInterfaceState" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.GetNetworkInterfaceState() (Page 1170)

9.2.23 ReadParameterSet

Description

Transfers the values of the recipe data set loaded in the controller to the corresponding edit tags.

Use in the function list

ReadParameterSet (Parameter set type, Output status, Processing status (optional))

The system function "ReadParameterSet" has the following parameters:

Parameter	Description
Parameter set type	Specifies the name or the ID of the parameter set type. If the name or ID of the parameter set type does not exist, execution is terminated.
Output status	Defines the output status: True = Alarms are output. False = Alarms are not output.
Processing status (optional)	Indicates the execution status of a function: 2 = Function is being executed. 4 = Function successfully executed. 12 = Function was canceled.

Using scripts

You can find more information on the "ReadParameterSet" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.ReadParameterSet() (Page 1261)

9.2.24 ReadParameterSetName

Description

Reads the name of the specified parameter set.

Use in the function list

ReadParameterSetName (Parameter set type ID, Parameter set ID, Language, ParameterSetName, Processing status)

The system function "ReadParameterSetName" has the following parameters:

Parameter	Description
Parameter set type ID	Specifies the name or the ID of the parameter set type. If the name or ID of the parameter set type does not exist, execution is terminated.
Parameter set ID	Specifies the name or the ID of the parameter set.
Language	Specifies the language of the ID that is to be read.
Parameter set name	The tag to which the name of the parameter set is written.
Processing status	Indicates the execution status of a function: 2 = Function is currently being executed. 4 = Function successfully executed. 12 - Function was canceled

Use in scripts

You can find more information on using the "GetParameterSetName" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.GetParameterSetName() (Page 1250)

9.2.25 ReadParameterSetTypeName

Description

Reads the name of the specified parameter set type.

Use in the function list

ReadParameterSetTypeName (Parameter set type ID, Language, ParameterSetTypeName, Processing status)

The system function "ReadParameterSetTypeName" has the following parameters:

Parameter	Description
Parameter set type ID	Specifies the name or the ID of the parameter set type. If the name or ID of the parameter set type does not exist, execution is terminated.
Language	Specifies the language of the ID that is to be read.
Parameter set type name	The tag to which the name of the parameter set type is written.
Processing status	Indicates the execution status of a function: 2 = Function is being executed. 4 = Function successfully executed. 12 = Function was canceled.

Using scripts

You can find more information on the "GetParameterSetTypeName" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.GetParameterSetTypeName() (Page 1252)

9.2.26 GetSmartServerState

Description

Returns the activation state of the Smart server.

Note

The "GetSmartServerState" system function is only available for WinCC Unified Comfort Panel. The system outputs a compiler warning if the function is used through manual input or through a device replacement in SIMATIC WinCC Unified PC.

Use in the function list

GetSmartServerState (Status)

The system function "GetSmartServerState" has the following parameters:

Parameter	Description
Status	Tag to which the activation status of the Smart Server is written: True = Smart Server is enabled. False = Smart Server is disabled.

Use in scripts

You can find more information on using the "GetSmartServerState" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.GetSmartServerState() (Page 1171)

9.2.27 ReadAndSaveParameterSet

Description

Reads a parameter set from the PLC and writes the parameter set to the parameter set memory.

Use in the function list

ReadAndWriteParameterSet (parameter set type ID, parameter set ID, overwrite, output status, processing status (optional))

The system function "ReadAndWriteParameterSet" has the following parameters:

Parameter	Description
Parameter set type ID	Specifies the name or the ID of the parameter set type. If the name or ID of the parameter set type does not exist, execution is terminated.
Parameter set ID	Specifies the name or the ID of the parameter set. If the name or ID of the parameter set does not exist, a new parameter set is created. If the name or the ID of the specified parameter set exists, the values in the PLC are overwritten with the parameter set values in the memory if hmiOverwrite.Enabled is set. If hmiOverwrite.Disabled is set, the data in the memory is not replaced.
Overwrite	Specifies whether the values in the memory are overwritten with the values from the import file: 0 = Overwriting is not allowed. 1 = Overwriting is allowed. The following cases are differentiated: • If the name / ID of the specified parameter set exists, the values in the PLC are overwritten with the parameter set values in the memory if overwriting is allowed. • If overwriting is not allowed, the data in the memory is not replaced. The process tag is updated to the status of the system function, if configured accordingly.
Output status	Specifies the output status: True = Alarms are output. False = Alarms are not output. If the output status is set to "True", alarms are generated and displayed (if configured).
Processing status (optional)	Indicates the execution status of a function: 2 = Function is being executed. 4 = Function was successfully executed. 12 = Function cancelled.

Use in scripts

You can find more information on using the "ReadAndSaveParameterSet" system function in JavaScript functions in the WinCC Unified object model.

See also

Transferring parameter sets via scripts (Page 879)

Transferring parameter sets (Page 897)

SysFct.ReadAndSaveParameterSet() (Page 1259)

9.2.28 ClearAlarmLog

Description

Deletes all recordings from the specified alarm log.

Note

No backup

Note that no automatic backup is performed before the execution of the function.

Use in the function list

ClearAlarmLog (Log name)

The system function "ClearAlarmLog" has the following parameters:

Parameter	Description
Log name	Name of the alarm log from which the entries are deleted.

Use in scripts

You can find more information on using the "ClearAlarmLog" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.ClearAlarmLog() (Page 1131)

9.2.29 DeleteParameterSet

Description

Deletes a parameter set.

Use in the function list

DeleteParameterSet (Parameter set type, Parameter set, Output status, Processing status (optional))

The system function "DeleteParameterSet" has the following parameters:

Parameter	Description
Parameter set type	Specifies the name or the ID of the type of parameter set from which the parameter set will be deleted.
Parameter set	Specifies the name or the ID of the parameter set that is being deleted.
Output status	Defines the output status: True = Alarms are output. False = Alarms are not output.
Processing status (optional)	Indicates the execution status of a function: 2 = Function is being executed. 4 = Function was successfully executed. 12 - Function was canceled.

Use in scripts

You can find more information on using the "DeleteParameterSet" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.DeleteParameterSet() (Page 1247)

9.2.30 ClearTagLog

Description

Deletes all data records in the specified data log.

Note

No backup!

Note that no automatic backup is performed before execution of the function!

Use in the function list

ClearTagLog (Log name)

The system function "ClearTagLog" has the following parameters:

Parameter	Description
Log name	Name of the data log from which all entries are deleted.

Use in scripts

You can find more information on using the "ClearTagLog" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.ClearTagLog() (Page 1331)

9.2.31 OpenScreenInPopup

Description

Opens a screen in a popup window.

Use in the function list

OpenScreenInPopup (Popup window name, Screen name, Close when open, Header, Left, Top, Hide close button, Parent screen path)

The system function "OpenScreenInPopup" has the following parameters:

Parameter	Description
Popup window name	Name of the popup window. The name must be unique within the parent screen and is required to close the pop-up window.
Screen name	Name of the screen that is to be opened in the pop-up window.
Close when opened	True = If the pop-up window is open when the function is called, it is closed. False = If the popup window is open when the function is called, it remains open.
Header	Specifies the window title of the popup window.
Left	Defines the window position as offset from the left margin.
Top	Defines the window position as offset from the top margin.
Hide close button	True = The "Close" button is not displayed. False = The "Close" button is displayed.
Parent screen path (optional)	Path of the parent screen. With this parameter, you specify whether the pop-up window is closed in case of a screen change or in case of a screen change in a screen window. If this value is not defined, the pop-up window is global. The pop-up window remains open until it is closed manually, by means of a function call or by exiting runtime.

Use in scripts

You can find more information on using the "OpenScreenInPopup" system function in JavaScript functions in the WinCC Unified object model.

See also

Opening and closing a screen in a pop-up window (Page 1017)

SysFct.OpenScreenInPopup() (Page 6844)

9.2.32 OpenScreenWithNumberInPopup

Description

Opens a screen in a popup window.

Use in the function list

OpenScreenWithNumberInPopup (Popup window name, Screen number, Close when open, Header, Left, Top, Hide close button, Parent screen path)

The system function "OpenScreenWithNumberInPopup" has the following parameters:

Parameter	Description
Popup window name	Name of the popup window. The name must be unique within the parent screen and is required to close the pop-up window.
Screen number	Unique number (> 0) of the screen that will be loaded into the popup window.
Close when opened	True = If the pop-up window is open when the function is called, it is closed. False = If the popup window is open when the function is called, it remains open.
Header	Specifies the window title of the popup window.
Left	Defines the window position as offset from the left margin.
Top	Defines the window position as offset from the top margin.
Hide close button	True = The "Close" button is not displayed. False = The "Close" button is displayed.
Parent screen path (optional)	Path of the parent screen. With this parameter, you specify whether the pop-up window is closed in case of a screen change or in case of a screen change in a screen window. If this value is not defined, the pop-up window is global. The pop-up window remains open until it is closed manually, by means of a function call or by exiting runtime.

Use in scripts

You can find more information on using the "OpenScreenByNumberInPopup" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.OpenScreenByNumberInPopup() (Page 6842)

9.2.33 OpenViewGRAPHByBlock

Description

Switches from any screen object to the PLC code view.

Use in the function list

OpenViewGRAPHByBlock (PLC name, GRAPH instance name, step number, screen object path)

The "OpenGRAPHViewerGraphByBlock" system function has the following parameters:

Parameter	Description
PLC name	Indicates the name of the PLC.
GRAPH instance name	Instance name of the GRAPH block to be displayed.
Step number	Number of the step to be displayed.
Screen object path	Path of the screen object PLC code view. For example, "./Screen window_1/ PlcCodeViewer control_1"

Using scripts

You can find more information on the "OpenViewerGraphByBlock" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.OpenViewerGraphByBlock() (Page 1566)

9.2.34 OpenGRAPHViewFromOverview

Description

Switches from the GRAPH overview to the PLC code view.

Use in the function list

OpenGRAPHViewFromOverview (Object path to GRAPH overview, Object path to PLC code view)

The system function "OpenGRAPHViewFromOverview" has the following parameters:

Parameter	Description
Object path to GRAPH overview	Path to the screen object GRAPH overview, from which switching is to take place.
Object path to PLC code display	Path to the screen object PLC code view.

Using scripts

You can find more information on the "OpenViewerGraphFromOverview" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.OpenViewerGraphFromOverview() (Page 1567)

9.2.35 OpenPLCCodeViewByAlarm

Description

Opens the corresponding block in the PLC code view according to the selected alarm in the alarm control.

Use in the function list

OpenPLCCodeViewByAlarm (Alarm control, PLC code view)

The "OpenPLCCodeViewByAlarm" system function has the following parameters:

Parameter	Description
Alarm control	Path of the alarm control
PLC code view	Path to the PLC code view

Use in scripts

You can find more information on the "OpenPlcCodeViewFromAlarm" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.OpenPlcCodeViewFromAlarm() (Page 1563)

9.2.36 ResetBitInTag

Description

Sets the bit with the specified number to 0 in the tag (False).

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. Operator and PLC have read-only access to the indicated tag until it is transferred back to the PLC.

For the system function to be executed, the value of the tags must be current and valid, which means the quality code must correspond to Good (cascade).

The following conditions must be met for external tags:

- the connection to the PLC is set up and
- the acquisition mode of the tags is "Cyclic in operation" and
- the tag is used at the "Process value" property of an object.

Note

The system function is executed with the last known process value. Since this process value cannot be kept up to date in all cases, it is prohibited to write it from multiple sources (e.g. from the HMI device via scripts and from the PLC). This ensures that the value that is changed actually corresponds to the process value.

Use in the function list

ResetBitInTag (Tag, Value)

The system function "ResetBitInTag" has the following parameters:

Parameter	Description
Tag	The tag in which a bit is set to 0 (False).
Bit number	The number of the bit that is set to 0 (False). When this system function is used in a user function, the bits in the given tag will be counted from right to left independent of the controller that is used. Numbering starts with 0.

Use in scripts

You can find more information on using the "ResetBitInTag" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.ResetBitInTag() (Page 1385)

9.2.37 ShiftAndMask

Description

The system function converts the input bit pattern of the source into an output bit pattern of the target. This involves bit shifting and masking. An integer number serves as bit mask, with whose bit pattern the shifted input bit pattern is multiplied. The shifted input bit pattern is multiplied by the bit mask, with bit-by-bit logical AND operation. The result has a decimal value and is stored in the target.

The following conditions must be met for external tags:

- the connection to the PLC is set up and
- the acquisition mode of the tags is "Cyclic in operation" and
- the tag is used by an object, e.g. an I/O field.

You can enter the bit mask in three different ways:

- Hexadecimal: First, enter "0h" or "0H" as prefix, followed by an optional space for better readability. Then group the bit pattern in blocks of four, for example (0000)(1001)(1010)(1110), and set each block in hexadecimal code: (0)(9)(A)(E). Only the characters 0-9, A-F, a-f are permitted for the input: "0h 09AE".
- Binary: First, enter "0b" or "0B" as prefix, followed by an optional space for better readability. Then group the binary bit pattern into blocks of four, for example 0000 1001 1010 1110 with spaces in between as a check. Only the characters "0" or "1" are permitted for the input: "0b 0000 1001 1010 1110".
- Decimal: Enter the value directly without prefix, for example "2478".

Use in the function list

ShiftAndMask (Source, Target, Bits to shift, Bit pattern)

The system function "ShiftAndMask" has the following parameters:

Parameter	Description
Source	The Source parameter includes the input bit pattern. Integer-type tags, e.g. "Byte", "Char", "Int", "UInt", "Long" and "ULong", are permitted. Example: The source of the 16-bit integer type has the current value 72: 0000000001001000.
Target	The output-bit pattern is stored in the Target. Integer type tags, e.g. "Byte", "Char", "Int", "UInt", "Long" and "ULong" are permitted.
Bits to shift	Number of bits by which the input bit pattern is shifted right. A negative value shifts the input bit pattern to the left. Example: "Bits to shift" has the value "+3". The input bit pattern is shifted right by three bits when the system function is called: 0000000000001001. Bits to the left are padded with "0". Three bits are truncated on the right. The new decimal value is "9".
Bit pattern	An integer serves as bit mask. The bit pattern is used to multiply the shifted input bit pattern.

Note

Note the following:

- Source and target have the same number of bits. When the source and target have a different number of bits, using the system function in the target can result in a violation of the value range.
- The number of the bits to shift is smaller than the number of bits of source and target.
- Bit pattern has no more bits than source and target.
- The left bit is "1" if the source has a signed Integer data type with the sign "-". This sign bit is padded with "0" when the bits are shifted right. The sign changes to "+".

Use in scripts

You can find more information on using the "ShiftAndMask" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.ShiftAndMask() (Page 1388)

9.2.38 ClosePopup

Description

Closes a pop-up window dynamically during runtime.

Use in the function list

ClosePopup (popup window path)

The system function "ClosePopup" has the following parameters:

Parameter	Description
Popup window path	Specifies the path to the popup window to be closed.

Use in scripts

You can find more information on using the "ClosePopup" system function in JavaScript functions in the WinCC Unified object model.

See also

Opening and closing a screen in a pop-up window (Page 1017)

SysFct.ClosePopup() (Page 6841)

9.2.39 WriteParameterSet

Description

Writes the values of the edit tag to the PLC.

Use in the function list

WriteParameterSet (Parameter set type, Output status, Processing status (optional))

The system function "WriteParametersSet" has the following parameters:

Parameter	Description
Parameter set type	Specifies the name or the ID of the parameter set type. If the name or ID of the parameter set type does not exist, execution is terminated.
Output status	Defines the output status: True = Alarms are output. False = Alarms are not output.
Processing status (optional)	Indicates the execution status of a function: 2 = Function is being executed. 4 = Function successfully executed. 12 = Function was canceled.

Using scripts

You can find more information on the "WriteParameterSet" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.WriteParameterSet() (Page 1266)

9.2.40 WriteManualValue

Description

Assigns a new value to the specified logging tag. The associated time stamp is transferred in this process.

Use in the function list

WriteManualValue (Logging tag name, Value, Time stamp)

The system function "WriteManualValue" has the following parameters:

Parameter	Description
Logging tag name	Logging tag to which the specified value is assigned.
Value	The value assigned to the specified logging tag.
Time stamp	The time stamp assigned to the specified value.

Use in scripts

You can find more information on using the "WriteManualValue" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.WriteManualValue() (Page 1332)

9.2.41 SetBitInTag

Description

Sets the bit with the specified number to 1 in the tag (True).

After the specified bit is changed, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. HMI device and PLC only have read access to the specified tag until it is transferred back to the PLC.

For the system function to be executed, the value of the tags must be current and valid, and the quality code must correspond to Good (cascade).

The following conditions must be met for external tags:

- The connection to the PLC is set up.
- The acquisition mode of the tags is "Cyclic in operation".
- The tag is used at the "Process value" property of an object.

Note

The system function is executed with the last known process value. Since this process value cannot be kept up to date in all cases, it is prohibited to write it from multiple sources (e.g. from the HMI device via scripts and from the PLC). This ensures that the value that is changed actually corresponds to the process value.

Data types not supported

The following data types are not supported by the function:

- UINT

Use in the function list

SetBitInTag (Tag, Value)

The "SetBitInTag" system function has the following parameters:

Parameter	Description
Tag	The tag in which a bit is set to 1 (True).
Bit number	The number of the bit that is set to 1 (True). When this system function is used in a user function, the bits in the given tag will be counted from right to left independent of the controller that is used. Numbering starts with 0.

Use in scripts

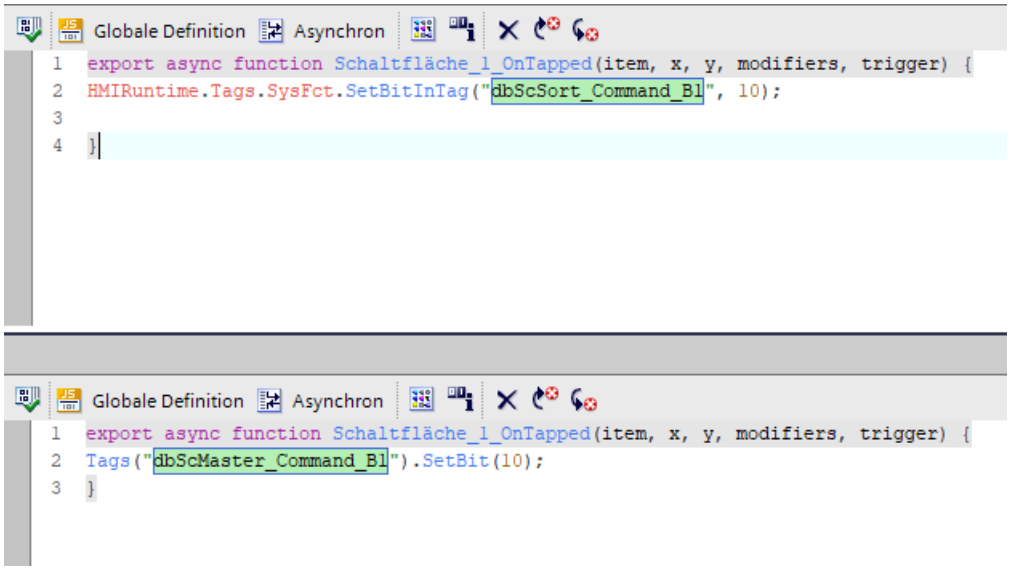
You can find more information on using the "SetBitInTag" system function in JavaScript functions in the WinCC Unified object model.

Use of "SetBitInTag" in structure tags

If "SetBitInTag" is used at a structure tag, the result is that after setting and resetting individual bits, all previously changed bits are overwritten when they are set again. This occurs, for example, as a result of an event of a button.

To prevent this, follow these steps:

1. Convert the function at the event to JavaScript.



2. Replace the "SetBitInTag" system function with the "SetBit()" method of the "Tags" object.

See also

Tag.SetBit() (Page 1351)

SysFct.SetBitInTag() (Page 1386)

9.2.42 SetDHCPState

Description

Changes the DHCP setting of the network adapter.

Note

The "SetDHCPState" system function is only available for WinCC Unified Comfort Panel. The system outputs a compiler warning if the function is used through manual input or through a device replacement in SIMATIC WinCC Unified PC.

Use in the function list

SetDHCPState (Adapter name, Enabled, IP V6 (optional))

The system function "SetDHCPState" has the following parameters:

Parameter	Description
Adapter name	Specifies the name of the network adapter. The following entries are possible: • X1 = Static network adapter name 1 • X2 = Static network adapter name 2 • Manual input
Enabled	Defines the DHCP setting of the network adapter: 0 = DHCP is disabled. 1 = DHCP is enabled.
IP V6 (optional)	Tag to which the IPv6 address is written.

Use in scripts

You can find more information on using the "SetDHCPState" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.SetDHCPState() (Page 1173)

9.2.43 SetPropertyValue

Description

Assigns a new value to the specified property of the screen item.

Note

Depending on the type of the object property, you can use this system function to assign strings and numbers.

Use in the function list

SetPropertyValue (Screen item path, Screen item property name, Value)

The system function "SetPropertyValue" has the following parameters:

Parameter	Description
Screen object path	Path of the screen item whose property is changed.
Screen object property name	Name of the property that will be changed. The property name can be copied with selected screen item to the Inspector window under "Properties > Properties": 1. Right-click the name of the property. 2. Select "Copy property name".
Value	The value assigned to the property.

Use in scripts

You can find more information on using the "SetPropertyValue" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.SetPropertyValue() (Page 6849)

9.2.44 SetBrightness

Description

Assigns a new value to the brightness of the display.

The value for the system function "SetBrightness" can be set between 0% and 100%. The set value is transferred to the HMI device. The brightness settings on the HMI device can be viewed and edited in "Start Center > Settings > Display". The HMI devices support a brightness setting between 10% and 100%.

If the system function "SetBrightness" is assigned a value of 0%, the display of the HMI device is switched off by default in runtime. If the operator touches the display, the display switches to the previous brightness setting.

If the system function "SetBrightness" is assigned a value between 1% and 10% and the operator opens the display settings in the Start Center, brightness is reset to 10%.

Note

The "SetBrightness" system function is only available for WinCC Unified Comfort Panel. The system outputs a compiler warning if the function is used through manual input or through a device replacement in SIMATIC WinCC Unified PC.

Note

The configuration that is set in the Control Panel / Start Center will be reestablished when you restart the HMI device.

Use in the function list

SetBrightness (value)

The system function "SetBrightness" has the following parameters:

Parameter	Description
Value	The new value for the brightness of the display.

Use in scripts

You can find more information on using the "SetBrightness" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.SetBrightness() (Page 1172)

9.2.45 SetIPV4Address

Description

Changes the IPv4 settings of the network adapter.

Note

The "SetIPV4Address" system function is only available for WinCC Unified Comfort Panel. The system outputs a compiler warning if the function is used through manual input or through a device replacement in SIMATIC WinCC Unified PC.

Use in the function list

SetIPV4Address (Name adapter, IP address, Subnet mask, Standard gateway (optional), DNS Server 1 (optional), DNS Server 2 (optional))

The system function "SetIPV4Address" has the following parameters:

Parameter	Description
Adapter name	Specifies the name of the network adapter. The following entries are possible: • X1 = Static network adapter name 1 • X2 = Static network adapter name 2 • Manual input
IP address	Specifies the IP address.
Subnet mask	Subnet mask of the IPv4 network.
Default gateway (optional)	IP address of the default gateway.
DNS server 1 (optional)	IP address of DNS server 1.
DNS server 2 (optional)	IP address of DNS server 2.

Use in scripts

You can find more information on using the "SetIPV4Address" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.SetIPV4Address() (Page 1174)

9.2.46 SetNetworkInterfaceState

Description

Changes the state of the network adapter.

Note

The "SetNetworkInterfaceState" system function is only available for WinCC Unified Comfort Panel. The system outputs a compiler warning if the function is used through manual input or through a device replacement in SIMATIC WinCC Unified PC.

Use in the function list

SetNetworkInterfaceState (Adapter name, Enabled)

The system function "SetNetworkInterfaceState" has the following parameters:

Parameter	Description
Adapter name	Specifies the name of the network adapter. The following entries are possible: • X1 = addresses PROFINET (X1) Port 0. • X1.0 = addresses PROFINET (X1) Port 0. • X1.1 = addresses PROFINET (X1) Port 1. • X2 = addresses Ethernet (X2). • Manual input
Enabled	Specifies the state of the network adapter: 0 = Network adapter is disabled. 1 = Network adapter is enabled.

Note

The Panel must be restarted after a change in the status of X1.0 or X1.1.

Use in scripts

You can find more information on using the "SetNetworkInterfaceState" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.SetNetworkInterfaceState() (Page 1176)

9.2.47 SetLanguage

Description

Toggles the language on the HMI device. All configured texts and system events are displayed on the HMI device in the newly set language.

Use in the function list

SetLanguage (LCID)

The system function "SetLanguage" has the following parameters:

Parameter	Description
LCID	LCID of the language set on the HMI device. Specify the language ID, e.g. 1031 for German - Standard, 1033 for English - USA. You can find an overview of all languages under: "https://docs.microsoft.com/de-de/deployoffice/office2016/language-identifiers-and-optionstate-id-values-in-office-2016".

Use in scripts

You can find more information on using the "SetLanguage" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.SetLanguage() (Page 6845)

9.2.48 SetSmartServerState

Description

Allows you to enable or disable the smart server.

Note

The "SetSmartServerState" system function is only available for WinCC Unified Comfort Panel. The system outputs a compiler warning if the function is used through manual input or through a device replacement in SIMATIC WinCC Unified PC.

Use in the function list

SetSmartServerState (Status)

The "SetSmartServerState" system function has the following parameters:

Parameter	Description
Status	Status to which the Smart Server is to be set: True = Smart Server is enabled. False = Smart Server is disabled.

Use in scripts

You can find more information on using the "SetSmartServerStart" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.SetSmartServerState() (Page 1177)

9.2.49 SetTagValue

Description

Assigns the specified tag a new value.

Depending on the tag type, you use this system function to assign strings and numbers.

Note

The "SetTagValue" system function is only executed after a connection has been established.

Use in the function list

SetTagValue (Tag, Value)

The system function "SetTagValue" has the following parameters:

Parameter	Description
Tag	Tag to which the specified value is assigned.
Value	The value that is assigned to the specified variable.

Use in scripts

You can find more information on using the "SetTagValue" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.SetTagValue() (Page 1387)

9.2.50 SetConnectionMode

Description

The specified connection is established or disconnected.

Use in the function list

SetConnectionMode (Connection name, Activated)

The "SetConnectionMode" system function has the following parameters:

Parameter	Description
Connection name	The PLC whose connection to the HMI device is established or disconnected. You specify the name of the PLC in the connection editor.
Enabled	0 = Offline: Connection is terminated. 1 = Online: Connection is established.

Use in scripts

You can find more information on using the "SetConnectionMode" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.SetConnectionMode() (Page 1152)

9.2.51 SaveParameterSet

Description

Saves the current values of the edit tag of a parameter set to the memory of the HMI device.

Use in the function list

SaveParameterSet (Parameter set type, Parameter set, Output status, Overwrite, Processing status (optional))

The system function "SaveParametersSet" has the following parameters:

Parameter	Description
Parameter set type	Specifies the name or the ID of the parameter set type. If the name or ID of the parameter set type does not exist, execution is terminated.
Parameter set	Specifies the name or the ID of the parameter set. If the name or ID of the parameter set does not exist, a new parameter set is created.
Overwrite	Specifies whether an existing parameter set is overwritten: 0 = Overwriting is not allowed. 1 = Overwriting is allowed. The following cases are differentiated: • If the name / ID of the specified parameter set exists, the values in the PLC are overwritten with the parameter set values in the memory if overwriting is allowed. • If overwriting is not allowed, the data in the memory is not replaced. The process tag is updated to the status of the system function, if configured accordingly.

Parameter	Description
Output status	Defines the output status: True = Alarms are output. False = Alarms are not output.
Processing status (optional)	Indicates the execution status of a function: 2 = Function is being executed. 4 = Function successfully executed. 12 = Function was canceled.

Using scripts

You can find more information on the "SaveParameterSet" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.SaveParameterSet() (Page 1264)

9.2.52 StartProgram

Description

Starts the specified program on the HMI device.

The runtime software continues running in the background.

Alarms continue to be output and process values continue to be updated.

When the given application is exited, the screen which was active during the performance of the system function is displayed on the HMI device.

This system function is used, for example, to edit recipe data records in MS Excel on the HMI device.

The function is supported by both the Windows and Linux systems.

Note

On a SIMATIC Unified PC, this system function can only be used to start applications that do not have a user interface.

Use in the function list

StartProgram (Program name, Program parameters, Display mode, Wait for end of program, Result (optional))

The system function "StartProgram" has the following parameters:

Parameter	Description
Program name	Name and path of the program which is started. Upper and lower case are taken into account in this parameter.
Program parameters	The parameters you transfer at the start of the program, for example a file that is opened after the start of the program. You can find additional information on the necessary parameters in the documentation of the program to be started.
Display mode	Determines how the program window is displayed on the HMI device. This function has no effect on Linux systems.
Waiting for program to end	Determines whether there is a change back to the project after the called up program has ended: 0 = No change to project. 1 = Change to project.
Result (optional)	Contains data that can be written to the standard output from an external application.

Note

If the path for the program name contains spaces, the program can only be started correctly if the path is specified in quotation marks, e.g. "C:\Program Files\START\start.exe".

Use in scripts

You can find more information on using the "StartProgram" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.StartProgram() (Page 1179)

Win32 Microsoft (https://docs.microsoft.com/en-us/locale/?target=https://docs.microsoft.com/en-us/windows/win32/api/winuser/nf-winuser-showwindow)

9.2.53 StopRuntime

Description

Ends the runtime software and the project running on the HMI device.

The system function can be used with or without parameters. If no parameters are specified, the system function remains undefined and stops the running project. In this case, the HMI device is not restarted.

Note

All functions after "StopRuntime" are not executed.

Use in the function list

StopRuntime (StopRuntime, stop runtime and restart operating system)

The "StopRuntime" system function can be used with or without the following parameter:

Parameter	Description
Mode (optional)	Sets the type of termination: 0 = Ends runtime. 1 = Ends runtime and restarts the device.

Use in scripts

You can find more information on using the "StopRuntime" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.StopRuntime() (Page 1181)

9.2.54 LookUpText

Description

Identifies a list entry from a text list. The result depends on the value of the list entry and the selected runtime language. The result is saved to a tag of data type "String".

Use in the function list

CallText (output text, index, LCID, text list name)

The system function "LookUpText" has the following parameters:

Parameter	Description
Output text	The tag to which the result is written.
Index	The tag that defines the value of the list entry.

Parameter	Description
LCID	LCID of the language set on the HMI device. Specify the language ID, e.g. 0x0409 for English - USA, 0x0007 for German - Standard. You can find an overview of all languages under: "https://msdn.microsoft.com/en-us/library/cc233982.aspx".
Text list name	Defines the text list. The list entry is read from the text list.

Use in scripts

You can find more information on using the "LookUpText" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.LookUpText() (Page 1312)

9.2.55 RenameParameterSet

Description

Changes the name of a parameter set.

Use in the function list

RenameParameterSet (Parameter set type, Parameter set, NewParameterSetName, Output status, Processing status (optional))

The system function "RenameParametersSet" has the following parameters:

Parameter	Description
Parameter set type	Specifies the name or the ID of the parameter set type. If the name or ID of the parameter set type does not exist, execution is terminated.
Parameter set	Specifies the name or the ID of the parameter set. If the name or ID of the parameter set does not exist, execution is terminated.
New parameter set name	Specifies the new name of the parameter set in the current Runtime language.
Output status	Defines the output status: True = Alarms are output. False = Alarms are not output.
Processing status (optional)	Indicates the execution status of a function: 2 = Function is being executed. 4 = Function successfully executed. 12 = Function was canceled.

Using scripts

You can find more information on the "RenameParameterSet" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.RenameParameterSet() (Page 1262)

9.2.56 ToggleGRAPHViewerMode

Description

Switches to the GRAPH-Viewer Mode of the PLC code view.

Use in the function list

ToggleGRAPHViewerMode (object path to PLC code view)

The system function "ToggleGRAPHViewerMode" has the following parameters:

Parameter	Description
Object path to PLC code display	Path to the PLC code view.

Using scripts

You can find more information on the "ToggleGRAPHViewerMode" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.ToggleGRAPHViewerMode() (Page 1569)

9.2.57 ToggleNetworkDisplay

Description

Switches to the network display of the PLC code view.

Use in the function list

ToggleNetworkDisplay (Object path to PLC code view)

The system function "ToggleNetworkDisplay" has the following parameters:

Parameter	Description
Object path to PLC code display	Path to the PLC code view.

Using scripts

You can find more information on the "ToggleNetworkDisplay" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.ToggleNetworkDisplay() (Page 1570)

9.2.58 ToggleLanguage

Description

This function allows you to change the runtime language in order to display language-dependent texts correctly on the user interface. The conversion takes place according to the runtime language configuration.

Use in the function list

ToggleLanguage()

The system function "ToggleLanguage" has no parameters.

Use in scripts

You can find more information on using the "ToggleLanguage" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.ToggleLanguage() (Page 6849)

9.2.59 ZoomIn

Description

Zooms in the view of the network in the network area of a PLC Code View.

Use in the function list

Zoom in (Object path to PLC code view)

The system function "ZoomIn" has the following parameters:

Parameter	Description
Object path to PLC code display	Path to the PLC code view.

Using scripts

You can find more information on the "ZoomIn" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.ZoomIn() (Page 1570)

9.2.60 ZoomOut

Description

Zooms out of the view of the network in the network area of a PLC code view.

Use in the function list

ZoomOut (Object path to PLC code view)

The system function "ZoomOut" has the following parameters:

Parameter	Description
Object path to PLC code display	Path to the PLC code view.

Using scripts

You can find more information on the "ZoomOut" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.ZoomOut() (Page 1571)

9.2.61 DecreaseTag

Description

Subtracts the given value from the tag value: X = X - a

If you configure the system function for events of an alarm without the tag being used in the current screen, it is not ensured that the actual tag value is being used in the PLC.

For the system function to be executed, the value of the tags must be current and valid, which means the quality code must correspond to Good (cascade).

The following conditions must be met for external tags:

- the connection to the PLC is set up and
- the acquisition mode of the tags is "Cyclic in operation" and
- the tag is used at the "Process value" property of an object.

Note

The system function is executed with the last known process value. Since this process value cannot be kept up to date in all cases, it is prohibited to write it from multiple sources (e.g. from the HMI device via scripts and from the PLC). This ensures that the value that is changed actually corresponds to the process value.

Use in the function list

DecreaseTag (Tag, Value)

The system function "DecreaseTag" has the following parameters:

Parameter	Description
Tag	Tag from which the specified value is subtracted. The following data types are not supported: Byte, Word, DWord, LWord.
Value	Value to be subtracted.

Note

Converting a value

The system function uses the same tag as input and output values. If you are using this system function to convert a value, follow these steps:

1. Create an auxiliary tag.
2. Assign the tag value to the auxiliary tag with the "SetTagValue" system function.

Use in scripts

You can find more information on using the "DecreaseTag" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.DecreaseTag() (Page 1383)

9.2.62 ChangeScreen

Description

Loads a new screen into a screen window.

Note

The function list is updated when the screen changes. The functions after "ChangeScreen" are therefore not executed.

Always execute "ChangeScreen" as the last function.

Use in the function list

ChangeScreen (Screen name, Screen window path)

The system function "ChangeScreen" has the following parameters:

Parameter	Description
Screen name	Name of the screen to which you change.
Screen window path	Path of the screen window or base screen that is displayed after the change has been completed. You can find additional information at "Addressing screen windows".

Use in scripts

You can find more information on using the "ChangeScreen" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.ChangeScreen() (Page 6837)

9.2.63 ChangeScreenAsync

Description

Switches the screen in a screen window. Switching only takes place after the current screen has been fully loaded.

Principle

ChangeScreenAsync (Screen name, Screen window path)

The system function "ChangeScreenAsync" has the following parameters:

Parameter	Description
Screen name	Specifies the name of the new screen.
Screen window path	Specifies the path of the screen window in which the screen is to be switched, for example, "Screen_window_1"

Using scripts

You can find more information on the "ChangeScreenAsync" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.ChangeScreenAsync() (Page 6837)

9.2.64 ChangeScreenAsyncWithNumber

Description

Switches the screen asynchronously in a screen window. Switching only takes place after the current screen has been fully loaded.

Principle

ChangeScreenAsyncWithNumber (screen number, screen window path)

The system function "ChangeScreenAsyncWithNumber" has the following parameters:

Parameter	Description
Screen number	Unique number (> 0) of the new screen to which you change.
Screen window path	Path of the top-level screen window or screen in which the screen is to be switched, for example, "Screen_window_1"

Using scripts

You can find more information on the "ChangeScreenAsyncByNumber" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.ChangeScreenAsyncByNumber() (Page 6838)

9.2.65 ChangeScreenWithNumber

Description

Performs a screen change to the specified screen window.

Note

The function list is updated when the screen changes. The functions after "ChangeScreenWithNumber" are therefore not executed.

Always execute "ChangeScreenWithNumber" as the last function.

Use in the function list

ChangeScreenWithNumber (screen number, screen window path)

The system function "ChangeScreenWithNumber" has the following parameters:

Parameter	Description
Screen number	Unique number (> 0) of the new screen to which you change.
Screen window path	Path of the top-level screen window or screen in which the screen is to be switched, for example, "Screen_window_1"

Use in scripts

You can find more information on using the "ChangeScreenByNumber" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.ChangeScreenByNumber() (Page 6840)

9.2.66 ChangeConnection

Description

Changes the connection parameters of an HMI connection. The following parameters can be changed: The IP address, the slot number and the rack number. Because the function is executed synchronously, the return value returns an error code that provides immediate information about the cause of the error. The error code can only be read if the function is called via a script.

Note

Change of function parameters after a function call

With the execution of the function you change the function parameters. The new connection may not be active yet at this point.

Note

Usage on devices of the S7 Plus PLC family

For devices of the S7 Plus PLC family (PLCs 15xx and 12xx) it is not possible to change the slot or the rack. The system function cannot be executed if parameters for slot or rack are set.

Use in the function list

ChangeConnection (Connection name, IP V4 address, Slot (optional), Rack (optional))

The "ChangeConnection" system function has the following parameters:

Parameter	Description
Connection name	Indicates the name of the connection.
IP V4 address	Specifies the IPv4 address. Example: 192.169.153.45
Slot (optional)	Specifies the slot number. Permitted values from 1 to 32.
Rack (optional)	Specifies the rack number. Permitted values from 0 to 7.

Use in scripts

You can find more information on using the "ChangeConnection" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.ChangeConnection() (Page 1150)

9.2.67 Next

Description

Goes to the next network in a PLC code view.

Use in the function list

Next (Object path to PLC code view)

The system function "Next" has the following parameters:

Parameter	Description
Object path to PLC code display	Path to the PLC code view.

Using scripts

You can find more information on the "Next" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.Next() (Page 1561)

9.2.68 ShowControlPanel

Description

- Hides or shows the Control Panel.
- Opens an applet in runtime.

Note

The "ShowControlPanel" system function is only available for WinCC Unified Comfort Panel. The system outputs a compiler warning if the function is used through manual input or through a device replacement in SIMATIC WinCC Unified PC.

Use in the function list

ShowControlPanel (Home)

The "ShowControlPanel" system function has the following parameter:

Parameter	Description
Home page	Specifies the applet to be displayed: "AppletName"

Use in scripts

You can find more information on using the "ShowControlPanel" system function in JavaScript functions in the WinCC Unified object model.

List of available applets

List of applet names that are available to the system function:

Display page	Applet name
Panel information	SystemProperties.PanelInformation
Display	SystemProperties.Display
Screensaver	SystemProperties.Screensaver
Reboot	SystemProperties.Reboot
Network settings	NetworkandInternet.NetworkSettings

See also

SysFct.ShowControlPanel() (Page 1178)

9.2.69 ShowSoftwareVersion

Description

Hides or shows the version number of the Runtime software.

Use this system function if during servicing, for example, you required the version of the runtime software used.

Note

The "ShowSoftwareVersion" system function is only available for WinCC Unified Comfort Panel. The system outputs a compiler warning if the function is used through manual input or through a device replacement in SIMATIC WinCC Unified PC.

Use in the function list

ShowSoftwareVersion ()

The system function "ShowSoftwareVersion" has no parameters.

Use in scripts

You can find more information on using the "ShowSoftwareVersion" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.ShowSoftwareVersion() (Page 1178)

9.2.70 Previous

Description

Navigates to the previous network in a PLC code view.

Use in the function list

Previous (Object path to PLC code view)

The "Back" system function has the following parameter:

Parameter	Description
Object path to PLC code display	Path to the PLC code view.

Using scripts

You can find more information on the "Previous" system function in JavaScript functions in the WinCC Unified object model.

See also

SysFct.Previous() (Page 1567)

Programming scripts 10

10.1 Runtime scripting

10.1.1 Introduction to runtime scripting

Area of application

You use Runtime Scripting in WinCC for the following tasks in runtime:

- Dynamization of properties
- Triggering functions for an event

Runtime Scripting uses JavaScript as the programming language. Runtime Scripting is supported at the following objects:

- Screen
- Screen object
- Task

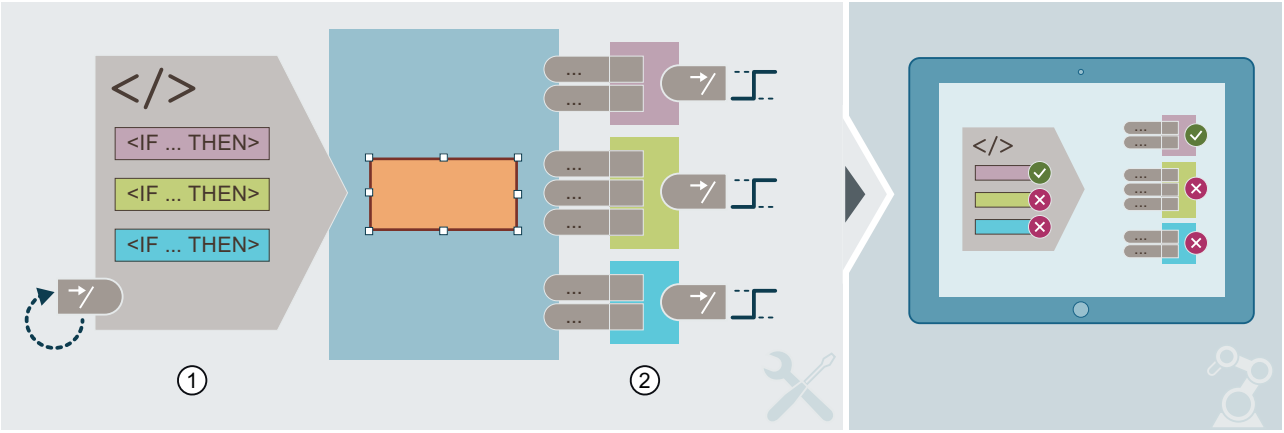
Global modules for frequently required functions

Global modules contain scripts which are available in the entire project. Global modules are therefore suitable for configuring frequently required functions.

Using scripts for dynamization

The properties of screens and screen items can be dynamized via local scripts. In addition, a screen or screen item has its own script area to create a "Global definition".

The "Global definition" is used to define modules, local tags and functions and to import other modules with "Import".



① Global definition for screen or screen item
② Local scripts per property

Input support

The "Scripts" editor assists you in entering code through:

- Syntax highlighting
- Snippets
- System functions
- Referencing HMI objects
- Tooltips
- Autocomplete
- Error marking and correction

See also

Global modules (Page 978)

Local scripts (Page 980)

Configuring a script to an event (Page 987)

Dynamizing object properties by script (Page 988)

Input support (Page 982)

10.1.2 Basics

Scripting environment

WinCC provides you with a modern scripting environment that you can use to automate a variety of system components, such as the graphical runtime system.

In the process, the scripting environment forms individual elements of the system components, such as the screens of the graphical runtime system, through an object model. You use this object model in your scripts to solve a variety of tasks or to control processes.

The script environment in WinCC offers:

- Efficiency and current technologies
  The scripting environment supports Unicode and uses JavaScript (JS) as the scripting language. The scripting environment is object-oriented and offers numerous asynchronous operations for high-performance and secure script execution.
- Support of mass data
  The script environment is optimized for the processing of mass data, for example the writing of 1000 tags in one pass. Special script objects are available to this purpose that record numerous HMI objects of the same type. These script objects execute operations on all the HMI objects simultaneously instead of processing each HMI object individually.

JavaScript

The script environment supports JavaScript according to the ECMAScript Language Specification. Google V8 is used as the script engine.

To find out which version of Node.js you are using, follow these steps:

1. Opens the file explorer.
2. Switch to "C:\Program Files\Siemens\Automation\WinCCUnified\WebRH\bin"
   The path may differ depending on the installation settings.
3. Open the shortcut menu of the file: "node.exe".
4. You can find the version used under "Details > Product version".

An overview of the functions that can be used in the individual versions of Node.js can be found under: https://node.green/ (https://node.green/).

Scripts in WinCC

As a rule the script environment executes all the scripts on the server side (NodeJS). Referenced external resources such as files used in the script therefore have to be available in the server environment.

Restrictions

The use of JavaScript is restricted when used with WinCC.

Functions that access external resources are not available:

- Access to the file system via the Node.js module "fs".
  Use WinCC Unified functions instead, for example `HMIRuntime.FileSystem.WriteFile()`, `HMIRuntime.FileSystem.ReadFile()`
- Connection to other web servers and access to content on the Internet, e.g. via `XMLHttpRequest` or `fetch()`.
- Import of other Node.js modules, e.g. via "import ... from ...".
  This applies to both Node.js modules provided by third-party vendors and Node.js modules provided with the current Node.js version.
  Only global modules of the runtime in TIA Portal can be imported.

To access other web servers and to import other Node.js modules, follow these steps:

- Create your own application.
  - On the Panel: Edge app
  - on the PC: any app, JavaScript is recommended.
- Run the application independently of WinCC Unified.
- Results of the application are passed to the runtime via OpenPipe and corresponding HTML tags.

10.1.3 Notes on creating scripts

Tips and tricks in SiePortal

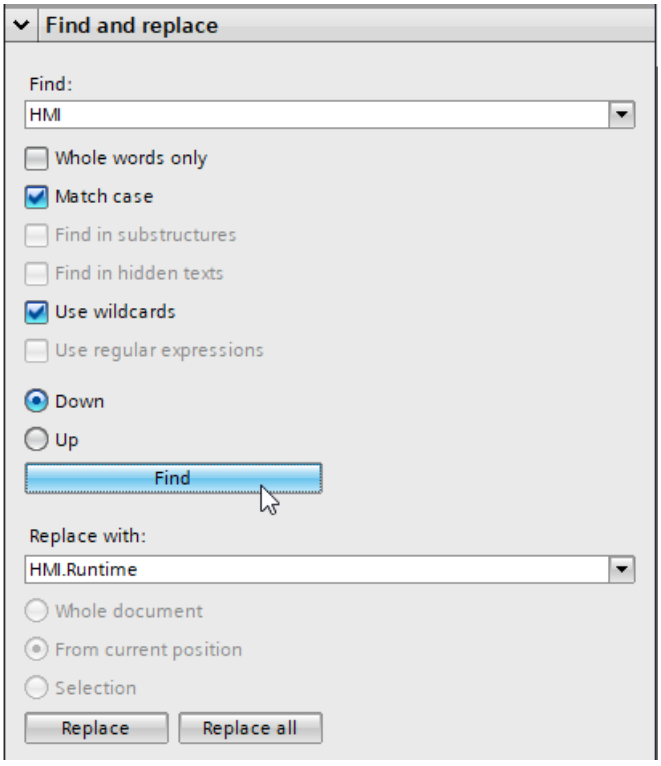
Get to know the options for creating scripts (JavaScript) in SIMATIC WinCC Unified and how you can quickly and easily create scripts with snippets. Tips and tricks on using objects via JavaScript are available for selected objects.

Tips and tricks in SiePortal: Tips and tricks for scripting (JavaScript) (https://support.industry.siemens.com/cs/ww/en/view/109758536)

Global search in scripts

Find and replace functions are available in a script.

1. To find strings that appear in a script or in the global definition range, use the global search in the project.
2. To open the "Find and replace" function, use menu "Edit > Search in project".
   - or -
   Press <Ctrl> + <F>.



The search is run on the script opened in the script editor.

The Find and replace function is also available if you open a script module type from a library for editing.

Floating-point numbers in JavaScript

JavaScript supports floating-point numbers with a mantissa of up to 54 bits. In scripting and Web client, values with a mantissa greater than 54 bits are therefore rounded.

This includes:

- Tag values
- Constants in the properties of screen objects

Note

Values with a mantissa of up to 64 bits are correctly displayed by I/O fields.

Triggering scripts

To improve performance, trigger the execution of scripts with tags. Avoid cyclic triggers.

Scripts with trigger tags

A script triggered by a tag is not allowed to write to this tag.

Using scripts during short cycle times

Calls of scripts with a short cycle time can lead to overloads.

Memory allocation by scripts

Memory usage by scripts is not limited in runtime. Pay particular attention to the size of the allocated memory when creating tags dynamically.

Application of graphic objects in runtime

Only those graphic objects which are referenced at least once, for example as an object reference in a script, are loaded in runtime. The assignment of a tag and the referencing of the tags does not function.

Example of correct referencing of a graphic object in a script:

```
Screen.Items("Grafikanzeige_1").Graphic =
HMIRuntime.Resources.Graphics("GraphicCollection.Up_Arrow").Name;
```

10.1.3.1 Data types

Data types in the object model

Unlike the basic JavaScript data types String, Number and Boolean, the data types in the WinCC object model are more typified.

The following table lists the utilized data types of the object model:

Data type	Description
Bool	Logical values (True/False)
UInt8	Unsigned 8-bit integer
Int8	Signed 8-bit integer
UInt16	Unsigned 16-bit integer
Int16	Signed 16-bit integer
UInt32	Unsigned 32-bit integer
Int32	Signed 32-bit integer
Float	Signed 32-bit floating-point number [1)]
String	Sequence of characters

Data type	Description
Variant	Object that can have any data type.
DateTime	Date/time information
StringStringMap	Map: Value pairs from strings
Promise	Object
Object	Object
Function	Method
ErrorCode	Error code

[1] JavaScript supports floating-point numbers with a mantissa up to 54 bits. In scripting and Web client, values with a mantissa greater than 54-bit are therefore rounded. This affects tag values and constants in the properties of screen objects.

Values with a mantissa of up to 64 bits are correctly displayed by I/O fields.

10.1.3.2 Object instances

Create objects

In the object model, all object instances are returned via access methods. There are no constructors that create objects.

Example

```
var t1 = Tags("Tag_1"); // returns HMITag object
var screenItem1 = Screen.FindItem("Button_1"); // returns HMIScreenItem
object
```

Error example

```
var t1 = new Tag("Tag_1"); // Error!
```

10.1.3.3 Enumerations

Description

Enumerations are enumeration types. Objects of this data type consist of elements with static values. Each permissible value has a unique name and an assigned integer.

Here is an example for the background fill pattern of screen objects. The enumeration has the name "HmiFillPattern" and defines the following 16 values with name and integer.

- Solid (0)
- Transparent (65536)
- Horizontal (131072)
- Vertical (131073)
- ForwardDiagonal (131074)
- BackwardDiagonal (131075)

- Cross (131076)
- DiagonalCross (131077)
- GradientHorizontal (1048576)
- GradientVertical (1048577)
- GradientForwardDiagonal (1048578)
- GradientBackwardDiagonal (1048579)
- GradientHorizontalTricolor (1048832)
- GradientVerticalTricolor (1048833)
- GradientForwardDiagonalTricolor (1048834)
- GradientBackwardDiagonalTricolor (1048835)

Use of enumerations

All enumeration can be found directly in context of their respective property.

Values of enumerations can be reference in scripts using the name or integer.

By way of example, the "GetSpecialFolder()" method of the "FileSystem" object is used for this in the following. This method can return the current temporary directory or the user directory according to the "FolderId" enumeration:

- TempDir (0): Directory for the temporary files
- HomeDir (1): Directory for the files of the current user

Referencing the value using the name of the element

Every enumeration can be addressed using the "Enums" object. This is followed by the name of the enumeration and the name of the desired element to reference the value:

Copy code

```
let tempDir =
HMIRuntime.FileSystem.GetSpecialFolder(HMIRuntime.FileSystem.Enums.FolderI
d.TempDir);
HMIRuntime.Trace("Temp folder path: " + tempDir);
```

Referencing the value using the integer of the element

The value can also be directly referenced using the integer of the element:

Copy code

```
let tempDir = HMIRuntime.FileSystem.GetSpecialFolder(0);
HMIRuntime.Trace("Temp folder path: " + tempDir);
```

10.1.3.4 Asynchronous operations

Promises in JavaScript

Promises are used in the script environment to handle asynchronous operations. A `Promise` object contains placeholders for results of an operation that are not yet known.

A `Promise` has the following status:

- Pending: Operation of the `Promise` object is still being executed.
- Settled: Operation of the `Promise` object has been completed.
  - Fulfilled: Operation was successful. Result is a value.
  - Rejected: Operation was unsuccessful. Result is a `reason`.
    `reason` may contain an error code for an object with text, links or any other conceivable contents of an object. For this reason, for targeted error processing, it is advisable for `reason` to use an instance of an `Error` object.

As soon as the operation has been completed, a corresponding Handler with the available result is called.

Promises minimize latencies (delay times caused by signal processing), because the script continues to be executed during evaluation. In contrast, a script stops with asynchronous calls. Promises allow clean error handling with the "`catch`" method.

Promises can be cascaded in order to transform results or to sequence asynchronous operations.

Using promises

In the simplest form, promises return a value or error which is processed with the "then" and "catch" methods of the `Promise` object:

```
getPromise()
.then(function(Value) {
    ...
})
.catch(function(ErrorCode) {
    ...
});
```

Cascaded promises each return a Promise and allow a sequence of asynchronous calls:

```
getPromise()
.then(return p1)
.then(return p2)
.then(return p3)
.catch();
```

The functions of the `Promise` objects are executed in the order p1 > p2 > p3 and the "catch" method is called in case of error. All tags of the calling function are also available in the internal functions.

10.1.3.5 Support for errors

The user has various options of diagnosing errors and then rectifying them.

Trace Log

WinCC writes a log file for every subsystem. This file contains helpful information of the respective subsystem for narrowing down possible error causes.

Note

The log files are located in the directory "%PROGRAMDATA%\Siemens\Automation\Logfiles\WinCC_Unified_SCADA_V*".

Trace Viewer

The Trace Viewer is an external application for the display and targeted filtering of Trace alarms.

See also

RTIL Trace Viewer (Page 1022)

10.1.3.6 Global modules

Global modules can only be linked with the global definition (script). All scripts except the global definition are simple functions.

The "import" statement must be a top-level statement.

Description

A global module is a container for one or more global functions with a shared definition area.

Several global modules can be created for each device.

Global modules are suitable for categorizing or grouping global functions.

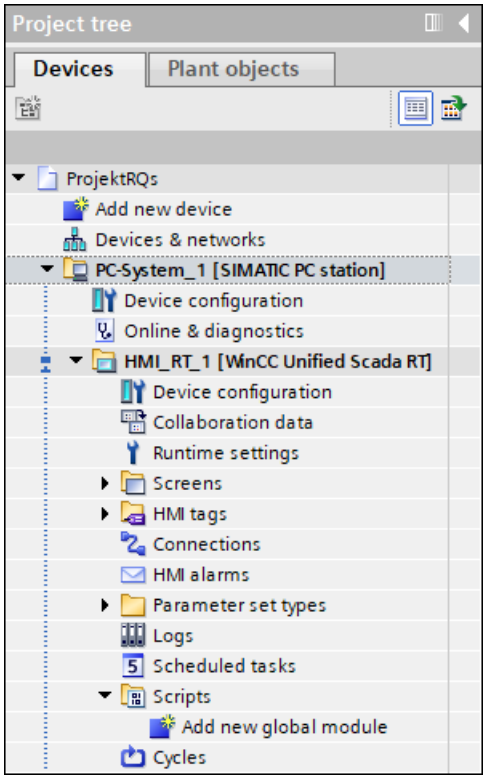
Note

Consider context when using global modules

After the import, a global module behaves like a local script. For example, it is not possible to use a global module on a task if a screen or screen object is referenced in the global module or an associated function. If an invalid reference to a screen or screen object is contained in a global module imported at a task, an error is output.

Call and view

Global modules are represented in the project tree in the respective device under "Scripts" as folder icons with the letters "JS" .



You can create new global modules via the shortcut menu of "Scripts".

You can create new global functions via the shortcut menu of the desired global module.

You can also add new global modules and functions via "Add ... new" in the project tree.

References to global modules

When you rename a global module, the alias is automatically renamed in all places where the global module is referenced.

References to functions defined in a global module are automatically updated in:

- Local scripts
- Global scripts
- Global definitions

Naming within the project remains consistent and runtime errors are avoided.

Examples

- General mathematical operations
- General logic operations
- Conversions of units of measurement

See also

Local scripts (Page 980)

10.1.3.7 Local scripts

A local script is a function written in JavaScript which is assigned to the object in question.

Starting local scripts

A local script is always started by a trigger:

- an event at a screen object
- a trigger on dynamization of object properties (cycle or change of a tag value)
- the event "Update" of a task in the Scheduler (cycle, change to a tag value or alarm)

Access to global modules

Local scripts can call functions which are contained in the scripts of global modules.

Applications

For example, local scripts can be used to

- dynamize object properties,
- process user entries and
- automatize complex operations

10.1.4 "Scripts" editor

10.1.4.1 Structure of the "Scripts" editor

In the "Scripts" editor, you create and edit customized JavaScript functions.

The "Scripts" editor can be opened in the following execution contexts:

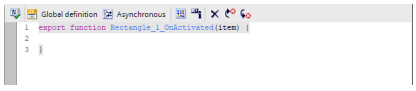
- Global functions in global modules
  You open the "Scripts" editor via the project tree by double-clicking a script.
- Local scripts which are triggered by events ("Images" editor and Scheduler)
  The "Scripts" editor is opened in the Inspector window under "Properties > Events" as soon as you have selected an event and selected the "Convert function list to script" button.
  Additional local scripts which are triggered by events can be triggered for each property under "Properties > Properties" for the events "Change" and "Quality code change".
- Local scripts for dynamizing object properties
  The "Scripts" editor is opened in the Inspector window under "Properties > Properties" as soon as you select the "Scripts" entry in the "Dynamization" column.

Different representation formats

Depending on the application, the "Scripts" editor is shown in different areas of TIA Portal and contains different operator controls.

Depending on the execution context, the code area opens either as a new editor window in the working area (global modules) or embedded in the Inspector window (local script).

Overview



The code area represents the actual JavaScript code.

Buttons are located above the code area. Depending on the application context, buttons are available with specific functions:

Button	Description	Global modules	Event-related functions	Dynamization of object properties
	Syntax check	✓	✓	✓
	Shows / hides the code area for the global definition.	×	✓	✓
	Specifies whether the function is synchronous/asynchronous	✓	✓	✓
	Enables the auto-completion of entries	✓	✓	✓
	Shows information or provides a tip for the place in the code where the insertion point is located	✓	✓	✓
	Deletes the script	×	✓	×
	Selects the trigger of dynamization (cycle or tag)	×	×	✓

Button	Description	Global modules	Event-related functions	Dynamization of object properties
	Sets the insertion point to the previous error in the code	✓	✓	✓
	Sets the insertion point to the next error in the code	✓	✓	✓

Note

Asynchronous functions cannot be used if the function returns a value.

Alternatively, the value can be specified via the respective property.

Shortcut menu

The shortcut menu contains so-called "snippets". Snippets provide frequently required code templates.

Input support (Page 982)

10.1.4.2 Input support

Introduction

You create the JavaScript code of your scripts in the code area of the "Scripts" editor.

The editor supports you with the following functions:

- Syntax highlighting
- Snippets (code templates)
- System functions
- Referencing HMI objects
- Tooltips
- Autocomplete
- Error marking and correction

Syntax highlighting

```
function OnAlarm(Errorcode, sysID, ResultSet) {
    HMIRuntime.Trace("Script OnAlarm Called");
    var index;
    var alarmCount = ResultSet.length;
    HMIRuntime.Trace("Alarm count = " + alarmCount);
    for (index = 0; index < alarmCount; ++index) {
        var name = ResultSet[index].Name;
        var alarm = HMIRuntime.Alarming.Alarms(name);
        alarm.CommentText = "Alarm is acknowledged and action done";
        alarm.ModificationTime = ResultSet[index].RaiseTime;
        alarm.Language = 1033;
        alarm.User = "My User Name";
        alarm.OperatorStation = "My Machine";
        var CommentErrorcode = alarm.SetComment();
        HMIRuntime.Trace("CommentErrorcode " + CommentErrorcode);
    }
}
```

The JavaScript code in the code area of the editor is highlighted in different colors to make it easier to read.

Snippets for programming support

Snippets are code templates for frequently required instructions: Snippets are divided into the following groups:

- HMIRuntime
  Contains Snippets for accessing the object model, e.g. "`Change base screen`" or "`Set Connection Mode`".
- Logic
  Contains Snippets such as "`If...Else`" or "`For loop`".
- Faceplate
  Only available in a faceplate.

You insert a Snippet in the local script via the shortcut menu.

System functions

The system functions are provided in the "Scripts" editor. For additional information, refer to "System functions".

Referencing HMI objects

HMI objects (e.g. tags and screens) are referenced in scripts.

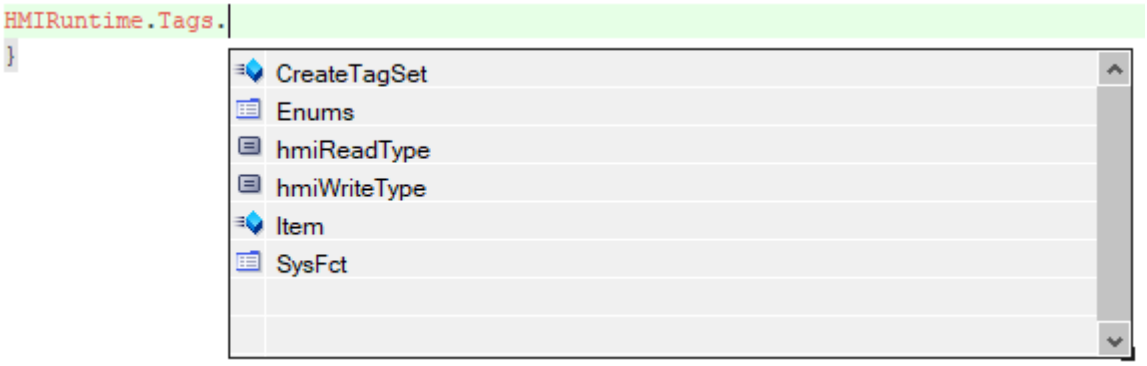
Therefore, you perform the following actions without editing the script:

- Rename HMI object
- Re-create a previously deleted HMI object
- Create HMI object used as text reference in the script

Info tips

While you compose the code, additional information about all objects of the WinCC Unified object model is displayed. For example, you receive information on the required parameters of the system functions.

Autocomplete



Autocomplete supports you in entering your code. Suitable objects of the WinCC Unified object model are displayed.

You call up autocomplete using the shortcut <Ctrl + I> or <Ctrl + Spacebar>.

<Ctrl+J>

The object selection can be called context-specifically by using the shortcut <Ctrl+J>. For example, you select screens, screen objects, tags, or graphics.

Error marking and correction

Errors can occur during compiling or during compiling and loading:

- Error while configuring
  Your JavaScript code is checked immediately during input for a variety of criteria and highlighted in color in case of errors.
  - To get a tooltip, move the cursor over the marking.
- Errors during compiling and loading
  Alarms during the compiling and loading of a project are displayed in the Inspector window in the "Info > Compile" tab.
  The "Scripts" editor supports you by displaying faulty scripts directly for editing:
  - To go directly to the "Scripts" editor, select the green arrow .

See also

System functions (Page 909)

10.1.4.3 Script and execution context

Introduction

Scripts are functions in the form of JavaScript code that you develop yourself.

You can use scripts to solve individual tasks, e.g.

- Automating processes
- Dynamizing objects
- Evaluating events, such as user input

The execution of a script is triggered by:

- An event
- A tag change
- A scheduled job

Preparation for creating and using scripts

In advance of creating the script, consider where you will enter the script and how it will be executed.

Depending on the objects and system components addressed, you enter the JavaScript code in different editors. The editors have a similar structure.

Depending on the execution context, the script is executed with different scopes.

Note

Each module has its own namespace, which means it is possible to use the same function name and global tag name in two modules.

The functions are distinguished by the symbol name of the imported module.

Example:

```
import * as modA from 'ModuleA';
import * as modB from 'ModuleB';
modA.function1();
modB.function1();
```

Execution context of the editor	Script context and referencing
"Script" editor in the "Screens" editor	Each screen has two independent script contexts: • Context for dynamization of properties • Context for evaluation of events The script of a property cannot access global tags of an event even in the same screen. Each script context references the modules that it has imported using the 'import' statement. However, each script context receives its own copy of the tags defined there.
"Script" editor for "Scheduled tasks"	All jobs share a script context. Different tasks can access common global tags. Each required module must be referenced by means of the 'import' statement.

Create "import" statement

A module can be referenced in a script or another module:

- Drag-and-drop the module to be referenced into the "Global Definition" area of the script or into the definition area of the module.

Note

Copying the "import" statement together with objects

If you copy a screen object and paste it into another screen, then the "import" statement is copied and pasted when the imported global module is used on the source object.

If the copied module has already been referenced under a different alias at the target, the copied module is inserted additionally.

10.1.4.4 Configuring a script to an event

Note

Restriction of "activated" and "deactivated" events

If the focus is on the affected screen item, scripts are executed at the "activated" and "deactivated" events.

Requirement

- One of the following objects is configured:
  - Task
  - Screen
  - Screen object

Procedure

To configure a script to an event, follow these steps:

1. Open the relevant editor.
2. Select the object.
3. Select the event under "Properties > Events" in the Inspector window.
4. Generate the local script.
5. Write the code.
6. Perform a syntax check.
7. Save the project.

10.1.4.5 Dynamizing object properties by script

Requirement

- One of the following objects is configured:
  - Screen
  - Screen object
- The selected object property supports the dynamization type "Script".

Procedure

1. Open the editor of the object in question.
2. Select the object.
3. Select the desired object property under "Properties > Properties" in the Inspector window.
4. Dynamize the object property:
   - Select the "Script" entry in the "Dynamization" column.
     The editor creates a script and is displayed in the Inspector window.
   - Write the code.
5. Select the trigger that triggers the dynamization in runtime.

Result

The script changes the selected property dynamically in line with the written code.

10.1.5 Examples

10.1.5.1 Notes on the code examples

General

The comments at the beginning of each code example are required for technical reasons.

At the same time these comments show the relationships between various code examples within a chapter.

Further comments in the code examples explain individual program code lines.

Executing examples

1. Set the language of the develop environment to "English", so that the object names used in the examples are automatically assigned correctly.
2. Create a project with corresponding screens in which you can configure buttons, I/O fields, etc. These elements are required to carry out the code examples.
3. Apply the code examples to the associated script areas.
4. Compile the project.
5. Start the simulation of the project.
6. Start the tracer to diagnose potential errors.

RTIL Trace Viewer (Page 1022)

10.1.5.2 Dynamizing the position of an object

Introduction

The example shows how to dynamically change an object position using JavaScript.

One classic application would be the adjustment of the object position to the size and/or position of adjacent objects on a screen.

Execution of example

1. Configure 4 tags with the names "HMI_Tag1" to "HMI_Tag_4".
2. Configure a screen with the following objects:
   - 4 objects of the type I/O field with the process values "HMI_Tag_1" to "HMI_Tag_4"
   - 1 object of the type "Circle" with the name "Circle_1"
   - 1 object of the type "Button" with the name "Button_1"
3. Dynamize the parameters "Position X" and ""Position" Y" of the objects "Circle_1" and "Button_1" using scripts.
4. Set the triggers for dynamization with the tags
   - HMI_Tag_1 for Button_1/Position X,
   - HMI_Tag_2 for Button_1/Position Y,
   - HMI_Tag_3 for Circle_1/Position X,
   - HMI_Tag_4 for Circle_1/Position Y.

   The scripts are started accordingly by changing the tag.
5. Copy the sample code below to your project.

Reading out and returning the tag **HMI_Tag_1**

The script with the function "`Circle_1_CenterX_Trigger(item)`" is created when the parameter "Position X" is dynamized by a script in the properties of the object "Circle_1".

```
//JEx: "Position X dynamization of a Circle with tags"
//TagsRequired: "HMI_Tag_1"
export function Circle_1_CenterX_Trigger(item) {
    var value = Tags("HMI_Tag_1").Read();
    return value;
}
```

Reading out and returning the tag **HMI_Tag_2**

The script with the function "`Circle_1_CenterY_Trigger(item)`" is generated when the parameter "Position Y" is dynamized by a script in the properties of the object "Circle_1".

```
//JEx: "Position Y dynamization of a Circle with tag"
//TagsRequired: "HMI_Tag_2"
export function Circle_1_CenterY_Trigger(item) {
    var value = Tags("HMI_Tag_2").Read();
    return value;
}
```

Reading out and returning the tag HMI_Tag_3

The script with the function "Button_1_Left_Trigger(item)" is generated when the parameter "Position X" is dynamized by a script in the properties of the object "Button_1".

```
//JEx: "Position X dynamization of a Button with tag"
//TagsRequired: "HMI_Tag_3"
export function Button_1_Left_Trigger(item) {
    var value = Tags("HMI_Tag_3").Read();
    return value;
}
```

Reading out and returning the tag HMI_Tag_4

The script with the function "Button_1_Top_Trigger(item)" is generated when the parameter "Position Y" is dynamized by a script in the properties of the object "Button_1".

```
//JEx: "Position Y dynamization of a Button with tag"
//TagsRequired: "HMI_Tag_4"
export function Button_1_Top_Trigger(item) {
    var value = Tags("HMI_Tag_4").Read();
    return value;
}
```

Result (in runtime)

The position of the object in question changes in accordance with the values entered in the I/O fields.

Notes on the code examples (Page 989)

10.1.5.3 Reading and writing tag values

Introduction

The example shows how to read, multiply and write the values from two tags ("HMI_Tag_2", "HMI_Tag_3") to another tag ("HMI_Tag_1").

In practical use, the tags could represent the following parameters:

- "HMI_Tag_1": Apparent power S
- "HMI_Tag_2": Electrical voltage U
- "HMI_Tag_3": Electrical current I

Executing an example

1. Configure three tags "HMI_Tag_1" to "HMI_Tag_3" of the type "Int".
2. You configure the following objects on a screen:
   – 1 button (in the example "Button_1")
   – 3 I/O fields with the process values "HMI_Tag_1" to "HMI_Tag_3"
3. Create a script for the event "Click left mouse button".
   The JavaScript editor creates the function "`Button_1_OnTapped(item, x, y, modifiers, trigger)`".
4. Insert the example code.

Sample code

```
//JEx: "Reading and writing tag values"
//Tags_Required: "HMI_Tag_1"; "HMI_Tag_2"; "HMI_Tag_3"
export function Button_1_OnTapped(item, x, y, modifiers, trigger) {
    Tags("HMI_Tag_1").Write(Tags("HMI_Tag_2").Read() * Tags("HMI_Tag_3").Read());
}
```

See also

Notes on the code examples (Page 989)

10.1.5.4 Simulating value changes in tags

Introduction

This example shows how tags are supplied with values in defined time intervals by a simulation.

With the simulation, demo projects can be created or tested without process integration.

Note

Connection of existing process tags leads to influencing of processes

The simulation writes the calculated values to the tags without further test steps.

- Do not link any external tags; these remain linked to any existing process.
  The simulation thus influences the process in which the external tag is integrated.
- If you purposely want to influence a process with simulation, note that the external tag of the process can only be reached for simulation if the following requirements are met:
  – The connection to the controller (PLC) is established.
  – The controller (PLC) is in "RUN" mode.

The global functions for generating sine and sawtooth waves use 5 parameters:

- `counter`: Counter that uses the current date in milliseconds.
- `phase`: Phase offset as a factor between 0.0 and 1.0
  The factor 0.0 to 1.0 corresponds to a phase offset of 0° to 360°.
- `period`: Duration of a full vibration cycle in milliseconds
- `amp`: Strength of the amplitude
- `offset`: Shift of the amplitude on the y-axis

Executing an example

1. Create a global "Simulator" module.
2. Configure the two functions "sinWave" and "sawTooth" in this global module.
   Use the source codes from the following sections for the functions:
   - "Example code > Simulate sine wave (global script)"
   - "Example code > Simulate sawtooth wave (global script)"
3. Create a script for the "Loaded" event for the screen.
4. Go to the "Global definition" view of the event.
5. Insert the sample code under "Sample code > Event - Global definition area" in the "Global definition" view of the event.
6. If necessary, adapt the copied sample code to your project. For example, if you use more than 2 tags, you must add more lines with the function `ts.Add(...)`.
7. Go back to the "Function" view of the event.
8. Insert the source code from "Example code > Event".

The tags HMI_Tag_1 and HMI_Tag_2 can now be connected to any objects in the screen that can display the values, such as:

- Function trend control
- Gauges
- Bar graphs
- Text fields

Result

1. When the application is loaded in runtime, the `import` function initializes the scripts from the global module "Simulator" for the "Loaded" event of the screen.
   The example code can be found under "Event - Global definition area".
2. If the event is triggered when the screen is loaded, the function "simulateTags()" starts at the specified intervals.
   In the example, the interval is 500 ms.
   The call of the function "simulateTags()" is stopped as soon as the screen is deselected.
   The example code can be found under "Event" and "Event - Global definition area".
3. The function "simulateTags()" starts with each call of the functions "sinWave" and "sawTooth" and transfers the new values to the tags.
   The example code can be found under "Simulate sine wave (global script)" and "Simulate sawtooth wave (global script)".

Sample code

Simulate sine wave (global script)

```
//JEx: "Simulate Sine Wave"
export function sinWave(counter, phase, period, amp, offset) {
 return offset + amp * Math.sin((phase + ((counter % period) / period)) * (2*Math.PI));
}
```

Simulate sawtooth wave (global script)

```
//JEx: "Simulate Saw Tooth Wave"
export function sawTooth(counter, phase, period, amp, offset) {
 return offset + amp * (((counter + phase * period) % period) / period);
}
```

Global event definition area

```
//JEx: "Generate signals"
//SOM_OM_"HmiTrendControl"
//JExRequired: "Simulate Sine Wave", "Simulate Saw Tooth Wave"
import * as sim from "Simulator";
function simulateTags() {
 let counter = Date.now();
 let ts = Tags.CreateTagSet();
 ts.Add([['HMI_Tag_1', sim.sinWave(counter, 0.00, 10000, 25, 25)]]);
 ts.Add([['HMI_Tag_2', sim.sawTooth(counter, 0.25, 37000, 30, 15)]]);
 ts.WriteAsync();
}
```

Event

```
//JEx: "Event Screen_1 OnLoad"
//SOM_OM_"HmiTrendControl"
//JExRequired: "Generate signals"
export function Screen_1_OnLoad(item) {
 HMIRuntime.Timers.SetInterval(simulateTags, 500);
}
```

Notes on the code examples (Page 989)

10.1.5.5 Using tag values globally

Introduction

The example shows how to use tag values globally. A tag value can therefore be shared between screens and tasks, for example.

The basic procedure is as follows:

1. The tag value is written into an internal tag via a script.
2. The tag value is read by another script at the desired place.

You can save and read the values of all data types supported by the object model in internal tags.

Executing an example

The following example writes a structured value of a JavaScript tag to an internal tag. Another member is added to the structured value in the sample code on button 2.

1. Configure an HMI tag "Tag".
2. Configure two buttons (in the example "Button_1" and "Button_2") on a screen.
3. Create a script for each "Click left mouse button" event of the buttons.
   The JavaScript editor creates the functions "`Button_1_OnTapped(item, x, y, modifiers, trigger)`" and `Button_2_OnTapped(item, x, y, modifiers, trigger)`.
4. Insert the sample code "Write structured value into internal tag" into the script of the first button.
5. Insert the sample code "Enhance structure by member "c"" into the script of the second button.
6. Compile and load it in runtime.
7. Trigger the event "Click left mouse button" on both buttons.

Result

Button 1

1. The JavaScript tag "tag" is created and initialized with the HMI tag "Tag".
2. The JavaScript tag "myObj" is created and initialized.
3. The JavaScript tag "myObj" is converted into a JSON string and assigned to the JavaScript tag "json".
4. The value of the JavaScript tag "json" is written into the HMI tag "Tag".

Button 2

1. The JavaScript tag "tag" is created and initialized with the HMI tag "Tag".
2. The JavaScript tag "myObj" is created and initialized.
3. The JavaScript tag "myObj" is extended by the member "c".
4. The JavaScript tag "myObj" is converted into a JSON string and assigned to the JavaScript tag "json".
5. The value of the JavaScript tag "json" is written into the HMI tag "Tag".

Sample code

Write structured value into internal tag

```
//JEx: "set initial values without 'c'"
export function Button_1_OnTapped(item, x, y, modifiers, trigger) {
let tag = Tags('Tag');
let myObj = {a:10, b:20, pos: {x:100, y:200}, layers: [1, 8, 18, 24, 33]};
let json = JSON.stringify(myObj);
HMIRuntime.Trace('Jason ' + json);
tag.Write(json, 1);
}
```

Enhance structure by member "c"

```
//JEx: "add member 'c'"
export function Button_2_OnTapped(item, x, y, modifiers, trigger) {
const tag = Tags('Tag');
let myObj = JSON.parse(tag.Read(1));
myObj.c = (myObj.c || 0) + 1; // increment 'c'
let json = JSON.stringify(myObj);
HMIRuntime.Trace("New JSON: " + json);
tag.Write(json, 1);
}
```

10.1.5.6 Converting values

Introduction

The example shows how temperature values can be converted into a different unit with JavaScript.

Executing an example

1. Create a global module "TemperatureConversions" with 2 global scripts:
   - "celsiusToFahrenheit(t_celsius)"
   - "fahrenheitToCelsius(t_fahrenheit)"
2. Copy the corresponding sample code to the global scripts.
3. Copy the sample code from the "Global definition range" to the global definition range of the global module "TemperatureConversion".
4. Create a screen with 2 elements of the type "I/O field".
5. Dynamize the "Process value" property of the two "I/O field" elements using scripts.
6. Copy the sample code of both scripts.

Celsius to Fahrenheit (global script)

```
//JEx: "CelsiusToFahrenheit"
//JExRequired: "TempConv_GlobalDefRange"
export function celsiusToFahrenheit(t_celsius) {
    return t_celsius * 1.8 + 32;
}
```

Fahrenheit to Celsius (global script)

```
//JEx: "FahrenheitToCelsius"
//JExRequired: "TempConv_GlobalDefRange"
export function fahrenheitToCelsius(t_fahrenheit) {
    return (t_fahrenheit - 32) / 1.8;
}
```

Global definition range

```
//JEx: "TempConv_GlobalDefRange"
import * as tempConv from 'TemperatureConversion';
```

Celsius to Fahrenheit (dynamization of process value)

The JavaScript function is triggered by the tag 'celsius1'.

```
//JEx: "DynCelsiusToFahrenheit"
//SOM_OM_"HmiIOField"
//TagsRequired: "celsius1"
//JExRequired: "celsiusToFahrenheit"
//JExRequired: "TempConv_GlobalDef"
export function I_O_field_1_ProcessValue_Trigger(item) {
    const tagCelsius = Tags('celsius1');
    tagCelsius.Read();
    return tempConv.celsiusToFahrenheit(tagCelsius.Value);
}
```

Fahrenheit to Celsius (dynamization of process value)

The JavaScript function is triggered by the tag 'fahrenheit1'.

```
//JEx: "DynFahrenheitToCelsius"
//SOM_OM_"HmiIOField"
//TagsRequired: "fahrenheit1"
//JExRequired: "fahrenheitToCelsius"
//JExRequired: "TempConv_GlobalDef"
export function I_O_field_2_ProcessValue_Trigger(item) {
    const tagFahrenheit = Tags('fahrenheit1');
    tagFahrenheit.Read();
    return tempConv.fahrenheitToCelsius(tagFahrenheit.Value);
}
```

Notes on the code examples (Page 989)

10.1.5.7 Change language

Introduction

The example shows how the interface language is changed by JavaScript.

Executing an example

1. Configure a button "Button_1".
2. Activate the project languages required for the example:
   - English
   - German
   - Hungarian
   - French
3. Create a script for the event "Left mouse button clicked" of the button "Button_1".
4. Define the tag "step" under "Global definition" and assign the value "2" to it.

Global definition

```
//JEx: "LanguageChangeGlobalDef"
var step = 2;
```

Sample code

Clicking the button increments the tag "step". The stored code for the language is assigned to `HMIRuntime.Language` according to its value.

```
//JEx: "LanguageChange"
//JExRequired: "LanguageChangeGlobalDef"
export function Button_1_OnTapped(item, x, y, modifiers, trigger) {
    //change to English
    if (step == 1) {HMIRuntime.Language = "1033";}
    //change to Hungarian
    if (step == 2) {HMIRuntime.Language = "1038";}
    //change to German
    if (step == 3) {HMIRuntime.Language = "1031";}
    //change to French
    if (step == 4) {HMIRuntime.Language = "1036";}
    step ++; //step
    if (step == 5) {step = 1;} //reset
}
```

Notes on the code examples (Page 989)

10.1.5.8 Dynamically changing the output format of an object

Introduction

This example shows how to dynamically change the output format of an object of the type "I/O field" using JavaScript.

The output in the example is switched between the following formats:

- Hexadecimal
- Decimal
- Binary

Executing an example

1. Configure a screen page with 3 buttons with the names "Button_1" to "Button_3".
2. Configure max. nine objects of the "I/O field" type with the names "HmiIOField_1" to "HmiIOField_9".
3. Create a script for the event "Button pressed" for each button.
4. Define the constants as described in the section "Global definition of constants".
5. Create 2 global scripts:
   - toggleOutputFormat()
   - setOutputFormat(format)
6. Transfer the source code from the following sections.

Global script "toggleOutputFormat()"

```
//JEx: "Toggle Output Format"
//SOM_OM_"HmiIOField"
//JExRequired: "Set Output Format";"GlobalConstants for OutputFormat"
function toggleOutputFormat() {
    let index = outputFormats.indexOf(Screen.FindItem(screenItemNameBase +
minScreenItemIndex).OutputFormat);
    index = (index + 1) % outputFormats.length;
    setOutputFormat(outputFormats[index]);
}
```

Global script "setOutputFormat(format)"

```
//JEx: "Set Output Format"
//SOM_OM_"HmiIOField"
//JExRequired: "GlobalConstants for OutputFormat"
function setOutputFormat(format) {
    for(let i = minScreenItemIndex; i <= maxScreenItemIndex; i++) {
        let name = screenItemNameBase + i;
        Screen.FindItem(name).OutputFormat = format;
    }
}
```

Global definition of constants

```
//JEx: "GlobalConstants for SetOutputFormat"
const outputFormats = ['{I}', '{H2,2}', '{B8,4}'];
// Creating dynamic object names which differ by a number at the end
const screenItemNameBase = 'HmiIOField_';
// the screen item names begin with the prefix 'HmiIOField_'
const minScreenItemIndex = 1; // range of the screen items: min
const maxScreenItemIndex = 9; // range of the screen items: max
```

Switch to hexadecimal output format

```
//JEx: "Switch Output Format Hex"
//SOM_OM_"HmiIOField"
//JExRequired: "Set Output Format"
export function Button_1_OnDown(item, x, y, modifiers, trigger) {
    setOutputFormat('{H2,2}');
}
```

Switch to decimal output format

```
//JEx: "Switch Output Format Dec"
//SOM_OM_"HmiIOField"
//JExRequired: "Set Output Format"
export function Button_2_OnDown(item, x, y, modifiers, trigger) {
    setOutputFormat('{I}');
}
```

Switch to the next output format

```
//JEx: "Switch Output Format Bin"
//SOM_OM_"HmiIOField"
//JExRequired: "Toggle Output Format"
export function Button_3_OnDown(item, x, y, modifiers, trigger) {
    toggleOutputFormat();
}
```

Notes on the code examples (Page 989)

10.1.5.9 Reading and writing binary files

Introduction

The example shows how to write a binary file to the file system with JavaScript.

Note

- For access to the data, use the class "DataView" or one of the "*Array" classes together with the class "arrayBuffer".
- If the Endianess of the computer systems used for development (Compiler) and execution (Runtime) are different, use the class "DataView".
- The method HMIRuntime.Trace(text) outputs whether the function was successful via the Tracer.

Executing an example

1. Configure 3 buttons with the names "Button_10", "Button_11" and "Button_14".
2. Create a script for the event "Print" for each button.
3. Copy the sample code below to your project.

Writing a binary file

```
//JEx: Write a binary file with class "Int32Array" into file system
export function Button_10_OnDown(item, x, y, modifiers, trigger) {
    var arrayBuffer = new Int32Array([1,2,3]);
    HMIRuntime.FileSystem.WriteFileBinary('C:\\Users\\Public\\binaryfile.bin',
arrayBuffer).then(
    function() {
        HMIRuntime.Trace('Write file finished successfully');
    }).catch(
    function(e) {
        HMIRuntime.Trace(`Write file failed with error code ${e}`);
    });
}
```

Reading a binary file with the class `Int32Array`

```
//JEx: Read a binary file with class "Int32Array" from file system
export function Button_11_OnDown(item, x, y, modifiers, trigger) {
    var arrayBuffer = new Int32Array([1,2,3]);
    HMIRuntime.FileSystem.ReadFileBinary('C:\\Users\\Public\\binaryfile.bin',
arrayBuffer).then(
    function(arrayBuffer) {
        let intView = new Int32Array(arrayBuffer);
        for(let i in intView) {
            HMIRuntime.Trace('intView[' + i  + '] = ' + intView[i]);
        }
    }).catch(
    function(e) {
        HMIRuntime.Trace(`Read file failed with error code ${e}`);
    });
}
```

Reading a binary file with the class `DataView`

```
//JEx: Read a binary file with class "DataView" from file system
export function Button_14_OnDown(item, x, y, modifiers, trigger) {
    HMIRuntime.FileSystem.ReadFileBinary('C:\\Users\\Public\\binaryfile.bin').then(
    function(arrayBuffer) {
        let dv = new DataView(arrayBuffer, 0, arrayBuffer.length);
        HMIRuntime.Trace('Int32[0] LE:' + dv.getInt32(0, true).toString(16));
        HMIRuntime.Trace('Int32[0] BE:' + dv.getInt32(0      ).toString(16));
        HMIRuntime.Trace('Int16[2] LE:' + dv.getInt16(2, true).toString(16));
    }).catch(
    function(e) {
        HMIRuntime.Trace(`Read file failed with error code ${e}`);
    });
}
```

10.1.5.10 Reading and writing text files

Introduction

This example shows how text files can be read and written with JavaScript.

Execution of example

Note

The method HMIRuntime.Trace(text) outputs whether the function was successful via the Tracer.

1. Configure 2 buttons "Button_12" and "Button_13".
2. Create a script for the event "Print" for each button.
3. Copy the sample code below to your project.

Writing sample code for text file

```
//JEx: "Write Text File"
export function Button_12_OnDown(item, x, y, modifiers, trigger) {
    HMIRuntime.FileSystem.WriteFile('C:\\Users\\Public\\textfile.txt', 'my utf8 string',
'utf8').then(
    function() {
        HMIRuntime.Trace('Write file finished successfully');
    }).catch(function(errorCode) {
        HMIRuntime.Trace('Write failed errorcode=' + errorCode);
    });
}
```

Reading sample code for text file

```
//JEx: "Read Text File"
export function Button_13_OnDown(item, x, y, modifiers, trigger) {
    HMIRuntime.FileSystem.ReadFile('C:\\Users\\Public\\textfile.txt',
'utf8').then(
    function(text) {
        HMIRuntime.Trace('Text=' + text);
    }).catch(function(errorCode) {
        HMIRuntime.Trace('Read failed errorcode=' + errorCode);
    });
}
```

Notes on the code examples (Page 989)

10.1.5.11 Setting bits

Introduction

The example shows how single and multiple bits are masked and set with JavaScript.

Note

Using different methods for integer data types

The methods of the "`Math.Uint64`" object and the standard model are available for setting and resetting multiple bits.

The methods of the "`Math.Uint64`" object work with all integer data types.

- For values < 2^{31} use the standard methods of JavaScript.
- For values ≥ 2^{31} use `BigInt` of the standard model or the methods of the `Math.Uint64` object.

`BigInt` of the standard model is used in the following examples.

Executing an example

1. Create 6 buttons in a project.
2. Create a tag of the "Int" type.
3. For all 6 buttons create local scripts for the event "Left mouse button pressed".
4. Transfer the source code for the examples to the respective script areas.
5. To retain a clear overview assign descriptive texts to the buttons.

Setting a single bit (no error handling)

The "`Tag.SetBit()`" and "`Tag.ResetBit()`" methods are available for setting and resetting single bits.

```
//JEx: "SetSingleBit"
//SOM_OM_"
//TagsRequired: "HMI_Tag_1"
export function Button_1_OnTapped(item, x, y, modifiers, trigger) {
    Tags('HMI_Tag_1').SetBit(37);
}
```

Setting a single bit

When error handling is included, a corresponding message is output with the `HMIRuntime.Trace()` method.

```
//JEx: "SetSingleBitWithErrorHandling"
//SOM_OM_"
//TagsRequired: "HMI_Tag_1"
export function Button_5_OnTapped(item, x, y, modifiers, trigger) {
    const tag1 = Tags('HMI_Tag_1');
    const bitNum = 37;
    tag1.SetBit(bitNum).then(() => {HMIRuntime.Trace('SetBit succeeded');})
    .catch((e) => {HMIRuntime.Trace(`SetBit failed, error=${e}`);});
}
```

Changing bits with "Xor" without error handling

Changing multiple bits with 64 bits without error handling.

Copy code

```
//JEx: "SetMultipleBits"
//SOM_OM_"
//TagsRequired: "HMI_Tag_1"
export function Button_6_OnTapped(item, x, y, modifiers, trigger) {
    const tag1 = Tags('HMI_Tag_1');

    // Define a 64-bit mask using a binary constant
    const mask = 0b0110011000000000000000000000000000000001n;

    // Read LWord Tag
    tag1.Read();

    let newValue = BigInt(tag1.Value);
    newValue ^= mask; // use Bit-operations for clearing / setting bits

    tag1.Write(newValue);
}
```

Setting bits with "Or"

The function sets every bit in the mask that has the value "1".

The example uses asynchronous writing and includes an extended error handling.

```
//JEx: "SetMultipleBitsWithErrorHandlingOr"
//TagsRequired: "HMI_Tag_1"
// set bits with 'Or': sets every bit which is '1' in mask
export function Button_16_OnTapped(item, x, y, modifiers, trigger) {
    const tag1 = Tags('HMI_Tag_1');
    const mask = 0b01100110000000000000000000000000000001n;

    tag1.Read();

    if(tag1.LastError != 0) {
        HMIRuntime.Trace(`Read failed, error=${tag1.LastError}`);
    } else if((tag1.QualityCode & 0x80) == 0) {
        // Check whether QC is 'good' or 'good cascade'
        HMIRuntime.Trace(
            `Read succeeded, but Quality is not 'good', QC=$
{tag1.QualityCode}`
        );
    } else {
        let newValue = BigInt(tag1.Value);
        newValue |= mask; // Set bits
        const ts = Tags.CreateTagSet([[tag1.Name, newValue]]);
        ts.WriteAsync().then(()=>{HMIRuntime.Trace('Write succeeded')})
        .catch((e)=>{HMIRuntime.Trace(`Write failed, error=${e}`)});
    }
}
```

Deleting bits with "AND"

The script deletes each masked bit with the value "1".

```
//JEx: "ClearMultipleBitsWithErrorHandlingAnd"
//TagsRequired: "HMI_Tag_1"
export function Button_17_OnTapped(item, x, y, modifiers, trigger) {
    const tag1 = Tags('HMI_Tag_1');
    let mask = 0b01100110000000000000000000000000000001n;

    // invert all bit of mask for 'And' operation
    mask ^= 0xfffffffffffffffn;
    tag1.Read();

    if(tag1.LastError != 0) {
        HMIRuntime.Trace(`Read failed, error=${tag1.LastError}`);
    } else if((tag1.QualityCode & 0x80) == 0) {
        // Check whether QC is 'good' or 'good cascade'
        HMIRuntime.Trace(
            `Read succeeded, but Quality is not 'good', QC=$
{tag1.QualityCode}`
        );
    } else {
        let newValue = BigInt(tag1.Value);
        newValue &= mask; // Delete bits

        const ts = Tags.CreateTagSet([[tag1.Name, newValue]]);
        ts.WriteAsync().then(()=>{HMIRuntime.Trace('Write succeeded')})
        .catch((e)=>{HMIRuntime.Trace(`Write failed, error=${e}`)});
    }
}
```

Replacing bits with "Xor"

The script replaces each bit in the mask that has the value "1".

```
//JEx: "FlipMultipleBitsWithErrorHandlingXor"
//TagsRequired: "HMI_Tag_1"
export function Button_12_OnTapped(item, x, y, modifiers, trigger) {
    const tag1 = Tags('HMI_Tag_1');
    const mask = 0b01100110000000000000000000000000000001n;

    tag1.Read();
    if(tag1.LastError != 0) {
        HMIRuntime.Trace(`Read failed, error=${tag1.LastError}`);
    } else if((tag1.QualityCode & 0x80) == 0) {
        // Check whether QC is 'good' or 'good cascade'
        HMIRuntime.Trace(
            `Read succeeded, but Quality is not 'good', QC=$
{tag1.QualityCode}`
        );
    } else {
        let newValue = BigInt(tag1.Value);
        newValue ^=mask;
        const ts = Tags.CreateTagSet([[tag1.Name, newValue]]);

        ts.WriteAsync().then(()=>{HMIRuntime.Trace('Write succeeded')})
        .catch((e)=>{HMIRuntime.Trace(`Write failed, error=${e}`)});
    }
}
```

Notes on the code examples (Page 989)

10.1.5.12 Changing the date format

Introduction

The example shows how the date format is changed using JavaScript.

Executing an example

1. Create 2 I/O fields and 1 button.
2. Configure 2 global tags:
   - HMI_Tag_1 of the type "Int"
   - HMI_Tag_2 of the type "WString"
3. Create a script for the event "Press" of the button "Button_1".

Sample code

```
//JEx: "ChangeDateformat"
//SOM_OM_"HmiIOField_1", SOM_OM"HmiIOField_2"
//TagsRequired: "HMI_Tag_1:Int","HMI_Tag_2:WString"
export function Button_1_OnDown(item, x, y, modifiers, trigger) {
    //Create array with all month names
    var monthNames = [
        "January", "February", "March",
        "April", "May", "June", "July",
        "August", "September", "October",
        "November", "December"
    ];
    var date = new Date(); //Create tag with current date
    var day = date.getDate(); //Separation of the individual date components
    var monthIndex = date.getMonth();
    var year = date.getFullYear();
    var month = monthIndex + 1;
    //The "getMonth()" object contains 12 values from "0" to "11".
    //Set the date format
    switch (Tags("HMI_Tag_1").Read()) {
        case 1: Tags("HMI_Tag_2").Write(day +'/' +month +'/' +year); break;
       case 2: Tags("HMI_Tag_2").Write(year +'-'  +month+ '-' +day); break;
        case 3:
           Tags("HMI_Tag_2").Write(year +'-'  +monthNames[monthIndex] + '-'
+day);
            break;
        default:
            Tags("HMI_Tag_2").Write(day + ' ' + monthNames[monthIndex] + '
' + year);
            break;
    }
}
```

Notes on the code examples (Page 989)

10.1.5.13 Monitoring alarms

Introduction

This example shows how to create and monitor active alarms.

The reason (NotificationReason) for which the alarms were sent can have the following values:

- `Unknown` (1)
- `Add` (1)
  The alarm was added to the filtered result list. The alarm meets the filter criteria that apply to the monitoring, for example "State = 1".

- `Modify` (2)
  Properties of the alarm were changed, but the alarm is still part of the filtered result list.
- `Remove` (3)
  The alarm was part of the result list, but it no longer meets the filter criteria due to changes to its properties.

Note

Changes to the alarm will not result in notifications until the alarm meets the filter criteria again, such as "State = 1". In this case, "NotificationReason" is set to `Add`.

State-based and event-based monitoring

The respective client application determines whether or not notifications of alarms with the "NotificationReason" `Modify` or `Remove` are ignored.

For example:

- State-based monitoring: A customer wants to create a list of incoming alarms. All notification reasons are relevant. The client removes an alarm from the list as soon as the notification reason is `Remove`.
- Event-based monitoring: If an alarm is received, an email should be sent. Only the notification reason `Add` is relevant.

Execution of example

1. Configure a button (in the example "Button_1") on a screen.
2. Create a script for the event "Click left mouse button".
   The JavaScript editor creates the function "`Button_1_OnTapped(item, x, y, modifiers, trigger)`".
3. Insert the example code.
4. Compile and load it in Runtime.
5. Trigger the event "Click left mouse button" on the button.

Result

1. A customer begins monitoring with the filter criterion "State = 1".
2. An alarm is triggered. Runtime notifies the customer of the "NotificationReason" as follows:

NotificationReason	Description
Add	"State" is 1 The alarm has arrived.
Modify	"State" property has not changed. Another property that is not part of the filter criterion has changed, e.g. "Priority".
Remove	"State" has changed. The alarm is removed.

Sample code

```
//JEx: "A client starts an alarm subscription with filter criterion "State = 1" (Raised
alarms)."
export function Button_1_OnTapped(item, x, y, modifiers, trigger) {
var subs = HMIRuntime.Alarming.CreateSubscription();
subs.Filter = 'State=1';
subs.Language = 1033;
subs.OnAlarm = function(Errorcode, SystemNames, ResultSet) {
  for (let index in ResultSet)
  {
    HMIRuntime.Trace('Alarm Name_' + (index+1) + ' = ' + ResultSet[index].Name);
    HMIRuntime.Trace(' Alarm State_' + (index+1) + '= ' + ResultSet[index].State);
    HMIRuntime.Trace(' Notification Reason_' + (index+1) + '= ' +
ResultSet[index].NotificationReason);
  }
}
subs.Start();
}
```

10.1.5.14 Set alarm filter

Introduction

The example shows how the alarm filter is set by a JavaScript function.

To make the examples easy, the filters are set by pressing a button.

Classic application example: Setting alarm filters using check boxes on a screen page.

Executing an example

1. Configure a screen with the following elements:
   - 1 alarm control ("Alarm control_1")
   - 2 buttons (in the example "Button_7" and "Button_8")
2. Configure the generation of alarms of the alarm class "Warning" and "Alarm".
3. Ensure that the alarms in the alarm control "Alarm control_1" are displayed.

Filtering sample code for "Warning"

In the sample code, alarms of the alarm class "Warning" are filtered.

```
//JEx: "Alarm Filter Control with Warnings"
//SOM_OM_"Alarm control" (Alarm control_1);
//JExRequired: "Alarm Subscription"
export function Button_7_OnDown(item, x, y, modifiers, trigger) {
    let alarmControl = Screen.FindItem('Alarm control_1');
    alarmControl.Filter = "AlarmClassName='Warning'";
}
```

Filtering sample code for "Warning" and "Alarm"

In the sample code, alarms of the alarm class "Warning" and "Alarm" are filtered.

```
//JEx: "Alarm Filter Control with Warnings and Alarms"
//SOM_ON_"Alarm control" (Alarm control_1);
//JExRequired: "Alarm Subscription"
export function Button_8_OnDown(item, x, y, modifiers, trigger) {
    let alarmControl = Screen.FindItem('Alarm control_1');
    alarmControl.Filter = "AlarmClassName IN ('Warning','Alarm')";
}
```

Notes on the code examples (Page 989)

10.1.5.15 Creating an alarm subscription

Introduction

The example shows how an "Alarm subscription" is programmed in JavaScript.

Executing an example

1. Configure a task in the Scheduler with the time interval for the update.
2. Create a script for the event "Update" at the configured task.
3. Create the tag "subs" under "Global definition" (compare section "Global definition").
4. Copy the code under "Example code" to the script for the "Update" event.

Global definition

```
//JEx: "AlarmSubscriptionDef"
// A global tag is required for the Alarm Subscription,
// to be able to end the subscription
var subs;
```

Sample code

The JavaScript function in the example is started via the event "Update" of a task in the Scheduler.

```
//JEx: "AlarmSubsciption"
//JExRequired: "AlarmSubscriptionDef"
//TagsReqired: "HMI_Tag_1_Int"
// Function will be generated when you create a script on event "Update" of a task
export function Task_Task_1_Update() {
    let tag = Tags("HMI_Tag_1_Int");
    tag.Read();
    if(tag.Value == 1) {
        // start subscription
        if(subs) {
            // stop already existing subscription
            subs.Stop();
            subs =  undefined;
        }
        subs = HMIRuntime.Alarming.CreateSubscription();
        subs.Filter = 'AlarmClassName=\'Warning\'';
        //subs.Language = 1033; // For explicit setting of a specific language
        subs.OnAlarm = function(Errorcode, SystemNames, ResultSet) {
            // Callback function is performed as soon as the alarm attribute changes
            for (let index in ResultSet) {
              HMIRuntime.Trace('Alarm[' + index + '] Name="' + ResultSet[index].Name + '"');
                HMIRuntime.Trace('Alarm[' + index + '] State="' + ResultSet[index].State +
'"');
                 HMIRuntime.Trace('Alarm[' + index + '] EventText="' +
ResultSet[index].EventText + '"');
            }
        }
        subs.Start();
    } else if(tag.Value == 2) {
        // stop subscription
        if(subs) {
            // Stop already existing Alarm Subscription
            subs.Stop();
            subs = undefined;
        }
    }
}
```

Notes on the code examples (Page 989)

10.1.5.16 Creating alarms with multilingual alarm texts

Introduction

The example shows how you transfer multilingual alarm text to the system function "CreateSystemAlarm" using text lists.

In the first sample code, you are using a text list entry in the "alarmText" parameter. In this entry, you refer to the "alarmParameterValue1" parameter.

In the second sample code, you are also using a text list entry in the "alarmText" parameter. In this entry, you refer to an additional text list.

This example can be transferred to the system functions "CreateSystemInformation" and "CreateOperatorInputInformation".

The system functions "CreateSystemInformation", "CreateSystemAlarm" and "CreateOperatorInputInformation" have the following parameters:

- "alarmText": Specifies the alarm text.
  You have the option of establishing references to the parameter values.
- "area" (optional): Specifies the scope.
- "alarmParameterValue1" to "alarmParameterValue7" (optional): Specifies the alarm parameters.

Tips for an efficient procedure

You can find the following snippets for the system function "CreateSystemInformation" in the shortcut menu of the "Scripts" editor under "Snippets > HMI Runtime > Alarming":

- "CreateSystemInformation with monolingual Alarm Text"
- "CreateSystemInformation with multilingual Alarm Text and Parameter Value"
- "CreateSystemInformation with multilingual Alarm Text and embedded Text List"

Executing an example

1. Create multiple project languages. One of the languages is English.
2. Activate the desired project languages in the runtime settings of the HMI device under "Language & Font".
3. Create a text list "Text_list_3" of the type "Value/Area".
4. Create an entry in the text list.
5. Set the value to "1".
6. Specify the English text: "Parameter value 1: @1%s@".
   "Parameter value 1 :" can be displayed in multiple languages.
   "@1%s@" is the reference to the "alarmParameterValue1" parameter. "1" indicates the number and "s" the data type. The data type is String.
7. Specify the text for additional languages in the Inspector window under "Properties > Texts".
8. Create a text list "Text_list_1" of the type "Value/Area".
9. Create an entry in the text list.

10. Set the value to "1".
11. Specify the text for all required languages: "@1%t#2T@".
    "@1%t#2T@" is the reference to the parameters "alarmParameterValue1" and "alarmParameterValue2".
    The name of the text list in transferred in "alarmParameterValue2".
    The value of the text list entry is transferred in "alarmParameterValue1".
12. Create a text list "Text_list_2" of the type "Value/Area".
13. Create an entry in the text list.
14. Set the value to "1".
15. Specify the English text: "MyText".
16. Specify the text for additional languages in the Inspector window under "Properties > Texts".
17. Configuring the buttons "Button_1" and "Button_2".
18. Configure an alarm control.
19. Configure the alarm control so that current alarms of the alarm class "SystemAlarm" are displayed.
20. Create a script for the event "Click left mouse button" at each of the buttons.
21. Add the respective sample code.
22. Configure buttons for switching the language.
23. Compile and load the project.
24. Trigger the events at the buttons.

Result

"Button_1"

- When the runtime language "English" is active, the alarm of the alarm class "SystemAlarm" is displayed as follows in the alarm control:
  - The area is "MyArea".
  - The alarm text is "Parameter value 1: My Parameter Value 1".
    The alarm text comes from the entry of the text list "Text_list_3".
- When you switch the language in runtime, the language-dependent alarm text is displayed. "My Parameter Value 1" is language-neutral.

"Button_2"

- When the runtime language "English" is active, the alarm of the alarm class "SystemAlarm" is displayed as follows in the alarm control:
  - The area is "MyArea".
  - The alarm text is "MyText".
    The alarm text comes from the entry of the text list "Text_list_2".
- When you change the language in runtime, the language-dependent message is displayed.

Sample codes

"Button_1"

```
//JEx: "CreateSystemAlarm with multilingual Alarm Text and Parameter Value"
//TextListsRequired: "Text_list_3"
//EntryRequired: value: "1", Text: "Parameter value 1: @1%s@"
export function Button_1_OnTapped(item, x, y, modifiers, trigger) {
let value = 1;
HMIRuntime.Alarming.SysFct.CreateSystemAlarm(
  HMIRuntime.Resources.TextLists("Text_list_3").Item(value), "MyArea", "My
Parameter Value 1");
}
```

"Button_2"

```
//JEx: "CreateSystemAlarm with multilingual Alarm Text and Parameter Value"
//TextListsRequired: "Text_list_1", "Text_list_2"
//Text_list_1: value: "1", Text: "@1%t#2T@"
//Text_list_2: value: "1", Text: "MyText"
export function Button_1_OnTapped(item, x, y, modifiers, trigger) {
let value = 1;
HMIRuntime.Alarming.SysFct.CreateSystemAlarm(
 HMIRuntime.Resources.TextLists("Text_list_1").Item(value),
 "MyArea", 1, HMIRuntime.Resources.TextLists("Text_list_2"));
}
```

10.1.5.17 Opening and closing a screen in a pop-up window

Introduction

The example shows you how to open and close a screen in a pop-up window. To do this, you use the system functions "OpenScreenInPopup" and "ClosePopup".

OpenScreenInPopup

The system function "OpenScreenInPopup" has the following parameters:

- "popupWindowName": Specifies the name of the pop-up window.
  The name must be unique within the parent screen.
- "screenName": Specifies the name of the screen that is opened in the pop-up window.
- "toggleOpen": Indicates whether the pop-up window is closed when the function is called again.
- "Caption": Specifies the title of the pop-up window.
- "Left": Defines the window position as offset from the left margin.
- "Top": Defines the window position as offset from the top margin.
- "hideCloseButton": Specifies whether to display the "Close" button.
- "parentScreenPath" (optional): Path of the parent screen. With this parameter you specify whether the popup window closes when a screen change is executed in the screen or screen window.
  You can specify the path absolute or relative:
  - Absolute path of the parent screen: "~/Screen"
  - Relative path of the parent screen: "./Screen"
  - Absolute path of the parent screen in a screen window: e.g. "~/Screen window_1/Screen"
    "Screen window_1" is the name of the screen window.
  - Relative path of the parent screen in a screen window: e.g. "./Screen window_1/Screen"
    "Screen window_1" is the name of the screen window.

  Relative path information is used in the following sample codes.

ClosePopup

The system function "ClosePopup" has the parameter "popupWindowPath". The parameter specifies the path of the pop-up window to be closed.

The "popupWindowPath" value is the result of the parameters "popupWindowName" and "parentScreenPath" of the system function "OpenScreenInPopup".

The parameter "popupWindowPath" is specified accordingly as relative or absolute path:

- Absolute path of the popup window: e.g. "~/MyPopup"
  "MyPopup" is the name of the popup window.
- Relative path of the popup window: e.g. "./MyPopup"
  "MyPopup" is the name of the popup window.
- Absolute path of the popup window with screen window: "~/Screen window_1/MyPopup"
  "MyPopup" is the name of the popup window and "Screen window_1" is the name of the screen window.
- Relative path of the popup windows with screen window: "./Screen window_1/MyPopup"
  "MyPopup" is the name of the popup window and "Screen window_1" is the name of the screen window.

Note

When the "parentScreenPath" parameter of the system function "OpenScreenInPopup" is not defined, the parameter is "popupWindowPath", for example, "/MyPopup". "MyPopup" is the name of the popup window.

Executing an example

1. Configure five screens: "Screen_1", "Screen_2", "Screen_3", "Screen_4" and "Screen_5".
2. Configure the following objects in the screen "Screen_1":
   - Five buttons: "Button_1", "Button_2", "Button_3", "Button_4" and "Button_5"
   - One screen window "Screen window_1"
3. Configure a screen change to "Screen_5" at the button "Button_5".
4. Add a button in "Screen_5" that triggers a screen change to "Screen_1".
5. Add a button in "Screen_3" that triggers a screen change to "Screen_4".
6. Add a button in "Screen_4" that triggers a screen change to "Screen_3".
7. Select "Screen_3" for the "Screen" property of the screen window.
8. Create a script for the event "Click left mouse button" at the buttons "Button_1", "Button_2", "Button_3" and "Button_4".
9. Add the respective sample code.
10. Compile and load the project.
11. Trigger the events at the buttons.

Result

- "Button_1":
  - "Screen_2" is opened in the pop-up window.
  - The pop-up window is closed when you change the screen by clicking "Button_5".
- "Button_2":
  - The pop-up window that was opened with "Button_1" is closed.
- "Button_3":
  - "Screen_2" is opened in the pop-up window.
  - When you change the screen in the screen window, the pop-up window is closed.
- "Button_4":
  - The pop-up window that was opened with "Button_3" is closed.

Sample code "Button_1"

```
//JEx: "OpenScreenInPopup with linked parentScreen"
export async function Button_1_OnTapped(item, x, y, modifiers, trigger) {
HMIRuntime.UI.SysFct.OpenScreenInPopup("MyPopup", "Screen_2", true,
"Popup", 100, 100, false, "./Screen");
}
```

Sample code "Button_2"

```
//JEx: "ClosePopup with linked parent screen"
export async function Button_2_OnTapped(item, x, y, modifiers, trigger) {
HMIRuntime.UI.SysFct.ClosePopup("./MyPopup");
}
```

Sample code "Button_3"

```
//JEx: "OpenScreenInPopup with linked parent screen in screen window"
//SOM_OM_"hmiScreenWindowInterface"
export async function Button_3_OnTapped(item, x, y, modifiers, trigger) {
HMIRuntime.UI.SysFct.OpenScreenInPopup("MyPopup", "Screen_2", true,
"Popup", 100, 100, false, "./Screen window_1/Screen");
}
```

Sample code "Button_4"

```
//JEx: "ClosePopup with linked parent screen in screen window"
//SOM_OM_"hmiScreenWindowInterface"
export async function Button_4_OnTapped(item, x, y, modifiers, trigger) {
HMIRuntime.UI.SysFct.ClosePopup("./Screen window_1/MyPopup");
}
```

10.1.5.18 Triggering a screen change with a tag

Introduction

The example shows how you can trigger a screen change in a screen window using a tag. In the example, the tag value is changed by clicking on the buttons.

Application example: The system contains a motor that is controlled with a PLC. As soon as the motor displays a fault, a detailed view of the motor is displayed on the HMI device.

Executing an example

1. Configure three screens: "Screen_Motor", "Screen_Error" and "Screen_NoError".
2. Define different background colors for the screens "Screen_Error" and "Screen_NoError".
3. Create the tag "PLC_State_Tag" of the data type "Int".
4. Configure the following objects in the screen "Screen_Motor":
   - Two buttons, "Error" and "NoError"
   - One screen window
5. At the "Error" button configure the system function "SetTagValue" for the event "Click left mouse button":
   - Tag: "PLC_State_Tag"
   - Value: "1" (data type "Int")
6. At the "NoError" button configure the system function "SetTagValue" for the event "Click left mouse button":
   - Tag: "PLC_State_Tag"
   - Value: "0" (data type "Int")
7. Select the screen window.
8. Under "Properties > Properties > General" in the Inspector window, select the "Screen" property.
9. In the "Dynamization" column, select the "Script" option.
10. Add a trigger.
11. Select "PLC_State_Tag" as the trigger tag.
12. Insert the sample code.
13. Compile and load the project.
14. Trigger the events at the buttons.

Result

- The screen window shows the screen "Screen_Error" by default.
- When you click the "Error" button, the screen in the screen window changes to "Screen_Error".
- When you click the "NoError" button, the screen in the screen window changes to "Screen_NoError".

Sample code

```
//JEx: "ActivateScreenByNumber"
//TagsRequired: "PLC_State_Tag"
//SOM_OM_"HMIScreenWindowInterface"
export function Screen_window_1_Screen_Trigger(item) {
    let screenName;
    // Read the state tag first which is the same as the trigger tag
    let tag1 = Tags("PLC_State_Tag");
    let value1 = tag1.Read();
    // Convert state to screen name
    switch(value1)
    {
      case 0: screenName = "Screen_NoError";
      break;
      case 1: screenName = "Screen_Error";
      break;
      default: screenName = "Screen_NoError";
      break;
    }
    return screenName;
}
```

10.1.6 Troubleshooting

10.1.6.1 RTIL Trace Viewer

Core statement

The RTIL Trace Viewer is a separate application which runs independently of the TIA Portal, but which can be integrated into the TIA Portal as an "external application".

Principle

During runtime, the RTIL Trace Viewer displays all alarms which are listed in the configurable TraceCatalog.

Layout

The traces are displayed in tabular form and can be sorted in ascending and descending order by the columns displayed.

Filters

The required alarms can be filtered using filters. Alarms in non-selected categories are hidden.

File functions

You export alarms as trace logs in the following formats:

- Text file (.txt, .log): Loading and evaluation in the RTIL Trace Viewer
- .csv file: Evaluation in conventional spreadsheet programs or other csv-compatible applications

See also

Support for errors (Page 978)

10.1.6.2 Integrate RTIL Trace Viewer as an external application

Procedure

1. Open the settings via "Tools > Settings".
2. Open the category "External applications".
3. Double-click in the first empty line.
   An input mask for the external application opens.
4. Assign a descriptive name for the application, e.g. "RTIL Trace Viewer" in the field "Name".
5. Insert the following path under "Command": `%ProgramFiles%\Siemens\Automation\WinCCUnified\bin\RTILtraceViewer.exe`
6. Leave the fields "Arguments" and "Start in" empty.
7. Click "Add" and then close the "Settings" dialog.

The application is now available via the menu "Tools > External applications".

10.1.6.3 Tracing with the RTIL Trace Viewer

There is a "Trace Viewer" for finding errors in the JavaScript code.

Preparation

The "Trace Viewer" are located in the following path:

- %ProgramFiles%\Siemens\Automation\WinCCUnified\bin\RTILtraceViewer.exe

Requirement

- Simulation or runtime are started.
- RTILtraceViewer.exe has been started.

Procedure

1. Carry out an action in the simulation which starts a JavaScript function.
2. Filter by the trace messages "Subsystem > ScriptFW".

   Note

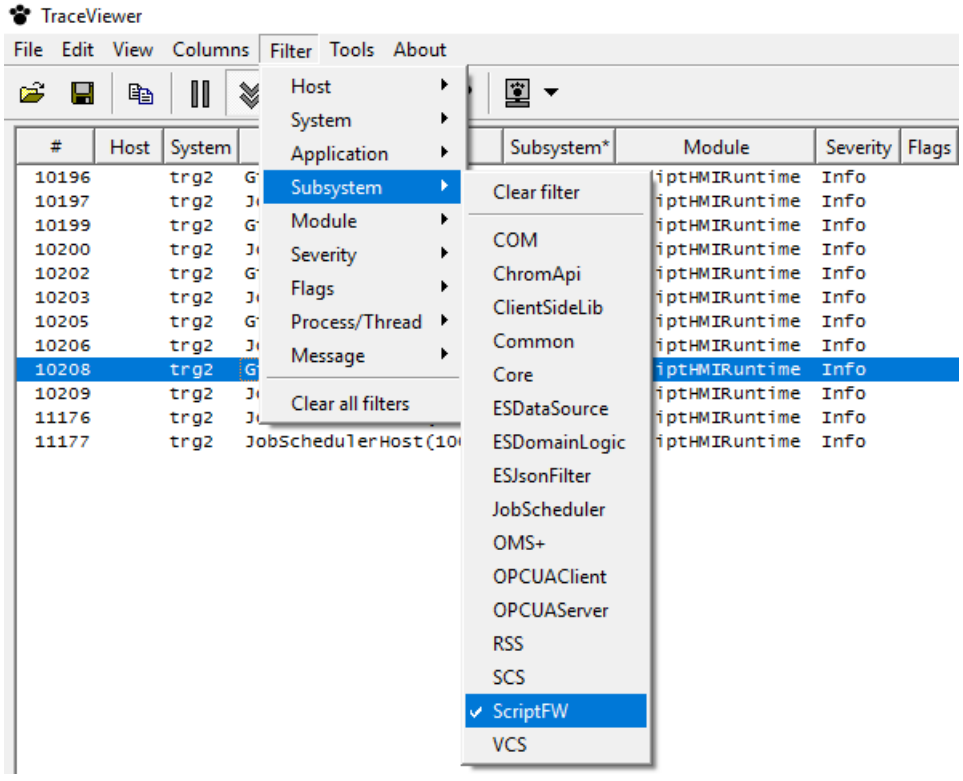
   As long as no JavaScript function was executed in the simulation during the runtime of the Trace Viewer, the entry "ScriptFW" is missing in the "Filter > Subsystem" menu.

3. Define additional filter criteria if required.
4. Evaluate trace messages if actions in the simulation lead to errors.

   Note

   If no messages are displayed in the Trace Viewer despite errors in the simulation, reset the filters:

   - Only in the submenu, e.g. "Subsystem": "Filter > Subsystem > Clear filter" menu
   - All filters: "Filter > Clear all filters" menu



See also

Integrate RTIL Trace Viewer as an external application (Page 1023)

10.1.7 Debugging scripts

10.1.7.1 Basics of debugging

Introduction

For example, you can use a debugger to test whether correct values are being transferred to tags and whether abort conditions are being correctly implemented. Check the following in the debugger:

- Source code of functions
- Function sequence
- Values

Note

Your code is displayed in the debugger but is write-protected.

Basic procedure

To find an error, check the script with the debugger.

The following options are available for your support:

- Setting breakpoints
- Step-by-step execution
- Viewing values parallel to execution of the script

You do not edit the code of your scripts directly in the debugger. When you find an error, follow these steps:

1. Correct the error in the engineering system.
2. Compile the changed code.
3. Load the runtime.
4. Update the debugger.

See also

Starting the debugger (Page 1029)

10.1.7.2 Design and function of the debugger

Google Chrome provides the user interface of the debugger. Not all functions of the user interface of the debugger are relevant for debugging WinCC Unified Scripts. Only the functions that are needed to debug scripts in WinCC Unified are explained below.

You can find more information on Chrome DevTools under: https://developers.google.com/web/tools/chrome-devtools/ (https://developers.google.com/web/tools/chrome-devtools/).

The debugger is divided into two areas:

- Debugger for screens
- Debugger for jobs

With the debugger for screens you view scripts at screens and screen objects. With the debugger for jobs, you view scripts that you have configured in the Scheduler.

Start page of the debugger

After the debugger has been started, its start page is displayed.

The available contents differ depending on the selected area.

On the start page of the debugger for screens you can see two different contexts:

- Dynamizations (e.g. "UMCadmin@192.168.116.144 VCS_1 Dynamics")
- Events (e.g. "UMCadmin@192.168.116.144 VCS_1 Events")

The name of the contexts is composed as follows:

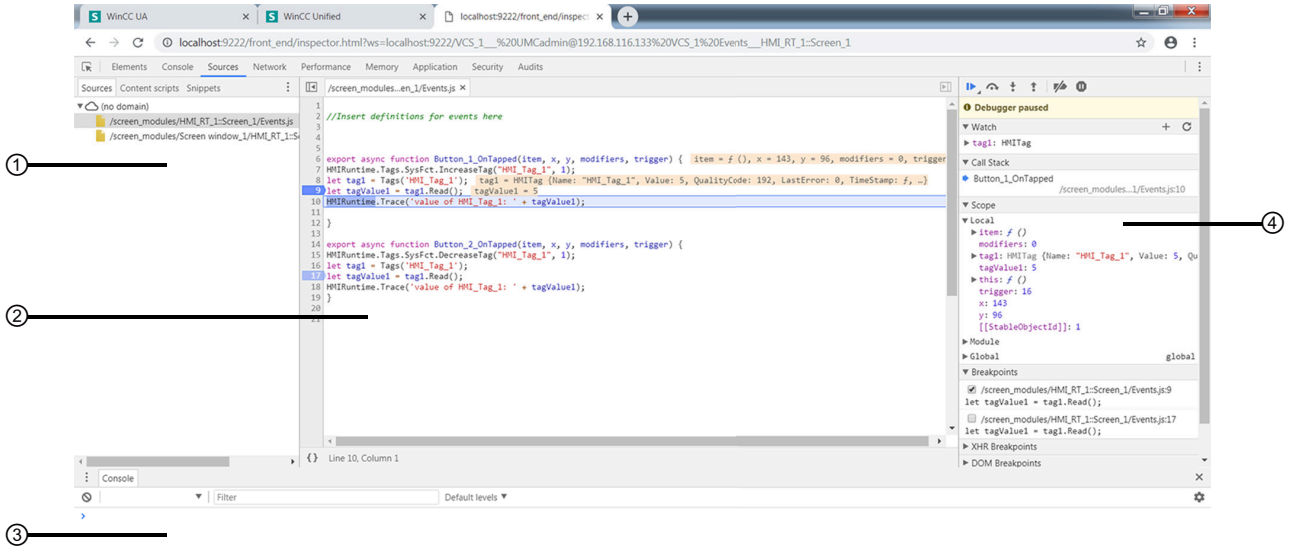
- UMCadmin: User name
- 192.168.116.144: IP address of the computer
- VCS: Name of the graphic component
- _1: Number of the open client
- Events/Dynamics: Scripts at events or dynamizations

Note

A client corresponds to a tab in Google Chrome in which the runtime is open. When you have opened runtime in multiple tabs, multiple clients are used. The client opened first is given the number 1. Numbering is reset when the runtime is restarted.

On the start page of the debugger for jobs you can see the context "JobsExecution".

User interface of the debugger



① Navigation area
② Code display area
③ Console
④ Debugging area

Navigation area

In the navigation area, the available contents for the screen shown in runtime are displayed in groups. The available groups vary depending on the use of scripts and functions.

Groups in the debugger for screens

The debugger for screens can contain the following groups in the dynamizations context:

- A group for scripts that were configured for dynamizations.
- One group per screen window in which scripts were configured for dynamizations.

The debugger for screens can contain the following groups in the events context:

- A group for scripts that were configured for events.
- One group for functions that were configured for events using the function list.
- One group per screen window in which scripts were configured for events.
- One group per screen window in which functions were configured for events using the function list.

Groups in the debugger for jobs

The debugger for jobs can contain the following groups:

- A group for scripts that were configured for tasks.
- One group for functions that were configured for tasks using the function list.

Code display area

Your code is displayed in the code display area. The rows are numbered.

Debugging area

The debugging area offers the following relevant options for WinCC Unified:

- Toolbar: Control for executing the script
- "Watch": Display of values
- "Callstack": Display of the current call stack
- "Scope": Available local values ("Local"), functions ("Module") and global values ("Global"),
- "Breakpoints": List of set breakpoints

10.1.7.3 Enabling the debugger

Requirement

- SIMATIC Runtime Manager is installed.
- The logged-on user has administrator rights.

Note

The debugger is only available locally.

Remote access from the debugger to other devices is not possible.

Procedure

The debugger is disabled by default.

Note

The debugger should be deactivated in production operation, as using the debugger can endanger system stability and security. Actions can accumulate if the debugger is, for example, at a breakpoint for a long time or the screen is not refreshed.

To activate the debugger, follow these steps:

1. Run the SIMATIC Runtime application with administrator rights.
2. Click the button  in the toolbar.
3. Switch to the "Scripts Debugger" tab.
4. To enable the debugger for screens, select the "Enable" check box in the "Screen debugger" area.
5. To enable the debugger for scheduled tasks, select the "Enable" check box in the "Scheduler debugger" area.
6. Assign an available port number to the debugger for screens (default port number: 9222).
7. Assign an available port number to the debugger for jobs (default port number: 9224).
8. Confirm your entries.

Note

Start the runtime after enabling the debugger.

10.1.7.4 Starting the debugger

Requirement

- Google Chrome (as of version 70) is installed.
- A project is opened in runtime.
- The debugger was activated in SIMATIC Runtime Manager.

Note

The debugger is only available locally.

Remote access from the debugger to other devices is not possible.

Procedure

1. In a new tab, call up the URL chrome://inspect in Google Chrome.
2. The home page of the Chrome DevTools is loaded in the tab.
3. Click "Devices".
4. Select the "Discover network targets" check box.
5. Click "Configure".

6. In the "Target discovery settings" dialog box, enter one of the following strings:
   - `127.0.0.1:<Port number>`
   - `localhost:<Port number>`

   Use the port entered for the Script Debugger in SIMATIC Runtime Manager.
7. Press <Enter>.
8. Click "Done".
9. Under "Remote Target", click "inspect" for the desired target.
   The DevTools open in a separate window with the selected target.
10. In the DevTools, select "Sources".
    The debugger is displayed.
11. Click "Toggle screencast".
12. In the navigation area under "Page", select the desired script module.

Updating the debugger

The debugger must be updated:

- After starting a new project
- After restarting a running project, for example, because you have reloaded the project in engineering with "Download to device > Software (all)".
- After a screen change in Runtime

The connection to the debugger is lost in each case. Google Chrome therefore shows an error message and asks whether you want to restore the connection.

To restore the connection, proceed as follows:

1. Close the DevTools window.
2. On the DevTools start page under "Remote Target", click "inspect" again for the desired target.

Stopping the debugger

Exit the debugger by closing the DevTools window and, if necessary, the DevTools homepage.

This does not stop runtime.

See also

Design and function of the debugger (Page 1025)

10.1.7.5 Working with breakpoints

Set breakpoints to stop the execution of the script at certain points and thus localize errors step-by-step. Previously set breakpoints are still available after updating the debugger.

Requirement

- Runtime has started.
- The debugger has been started.
- The group you want to debug is selected.

Pause script

To pause the execution of a script, you have 2 options:

- To pause the script immediately, click the "Pause script execution" button while the script is being executed.
- Set a breakpoint in the desired line.
  The script pauses when a breakpoint is reached.

To pause a script at a breakpoint that is configured to an event, follow these steps:

1. Set a breakpoint in the script.
2. Trip the respective event in runtime.
   The script pauses at the breakpoint.

Setting breakpoints

You have several options to set a breakpoint in a line of the script:

- Click on the line number.
- Right-click the line number and select "Add Breakpoint".

All set breakpoints are displayed in the debugging area under "Breakpoints".

Linking breakpoints to conditions

To link a breakpoint to a condition, proceed as follows:

1. Open the shortcut menu of the relevant line.
2. Select the entry "Add conditional breakpoint".
   Execution of the script is stopped at the breakpoint when the condition is fulfilled.

Edit conditions as follows:

1. Open the shortcut menu of the relevant line.
2. Select the entry "Edit breakpoint...".

To prevent the script from pausing at a selected line, proceed as follows:

1. Open the shortcut menu of the respective line.
2. Select the entry "Never pause here".

Showing and hiding breakpoints

When you hide a breakpoint, its position is retained. The script then ignores the hidden breakpoint. When you need the breakpoint again, it can simply be shown.

In the debugging area, all breakpoints set in the selected group are displayed under "Breakpoints".

You have several options to show a breakpoint:

- Set the check mark in front of the relevant breakpoint in the debugging area under "Breakpoints".
- Alternatively, right-click the number of the respective line in the code display area and then select "Enable breakpoint".

You have several options to hide a breakpoint:

- Remove the check mark in front of the relevant breakpoint in debugging area under "Breakpoints".
- Alternatively, right-click the number of the respective line in the code display area and then select "Disable breakpoint".

To show or hide all breakpoints, follow these steps:

1. Open the shortcut menu in the debugging area under "Breakpoints".
2. Select "Enable all breakpoints" or "Disable all breakpoints"

Enabling and disabling breakpoints

You can enable or disable all breakpoints independent of showing or hiding individual breakpoints.

You have several options to enable or disable all breakpoints:

- Click on the  "Deactivate breaktpoints" button in the debugging area.
- Open the shortcut menu of a breakpoint in the debugging area and select "Activate breakpoints" or "Deactivate breakpoints".
- Press <Ctrl + F8>.

Deleting breakpoints

You have several options to delete a breakpoint:

- Click on the breakpoint in the code display area.
- Open the shortcut menu of the breakpoint in the code display area and select "Remove breakpoint".
- Open the shortcut menu in the debugging area under "Breakpoints" and select "Remove breakpoint"..

To delete breakpoints, the shortcut menu offers the following additional options in the debugging area under "Breakpoints":

- Delete all breakpoints ("Remove all breakpoints")
- Delete all breakpoints except the selected breakpoint ("Remove other breakpoints")

10.1.7.6 Step-by-step execution of scripts

Introduction

The following options are available to execute your script step-by-step:

- Execute script to the next breakpoint
- Force execution of a script
- Execute script to the next function call
- Jump into a function
- Jump out of a function
- Execute script up to a selected line
- Pause at Exceptions
- Use call stack

Requirement

- The group you want to debug is selected.
- The script pauses at a breakpoint.

Execute script to the next breakpoint

To pause the continuation of a script, you have several options:

- Click on the "Resume script execution" button in the debugging area.
- Press the <F8> key.
  The script is executed to the next breakpoint. If there is no other breakpoint, the script is executed completely.

Force execution of a script

To ignore the following breakpoints when resuming execution of a paused script, proceed as follows:

1. Click and hold down the "Resume script execution" button.
   The "Force script execution" button appears.
2. Move the mouse pointer to the "Force script execution" button while keeping the mouse button pressed.
3. Now release the mouse button.
   The script is executed to the end.

Execute script to the next function call

If a line with a breakpoint contains a function that you are not interested in, you can suppress the debugging of this function:

- Click on the "Step over next function call" button in the debugging area.
- Press the <F10> key.
  The function is executed without the script pausing within the function.

Jumping into a function

If the script pauses in a line containing a function that interests you, you can pause the script in that function:

- Click on the "Step into next function call" button in the debugging area.
- Press the <F11> key.
  The script pauses in the first line of the function.

Note

You can only jump into functions that you have defined yourself.

Jump out of a function

If the script pauses within a function that you are not interested in, you can suppress further debugging of this function:

- Click on the "Step out of current function" button in the debugging area.
- Press the key combination <Shift + F11>.

Note

You can only jump out of a function that you have defined yourself.

Execute script up to a selected line

To pause a paused script again at a selected line, proceeds as follows:

1. Right-click the number of the line in the code display area.
2. Select the entry "Continue to here".
   The script pauses at the selected line.

Pause at Exceptions

- To pause the script at Exceptions, click on the "Pause on exceptions" button in the debugging area.

Use call stack

- To jump into a function of the call stack, click on the corresponding entry under "Call Stack".

Note

You can only jump into functions that you have defined yourself.

10.1.7.7 Show values

Introduction

To identify errors in your script efficiently, have current values displayed while the script is being executed. This way you can view properties of objects or parameters of functions, for example. You can find additional information on objects and their properties under "WinCC Unified Object Model".

Requirements

- The group you want to debug is selected.
- The script pauses at a breakpoint.

Procedure

You view values by moving the mouse over the label in the code display area.

You also have the following options to view values:

- In the debugging area under "Scope"
- In the debugging area under "Watch"
- In the console

"Scope" area

All local values ("Local"), functions ("Module") and global values ("Global") that are defined at this time are displayed in the "Scope" area.

The values cannot be edited.

"Watch" area

In the "Watch" area, you view how values change in the course of a script.

The following buttons are available to you:

- "Add expression": Add a value
- "Refresh": Refresh the "Watch" area
- "Delete watch expression": Delete a value from the "Watch" area. Available when the mouse pointer is located above the respective value.

Console

The values available at the current time can be called in the console.

- You show or hide the console with <Esc>.

Call the current values in the console as follows:

1. Enter the name of a local or global value in the console.
2. Press <Enter>.

See also

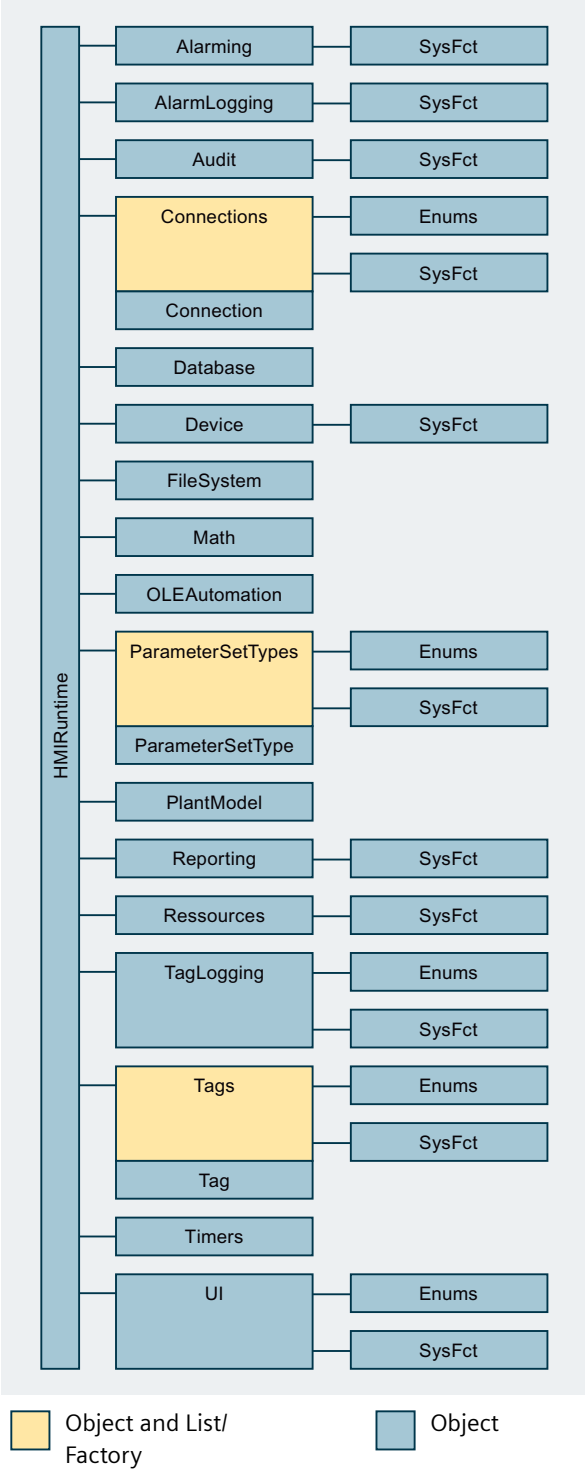
WinCC Unified object model (Page 1037)

10.2 WinCC Unified object model

10.2.1 WinCC Unified object model

Object model

The figure below shows an overview of the object model of the graphical Runtime system of WinCC Unified:



You access the objects of the graphical runtime system through the object model.

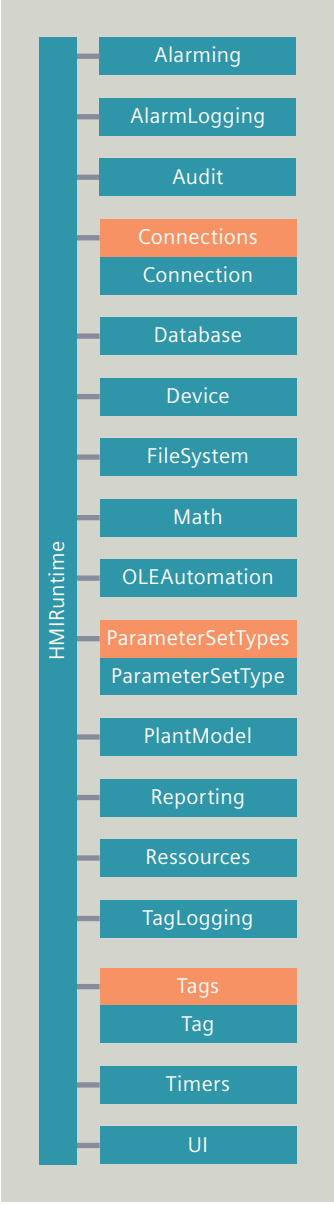
Use

You use the object model as follows:

- Objects
  Objects and lists give you access to basic elements of the runtime system, for example, tags, screens and levels.
- Properties
  You use the properties to read the current status of individual objects, for example, the name of a tag. You can also change many properties of the objects directly, for example, enable a button.
- Methods
  You apply methods to individual objects and write, for example, tag values back to the AS or output alarms in runtime.

10.2.2 HMIRuntime

Description



The "HMIRuntime" object represents the runtime system of WinCC Unified. The "HMIRuntime" object contains properties, methods and all objects of the runtime that support scripting.

Use

Note

The following objects have an alias to allow briefer notation:

- Alias `Tags` corresponds to `HMIRuntime.Tags`
- Alias `UI` corresponds to `HMIRuntime.UI`
- Alias `Screen` corresponds to the screen in which the script is executed.
- Alias `PlantModel` corresponds to `HMIRuntime.PlantModel`
- Alias `ParameterSetTypes` corresponds to `HMIRuntime.ParameterSetTypes`
- Alias `Faceplate` corresponds to the faceplate type in which the script is executed.

Object type

HMIRuntime

Properties

The "HMIRuntime" object has the following properties:

Language
Sets the runtime language.

Methods

The "HMIRuntime" object has the following methods:

- **GetDetailedErrorDescription()**
  Returns a detailed error description of the error code.
- **Trace()**
  Outputs a user-defined text via the debug output of the trace viewer in runtime.

10.2.2.1 HMIRuntime.Language

Description

The "Language" property specifies the runtime language.

Type

UInt32, HMILCID

Access

Read-write

Syntax

```
HMIRuntime.Language
```

Locale IDs (HMILCID)

The following table contains the Microsoft locale IDs of the languages supported in runtime:

Language	Country/Region	Locale ID
Afrikaans	South Africa	1078
Albanian	Albania	1052
Armenian	Armenia	1067
Azerbaijani (Cyrillic)	Azerbaijan	2092
Azerbaijani (Latin)	Azerbaijan	1068

HMIRuntime (Page 1040)

10.2.2.2 HMIRuntime.GetDetailedErrorDescription()

Description

The "GetDetailedErrorDescription" method returns a detailed error description of the error code passed.

Syntax

```
HMIRuntime.GetDetailedErrorDescription(errorCode);
```

Parameters

errorCode

Type: ErrorCode

Error code for which the detailed error description is to be output.

Return value

String

See also

HMIRuntime (Page 1040)

10.2.2.3 HMIRuntime.Trace()

Description

The "Trace" method outputs a user-defined text through the debug output of the trace viewer in runtime.

Syntax

```
HMIRuntime.Trace(message);
```

Parameter

message

Type: String

The text which is output.

Return value

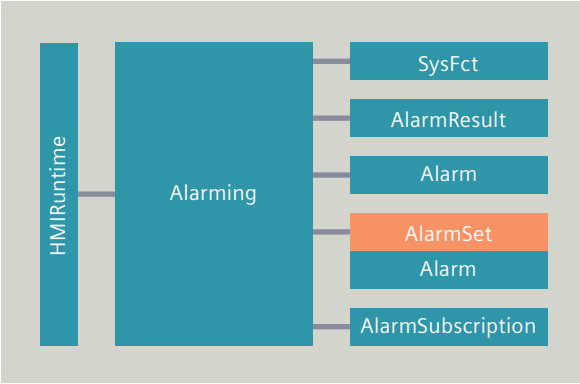
--

See also

HMIRuntime (Page 1040)

10.2.2.4 Alarming

Description



The "Alarming" object ("HMIAlarming" type) enables access to the WinCC Unified alarm system. You can create a new "AlarmSet" list, compile active alarms ("AlarmSubscription" objects) and reference configured alarms ("Alarm" objects) for read and write access.

Object type

HMIAlarming

Properties

--

Methods

The "Alarming" object has the following methods:

- **Alarms()**
  Returns an "Alarm" object.
- **CreateAlarmSet()**
  Creates an "AlarmSet" object.
- **CreateSubscription()**
  Creates an "AlarmSubscription" object.
- **GetActiveAlarms()**
  Supplies all active alarms at the time of the call.

Alarming.Alarms()

Description

The "Alarms" method returns an "Alarm" object ("HMIAlarm" type). You can use the "Alarm" object to perform operations with an alarm, for example, acknowledge or comment.

Syntax

```
HMIRuntime.Alarming.Alarms(AlarmName);
```

Parameters

AlarmName

Type: String, HMIAlarm

Name of an alarm

Return value

Object, HMIAlarm (Page 1050)

Example

Create an "Alarm" object with the "alarm1" alarm:

Copy code

```
var alarm = HMIRuntime.Alarming.Alarms('alarm1');
```

See also

Alarm (Page 1050)

Alarming (Page 1046)

Alarming.CreateAlarmSet()

Description

The "CreateAlarmSet" method creates a new "AlarmSet" object ("HMIAlarmSet" type). With the returned "AlarmSet" object, you can execute operations with multiple alarms in one call, for example, acknowledge or comment.

Syntax

```
HMIRuntime.Alarming.CreateAlarmSet([AlarmNames]);
```

Parameters

`AlarmNames`

Optional, type: String, HMIAlarm | String[], HMIAlarm | Variant[][], HMIAlarm

Name of one or more active alarms added to the "AlarmSet" object. Without parameters, an empty "AlarmSet" object is created.

Return value

Object, HMIAlarmSet (Page 1056)

Example

Create an "AlarmSet" object with two alarms:

Copy code

```
var alarmSet = HMIRuntime.Alarming.CreateAlarmSet(['alarm1', 'alarm2']);
```

See also

Alarming (Page 1046)

AlarmSet (Page 1056)

Alarming.CreateSubscription()

Description

The "CreateSubscription" method creates an "AlarmSubscription" object ("HMIAlarmSubscription" type). With the returned object "AlarmSubscription" you specify the grouping of active alarms.

Syntax

```
HMIRuntime.Alarming.CreateSubscription();
```

Parameters

--

Return value

Object, HMIAlarmSubscription (Page 1067)

See also

Alarming (Page 1046)

AlarmSubscription (Page 1067)

Alarming.GetActiveAlarms()

Description

The "GetActiveAlarms" method returns all active alarms at the time of the call. Unlike with an AlarmSubscription, no status changes or new alarms are signaled that occur after the function call.

Users can filter the alarms or specify a SystemName if they only want to receive the active alarms of a specific system.

The method executes an asynchronous read operation without blocking further script execution. In doing so, the method uses a Promise object, which has handlers for successful ("then()") and faulty ("catch()") execution of the read operation. Depending on the result, once execution is complete the corresponding handler of the Promise pattern is called with the "AlarmResult" objects or the error code as parameter.

Syntax

```
HMIRuntime.Alarming.GetActiveAlarms(Language[,Filter][,SystemNames])
.then(function(HMIAlarmResult[]) {
    ...
});
.catch(function(ErrorCode) {
    ...
});
```

Parameters

`Language`

Type: UInt32, HMILCID

Language for all texts of an alarm and the filter

`Filter`

Optional, type: String, HMIAlarmFilterString

SQL-type string for filtering

`SystemNames`

Optional, type: String[], HMISystem

A string array containing the SystemNames of the systems by which alarms are to be filtered.

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled
  Object, HMIAlarmResult[] (Page 1077) as parameter of the "then()" handler.
- Promise rejected
  ErrorCode as parameter of the "catch()" handler.

Example

Read out all active alarms of the "RUNTIME_1" system:

Copy code

```
var promise = HMIRuntime.Alarming.GetActiveAlarms(1033,"","RUNTIME_1");
```

See also

Alarming (Page 1046)

AlarmResult (Page 1077)

Alarm

Description

The "Alarm" object ("HMIAlarm" type) enables access to properties and methods of active alarms. An "Alarm" object is returned by the "Alarming" or "AlarmSet" lists.

Object type

HMIAlarm

Properties

The "Alarm" object has the following properties:

- **Name**
  Specifies the name of the alarm.
- **ErrorCode**
  Specifies the error code of the last method call of the object.

Methods

The "Alarm" object has the following methods:

- **Acknowledge()**
  Acknowledges active alarms.
- **Disable()**
  Temporarily disables the generation of alarms.
- **Enable()**
  Re-enables disabled alarms for display.
- **Reset()**
  Acknowledges the outgoing state of an active alarm.
- **Shelve()**
  Hides active alarms.
- **Unshelve()**
  Makes hidden active alarms visible again.

Alarm.ErrorCode

Description

The "ErrorCode" property specifies the error code of the last method call of the "Alarm" object.

Type

ErrorCode

Access

Read-write

Syntax

```
Alarm.ErrorCode
```

See also

Alarm (Page 1050)

Alarm.Name

Description

The "Name" property specifies the name of the alarm ("Alarm" object).

Type

String, HMIAlarm

Access

Read-write

Syntax

```
Alarm.Name
```

See also

Alarm (Page 1050)

Alarm.Acknowledge()

Description

The "Acknowledge" method acknowledges active alarms. The method uses the entire "Alarm" object as reference.

The method is executed as a synchronous operation.

Syntax

```
Alarm.Acknowledge([InstanceID])
```

Parameters

`InstanceID`

Optional, type: UInt32

Number of the alarm instance.

Return value

ErrorCode

Example

Acknowledge an alarm:

Copy code

```
var AckErrorcode = alarm.Acknowledge();
```

See also

Alarm (Page 1050)

Alarm.Disable()

Description

The "Disable" method temporarily deactivates the generation of alarms in the alarm source. You can reactivate the generation of the alarms with the "Enable" method.

You can use the "Disable" method to prevent the display of the alarms, for example, for maintenance work.

The method is executed as a synchronous operation.

Syntax

```
Alarm.Disable()
```

Parameters

--

Return value

ErrorCode

Example

Deactivate an alarm:

Copy code

```
var DisableErrorcode = alarm.Disable();
```

See also

Alarm (Page 1050)

Alarm.Enable() (Page 1053)

Alarm.Enable()

Description

The "Enable" method re-enables disabled alarms for display. You can temporarily deactivate the generation of alarms in the alarm source with the "Disable" method.

The method is executed as a synchronous operation.

Syntax

```
Alarm.Enable()
```

Parameters

--

Return value

ErrorCode

Example

Log an alarm:

Copy code

```
var EnableErrorcode = alarm.Enable();
```

See also

Alarm (Page 1050)

Alarm.Disable() (Page 1053)

Alarm.Reset()

Description

The "Reset" method acknowledges the outgoing state of an active alarm. The alarm is removed from the alarm system. The method uses the entire "Alarm" object as reference.

The method is executed as a synchronous operation.

Syntax

```
Alarm.Reset([InstanceID])
```

Parameters

`InstanceID`

Optional, type: UInt32

Number of the alarm instance.

Return value

ErrorCode

See also

Alarm (Page 1050)

Alarm.Shelve()

Description

The "Shelve" method hides active alarms. These are no longer displayed by the alarm control in runtime. You can show the alarms again with the "Unshelve" method.

The method is executed as a synchronous operation.

Syntax

```
Alarm.Shelve()
```

Parameters

--

Return value

ErrorCode

Example

Hides an alarm:

Copy code

```
var Errorcode = alarm.Shelve();
```

See also

Alarm (Page 1050)

Alarm.Unshelve() (Page 1055)

Alarm.Unshelve()

Description

The "Unshelve" method makes active alarms visible again. These are displayed again by the alarm control in runtime. You can hide the alarms again with the "Shelve" method.

The method is executed as a synchronous operation.

Syntax

```
Alarm.Unshelve()
```

Parameters

--

Return value

ErrorCode

See also

Alarm (Page 1050)

Alarm.Shelve() (Page 1055)

AlarmSet

Description

The "AlarmSet" object ("HMIAlarmSet" type) is a list of "Alarm" objects that provides optimized access to active alarms in runtime. After the initialization of the "AlarmSet" object, you can execute operations with multiple alarms in one call, such as acknowledge or comment. Simultaneous access demonstrates better performance and lower communication load than single access to multiple tags.

You create a new "AlarmSet" object with the "Alarming.CreateAlarmSet" method.

Object type

HMIAlarmSet

Properties

The "AlarmSet" object has the following properties:

- **Count**
  Returns the number of elements of the "AlarmSet" list.

Methods

The "AlarmSet" object has the following methods:

- **Acknowledge()**
  Acknowledges active alarms.
- **Add()**
  Adds alarms to the "AlarmSet" list.

- **Disable()**
  Temporarily disables the generation of alarms.
- **Enable()**
  Re-enables disabled alarms for display.
- **Item()**
  Returns an alarm of the "AlarmSet" list.
- **Remove()**
  Removes alarms by their name from the "AlarmSet" list.
- **Reset()**
  Acknowledges the outgoing state of active alarms.
- **Shelve()**
  Hides active alarms.
- **Unshelve()**
  Makes hidden active alarms visible again.

See also

Alarming.CreateAlarmSet() (Page 1047)

AlarmSet.Count

Description

The "Count" property returns the number of elements in the "AlarmSet" list.

Type

UInt32

Access

Read-only

Syntax

```
AlarmSet.Count
```

See also

AlarmSet (Page 1056)

AlarmSet.Acknowledge()

Description

The "Acknowledge" method acknowledges active alarms. The method uses the entire "Alarm" object as reference.

The method is applied to all "Alarm" objects of the list. The method is executed as asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful ("then()") and faulty ("catch()") execution of the operation. Depending on the result, the corresponding handler of the Promise pattern is called with the ErrorCode as parameter after execution.

Syntax

```
AlarmSet.Acknowledge()
.then(function(ErrorCode) {
    ...
})
.catch(function(ErrorCode) {
    ...
})
```

Parameters

--

Return value

Promise

ErrorCode, depending on the status of the Promise object:

- Promise successful (fulfilled)
  ErrorCode "0" as parameter of the "then()" handler
- Promise rejected
  ErrorCode as parameter of the "catch()" handler

Example

Acknowledge all alarms of an "AlarmSet" object:

Copy code

```
var alarmSet = HMIRuntime.Alarming.CreateAlarmSet('alarm1', 'alarm2', 'alarm3');
var promise = alarmSet.Acknowledge();
```

See also

AlarmSet (Page 1056)

AlarmSet.Add()

Description

The "Add" method adds alarms to the "AlarmSet" list. The alarms are referenced by name.

Syntax

```
AlarmSet.Add(AlarmName,[InstanceID])
```

Parameters

`AlarmName`

Type: String, HMIAlarm | String[], HMIAlarm | Variant[][], HMIAlarm

Names of "Alarm" objects that are added to the list.

The following data types are supported:

- Alarm name
- Array with alarm names
- Two-dimensional array with alarm name/value pairs

`InstanceID`

Optional, type: UInt32

Number of the alarm instance.

Return value

Object[], HMIAlarm (Page 1050)

Example

Create an "AlarmSet" object with two alarms:

Copy code

```
var name1 =  ResultSet[index].Name;
var name2 =  ResultSet[index+1].Name;
var alarmSet = HMIRuntime.Alarming.CreateAlarmSet();
var addedAlarms = alarmSet.Add([name1,name2]);
```

See also

AlarmSet (Page 1056)

Alarm (Page 1050)

AlarmSet.Disable()

Description

The "Disable" method temporarily deactivates the generation of alarms in the alarm source. You can reactivate the generation of the alarms with the "Enable" method.

You can use the "Disable" method to prevent the display of the alarms, for example, for maintenance work.

The method is applied to all "Alarm" objects of the list. The method is executed as asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful ("then()") and faulty ("catch()") execution of the operation. Depending on the result, the corresponding handler of the Promise pattern with the ErrorCode as parameter is called after the execution.

Syntax

```
AlarmSet.Disable()
.then(function(ErrorCode) {
    ...
})
.catch(function(ErrorCode) {
    ...
})
```

Parameters

--

Return value

Promise

ErrorCode, for "AlarmSet" objects depending on the status of the Promise object:

- Promise successful (fulfilled)
  ErrorCode "0" as parameter of the "then()" handler
- Promise rejected
  ErrorCode as parameter of the "catch()" handler

Example

Deactivate all alarms of an "AlarmSet" object:

Copy code

```
var alarmSet = HMIRuntime.Alarming.CreateAlarmSet('alarm1', 'alarm2');
var promise = alarmSet.Disable();
```

See also

AlarmSet (Page 1056)

AlarmSet.Enable() (Page 1061)

AlarmSet.Enable()

Description

The "Enable" method re-enables disabled alarms for display. You can temporarily deactivate the generation of alarms in the alarm source with the "Disable" method.

The method is applied to all "Alarm" objects of the list. The method is executed as asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful ("then()") and faulty ("catch()") execution of the operation. Depending on the result, the corresponding handler of the Promise pattern with the ErrorCode as parameter is called after the execution.

Syntax

```
AlarmSet.Enable()
.then(function(ErrorCode) {
    ...
})
.catch(function(ErrorCode) {
    ...
})
```

Parameters

--

Return value

Promise

ErrorCode, for "AlarmSet" objects depending on the status of the Promise object:

- Promise successful (fulfilled)
  ErrorCode "0" as parameter of the "then()" handler
- Promise rejected
  ErrorCode as parameter of the "catch()" handler

Example

Activate all alarms of an "AlarmSet" object:

Copy code

```
var alarmSet = HMIRuntime.Alarming.CreateAlarmSet('alarm1', 'alarm2');
var promise = alarmSet.Enable();
```

See also

AlarmSet (Page 1056)

AlarmSet.Disable() (Page 1060)

AlarmSet.Item()

Description

The "Item" method returns an "Alarm" object of the "AlarmSet" list.

Syntax

```
AlarmSet[.Item](name,[InstanceID])
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "AlarmSet" object.

Parameters

`name`

Type: String, HMIAlarm | Int32, HMIAlarm

Name or index number (1...n) of an "Alarm" object in the list

Note

The index number of an "Alarm" object does not represent the order in which the "Alarm" objects were added to the "AlarmSet" list.

`InstanceID`

Optional, type: UInt32

Number of the alarm instance

Return value

Object, HMIAlarm (Page 1050)

See also

AlarmSet (Page 1056)

Alarm (Page 1050)

AlarmSet.Remove()

Description

The "Remove" method removes alarms ("Alarm" objects) from the "AlarmSet" list by their names.

Syntax

```
AlarmSet.Remove(AlarmName,[InstanceID])
```

Parameters

AlarmName

Type: String, HMITag | String[], HMITag

Name of "Alarm" objects that are removed from the "AlarmSet" list.

The following data types are supported:

- Alarm name
- Array with alarm names

Note

No "Alarm" object can be transferred as a parameter. An "Alarm" object is referenced using the name.

InstanceID

Optional, type: UInt32

Number of the alarm instance

Return value

ErrorCode

Example

Create an "AlarmSet" object with two alarms and then remove both alarms from the AlarmSet again:

Copy code

```
var name1 =  ResultSet[index].Name;
var alarmSet = HMIRuntime.Alarming.CreateAlarmSet([name1, 'alarm2']);
alarmSet.remove([name1,'alarm2']);
```

See also

AlarmSet (Page 1056)

AlarmSet.Reset()

Description

The "Reset" method acknowledges the outgoing state of active alarms. The alarms are removed from the alarm system. The method uses the entire "Alarm" object as reference.

The method is applied to all "Alarm" objects of the list. The method is executed as asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful ("then()") and faulty ("catch()") execution of the operation. Depending on the result, the corresponding handler of the Promise pattern with the ErrorCode as parameter is called after the execution.

Syntax

```
AlarmSet.Reset()
.then(function(ErrorCode) {
    ...
})
.catch(function(ErrorCode) {
    ...
})
```

Parameters

--

Return value

Promise

ErrorCode, depending on the status of the Promise object:

- Promise successful (fulfilled)
  ErrorCode "0" as parameter of the "then()" handler
- Promise failed ("rejected")
  ErrorCode as parameter of the "catch()" handler

See also

AlarmSet (Page 1056)

AlarmSet.Shelve()

Description

The "Shelve" method hides active alarms. These are no longer displayed by Alarm Control in runtime. You can show the alarms again with the "Unshelve" method.

The method is applied to all "Alarm" objects of the list. The method is executed as asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful ("then()") and faulty ("catch()") execution of the operation. Depending on the result, the corresponding handler of the Promise pattern with the ErrorCode as parameter is called after the execution.

Syntax

```
AlarmSet.Shelve()
.then(function(ErrorCode) {
    ...
})
.catch(function(ErrorCode) {
    ...
})
```

Parameters

--

Return value

Promise

ErrorCode, for "AlarmSet" objects depending on the status of the Promise object:

- Promise successful (fulfilled)
  ErrorCode "0" as parameter of the "then()" handler
- Promise rejected
  ErrorCode as parameter of the "catch()" handler

Example

Hide all alarms of an "AlarmSet" object:

Copy code

```
var alarmSet = HMIRuntime.Alarming.CreateAlarmSet('alarm1', 'alarm2');
var promise = alarmSet.Shelve();
```

See also

AlarmSet (Page 1056)

AlarmSet.Unshelve() (Page 1066)

AlarmSet.Unshelve()

Description

The "Unshelve" method makes active alarms visible again. These are once again displayed by the Alarm Control in runtime. You can hide the alarms again with the "Shelve" method.

The method is applied to all "Alarm" objects of the list. The method is executed as asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful ("then()") and faulty ("catch()") execution of the operation. Depending on the result, the corresponding handler of the Promise pattern with the ErrorCode as parameter is called after the execution.

Syntax

```
AlarmSet.Unshelve()
.then(function(ErrorCode) {
    ...
})
.catch(function(ErrorCode) {
    ...
})
```

Parameters

--

Return value

Promise

ErrorCode, for "AlarmSet" objects depending on the status of the Promise object:

- Promise successful (fulfilled)
  ErrorCode "0" as parameter of the "then()" handler
- Promise rejected
  ErrorCode as parameter of the "catch()" handler

Example

Show all alarms of an "AlarmSet" object again:

Copy code

```
var alarmSet = HMIRuntime.Alarming.CreateAlarmSet('alarm1', 'alarm2');
var promise = alarmSet.Unshelve();
```

See also

AlarmSet (Page 1056)

AlarmSet.Shelve() (Page 1065)

Alarm

Description

Alarm (Page 1050)

AlarmSubscription

Description

The "AlarmSubscription" object ("HMIAlarmSubscription" type) enables access to active alarms.

Use

The "AlarmSubscription" object represents a selection of active alarms. An "AlarmSubscription" object is initialized through the "CreateSubscription" method of the "Alarming" object. The active alarms are then grouped and called according to the properties of the "AlarmSubscription" object. Finally, notification is given of the changes to the alarm image.

Object type

HMIAlarmSubscription

Properties

The "AlarmSubscription" object has the following properties:

- **Filter**
  Defines a string for filtering active alarms.
- **Language**
  Specifies the current runtime language.
- **OnAlarm**
  Sets the name of the callback function "OnAlarm" for monitoring active alarms.
- **SystemNames**
  Specifies the name of the runtime for compiling active alarms.

Methods

The "AlarmSubscription" object has the following methods:

- **Start()**
  Activates the monitoring of defined alarms of the "AlarmSubscription" object.
- **Stop()**
  Stops monitoring of defined alarms of the "AlarmSubscription" object.

See also

Alarming.CreateSubscription() (Page 1048)

AlarmSubscription.Filter

Description

The "Filter" property specifies a string for filtering active alarms.

The syntax of the filter string corresponds to the WHERE clause of an SQL command.

Type

String, HMIAlarmFilterString

Access

Read-write

Syntax

```
AlarmSubscription.Filter
```

Supported alarm properties

The following properties of an alarm can be used in the filter string:

- AcknowledgementTime
- Alarm
- AlarmClassName
- AlarmClassSymbol
- AlarmParameterValues
- AlarmText1 ... 9
- Area
- BackColor
- ChangeReason
- ClearTime
- Connection
- EventText
- Flashing
- InfoText
- InstanceID
- LoopInAlarm

- ModificationTime
- Name
- Origin
- Priority
- RaiseTime
- ResetTime
- SourceID
- SourceType
- State
- StateMachine
- StateText
- SuppressionState
- SystemSeverity
- TextColor
- Value
- ValueLimit

Operators

The following operators can be used in the filter string:

Operator	Description	Example
`=`	equal to	`AlarmClassName = 'demo'`
`IS NOT string`	is not equal to the string *string*	`AlarmText4 IS NOT 'Text5'`
`<>`	not equal	`Value <> 0.0`
`>`	greater than	`ModificationTime > '11.08.2016'`
`<`	less than	`Value < 75.0`
`>=`	greater than or equal to	`Value >= 25.0`
`<=`	less than or equal to	`Value <= 75.0`
`OR, ||`	logical OR	`State = 1 OR State = 3`
`AND, &&`	logical AND	`EventText = 'Text1' AND Origin = 'Motor'`
`BETWEEN`	within a range	`Value BETWEEN 25.0 AND 75.0`
`NOT BETWEEN`	outside a range	`Value NOT BETWEEN 25.0 AND 75.0`
`LIKE string`	corresponds to the string *string*	`Name LIKE 'Motor*'`
`NOT LIKE string`	does not correspond to the string *string*	`Name NOT LIKE 'Valve*'`
`IN (v1, v2, …)`	corresponds to one or more values	`State IN (1, 4, 7)`
`NOT IN (v1, v2, …)`	does not correspond to one or more values	`State NOT IN (0, 2, 3, 5, 6)`

Operator	Description	Example
`IS NULL`	compares to zero (missing data)	`Context IS NULL`
`IS NOT NULL`	compares to zero (unknown data)	`Context IS NOT NULL`

Wildcards

The following wildcards can be used for characters of filter strings:

Wildcard	Description	Example
`*`	replaces 0, 1 or more characters	`Name LIKE 'Motor*'`
`?`	replaces exactly 1 character	`Name = 'Recipe?'`

AlarmSubscription (Page 1067)

AlarmSubscription.Language

Description

The "Language" property specifies the current language for all texts of an alarm and the filter.

Type

UInt32, HMILCID

Access

Read-write

Syntax

```
AlarmSubscription.Language
```

Locale IDs (HMILCID)

The following table contains the Microsoft locale IDs of the languages supported in runtime:

Language	Country/Region	Locale ID
Afrikaans	South Africa	1078
Albanian	Albania	1052
Armenian	Armenia	1067
Azerbaijani (Cyrillic)	Azerbaijan	2092
Azerbaijani (Latin)	Azerbaijan	1068
Basque	Basque country	1069
Belarusian	Belarus	1059

Language	Country/Region	Locale ID
Bulgarian	Bulgaria	1026
Chinese	Hong Kong S.A.R.	3076

AlarmSubscription (Page 1067)

AlarmSubscription.OnAlarm

Description

The "OnAlarm" property specifies the name of the "OnAlarm" callback function for monitoring active alarms.

The properties of the active alarms are passed to the "OnAlarm" callback function as the "AlarmResultArray" object.

Required prototype of the callback function:
`OnAlarm(errorCode,systemName,alarmResultArray)`

Type

Function, HMIOnAlarmCB

Access

Write-only

Syntax

```
AlarmSubscription.OnAlarm
```

Parameters

Parameters of the callback function:

errorCode

Type: ErrorCode

Error code of the active alarm

systemName

Type: String

Name of the runtime system

alarmResultArray

Type: Object, HMIAlarmResult[]

Array with "AlarmResult" objects of the active alarm

Example

Monitor active alarms and output their properties:

Copy code

```
function AlarmSubscribe() {
    var subs = HMIRuntime.Alarming.CreateSubscription();
    subs.Filter = "";
    subs.language = 1033;
    subs.SystemNames = "System4";
    subs.OnAlarm = OnAlarm;
    subs.Start();
}

function OnAlarm(Errorcode, SystemName, ResultArray) {
    HMIRuntime.Trace("Script OnAlarm Called");
    var alarmcount = ResultArray.length;

    for (var index = 0; index < alarmcount; ++index) {
        if(ErrorCode[index] >= 0) //access resultarray only when it's
succeeded
        {
            HMIRuntime.Trace(ResultArray[index].EventText);
            HMIRuntime.Trace(ResultArray[index].InstanceID);
            HMIRuntime.Trace(ResultArray[index].AlarmClassName);
            HMIRuntime.Trace(ResultArray[index].State);
            HMIRuntime.Trace(SystemName[index]);
            HMIRuntime.Trace(Errorcode[index]);
        }
    }
}
```

AlarmSubscription (Page 1067)

AlarmSubscription.Start() (Page 1075)

AlarmSubscription.SystemNames

Description

The "SystemNames" property specifies the name of the runtime ("HMISystem" type) for compiling active alarms.

Type

String[], HMISystem

Access

Read-write

Syntax

```
AlarmSubscription.SystemNames
```

See also

AlarmSubscription (Page 1067)

AlarmSubscription.Start()

Description

The "Start" method activates the monitoring of defined alarms of the "AlarmSubscription" object.

Syntax

```
AlarmSubscription.Start()
```

Parameters

--

Return value

ErrorCode

Example

Start monitoring of alarms and output number of alarms:

Copy code

```
var subs =  HMIRuntime.Alarming.CreateSubscription();
subs.SystemNames = "System24";
subs.Language = 1033;
subs.OnAlarm = function (Errorcode, sysID, ResultSet){
    HMIRuntime.Trace("Script OnAlarm Called");
    var alarmCount = ResultSet.length;
    HMIRuntime.Trace("Alarm count = " + alarmCount);
};
subs.Start();
```

See also

AlarmSubscription (Page 1067)

AlarmSubscription.OnAlarm (Page 1073)

AlarmSubscription.Stop() (Page 1076)

AlarmSubscription.Stop()

Description

The "Stop" method stops the monitoring of defined alarms of the "AlarmSubscription" object.

Syntax

```
AlarmSubscription.Stop()
```

Parameters

--

Return value

ErrorCode

Example

Cancel monitoring of alarms after the first output:

Copy code

```
var subs =  HMIRuntime.Alarming.CreateSubscription();
subs.SystemNames = "System24";
subs.Language = 1033;
subs.OnAlarm = function (Errorcode, sysID, ResultSet){
    HMIRuntime.Trace("Script OnAlarm Called");
    var alarmCount = ResultSet.length;
    HMIRuntime.Trace("Alarm count = " + alarmCount);
    subs.Stop();
};
subs.Start();
```

AlarmSubscription (Page 1067)

AlarmSubscription.Start() (Page 1075)

AlarmResult

Description

The "AlarmResult" object ("HMIAlarmResult" type) provides access to the properties of an active alarm. The "AlarmResult" object is a pure data object which maps all properties of an active alarm.

Use

The OnAlarm callback function is called after an active alarm has been output. The "AlarmResult" object together with the SystemName and ErrorCode are transferred as parameters to this function.

In the case of multiple active alarms, the parameters are passed as lists to the OnAlarm callback function. Alarms from different servers are processed in only one call of the OnAlarm callback function.

The "AlarmResult" object only contains properties and no methods.

All texts of the "AlarmResult" object are monolingual strings. The language is specified with the "AlarmSubscription.Language" property.

Object type

HMIAlarmResult

Properties

The "AlarmResult" object has the following properties:

- **AcknowledgementTime**
  Returns the time when an alarm was acknowledged.
- **AlarmClassName**
  Returns the name of the alarm class.
- **AlarmClassSymbol**
  Returns the abbreviation for the display of the alarm class.
- **AlarmGroupID**
  Returns the alarm group ID.
- **AlarmParameterValues**
  Returns an array with parameter values of an alarm.
- **AlarmText**
  Returns the localized additional texts 1-9 of an alarm as array.
- **Area**
  Returns the area of origin of an alarm.
- **BackColor**
  Returns the background color of an alarm.
- **ChangeReason**
  Returns the event that triggered the change in the alarm state.
- **ClearTime**
  Returns the time of the reset of an alarm.
- **Connection**
  Returns the name of the connection via which an alarm was triggered.
- **Duration**
  Returns the duration of an alarm.
- **EventText**
  Returns a localized text describing an event to the alarm.
- **Flashing**
  Returns whether the specified object flashes in runtime.
- **ID**
  Returns the ID of the alarm that is also used in the display.
- **InstanceID**
  Returns the ID of alarms with multiple instances.
- **InvalidFlags**
  Returns the cause of invalid data of an alarm.
- **LoopInAlarm**
  Returns the name of the function that navigates from the display of an active alarm to its origin.
- **LoopInAlarmParameterValues**
  Returns the parameters of the function that navigates from the display of an active alarm to its origin.

- **ModificationTime**
  Returns the time stamp of the last change of the alarm state.
- **Name**
  Returns the name of the alarm.
- **NotificationReason**
  Returns the reason of an alarm.
- **Origin**
  Returns the origin of an alarm.
- **Priority**
  Returns the relevance of an alarm or a machine status.
- **RaiseTime**
  Returns the raise time of an alarm.
- **ResetTime**
  Returns the time of the reset of an alarm.
- **SourceID**
  Returns the source where an alarm was triggered.
- **State**
  Returns the state of an alarm.
- **StateText**
  Returns the alarm state as text, for example, "Incoming" or "Outgoing".
- **SuppressionState**
  Returns the visibility status of an active alarm.
- **SystemSeverity**
  Returns the level of the severity of a system fault as property of a system alarm.
- **TextColor**
  Returns the text color of the alarm state.
- **UserName**
  Returns the name of the user who triggered the alarm.
- **UserResponse**
  Returns the expected or required user response to an alarm.
- **Value**
  Returns the process value of an alarm.
- **ValueLimit**
  Returns the limit of a process value of an alarm.
- **ValueQuality**
  Returns the quality level of a process value of an alarm.

Methods

--

See also

Alarming.GetActiveAlarms() (Page 1049)

AlarmResult.AcknowledgementTime

Description

The "AcknowledgementTime" property returns the time of the acknowledgment of an alarm.

Type

DateTime

Access

Read-only

Syntax

```
AlarmResult.AcknowledgementTime
```

See also

AlarmResult (Page 1077)

AlarmResult.AlarmClassName

Description

The "AlarmClassName" property returns the name of the alarm class.

Type

String

Access

Read-only

Syntax

```
AlarmResult.AlarmClassName
```

See also

AlarmResult (Page 1077)

AlarmResult.AlarmClassSymbol

Description

The "AlarmClassSymbol" property returns the abbreviation for the display of the alarm class of the alarm, for example, "W" for the alarm class "Warning".

Type

String

Access

Read-only

Syntax

```
AlarmResult.AlarmClassSymbol
```

See also

AlarmResult (Page 1077)

AlarmResult.AlarmGroupID

Description

The "AlarmGroupID" property returns the alarm group ID.

Type

UInt8

Access

Read-only

Syntax

```
AlarmResult.AlarmGroupID
```

See also

AlarmResult (Page 1077)

AlarmResult.AlarmParameterValues

Description

The "AlarmParameterValues" property returns an array with parameter values of an alarm.

The parameter values are added to an alarm from the source in the "Incoming" and "Reset" state. They can also include diagnostic or raw data from the PLC in addition to simple tag values from the configured AlarmParamterTags.

Type

Variant[]

Access

Read-only

Syntax

```
AlarmResult.AlarmParameterValues
```

See also

AlarmResult (Page 1077)

AlarmResult.AlarmText

Description

The "AlarmText" property returns the localized additional texts 1-9 as an array. The text can contain triggered placeholders and reference all "AlarmParameterValues" properties of the respective alarm state "Incoming" or "Reset".

Type

String[]

Access

Read-only

Syntax

```
AlarmResult.AlarmText
```

See also

AlarmResult (Page 1077)

AlarmResult.Area

Description

The "Area" property specifies the area of origin of an alarm.

The "Area" property can be configured and, together with the "Origin" property, defines the source of an alarm. You can also use placeholders for context-sensitive format.

The "Area" property, for example, includes subsystem, application name or PLC ID. You can sort and filter alarms through the "Area" context.

Type

String

Access

Read-only

Syntax

```
AlarmResult.Area
```

See also

AlarmResult (Page 1077)

AlarmResult.BackColor

Description

The "BackColor" property returns the background color of an alarm.

Type

UInt32

Access

Read-only

Syntax

```
AlarmResult.BackColor
```

See also

AlarmResult (Page 1077)

AlarmResult.ChangeReason

Description

The "ChangeReason" property returns the event that triggered the change in the alarm state. The time of last modification is saved in the "ModificationTime" property.

The alarm status may change for the following reasons:

Values	ChangeReason	Description
0x0001	AlarmStateChanged	The "State" property has changed
0x0003	RaisedEvent	Status change "Incoming"
0x0005	ClearEvent	Status change "Reset"
0x0007	AcknowledgeEvent	Status change "Acknowledged"
0x0009	ResetEventReason	Status change "Deleted"
0x000F	RemoveEvent	Status change "Removed"
0x0010	AlarmQualityChanged	The "Quality" property has changed
0x0020	AlarmParameterValueChanged	A value of the "AlarmParameterValues" property has changed
0x0040	AlarmPriorityChanged	The "Priority" property has changed
0x0080	AlarmSuppressionStateChanged	The "SuppressionState" property has changed
0x0100	AlarmEscalationReasonChanged	The "EscalationReason" property has changed
0x0200	AlarmEnableStateChanged	Is set together with "RemoveEvent" to show that the alarm was deactivated
0x0400	TextUpdate	Alarm texts have changed
0x1000	ConfigurationChanged	Alarm configuration has changed
0x2000	ExternalUpdate	The "ModificationTime" property was changed for certain application-specific alarm scenarios
0x8000	IgnoreInLogging	For suppressing the reporting of specific alarms.

Type

UInt16

Access

Read-only

Syntax

```
AlarmResult.ChangeReason
```

See also

AlarmResult (Page 1077)

AlarmResult.ClearTime

Description

The "ClearTime" property returns the time of the reset of an alarm.

Type

DateTime

Access

Read-only

Syntax

```
AlarmResult.ClearTime
```

See also

AlarmResult (Page 1077)

AlarmResult.Connection

Description

The "Connection" property returns the name of the connection by which an alarm was triggered.

Type

String

Access

Read-only

Syntax

```
AlarmResult.Connection
```

See also

AlarmResult (Page 1077)

AlarmResult.Duration

Description

The "Duration" property returns the duration of an alarm.

Type

Time

Access

Read-only

Syntax

```
AlarmResult.Duration
```

See also

AlarmResult (Page 1077)

AlarmResult.EventText

Description

The "EventText" property returns a localized text that describes an alarm event.

The text can contain triggered placeholders and reference all "AlarmParameterValues" properties of the respective alarm state "Incoming" or "Reset".

Type

String

Access

Read-only

Syntax

```
AlarmResult.EventText
```

See also

AlarmResult (Page 1077)

AlarmResult.Flashing

Description

The "Flashing" property returns whether the specified object flashes in runtime.

Value	Status
1	Alarm flashes
0	Alarm does not flash

A background color for flashing is specified with the "BackColor" property. The second background color and the frequency of the flashing is configured in the alarm control.

Type

Bool

Access

Read-only

Syntax

```
AlarmResult.Flashing
```

See also

AlarmResult (Page 1077)

AlarmResult.ID

Description

The "ID" property returns the ID of an alarm.

Type

UInt32

Access

Read-only

Syntax

```
AlarmResult.ID
```

See also

AlarmResult (Page 1077)

AlarmResult.InstanceID

Description

The "InstanceID" property returns the ID of alarms with multiple instances.

Type

UInt32

Access

Read-only

Syntax

```
AlarmResult.InstanceID
```

See also

AlarmResult (Page 1077)

AlarmResult.InvalidFlags

Description

The "InvalidFlags" property returns the cause of invalid data of an alarm.

An invalid alarm is marked with the following bits:

Bit number	InvalidFlags	Description
Bit 0	Invalid configuration flag	Alarm configuration is invalid. HMI device does not match data source.
Bit 1	Invalid timestamp flag	Data source transfers invalid time stamps.
Bit 2	Invalid alarm parameter flag	Data source transfers invalid parameter values.
Bit 3	Invalid event text flag	Runtime cannot format the text due to missing parameter values.

The valid alarm has the following properties:

- InvalidFlags = 0
- Quality = "good"

Type

UInt8

Access

Read-only

Syntax

```
AlarmResult.InvalidFlags
```

See also

AlarmResult (Page 1077)

AlarmResult.LoopInAlarm

Description

The "LoopInAlarm" property returns the name of the function that navigates from the display of an active alarm to its origin.

The required parameters of the function are returned with the associated "LoopInAlarmParameterValues" property.

Type

String

Access

Read-only

Syntax

```
AlarmResult.LoopInAlarm
```

See also

AlarmResult (Page 1077)

AlarmResult.LoopInAlarmParameterValues

Description

The "LoopInAlarmParameterValues" property returns the parameters of the function that navigates from the display of an active alarm to its origin. The associated "LoopInAlarm" property contains the name of the function used for the call, for example, the "OpenScreen" function if the origin of the alarm is a screen.

Type

Variant[]

Access

Read-only

Syntax

```
AlarmResult.LoopInAlarmParameterValues
```

See also

AlarmResult (Page 1077)

AlarmResult.ModificationTime

Description

The "ModificationTime" property returns the time stamp of the last modification of the alarm state.

The reason for the change is included in the "ChangeReason" property.

Type

DateTime

Access

Read-only

Syntax

```
AlarmResult.ModificationTime
```

See also

AlarmResult (Page 1077)

AlarmResult.Name

Description

The "Name" property returns the name of the alarm ("Alarm" object).

Type

String, HMIAlarm

Access

Read-only

Syntax

```
AlarmResult.Name
```

See also

AlarmResult (Page 1077)

AlarmResult.NotificationReason

Description

The "NotificationReason" property returns the reason for an alarm.

The property can have the following values:

- 0: Unknown (for example, if the alarm was read out from a log).
- 1: Add
- 2: Change
- 3: Remove

Type

UInt8

Access

Read-only

Syntax

```
AlarmResult.NotificationReason
```

See also

AlarmResult (Page 1077)

AlarmResult.Origin

Description

The "Origin" property returns the origin of an alarm.

For example, the "Origin" property contains system name, data source or CPU ID. You can sort and filter alarms through the "Origin" context.

The "Origin" property can be configured and, together with the "Area" property, defines the source of an alarm. You can also use placeholders for context-sensitive format.

Type

String

Access

Read-only

Syntax

```
AlarmResult.Origin
```

See also

AlarmResult (Page 1077)

AlarmResult.Priority

Description

The "Priority" property defines the relevance of an alarm or a machine status.

Type

UInt8

Access

Read-only

Syntax

```
AlarmResult.Priority
```

See also

AlarmResult (Page 1077)

AlarmResult.RaiseTime

Description

The "RaiseTime" property returns the trigger time of an alarm.

Type

DateTime

Access

Read-only

Syntax

```
AlarmResult.RaiseTime
```

See also

AlarmResult (Page 1077)

AlarmResult.ResetTime

Description

The "ResetTime" property returns the time of the reset of an alarm. After resetting, the alarm is removed from the alarm system.

Type

DateTime

Access

Read-only

Syntax

```
AlarmResult.ResetTime
```

See also

AlarmResult (Page 1077)

AlarmResult.SourceID

Description

The "SourceID" property returns the source at which an alarm was triggered.

The value depends on the origin of the alarm and is assigned by the data source, for example, Range-ID, controller/connection name or computer name.

Type

String

Access

Read-only

Syntax

```
AlarmResult.SourceID
```

See also

AlarmResult (Page 1077)

AlarmResult.State

Description

The "State" property returns the state of an alarm.

The table below shows the possible states of an alarm.

Value	State	Description
0x00	Normal (Idle)	Not an active alarm
0x01	Raised	Incoming
0x02	RaisedCleared	Incoming and reset
0x05	RaisedAcknowledged	Incoming and acknowledged
0x06	RaisedAcknowledgedCleared	Incoming, acknowledged and reset
0x07	RaisedClearedAcknowledged	Incoming, reset and acknowledged
0x80	Removed	Alarm has been removed and is no longer available

Type

UInt32

Access

Read-only

Syntax

```
AlarmResult.State
```

See also

AlarmResult (Page 1077)

AlarmResult.StateText

Description

The "StateText" property returns the alarm state as text, for example, "Incoming" or "Outgoing".

The texts can be assigned system-wide for each alarm status.

Type

String

Access

Read-only

Syntax

```
AlarmResult.StateText
```

See also

AlarmResult (Page 1077)

AlarmResult.SuppressionState

Description

The "SuppressionState" property returns the status of visibility of an active alarm.

Value	SuppressionState	Description
0x0	Unsuppressed	Alarm is visible.
0x1	Suppressed	Alarm is configured as not visible.
0x3	Shelved	Alarm was hidden manually. The methods "Unshelve" and "Shelve" can be applied.

Type

UInt8

Access

Read-only

Syntax

```
AlarmResult.SuppressionState
```

See also

AlarmResult (Page 1077)

AlarmResult.SystemSeverity

Description

The "SystemSeverity" property returns the level of the severity of a system fault as property of a system alarm. The value of the "SystemSeverity" property also influences runtime monitoring (SystemHealthIndex).

The "SystemSeverity" property can indicate the following severity:

Value	SystemSeverity	Description
0	None	No effect on system monitoring.
1	Lowest severity	Fault with lowest impact on system monitoring.
2	Low severity	Fault with low impact on system monitoring.
3	Medium severity	Fault with medium impact on system monitoring.
4	High severity	Fault with great impact on system monitoring.
5	Highest severity	Fault with greatest impact on system monitoring.

Type

UInt16

Access

Read-only

Syntax

```
AlarmResult.SystemSeverity
```

See also

AlarmResult (Page 1077)

AlarmResult.TextColor

Description

The "TextColor" property returns the text color of the alarm state. Each alarm state has its own visual representation.

Type

UInt32

Access

Read-only

Syntax

```
AlarmResult.TextColor
```

See also

AlarmResult (Page 1077)

AlarmResult.UserName

Description

The "UserName" property returns the name of the user who triggered the alarm.

Type

String

Access

Read-only

Syntax

```
AlarmResult.UserName
```

See also

AlarmResult (Page 1077)

AlarmResult.UserResponse

Description

The "UserResponse" property returns the expected or required user response to an alarm:

Value	UserResponse	Description
0x0	No response	Active alarm does not expect user response
0x1	Acknowledgment	Active alarm expects acknowledgment (also in group)
0x2	Reset	Active alarm expects reset (also in group)
0x5	Single acknowledgment	Active alarm explicitly expects single acknowledgment
0x6	Single reset	Active alarm explicitly expects single reset

Type

UInt16

Access

Read-only

Syntax

```
Alarmesult.UserResponse
```

See also

AlarmResult (Page 1077)

AlarmResult.Value

Description

The "Value" property returns the process value of an alarm.

Type

Variant

Access

Read-only

Syntax

```
AlarmResult.Value
```

See also

AlarmResult (Page 1077)

AlarmResult.ValueLimit

Description

The "ValueLimit" property returns the limit of the process value of an alarm.

Type

Variant

Access

Read-only

Syntax

```
AlarmResult.ValueLimit
```

See also

AlarmResult (Page 1077)

AlarmResult.ValueQuality

Description

The "ValueQuality" property returns the level of the quality of the process value of an alarm.

Type

UInt16

Access

Access depends on the object.

Syntax

```
AlarmResult.ValueQuality
```

See also

AlarmResult (Page 1077)

SysFct

Description

The "SysFct" object ("HMIAlarmingSysFct" type) enables access to the system functions of the "Alarming" object.

Object type

HMIAlarmingSysFct

Properties

--

Methods

The "SysFct" object has the following methods:

- **CreateOperatorInputInformation()**
  Creates an alarm of the "OperatorInputInformation" class.
- **CreateSystemAlarm()**
  Creates an alarm of the "SystemAlarm" class.
- **CreateSystemInformation()**
  Creates an alarm of the "SystemInformation" class.

See also

Alarming (Page 1046)

SysFct.CreateOperatorInputInformation()

Description

The "CreateOperatorInputInformation" method creates an alarm of the "OperatorInputInformation" class.

Syntax

```
HMIRuntime.Alarming.SysFct.CreateOperatorInputInformation(AlarmText[
,Area][,AlarmParameterValue1][,AlarmParameterValue2]
[,AlarmParameterValue3][, AlarmParameterValue4]
[,AlarmParameterValue5][,AlarmParameterValue6]
[,AlarmParameterValue7]);
```

Parameters

AlarmText

Type: String

Specifies the alarm text.

In a script, the alarm text can be either a fixed string or a reference to a text list. Alarm texts can also be defined language-dependent using text lists.

Area

Optional, type: String

Specifies the scope of the alarm.

AlarmParameterValue1

Optional, type: Variant, Scalar

Value of the first alarm parameter.

AlarmParameterValue2

Optional, type: Variant, Scalar

Value of the second alarm parameter.

AlarmParameterValue3

Optional, type: Variant, Scalar

Value of the third alarm parameter.

AlarmParameterValue4

Optional, type: Variant, Scalar

Value of the fourth alarm parameter.

AlarmParameterValue5

Optional, type: Variant, Scalar

Value of the fifth alarm parameter.

AlarmParameterValue6

Optional, type: Variant, Scalar

Value of the sixth alarm parameter.

AlarmParameterValue7

Optional, type: Variant, Scalar

Value of the seventh alarm parameter.

Return value

ErrorCode

AlarmResult.AlarmParameterValues (Page 1082)

SysFct.CreateSystemAlarm()

Description

The "CreateSystemAlarm" method creates an alarm of the "SystemAlarm" class.

Syntax

```
HMIRuntime.Alarming.SysFct.CreateSystemAlarm(AlarmText[,Area]
[,AlarmParameterValue1][,AlarmParameterValue2]
[,AlarmParameterValue3][,AlarmParameterValue4]
[,AlarmParameterValue5][,AlarmParameterValue6]
[,AlarmParameterValue7]);
```

Parameters

AlarmText

Type: String

Specifies the alarm text.

In a script, the alarm text can be either a fixed string or a reference to a text list. Alarm texts can also be defined language-dependent using text lists.

Area

Optional, type: String

Specifies the scope of the alarm.

AlarmParameterValue1

Optional, type: Variant, Scalar

Value of the first alarm parameter.

AlarmParameterValue2

Optional, type: Variant, Scalar

Value of the second alarm parameter.

AlarmParameterValue3

Optional, type: Variant, Scalar

Value of the third alarm parameter.

AlarmParameterValue4

Optional, type: Variant, Scalar

Value of the fourth alarm parameter.

AlarmParameterValue5

Optional, type: Variant, Scalar

Value of the fifth alarm parameter.

AlarmParameterValue6

Optional, type: Variant, Scalar

Value of the sixth alarm parameter.

AlarmParameterValue7

Optional, type: Variant, Scalar

Value of the seventh alarm parameter.

Return value

ErrorCode

SysFct (Page 1101)

AlarmResult.AlarmParameterValues (Page 1082)

SysFct.CreateSystemInformation()

Description

The "CreateSystemInformation" method creates an alarm of the "SystemInformation" class.

The "SystemInformation" alarm class only has the state "Incoming" and is therefore only displayed in the alarm control under "Logged alarms" and not under "Pending alarms".

Syntax

```
HMIRuntime.Alarming.SysFct.CreateSystemInformation(AlarmText[,Area]
[,AlarmParameterValue1][,AlarmParameterValue2]
[,AlarmParameterValue3][,AlarmParameterValue4]
[,AlarmParameterValue5][,AlarmParameterValue6]
[,AlarmParameterValue7]);
```

Parameters

AlarmText

Type: String

Specifies the alarm text.

In a script, the alarm text can be either a fixed string or a reference to a text list. Alarm texts can also be defined language-dependent using text lists.

Area

Optional, type: String

Specifies the scope of the alarm.

AlarmParameterValue1

Optional, type: Variant, Scalar

Value of the first alarm parameter.

AlarmParameterValue2

Optional, type: Variant, Scalar

Value of the second alarm parameter.

AlarmParameterValue3

Optional, type: Variant, Scalar

Value of the third alarm parameter.

AlarmParameterValue4

Optional, type: Variant, Scalar

Value of the fourth alarm parameter.

AlarmParameterValue5

Optional, type: Variant, Scalar

Value of the fifth alarm parameter.

AlarmParameterValue6

Optional, type: Variant, Scalar

Value of the sixth alarm parameter.

`AlarmParameterValue7`

Optional, type: Variant, Scalar

Value of the seventh alarm parameter.

Return value

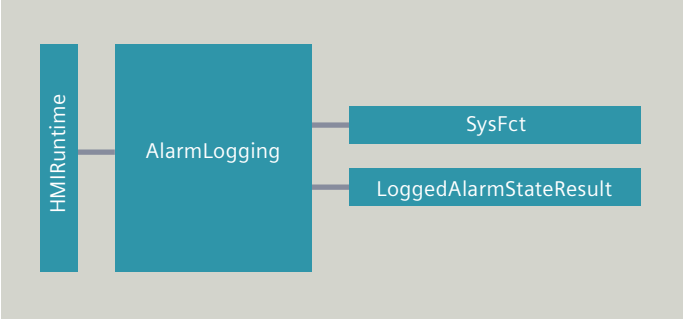
10.2.2.5 AlarmLogging

Description

The object "AlarmLogging" (type "HMIAlarmLogging") enables access to the logging system. You can read and comment on the logged alarms ("HMILoggedAlarmStateResult[]" objects) asynchronously.



Object type

HMIAlarmLogging

Properties

--

Methods

The "AlarmLogging" object has the following methods:

- **AddComment()**
  Adds a comment to logged alarms asynchronously in the logging system.
- **Read()**
  Reads out logged alarms of a time period asynchronously from a logging system.

AlarmLogging.AddComment()

Description

The "AddComment" method adds comments for logged alarms ("HMILoggedAlarmStateResult[]" objects) asynchronously in the logging system.

The method executes an asynchronous write operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the write operation.

Note

The "LoggedAlarmStateObjectID", "InstanceID" and "TimeStamp" parameters must correspond to the properties of the associated "HMILoggedAlarmStateResult" object.

Syntax

```
HMIRuntime.AlarmLogging.AddComment(LoggedAlarmStateObjectID,Instance
ID,TimeStamp,Language,Comment)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

LoggedAlarmStateObjectID

Type: String

ID of the logged alarm

InstanceID

Type: UInt32

InstanceID of the logged alarm

`TimeStamp`

Type: DateTime

Time stamp of the comment

`Language`

Type: UInt32, HMILCID

Country identification of the language of the comment

`Comment`

Type: String

Comment on the logged alarms

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

AlarmLogging (Page 1106)

LoggedAlarmStateResult (Page 1110)

AlarmLogging.Read()

Description

The "Read" method reads logged alarms ("HMILoggedAlarmStateResult[]" objects) of a time period asynchronously from a logging system.

The method executes an asynchronous read operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the read operation. Depending on the result, the corresponding handler of the Promise pattern is called after the read operation with an Array of "HMILoggedAlarmStateResult" objects or an error code as parameter.

Syntax

```
HMIRuntime.AlarmLogging.Read(dateFrom,dateTo,filter,language,
[systemNames])
.then(function(alarmResultArray) {
    ...
})
```

```
.catch(function(errorCode) {
    ...
});
```

Parameters

dateFrom

Type: DateTime

End date of the time period

dateTo

Type: DateTime

Start date of the time period

filter

Type: String, HMIAlarmFilterString

SQL-type string for filtering the result set of the logged alarms

language

Type: UInt32, HMILCID

Country code of the language of the logged alarms and the filter

systemNames

Type: String[], HMISystem

Array of system names

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  Object, HMILoggedAlarmStateResult[] (Page 1110) as parameter of the "then()" handler.
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

AlarmLogging (Page 1106)

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult

Description

The "LoggedAlarmStateResult" object ("HMILoggedAlarmStateResult" type) provides access to the properties of a logged alarm. The "LoggedAlarmStateResult" object is a pure data object that maps all properties of a logged alarm.

Object type

HMILoggedAlarmStateResult

Properties

The "LoggedAlarmStateResult" object has the following properties:

- **AcknowledgementTime**
  Returns the time when an alarm was acknowledged.
- **AlarmClassName**
  Returns the name of the alarm class.
- **AlarmClassSymbol**
  Returns the abbreviation for the display of the alarm class.
- **AlarmGroupID**
  Returns the alarm group ID.
- **AlarmParameterValues**
  Returns an array with parameter values of an alarm.
- **AlarmText**
  Returns the localized additional texts 1-9 of an alarm as array.
- **Area**
  Returns the area of origin of an alarm.
- **BackColor**
  Returns the background color of an alarm.
- **ChangeReason**
  Returns the event that triggered the change in the alarm state.
- **ClearTime**
  Returns the time of the reset of an alarm.
- **Connection**
  Returns the name of the connection via which an alarm was triggered.
- **Deadband**
  Returns the hysteresis value of the trigger tag of an alarm.
- **EventText**
  Returns a localized text describing an event to the alarm.
- **HostName**
  Returns the name of the PC at which the alarm was triggered.

- **ID**
  Returns the ID of a logged alarm.
- **InfoText**
  Returns the information text of an alarm in all archived languages.
- **InstanceID**
  Returns the ID of alarms with multiple instances.
- **InvalidFlags**
  Selects the valid or invalid alarm condition.
- **LoggedAlarmStateObjectID**
  Returns the ID of a logged alarm.
- **ModificationTime**
  Returns the time stamp of the last change of the alarm state.
- **Origin**
  Returns the origin of an alarm.
- **Priority**
  Returns the relevance of an alarm or a machine status.
- **RaiseTime**
  Returns the trigger time of an alarm.
- **ResetTime**
  Returns the time of the reset of an alarm.
- **SingleAcknowledgement**
  Returns whether an alarm must be acknowledged exclusively or can also be acknowledged in a group.
- **SourceType**
  Returns the type of alarm source.
- **State**
  Returns the state of an alarm.
- **StateMachine**
  Returns the behavior of the alarm for states and events.
- **StateText**
  Returns the alarm state as text.
- **SuppressionState**
  Returns the status of visibility of an active alarm.
- **TextColor**
  Returns the text color of the alarm state.
- **UserName**
  Returns the name of the user who triggered the alarm object.
- **UserResponse**
  Returns the expected or required user response to an alarm.
- **Value**
  Returns the process value of an alarm.

- **ValueLimit**
  Returns the limit of a process value of an alarm.
- **ValueQuality**
  Returns the level of the quality of a process value of an alarm.

Methods

--

AlarmLogging (Page 1106)

LoggedAlarmStateResult.AcknowledgementTime

Description

The "AcknowledgementTime" property returns the time of the acknowledgment of an alarm.

Type

DateTime

Access

Read-only

Syntax

```
LoggedAlarmStateResult.AcknowledgementTime
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.AlarmClassName

Description

The "AlarmClassName" property returns the name of the alarm class.

Type

String

Access

Read-only

Syntax

```
LoggedAlarmStateResult.AlarmClassName
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.AlarmClassSymbol

Description

The "AlarmClassSymbol" property returns the abbreviation for the display of the alarm class of the alarm, for example, "W" for the alarm class "Warning".

Type

String

Access

Read-only

Syntax

```
LoggedAlarmStateResult.AlarmClassSymbol
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.AlarmGroupID

Description

The "AlarmGroupID" property returns the alarm group ID.

Type

UInt8

Access

Read-only

Syntax

```
LoggedAlarmStateResult.AlarmGroupID
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.AlarmParameterValues

Description

The "AlarmParameterValues" property returns an Array with parameter values of an alarm.

The parameter values are added to an alarm from the source in the "Incoming" and "Reset" state. They can also include diagnostic or raw data from the PLC in addition to simple tag values from the configured AlarmParamterTags.

Type

Variant[]

Access

Read-only

Syntax

```
LoggedAlarmStateResult.AlarmParameterValues
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.AlarmText

Description

The "AlarmText" property returns the localized additional texts 1-9 of an alarm as Array. The text can contain triggered placeholders and reference all "AlarmParameterValues" properties of the respective alarm state "Incoming" or "Reset".

Type

String[]

Access

Read-only

Syntax

```
LoggedAlarmStateResult.AlarmText
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.Area

Description

The "Area" property returns the area of origin of an alarm.

The "Area" property can be configured and, together with the "Origin" property, defines the source of an alarm. You can also use placeholders for context-sensitive format.

The "Area" property, for example, includes subsystem, application name or PLC ID. You can sort and filter alarms through the "Area" context.

Type

String

Access

Read-only

Syntax

```
LoggedAlarmStateResult.Area
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.BackColor

Description

The "BackColor" property returns the background color of an alarm.

Type

UInt32

Access

Read-only

Syntax

```
LoggedAlarmStateResult.BackColor
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.ChangeReason

Description

The "ChangeReason" property returns the event that triggered the change in the alarm state. The time of last modification is saved in the "ModificationTime" property.

The alarm status may change for the following reasons:

Values	ChangeReason	Description
0x0001	AlarmStateChanged	The "State" property has changed
0x0003	RaisedEvent	Status change "Incoming"
0x0005	ClearEvent	Status change "Reset"
0x0007	AcknowledgeEvent	Status change "Acknowledged"
0x0009	ResetEventReason	Status change "Deleted"
0x000F	RemoveEvent	Status change "Removed"
0x0010	AlarmQualityChanged	The "Quality" property has changed
0x0020	AlarmParameterValueChanged	A value of the "AlarmParameterValues" property has changed
0x0040	AlarmPriorityChanged	The "Priority" property has changed
0x0080	AlarmSuppressionStateChanged	The "SuppressionState" property has changed
0x0100	AlarmEscalationReasonChanged	The "EscalationReason" property has changed

Values	ChangeReason	Description
0x0200	AlarmEnableStateChanged	Is set together with "RemoveEvent" to show that the alarm was deactivated
0x0400	TextUpdate	Alarm texts have changed
0x1000	ConfigurationChanged	Alarm configuration has changed
0x2000	ExternalUpdate	The "ModificationTime" property was changed for certain application-specific alarm scenarios
0x8000	IgnoreInLogging	For suppressing the reporting of specific alarms.

Type

UInt16

Access

Read-only

Syntax

```
LoggedAlarmStateResult.ChangeReason
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.ClearTime

Description

The "ClearTime" property returns the time of the reset of an alarm.

Type

DateTime

Access

Read-only

Syntax

```
LoggedAlarmStateResult.ClearTime
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.Connection

Description

The "Connection" property returns the name of the connection by which an alarm was triggered.

Type

String

Access

Read-only

Syntax

```
LoggedAlarmStateResult.Connection
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.Deadband

Description

The "Deadband" property returns the hysteresis value of the trigger tag of an alarm.

Type

Variant

Access

Read-only

Syntax

```
LoggedAlarmStateResult.Deadband
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.EventText

Description

The "EventText" property returns a localized text that describes an alarm event.

The text can contain triggered placeholders and reference all "AlarmParameterValues" properties of the respective "incoming" or "reset" alarm state.

Type

String

Access

Read-only

Syntax

```
LoggedAlarmStateResult.EventText
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.HostName

Description

The "HostName" property returns the name of the PC at which an alarm was triggered.

Type

Boolean

Access

Read-only

Syntax

```
LoggedAlarmStateResult.HostName
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.ID

Description

The "ID" property returns the ID of a logged alarm.

Type

UInt32

Access

Read-only

Syntax

```
LoggedAlarmStateResult.ID
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.InfoText

Description

The "InfoText" property returns the information text of an alarm in all archived languages. Normally, the text is used for operator instructions.

Type

String

Access

Read-only

Syntax

```
LoggedAlarmStateResult.InfoText
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.InstanceID

Description

The "InstanceID" property returns the ID of alarms with multiple instances.

Type

UInt32

Access

Read-only

Syntax

```
LoggedAlarmStateResult.InstanceID
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.InvalidFlags

Description

The "InvalidFlags" property marks the valid or invalid alarm state.

Type

UInt8

Access

Read-only

Syntax

```
LoggedAlarmStateResult.InvalidFlags
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.LoggedAlarmStateObjectID

Description

The "LoggedAlarmStateObjectID" property returns the ID of a logged alarm.

The ID is used for referencing a logged alarm, for example, for commenting with the "AlarmLogging.AddComment" method.

Type

String

Access

Read-only

Syntax

```
LoggedAlarmStateResult.LoggedAlarmStateObjectID
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.ModificationTime

Description

The "ModificationTime" property returns the time stamp of the last modification of the alarm state.

The reason for the change is included in the "ChangeReason" property.

Type

DateTime

Access

Read-only

Syntax

```
LoggedAlarmStateResult.ModificationTime
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.Origin

Description

The "Origin" property returns the origin of an alarm.

The "Origin" property, for example, includes system names, data source or CPU ID. You can sort and filter alarms through the "Origin" context.

The "Origin" property can be configured and, together with the "Area" property, defines the source of an alarm. You can also use placeholders for context-sensitive format.

Type

String

Access

Read-only

Syntax

```
LoggedAlarmStateResult.Origin
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.Priority

Description

The "Priority" property specifies the relevance of an alarm or a machine status.

Type

UInt8

Access

Read-only

Syntax

```
LoggedAlarmStateResult.Priority
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.RaiseTime

Description

The "RaiseTime" property returns the trigger time of an alarm.

Type

DateTime

Access

Read-only

Syntax

```
LoggedAlarmStateResult.RaiseTime
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.ResetTime

Description

The "ResetTime" property returns the time of the reset of an alarm.

Type

DateTime

Access

Read-only

Syntax

```
LoggedAlarmStateResult.ResetTime
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.SingleAcknowledgement

Description

The "SingleAcknowledgement" property returns whether an alarm must be acknowledged exclusively or can also be acknowledged in a group.

Type

Boolean

Access

Read-only

Syntax

```
LoggedAlarmStateResult.SingleAcknowledgement
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.SourceType

Description

The "SourceType" property returns the type of alarm source. During resetting, the alarm is removed from the alarm system.

Type

UInt16

Access

Read-only

Syntax

```
LoggedAlarmStateResult.SourceType
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.State

Description

The "State" property returns the state of an alarm.

Type

UInt32

Access

Read-only

Syntax

```
LoggedAlarmStateResult.State
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.StateMachine

Description

The "StateMachine" property returns the behavior of an alarm for states and events.

Type

UInt8

Access

Read-only

Syntax

```
LoggedAlarmStateResult.StateMachine
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.StateText

Description

The "StateText" property returns the alarm state as text, for example, "Incoming" or "Outgoing".

The texts can be assigned system-wide for each alarm status.

Type

String

Access

Read-only

Syntax

```
LoggedAlarmStateResult.StateText
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.SuppressionState

Description

The "SuppressionState" property returns the status of visibility of an active alarm.

Type

UInt8

Access

Read-only

Syntax

```
LoggedAlarmStateResult.SuppressionState
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.TextColor

Description

The "TextColor" property returns the text color of the alarm state. Each alarm state has its own visual representation.

Type

UInt32

Access

Read-only

Syntax

```
LoggedAlarmStateResult.TextColor
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.UserName

Description

The "UserName" property returns the name of the user who triggered the alarm object.

Type

String

Access

Read-only

Syntax

```
LoggedAlarmStateResult.UserName
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.UserResponse

Description

The "UserResponse" property returns the expected or required user response to an alarm.

Type

UInt16

Access

Read-only

Syntax

```
LoggedAlarmStateResult.UserResponse
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.Value

Description

The "Value" property returns the process value of an alarm.

Type

Variant

Access

Read-only

Syntax

```
LoggedAlarmStateResult.Value
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.ValueLimit

Description

The "ValueLimit" property returns the limit of the process value of an alarm.

Type

Variant

Access

Read-only

Syntax

```
LoggedAlarmStateResult.ValueLimit
```

See also

LoggedAlarmStateResult (Page 1110)

LoggedAlarmStateResult.ValueQuality

Description

The "ValueQuality" property returns the level of the quality of the process value of an alarm.

Type

UInt16

Access

Read-only

Syntax

```
LoggedAlarmStateResult.ValueQuality
```

See also

LoggedAlarmStateResult (Page 1110)

SysFct

Description

The "SysFct" object ("HMIAlarmLoggingSysFct" type) enables access to the system functions of the "HMIAlarmLogging" object.

Object type

HMIAlarmLoggingSysFct

Properties

--

Methods

The "SysFct" object has the following methods:

- **ClearAlarmLog()**
  Removes all logged alarms from the specified logging system.

See also

AlarmLogging (Page 1106)

SysFct.ClearAlarmLog()

Description

The "ClearAlarmLog" method deletes the logged alarms from the alarm log whose name was passed via the parameter. The method removes all records from the specified alarm log. All segments up to the current segment are deleted. The remaining segment is given a new start time.

Note

No automatic backup is created before the "ClearAlarmLog" method is executed.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
HMIRuntime.AlarmLogging.SysFct.ClearAlarmLog(LogName)
.then(function() {
```

```
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

LogName

Type: String, HMIAlarmLog

Name of the logging system from which the alarms are deleted.

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

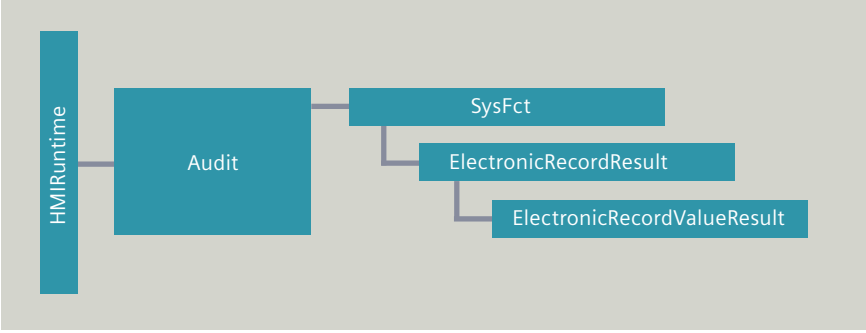
See also

SysFct (Page 1131)

AlarmLogging (Page 1106)

10.2.2.6 Audit

Description



The "Audit" object provides access to the "AuditTrail" logs contained in the project ("ElectronicRecordResult" objects) and to entries contained there ("ElectronicRecordValueResult" objects).

Object type

HMIAudit

Properties

--

Methods

--

SysFct

Description

The "SysFct" object enables access to system functions of the "Audit" object.

Type

HMIAuditSysFct

Properties

--

Methods

The "SysFct" object has the following methods:

- **InsertElectronicRecord()**
  Saves an entry in the Audit Trail.
- **ReadElectronicRecord()**
  Reads entries from the Audit Trail.

SysFct.InsertElectronicRecord()

Description

The "InsertElectronicRecord" method saves an entry in the Audit Trail.

This method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
HMIRuntime.Audit.SysFct.InsertElectronicRecord(ObjectName,
Category, OperationType, OldValue, NewValue, ConfirmationType[,
Reason])
.then(function(errorCode) {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

ObjectName

Type: String

Name of the edited object.

Category

Type: String

Category that classifies the change made.

OperationType

Type: hmiOperationType

Specifies the type of change:

- hmiCreation (1): Object newly created
- hmiUpdate (2): Object edited
- hmiDeletion (3): Object deleted

OldValue

Type: Variant

Previous value of the associated object.

NewValue

Type: Variant

New value for the edited object.

ConfirmationType

Type: UInt8, hmiConfirmationType

Specifies the type of approval needed for the change:

- hmiNone (0): No acknowledgment required.
- hmiConfirmationRequired (1): Acknowledgment required.
- hmiReasonRequired (2): Acknowledgement and indication of a reason for the change is required.

Reason

Optional, type: String, HMITextList

Text list to select a reason for the change.

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  ErrorCode as parameter of the "then()" handler.
- Promise rejected (rejected):
  ErrorCode as parameter of the "catch()" handler.

See also

SysFct (Page 1133)

SysFct.ReadElectronicRecord()

Description

The "ReadElectronicRecord" method reads entries from the Audit Trail.

This method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
HMIRuntime.Audit.SysFct.ReadElectronicRecord(dateFrom, dateTo,
offSet)
.then(function(electronicRecordResult) {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

dateFrom

Type: DateTime

Start of the time period

`dateTo`

Type: DateTime

End of the time period

`offSet`

Type: UInt32

Page number of the electronic report

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  Object, HMIElectronicRecordResult (Page 1136) as parameter of the handler "then()".
- Promise rejected (rejected):
  ErrorCode as parameter of the "catch()" handler.

See also

ElectronicRecordResult (Page 1136)

SysFct (Page 1133)

ElectronicRecordResult

Description

The "ElectronicRecordResult" object represents an AuditTrail log.

Object type

HMIElectronicRecordResult

Properties

The "ElectronicRecordResult" object has the following properties:

- **InvalidValues**
  Specifies invalid values in the Audit Trail.
- **More**
  Specifies that the page displayed in the AuditTrail is not the last page.
- **Values**
  Specifies valid values in the Audit Trail.

Methods

--

ElectronicRecordResult.InvalidValues

Description

The "InvalidValues" property represents invalid entries ("ElectronicRecordValueResult" objects) in the Audit Trail.

Type

Object, HMIElectronicRecordValueResult[] (Page 1137)

Access

Read-write

Syntax

```
ElectronicRecordResult.InvalidValues
```

See also

ElectronicRecordValueResult (Page 1137)

ElectronicRecordValueResult

Description

The "ElectronicRecordValueResult" object represents an entry from the AuditTrail.

Object type

HMIElectronicRecordValueResult

Properties

The "ElectronicRecordValueResult" object has the following properties:

- **AuditProvider**
  Specifies the name of the Audit Trail in which entries are stored.
- **AuditProviderType**
  Specifies the format of the AuditTrail.

- **Integrity**
  Specifies the checksum.
- **Language**
  Specifies the language of the entry.
- **NewValue**
  Specifies the new value.
- **ObjectName**
  Specifies the name of the associated object.
- **ObjectReference**
  Refers to the associated object.
- **OldValue**
  Specifies the original value.
- **OperatorStation**
  Specifies the HMI device that generates the entry.
- **OperationType**
  Defines the type of operation.
- **Reason**
  Specifies the reason for the change.
- **Signature**
  Specifies the electronic signature of the entry.
- **TimeStamp**
  Specifies the time stamp of the entry.
- **User**
  Specifies the operator who made the change.

Methods

--

ElectronicRecordValueResult.AuditProvider

Description

The "AuditProvider" property specifies the name of the Audit Trail where the entries are stored.

Type

String

Access

Read-write

Syntax

```
ElectronicRecordValueResult.AuditProvider
```

See also

ElectronicRecordValueResult (Page 1137)

ElectronicRecordValueResult.AuditProviderType

Description

The "AuditProviderType" property specifies the format of the Audit Trail.

Type

UInt16

Access

Read-write

Syntax

```
ElectronicRecordValueResult.AuditProviderType
```

See also

ElectronicRecordValueResult (Page 1137)

ElectronicRecordValueResult.Integrity

Description

The "Integrity" property specifies the checksum.

Type

UInt16

Access

Read-write

Syntax

```
ElectronicRecordValueResult.Integrity
```

See also

ElectronicRecordValueResult (Page 1137)

ElectronicRecordValueResult.Language

Description

The "Language" property specifies the language of the entry.

Type

UInt32

Access

Read-write

Syntax

```
ElectronicRecordValueResult.Language
```

See also

ElectronicRecordValueResult (Page 1137)

ElectronicRecordValueResult.NewValue

Description

The "NewValue" property specifies the new value.

Type

Variant

Access

Read-write

Syntax

```
ElectronicRecordValueResult.NewValue
```

See also

ElectronicRecordValueResult (Page 1137)

ElectronicRecordValueResult.OldValue (Page 1142)

ElectronicRecordValueResult.ObjectName

Description

The "ObjectName" property specifies the name of the associated object.

Type

Variant

Access

Read-write

Syntax

```
ElectronicRecordValueResult.ObjectName
```

See also

ElectronicRecordValueResult (Page 1137)

ElectronicRecordValueResult.ObjectReference

Description

The "ObjectReference" property refers to the associated object.

Type

Variant

Access

Read-write

Syntax

```
ElectronicRecordValueResult.ObjectReference
```

See also

ElectronicRecordValueResult (Page 1137)

ElectronicRecordValueResult.OldValue

Description

The "OldValue" property specifies the original value.

Type

Variant

Access

Read-write

Syntax

```
ElectronicRecordValueResult.OldValue
```

See also

ElectronicRecordValueResult (Page 1137)

ElectronicRecordValueResult.NewValue (Page 1140)

ElectronicRecordValueResult.OperatorStation

Description

The "OperatorStation" property specifies the HMI device that creates the entry.

Type

String

Access

Read-write

Syntax

```
ElectronicRecordValueResult.OperatorStation
```

See also

ElectronicRecordValueResult (Page 1137)

ElectronicRecordValueResult.OperationType

Description

The "OperationType" property specifies the type of the operation.

Type

UInt8, hmiOperationTyp

Specifies the type of change:

- hmiCreation (1): Entry newly created.
- hmiUpdate (2): Entry edited.
- hmiDeletion (3): Entry deleted.

Access

Read-write

Syntax

```
ElectronicRecordValueResult.OperationType
```

See also

ElectronicRecordValueResult (Page 1137)

ElectronicRecordValueResult.Reason

Description

The "Reason" property specifies the reason for the change.

Type

Variant

Access

Read-write

Syntax

```
ElectronicRecordValueResult.Reason
```

See also

ElectronicRecordValueResult (Page 1137)

ElectronicRecordValueResult.Signature

Description

The "Signature" property specifies the electronic signature of the entry.

Type

Variant

Access

Read-write

Syntax

```
ElectronicRecordValueResult.Signature
```

See also

ElectronicRecordValueResult (Page 1137)

ElectronicRecordValueResult.TimeStamp

Description

The "TimeStamp" property specifies the time stamp of the entry.

Type

DateTime

Access

Read-write

Syntax

```
ElectronicRecordValueResult.TimeStamp
```

See also

ElectronicRecordValueResult (Page 1137)

ElectronicRecordValueResult.User

Description

The "User" property specifies the operator who made the change.

Type

String

Access

Read-write

Syntax

```
ElectronicRecordValueResult.String
```

See also

ElectronicRecordValueResult (Page 1137)

ElectronicRecordResult.More

Description

The "More" property specifies that the displayed page in the AuditTrail is not the last page.

Type

Bool

Access

Read-write

Syntax

```
ElectronicRecordResult.More
```

See also

ElectronicRecordResult (Page 1136)

ElectronicRecordResult.Values

Description

The "Values" property represents valid entries ("ElectronicRecordValueResult" objects) in the AuditTrail.

Type

Object, HMIElectronicRecordValueResult[] (Page 1137)

Access

Read-write

Syntax

```
ElectronicRecordResult.Values
```

See also

ElectronicRecordValueResult (Page 1137)

ElectronicRecordResult (Page 1136)

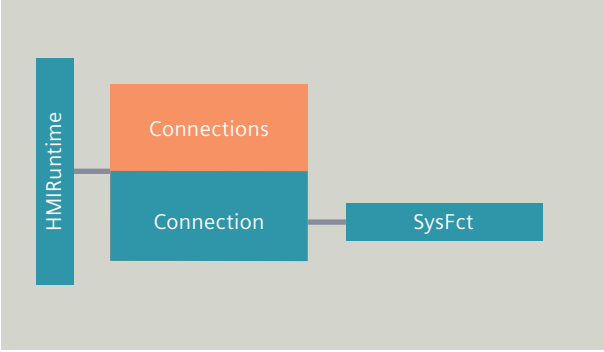
ElectronicRecordValueResult

Description

ElectronicRecordValueResult (Page 1137)

10.2.2.7 Connections

Description



The "Connections" object ("HMIConnections" type) enables access to the connections of the Runtime system. A connection is a configured, logical assignment of two communication partners.

Use

Note

The "Connections" object is not a list, but rather a "Factory". You create an instance of the "Connection" object using the tag name.

The "Connection" objects cannot be counted and enumerated like conventional lists.

To reduce the use of the "Connections" object, you can also use the alias `Connections` for `HMIRuntime.Connections`.

Object type

HMIConnections

Properties

--

Methods

The "Connections" object has the following methods:

- **Item()**
  Returns a connection ("Connection" object) of the runtime system.

Connections.Item()

Description

The "Item" method returns a connection ("Connection" object) of the runtime system.

Syntax

```
HMIRuntime.Connections[.Item](name);
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "Connections" object.

Parameters

`name`

Type: String, HMIConnection

Name of a connection

Return value

Object, HMIConnection (Page 1148)

See also

Connection (Page 1148)

Connection

Description

The "Connection" object ("HMIConnection" type) enables access to individual connections of the Runtime system. A connection is a configured, logical assignment of two communication partners.

Object type

HMIConnection

Properties

--

Methods

The "Connection" object has the following methods:

- **SetConnectionMode()**
  Changes the status of a connection ("Connection" object) in the Runtime system.

Connection.SetConnectionMode()

Description

The "SetConnectionMode" method changes the status of a connection ("Connection" object) in the runtime system.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the operation. Depending on the result, the corresponding handler of the Promise pattern is called after the execution.

Syntax

```
Connection.SetConnectionMode(mode)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

mode

Type: Int32, hmiConnectionMode

Specifies the connection status:

- Disabled (0): Disconnect
- Enabled (1): Set up connection

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the handler "then()".
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

Connection (Page 1148)

SysFct

Description

The "SysFct" object ("HMIConnectionsSysFct" type) enables access to the system functions of the "Connections" object.

Object type

HMIConnectionsSysFct

Properties

--

Methods

The "SysFct" object has the following methods:

- **ChangeConnection()**
  Changes the connection parameters of an HMI connection in the runtime system.
- **SetConnectionMode()**
  Changes the status of a connection in the runtime system.

See also

Connection (Page 1148)

SysFct.ChangeConnection()

Description

The "ChangeConnection" method changes the connection parameters of an HMI connection.

Because the function is executed synchronously, the return value returns an error code that provides immediate information about the cause of the error. The error code can only be read if the function is called via a script.

Note

Change of function parameters after a function call

With the execution of the function, you change the function parameters. The new connection may not be active yet at this point.

Note

Usage on devices of the S7 Plus PLC family

For devices of the S7 Plus PLC family (PLCs 15xx and 12xx) it is not possible to change the slot or the rack. The system function cannot be executed if parameters for slot or rack are set.

Syntax

```
HMIRuntime.Connections.SysFct.ChangeConnection(ConnectionName,IPv4Address[,Slot][,Rack]);
```

Parameters

`ConnectionName`

Type: String, HMIConnection

Indicates the name of the connection.

`IPv4Address`

Type: String, HMIIPv4Address

Specifies the IPv4 address. Example: 192.169.153.45

`Slot`

Optional, type: UInt8

Specifies the slot number. Permitted values from 1 to 32.

`Rack`

Optional, type: UInt8

Specifies the rack number. Permitted values from 0 to 7.

Return value

ErrorCode

See also

SysFct (Page 1150)

SysFct.SetConnectionMode()

Description

The "SetConnectionMode" method changes the status of a connection ("Connection" object) in the runtime system.

Syntax

```
HMIRuntime.Connections.SysFct.SetConnectionMode(ConnectionName,Enabl
eState);
```

Parameters

ConnectionName

Type: String, HMIConnection

Name of a connection in the runtime system

EnableState

Type: Bool

Status of a connection in the runtime system:

- False: Disconnect
- True: Set up connection

Return value

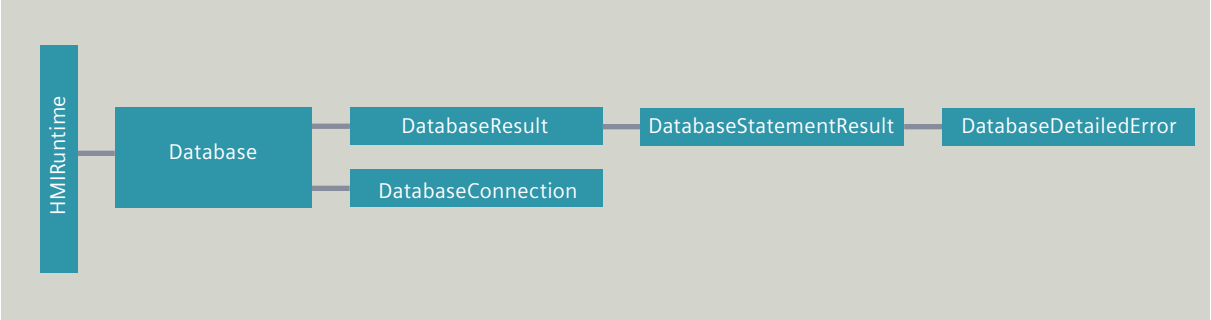
ErrorCode

See also

SysFct (Page 1150)

10.2.2.8 Database

Description



The "Database" object represents the ODBC interface. You use this interface to access the data in a database using SQL commands.

Requirement is that an ODBC interface is installed on the HMI device.

Object type

HMIDatabase

Properties

--

Methods

The "Database" object has the following methods:

- **CreateConnection()**
  Establishes the connection to a database.

Database.CreateConnection()

Description

The "CreateConnection" method establishes the connection to a database.

The method executes an asynchronous read operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the read operation. Depending on the result, the corresponding handler of the Promise pattern with the object "DatabaseConnection" or "DatabaseResult" as parameter is called after the operation.

Syntax

```
HMIRuntime.Database.CreateConnection(connectionString)
.then(function(DatabaseConnection) {
    ...
})
.catch(function(Result) {
    ...
});
```

Parameters

connectionString

Type: String

Name of the database

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  Object, HMIDatabaseConnection (Page 1154) as parameter of the "then()" handler
- Promise rejected (rejected)
  Object, HMIDatabaseResult (Page 1157) as parameter of the "catch()" handler

See also

DatabaseConnection (Page 1154)

DatabaseResult (Page 1157)

Database (Page 1153)

DatabaseConnection

Description

The "DatabaseConnection" object displays the connection to a database.

Object type

HMIDatabaseConnection

Properties

--

Methods

The "DatabaseConnection" object has the following methods:

- **Close()**
  Terminates the connection to a database.
- **Execute()**
  Executes a query in a database.

See also

Database (Page 1153)

DatabaseConnection.Close()

Description

The "Close" method terminates the connection to a database.

The method executes an asynchronous read operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the read operation. Depending on the result, the corresponding handler of the Promise pattern with the "HMIDatabaseResult" object as parameter is called after the execution.

Syntax

```
DatabaseConnection.Close()
.then(function(DatabaseResult) {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

--

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  Object, HMIDatabaseResult (Page 1157) as parameter of the "then()" handler
- Promise rejected (rejected)
  Object, HMIDatabaseResult (Page 1157) as parameter of the "catch()" handler.

See also

DatabaseConnection (Page 1154)

DatabaseResult (Page 1157)

DatabaseConnection.Execute()

Description

The "Execute" executes a query in the database.

The method executes an asynchronous read operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the read operation. Depending on the result, the corresponding handler of the Promise pattern with the "HMIDatabaseResult" object as parameter is called after the execution.

Syntax

```
DatabaseConnection.Execute(query[,values])
.then(function(DatabaseResult) {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

query

Type: String

Query

values

Type: Variant | Variant[]

Value array

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  Object, HMIDatabaseResult (Page 1157) as parameter of the "then()" handler
- Promise rejected (rejected)
  Object, HMIDatabaseResult (Page 1157) as parameter of the "catch()" handler.

See also

DatabaseResult (Page 1157)

DatabaseConnection (Page 1154)

DatabaseResult

Description

DatabaseResult (Page 1157)

DatabaseResult

Description

The "DatabaseResult" object represents the result of a database query.

Object type

HMIDatabaseResult

Properties

The "DatabaseResult" object has the following properties:

- **GlobalError**
  Returns the global error ID.
- **Results**
  Contains the result of the database query.

Methods

--

See also

Database (Page 1153)

DatabaseResult.GlobalError

Description

The "GlobalError" property returns the global error ID.

Type

ErrorCode

Access

Read-only

Syntax

```
DatabaseResult.GlobalError
```

See also

DatabaseResult (Page 1157)

DatabaseResult.Results

Description

The "Results" property contains the result of the database query.

Type

Object[], HMIDatabaseStatementResult (Page 1159)

Access

Read-only

Syntax

```
DatabaseResult.Results
```

See also

DatabaseStatementResult (Page 1159)

DatabaseStatementResult

Description

The "DatabaseStatementResult" object represents table rows of a database query.

Object type

HMIDatabaseStatementResult

Properties

The "DatabaseStatementResult" object has the following properties:

- **Errors**
  Returns the error descriptions.
- **Rows**
  Returns the rows of the database table.

Methods

--

See also

Database (Page 1153)

DatabaseStatementResult.Errors

Description

The "Errors" property returns the error descriptions.

Type

Object[], HMIDatabaseDetailedError (Page 1160)

Access

Read-only

Syntax

```
DatabaseStatementResult.Errors
```

See also

DatabaseDetailedError (Page 1160)

DatabaseDetailedError

Description

The "DatabaseDetailedError" object displays the error description of a failed database query.

Object type

HMIDatabaseDetailedError

Properties

The "DatabaseDetailedError" object has the following properties:

- **Message**
  Returns the error description.
- **State**
  Returns the ODBC error type.

Methods

--

See also

Database (Page 1153)

DatabaseDetailedError.Message

Description

The "Message" property returns the error description.

Type

String

Access

Read-only

Syntax

```
DatabaseDetailedError.Message
```

See also

DatabaseDetailedError (Page 1160)

DatabaseDetailedError.State

Description

The "State" property returns the ODBC error type.

Type

String

Access

Read-only

Syntax

```
DatabaseDetailedError.State
```

See also

DatabaseDetailedError (Page 1160)

DatabaseStatementResult.Rows

Description

The "Rows" property returns the rows of the database table.

Type

Object[]

Access

Read-only

Syntax

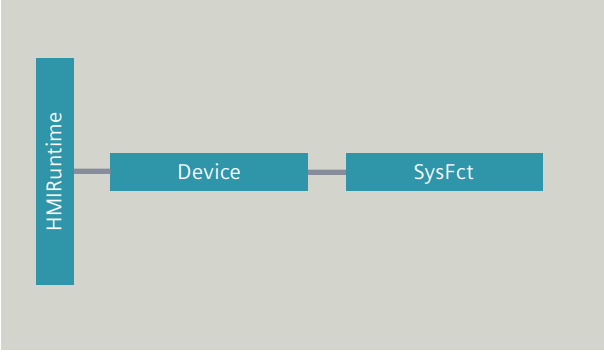
```
DatabaseStatementResult.Rows
```

See also

DatabaseStatementResult (Page 1159)

10.2.2.9 Device

Description



The "Device" object represents a device that is configured in "Devices & networks".

Object type

HMIDevice

Properties

--

Methods

--

SysFct

Description

The "SysFct" object enables access to the system functions of the "Device" object.

Object type

HMIDeviceSysFct

Properties

--

Methods

The "SysFct" object has the following methods:

- **CreateScreenshot()**
  Creates a screenshot of the current screen and saves it to a specified location.
- **EjectStorageMedium()**
  Safely ejects the external storage medium.
- **GetBrightness()**
  Returns the value of the screen brightness.
- **GetDHCPState()**
  Returns the DHCP status.
- **GetIPV4Address()**
  Returns the static IPV4 address of a network adapter.
- **GetNetworkInterfaceState()**
  Returns the status of the network adapter.
- **GetSmartServerState()**
  Returns the status of the SmartServers.
- **SetBrightness()**
  Sets the brightness of the screen.
- **SetDHCPState()**
  Enables DHCP for the specified network adapter.
- **SetIPV4Address()**
  Sets the static IPV4 address of a network adapter.
- **SetNetworkInterfaceState()**
  Changes the status of the network adapter.
- **SetSmartServerState()**
  Sets the status of the SmartServers.
- **ShowControlPanel()**
  Shows the Control Panel of the HMI Panel.
- **ShowSoftwareVersion()**
  Displays the software version.
- **StartProgram()**
  Starts an external application.
- **StopRuntime()**
  Ends the Runtime and the current project.

SysFct.CreateScreenshot()

Description

The "CreateScreenshot" method creates a screenshot of the current screen and saves it to a specified location.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
HMIRuntime.Device.SysFct.CreateScreenshot(StoragePath)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

StoragePath

Type: String

Path for the location of the screenshot

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

SysFct (Page 1162)

SysFct.EjectStorageMedium()

Description

The "EjectStorageMedium" method safely ejects the external storage medium.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
HMIRuntime.Device.SysFct.EjectStorageMedium(StorageDevice)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

StorageDevice

Type: String, HMIStorageDevice

External storage medium, e.g. SD-X51, USB-X61, USB-X62

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

SysFct (Page 1162)

SysFct.GetBrightness()

Description

The "GetBrightness" method returns the value of the screen brightness.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
HMIRuntime.Device.SysFct.GetBrightness(Value)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

`Value`

Type: Object, HMISetValueCommandBase

Specifies the HMI tag to which the current brightness of the HMI device is written.

Note

Define the HMI tag of the "Value" parameter with the "CreateSetTagCommand" system function. Use, for example, the instruction `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` for the HMI tag "MyTag".

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

SysFct.CreateSetTagCommand() (Page 1382)

SysFct (Page 1162)

SysFct.GetDHCPState()

Description

The "GetDHCPState" method returns the DHCP status.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful

(then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
HMIRuntime.Device.SysFct.GetDHCPState(AdapterName,State[,IPV6])
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

AdapterName

Type: String

Name of the network adapter, for example, "X1"

State

Type: Object, HMISetValueCommandBase

Specifies the HMI tag to which the DHCP status is written.

Note

Define the HMI tag of the "State" parameter with the system function "CreateSetTagCommand". Use, for example, the instruction `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` for the HMI tag "MyTag".

IPV6

Optional, type: Bool

Type of IP address:

- True: IPV6 address
- False or undefined: IPV4 address

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

SysFct.CreateSetTagCommand() (Page 1382)

SysFct (Page 1162)

SysFct.GetIPV4Address()

Description

The "GetIPV4Address" returns the static IP address of a network adapter.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
HMIRuntime.Device.SysFct.GetIPV4Address(AdapterName,IPAddress,Subnet
Mask[,DefaultGateway][,DNSServer1][,DNSServer2])
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

`AdapterName`

Type: String

Name of the network adapter, for example, "X1"

`IPAddress`

Type: Object, HMISetValueCommandBase

Specifies the HMI tag into which the IPv4 address of the network adapter is written in dotted decimal notation, e.g. 192.168.133.15.

Note

Define the HMI tag of the "IPAddess" parameter with the "CreateSetTagCommand" system function. Use, for example, the instruction `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` for the HMI tag "MyTag".

`SubnetMask`

Type: Object, HMISetValueCommandBase

Specifies the HMI tag to which the new subnet mask of the network adapter is written in dotted decimal notation, e.g. 255.255.255.0.

Note

Define the HMI tag of the "SubnetMask" parameter with the "CreateSetTagCommand" system function. Use, for example, the instruction `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` for the HMI tag "MyTag".

`DefaultGateway`

Optional, type: Object, HMISetValueCommandBase

Specifies the HMI tag to which the IP address of the default gateway is written in dotted decimal notation, e.g. 192.168.133.1.

Note

Define the HMI tag of the "DefaultGateway" parameter with the "CreateSetTagCommand" system function. Use, for example, the `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` instruction for the "MyTag" HMI tag.

`DNSServer1`

Optional, type: Object, HMISetValueCommandBase

Specifies the HMI tag to which the IP address of the primary DNS server, for example, 192.168.133.1, is written.

Note

Define the HMI tag of the "DNSServer1" parameter with the "CreateSetTagCommand" system function. Use, for example, the `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` instruction for the "MyTag" HMI tag.

`DNSServer2`

Optional, type: Object, HMISetValueCommandBase

Specifies the HMI tag to which the IP address of the secondary DNS server, for example, 192.168.133.2, is written.

Note

Define the HMI tag of the "DNSServer2" parameter with the "CreateSetTagCommand" system function. Use, for example, the `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` instruction for the "MyTag" HMI tag.

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

SysFct (Page 1162)

SysFct.GetNetworkInterfaceState()

Description

The "GetNetworkInterfaceState" method returns the status of the network adapter.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
HMIRuntime.Device.SysFct.GetNetworkInterfaceState(AdapterName,State)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

AdapterName

Type: String

Name of the network adapter, for example, "X1"

State

Type: Object, HMISetValueCommandBase

Specifies the HMI tag to which the status of the network adapter is written.

Note

Define the HMI tag of the "State" parameter with the system function "CreateSetTagCommand". Use, for example, the instruction `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` for the HMI tag "MyTag".

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

SysFct.CreateSetTagCommand() (Page 1382)

SysFct (Page 1162)

SysFct.GetSmartServerState()

Description

The "GetSmartServerState" method returns the status of the SmartServer.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
HMIRuntime.Device.SysFct.GetSmartServerState(State)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

`State`

Type: Object, HMISetValueCommandBase

Specifies the HMI tag to which the SmartServer status is written.

- True: activated
- False: deactivated

Note

Define the HMI tag of the "State" parameter with the system function "CreateSetTagCommand". Use, for example, the instruction `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` for the HMI tag "MyTag".

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

SysFct.CreateSetTagCommand() (Page 1382)

SysFct.SetBrightness()

Description

The "SetBrightness" method specifies the brightness of the screen.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
HMIRuntime.Device.SysFct.SetBrightness(Value)
.then(function() {
    ...
})
.catch(function(errorCode) {
```

```
    ...
});
```

Parameters

Value

Type: UInt16

Brightness in percent

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

SysFct (Page 1162)

SysFct.SetDHCPState()

Description

The "SetDHCPState" enables DHCP for the specified network adapter.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
HMIRuntime.Device.SysFct.SetDHCPState(AdapterName,Enabled[,IPV6])
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

`AdapterName`

Type: String

Name of the network adapter, for example, "X1"

`Enabled`

Type: Bool

DHCP mode

`IPV6`

Optional, type: Bool

Type of IP address:

- True: IPV6 address
- False or undefined: IPV4 address

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

SysFct (Page 1162)

SysFct.SetIPV4Address()

Description

The "SetIPV4Address" method sets the static IP address of a network adapter.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
HMIRuntime.Device.SysFct.SetIPV4Address(AdapterName,IPAddress,Subnet
Mask[,DefaultGateway][,DNSServer1][,DNSServer2])
.then(function() {
```

```
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

AdapterName

Type: String

Name of the network adapter, for example, "X1"

IPAddress

Type: Object, HMISetValueCommandBase

IP4 Address of the network adapter in dotted decimal notation, e.g. 192.168.133.15

SubnetMask

Type: Object, HMISetValueCommandBase

New subnet mask of the network adapter in dotted decimal notation, e.g. 255.255.255.0

DefaultGateway

Optional, type: Object, HMISetValueCommandBase

IP address of the default gateway in dotted decimal notation, e.g. 192.168.133.1

DNSServer1

Optional, type: Object, HMISetValueCommandBase

IP address of the primary DNS server, e.g. 192.168.133.1

DNSServer2

Optional, type: Object, HMISetValueCommandBase

IP address of the secondary DNS server, e.g. 192.168.133.2

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

SysFct (Page 1162)

SysFct.SetNetworkInterfaceState()

Description

The "SetNetworkInterfaceState" method sets the status of the network adapter.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
HMIRuntime.Device.SysFct.SetNetworkInterfaceState(AdapterName,Enable
d)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

AdapterName

Type: String

Name of the network adapter, for example, "X1"

Enabled

Type: Bool

Status of the network adapter

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

SysFct (Page 1162)

SysFct.SetSmartServerState()

Description

The "SetSmartServerState" method sets the status of the SmartServer.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
HMIRuntime.Device.SysFct.SetSmartServerState(State)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

State

Type: Bool

SmartServer status:

- True: activated
- False: deactivated

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

SysFct (Page 1162)

SysFct.ShowControlPanel()

Description

The "ShowControlPanel" method shows the Control Panel of the HMI Panel.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
HMIRuntime.Device.SysFct.ShowControlPanel(StartPage)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

StartPage

Type: String

Home page of the Control Panel of the Panel.

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

SysFct (Page 1162)

SysFct.ShowSoftwareVersion()

Description

The "ShowSoftwareVersion" method shows the software version of the runtime.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
HMIRuntime.Device.SysFct.ShowSoftwareVersion()
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

--

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

SysFct (Page 1162)

SysFct.StartProgram()

Description

The "StartProgram" method starts an external application.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
HMIRuntime.Device.SysFct.StartProgram(ProgramName,ProgramParams,Disp
layMode,WaitForProgramToEnd[,Result])
.then(function() {
```

```
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

`ProgramName`

Type: String

Name of the application

`ProgramParams`

Type: String

Parameters of the application

`DisplayMode`

Type: UInt16

Display mode of the application

`WaitForProgramToEnd`

Type: Bool

Continues to execute the function list or waits until the application is terminated.

`Result`

Optional, type: Object, HMISetValueCommandBase

Specifies the HMI tag to which the result of the external application is written.

Note

Define the HMI tag of the "Result" parameter with the system function "CreateSetTagCommand". Use, for example, the instruction `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` for the HMI tag "MyTag".

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

SysFct.CreateSetTagCommand() (Page 1382)

SysFct (Page 1162)

SysFct.StopRuntime()

Description

The "StopRuntime" method terminates the Runtime and the project that is running.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
HMIRuntime.Device.SysFct.StopRuntime([Mode])
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

Mode

Optional, type: HMIStopRuntimeMode

Specifies the type of termination:

- hmiStopRuntime (0): Ends the Runtime.
- hmiStopRuntimeAndRebootDevice (1): Ends the Runtime and restarts the device.

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

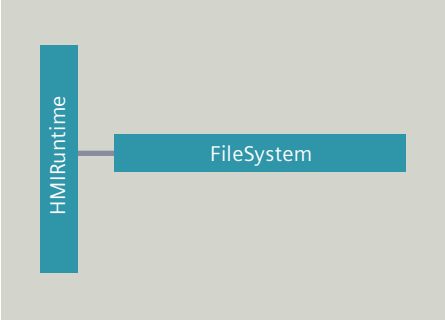
10.2.2.10 FileSystem

Description



The "FileSystem" object ("HMIFileSystem" type) enables access to the file system of the server on which WinCC Unified is installed.

Object type

HMIFileSystem

Properties

--

Methods

The "FileSystem" object has the following methods:

- **AppendFile()**
  Appends text to the end of a text file in the file system.
- **AppendFileBinary()**
  Appends binary data to the end of a binary file in the file system.
- **Browse()**
  Lists files and directories of a selected directory.
- **CreateDirectory()**
  Creates a new directory in the file system.
- **DeleteDirectory()**
  Deletes a directory with all subdirectories and files contained in the file system.
- **DeleteFile()**
  Deletes a file from the file system.
- **GetSpecialFolder()**
  Returns the path of a special directory.
- **IsDirectory()**
  Checks if the path name is a directory in the file system.

- **ReadFile()**
  Reads the contents of a text file from the file system.
- **ReadFileBinary()**
  Reads the contents of a binary file from the file system.
- **WriteFile()**
  Writes text to a new file in the file system.
- **WriteFileBinary()**
  Writes binary data to a new file in the file system.

FileSystem.AppendFile()

Description

The "AppendFile" method appends text to the end of a text file in the file system.

The method executes an asynchronous write operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the execution.

Syntax

```
HMIRuntime.FileSystem.AppendFile(path,data,encoding)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

path

Type: String

Path of the text file in the file system

data

Type: String

Content that is appended to the text file.

encoding

Type: String

Encoding of text file, e.g. UFT-8 or UCS-2.

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

FileSystem (Page 1182)

FileSystem.AppendFileBinary() (Page 1184)

FileSystem.AppendFileBinary()

Description

The "AppendFileBinary" method appends binary data to the end of a binary file in the file system.

The method executes an asynchronous write operation without blocking further script execution. In doing so, the method uses a Promise object, which has handlers for successful ("then()") and faulty ("catch()") execution of the write operation. Depending on the result, after the execution, the corresponding handler of the Promise pattern is called.

Syntax

```
HMIRuntime.FileSystem.AppendFileBinary(path,data)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

path

Type: String

Path of the binary file in the file system

data

Type: Blob

Content that is appended to the binary file.

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

FileSystem (Page 1182)

FileSystem.AppendFile() (Page 1183)

FileSystem.Browse()

Description

The "Browse" method lists files and directories of a selected directory.

This method executes an asynchronous read operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the read operation. Depending on the result, the corresponding handler of the Promise pattern is called after the execution.

Note

Browsing directories with many files and subdirectories can lead to system performance degradation until the result is available. Use the parameter `filter` to limit the search.

Syntax

```
HMIRuntime.FileSystem.Browse(path[ ,filter][ ,recursive])
.then(function(data) {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

`path`

Type: String

Path of the directory in the file system

`filter`

Optional, type: String

Filters for file names. Does not filter any directory names.

Wildcards are allowed:

- "*": Any sequence of characters (can be empty)
- "?": Exactly one random character.

`recursive`

Optional, type: Bool

- True: Search all included directories.
- False: Search only the selected directory.

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  String[], as parameter of the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

Example

List all ".txt" files and directories from "/Temp" recursively:

Copy code

```
let fs = HMIRuntime.FileSystem;
fs.Browse("/Temp", "*.txt", true)
.then(/*handle path names*/);
```

See also

FileSystem (Page 1182)

FileSystem.CreateDirectory()

Description

The "CreateDirectory" method creates a new directory in the file system.

The method executes an asynchronous write operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the execution.

Syntax

```
HMIRuntime.FileSystem.CreateDirectory(path)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

path

Type: String

Path of the directory in the file system

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

FileSystem (Page 1182)

FileSystem.DeleteDirectory() (Page 1187)

FileSystem.DeleteDirectory()

Description

The "DeleteDirectory" method deletes a directory with all subdirectories and files contained in the file system.

The method executes an asynchronous write operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the execution.

Syntax

```
HMIRuntime.FileSystem.DeleteDirectory(path)
.then(function() {
    ...
```

```
})
.catch(function(errorCode) {
    ...
});
```

Parameters

path

Type: String

Path of the directory in the file system

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

FileSystem (Page 1182)

FileSystem.CreateDirectory() (Page 1186)

FileSystem.DeleteFile()

Description

The "DeleteFile" method deletes a file in the file system.

The method executes an asynchronous write operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the execution.

Syntax

```
HMIRuntime.FileSystem.DeleteFile(path)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

path

Type: String

Path of the file in the file system

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

FileSystem (Page 1182)

FileSystem.GetSpecialFolder()

Description

The "GetSpecialFolder" method returns the path of a special directory.

The following paths are typical:

Type	Path in Windows	Path in Linux
Temporary folder	C:/WINDOWS/ServiceProfiles/WCCILScs-Service /AppData/Local/Temp/	/var/tmp/
Home directory of the user	C:/WINDOWS/ServiceProfiles/WCCILScs-Service/	/home/industrial/

Syntax

```
HMIRuntime.FileSystem.GetSpecialFolder(Folder);
```

Parameters

Folder

Type: Int32, FolderId

Specifies the special directory:

- TempDir (0): Special directory for the temporary files
- HomeDir (1): Special directory for the files of the current user

Return value

String

Example

Copy code

```
let tempDir =
HMIRuntime.FileSystem.GetSpecialFolder(HMIRuntime.FileSystem.Enums.FolderId.TempDir);
```

See also

FileSystem (Page 1182)

FileSystem.IsDirectory()

Description

The "IsDirectory" method checks whether the path name is a directory in the file system.

Note

The returned path names of the `FileSystem.Browse` method can be passed directly to this method.

Syntax

```
HMIRuntime.FileSystem.IsDirectory(path)
```

Parameters

`path`

Type: String

Path of the object in the file system

Return value

Bool

Example

List all ".txt" files and directories from "/Temp" and check whether they are directories or files:

Copy code

```
let fs = HMIRuntime.FileSystem;
fs.Browse("/Temp", "*.txt", false)
.then(function (pathnames) {
   for (let path of pathnames) {
          if (fs.IsDirectory(path)) { /*handle directory*/

      } else { /*handle file*/}
       })
.catch(function (ErrorCode) { /*handle error*/});
```

See also

FileSystem (Page 1182)

FileSystem.ReadFile()

Description

The "ReadFile" method reads the contents of a text file from the file system.

The method executes an asynchronous read operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the read operation. Depending on the result, the corresponding handler of the Promise pattern is called with the content of the file or the error code as parameter after the execution.

Syntax

```
HMIRuntime.FileSystem.ReadFile(path,encoding)
.then(function(data) {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

path

Type: String

Path of the text file in the file system

encoding

Type: String

Encoding of text file, e.g. UTF-8 or UCS-2.

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  String as parameter of the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

FileSystem (Page 1182)

FileSystem.ReadFileBinary() (Page 1192)

FileSystem.ReadFileBinary()

Description

The "ReadFileBinary" method reads the contents of a binary file from the file system.

The method executes an asynchronous read operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the read operation. Depending on the result, the corresponding handler of the Promise pattern is called with the content of the file or the error code as parameter after the execution.

Syntax

```
HMIRuntime.FileSystem.ReadFileBinary(path)
.then(function(data) {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

path

Type: String

Path of the binary file in the file system

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled
  Blob as parameter of the "then()" handler
- Promise rejected
  ErrorCode as parameter of the handler "catch()".

See also

FileSystem (Page 1182)

FileSystem.ReadFile() (Page 1191)

FileSystem.WriteFile()

Description

The "WriteFile" method writes text to a new file in the file system.

The method executes an asynchronous write operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the execution.

Syntax

```
HMIRuntime.FileSystem.WriteFile(path,data,encoding)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

path

Type: String

Path of the new text file in the file system

data

Type: String

Content that is written to the new text file.

encoding

Type: String

Encoding of the new text file, e.g. UFT-8 or UCS-2.

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

FileSystem (Page 1182)

FileSystem.WriteFileBinary() (Page 1194)

FileSystem.WriteFileBinary()

Description

The "WriteFileBinary" method writes binary data to a new file in the file system.

The method executes an asynchronous write operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the execution.

Syntax

```
HMIRuntime.FileSystem.WriteFileBinary(path,data)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

path

Type: String

Path of the new binary file in the file system

data

Type: Blob

Content that is written to the new binary file.

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

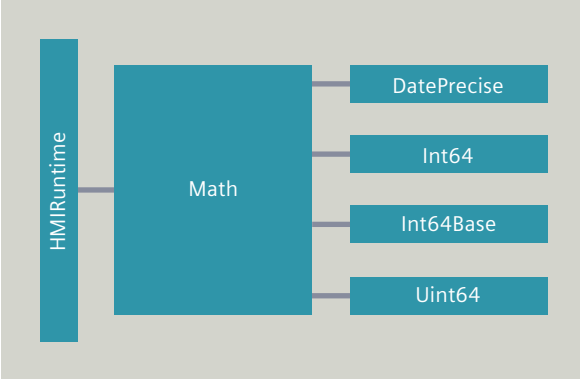
FileSystem (Page 1182)

FileSystem.WriteFile() (Page 1193)

10.2.2.11 Math

Description



The "Math" object ("HMIMath" type) enables the use of 64-bit data types in the scripting environment. Because JavaScript does not offer native support for 64-bit integer values, these values are encapsulated as object for further processing.

Some methods return different data types; the "Tag.Read" method, for example, returns the data type "Variant". You can check the return values of these methods with the JavaScript operator "instanceof" for agreement with a 64-bit data type.

Note

64-bit values should only be processed with the methods of the "Int64" and "Uint64" objects. When you are using the native computing operations of JavaScript (e.g. "+" or "-"), the accuracy of the results is diminished.

Object type

HMIMath

Properties

The "Math" object has the following properties:

- **DatePrecise**
  Represents a time information in 100 ns resolution.
- **Int64**
  Represents a 64-bit integer value with sign and contains methods for mathematical operations.
- **Int64Base**
  Checks for a 64-bit data type in combination with the `instanceof` operator.
- **Uint64**
  Represents a 64-bit integer value without sign and contains methods for mathematical operations.

Methods

The "Math" object has the following methods:

- **RGB()**
  Converts an RGB(A) specification into the corresponding hexadecimal value.
- **RGBWeb()**
  Converts a hexadecimal RGB(A) specification into the corresponding hexadecimal value.

Math.DatePrecise

Description

The "DatePrecise" property represents a "DatePrecise" object ("HMIDatePrecise" type) for high-resolution time information with a resolution of 100 ns as a 64-bit integer value.

The object contains methods for converting between different time-stamp formats. The following representations are supported:

- Number of milliseconds since 1970-01-01T00:00:00
- "DOMHighResTimeStamp"
  Number of milliseconds since 1970-01-01T00:00:00Z and the fraction for microseconds (resolution is approx. 5 µs).
- "hrtime"
  Array of two numbers [seconds, nanoseconds]
  - seconds: Number of seconds since 1970-01-01T00:00:00Z
  - nanosecs: Number of nanoseconds that cannot be expressed in seconds (resolution is limited to 100 nanoseconds). This data type is taken from "node.js" (https://nodejs.org/api/process.html#process_process_hrtime_time).
- "fileTime"
  Number of 100 nanosecond intervals since 1601-01-01T00:00:00Z (corresponds to Win32-"FILETIME").
  This is the internal format and therefore the exact representation in terms of accuracy and value range.

The object is used, for example, to enable commenting of alarms via scripting.

Use

Note

All internal time information is available as "DatePrecise" objects. To use the native JavaScript functions for handling data objects, you must first convert the "DatePrecise" object to a JavaScript "Date" object.

Type

Object, HMIDatePrecise

Access

Read-only

Syntax

```
HMIRuntime.Math.DatePrecise;
```

Properties

--

Methods

The "DatePrecise" object has the following methods:

- **GetFiletime()**
  Returns the time information as FILETIME type.
- **GetHrTime()**
  Returns the time information as high-resolution time (hrtime) as Array in the format [seconds, nanoseconds].
- **GetMicroseconds()**
  Returns the microseconds of time information in the value range of 0 to 999.
- **GetNanoseconds()**
  Returns the nanoseconds of time information in the value range of 0 to 999.
- **GetTime()**
  Returns the time information as type "DOMHighResTimeStamp".
- **Item()**
  Creates a precise time information as a 64-bit integer value ("DatePrecise" object) and returns it.
- **SetFiletime()**
  Saves high-resolution time information as the FILETIME type.
- **SetHrTime()**
  Saves high-resolution time information of the type "hrtime".
- **SetMicroseconds()**
  Saves the microseconds of high-resolution time information.
- **SetNanoseconds()**
  Saves the microseconds of high-resolution time information.
- **SetTime()**
  Saves high-resolution time information of the type "DOMHighResTimeStamp".
- **toString()**
  Converts the time information of a "DatePrecise" object into a string.
- **valueOf()**
  Returns the time information saved in a "DatePrecise" object as "DOMHighResTimeStamp".

Example

Checks whether the time information is a "DatePrecise" object:

Copy code

```
function AlarmTriggerFunction(errorCode, SystemName, alarmResultArray) {
   let nanoSeconds; //check first if RaiseTime is a DatePrecise object
   if (alarmResultArray[0].RaiseTime instanceof HMIRuntime.Math.DatePrecise) {
      nanoSeconds = alarmResultArray[0].RaiseTime.GetNanoseconds();
   }
}
```

Converts a "DatePrecise" object to a JavaScript "Date" object so that the native JavaScript "getFullYear" function can be used:

Copy code

```
function AlarmTriggerFunction(errorCode, SystemName, alarmResultArray) {
   //convert to JavaScript-Date object first
   let fullYear = new Date(alarmResultArray[0].RaiseTime).getFullYear();
}
```

DatePrecise.GetFiletime()

Description

The "GetFiletime" method returns the time information as FILETIME type.

The type corresponds to the format of Win32-"FILETIME": Number of 100 nanosecond intervals since 1601-01-01T00:00:00Z

Syntax

```
DatePrecise.GetFiletime()
```

Parameters

--

Return value

Object, HMIInt64 (Page 1207)

See also

Math.Int64 (Page 1207)

Math.DatePrecise (Page 1196)

DatePrecise.GetHrTime()

Description

The "GetHrTime" method returns the time information as high-resolution date (hrtime) as Array in the format [seconds, nanoseconds].

Example: 2020-10-04 11:30:22.5454118 is returned as [13238335822, 545411800].

Syntax

```
DatePrecise.GetHrTime()
```

Parameters

--

Return value

Float[], hrtime

See also

Math.DatePrecise (Page 1196)

DatePrecise.GetMicroseconds()

Description

The "GetMicroseconds" method returns the microseconds of time information in the value range of 0 to 999.

Syntax

```
DatePrecise.GetMicroseconds()
```

Parameters

--

Return value

UInt16

See also

Math.DatePrecise (Page 1196)

DatePrecise.GetNanoseconds()

Description

The "GetNanoseconds" method returns the nanoseconds of time information in the value range of 0 to 999.

Syntax

```
DatePrecise.GetNanoseconds()
```

Parameters

--

Return value

UInt16

See also

Math.DatePrecise (Page 1196)

DatePrecise.GetTime()

Description

The "GetTime" method returns the time information as type "DOMHighResTimeStamp".

The type corresponds to the following format: Number of milliseconds since 1970-01-01T00:00:00Z and the fraction for microseconds (resolution is approx. 5 µs).

Syntax

```
DatePrecise.GetTime()
```

Parameters

--

Return value

Float, DOMHighResTimeStamp

See also

Math.DatePrecise (Page 1196)

DatePrecise.Item()

Description

The "Item" method creates precise time information as a 64-bit integer value ("DatePrecise" object) and returns this.

Syntax

```
DatePrecise[.Item]([year,][month,][day,][hours,][seconds,]
[milliseconds,][microseconds,][nanoseconds])
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "DatePrecise" object.

Parameters

`year`

Optional, type: Variant, HMIInt64 | Variant, HMIDatePrecise | Variant, DOMHighResTimeStamp | Variant, hrtime

Full year of the time information.

`month`

Optional, type: UInt8

Number that represents a month. (0 = January ... 11 = December)

`day`

Optional, type: UInt8

Number that represents a day (1 ... 31)

`hours`

Optional, type: UInt8

Number that represents an hour (0 ... 23)

`minutes`

Optional, type: UInt8

Number that represents a minute (0 ... 59)

`seconds`

Optional, type: UInt8

Number that represents a second (0 ... 59)

`milliseconds`

Optional, type: UInt16

Number that represents a millisecond (0 ... 999)

`microseconds`

Optional, type: UInt16

Number that represents a microsecond (0 ... 999)

nanoseconds

Optional, type: UInt16

Number that represents a nanosecond (0 ... 999)

Return value

Object, HMIDatePrecise (Page 1196)

See also

Math.DatePrecise (Page 1196)

DatePrecise.SetFiletime()

Description

The "SetFiletime" method saves high-resolution time information as type FILETIME.

Syntax

```
DatePrecise.SetFiletime([fileTime])
```

Parameters

fileTime

Optional, type: Object, HMIInt64

Time information in the format of Win32 "FILETIME": Number of 100 nanosecond intervals since 1601-01-01T00:00:00Z

Return value

--

See also

Math.DatePrecise (Page 1196)

DatePrecise.SetHrTime()

Description

The "SetHrTime" method saves high-resolution time information of type "hrtime".

Syntax

```
DatePrecise.SetHrTime(hrtime)
```

Parameters

`hrtime`

Type: Float[], hrtime

Time information of type "hrtime" as an array in format [seconds, nanoseconds]: for example, 2020-10-04 11:30:22.5454118 as [13238335822, 545411800]. The type is also returned by the "GetHrTime" method.

Return value

--

See also

Math.DatePrecise (Page 1196)

DatePrecise.SetMicroseconds()

Description

The "SetMicroseconds" method saves the microseconds of high-resolution time information.

Syntax

```
DatePrecise.SetMicroseconds(microSeconds)
```

Parameters

`microSeconds`

Type: UInt16

Microseconds of time information in the value range of 0 ... 999

Return value

--

See also

Math.DatePrecise (Page 1196)

DatePrecise.SetNanoseconds()

Description

The "SetNanoseconds" method saves the nanoseconds of a high-resolution time information.

Syntax

```
DatePrecise.SetNanoseconds(nanoSeconds)
```

Parameters

nanoSeconds

Type: UInt16

Nanoseconds of time information in the value range of 0 to 999

Return value

--

See also

Math.DatePrecise (Page 1196)

DatePrecise.SetTime()

Description

The "SetTime" method saves high-resolution time information of type "DOMHighResTimeStamp".

Syntax

```
DatePrecise.SetTime(time)
```

Parameters

time

Type: Float, DOMHighResTimeStamp

Time information: Number of milliseconds since 1970-01-01T00:00:00Z and the fraction for microseconds (resolution is approx. 5 µs). The type is also returned by the "GetTime" method.

Return value

--

See also

Math.DatePrecise (Page 1196)

DatePrecise.toString()

Description

The "toString" method converts the time information of a "DatePrecise" object into a character string.

The fixed format of the character string is "yyyy-mm-dd hh:mm:ss.HundredNanoSeconds", for example, "2020-07-04 11:30:22.5454118".

Syntax

```
DatePrecise.toString()
```

Parameters

--

Return value

String

See also

Math.DatePrecise (Page 1196)

DatePrecise.valueOf()

Description

The "valueOf" method returns the time information saved in a "DatePrecise" object as "DOMHighResTimeStamp".

The value can represent either a specific point in time (in milliseconds since 01/01/1970) or the difference between two points in time.

The value is specified in the unit milliseconds. The accuracy is up to 5 µs.

Syntax

```
DatePrecise.valueOf()
```

Parameters

--

Return value

Float, DOMHighResTimeStamp

See also

Math.DatePrecise (Page 1196)

Int64

Description

Int64 (Page 1207)

Math.Int64

Description

The "Int64" property represents a "Int64" object ("HMIInt64" type) for a 64-bit signed integer value and contains basic arithmetic and bit operations. Because JavaScript does not offer native support for 64-bit integer values, these values are encapsulated as "Int64" object.

Use

Note

64-bit values should only be processed with the methods of the "Int64" and "Uint64" objects. When you are using the native computing operations of JavaScript (e.g. "+" or "-"), the accuracy of the results is diminished.

Type

Object, HMIInt64

Access

Read-only

Syntax

```
HMIRuntime.Math.Int64;
```

Properties

The "Int64" object has the following properties:

- **Hi**
  Saves and returns the high part (32-bit) of a 64-bit integer value.
- **Lo**
  Saves and returns the low part (32-bit) of a 64-bit integer value.

Methods

The "Int64" object has the following methods:

- **Add()**
  Provides the "Addition" arithmetic operation for 64-bit objects.
- **And()**
  Provides the "AND" bit operation for 64-bit objects.
- **Div()**
  Provides the "Division" arithmetic operation for 64-bit objects.
- **Item()**
  Creates 64-bit integer values ("Int64" and "Uint64" objects) and returns them.
- **Mul()**
  Provides the "Multiplication" arithmetic operation for 64-bit objects.
- **Or()**
  Provides the "OR" bit operation for 64-bit objects.
- **ShiftLeft()**
  Provides a bit shift "SHL" for 64-bit objects.
- **ShiftRight()**
  Provides the bit shift "SHR" for 64-bit objects.
- **Sub()**
  Provides the "Subtraction" arithmetic operation for 64-bit objects.
- **toString()**
  Converts the value of a 64-bit object into a string.
- **Xor()**
  Provides the "XOR" bit operation for 64-bit objects.

Example

Creates a new "signed" 64-bit object and writes the value to the tag:

Copy code

```
function Write_Int64TagValue() {
    //create new Int64-object
    var newTagVal = HMIRuntime.Math.Int64('-6000000000000000000');
    //write to tag
    HMIRuntime.Tags('Tag1').Write(newTagVal);
}
```

Checks whether the value of a "Tag" object is a signed 64-bit data type, multiplies the value with -1 and returns the result as 64-bit object:

Copy code

```
function NegMul_Int64TagValue() {
   var tagVal = HMIRuntime.Tags('Tag1').Read();
   //check if it is *signed* 64-Bit type
   if (tagVal instanceof HMIRuntime.Math.Int64) {
   //if yes, use Mul method with negative number
      return tagVal.Mul(-1);
   }
}
```

Int64.Hi

Description

The "Hi" property saves and returns the high part (32-bit) of a 64-bit integer value.

Type

UInt32

Access

Read-only

Syntax

```
Int64.Hi
```

See also

Math.Int64 (Page 1207)

Int64.Lo

Description

The "Lo" property saves and returns the low part (32-bit) of a 64-bit integer value.

Type

UInt32

Access

Read-only

Syntax

```
Int64.Lo
```

See also

Math.Int64 (Page 1207)

Int64.Add()

Description

The "Add" method provides the "Addition" arithmetic operation for 64-bit objects. The value of the "Int64" objects is increased by the specified value.

This method corresponds to the JavaScript operator "+" for other data types.

Syntax

```
Int64.Add(value)
```

Parameters

value

Type: Variant, HMIInt64 | Variant, HMIUint64

Value that is added to the current value of the object.

Return value

Object, HMIInt64 (Page 1207)

See also

Math.Int64 (Page 1207)

Int64.And()

Description

The "And" method provides the "AND" bit operation for 64-bit objects. The binary value of the "Int64" objects is ANDed with the specified value.

This method corresponds to the JavaScript operator "&" for other data types.

Syntax

```
Int64.And(value)
```

Parameters

value

Type: Variant, HMIInt64 | Variant, HMIUint64

Bit sequence of the same length with which the binary value of the object is ANDed.

Return value

Object, HMIInt64 (Page 1207)

See also

Math.Int64 (Page 1207)

Int64.Div()

Description

The "Div" method provides the "Division" arithmetic operation for 64-bit objects. The value of the "Int64" objects is divided by the specified value.

This method corresponds to the JavaScript operator "/" for other data types.

Syntax

```
Int64.Div(value)
```

Parameters

`value`

Type: Variant, HMIInt64 | Variant, HMIUint64

Value by which the current value of the object is divided.

Return value

Object, HMIInt64 (Page 1207)

See also

Math.Int64 (Page 1207)

Int64.Item()

Description

The "Item" method creates 64-bit integer values ("Int64" objects) and returns them.

Syntax

```
Int64[.Item](value)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "Int64" object.

Parameters

value

Type: Variant

New 64-bit integer value as integer string with base 10.

Return value

Object, HMIInt64 (Page 1207)

See also

Math.Int64 (Page 1207)

Int64.Mul()

Description

The "Mul" method provides the "Multiplication" arithmetic operation for 64-bit objects. The value of the "Int64" objects is multiplied by the specified value.

This method corresponds to the JavaScript operator "*" for other data types.

Syntax

```
Int64.Mul(value)
```

Parameters

value

Type: Variant, HMIInt64 | Variant, HMIUint64

Value by which the current value of the object is multiplied.

Return value

Object, HMIInt64 (Page 1207)

See also

Math.Int64 (Page 1207)

Int64.Or()

Description

The "Or" method provides the "OR" bit operation for 64-bit objects. The binary value of the "Int64" objects is ANDed with the specified value.

This method corresponds to the JavaScript operator "|" for other data types.

Syntax

```
Int64.Or(value)
```

Parameters

value

Type: Variant, HMIInt64 | Variant, HMIUint64

Bit sequence of the same length with which the binary value of the object is ORed.

Return value

Object, HMIInt64 (Page 1207)

See also

Math.Int64 (Page 1207)

Int64.ShiftLeft()

Description

The "ShiftLeft" method provides a bit shift "SHL" for 64-bit objects. The binary value of the "Int64" objects is shifted by the specified number of digits.

This method corresponds to the JavaScript operator "<<" for other data types.

Syntax

```
Int64.ShiftLeft(value)
```

Parameters

value

Type: UInt8

Number of digits by which the binary value of the object is shifted to the left.

Return value

Object, HMIInt64 (Page 1207)

See also

Math.Int64 (Page 1207)

Int64.ShiftRight()

Description

The "ShiftRight" method provides the bit shift "SHR" for 64-bit objects. The binary value of the "Int64" objects is shifted by the specified number of digits.

This method corresponds to the JavaScript operator ">>" for other data types.

Syntax

```
Int64.ShiftRight(value)
```

Parameters

value

Type: UInt8

Number of digits by which the binary value of the object is shifted to the right.

Return value

Object, HMIInt64 (Page 1207)

See also

Math.Int64 (Page 1207)

Int64.Sub()

Description

The "Sub" method provides the "Subtraction" arithmetic operation for 64-bit objects. The value of the "Int64" objects is decreased by the specified value.

This method corresponds to the JavaScript operator "-" for other data types.

Syntax

```
Int64.Sub(value)
```

Parameters

value

Type: Variant, HMIInt64 | Variant, HMIUint64

Value that is subtracted from the current value of the object.

Return value

Object, HMIInt64 (Page 1207)

See also

Math.Int64 (Page 1207)

Int64.toString()

Description

The "toString" method converts the value of a 64-bit object into a character string. For other data types, you can use the native JavaScript method "toString" with the same name.

Syntax

```
Int64.toString([base])
```

Parameters

base

Optional, type: UInt8

Base to which 64-bit value of the object is converted to a character string. Without parameters, the basis is set to "10".

Return value

String

See also

Math.Int64 (Page 1207)

Int64.Xor()

Description

The "Xor" method provides the "XOR" bit operation for 64-bit objects. The binary value of the "Int64" objects is ANDed with the specified value.

This method corresponds to the JavaScript operator "^" for other data types.

Syntax

```
Int64.Xor(value)
```

Parameters

value

Type: Variant, HMIInt64 | Variant, HMIUint64

Bit sequence of the same length with which the binary value of the object is XORed.

Return value

Object, HMIInt64 (Page 1207)

See also

Math.Int64 (Page 1207)

Math.Int64Base

Description

The "Int64Base" property represents an "Int64Base" object ("HMIInt64Base" type). The object is used exclusively to check for a 64-bit integer data type. Because JavaScript does not offer native support for 64-bit integer values, these values are encapsulated as "Int64" or "Uint64" objects for further use.

Use

Note

64-bit values should only be processed with the methods of the "Int64" and "Uint64" objects. When you are using the native computing operations of JavaScript (e.g. "+" or "-"), the accuracy of the results is diminished.

The "Int64Base" object returns TRUE for all signed or unsigned 64-bit integer values when checked with the "instanceof" operator against an object.

Type

Object, HMIInt64Base

Access

Read-only

Syntax

```
HMIRuntime.Math.Int64Base;
```

Properties

--

Methods

--

Example

Checks whether the value of a "Tag" object is a 64-bit data type:

Copy code

```
function Int64TagValue() {
   var tagVal = HMIRuntime.Tags('Tag1').Read(); //check if it is 64-Bit type (signed or
unsigned)
   if (tagVal instanceof HMIRuntime.Math.Int64Base) {
      ...
   }
}
```

See also

Math (Page 1195)

Math.Uint64

Description

The "Uint64" property represents a "Uint64" object ("HMIUint64" type) for a 64-bit unsigned integer value and contains basic arithmetic and bit operations. Because JavaScript does not offer native support for 64-bit integer values, these values are encapsulated as "Uint64" object.

Use

Note

64-bit values should only be processed with the methods of the "Int64" and "Uint64" objects. When you are using the native computing operations of JavaScript (e.g. "+" or "-"), the accuracy of the results is diminished.

Type

Object, HMIUint64

Access

Read-only

Syntax

```
HMIRuntime.Math.Uint64;
```

Properties

The "Uint64" object has the following properties:

- **Hi**
  Saves and returns the high part (32-bit) of a 64-bit integer value.
- **Lo**
  Saves and returns the low part (32-bit) of a 64-bit integer value.

Methods

The "Int64" object has the following methods:

- **Add()**
  Provides the "Addition" arithmetic operation for 64-bit objects.
- **And()**
  Provides the "AND" bit operation for 64-bit objects.
- **Div()**
  Provides the "Division" arithmetic operation for 64-bit objects.
- **Item()**
  Creates 64-bit integer values ("Int64" and "Uint64" objects) and returns them.
- **Mul()**
  Provides the "Multiplication" arithmetic operation for 64-bit objects.
- **Or()**
  Provides the "OR" bit operation for 64-bit objects.
- **ShiftLeft()**
  Provides a bit shift "SHL" for 64-bit objects.
- **ShiftRight()**
  Provides the bit shift "SHR" for 64-bit objects.
- **Sub()**
  Provides the "Subtraction" arithmetic operation for 64-bit objects.
- **toString()**
  Converts the value of a 64-bit object into a string.
- **Xor()**
  Provides the "XOR" bit operation for 64-bit objects.

Example

Creates a new "unsigned" 64-bit object and writes the value to the tag:

Copy code

```
function Write_Uint64TagValue() {
   //create new Uint64-object
   var newTagVal = HMIRuntime.Math.Uint64('6000000000000000000');
   //write to tag
   HMIRuntime.Tags('Tag1').Write(newTagVal);
}
```

Copy code

Checks whether the value of an object "Tag" is a signed 64-bit data type, adds the value 99 and returns the result as a 64-bit object:

Copy code

```
function Add_Int64TagValue() {
   var tagVal = HMIRuntime.Tags('Tag1').Read();
   //check if it is 64-Bit type (unsigned)
   if (tagVal instanceof HMIRuntime.Math.Uint64) {
   //if yes, use Add method
      return tagVal.Add(99);
   }
}
```

Uint64.Hi

Description

The "Hi" property saves and returns the high part (32-bit) of a 64-bit integer value.

Type

UInt32

Access

Read-only

Syntax

```
Uint64.Hi
```

See also

Math.Uint64 (Page 1218)

Uint64.Lo

Description

The "Lo" property saves and returns the low part (32-bit) of a 64-bit integer value.

Type

UInt32

Access

Read-only

Syntax

```
Uint64.Lo
```

See also

Math.Uint64 (Page 1218)

Uint64.Add()

Description

The "Add" method provides the "Addition" arithmetic operation for 64-bit objects. The value of the "Uint64" objects is increased by the specified value.

This method corresponds to the JavaScript operator "+" for other data types.

Syntax

```
Uint64.Add(value)
```

Parameters

value

Type: Variant, HMIInt64 | Variant, HMIUint64

Value that is added to the current value of the object.

Return value

Object, HMIUint64 (Page 1218)

See also

Math.Uint64 (Page 1218)

Uint64.And()

Description

The "And" method provides the "AND" bit operation for 64-bit objects. The binary value of the "Uint64" objects is ANDed with the specified value.

This method corresponds to the JavaScript operator "&" for other data types.

Syntax

```
Uint64.And(value)
```

Parameters

value

Type: Variant, HMIInt64 | Variant, HMIUint64

Bit sequence of the same length with which the binary value of the object is ANDed.

Return value

Object, HMIUint64 (Page 1218)

See also

Math.Uint64 (Page 1218)

Uint64.Div()

Description

The "Div" method provides the "Division" arithmetic operation for 64-bit objects. The value of the "Uint64" objects is divided by the specified value.

This method corresponds to the JavaScript operator "/" for other data types.

Syntax

```
Uint64.Div(value)
```

Parameters

value

Type: Variant, HMIInt64 | Variant, HMIUint64

Value by which the current value of the object is divided.

Return value

Object, HMIUint64 (Page 1218)

See also

Math.Uint64 (Page 1218)

Uint64.Item()

Description

The "Item" method creates 64-bit integer values ("Uint64" objects) and returns them.

Syntax

```
Uint64[.Item](value)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "Uint64" object.

Parameters

value

Type: Variant

New 64-bit integer value as integer string with base 10.

Return value

Object, HMIUint64 (Page 1218)

See also

Math.Uint64 (Page 1218)

Uint64.Mul()

Description

The "Mul" method provides the "Multiplication" arithmetic operation for 64-bit objects. The value of the "Uint64" objects is multiplied by the specified value.

This method corresponds to the JavaScript operator "*" for other data types.

Syntax

```
Uint64.Mul(value)
```

Parameters

value

Type: Variant, HMIInt64 | Variant, HMIUint64

Value by which the current value of the object is multiplied.

Return value

Object, HMIUint64 (Page 1218)

See also

Math.Uint64 (Page 1218)

Uint64.Or()

Description

The "Or" method provides the "OR" bit operation for 64-bit objects. The binary value of the "Uint64" objects is ANDed with the specified value.

This method corresponds to the JavaScript operator "|" for other data types.

Syntax

```
Uint64.Or(value)
```

Parameters

value

Type: Variant, HMIInt64 | Variant, HMIUint64

Bit sequence of the same length with which the binary value of the object is ORed.

Return value

Object, HMIUint64 (Page 1218)

See also

Math.Uint64 (Page 1218)

Uint64.ShiftLeft()

Description

The "ShiftLeft" method provides a bit shift "SHL" for 64-bit objects. The binary value of the "Uint64" objects is shifted by the specified number of digits.

This method corresponds to the JavaScript operator "<<" for other data types.

Syntax

```
Uint64.ShiftLeft(value)
```

Parameters

value

Type: UInt8

Number of digits by which the binary value of the object is shifted to the left.

Return value

Object, HMIUint64 (Page 1218)

See also

Math.Uint64 (Page 1218)

Uint64.ShiftRight()

Description

The "ShiftRight" method provides the bit shift "SHR" for 64-bit objects. The binary value of the "Uint64" objects is shifted by the specified number of digits.

This method corresponds to the JavaScript operator ">>" for other data types.

Syntax

```
Uint64.ShiftRight(value)
```

Parameters

value

Type: UInt8

Number of digits by which the binary value of the object is shifted to the right.

Return value

Object, HMIUint64 (Page 1218)

See also

Math.Uint64 (Page 1218)

Uint64.Sub()

Description

The "Sub" method provides the "Subtraction" arithmetic operation for 64-bit objects. The value of the "Uint64" objects is decreased by the specified value.

This method corresponds to the JavaScript operator "-" for other data types.

Syntax

```
Uint64.Sub(value)
```

Parameters

value

Type: Variant, HMIInt64 | Variant, HMIUint64

Value that is subtracted from the current value of the object.

Return value

Object, HMIUint64 (Page 1218)

See also

Math.Uint64 (Page 1218)

Uint64.toString()

Description

The "toString" method converts the value of a 64-bit object into a character string. For other data types, you can use the native JavaScript method "toString" with the same name.

Syntax

```
Uint64.toString([base])
```

Parameters

base

Optional, type: UInt8

Base to which 64-bit value of the object is converted to a character string. Without parameters, the basis is set to "10".

Return value

String

See also

Math.Uint64 (Page 1218)

Uint64.Xor()

Description

The "Xor" method provides the "XOR" bit operation for 64-bit objects. The binary value of the "Uint64" objects is ANDed with the specified value.

This method corresponds to the JavaScript operator "^" for other data types.

Syntax

```
Uint64.Xor(value)
```

Parameters

value

Type: Variant, HMIInt64 | Variant, HMIUint64

Bit sequence of the same length with which the binary value of the object is XORed.

Return value

Object, HMIUint64 (Page 1218)

See also

Math.Uint64 (Page 1218)

Math.RGB()

Description

The "RGB" method converts a RGB(A) specification into the corresponding hexadecimal value.

Syntax

```
HMIRuntime.Math.RGB(R, G, B[, A]);
```

Parameters

R

Type: UInt32

Red value

G

Type: UInt32

Green value

B

Type: UInt32

Blue value

A

Optional, type: UInt32

Alpha value (density)

Return value

UInt32

See also

Math (Page 1195)

Math.RGBWeb()

Description

The "RGBWeb" method converts a hexadecimal RGB(A) specification into the corresponding hexadecimal value.

Syntax

```
HMIRuntime.Math.RGBWeb(RGB[, A]);
```

Parameters

RGB

Type: UInt32

Red-green-blue value in hexadecimal notation

A

Optional, type: UInt32

Alpha value (density) in hexadecimal format

Return value

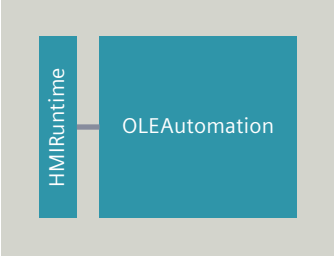
UInt32

See also

Math (Page 1195)

10.2.2.12 OLEAutomation

Description



The "OLEAutomation" object communicates in Microsoft Windows with objects of other applications (Automation objects) via script. These applications (Automation server) make their functionality available to the scripting environment (Automation client) through the COMinterface.

This gives you the opportunity to integrate WinCC Unified in existing systems, e.g. databases, Office applications or the file system. You can also integrate your own components. All COM objects that implement the IDispatch interface and have a Library type are supported.

Note

When the scripting environment is started as a service, as of Microsoft Windows Vista it is no longer possible to communicate with interactive programs (e.g. Microsoft Excel) by means of a script. Database access via ADO (ActiveX Data Objects) to a closed application is still possible.

Use

Note

Note that the scripts are always executed on the server side. Therefore all the referenced applications and files have to be available on the server.

Note

JavaScript does not support properties with parameters. Parameters must be referenced with a function type syntax for COM objects:

```
var textcell = o.Cells.Range('A1');
```

Note

JavaScript does not support functions with return parameters. Return values for COM objects must be referenced through an object:

```
var oReturnValue = {
    value: 100
};

AutomationObject.MethodWithOutParam(oReturnValue);
//out parameter set by function will be available as
"oReturnValue.value"
```

Object type

HMIOLEAutomation

Properties

--

Methods

The "OLEAutomation" object has the following methods:

- CreateObject()
  Creates a reference to an automation object.
- GetObject()
  Returns a reference to an automation object from a file.

Example

A new "testfile.txt" file with the content "this is some data" is created in the file system:

Copy code

```
function WriteToFile() {
    var fso = HMIRuntime.OLEAutomation.CreateObject('Scripting.FileSystemObject');
    var f = fso.CreateTextFile('testfile.txt');
    f.WriteLine('this is some data');
    f.Close();
}
```

The "OLEAutomation" object is only available in Microsoft Windows. This is how you check to determine if the functionality is available:

Copy code

```
if (undefined != HMIRuntime.OLEAutomation) {
    ...
}
```

OLEAutomation.CreateObject()

Description

The "CreateObject" method creates a reference to an automation object.

Syntax

```
HMIRuntime.OLEAutomation.CreateObject(progid);
```

Parameters

progid

Type: String

The name of the application that provides the object and the type or class of the object to be created.

Return value

Object

Example

Create a reference to an automation object:

Copy code

```
var obj = HMIRuntime.OLEAutomation.CreateObject('Scripting.FileSystemObject');
```

See also

OLEAutomation (Page 1229)

OLEAutomation.GetObject()

Description

The "GetObject" method returns a reference to an automation object from a file.

Syntax

```
HMIRuntime.OLEAutomation.GetObject([pathname][, class]);
```

Parameters

pathname

Optional, type: String

Full path and name of the file containing the object to be retrieved.

Note

If the "pathname" parameter is omitted, the "class" parameter is required.

class

Optional, type: String

Class of the object

Note

If the "class" parameter is omitted, the "pathname" parameter is required.

Return value

Object

Example

Return a reference to an automation object from a file:

Copy code

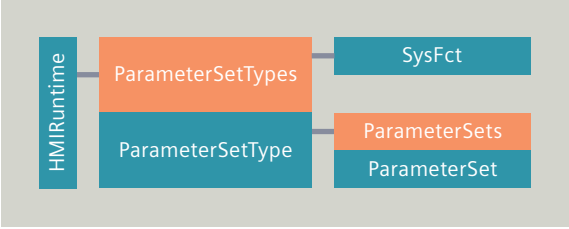
```
var obj = HMIRuntime.OLEAutomation.GetObject('C:\tmp\data.mdb');
```

See also

OLEAutomation (Page 1229)

10.2.2.13 ParameterSetTypes

Description



The "ParameterSetTypes" object represents the list of parameter set types.

To reduce the use of the "ParameterSetTypes" object, you can also use the alias `ParameterSetTypes` for `HMIRuntime.ParameterSetTypes`.

Object type

HMIParameterSetTypes

Properties

--

Methods

The "ParameterSetTypes" object has the following methods:

- **Item()**
  Returns a parameter set.

ParameterSetTypes.Item()

Description

The "Item" method returns a parameter set type ("ParameterSetType" object).

Syntax

```
[HMIRuntime.]ParameterSetTypes[.Item](parameterSetTypeId)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "ParameterSetTypes" object.

Parameters

`parameterSetTypeId`

Type: String|UInt32

Custom ID or name of the parameter set type

Return value

Object, HMIParameterSetType (Page 1234)

See also

ParameterSetTypes (Page 1233)

ParameterSetType (Page 1234)

ParameterSetType

Description

The "ParameterSetType" object represents a parameter set type.

Object type

HMIParameterSetType

Properties

The "ParameterSetType" object has the following properties:

- **ParameterSets**
  Returns the list of the parameter sets ("ParameterSets" objects).

Methods

The "ParameterSetType" object has the following methods:

- **Export()**
  Exports one or all parameter sets ("ParameterSets" objects) of a parameter set type ("ParameterSetType" object).
- **GetName()**
  Returns the name of the parameter set.
- **Import()**
  Imports one or all parameter sets ("ParameterSets" objects) of a parameter set type ("ParameterSetType" object).

See also

ParameterSetTypes (Page 1233)

ParameterSetType.Export()

Description

The "Export" method exports one or all parameter sets ("ParameterSets" objects) of a parameter set type ("ParameterSetType" object).

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
ParameterSetType.Export(ParameterSetId, FileName, OverWrite,
OutputStatus, GenerateChecksum)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

`ParameterSetId`

Type: Variant

Custom ID or name of the parameter set.

`FileName`

Type: String

Name of the file into which the parameter set is exported.

`OverWrite`

Type: UInt32, hmiOverwrite

Specifies whether an existing parameter set is overwritten:

- Disabled (0): Do not overwrite parameter set
- Enabled (1): Overwrite parameter set

`OutputStatus`

Type: Bool

Specifies whether a status message is output after the transfer.

- True: Output status message
- False: Do not output status message

`GenerateChecksum`

Type: Bool

Specifies whether the checksum is checked during export.

- True: Generate checksum
- False: Do not generate checksum

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler.
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler.

See also

ParameterSetType (Page 1234)

ParameterSetType.Import() (Page 1237)

ParameterSetType.GetName()

Description

The "GetName" method returns the name of the parameter set type.

This method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
ParameterSetType.GetName(Language)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

Language

Type: UInt32, HMILCID

LCID of the language of the parameter set type.

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler.
- Promise rejected (rejected):
  ErrorCode as parameter of the "catch()" handler.

See also

ParameterSetType (Page 1234)

ParameterSetType.Import()

Description

The "Import" method imports one or all parameter sets ("ParameterSets" objects) of a parameter set type ("ParameterSetType" object).

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
ParameterSetType.Import(FileName, ParameterSetId, OverWrite,
OutputStatus, VerifyChecksum)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

`FileName`

Type: String

Name of the file from which the parameter set is imported.

`ParameterSetId`

Type: Variant

Custom ID or name of the parameter set.

`OverWrite`

Type: UInt32, hmiOverwrite

Specifies whether an existing parameter set is overwritten:

- Disabled (0): Do not overwrite parameter set
- Enabled (1): Overwrite parameter set

`OutputStatus`

Type: Bool

Specifies whether a status message is output after the transfer.

- True: Output status message
- False: Do not output status message

`VerifyChecksum`

Type: Bool

Specifies whether the checksum is checked during import.

- True: Check checksum
- False: Do not check checksum

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler.
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler. This state is only present if no alarms of the "ParameterSetType" object could be output.

See also

ParameterSetType (Page 1234)

ParameterSetType.Export() (Page 1235)

ParameterSetType.ParameterSets

Description

The "ParameterSets" property represents the list of parameter sets ("ParameterSets" objects).

Type

Object, HMIParameterSets

Access

Read-only

Syntax

```
ParameterSetType.ParameterSets
```

Properties

--

Methods

The "ParameterSets" object has the following methods:

- **Item()**
  Returns an object of the type "ParameterSet".

See also

ParameterSetType (Page 1234)

ParameterSets.Item()

Description

The "Item" method returns a parameter set ("ParameterSet" object).

Syntax

```
ParameterSets[.Item](parameterSetId)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "ParameterSets" object.

Parameters

`parameterSetId`

Type: String|UInt32

Custom ID or name of the parameter set.

Return value

Object, HMIParameterSet (Page 1240)

See also

ParameterSetType.ParameterSets (Page 1239)

ParameterSet (Page 1240)

ParameterSet

Description

The "ParameterSet" object represents a parameter set.

Object type

HMIParameterSet

Properties

--

Methods

The "ParameterSet" object has the following methods:

- **GetName()**
  Returns the name of the parameter set.
- **LoadAndWrite()**
  Loads a parameter set ("ParameterSet" object) from the memory of the HMI device and writes the parameter set to the PLC.
- **ReadAndSave()**
  Reads a parameter set ("ParameterSet" object) from the PLC and writes the parameter set to the local memory of the HMI device.

See also

ParameterSetType.ParameterSets (Page 1239)

ParameterSet.GetName()

Description

The "GetName" method returns the name of the parameter set type.

This method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
ParameterSet.GetName(Language)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

Language

Type: UInt32, HMILCID

LCID of the language of the parameter set.

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler.
- Promise rejected (rejected):
  ErrorCode as parameter of the "catch()" handler.

See also

ParameterSet (Page 1240)

ParameterSet.LoadAndWrite()

Description

The "LoadAndWrite" method loads a parameter set from the HMI device memory and writes the parameter set to the PLC.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
ParameterSet.LoadAndWrite(OutputStatus)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

`OutputStatus`

Type: Bool

Specifies whether a status message is output after the transfer.

- True: Output status message
- False: Do not output status message

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler.
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler.

See also

ParameterSet (Page 1240)

ParameterSet.ReadAndSave() (Page 1243)

ParameterSet.ReadAndSave()

Description

The "ReadAndSave" method reads a parameter set from the PLC and writes the parameter set to the local memory of the HMI device.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
ParameterSet.ReadAndSave(OutputStatus, OverWrite)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

`OutputStatus`

Type: Bool

Specifies whether a status message is output after the transfer.

- True: Output status message
- False: Do not output status message

`OverWrite`

Type: UInt32, hmiOverwrite

Specifies whether an existing parameter set is overwritten:

- Disabled (0): Do not overwrite parameter set
- Enabled (1): Overwrite parameter set

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler.
- Promise rejected (rejected):
  ErrorCode as parameter of the "catch()" handler.

ParameterSet (Page 1240)

ParameterSet.LoadAndWrite() (Page 1242)

SysFct

Description

The "SysFct" object enables access to the system functions of the "ParameterSetTypes" object.

Object type

HMIParameterSetTypesSysFct

Properties

--

Methods

The "SysFct" object has the following methods:

- **CreateParameterSet()**
  Creates a parameter set with default values configured in the Engineering System.
- **DeleteParameterSet()**
  Deletes a parameter set.
- **ExportParameterSets()**
  Exports one or all parameter sets of a parameter set type.
- **GetParameterSetName()**
  Returns the name of a parameter set based on the parameter set ID and the language.

- **GetParameterSetTypeName()**
  Returns the name of a parameter set type based on the parameter set type ID and the language.
- **ImportParameterSets()**
  Imports one or all parameter sets of a parameter set type.
- **LoadAndWriteParameterSet()**
  Loads a parameter set from the memory of the HMI and writes the parameter set to the PLC.
- **LoadParameterSet()**
  Loads a parameter set from the local memory of the HMI device and writes the parameter set to the edit tag.
- **ReadAndSaveParameterSet()**
  Reads a parameter set from the PLC and writes the parameter set to the local memory of the HMI.
- **ReadParameterSet()**
  Reads a parameter set type from the PLC to the corresponding edit tag.
- **RenameParameterSet()**
  Changes the name of a parameter set.
- **SaveParameterSet()**
  Reads a parameter set from the edit tag and writes the parameter set to the local memory of the HMI device.
- **WriteParameterSet()**
  Loads a parameter set from the edit tag and writes the parameter set to the PLC.

ParameterSetTypes (Page 1233)

SysFct.CreateParameterSet()

Description

The "CreateParameterSet" method creates a parameter set with default values configured in the Engineering System.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
[HMIRuntime.]ParameterSetTypes.SysFct.CreateParameterSet(ParameterSe
tType[, ParameterSetID][, ParameterSetName], OutputStatus[,
ProcessingStatus])
.then(function() {
    ...
})
```

```
.catch(function(errorCode) {
    ...
})
```

Parameters

`ParameterSetType`

Type: Variant

Custom ID or name of the parameter set type

`ParameterSetID`

Optional, type: UInt32

Custom ID of the parameter set. If not specified, the default ID is assigned.

`ParameterSetName`

Optional, type: String

Custom name of the parameter set. If not specified, the default name is assigned.

`OutputStatus`

Type: Bool

Specifies whether a status message is output after the transfer.

- True: Output status message
- False: Do not output status message

`ProcessingStatus`

Optional, type: Object, HMISetValueCommandBase

HMI tag in which the processing status is stored.

Indicates the execution status of the method:

- 2: Function is being executed.
- 4: Function completed successfully.
- 12: Function was canceled.

Note

Define the HMI tag of the "ProcessingStatus" parameter with the "CreateSetTagCommand" system function. Use, for example, the instruction `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` for the HMI tag "MyTag".

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler.
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler.

See also

SysFct (Page 1244)

SysFct.DeleteParameterSet()

Description

The "DeleteParameterSet" method deletes a parameter set.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
[HMIRuntime.]ParameterSetTypes.SysFct.DeleteParameterSet(ParameterSe
tType, ParameterSet, OutputStatus[, ProcessingStatus])
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

ParameterSetType

Type: Variant

Custom ID or name of the parameter set type

ParameterSet

Type: Variant

Custom ID or name of the parameter set.

OutputStatus

Type: Bool

Specifies whether a status message is output after the transfer.

- True: Status message output.
- False: Status message not output.

`ProcessingStatus`

Optional, type: Object, HMISetValueCommandBase

HMI tag in which the processing status is stored.

Indicates the execution status of the method:

- 2: Function is being executed.
- 4: Function completed successfully.
- 12: Function was canceled.

Note

Define the HMI tag of the "ProcessingStatus" parameter with the "CreateSetTagCommand" system function. Use, for example, the instruction `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` for the HMI tag "MyTag".

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler.
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler.

See also

SysFct (Page 1244)

SysFct.ExportParameterSets()

Description

The "ExportParameterSets" method exports one or all parameter sets ("ParameterSets" objects) of a parameter set type ("ParameterSetType" object).

This method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
[HMIRuntime.]ParameterSetTypes.SysFct.ExportParameterSets(ParameterS
etTypeId, ParameterSetId, FileName, OverWrite, OutputStatus[,
ProcessingStatus], GenerateChecksum)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

ParameterSetTypeId

Type: Variant

Custom ID or name of the parameter set type

ParameterSetId

Type: Variant

Custom ID or name of the parameter set.

FileName

Type: String

Name of the file into which the parameter set is exported.

OverWrite

Type: UInt32, hmiOverwrite

Specifies whether an existing parameter set is overwritten:

- Disabled (0): Do not overwrite parameter set.
- Enabled (1): Overwrite parameter set.

OutputStatus

Type: Bool

Specifies whether a status message is output after the transfer.

- True: Status message output.
- False: Status message not output.

ProcessingStatus

Optional, type: Object, HMISetValueCommandBase

HMI tag in which the processing status is stored.

Indicates the execution status of the method:

- 2: Function is being executed.
- 4: Function completed successfully.
- 12: Function was canceled.

Note

Define the HMI tag of the "ProcessingStatus" parameter with the "CreateSetTagCommand" system function. Use, for example, the instruction `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` for the HMI tag "MyTag".

`GenerateChecksum`

Type: Bool

Specifies whether the checksum is checked during export.

- True: Generate checksum.
- False: Do not generate checksum.

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler.
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler.

SysFct (Page 1244)

SysFct.ImportParameterSets() (Page 1254)

SysFct.CreateSetTagCommand() (Page 1382)

SysFct.GetParameterSetName()

Description

The "GetParameterSetName" method returns the name of a parameter set based on the parameter set ID and the language.

This method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then())

and faulty (catch()) execution of the operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
[HMIRuntime.]ParameterSetTypes.SysFct.GetParameterSetName(ParameterS
etTypeId, ParameterSetId, Language, ParameterSetName,
ProcessingStatus)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

ParameterSetTypeId

Type: UInt32

Custom ID of the parameter set type.

ParameterSetId

Type: UInt32

Custom ID of the parameter set.

Language

Type: UInt32, HMILCID

LCID of the language

ParameterSetName

Type: Object, HMISetValueCommandBase

HMI tag in which the name of the parameter set is stored.

Note

Define the HMI tag of the "ParameterSetName" parameter with the "CreateSetTagCommand" system function. Use, for example,
the `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` instruction for the "MyTag" HMI tag.

ProcessingStatus

Type: Object, HMISetValueCommandBase

HMI tag in which the processing status is stored.

Indicates the execution status of the method:

- 2: Function is being executed.
- 4: Function completed successfully.
- 12: Function was canceled.

Note

Define the HMI tag of the "ProcessingStatus" parameter with the "CreateSetTagCommand" system function. Use, for example, the instruction `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` for the HMI tag "MyTag".

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler.
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler.

See also

SysFct (Page 1244)

SysFct.GetParameterSetTypeName()

Description

The "GetParameterSetTypeName" method returns the name of a parameter set type based on the parameter set type ID and the language.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
[HMIRuntime.]ParameterSetTypes.SysFct.GetParameterSetTypeName(Parame
terSetTypeId, Language, ParameterSetTypeName, ProcessingStatus)
.then(function() {
    ...
})
.catch(function(errorCode) {
```

```
    ...
})
```

Parameters

`ParameterSetTypeId`

Type: UInt32

Custom ID of the parameter set type.

`Language`

Type: UInt32, HMILCID

LCID of the language

`ParameterSetTypeName`

Type: Object, HMISetValueCommandBase

HMI tag in which the name of the parameter set type is stored.

Note

Define the HMI tag of the "ParameterSetTypeName" parameter with the "CreateSetTagCommand" system function. Use, for example, the `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` instruction for the "MyTag" HMI tag.

`ProcessingStatus`

Type: Object, HMISetValueCommandBase

HMI tag in which the processing status is stored.

Indicates the execution status of the method:

- 2: Function is being executed.
- 4: Function completed successfully.
- 12: Function was canceled.

Note

Define the HMI tag of the "ProcessingStatus" parameter with the "CreateSetTagCommand" system function. Use, for example, the instruction `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` for the HMI tag "MyTag".

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler.
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler.

See also

SysFct (Page 1244)

SysFct.ImportParameterSets()

Description

The "ImportParameterSets" method imports one or all parameter sets ("ParameterSets" objects) of a parameter set type ("ParameterSetType" object).

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
[HMIRuntime.]ParameterSetTypes.SysFct.ImportParameterSets(FileName,
ParameterSetId, OverWrite, OutputStatus[, ProcessingStatus],
VerifyChecksum)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

`FileName`

Type: String

Name of the file from which the parameter set is imported.

`ParameterSetId`

Type: Variant

Custom ID or name of the parameter set.

`OverWrite`

Type: UInt32, hmiOverwrite

Specifies whether an existing parameter set is overwritten:

- Disabled (0): Do not overwrite parameter set.
- Enabled (1): Overwrite parameter set.

`OutputStatus`

Type: Bool

Specifies whether a status message is output after the transfer.

- True: Status message output.
- False: Status message not output.

`ProcessingStatus`

Optional, type: Object, HMISetValueCommandBase

HMI tag in which the processing status is stored.

Indicates the execution status of the method:

- 2: Function is being executed.
- 4: Function completed successfully.
- 12: Function was canceled.

Note

Define the HMI tag of the "ProcessingStatus" parameter with the "CreateSetTagCommand" system function. Use, for example, the instruction `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` for the HMI tag "MyTag".

`VerifyChecksum`

Type: Bool

Specifies whether the checksum is checked during import.

- True: Check checksum.
- False: Do not check checksum.

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler.
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler.

SysFct.CreateSetTagCommand() (Page 1382)

SysFct.LoadAndWriteParameterSet()

Description

The "LoadAndWriteParameterSet" method loads a parameter set from the HMI device memory and writes the parameter set to the PLC.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
[HMIRuntime.]ParameterSetTypes.SysFct.LoadAndWriteParameterSets(Para
meterSetTypeId, ParameterSetId, OutputStatus[, ProcessingStatus])
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

`ParameterSetTypeId`

Type: Variant

Custom ID or name of the parameter set.

`ParameterSetId`

Type: Variant

Custom ID or name of the parameter set.

`OutputStatus`

Type: Bool

Specifies whether a status message is output after the transfer.

- True: Status message output.
- False: Status message not output.

ProcessingStatus

Optional, type: Object, HMISetValueCommandBase

HMI tag in which the processing status is stored.

Indicates the execution status of the method:

- 2: Function is being executed.
- 4: Function completed successfully.
- 12: Function was canceled.

Note

Define the HMI tag of the "ProcessingStatus" parameter with the "CreateSetTagCommand" system function. Use, for example, the instruction `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` for the HMI tag "MyTag".

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler.
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler.

SysFct.CreateSetTagCommand() (Page 1382)

SysFct.LoadParameterSet()

Description

The "LoadParameterSet" method loads a parameter set from the local memory of the HMI device and writes the parameter set to the edit tag.

This method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
[HMIRuntime.]ParameterSetTypes.SysFct.LoadParameterSet(ParameterSetT
ype, ParameterSet, OutputStatus[, ProcessingStatus])
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

`ParameterSetType`

Type: Variant

Custom ID or name of the parameter set type

`ParameterSet`

Type: Variant

Custom ID or name of the parameter set.

`OutputStatus`

Type: Bool

Specifies whether a status message is output after the transfer.

- True: Status message output.
- False: Status message not output.

`ProcessingStatus`

Optional, type: Object, HMISetValueCommandBase

HMI tag in which the processing status is stored.

Indicates the execution status of the method:

- 2: Function is being executed.
- 4: Function completed successfully.
- 12: Function was canceled.

Note

Define the HMI tag of the "ProcessingStatus" parameter with the "CreateSetTagCommand" system function. Use, for example, the instruction `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` for the HMI tag "MyTag".

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler.
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler.

SysFct.ReadAndSaveParameterSet()

Description

The "ReadAndSaveParameterSet" method reads a parameter set from the PLC and writes the parameter set to the local memory of the HMI device.

This method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
[HMIRuntime.]ParameterSetTypes.SysFct.ReadAndSaveParameterSet(Parame
terSetTypeId, ParameterSetId, OverWrite, OutputStatus[,
ProcessingStatus])
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

ParameterSetTypeId

Type: Variant

Custom ID or name of the parameter set type

ParameterSetId

Type: Variant

Custom ID or name of the parameter set.

`OverWrite`

Type: UInt32, hmiOverwrite

Specifies whether an existing parameter set is overwritten:

- Disabled (0): Do not overwrite parameter set.
- Enabled (1): Overwrite parameter set.

`OutputStatus`

Type: Bool

Specifies whether a status message is output after the transfer.

- True: Status message output.
- False: Status message not output.

`ProcessingStatus`

Optional, type: Object, HMISetValueCommandBase

HMI tag in which the processing status is stored.

Indicates the execution status of the method:

- 2: Function is being executed.
- 4: Function completed successfully.
- 12: Function was canceled.

Note

Define the HMI tag of the "ProcessingStatus" parameter with the "CreateSetTagCommand" system function. Use, for example, the instruction `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` for the HMI tag "MyTag".

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler.
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler.

SysFct.ReadParameterSet()

Description

The "ReadParameterSet" method reads a parameter set from the PLC to the corresponding edit tag.

This method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the read operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
[HMIRuntime.]ParameterSetTypes.SysFct.ReadParameterSet(ParameterSetT
ype, OutputStatus[, ProcessingStatus])
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

ParameterSetType

Type: Variant

Custom ID or name of the parameter set type

OutputStatus

Type: Bool

Specifies whether a status message is output after the transfer:

- True: Status message output.
- False: Status message not output.

ProcessingStatus

Optional, type: Object, HMISetValueCommandBase

HMI tag in which the processing status is stored.

Indicates the execution status of the method:

- 2: Function is being executed.
- 4: Function completed successfully.
- 12: Function was canceled.

Note

Define the HMI tag of the "ProcessingStatus" parameter with the "CreateSetTagCommand" system function. Use, for example, the instruction `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` for the HMI tag "MyTag".

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler.
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler.

SysFct (Page 1244)

SysFct.RenameParameterSet()

Description

The "RenameParameterSet" method changes the name of a parameter set.

This method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
[HMIRuntime.]ParameterSetTypes.SysFct.RenameParameterSet(ParameterSe
tType, ParameterSet, NewParameterSetName, OutputStatus[,
ProcessingStatus])
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

`ParameterSetType`

Type: Variant

Custom ID or name of the parameter set type

`ParameterSet`

Type: Variant

Custom ID or name of the parameter set.

`NewParameterSetName`

Type: String

New user-defined name of the parameter set.

`OutputStatus`

Type: Bool

Specifies whether a status message is output after the transfer.

- True: Status message output.
- False: Status message not output.

`ProcessingStatus`

Optional, type: Object, HMISetValueCommandBase

HMI tag in which the processing status is stored.

Indicates the execution status of the method:

- 2: Function is being executed.
- 4: Function completed successfully.
- 12: Function was canceled.

Note

Define the HMI tag of the "ProcessingStatus" parameter with the "CreateSetTagCommand" system function. Use, for example, the instruction `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` for the HMI tag "MyTag".

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler.
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler.

SysFct.SaveParameterSet()

Description

The "SaveParameterSet" method reads a parameter set from the edit tag and writes the parameter set to the local memory of the HMI device.

This method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
[HMIRuntime.]ParameterSetTypes.SysFct.SaveParameterSet(ParameterSetT
ype, ParameterSet, OverWrite, OutputStatus[, ProcessingStatus])
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

`ParameterSetType`

Type: Variant

Custom ID or name of the parameter set type

`ParameterSet`

Type: Variant

Custom ID or name of the parameter set.

`OverWrite`

Type: Bool

Specifies whether an existing parameter set is overwritten:

- True: Overwrite parameter set.
- False: Do not overwrite parameter set.

`OutputStatus`

Type: Bool

Specifies whether a status message is output after the transfer.

- True: Status message output.
- False: Status message not output.

`ProcessingStatus`

Optional, type: Object, HMISetValueCommandBase

HMI tag in which the processing status is stored.

Indicates the execution status of the method:

- 2: Function is being executed.
- 4: Function completed successfully.
- 12: Function was canceled.

Note

Define the HMI tag of the "ProcessingStatus" parameter with the "CreateSetTagCommand" system function. Use, for example, the instruction `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` for the HMI tag "MyTag".

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler.
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler.

SysFct.WriteParameterSet()

Description

The "WriteParameterSet" method loads a parameter set from the edit tag and writes the parameter set to the PLC.

This method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
[HMIRuntime.]ParameterSetTypes.SysFct.WriteParameterSet(ParameterSet
Type, OutputStatus[, ProcessingStatus])
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

`ParameterSetType`

Type: Variant

Custom ID or name of the parameter set type

`OutputStatus`

Type: Bool

Specifies whether a status message is output after the transfer:

- True: Status message output.
- False: Status message not output.

`ProcessingStatus`

Optional, type: Object, HMISetValueCommandBase

HMI tag in which the processing status is stored.

Indicates the execution status of the method:

- 2: Function is being executed.
- 4: Function completed successfully.
- 12: Function was canceled.

Note

Define the HMI tag of the "ProcessingStatus" parameter with the "CreateSetTagCommand" system function. Use, for example, the instruction `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` for the HMI tag "MyTag".

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler.
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler.

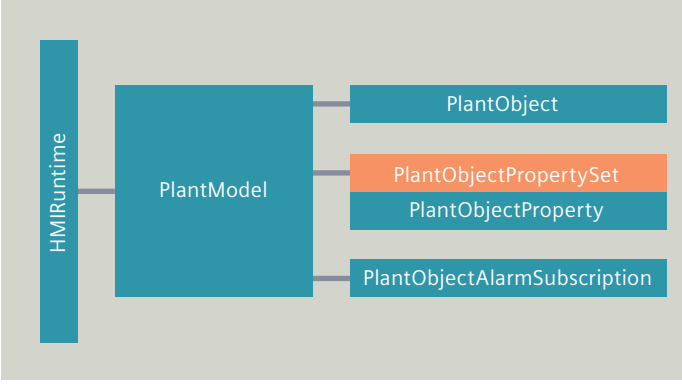
SysFct (Page 1244)

10.2.2.14 PlantModel

Description



The "PlantModel" object ("HMIPlantModel" type) represents the common plant model of the graphical runtime system. You reference all object instances ("PlantObject" objects) and properties of the Common Plant Models by means of the "PlantModel" object.

These object instances represent specific components or parts of the plant. This means that you have access to all the properties and methods of these objects.

Note

The Common Plant Model can map plant hierarchies in runtime. Each hierarchy consists of object instances which represent a component or a function part of the plant.

Each object instance is assigned to a hierarchy node of a plant hierarchy. Through this assignment the object instance has a unique position and address in a hierarchy.

The address in the hierarchy is represented with a path. This hierarchy path is used to reference specific objects in the properties and methods of the CommonPlantModels.

Object type

HMIPlantModel

Properties

The "PlantModel" object has the following properties:

- **LastError**
  Returns an error code for the last faulty read or write operation.

Methods

The "PlantModel" object has the following methods:

- **GetPlantObject()**
  Returns an object instance.
- **GetPlantObjectsByExpression()**
  Returns an array of object instances.
- **GetPlantObjectsByPropertyNames()**
  Returns an array of object instances.
- **GetPlantObjectsByType()**
  Returns an array of object instances.

PlantModel.LastError

Description

The "LastError" property returns an error code for the last faulty read or write operation.

Note

When the property is read out via a set, the error code of the last method call is returned.

Type

ErrorCode

Access

Read-only

Syntax

```
[HMIRuntime.]PlantModel.LastError;
```

Note

When the error occurs when accessing via a set, evaluate the "LastError" property for all objects of the set.

See also

PlantModel (Page 1267)

PlantModel.GetPlantObject()

Description

The "GetPlantObject" method returns an object instance.

Syntax

```
[HMIRuntime.]PlantModel.GetPlantObject(plantObject);
```

Parameters

plantObject

Type: String, HMIPlantObject

Name of the plant object or its position in the plant hierarchy.

Return value

Object, HMIPlantObject (Page 1273)

Example

An object instance is returned via view and path:

Copy code

```
var plantObject1 = PlantModel.GetPlantObject('.TechnologicalView::P1/S1/L2/LeftPump');
```

An object instance is returned via the name of the "HMIPlantObject" object:

Copy code

```
var plantObject2 = PlantModel.GetPlantObject('U4711');
```

See also

PlantModel (Page 1267)

PlantObject (Page 1273)

PlantModel.GetPlantObjectsByExpression()

Description

The "GetPlantObjectsByExpression" method returns an array of object instances.

Syntax

```
[HMIRuntime.]PlantModel.GetPlantObjectsByExpression(PropertyNames,Pl
antObjectType,ExpressionFilter[,ViewPath]);
```

Parameters

`PropertyNames`

Type: String, HMIPlantObjectProperty | String[], HMIPlantObjectProperty

List of the names of the properties

`PlantObjectType`

Type: String, HMIPlantObjectType

Name of the plant object type

`ExpressionFilter`

Type: String

Filter for the values of the properties.

`ViewPath`

Optional, type: String, HMIViewPath

Position of the plant object in the plant hierarchy.

Return value

Object[], HMIPlantObject[] (Page 1273)

Example

Returns an array of object instances:

Copy code

```
var plantObjectArr = PlantModel.GetPlantObjectsByExpression("Temperature", "Motor",
"Temperature>100");
```

See also

PlantModel (Page 1267)

PlantObject (Page 1273)

PlantObjectProperty (Page 1295)

PlantModel.GetPlantObjectsByPropertyNames()

Description

The "GetPlantObjectsByPropertyNames" method returns an array of object instances.

Syntax

```
[HMIRuntime.]PlantModel.GetPlantObjectsByPropertyNames(PropertyName
s[,ViewPath]);
```

Parameters

`PropertyNames`

Type: String, HMIPlantObjectProperty | String[], HMIPlantObjectProperty

List of the names of the properties

`ViewPath`

Optional, type: String, HMIViewPath

Position of the plant object in the plant hierarchy.

Return value

Object[], HMIPlantObject[] (Page 1273)

Example

Returns an array of object instances via their property names:

Copy code

```
var plantObjectArr = PlantModel.GetPlantObjects(["PPP", "ABC"]);
```

See also

PlantModel (Page 1267)

PlantObject (Page 1273)

PlantObjectProperty (Page 1295)

PlantModel.GetPlantObjectsByType()

Description

The "GetPlantObjectsByType" method returns an Array of object instances.

Syntax

```
[HMIRuntime.]PlantModel.GetPlantObjectsByType(PlantObjectType[,ViewP
ath]);
```

Parameters

`PlantObjectType`

Type: String, HMIPlantObjectType

Name of the plant object type

`ViewPath`

Optional, type: String, HMIViewPath

Position of the plant object in the plant hierarchy.

Return value

Object[], HMIPlantObject[] (Page 1273)

Example

Returns an Array of object instances via the plant object type:

Copy code

```
var plantObjectArr = PlantModel.GetPlantObjectsByType("Motor");
```

See also

PlantModel (Page 1267)

PlantObject (Page 1273)

PlantObject

Description

The "PlantObject" object ("HMIPlantObject" object) represents the object instances of the Common Plant Model.

The "PlantObject" object gives you access to all object properties or adjacent object instances in the plant hierarchy.

Note

The Common Plant Model can map any number of plant hierarchies in runtime. Each hierarchy consists of object instances which represent a component or a function part of the plant.

Each object instance is assigned to a hierarchy node in a plant hierarchy. Through this assignment the object instance has a unique position and address in a hierarchy.

The address in the hierarchy is represented with a path. This hierarchy path is used to reference specific objects in the properties and methods of the CommonPlantModels.

Object type

HMIPlantObject

Properties

The "PlantObject" object has the following properties:

- **Children**
  Returns all child object instances of an object instance in the hierarchy.
- **CurrentPlantView**
  Returns the current view of an object instance.
- **InstanceScreens**
  Returns the list of HMI screens that are assigned to an object instance.
- **LastError**
  Returns an error code for the last faulty read or write operation.
- **Name**
  Returns the object name.

- **Parent**
  Returns the higher-level object instance (Parent) that contains the current object instance as child.
- **PlantViewPaths**
  Returns the path of an object instance in a view.

Methods

The "PlantObject" object has the following methods:

- **CreateAlarmSubscription()**
  Creates a "PlantObjectAlarmSubscription" object for the object instance.
- **GetActiveAlarms()**
  Returns all active alarms of the object instance at the time of the call.
- **GetChild()**
  Returns the child object instance ("PlantObject" object) of an object instance.
- **GetProperties()**
  Returns the properties of object instances ("PlantObject" objects) as "PlantObjectPropertySet" list.

PlantObject.Children

Description

The "Children" property returns all child object instances of an object instance in the hierarchy.

Type

Object, HMIPlantObject[] (Page 1273)

Access

Read-only

Syntax

```
PlantObject.Children
```

See also

PlantObject (Page 1273)

PlantObject

Description

PlantObject (Page 1273)

PlantObject.CurrentPlantView

Description

The "CurrentPlantView" property returns the current view of an object instance. The property also specifies the view for referencing an object instance.

Type

String

Access

Read-write

Syntax

```
PlantObject.CurrentPlantView
```

Example

References the "Maintenance" view via the object path:

Copy code

```
let plantObject = PlantModel.GetPlantObject(".Maintenance::Plant1/Line3");
let maintChildren = plantObject.Children;
```

References the "Technological" view via the "CurrentPlantView" property:

Copy code

```
plantObject.CurrentPlantView = "Technological";
let techChildren = plantObject.Children;
```

See also

PlantObject (Page 1273)

PlantObject.InstanceScreens

Description

The "InstanceScreens" property returns the list of HMI screens assigned to an object instance.

Type

String[], HmiScreen[]

Access

Read-only

Syntax

```
PlantObject.InstanceScreens
```

See also

PlantObject (Page 1273)

PlantObject.LastError

Description

The "LastError" property returns an error code for the last faulty read or write operation.

Type

ErrorCode

Access

Read-only

Syntax

```
PlantObject.LastError
```

See also

PlantObject (Page 1273)

PlantObject.Name

Description

The "Name" property returns the name of an object instance.

Type

String, HMIPlantObject

Access

Read-only

Syntax

```
PlantObject.Name
```

See also

PlantObject (Page 1273)

PlantObject.Parent

Description

The "Parent" property returns the higher-level object instance (Parent) that contains the current object instance as child.

Type

Object, HMIPlantObject (Page 1273)

Access

Read-only

Syntax

```
PlantObject.Parent
```

See also

PlantObject (Page 1273)

PlantObject

Description

PlantObject (Page 1273)

PlantObject.PlantViewPaths

Description

The "PlantViewPaths" property returns the path of an object instance in a view.

Type

StringStringMap

Access

Read-only

Syntax

```
PlantObject.PlantViewPaths
```

Example

Returns the path of the object in the current view:

Copy code

```
let pathCurrent = plantObject.PlantViewPaths[plantObject.CurrentPlantView];
```

Returns the path of the object in the "Maintenance" view:

Copy code

```
let pathMaint = plantObject.PlantViewPaths["Maintenance"];
```

See also

PlantObject (Page 1273)

PlantObject.GetActiveAlarms()

Description

The "GetActiveAlarms" method returns all active alarms of the object instance at the time of the call.

The method executes an asynchronous read operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful ("then()") and faulty ("catch()") execution of the read operation. Depending on the result, once execution is complete the corresponding handler of the Promise pattern is called with the "AlarmResult" objects or the error code as parameter.

Syntax

```
PlantObject.GetActiveAlarms(Language[,IncludeChildren][,Filter])
.then(function(alarmResultArray) {
    ...
});
.catch(function(errorCode) {
    ...
})
```

Parameters

`Language`

Type: UInt32, HMILCID

Language for all texts of an alarm and the filter

`IncludeChildren`

Optional, type: Bool

Specifies whether the alarms of all child object instances are included.

`Filter`

Optional, type: String, HMIAlarmFilterString

SQL-type string for filtering

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  Object, HMIAlarmResult[] (Page 1077) as parameter of the handler "then()".
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler. This state is only present if no alarms of the "PlantObject" object could be output.

Example

Read out all active alarms of the "PlantObject" object instance:

Copy code

```
var promise = PlantObject.GetActiveAlarms(1033);
```

See also

PlantObject (Page 1273)

AlarmResult (Page 1077)

PlantObject.GetChild()

Description

The "GetChild" method returns the child object instance ("PlantObject" object) of an object instance.

Syntax

```
PlantObject.GetChild(ChildName)
```

Parameters

`ChildName`

Type: String

Name of the child object instance in the view

Return

Object, HMIPlantObject (Page 1273)

See also

PlantObject (Page 1273)

PlantObject.GetProperties()

Description

The "GetProperties" method returns the properties of object instances ("PlantObject" objects) as "PlantObjectPropertySet" list.

Syntax

```
PlantObject.GetProperties([propertyName])
```

Parameters

propertyName

Optional, type: String | String[]

One or more properties of an object instance

Return

Object, HMIPlantObjectPropertySet (Page 1288)

Example

Returns the "Speed" and "Temperature" properties of an object instance.

Copy code

```
var plantObjectPropertySet = plantObject.GetProperties(['Speed', 'Temperature']);
```

See also

PlantObjectPropertySet (Page 1288)

PlantObject (Page 1273)

PlantObject.CreateAlarmSubscription()

Description

The "CreateAlarmSubscription" method creates a "PlantObjectAlarmSubscription" object for the object instance. With the returned object "PlantObjectAlarmSubscription" you specify the grouping of active alarms.

Syntax

```
PlantObject.CreateAlarmSubscription()
```

Parameters

--

Return value

Object, HMIPlantObjectAlarmSubscription (Page 1282)

Example

Creates an object "PlantObjectAlarmSubscription" for the composition of active alarms of the object instance "po":

Copy code

```
var po = PlantModel.GetPlantObject(".hierarchy::Node1\\Node2");
var alarmsubscription = po.CreateAlarmSubscription();
```

See also

PlantObjectAlarmSubscription (Page 1282)

PlantObject (Page 1273)

PlantObjectAlarmSubscription

Description

The "PlantObjectAlarmSubscription" object ("HMIPlantObjectAlarmSubscription" type) enables access to active alarms from all object instances of the Common Plant Models.

The object represents a selection of active alarms. The object is initialized via the "CreateAlarmSubscription" method of the "PlantObject" object. The active alarms are then grouped and called according to the properties of the "PlantObjectAlarmSubscription" object. Finally, notification is given of the changes to the alarm mapping.

Object type

HMIPlantObjectAlarmSubscription

Properties

The "PlantObjectAlarmSubscription" object has the following properties:

- **Filter**
  Defines a string for filtering active alarms.
- **IncludeChildren**
  Specifies whether all alarms of child object instances are included.
- **Language**
  Specifies the current runtime language for all texts of a message and the filter.
- **OnAlarm**
  Specifies the name of the "OnAlarm" Callback function for the monitoring of active alarms.
- **SystemNames**
  Specifies the name of the runtime system for the grouping of active alarms.

Methods

The "PlantObjectAlarmSubscription" object has the following methods:

- **Start()**
  Activates the monitoring of defined alarms of the "PlantObjectAlarmSubscription" object.
- **Stop()**
  Cancels monitoring of defined alarms of the "PlantObjectAlarmSubscription" object.

PlantObjectAlarmSubscription.Filter

Description

The "Filter" property specifies a string for filtering active alarms.

The syntax of the filter string corresponds to the WHERE clause of an SQL command.

Type

String, HMIAlarmFilterString

Access

Read-write

Syntax

```
PlantObjectAlarmSubscription.Filter
```

See also

PlantObjectAlarmSubscription (Page 1282)

AlarmSubscription.Filter (Page 1068)

PlantObjectAlarmSubscription.IncludeChildren

Description

The "IncludeChildren" property specifies whether all alarms of child object instances are included.

Type

Bool

Access

Read-write

Syntax

```
PlantObjectAlarmSubscription.IncludeChildren
```

See also

PlantObjectAlarmSubscription (Page 1282)

PlantObjectAlarmSubscription.Language

Description

The "Language" specifies the current runtime language for all texts of a message and the filter.

Type

UInt32, HMILCID

Access

Read-write

Syntax

```
PlantObjectAlarmSubscription.Language
```

See also

PlantObjectAlarmSubscription (Page 1282)

PlantObjectAlarmSubscription.OnAlarm

Description

The "OnAlarm" property specifies the name of the "OnAlarm" Callback function for the monitoring of active alarms.

The properties of the active alarms are passed to the Callback function "OnAlarm" as object "AlarmResultArray".

Required prototype of the Callback function:
`OnAlarm(errorCode,systemName,alarmResultArray)`

Type

Function, HMIOnAlarmCB

Access

Write-only

Syntax

```
PlantObjectAlarmSubscription.OnAlarm
```

Parameters

Parameters of the callback function:

errorCode

Type: ErrorCode

Error code of the active alarm

systemName

Type: String

Name of the runtime system

alarmResultArray

Type: Object, HMIAlarmResult[] (Page 1077)

Array with "AlarmResult" objects of the active alarm

See also

PlantObjectAlarmSubscription (Page 1282)

AlarmResult (Page 1077)

PlantObjectAlarmSubscription.SystemNames

Description

The "SystemNames" property specifies the name of the runtime system for compiling active alarms.

Type

String[], HMISystem

Access

Read-write

Syntax

```
PlantObjectAlarmSubscription.SystemNames
```

See also

PlantObjectAlarmSubscription (Page 1282)

PlantObjectAlarmSubscription.Start()

Description

The "Start" method activates the monitoring of defined alarms of the "PlantObjectAlarmSubscription" object.

Syntax

```
PlantObjectAlarmSubscription.Start()
```

Parameters

--

Return value

ErrorCode

Example

Start monitoring of alarms for object instance "po" and output number of alarms:

Copy code

```
var po = PlantModel.GetPlantObject(".hierarchy::Node1\\Node2");
var alarmsubscription = po.CreateAlarmSubscription(); // returns
HMIPlantObjectAlarmSubscription
alarmsubscription.Language = 1033;
alarmsubscription.OnAlarm = function(ErrorCode, SystemName, ResultSet) {

   for (let index in ResultSet) {
      HMIRuntime.Trace('Alarm Name_' + (index + 1) + ' = ' + ResultSet[index].Name);
      HMIRuntime.Trace(' Alarm State_' + (index + 1) + '= ' + ResultSet[index].State);
      HMIRuntime.Trace(' Alarm Area_' + (index + 1) + '= ' + ResultSet[index].Area);
   }
};
alarmsubscription.Filter = 'AlarmClassName=\'Alarm\'';
alarmsubscription.IncludeChildren = true;
alarmsubscription.Start();
```

See also

PlantObjectAlarmSubscription (Page 1282)

PlantObjectAlarmSubscription.Stop()

Description

The "Stop" method cancels the monitoring of defined alarms of the "PlantObjectAlarmSubscription" object.

Syntax

```
PlantObjectAlarmSubscription.Stop()
```

Parameters

--

Return value

ErrorCode

Example

Stop monitoring of alarms:

Copy code

```
var po = PlantModel.GetPlantObject(".hierarchy::Node1\\Node2");

var alarmsubscription = po.CreateAlarmSubscription(); // returns
HMIPlantObjectAlarmSubscription
alarmsubscription.Language = 1033;
alarmsubscription.OnAlarm = function(ErrorCode, SystemName, ResultSet) {
   for (let index in ResultSet) {
      HMIRuntime.Trace('Alarm Name_' + (index + 1) + ' = ' + ResultSet[index].Name);
      HMIRuntime.Trace(' Alarm State_' + (index + 1) + '= ' + ResultSet[index].State);
      HMIRuntime.Trace(' Alarm Area_' + (index + 1) + '= ' + ResultSet[index].Area);

   }
};
alarmsubscription.Filter = 'AlarmClassName=\'Alarm\'';
alarmsubscription.IncludeChildren = true;
alarmsubscription.Start();
```

PlantObjectAlarmSubscription (Page 1282)

PlantObjectPropertySet

Description

The object "PlantObjectPropertySet" (type "HMIPlantObjectPropertySet") is a list "PlantObjectProperty" objects that provides optimized access to the properties of the object instances of the Common Plant Models.

After initialization of the "PlantObjectPropertySet" object, you can read and write multiple properties in a single call. Simultaneous access has better performance and a lower communication load than single access to multiple properties.

You reference the "PlantObjectPropertySet" object via the "PlantObject" object. The "PlantObjectPropertySet" object is a list and can be counted and enumerated. You can access the "PlantObjectPropertySet" list through the index or the "item" method.

Object type

HMIPlantObjectPropertySet

Properties

The "PlantObjectPropertySet" object has the following properties:

- **Count**
  Returns the number of object properties in the "PlantObjectPropertySet" list.

Methods

The "PlantObjectPropertySet" object has the following methods:

- **Add()**
  Adds one or more object properties to an existing "PlantObjectPropertySet" list.
- **Item()**
  Returns a property from the "PlantObjectPropertySet" list.
- **Read()**
  Reads in all object properties of the "PlantObjectPropertySet" list.
- **ReadAsync()**
  Asynchronously reads in all object properties of the "PlantObjectPropertySet" list.
- **Remove()**
  Removes one or more object properties from an existing "PlantObjectPropertySet" list.
- **Write()**
  Writes the values of all object properties of the "PlantObjectPropertySet" list.
- **WriteAsync()**
  Asynchronously writes the values of all object properties of the "PlantObjectPropertySet" list.

See also

PlantObjectProperty (Page 1295)

PlantObject (Page 1273)

PlantObjectPropertySet.Count

Description

The "Count" property returns the number of object properties in the "PlantObjectPropertySet" list.

Type

UInt32

Access

Read-only

Syntax

```
PlantObjectPropertySet.Count
```

See also

PlantObjectProperty (Page 1295)

PlantObjectPropertySet (Page 1288)

PlantObjectPropertySet.Add()

Description

The "Add" method adds one or more object properties to an existing "PlantObjectPropertySet" list. The object properties are referenced by name.

Syntax

```
PlantObjectPropertySet.Add(name)
```

Parameters

name

Type: String

Name of object properties that are added to the list.

Return

Object[], HMIPlantObjectProperty[] (Page 1295)

See also

PlantObjectProperty (Page 1295)

PlantObjectPropertySet (Page 1288)

PlantObjectPropertySet.Item()

Description

The "Item" method returns a property ("PlantObjectProperty" object) from the "PlantObjectPropertySet" list.

Syntax

```
PlantObjectPropertySet[.Item](name)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "PlantObjectPropertySet" object.

Parameters

`name`

Type: String, HMIPlantObjectProperty | Int32, HMIPlantObjectProperty

Name or index number (0 ... n) of an object property of the "PlantObjectPropertySet" list.

Note

The index number of a "PlantObjectPropertySet" object does not describe the order in which the "PlantObjectProperty" objects were added to the "PlantObjectPropertySet" list.

Return

Object, HMIPlantObjectProperty (Page 1295)

See also

PlantObjectProperty (Page 1295)

PlantObjectPropertySet (Page 1288)

PlantObjectPropertySet.Read()

Description

The "Read" method reads in all object properties ("PlantObjectProperty" objects) of the "PlantObjectPropertySet" list. The value, the Quality Code and the time stamp of all properties are determined when the properties are read.

The method executes a synchronous read operation. After the read operation is complete, use the "LastError " property to determine whether the execution was successful.
if you do not want the read operation to block script execution use the method "PlantObjectPropertySet.ReadAsync".

Syntax

```
PlantObjectPropertySet.Read()
```

Parameters

--

Return

--

See also

PlantObjectPropertySet (Page 1288)

PlantObjectProperty (Page 1295)

PlantObjectPropertySet.ReadAsync()

Description

The "ReadAsync" method reads in all object properties ("PlantObjectProperty" objects) of the "PlantObjectPropertySet" list. The value, the Quality Code and the time stamp of all properties are determined when the properties are read.

The method executes an asynchronous read operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the read operation. Depending on the result, the corresponding handler of the Promise pattern with the "PlantObjectPropertySet" object or the error code as parameter is called after the operation. Execution only fails (promise rejected) when no "PlantObjectProperty" object of the "PlantObjectPropertySet" list could be read.

Syntax

```
PlantObjectProperty.ReadAsync()
.then(function(propertySet) {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

--

Return

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  Object, HMIPlantObjectPropertySet (Page 1288) as parameter of the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler. This status only exists if no "PlantObjectProperty" object of the "PlantObjectPropertySet" list could be read.

See also

PlantObjectPropertySet (Page 1288)

PlantObjectPropertySet.Remove()

Description

The "Remove" method removes one or more object properties ("PlantObjectProperty" objects) from an existing "PlantObjectPropertySet" list. The properties are referenced by the name.

Syntax

```
PlantObjectPropertySet.Remove(name)
```

Parameters

name

Type: String

Name of object properties that will be removed from the list.

Return

--

See also

PlantObjectPropertySet (Page 1288)

PlantObjectProperty (Page 1295)

PlantObjectPropertySet.Write()

Description

The "Write" method writes the values of all object properties ("PlantObjectProperty" objects) of the "PlantObjectPropertySet" list. You must first set the values of the individual object properties with the "Value" property. The value of the "Value" property does not have to correspond to the actual current value of the "PlantObjectProperty" object after the write operation is complete. If you want to update the "PlantObjectProperty" objects, execute a Read method.

The method executes a synchronous write operation. After the write operation is complete, use the "LastError " property to determine whether the execution was successful. Use the "WriteAsync" method to acquire the result of the write operation without blocking script execution,

The properties "QualityCode" and "TimeStamp" of the "PlantObjectProperty" objects are not determined during writing.

Syntax

```
PlantObjectPropertySet.Write()
```

Parameters

--

Return

--

See also

PlantObjectPropertySet (Page 1288)

PlantObjectProperty (Page 1295)

PlantObjectPropertySet.WriteAsync()

Description

The "WriteAsync" method writes the values of all object properties ("PlantObjectProperty") of the "PlantObjectPropertySet" list. You must first set the values of the individual object properties with the "Value" property. The value of the "Value" property does not have to correspond to the actual current value of the "PlantObjectProperty" objects after completion of the write operation. If you want to update the "PlantObjectProperty" objects, execute a Read method.

After the write operation is complete, use the "LastError " property to determine whether the execution was successful.

The properties "QualityCode" and "TimeStamp" of the "PlantObjectProperty" objects are not determined during writing.

The method executes an asynchronous write operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, once execution is complete the corresponding handler of the Promise pattern is called with the "PlantObjectPropertySet" object or the error code as parameter. Execution only fails (Promise rejected) when no "PlantObjectProperty" object of the "PlantObjectPropertySet" object could be written.

Syntax

```
PlantObjectPropertySet.WriteAsync()
.then(function(propertySet) {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

--

Return

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  Object, HMIPlantObjectPropertySet as parameter of the "then()" handler.
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler. This status only exists if no "PlantObjectProperty" object of the "PlantObjectPropertySet" list could be written.

See also

PlantObjectPropertySet (Page 1288)

PlantObjectProperty (Page 1295)

PlantObjectProperty

Description

The "PlantObjectProperty" object ("HMIPlantObjectProperty" type) represents the property of an object instance ("PlantObject" object) of the Common Plant Models.

A "PlantObjectProperty" object is returned by the "PlantObjectPropertySet" list or the `PlantObject.GetProperties` method.

Object type

HMIPlantObjectProperty

Properties

The "PlantObjectProperty" object has the following properties:

- **LastError**
  Returns an error code for the last faulty read or write operation.
- **Name**
  Returns the name of an object property.
- **QualityCode**
  Returns the level of the quality of the value of an object property after reading.
- **TimeStamp**
  Returns the time stamp of the last read operation.
- **Value**
  Specifies the value of an object property.

Methods

The "PlantObjectProperty" object has the following methods:

- **Read()**
  Reads an object property
- **Write()**
  Writes the value of an object property.

See also

PlantModel (Page 1267)

PlantObject (Page 1273)

PlantObjectPropertySet (Page 1288)

PlantObjectProperty.LastError

Description

The "LastError" property returns an error code for the last faulty read or write operation.

Type

ErrorCode

Access

Read-only

Syntax

```
PlantObjectProperty.LastError
```

See also

PlantObjectProperty (Page 1295)

PlantObject (Page 1273)

PlantObjectProperty.Name

Description

The "Name" property returns the name of the object property.

Type

String

Access

Read-only

Syntax

```
PlantObjectProperty.Name
```

See also

PlantObjectProperty (Page 1295)

PlantObject (Page 1273)

PlantObjectProperty.QualityCode

Description

The "QualityCode" property returns the level of the quality of the value of an object property after the read operation.

Type

UInt32

Access

Read-only

Syntax

```
PlantObjectProperty.QualityCode
```

See also

PlantObjectProperty (Page 1295)

PlantObject (Page 1273)

Tag.QualityCode (Page 1341)

PlantObjectProperty.TimeStamp

Description

The "TimeStamp" property returns the time stamp of the last read operation.

The value 0 is returned after writing or rejected reading.

Type

DateTime

Access

Read-only

Syntax

```
PlantObjectProperty.TimeStamp
```

See also

PlantObjectProperty (Page 1295)

PlantObject (Page 1273)

Tag.TimeStamp (Page 1345)

PlantObjectProperty.Value

Description

The "Value" property specifies a value of an object property.

Type

Variant

Access

Read-write

Syntax

```
PlantObjectProperty.Value
```

See also

PlantObjectProperty (Page 1295)

PlantObject (Page 1273)

PlantObjectProperty.Read()

Description

The "Read" method reads a property ("PlantObjectProperty" object) of an object instance of the Common Plant Models. The value, the Quality Code and the time stamp of the object property are determined when the property is read.

The method executes a synchronous read operation. When completed, you can use the property "PlantObjectProperty.LastError" to determine if the execution was successful.

if you do not want the read operation to block script execution use the method "PlantObjectPropertySet.ReadAsync".

Syntax

```
PlantObjectProperty.Read()
```

Parameters

--

Return

Variant

See also

PlantObjectProperty (Page 1295)

PlantObject (Page 1273)

PlantObjectProperty.Write()

Description

The "Write" method writes the value of the property ("PlantObjectProperty" object) of an object instance of the Common Plant Models. Set the values of the individual "PlantObjectProperty" objects beforehand with the property "Value". The value of the "Value" property does not have to correspond to the actual current value of the "PlantObjectProperty" object after the write operation is complete. To update the "PlantObjectProperty" objects, execute a Read method.

The "Write" method executes a synchronous write operation. When completed, you can use the "LastError" property of the "PlantObjectProperty" object to determine if the execution was successful.

To acquire the result of the write operation without blocking script execution, use the "WriteAsync" method of the "PlantObjectPropertySet" object.

The "QualityCode" and "TimeStamp" properties of the "PlantObjectProperty" object are not determined during writing.

Syntax

```
PlantObjectProperty.Write([value])
```

Parameters

value

Optional, type: Variant

Value of the object property:

- Specify value
  The specified value overwrites the current value of the "Value" property of the "PlantObjectProperty" object.
- Without value
  The current value of the "Value" property of the "PlantObjectProperty" object is written.

Return

--

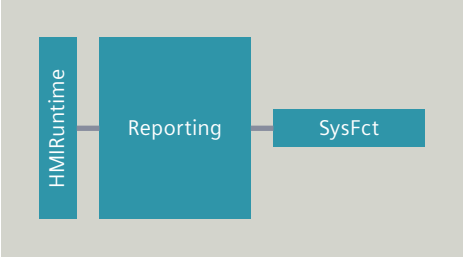
See also

PlantObjectProperty (Page 1295)

PlantObject (Page 1273)

10.2.2.15 Reporting

Description



The "Reporting" object allows access to the report function (production logs) of the runtime. When a report job is executed, the data source items defined in the report template are read from the Runtime project and their data are imported into a table in the report.

Object type

HMIReporting

Properties

--

Methods

--

SysFct

Description

The "SysFct" object enables access to the system functions of the "Reporting" object.

Object type

HMIReportingSysFct

Properties

--

Methods

The "SysFct" object has the following methods:

- **ExecuteReport()**
  Starts the specified report task.

See also

Reporting (Page 1301)

SysFct.ExecuteReport()

Description

The "ExecuteReport" method starts the specified report job.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
HMIRuntime.Reporting.SysFct.Report(ReportTaskName)
.then(function() {
    ...
})
.catch(function(errorCode){
    ...
});
```

Parameters

ReportTaskName

Type: String

Name of the report job

Return value

Promise

Depending on the status of the Promise object:

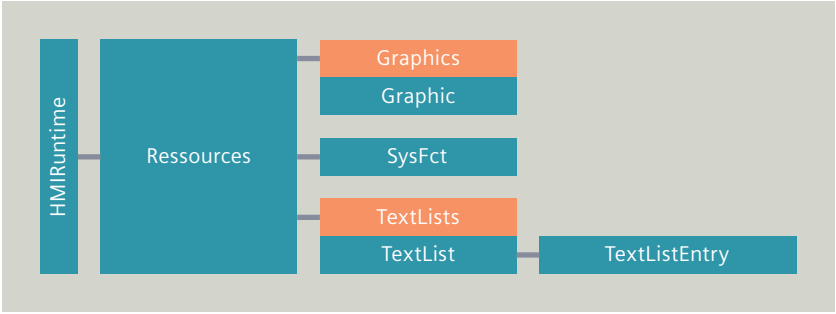
- Promise fulfilled (fulfilled)
  No return for the "then()" handler.
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler.

See also

SysFct (Page 1301)

10.2.2.16 Resources

Description



The "Resources" object provides access to the runtime text and graphic lists.

Object type

HMIResources

Properties

The "Resources" object has the following properties:

- **Graphics**
  Returns the "Graphics" list.
- **TextLists**
  Returns the "TextLists" list.

Methods

--

Resources.Graphics

Description

The "Graphics" property returns the list of the "Graphic" objects. In the graphic list (object "Graphics"), certain graphic ("Graphic" objects) are assigned to the possible values or value ranges of a tag.

Type

Object, HMIGraphics

Access

Read-only

Syntax

```
HMIRuntime.Resources.Graphics
```

Properties

--

Methods

The "Graphics" property has the following methods:

- **Item**
  Returns an object of the type "Graphic".

See also

Resources (Page 1303)

Graphics.Item()

Description

The "Item" method returns a "Graphic" object of the "Graphics" list.

Syntax

```
HMIRuntime.Resources.Graphics[.Item](graphicName);
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "Graphics" object.

Parameters

`graphicName`

Type: String, HMIGraphic

Fully qualified name of the graphic, e.g. "GraphicCollection.MyImage"

Return value

Object, HMIGraphic (Page 1305)

Example

Assign a graphic to the "Button_1" button:

Copy code

```
Screen.Items("Button_1").Graphic =
HMIRuntime.Resources.Graphics("GraphicCollection.Left_Arrow").Name;
```

See also

Resources.Graphics (Page 1303)

Graphic (Page 1305)

Graphic

Description

The "Graphic" object contains the graphic assigned to a defined value or value range of a tag.

Object type

HMIGraphic

Properties

The "Graphic" object has the following properties:

- **Name**
  Returns the fully qualified name of the graphic.

Methods

--

See also

Resources.Graphics (Page 1303)

Graphic.Name

Description

The "Name" property returns the fully qualified name of the graphic, e.g. "GraphicCollection.MyImage".

Type

String

Access

Read-only

Syntax

```
Graphic.Name
```

See also

Graphic (Page 1305)

Resources.TextLists

Description

The "TextLists" property returns the list of the "TextList" objects. In the text list (object "TextLists"), certain texts ("TextList" object) are assigned in multiple languages to the possible values or value ranges of a tag.

Type

Object, HMITextLists

Access

Read-only

Syntax

```
HMIRuntime.Resources.TextLists
```

Properties

--

Methods

The "TextLists" property has the following methods:

- **Item**
  Returns an object of the type "TextList".

See also

Resources (Page 1303)

TextLists.Item()

Description

The "Item" method returns a "TextList" object of the "TextLists" list.

Syntax

```
HMIRuntime.Resources.TextLists[.Item](textListName);
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "TextLists" object.

Parameters

`textListName`

Type: String, HMITextList

Fully qualified name of the text list of the "TextList" object of the "TextLists" list.

Return value

Object, HMITextList (Page 1308)

See also

Resources.TextLists (Page 1306)

TextList (Page 1308)

TextList

Description

The "TextList" object contains the multilingual text list entries assigned to a defined value or value range of a tag ("TextListEntry" objects).

Object type

HMITextList

Properties

The "TextList" object has the following properties:

- **Name**
  Returns the fully qualified name of the text list.

Methods

The "TextList" object has the following methods:

- **Item()**
  Returns an entry of the text list.

See also

Resources.TextLists (Page 1306)

TextListEntry (Page 1309)

TextList.Name

Description

The "Name" property returns the fully qualified name of the text list.

Type

String

Access

Read-only

Syntax

```
TextList.Name
```

See also

TextList (Page 1308)

TextList.Item()

Description

The "Item" method returns a "TextListEntry" object of the "TextList" list.

Syntax

```
TextList[.Item](index)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "TextList" object.

Parameters

`index`

Type: Int32

Index of the "TextListEntry" object in the "TextList" list.

Return value

Object, HMITextListEntry (Page 1309)

See also

TextList (Page 1308)

TextListEntry (Page 1309)

TextListEntry

Description

The "TextListEntry" object contains the language-dependent texts of a text list.

Object type

HMITextListEntry

Properties

The "TextListEntry" object has the following properties:

- **Index**
  Returns the index of the text list entry.

Methods

The "TextListEntry" object has the following methods:

- **Item()**
  Returns a text list entry.

See also

TextList (Page 1308)

TextListEntry.Index

Description

The "Index" property returns the index of a text list entry.

Type

Int32

Access

Read-only

Syntax

```
TextListEntry.Index
```

See also

TextListEntry (Page 1309)

TextListEntry.Item()

Description

The "Item" method returns the language-dependent text of the "TextListEntry" object.

Syntax

```
TextListEntry[.Item](lcid)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "TextListEntry" object.

Parameters

`lcid`

Type: Int32, HMILCID

Language of the text

Return value

String

See also

TextListEntry (Page 1309)

SysFct

Description

The "SysFct" object enables access to the system functions of the "Resources" object.

Object type

HMIResourcesSysFct

Properties

--

Methods

The "SysFct" object has the following methods:

- **LookUpText**
  Returns the contents of a text list.

See also

Resources (Page 1303)

SysFct.LookUpText()

Description

The "LookUpText" method returns the text of a text list.

Syntax

```
HMIRuntime.Resources.SysFct.LookUpText(OutputText, index, lcid,
TextListName);
```

Parameters

`OutputText`

Type: Object, HMISetValueCommandBase

HMI tag in which the selected text is stored.

Note

Define the HMI tag of the "OutputText" parameter with the "CreateSetTagCommand" system function. Use, for example, the instruction `HMIRuntime.Tags.SysFct.CreateSetTagCommand("MyTag")` for the HMI tag "MyTag".

`index`

Type: Variant

Index of the text list entry

`lcid`

Type: UInt32, HMILCID

LCID the language of the text list entry

`TextListName`

Type: String, HMITextList

Name of the text list

Return value

ErrorCode

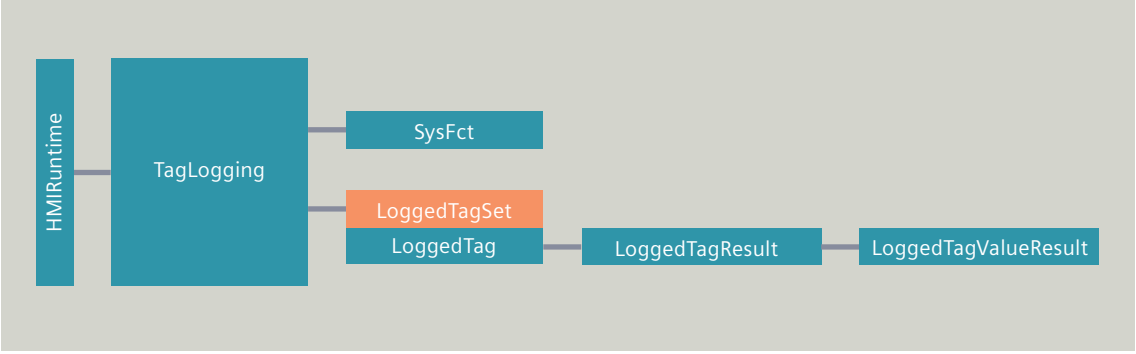
See also

SysFct (Page 1311)

SysFct.CreateSetTagCommand() (Page 1382)

10.2.2.17 TagLogging

Description



The "TagLogging" object ("HMITagLogging" type) enables access to the logging tags of a logging system.

Object type

HMITagLogging

Properties

--

Methods

The "TagLogging" object has the following methods:

- **CreateLoggedTagSet()**
  Creates a new "LoggedTagSet" object.
- **LoggedTags()**
  References a logging tag ("LoggedTag" object) of a logging system.

TagLogging.CreateLoggedTagSet()

Description

The "CreateLoggedTagSet" method creates a new "LoggedTagSet" object ("HMILoggedTagSet" type). The "LoggedTagSet" object can be filled with one or more logging tags.

You use the returned "LoggedTagSet" object for optimized read and write access to multiple logging tags.

Syntax

```
HMIRuntime.TagLogging.CreateLoggedTagSet([loggedTagNameArray]);
```

Parameter

`loggedTagNameArray`

Type: String, HMILoggedTag | String[], HMILoggedTag[]

Logging tag name or array with names of multiple logging tags that are added to the "LoggedTagSet" object. Without parameters, an empty "LoggedTagSet" object is created.

Return value

Object, HMILoggedTagSet (Page 1324)

See also

TagLogging (Page 1313)

LoggedTagSet (Page 1324)

LoggedTagSet (Page 1324)

TagLogging.LoggedTags()

Description

The "LoggedTags" method references a logging tag ("LoggedTag" object) of a logging system.

Syntax

```
HMIRuntime.TagLogging.LoggedTags(loggedTagName);
```

Parameter

`loggedTagName`

Type: String, HMILoggedTag

Logging tag name of a "LoggedTag" object

Return value

Object, HMILoggedTag (Page 1315)

See also

TagLogging (Page 1313)

LoggedTag (Page 1315)

LoggedTag

Description

The "LoggedTag" object ("HMILoggedTag" type) represents a logging tag of a logging system. A "LoggedTag" object is returned by the "TagLogging" object or the "LoggedTagSet" list.

Object type

HMILoggedTag

Properties

The "LoggedTag" object has the following property:

- **Name**
  Returns the name of the logging tag.

Methods

The "LoggedTag" object has the following methods:

- **AddComment()**
  Adds a comment to a logging tag asynchronously in the logging system.
- **Read()**
  Reads a logging tag of a period from a logging system.
- **WriteCorrectionValue()**
  Writes a correction value to a logging tag.

See also

TagLogging (Page 1313)

LoggedTagSet (Page 1324)

LoggedTag.Name

Description

The "Name" property returns the name of the logging tag ("LoggedTag" object).

Type

String, HMILoggedTag

Access

Read-only

Syntax

```
LoggedTag.Name
```

See also

LoggedTag (Page 1315)

LoggedTag.AddComment()

Description

The "AddComment" method adds a comment to a logging tag ("LoggedTag" object) asynchronously in the logging system.

The method executes an asynchronous write operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the write operation.

Note

The comment properties "User", "OperatorStation" and "CommentTimeStamp" are determined from the current script context and cannot be set manually.

Syntax

```
LoggedTag.AddComment(TimeStamp,Language,Comment)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

`TimeStamp`

Type: DateTime

Time stamp of the comment

`Language`

Type: UInt32, HMILCID

Country identification of the language of the comment

`Comment`

Type: String

Comment on the logged tags

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

LoggedTag (Page 1315)

LoggedTag.Read()

Description

The "Read" method reads out a logging tag ("LoggedTag" object) of a time period from a logging system. The value, the Quality Code, the time stamp and context information of the logging tag are determined when the logging tag is read.

The method executes an asynchronous read operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the read operation. Depending on the result, after execution is complete, the corresponding handler of the Promise pattern is called with an "LoggedTagResult" object or an error code as parameter.

Syntax

```
LoggedTag.Read(dateFrom,dateTo,boundingValue)
.then(function(loggedTagResult) {
    ...
```

```
})
.catch(function(errorCode) {
    ...
});
```

Parameters

dateFrom

Type: DateTime

End date of the time period

dateTo

Type: DateTime

Start date of the time period

boundingValue

Type: Bool

Specifies whether the limit values of the time period are transferred.

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  Object, HMILoggedTagResult (Page 1319) as parameter of the "then()" handler.
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler.

See also

LoggedTag (Page 1315)

LoggedTagResult (Page 1319)

LoggedTag.WriteCorrectionValue()

Description

The "WriteCorrectionValue" method writes a correction value into a logging tag.

Syntax

```
LoggedTag.WriteCorrectionValue(Timestamp,Value)
```

Parameters

Timestamp

Type: DateTime

Time stamp of the logging tag whose value is being corrected.

Value

Type: Variant

Corrected value which is assigned to the logging tag.

Return value

ErrorCode

See also

LoggedTag (Page 1315)

LoggedTagResult

Description

The "LoggedTagResult" object ("HMILoggedTagResult" type) enables access to the process values of a logging tag. The "LoggedTagResult" object is returned by a read operation of objects "LoggedTag" and "LoggedTagSet" in the logging system. You have access to the process values of logging tags and errors of read operations in the logging system.

Object type

HMILoggedTagResult

Properties

The "LoggedTagResult" object has the following properties:

- **Error**
  Returns an error code for the last faulty read or write operation.
- **Name**
  Returns the name of the object or specifies it.
- **Values**
  Returns an array of process values including the quality code.

Methods

--

TagLogging (Page 1313)

LoggedTag (Page 1315)

LoggedTagSet (Page 1324)

LoggedTagResult.Error

Description

The "Error" property returns an error code for the last faulty read or write operation.

Note

The value "0" is returned after a successful read or write operation. The error code always relates to the last method call of the object.

Type

ErrorCode

Access

Read-write

Syntax

```
LoggedTagResult.Error
```

See also

LoggedTagResult (Page 1319)

LoggedTagResult.Name

Description

The "Name" property returns or specifies the name of the logging tag.

Type

String, HMILoggedTag

Access

Read-write

Syntax

```
LoggedTagResult.Name
```

See also

LoggedTagResult (Page 1319)

LoggedTagResult.Values

Description

The "Values" property returns an array of process values including quality code.

Type

Object, HMILoggedTagValueResult[] (Page 1321)

Access

Read-write

Syntax

```
LoggedTagResult.Values
```

See also

LoggedTagResult (Page 1319)

LoggedTagValueResult (Page 1321)

LoggedTagValueResult

Description

The "LoggedTagValueResult" object ("HMILoggedTagValueResult" type) represents the process values of a logging tag with all associated context information.

The object is referenced via the `LoggedTagResult.Values` property.

Object type

HMILoggedTagValueResult

Properties

The "LoggedTagValueResult" object has the following properties:

- **Flags**
  Returns context information on the process value.
- **Quality**
  Returns the level of the quality of the process value.
- **TimeStamp**
  Returns the time stamp of the process value.
- **Value**
  Returns the process value.

Methods

--

See also

TagLogging (Page 1313)

LoggedTagResult.Values (Page 1321)

LoggedTagValueResult.Flags

Description

The "Flags" property returns context information on the process value.

Type

Int32, hmiTagLoggingValueFlags

Returns context information on the process value:

- Extra (0): There are still additional values at the time of the process value.
- Calculated (2): Process value is calculated.
- Bounding (16): Process value is a limit value.
- NoData (32): No additional information available
- FirstStored (64): Process value is the first value stored in the logging system.
- LastStored (128): Process value is the last value stored in the logging system.

Access

Read-write

Syntax

```
LoggedTagValueResult.Flags
```

See also

LoggedTagValueResult (Page 1321)

LoggedTagValueResult.Quality

Description

The "Quality" property returns the level of the quality of the process value.

Type

UInt32

Access

Read-write

Syntax

```
LoggedTagValueResult.Quality
```

See also

LoggedTagValueResult (Page 1321)

LoggedTagValueResult.TimeStamp

Description

The "TimeStamp" property returns the time stamp of the process value.

Type

DateTime

Access

Read-write

Syntax

```
LoggedTagValueResult.TimeStamp
```

See also

LoggedTagValueResult (Page 1321)

LoggedTagValueResult.Value

Description

The "Value" property returns the process value.

Type

Variant

Access

Read-write

Syntax

```
LoggedTagValueResult.Value
```

See also

LoggedTagValueResult (Page 1321)

LoggedTagSet

Description

The "LoggedTagSet" object ("HMILoggedTagSet" type) is a list of "LoggedTag" objects that provides optimized access to logging tags. After initialization of the "LoggedTagSet" object, you have read access to multiple logging tags in one call. Access demonstrates better performance and lower communication load than single access to multiple logging tags.

You create a new "LoggedTagSet" object with the "TagLogging.CreateLoggedTagSet" method.

The "LoggedTagSet" object can be counted and enumerated. You can access the "LoggedTagSet" list via the index or the logging tag name.

Object type

HMILoggedTagSet

Properties

The "LoggedTagSet" object has the following properties:

- **Count**
  Returns the number of elements of the "LoggedTagSet" list.
- **Error**
  Returns an error code for the last faulty read or write operation.

Methods

The "LoggedTagSet" object has the following methods:

- **Add()**
  Adds a logging tag to the "LoggedTagSet" list.
- **Clear()**
  Removes all logging tags from the "LoggedTagSet" list.
- **Item()**
  Returns a logging tag of the "LoggedTagSet" list.
- **Read()**
  Reads in all logging tags of the "LoggedTagSet" list.
- **Remove()**
  Removes a logging tag by its name from the "LoggedTagSet" list.

See also

TagLogging (Page 1313)

TagLogging.CreateLoggedTagSet() (Page 1314)

LoggedTag (Page 1315)

LoggedTagSet.Count

Description

The "Count" property returns the number of elements in the "LoggedTagSet" list.

Type

UInt32

Access

Read-only

Syntax

```
LoggedTagSet.Count
```

See also

LoggedTagSet (Page 1324)

LoggedTagSet.Error

Description

The "Error" property returns an error code for the last faulty read or write operation.

The value "0" is returned after a successful read or write operation. The error code always relates to the last method call of the object.

Evaluate the "Error" property for all objects of the "LoggedTagSet".

Type

ErrorCode

Access

Read-only

Syntax

```
LoggedTagSet.Error
```

See also

LoggedTagSet (Page 1324)

LoggedTagSet.Add()

Description

The "Add" method adds logging tags ("LoggedTag" objects) to the "LoggedTagSet" list. The logging tags are referenced using the name.

Syntax

```
LoggedTagSet.Add(loggedTags)
```

Parameters

`loggedTags`

Type: String, HMILoggedTag | String[], HMILoggedTag

Names of "LoggedTag" objects that are added to the list.

Note

No "LoggedTag" object can be transferred as a parameter. A "LoggedTag" object is referenced using the name.

Return value

Object[], HMILoggedTag[] (Page 1315)

See also

LoggedTag (Page 1315)

LoggedTagSet (Page 1324)

LoggedTagSet.Clear()

Description

The "Clear" method removes all logging tags ("LoggedTag" objects) from the "LoggedTagSet" list.

Syntax

```
LoggedTagSet.Clear()
```

Parameter

--

Return value

--

See also

LoggedTagSet (Page 1324)

LoggedTag (Page 1315)

LoggedTagSet.Item()

Description

The "Item()" method returns a "LoggedTag" object of the "LoggedTagSet" list.

Syntax

```
LoggedTagSet[.Item](name)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "LoggedTagSet" object.

Parameters

`name`

Type: String, HMILoggedTag | Int32, HMILoggedTag

Tag name or index number (1 ... n) of a "LoggedTag" object of the list.

Note

The index number does not describe the order in which the "LoggedTag" objects were added to the "LoggedTagSet" list.

Return

Object, HMILoggedTag (Page 1315)

See also

LoggedTagSet (Page 1324)

LoggedTag (Page 1315)

LoggedTagSet.Read()

Description

The "Read" method reads all logging tags ("LoggedTag" objects) from the "LoggedTagSet" list. The value, the Quality Code, the time stamp and context information of all logging tags are determined when the logging tag is read.

The method executes an asynchronous read operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the

successful (then()) and faulty (catch()) execution of the read operation. Depending on the result, after execution is complete, the corresponding handler of the Promise pattern is called with an array with "LoggedTagResult" object or an error code as parameter.

Syntax

```
LoggedTagSet.Read(dateFrom,dateTo,boundingValue)
.then(function(loggedTagArrayResult) {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

dateFrom

Type: DateTime

End date of the time period

dateTo

Type: DateTime

Start date of the time period

boundingValue

Type: Boolean

Specifies whether the limit values of the time period are transferred.

Return value

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  Object, HMILoggedTagResult[] (Page 1319) as parameter of the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler. This status only exists when all logging tags of the "LoggedTagSet" object could not be read.

See also

LoggedTagSet (Page 1324)

LoggedTag (Page 1315)

LoggedTagResult (Page 1319)

LoggedTagSet.Remove()

Description

The "Remove" method removes logging tags ("LoggedTag" objects) using their names from the "LoggedTagSet" list.

Syntax

```
LoggedTagSet.Remove(loggedTags)
```

Parameters

`loggedTags`

Type: String, HMILoggedTag | String[], HMILoggedTag

Removes a "LoggedTag" object from the "LoggedTagSet" list.

Note

No "LoggedTag" object can be transferred as a parameter. A "LoggedTag" object is referenced using the name.

Return value

LoggedTagSet (Page 1324)

LoggedTag (Page 1315)

LoggedTag

Description

LoggedTag (Page 1315)

LoggedTagResult

Description

LoggedTagResult (Page 1319)

SysFct

Description

The "SysFct" object ("HMITagLoggingSysFct" type) enables access to system functions of the "TagLogging" object.

Object type

HMITagLoggingSysFct

Properties

--

Methods

The "SysFct" object has the following methods:

- **ClearTagLog()**
  Deletes all logging tags in the specified logging system.
- **WriteManualValue()**
  Assigns a new value to the specified logging tag.

See also

TagLogging (Page 1313)

SysFct.ClearTagLog()

Description

The "ClearTagLog" method deletes the logged tags from the logging system whose name was passed via the parameter. The method removes all records from the specified logging system. All segments up to the current segment are deleted. The remaining segment is given a new start time.

Note

No automatic backup is created before the "ClearTagLog" method is executed.

The method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
HMIRuntime.TagLogging.SysFct.ClearTagLog(LogName)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
});
```

Parameters

LogName

Type: String, HMIDataLog

Name of the logging system from which the logging tags are deleted.

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler

See also

SysFct (Page 1331)

SysFct.WriteManualValue()

Description

The "WriteManualValue" method assigns a new value to the specified logging tag. The associated time stamp is transferred in this process.

Syntax

```
HMIRuntime.TagLogging.SysFct.WriteManualValue(LoggedTagName,Value,Ti
mestamp);
```

Parameter

LoggedTagName

Type: String, HMILoggedTag

Logging tag which is assigned the specified value.

`Value`

Type: Variant

Value assigned to the specified logging tag.

`Timestamp`

Type: DateTime

Time stamp assigned to the specified value.

Return value

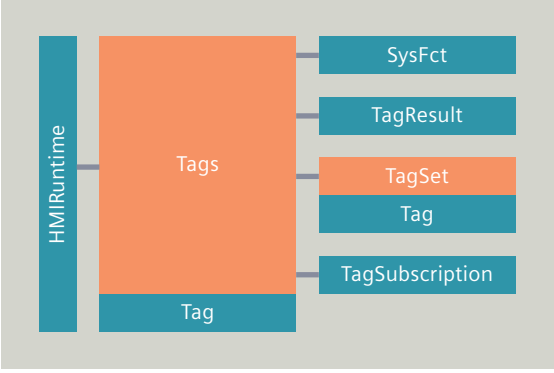
ErrorCode

See also

SysFct (Page 1331)

10.2.2.18 Tags

Description



The "Tags" object ("HMITags" type) enables access to HMI tags in runtime. By default, you reference a "Tag" object ("HMITag" type) through the "Tags" object. The "Tag" object gives you access to all properties and methods of the tags.

Use

Note

The "Tags" object is not a listing like, for example the objects "TagSet" or "AlarmSet", but rather a Factory. You create an instance of the "Tag" object via the tag name.

The "Tag" objects cannot be counted and enumerated like conventional lists.

The Tags object declares tags ("Tag" objects) for read and write access. The appropriate HMI tags must exist for the read and write access to be executed without errors.

To reduce the use of the "Tags" object, you can also use the alias `Tags` for `HMIRuntime.Tags`.

Object type

HMITags

Properties

--

Methods

The "Tags" object has the following methods:

- **CreateSubscription()**
  Creates a "TagSubscription" object for monitoring HMI tags
- **CreateTagSet()**
  Creates a new "TagSet" object.
- **Item()**
  Returns a new instance of a "Tag" object.

Tags.CreateSubscription()

Description

The "CreateSubscription" method creates a "TagSubscription" object ("HMITagSubscription" type). The "TagSubscription" returned object enables HMI tags to be monitored for change.

Syntax

```
Tags.CreateSubscription(tagNameArray, OnTag);
```

Parameters

`tagNameArray`

Type: String | String[], HMITag[]

Name or array of names of the monitored HMI tags.

`OnTag`

Type: Function, HMIOnTagCB

Callback function that is executed when HMI tags are changed.

Prototype of the callback function: `OnTag(tagResult)`

The "tagResult" parameter is an object of type "HMITagResult[]" that contains the properties of the changed HMI tags.

Return value

Object, HMITagSubscription (Page 1363)

Example

Monitor changes to HMI tags "HMI_Tag_1", "HMI_Tag_2", "HMI_Tag_3", and output names and changed values:

Copy code

```
let subs = HMIRuntime.Tags.CreateSubscription(['HMI_Tag_1', 'HMI_Tag_2',
'HMI_Tag_3'], function (TagArray) {
    for (let index in TagArray) {
        HMIRuntime.Trace("Tag Name_" + (index + 1) + " = " +
TagArray[index].Name);
        HMIRuntime.Trace("Tag Value_" + (index + 1) + "= " +
TagArray[index].Value);
    }
});
subs.Start();
```

See also

Tags (Page 1333)

TagResult (Page 1356)

TagSubscription (Page 1363)

Tags.CreateTagSet()

Description

The "CreateTagSet" method creates a new "TagSet" object ("HMITagSet" type). The "TagSet" object can be filled with one or more tags.

You use the returned "TagSet" object for read and write access to multiple tags.

Syntax

```
[HMIRuntime.]Tags.CreateTagSet([tagNameArray]);
```

Note

The `HMIRuntime.` part of the expression is not required. The alias `Tags` stands for `HMIRuntime.Tags`.

Parameters

`tagNameArray`

Optional, type: String, HMITag | String[], HMITag

Name of a tag or array with names of multiple tags that are added to the "TagSet" object. Without parameters, an empty "TagSet" object is created.

Return value

Object, HMITagSet (Page 1365)

Example

Create a "TagSet" object and add multiple objects "Tag" by their names:

Copy code

```
function TagSetCreate() {
   //Tags_Required: "Tag0"; "Tag1"; "Tag2"
   var tagnameArray = ["Tag0","Tag1","Tag2"];
   var ts = Tags.CreateTagSet(tagnameArray);
}
```

See also

Tags (Page 1333)

TagSet (Page 1365)

Tags.Item()

Description

The "Item" returns a new instance of a "Tag" object.

Syntax

```
[HMIRuntime.]Tags[.Item](tagName);
```

Note

The `HMIRuntime.` part of the expression is not required. The alias `Tags` stands for `HMIRuntime.Tags`.

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "Tags" object.

Parameters

`tagName`

Type: String, HMITag

Tag name of a "Tag" object.

Note

The "Tags" object is not a list, but rather a Factory. The "Tag" objects cannot be counted and enumerated like conventional lists. Tags are only referenced through their configured name.

Return value

Object, HMITag (Page 1338)

Example

Instantiate the "TankLevel" tag as the "Tag" object and assign it to the "level" tag:

Copy code

```
var level = HMIRuntime.Tags.Item("TankLevel");
```

or

Copy code

```
var level = Tags("TankLevel");
```

See also

Tags (Page 1333)

Tag (Page 1338)

Tag

Description

The "Tag" object (type "HMITag") represents an HMI tag in runtime. A "Tag" object is returned by the "Tags" object or the "TagSet" list. The "Tag" object gives you access to all properties and methods of a tag.

Object type

HMITag

Properties

The "Tag" object has the following properties:

- **ErrorDescription**
  Returns a description of the error code for the last faulty access.
- **LastError**
  Returns an error code for the last faulty read or write operation.
- **Name**
  Returns the name of the tag.
- **QualityCode**
  Returns the quality level of a tag value after reading a tag.
- **TimeStamp**
  Returns the time stamp of the last read operation.
- **Value**
  Specifies a value for the object being used or returns it.

Methods

The "Tag" object has the following methods:

- **Decrease()**
  Reduces the current tag value in the AS by the specified value.
- **Increase()**
  Increases the current tag value in the AS by the specified value.
- **Read()**
  Reads a tag ("Tag" object).
- **ResetBit()**
  Deletes a bit of the tag in the automation system.
- **SetBit()**
  Sets a bit of the tag in the AS.
- **Write()**
  Writes tag in the automation system.

- **WriteQCD()**
  Writes the value of the tag ("Tag" object).
- **WriteWithOperatorMessage()**
  Writes the values of the tag ("Tag" object) and then triggers an operator input alarm.

Values after initialization

The properties of the "Tag" object include the following values after successful initialization of the object:

Property	After successful initialization
Name	Tag name (unchanged)
Value	VT_EMPTY
QualityCode	BAD NON-SPECIFIC
TimeStamp	0
LastError	0
ErrorDescription	""

Values after a read operation

The properties of the "Tag" object include the following values after the last read operation:

Property	After successful read operation	After unsuccessful read operation
Name	Tag name (unchanged)	
Value	Current value of the tag	VT_EMPTY
QualityCode	Quality level	BAD OUT OF SERVICE
TimeStamp	Current time stamp of the tag	0
LastError	0	Error code of read operation
ErrorDescription	""	Description of the error code

Values after a write operation

The properties of the "Tag" object include the following values after the last write operation:

Property	After successful write operation	After unsuccessful write operation
Name	Tag name (unchanged)	
Value	Current value of the "Tag" object (unchanged)	
QualityCode	BAD OUT OF SERVICE	
TimeStamp	0	
LastError	0	Error code of write operation
ErrorDescription	""	Description of the error code

Tag.ErrorDescription

Description

The "ErrorDescription" property returns a description of the error code for the last faulty access.

Note

An empty string is returned after a successful read or write operation.

Type

String

Access

Read-only

Syntax

```
Tag.ErrorDescription
```

See also

Tag (Page 1338)

Tag.LastError

Description

The "LastError" property returns an error code for the last faulty read or write operation.

Note

The value "0" is returned after a successful read or write operation.

Type

ErrorCode

Access

Read-only

Syntax

```
Tag.LastError
```

See also

Tag (Page 1338)

Tag.Name

Description

The "Name" property returns the name of the tag ("Tag" object).

Type

String, HMITag

Access

Read-only

Syntax

```
Tag.Name
```

See also

Tag (Page 1338)

Tag.QualityCode

Description

The "QualityCode" property returns the level of the quality of a tag value after the reading of a tag.

The quality code has the binary 8-bit structure **QQSSSLL.** The first two positions (QQ) of the quality code define the quality of the tag value:

Quality	Description	Q	Q	S	S	S	S	L	L
Bad	Tag value cannot be used.	0	0	-	-	-	-	-	-
Uncertain	Quality of the tag value is worse than usual. However, it might still be possible to use the tag value.	0	1	-	-	-	-	-	-
Good (Non-Cascade)	Quality of the tag value is good. Attention should be paid to substatus.	1	0	-	-	-	-	-	-
Good (Cascade)	Quality of the tag value is good. Tag value could be used.	1	1	-	-	-	-	-	-

Positions 3 to 6 (SSSS) of the quality code specify the substatus of the quality. Positions 7 and 8 (LL) are optional and define possible limits.

Note

Directly after initializing a "Tag" object, the "BAD NON-SPECIFIC" value is returned. After a write operation or an incorrect read operation, the value "BAD OUT OF SERVICE" is returned.

Type

UInt32

Access

Read-write

Syntax

```
Tag.QualityCode
```

Quality code of tags

The realized quality codes are listed in the following table. The table begins with the worst quality code and ends with the best quality code. The best quality code has the lowest priority, while the worst quality has the highest priority. If several statuses occur simultaneously for a tag in the processing chain, the poorest code is passed on.

Code (hex)	Quality	Description	Q	Q	S	S	S	S	L	L
0x23	Bad	Device passivated - Diagnostic alerts inhibited	0	0	1	0	0	0	1	1
0x3F	Bad	Function check - Local override	0	0	1	1	1	1	1	1
0x1C	Bad	Out of Service - The value is not reliable because the block is not being evaluated, and may be under construction by a configurer. Set if the block mode is O/S.	0	0	0	1	1	1	-	-
0x73	Uncertain	Simulated value - Start	0	1	1	1	0	0	1	1
0x74	Uncertain	Simulated value - End	0	1	1	1	0	1	-	-
0x84	Good (Non-Cascade)	Active Update event - Set if the value is good and the block has an active Update event.	1	0	0	0	0	1	-	-
0x24	Bad	Maintenance alarm - More diagnostics available.	0	0	1	0	0	1	-	-
0x18	Bad	No Communication, with no usable value - Set if there has never been any communication with this value since it was last "Out of Service".	0	0	0	1	1	0	-	-
0x14	Bad	No Communication, with last usable value - Set if this value had been set by communication, which has now failed.	0	0	0	1	0	1	-	-

Code (hex)	Quality	Description	Q	Q	S	S	S	S	L	L
0x0C	Bad	Device Failure - Set if the source of the value is affected by a device failure.	0	0	0	0	1	1	-	-
0x10	Bad	Sensor failure	0	0	0	1	0	0	-	-
0x08	Bad	Not Connected - Set if this input is required to be connected and is not connected.	0	0	0	0	1	0	-	-
0x04	Bad	Configuration Error - Set if the value is not useful because there is some inconsistency regarding the parameterization or configuration, depending on what a specific manufacturer can detect.	0	0	0	0	0	1	-	-
0x00	Bad	Non-specific - There is no specific reason why the value is bad. Used for propagation.	0	0	0	0	0	0	-	-
0x28	Bad	Process related - Substitute value	0	0	1	0	1	0	-	-
0x2B	Bad	Process related - No maintenance	0	0	1	0	1	0	1	1
0x68	Uncertain	Maintenance demanded	0	1	1	0	1	0	-	-
0x60	Uncertain	Simulated value - Set when the process value is written by the operator while the block is in manual mode.	0	1	1	0	0	0	-	-
0x64	Uncertain	Sensor calibration	0	1	1	0	0	1	-	-
0x5C	Uncertain	Configuration error	0	1	0	1	1	1	-	-
0x58	Uncertain	Sub-normal	0	1	0	1	1	0	-	-
0x54	Uncertain	Engineering Unit Range Violation - Set if the value lies outside of the set of values defined for this parameter. The Limits define which direction has been exceeded.	0	1	0	1	0	1	-	-
0x50	Uncertain	Sensor conversion not accurate	0	1	0	1	0	0	-	-
0x4B	Uncertain	Substitute (constant)	0	1	0	0	1	0	1	1
0x78	Uncertain	Process related - No maintenance	0	1	1	1	1	0	-	-
0x4C	Uncertain	Initial Value - Value of volatile parameters during and after reset of the device or of a parameter.	0	1	0	0	1	1	-	-
0x48	Uncertain	Substitute value - Predefined value is used instead of the calculated one. This is used for fail safe handling.	0	1	0	0	1	0	-	-
0x44	Uncertain	Last Usable Value - Whatever was writing this value has stopped doing so. This is used for fail safe handling.	0	1	0	0	0	1	-	-
0x40	Uncertain	Non-specific - There is no specific reason why the value is uncertain.	0	1	0	0	0	0	-	-
0xE0	Good (Cascade)	Initiate Fail Safe (IFS) - The value is from a block that wants its downstream output block (e.g. AO) to go to Fail Safe.	1	1	1	0	0	0	-	-

Code (hex)	Quality	Description	Q	Q	S	S	S	S	L	L
0xD8	Good (Cascade)	Local Override (LO) - The value is from a block that has been locked out by a local key switch or is a Complex AO/DO with interlock logic active. The failure of normal control must be propagated to a function running in a host system for alarm and display purposes. This also implies "Not Invited".	1	1	0	1	1	0	-	-
0xD4	Good (Cascade)	Do Not Select (DNS) - The value is from a block which should not be selected, due to conditions in or above the block.	1	1	0	1	0	1	-	-
0xCC	Good (Cascade)	Not Invited (NI) - The value is from a block which does not have a target mode that would use this input.	1	1	0	0	1	1	-	-
0xC8	Good (Cascade)	Initialization Request (IR) - The value is an initialization value for a source (back calculation input parameter), because the lower loop is broken or the mode is wrong.	1	1	0	0	1	0	-	-
0xC4	Good (Cascade)	Initialization Acknowledge (IA) - The value is an initialized value from a source (cascade input, remote-cascade in, and remote-output in parameters).	1	1	0	0	0	1	-	-
0xC0	Good (Cascade)	OK - No error or special condition is associated with this value.	1	1	0	0	0	0	-	-
0xA0	Good (Non-Cascade)	Initiate fail safe	1	0	1	0	0	0	-	-
0x98	Good (Non-Cascade)	Unacknowledged Critical Alarm - Set if the value is good and the block has an unacknowledged Alarm with a priority greater than or equal to 8.	1	0	0	1	1	0	-	-
0x94	Good (Non-Cascade)	Unacknowledged Advisory Alarm - Set if the value is good and the block has an unacknowledged Alarm with a priority less than 8.	1	0	0	1	0	1	-	-
0x90	Good (Non-Cascade)	Unacknowledged Update event - Set if the value is good and the block has an unacknowledged Update event.	1	0	0	1	0	0	-	-
0x8C	Good (Non-Cascade)	Active Critical Alarm - Set if the value is good and the block has an active Alarm with a priority greater than or equal to 8.	1	0	0	0	1	1	-	-
0x88	Good (Non-Cascade)	Active Advisory Alarm - Set if the value is good and the block has an active Alarm with a priority less than 8.	1	0	0	0	1	0	-	-
0xA8	Good (Non-Cascade)	Maintenance demanded	1	0	1	0	1	0	-	-
0xA4	Good (Non-Cascade)	Maintenance required	1	0	1	0	0	1	-	-
0xBC	Good (Non-Cascade)	Function check - Local override	1	0	1	1	1	1	-	-
0x80	Good (Non-Cascade)	OK - No error or special condition is associated with this value.	1	0	0	0	0	0	-	-

Limit

The quality codes can be further subdivided by limits. Limits are optional.

Description	Q	Q	S	S	S	S	L	L
O.K. - The value is free to move.	-	-	-	-	-	-	0	0
Low limited - The value has acceded its low limits.	-	-	-	-	-	-	0	1
High limited - The value has acceded its high limits.	-	-	-	-	-	-	1	0
Constant (high and low limited) - The value cannot move, no matter what the process does.	-	-	-	-	-	-	1	1

Tag (Page 1338)

Tag.WriteQCD() (Page 1353)

Tag.TimeStamp

Description

The "TimeStamp" property returns or specifies the time stamp of the last read operation.

Note

After a write operation or an incorrect read operation, the value "0" is returned.

Type

DateTime

Access

Read-write

Syntax

```
Tag.TimeStamp
```

See also

Tag (Page 1338)

Tag.WriteQCD() (Page 1353)

Tag.Value

Description

The "Value" property specifies or returns the value of a tag.

Note

Immediately after initialization of a "Tag" object or an incorrect read operation, the value "VT_EMPTY" is returned.

Type

Variant

Access

Read-write

Syntax

```
Tag.Value
```

See also

Tag (Page 1338)

Tag.Decrease()

Description

The "Decrease" method reduces the current tag value in the automation system by the specified value. The value is written directly to the AS and not returned to the "Tag" object. If you need the changed tag value, execute a "Read" method.

The method prevents multiple transfer of the tag value for reading, calculating and writing.

The method executes an asynchronous write operation without blocking further script execution. In doing so, the method uses a Promise object, which has handlers for successful ("then()") and faulty ("catch()") execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern with the error code as parameter is called after the execution. In case of a successful execution, the handler will always receive the error code "0".

For the method to be executed, the value of the tags must be current and valid, the quality code must correspond to Good (cascade).

The following conditions must be met for external tags:

- the connection to the PLC is set up and
- the acquisition mode of the tags is "Cyclic in operation" and
- the tag is used by an object, e.g. an I/O field.

Syntax

```
Tag.Decrease(value)
.then(function(ErrorCode) {
    ...
})
.catch(function(ErrorCode) {
    ...
})
```

Parameters

value

Type: Float

Numerical value by which the current tag value is decreased in the AS.

Return value

Promise

Depending on the status of the Promise object:

- Promise successful (fulfilled)
  ErrorCode "0" as parameter of the "then()" handler
- Promise failed ("rejected")
  ErrorCode as parameter of the "catch()" handler

Tag (Page 1338)

Tag.Increase() (Page 1347)

SysFct.DecreaseTag() (Page 1383)

Tag.Increase()

Description

The "Increase" method increases the current tag value in the AS by the specified value. The value is written directly to the AS and not returned to the "Tag" object. If you need the changed tag value, execute a "Read-" method.

The method prevents multiple transfer of the tag value for reading, calculating and writing.

The method executes an asynchronous write operation without blocking further script execution. In doing so, the method uses a Promise object, which has handlers for successful ("then()") and faulty ("catch()") execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern with the error code as parameter is called after the execution. In case of a successful execution, the handler will always receive the error code "0".

For the method to be executed, the value of the tags must be current and valid, the quality code must correspond to Good (cascade).

The following conditions must be met for external tags:

- the connection to the PLC is set up and
- the acquisition mode of the tags is "Cyclic in operation" and
- the tag is used by an object, e.g. an I/O field.

Syntax

```
Tag.Increase(value)
.then(function(ErrorCode) {
    ...
})
.catch(function(ErrorCode) {
    ...
})
```

Parameters

value

Type: Float

Numerical value by which the current tag value is increased in the AS.

Return value

Promise

Depending on the status of the Promise object:

- Promise successful (fulfilled)
  ErrorCode "0" as parameter of the "then()" handler
- Promise failed ("rejected")
  ErrorCode as parameter of the "catch()" handler

See also

Tag (Page 1338)

Tag.Decrease() (Page 1346)

SysFct.IncreaseTag() (Page 1384)

Tag.Read()

Description

The "Read" method reads a tag ("Tag" object). The value, the Quality Code and the time stamp of the tag are determined when the tag is read.

The tags are either read from the tag image (cache) or directly from the AS. When the tag image is used, the method registers all tags that are not yet registered. You should use the tag image for cyclic readout of tags. If you do not need the tag value cyclically or the update cycle of the tag is too long, use direct readout (hmiReadDirect).

The method executes a synchronous read operation. When completed, you can use the "" properties "LastError" and "ErrorDescription" to determine if the execution was successful.

Syntax

```
Tag.Read([readType])
```

Parameters

readType

Optional, type: Int32, hmiReadType

Origin of the tag values:

- hmiReadCache (0) or empty
  Reads the tag value from the tag image. If no registration exists, the tag is registered. For high-performance access, define the used tags as triggers of the script.
- hmiReadDirect (1)
  Reads the tag value directly from the AS. The tag image is not used.

Return value

Variant

See also

Tag (Page 1338)

Tag.ResetBit()

Description

The "ResetBit" method deletes a bit of the tag in the AS. The bit of the tag is written directly to the AS and not returned to the "Tag" object. If you need the changed tag value, execute a "Read" method.

The method prevents multiple transfer of the tag value for reading, calculating and writing.

The method executes an asynchronous write operation without blocking further script execution. In doing so, the method uses a Promise object, which has handlers for successful ("then()") and faulty ("catch()") execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern with the error code as parameter is called after the execution. In case of a successful execution, the handler will always receive the error code "0".

For the method to be executed, the value of the tags must be current and valid, the quality code must correspond to Good (cascade).

The following conditions must be met for external tags:

- the connection to the PLC is set up and
- the acquisition mode of the tags is "Cyclic in operation" and
- the tag is used by an object, e.g. an I/O field.

Syntax

```
Tag.ResetBit(BitNumber)
.then(function(ErrorCode) {
    ...
})
.catch(function(ErrorCode) {
    ...
})
```

Parameters

`BitNumber`

Type: UInt8, value range: 0-63, depending on the data type of the tag

Bit of tag which is set to "0" (False).

Return value

Promise

Depending on the status of the Promise object:

- Promise successful (fulfilled)
  ErrorCode "0" as parameter of the "then()" handler
- Promise failed ("rejected")
  ErrorCode as parameter of the "catch()" handler

See also

Tag (Page 1338)

Tag.SetBit() (Page 1351)

SysFct.ResetBitInTag() (Page 1385)

Tag.SetBit()

Description

The "SetBit" method sets a bit of the tag in the AS. The bit of the tag is written directly to the AS and not returned to the "Tag" object. If you need the changed tag value, execute a "Read" method.

The method prevents multiple transfer of the tag value for reading, calculating and writing.

The method executes an asynchronous write operation without blocking further script execution. In doing so, the method uses a Promise object, which has handlers for successful ("then()") and faulty ("catch()") execution of the write operation. Depending on the result, the corresponding handler of the Promise pattern with the error code as parameter is called after the execution. In case of a successful execution, the handler will always receive the error code "0".

For the method to be executed, the value of the tags must be current and valid, the quality code must correspond to Good (cascade).

The following conditions must be met for external tags:

- the connection to the PLC is set up and
- the acquisition mode of the tags is "Cyclic in operation" and
- the tag is used by an object, e.g. an I/O field.

Syntax

```
Tag.SetBit(BitNumber)
.then(function(ErrorCode) {
    ...
})
.catch(function(ErrorCode) {
    ...
})
```

Parameters

`BitNumber`

Type: UInt8, value range: 0-63, depending on the data type of the tag

Bit of the tag that is set to "1" (TRUE).

Return value

Promise

Depending on the status of the Promise object:

- Promise successful (fulfilled)
  ErrorCode "0" as parameter of the "then()" handler
- Promise failed ("rejected")
  ErrorCode as parameter of the "catch()" handler

Tag.ResetBit() (Page 1350)

SysFct.SetBitInTag() (Page 1386)

Tag.Write()

Description

The "Write" method writes the values of the tag ("Tag" object). You must first set the values of the individual tags with the "Value" property. The value of the "Value" property does not have to be the current value of the tag after the write operation is complete. If you want to update the information for the tags, execute a "Read" method.

The Tag.Write method works asynchronously. The Tag.Read method may return unexpected results if the processing of a preceding Write call is not yet complete.

If the method waits for the write operation to be completed ("hmiWriteWait"), the properties "LastError" and "ErrorDescription" are also written for each tag. This enables you to determine if the execution was successful. If you need the result of the write operation without blocking the script execution, use the "WriteAsync" method of the "TagSet" object.

The properties "QualityCode" and "TimeStamp" of the tags are not determined during writing.

The tags are written directly to the AS. The tag image and the process image are not used by the method.

Syntax

```
Tag.Write([value],[writeType])
```

Parameters

value

Optional, type: Variant

Writes the tag value:

- Specify value
  The specified value overwrites the current value of the "Value" property of the tag.
- Without value
  The current value of the "Value" property of the tag is written.

writeType

Optional, type: Int32, hmiWriteType

Specifies if the method waits for the write operation to be completed:

- hmiWriteNoWait (0) or empty
  Writes the tag value without waiting. Errors for the write operation are not detected.
- hmiWriteWait (1)
  Waits until the tag value is written in the AS. The properties "LastError" and "ErrorDescription" of the tags are written.

Return value

ErrorCode

See also

Tag (Page 1338)

Tag.WriteQCD() (Page 1353)

Tag.WriteWithOperatorMessage() (Page 1354)

Tag.WriteQCD()

Description

The "WriteQCD" method writes the value of an internal tag ("Tag" object), including its quality code and time stamp, both synchronously and asynchronously.

When you call the method for an external tag, it writes the quality code and time stamp predefined by the system, not the one defined by the user.

Use this method to import already logged tag values from a runtime system to WinCC Unified.

Syntax

```
Tag.WriteQCD([value],[writeType],[TimeStamp],[QualityCode])
```

Parameters

`value`

Optional, type: Variant

Writes the tag value.

`writeType`

Optional, type: Int32, hmiWriteType

Specifies if the method waits for the write operation to be completed:

- hmiWriteNoWait (0) or empty
  Writes the tag value without waiting. Errors for the write operation are not detected.
- hmiWriteWait (1)
  Waits until the tag value is written in the AS. The properties "LastError" and "ErrorDescription" of the tags are written.

`TimeStamp`

Optional, type: DateTime

Writes the time stamp.

`QualityCode`

Optional, type: UInt32

Writes the quality code.

Return value

ErrorCode

See also

Tag (Page 1338)

Tag.QualityCode (Page 1341)

Tag.TimeStamp (Page 1345)

Tag.Write() (Page 1352)

Tag.WriteWithOperatorMessage() (Page 1354)

Tag.WriteWithOperatorMessage()

Description

The "WriteWithOperatorMessage" method writes the values of the tag ("Tag" object) and then triggers an operator input alarm. The value of the "Value" property does not have to be the current value of the tags after the write operation is complete. If you want to update the information for the tags, execute a "Read" method.

The triggered operator input alarm contains the reason for the value change, the old and new value, the user and host name and the unit.

Once the write operation is completed, the properties "LastError" and "ErrorDescription" are also written for each tag. This enables you to determine if the execution was successful.

The properties "QualityCode" and "TimeStamp" of the tags are not determined during writing.

The tags are written directly to the AS. The tag image and the process image are not used by the method.

Syntax

```
Tag.WriteWithOperatorMessage(value,reason)
```

Parameters

value

Type: Variant

Tag value. The specified value overwrites the current value of the "Value" property of the tags.

reason

Type: String

Reason for the value change of the triggered alarm.

Return value

ErrorCode

Example

Write a tag and then output the operator input alarm "Reason":

Copy code

```
var tag1 = Tags("Tag1");
var err = tag1.WriteWithOperatorMessage(5000,"Reason");
```

Tag.WriteQCD() (Page 1353)

TagResult

Description

The "TagResult" object represents the result of a changed HMI tag.

Object type

HMITagResult

Properties

The "TagResult" object has the following properties:

- **ErrorDescription**
  Returns a description of the error code for the last faulty access.
- **LastError**
  Returns an error code for the last faulty read or write operation.
- **Name**
  Returns the name of the tag.
- **QualityCode**
  Returns the quality level of a tag value after reading a tag.
- **TimeStamp**
  Returns the time stamp of the last read operation.
- **Value**
  Specifies or returns a value, depending on the object being used.

Methods

--

TagResult.ErrorDescription

Description

The "ErrorDescription" property returns a description of the error code for the last faulty access.

Note

An empty string is returned after a successful read or write operation.

Type

String

Access

Read-only

Syntax

```
TagResult.ErrorDescription
```

See also

TagResult (Page 1356)

TagResult.LastError

Description

The "LastError" property returns an error code for the last faulty read or write operation.

Note

The value "0" is returned after a successful read or write operation.

Type

ErrorCode

Access

Read-only

Syntax

```
TagResult.LastError
```

See also

TagResult (Page 1356)

TagResult.Name

Description

The "Name" property returns the name of the tag ("Tag" object).

Type

String, HMITag

Access

Read-only

Syntax

```
TagResult.Name
```

See also

TagResult (Page 1356)

TagResult.QualityCode

Description

The "QualityCode" property returns the quality level of a tag value after reading a tag.

The quality code has the binary 8-bit structure **QQSSSLL.** The first two positions (QQ) of the quality code define the quality of the tag value:

Quality	Description	Q	Q	S	S	S	S	L	L
Bad	Tag value cannot be used.	0	0	-	-	-	-	-	-
Uncertain	Quality of the tag value is worse than usual. However, it might still be possible to use the tag value.	0	1	-	-	-	-	-	-
Good (Non-Cascade)	Quality of the tag value is good. Attention should be paid to substatus.	1	0	-	-	-	-	-	-
Good (Cascade)	Quality of the tag value is good. Tag value could be used.	1	1	-	-	-	-	-	-

Positions 3 to 6 (SSSS) of the quality code specify the substatus of the quality. Positions 7 and 8 (LL) are optional and define possible limits.

Note

Directly after initializing a "Tag" object, the "BAD NON-SPECIFIC" value is returned. After a write operation or an incorrect read operation, the value "BAD OUT OF SERVICE" is returned.

Type

UInt32

Access

Read-write

Syntax

```
TagResult.QualityCode
```

Quality code of tags

The implemented quality codes are listed in the following table. The table begins with the worst quality code and ends with the best quality code. The best quality code has the lowest priority, while the worst quality has the highest priority. If multiple statuses occur simultaneously for a tag in the processing chain, the poorest code is passed on.

Code (hex)	Quality	Description	Q	Q	S	S	S	S	L	L
0x23	Bad	Device passivated - Diagnostic alerts inhibited	0	0	1	0	0	0	1	1
0x3F	Bad	Function check - Local override	0	0	1	1	1	1	1	1
0x1C	Bad	Out of Service - The value is not reliable because the block is not being evaluated, and may be under construction by a configurer. Set if the block mode is O/S.	0	0	0	1	1	1	-	-
0x73	Uncertain	Simulated value - Start	0	1	1	1	0	0	1	1
0x74	Uncertain	Simulated value - End	0	1	1	1	0	1	-	-
0x84	Good (Non-Cascade)	Active Update event - Set if the value is good and the block has an active Update event.	1	0	0	0	0	1	-	-
0x24	Bad	Maintenance alarm - More diagnostics available.	0	0	1	0	0	1	-	-
0x18	Bad	No Communication, with no usable value - Set if there has never been any communication with this value since it was last "Out of Service".	0	0	0	1	1	0	-	-
0x14	Bad	No Communication, with last usable value - Set if this value had been set by communication, which has now failed.	0	0	0	1	0	1	-	-
0x0C	Bad	Device Failure - Set if the source of the value is affected by a device failure.	0	0	0	0	1	1	-	-
0x10	Bad	Sensor failure	0	0	0	1	0	0	-	-
0x08	Bad	Not Connected - Set if this input is required to be connected and is not connected.	0	0	0	0	1	0	-	-
0x04	Bad	Configuration Error - Set if the value is not useful because there is some inconsistency regarding the parameterization or configuration, depending on what a specific manufacturer can detect.	0	0	0	0	0	1	-	-
0x00	Bad	Non-specific - There is no specific reason why the value is bad. Used for propagation.	0	0	0	0	0	0	-	-
0x28	Bad	Process related - Substitute value	0	0	1	0	1	0	-	-
0x2B	Bad	Process related - No maintenance	0	0	1	0	1	0	1	1
0x68	Uncertain	Maintenance demanded	0	1	1	0	1	0	-	-
0x60	Uncertain	Simulated value - Set when the process value is written by the operator while the block is in manual mode.	0	1	1	0	0	0	-	-
0x64	Uncertain	Sensor calibration	0	1	1	0	0	1	-	-

Code (hex)	Quality	Description	Q	Q	S	S	S	S	L	L
0x5C	Uncertain	Configuration error	0	1	0	1	1	1	-	-
0x58	Uncertain	Sub-normal	0	1	0	1	1	0	-	-
0x54	Uncertain	Engineering Unit Range Violation - Set if the value lies outside of the set of values defined for this parameter. The Limits define which direction has been exceeded.	0	1	0	1	0	1	-	-
0x50	Uncertain	Sensor conversion not accurate	0	1	0	1	0	0	-	-
0x4B	Uncertain	Substitute (constant)	0	1	0	0	1	0	1	1
0x78	Uncertain	Process related - No maintenance	0	1	1	1	1	0	-	-
0x4C	Uncertain	Initial Value - Value of volatile parameters during and after reset of the device or of a parameter.	0	1	0	0	1	1	-	-
0x48	Uncertain	Substitute value - Predefined value is used instead of the calculated one. This is used for fail safe handling.	0	1	0	0	1	0	-	-
0x44	Uncertain	Last Usable Value - Whatever was writing this value has stopped doing so. This is used for fail safe handling.	0	1	0	0	0	1	-	-
0x40	Uncertain	Non-specific - There is no specific reason why the value is uncertain.	0	1	0	0	0	0	-	-
0xE0	Good (Cascade)	Initiate Fail Safe (IFS) - The value is from a block that wants its downstream output block (e.g. AO) to go to Fail Safe.	1	1	1	0	0	0	-	-
0xD8	Good (Cascade)	Local Override (LO) - The value is from a block that has been locked out by a local key switch or is a Complex AO/DO with interlock logic active. The failure of normal control must be propagated to a function running in a host system for alarm and display purposes. This also implies "Not Invited".	1	1	0	1	1	0	-	-
0xD4	Good (Cascade)	Do Not Select (DNS) - The value is from a block which should not be selected, due to conditions in or above the block.	1	1	0	1	0	1	-	-
0xCC	Good (Cascade)	Not Invited (NI) - The value is from a block which does not have a target mode that would use this input.	1	1	0	0	1	1	-	-
0xC8	Good (Cascade)	Initialization Request (IR) - The value is an initialization value for a source (back calculation input parameter), because the lower loop is broken or the mode is wrong.	1	1	0	0	1	0	-	-
0xC4	Good (Cascade)	Initialization Acknowledge (IA) - The value is an initialized value from a source (cascade input, remote-cascade in, and remote-output in parameters).	1	1	0	0	0	1	-	-
0xC0	Good (Cascade)	OK - No error or special condition is associated with this value.	1	1	0	0	0	0	-	-
0xA0	Good (Non-Cascade)	Initiate fail safe	1	0	1	0	0	0	-	-

Code (hex)	Quality	Description	Q	Q	S	S	S	S	L	L
0x98	Good (Non-Cascade)	Unacknowledged Critical Alarm - Set if the value is good and the block has an unacknowledged Alarm with a priority greater than or equal to 8.	1	0	0	1	1	0	-	-
0x94	Good (Non-Cascade)	Unacknowledged Advisory Alarm - Set if the value is good and the block has an unacknowledged Alarm with a priority less than 8.	1	0	0	1	0	1	-	-
0x90	Good (Non-Cascade)	Unacknowledged Update event - Set if the value is good and the block has an unacknowledged Update event.	1	0	0	1	0	0	-	-
0x8C	Good (Non-Cascade)	Active Critical Alarm - Set if the value is good and the block has an active Alarm with a priority greater than or equal to 8.	1	0	0	0	1	1	-	-
0x88	Good (Non-Cascade)	Active Advisory Alarm - Set if the value is good and the block has an active Alarm with a priority less than 8.	1	0	0	0	1	0	-	-
0xA8	Good (Non-Cascade)	Maintenance demanded	1	0	1	0	1	0	-	-
0xA4	Good (Non-Cascade)	Maintenance required	1	0	1	0	0	1	-	-
0xBC	Good (Non-Cascade)	Function check - Local override	1	0	1	1	1	1	-	-
0x80	Good (Non-Cascade)	OK - No error or special condition is associated with this value.	1	0	0	0	0	0	-	-

Limit

The quality codes can be further subdivided by limits. Limits are optional.

Description	Q	Q	S	S	S	S	L	L
O.K. - The value is free to move.	-	-	-	-	-	-	0	0
Low limited - The value has acceded its low limits.	-	-	-	-	-	-	0	1
High limited - The value has acceded its high limits.	-	-	-	-	-	-	1	0
Constant (high and low limited) - The value cannot move, no matter what the process does.	-	-	-	-	-	-	1	1

TagResult (Page 1356)

TagResult.TimeStamp

Description

The "TimeStamp" property returns or specifies the time stamp of the last read operation.

Note

After a write operation or an incorrect read operation, the value "0" is returned.

Type

DateTime

Access

Read-write

Syntax

```
TagResult.TimeStamp
```

TagResult (Page 1356)

TagSubscription

Description

The "TagSubscription" object enables HMI tags to be monitored for change.

Use

The "AlarmSubscription" object represents a selection of active alarms. A "TagSubscription" object is initialized through the "CreateSubscription" method of the "Tags" object.

Object type

HMITagSubscription

Properties

--

Methods

The "TagSubscription" object has the following methods:

- **Start()**
  Activates monitoring of HMI tags of the "TagSubscription" object.
- **Stop()**
  Stops monitoring of HMI tags of the "TagSubscription" object.

TagSubscription.Start()

Description

The "Start" method activates the monitoring of HMI tags of the "TagSubscription" object.

Syntax

```
TagSubscription.Start();
```

Parameters

--

Return value

ErrorCode

Example

Monitor changes to the "HMI_Tag_1" and "HMI_Tag_1" tags:

Copy code

```
const subs = HMIRuntime.Tags.CreateSubscription(['HMI_Tag_1', 'HMI_Tag_2'], (changedTags)
=> {
   for (const tag of changedTags) {
          HMIRuntime.Trace(`Tag ${tag.Name} value updated to ${tag.Value}`);
   }
   subs.Stop();
});
subs.Start();
```

See also

TagSubscription (Page 1363)

TagSubscription.Stop() (Page 1364)

TagSubscription.Stop()

Description

The "Stop" method terminates the monitoring of HMI tags of the "TagSubscription" object.

Syntax

```
TagSubscription.Stop();
```

Parameters

--

Return value

ErrorCode

Example

Stop monitoring the changes to the "HMI_Tag_1" and "HMI_Tag_1" tags:

Copy code

```
const subs = HMIRuntime.Tags.CreateSubscription(['HMI_Tag_1', 'HMI_Tag_2'], (changedTags)
=>
   {
   for(const tag of changedTags)
      {
      HMIRuntime.Trace(`Tag ${tag.Name} value updated to ${tag.Value}`);
      }
   subs.Stop();
   });
subs.Start();
```

TagSubscription (Page 1363)

TagSubscription.Start() (Page 1363)

TagSet

Description

The "TagSet" object ("HMITagSet" type) is a list of "Tag" objects that provides optimized access to tags in runtime. After initialization of the "TagSet" object, you can execute read and write access to multiple tags in one call. Access demonstrates better performance and lower communication load than single access to multiple tags.

You reference a "TagSet" object through the "Tags" object or create a new "TagSet" object with the "Tags.CreateTagSet" method.

By default, you access a "Tag" object (type "HMITag") through the "TagSet" object. The "Tag" object gives you access to all properties and methods of the tags.

Use

The "TagSet" object is a list and can be counted and enumerated. You can access the "TagSet" list using the index or the tag name.

The appropriate HMI tags must exist for the read and write access to tags ("Tag" objects) of the list to be executed without errors. If a read or write access error has occurred, can be read out with the properties "LastError" and "ErrorDescription" once the methods have been executed.

Object type

HMITagSet

Properties

The "TagSet" object has the following properties:

- **Count**
  Returns the number of elements of the "TagSet" list.
- **ErrorDescription**
  Returns a description of the error code for the last faulty access.
- **LastError**
  Returns an error code for the last faulty read or write operation.

Methods

The "TagSet" object has the following methods:

- **Add()**
  Adds a tag to the "TagSet" list.
- **Clear()**
  Removes all tags from the "TagSet" list.
- **Item()**
  Returns a tag of the "TagSet" list.
- **Read()**
  Reads in all tags of the "TagSet" list.
- **ReadAsync()**
  Reads in all tags of the "TagSet" list (asynchronous).
- **ReadMaxAge()**
  Reads in all tags of the "TagSet" list and ensures that these are not older than the specified time period (maxAge).
- **Remove()**
  Removes a tag by its name from the "TagSet" list.
- **Write()**
  Writes the values of all tags of the "TagSet" list.
- **WriteAsync()**
  Writes the values of all tags of the "TagSet" list (asynchronous).
- **WriteAsyncQCD()**
  Writes the values of all tags in the "TagSet" list, including their quality code and time stamps (asynchronous).
- **WriteQCD()**
  Writes the values of all tags in the "TagSet" list, including their quality code and time stamps.
- **WriteWithOperatorMessage()**
  Writes the values of all tags of the "TagSet" list and then triggers an operator input alarm for each tag.

TagSet.Count

Description

The "Count" property returns the number of elements in the "TagSet" list.

Type

UInt32

Access

Read-only

Syntax

```
TagSet.Count
```

See also

TagSet (Page 1365)

TagSet.ErrorDescription

Description

The "ErrorDescription" property returns a description of the error code for the last faulty access. The description of the error code of the last method call is returned.

Note

An empty string is returned after a successful read or write operation.

Type

String

Access

Read-only

Syntax

```
TagSet.ErrorDescription
```

See also

TagSet (Page 1365)

TagSet.LastError

Description

The "LastError" property returns an error code for the last faulty read or write operation. The error code for the last method call is returned.

Note

The value "0" is returned after a successful read or write operation.

Type

ErrorCode

Access

Read-only

Syntax

```
TagSet.LastError
```

Note

Evaluate the "LastError" property for all objects of the TagSet.

See also

TagSet (Page 1365)

TagSet.Add()

Description

The "Add" method adds a tag ("Tag" object) to the "TagSet" list. The tags are referenced by the name.

Syntax

```
TagSet.Add(tag)
```

Parameters

tag

Type: String, HMITag | String[], HMITag | Variant[][], HMITag

Names of "Tag" objects that are added to the list.

Note

No "Tag" object can be transferred as a parameter. A "Tag" object is referenced using the name.

Return value

Object[], HMITag (Page 1338)

See also

Tag (Page 1338)

TagSet (Page 1365)

TagSet.Clear()

Description

The "Clear" method removes all tags ("Tag" objects) from the "TagSet" list.

Syntax

```
TagSet.Clear()
```

Parameter

--

Return value

--

See also

TagSet (Page 1365)

TagSet.Remove() (Page 1374)

TagSet.Item()

Description

The "Item" method returns a "Tag" object of the "TagSet" list.

Syntax

```
TagSet[.Item](name)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "TagSet" object.

Parameter

`name`

Type: String, HMITag | Int32, HMITag

Tag name or index number (1...n) of a "Tag" object in the list

Note

The index number of a "Tag" object does not represent the order in which the "Tag" objects were added to the TagSet list.

Return value

Object, HMITag (Page 1338)

See also

Tag (Page 1338)

TagSet (Page 1365)

TagSet.Read()

Description

The "Read" method reads in all tags ("Tag" objects) of the "TagSet" list. The value, the Quality Code and the time stamp of all tags are determined when the tag is read.

The tags are either read from the tag image (cache) or directly from the AS. When the tag image is used, the method registers all tags that are not yet registered. You should use the

tag image for cyclic readout of tags. If you do not need the tag value cyclically or the update cycle of the tag is too long, use direct readout (hmiReadDirect).

The method executes a synchronous read operation. When completed, you can use the "TagSet" properties "LastError" and "ErrorDescription" to determine if the execution was successful.

Syntax

```
TagSet.Read([readType])
```

Parameter

readType

Optional, type: Int32, hmiReadType

Origin of the tag values:

- hmiReadCache (0) or empty
  Reads the tag value from the tag image. If no registration exists, the tag is registered. For high-performance access, define the used tags as triggers of the script.
- hmiReadDirect (1)
  Reads the tag value directly from the AS. The tag image is not used.

Return value

--

See also

TagSet (Page 1365)

TagSet.ReadAsync() (Page 1371)

TagSet.ReadMaxAge() (Page 1373)

TagSet.ReadAsync()

Description

The "ReadAsync" method reads in all tags ("Tag" objects) of the "TagSet" list. The value, the Quality Code and the time stamp of all tags are determined when the tag is read.

The tags are either read from the tag image (cache) or directly from the AS. When the tag image is used, the method registers all tags that are not yet registered. You should use the tag image for cyclic readout of tags. If you do not need the tag value cyclically or the update cycle of the tag is too long, use direct readout (hmiReadDirect).

The method executes an asynchronous read operation without blocking further script execution. In doing so, the method uses a Promise object, which has handlers for successful ("then()") and faulty ("catch()") execution of the read operation. Depending on the result,

once execution is complete the corresponding handler of the Promise pattern is called with the "TagSet" object or the error code as parameter.

Syntax

```
TagSet.ReadAsync([readType])
.then(function(HMITagSet) {
    ...
})
.catch(function(ErrorCode) {
    ...
})
```

Parameters

readType

Optional, type: Int32, hmiReadType

Origin of the tag values:

- hmiReadCache (0) or empty
  Reads the tag value from the tag image. If no registration exists, the tag is registered. For high-performance access, define the used tags as triggers of the script.
- hmiReadDirect (1)
  Reads the tag value directly from the AS. The tag image is not used.

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled
  Object, HMITagSet (Page 1365) as parameter of the "then()" handler.
- Promise failed (rejected)
  ErrorCode as parameter of the "catch()" handler. This status only exists when all tags of the "TagSet" object could not be read.

See also

TagSet (Page 1365)

TagSet.Read() (Page 1370)

TagSet.ReadMaxAge() (Page 1373)

TagSet.ReadMaxAge()

Description

The "ReadMaxAge" method reads in all tags ("Tag" objects) of the "TagSet" list and ensures that these are not older than the specified time period (maxAge). The value, the Quality Code and the time stamp of all tags are determined when the tag is read.

The tags are read either from the process image (maxAge > 0) or directly from the AS (maxAge = 0). The method does not use the tag image and does not register tags. You should not use this method for cyclic readout of tags.

The method executes an asynchronous read operation without blocking further script execution. In doing so, the method uses a Promise object, which has handlers for successful ("then()") and faulty ("catch()") execution of the read operation. Depending on the result, once execution is complete the corresponding handler of the Promise pattern is called with the "TagSet" object or the error code as parameter.

Syntax

```
TagSet.ReadMaxAge(maxAge)
.then(function(HMITagSet) {
    ...
})
.catch(function(ErrorCode) {
    ...
})
```

Parameters

maxAge

Type: UInt32

Time interval in milliseconds after which a tag value must be updated.

- maxAge = 0
  Read tag value immediately directly from the AS.
- maxAge > 0
  Read tag value from process image according to time stamp.

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled
  Object, HMITagSet (Page 1365) as parameter of the "then()" handler.
- Promise failed (rejected)
  ErrorCode as parameter of the "catch()" handler. This status only exists when all tags of the "TagSet" object could not be read.

See also

TagSet (Page 1365)

TagSet.Read() (Page 1370)

TagSet.ReadAsync() (Page 1371)

TagSet.Remove()

Description

The "Remove" method removes tags ("Tag" objects) using their names from the "TagSet" list.

Syntax

```
TagSet.Remove(tag)
```

Parameters

tag

Type: String, HMITag | String[], HMITag | Variant[][], HMITag

Removes a "Tag" object from the "TagSet" list.

Note

No "Tag" object can be transferred as a parameter. A "Tag" object is referenced using the name.

Return value

--

See also

TagSet (Page 1365)

TagSet.Clear() (Page 1369)

TagSet.Write()

Description

The "Write" method writes the values of all tags ("Tag" objects) of the "TagSet" list. You must first set the values of the individual tags with the "Value" property. The value of the "Value" property must not correspond to the actual value of the tag once the write operation is complete. If you want to update the information for the tags, execute a "Read" method.

If the method waits for the write operation to be completed ("hmiWriteWait"), the properties "LastError" and "ErrorDescription" are also written for each tag. This enables you to determine if the execution was successful. If you need the result of the write operation without blocking the script execution, use the "WriteAsync" method.

The properties "QualityCode" and "TimeStamp" of the tags are not determined during writing.

The tags are written directly to the AS. The tag image and the process image are not used by the method.

Syntax

```
TagSet.Write([writeType])
```

Parameters

writeType

Optional, type: Int32, hmiWriteType

Specifies if the method waits for the write operation to be completed:

- hmiWriteNoWait (0) or empty
  Writes the tag value without waiting. Errors for the write operation are not detected.
- hmiWriteWait (1)
  Waits until the tag value is written in the AS. The properties "LastError" and "ErrorDescription" of the tags are written.

Return value

--

See also

TagSet (Page 1365)

TagSet.WriteAsync() (Page 1375)

TagSet.WriteAsyncQCD() (Page 1377)

TagSet.WriteQCD() (Page 1378)

TagSet.WriteWithOperatorMessage() (Page 1379)

TagSet.WriteAsync()

Description

The "WriteAsync" method writes the values of all tags ("Tag" objects) of the "TagSet" list. You must first set the values of the individual tags with the "Value" property. The value of the "Value" property must not correspond to the actual value of the tag once the write operation is complete. If you want to update the information for the tags, execute a "Read" method.

If the method waits for the write operation to be completed ("hmiWriteWait"), the properties "LastError" and "ErrorDescription" are written for each tag. This enables you to determine if the execution was successful.

The properties "QualityCode" and "TimeStamp" of the tags are not determined during writing.

The tags are written directly to the AS. The tag image and the process image are not used by the method.

The method executes an asynchronous write operation without blocking further script execution. In doing so, the method uses a Promise object, which has handlers for successful ("then()") and faulty ("catch()") execution of the write operation. Depending on the result, once execution is complete the corresponding handler of the Promise pattern is called with the "TagSet" object or the error code as parameter. An execution is only faulty ("Promise rejected") when none of the tags of the "TagSet" object could be written.

Syntax

```
TagSet.WriteAsync([writeType])
.then(function(HMITagSet) {
    ...
})
.catch(function(ErrorCode) {
    ...
})
```

Parameters

`writeType`

Optional, type: Int32, hmiWriteType

Specifies if the method waits for the write operation to be completed:

- hmiWriteNoWait (0) or empty
  Writes the tag value without waiting. Errors for the write operation are not detected.
- hmiWriteWait (1)
  Waits until the tag value is written in the AS. The properties "LastError" and "ErrorDescription" of the tags are written.

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled
  Object, HMITagSet (Page 1365) as parameter of the "then()" handler.
- Promise failed (rejected)
  ErrorCode as parameter of the "catch()" handler. This status only exists when none of the tags of the "TagSet" object could be written.

See also

TagSet (Page 1365)

TagSet.Write() (Page 1374)

TagSet.WriteAsyncQCD() (Page 1377)

TagSet.WriteQCD() (Page 1378)

TagSet.WriteWithOperatorMessage() (Page 1379)

TagSet.WriteAsyncQCD()

Description

The "WriteAsync" method writes the values of all tags ("Tag" objects) of the "TagSet" list, including their quality code and time stamps.

You must first set the values of the individual tags with the "Value" property. The value of the "Value" property must not correspond to the actual value of the tag once the write operation is complete. If you want to update the information for the tags, execute a "Read" method.

If the method waits for the write operation to be completed ("hmiWriteWait"), the properties "LastError" and "ErrorDescription" are written for each tag. This enables you to determine if the execution was successful.

The tags are written directly to the AS. The tag image and the process image are not used by the method.

The method executes an asynchronous write operation without blocking further script execution. In doing so, the method uses a Promise object, which has handlers for successful ("then()") and faulty ("catch()") execution of the write operation. Depending on the result, once execution is complete the corresponding handler of the Promise pattern is called with the "TagSet" object or the error code as parameter. An execution is only faulty ("Promise rejected") when none of the tags of the "TagSet" object could be written.

When you call the method for external tags, it writes the quality code and time stamp predefined by the system, not the one defined by the user.

Syntax

```
TagSet.WriteAsyncQCD([writeType])
.then(function(HMITagSet) {
    ...
})
.catch(function(ErrorCode) {
    ...
})
```

Parameters

writeType

Optional, type: Int32, hmiWriteType

Specifies if the method waits for the write operation to be completed:

- hmiWriteNoWait (0) or empty
  Writes the tag value without waiting. Errors for the write operation are not detected.
- hmiWriteWait (1)
  Waits until the tag value is written in the AS. The properties "LastError" and "ErrorDescription" of the tags are written.

Return value

Promise

Depending on the status of the Promise object:

- Promise fulfilled
  Object, HMITagSet (Page 1365) as parameter of the "then()" handler.
- Promise failed (rejected)
  ErrorCode as parameter of the "catch()" handler. This status only exists when none of the tags of the "TagSet" object could be written.

TagSet.WriteAsync() (Page 1375)

TagSet.WriteQCD() (Page 1378)

TagSet.WriteWithOperatorMessage() (Page 1379)

TagSet.WriteQCD()

Description

The "Write" method writes the values of all tags ("Tag" objects) of the "TagSet" list, including their quality code and time stamps.

You must first set the values of the individual tags with the "Value" property. The value of the "Value" property must not correspond to the actual value of the tag once the write operation is complete. If you want to update the information for the tags, execute a "Read" method.

If the method waits for the write operation to be completed ("hmiWriteWait"), the properties "LastError" and "ErrorDescription" are also written for each tag. This enables you to determine if the execution was successful. If you need the result of the write operation without blocking the script execution, use the "WriteAsync" method.

The tags are written directly to the AS. The tag image and the process image are not used by the method.

When you call the method for external tags, it writes the quality code and time stamp predefined by the system, not the one defined by the user.

Syntax

```
TagSet.WriteQCD([writeType])
```

Parameter value

writeType

Optional, type: Int32, hmiWriteType

Specifies if the method waits for the write operation to be completed:

- hmiWriteNoWait (0) or empty
  Writes the tag value without waiting. Errors for the write operation are not detected.
- hmiWriteWait (1)
  Waits until the tag value is written in the AS. The properties "LastError" and "ErrorDescription" of the tags are written.

Return value

--

See also

TagSet (Page 1365)

TagSet.Write() (Page 1374)

TagSet.WriteAsync() (Page 1375)

TagSet.WriteAsyncQCD() (Page 1377)

TagSet.WriteWithOperatorMessage() (Page 1379)

TagSet.WriteWithOperatorMessage()

Description

The "WriteWithOperatorMessage" method writes the values of all tags ("Tag" objects) of the "TagSet" list and then triggers an operator input alarm for each tag. You must first set the values of the individual tags with the "Value" property. The value of the "Value" property does not correspond to the actual value of the tag once the write operation is complete. If you want to update the information for the tags, execute a "Read" method.

In addition to the reason, the triggered operator input alarms contain the old and new value, the user and host name and the unit.

Once the write operation is completed, the properties "LastError" and "ErrorDescription" are also written for each tag. This enables you to determine if the execution was successful. If you need the result of the write operation without blocking the script execution, use the "WriteAsync" method.

The properties "QualityCode" and "TimeStamp" of the tags are not determined during writing.

The tags are written directly to the AS. The tag image and the process image are not used by the method.

Syntax

```
TagSet.WriteWithOperatorMessage(reason)
```

Parameters

reason

Type: String

Reason for the change in value of the triggered alarms.

Return value

ErrorCode

Example

Write tags in a TagSet and then output the operator input alarm "Reason":

Copy code

```
var ts = Tags.CreateTagSet();
ts.Add("Tag1"); ts.Add("Tag2");
ts.Item("Tag1").Value = 10; ts.Item("Tag2").Value = 20;
var err = tag1.WriteWithOperatorMessage("Reason");
```

Tag

Description

Tag (Page 1338)

SysFct

Description

The "SysFct" object ("HMITagSysFct" type) enables access to the system functions of the "Tags" object.

Object type

HMITagSysFct

Properties

--

Methods

The "SysFct" object has the following methods:

- **DecreaseTag()**
  Subtracts a value from the value of the tag.
- **IncreaseTag()**
  Adds a value to the value of the tag.
- **InvertBitInTag()**
  Inverts a bit in the tag.
- **ResetBitInTag()**
  Resets a bit in the tag.
- **SetBitInTag()**
  Sets a bit in the tag.
- **SetTagValue()**
  Assigns a new value to the tag.
- **ShiftAndMask()**
  Converts the bit pattern of a source tag into the bit pattern of a target tag.
- **UpdateTag()**
  Reads from the PLC the current value of the tags with the specified update ID.

See also

Tags (Page 1333)

SysFct.CreateSetTagCommand()

Description

The "CreateSetTagCommand" method is an auxiliary function via which the result of return parameters of system functions can be written to HMI tags.

Syntax

```
[HMIRuntime.]Tags.SysFct.CreateSetTagCommand(TagName);
```

Parameters

TagName

Type: String, HMITag

HMI tag to which the return is written.

Return value

Object, HMISetTagCommand

Example

Write the result of the "LookUpText" system function to the "tempResultTagName" HMI tag and read it out:

Copy code

```
let setTagCommand = HMIRuntime.Tags.SysFct.CreateSetTagCommand(tempResultTagName);
HMIRuntime.Resources.SysFct.LookUpText(setTagCommand, qualitiyValue.value,
HMIRuntime.Language, nameTextList);
result = Tags(tempResultTagName).Read();
```

See also

SysFct (Page 1381)

SysFct.DecreaseTag()

Description

The "DecreaseTag" method subtracts the given value from the value of the tag.

Note

The system function uses the same tag as input and output values. When this system function is used to convert a value, an auxiliary tag must be used. You can assign the tag value to the auxiliary tag with the "SetTagValue" system function.

Syntax

```
[HMIRuntime.]Tags.SysFct.DecreaseTag(Tag,value);
```

Parameters

`Tag`

Type: String, HMITag

Tag from which the specified value is subtracted.

`value`

Type: Float

Numeric value that is subtracted.

Return value

ErrorCode

See also

SysFct (Page 1381)

SysFct.IncreaseTag() (Page 1384)

Tag.Decrease() (Page 1346)

SysFct.IncreaseTag()

Description

The "IncreaseTag" method adds the specified value to the value of the tag.

Note

The system function uses the same tag as input and output values. When this system function is used to convert a value, an auxiliary tag must be used. You can assign the tag value to the auxiliary tag with the "SetTagValue" system function.

Syntax

```
[HMIRuntime.]Tags.SysFct.IncreaseTag(Tag,value);
```

Parameters

`Tag`

Type: String, HMITag

Tag to which the specified value is added.

`value`

Type: Float

Numeric value that is added.

Return value

ErrorCode

See also

SysFct (Page 1381)

SysFct.DecreaseTag() (Page 1383)

Tag.Increase() (Page 1347)

SysFct.InvertBitInTag()

Description

The "InvertBitInTag" method inverts a bit in the specified tag:

- If the bit in the tag has the value "1" (True), it is set to "0" (False).
- If the bit in the tag has the value "0" (False), it is set to "1" (True).

After changing the specified bit, the system function transfers the entire tag back to the PLC. In the meantime it is not checked whether other bits in the tag have changed. Operator and PLC have read-only access to the specified tag until it is transferred back to the PLC.

Syntax

```
[HMIRuntime.]Tags.SysFct.InvertBitInTag(Tag,BitNumber);
```

Parameters

Tag

Type: String, HMITag

tag in which the bit is inverted.

BitNumber

Type: UInt8, value range: 0-63, depending on the data type of the tag

Bit of the tag that is inverted.

The bits are counted in a tag from right to left. The counting begins with 0.

Return value

ErrorCode

See also

SysFct (Page 1381)

SysFct.ResetBitInTag() (Page 1385)

SysFct.SetBitInTag() (Page 1386)

SysFct.ResetBitInTag()

Description

The "ResetBitInTag" method sets a bit in the specified tag to "0" (False).

After changing the specified bit, the system function transfers the entire tag back to the PLC. In the meantime it is not checked whether other bits in the tag have changed. Operator and PLC have read-only access to the specified tag until it is transferred back to the PLC.

Syntax

```
[HMIRuntime.]Tags.SysFct.ResetBitInTag(Tag,BitNumber);
```

Parameters

`Tag`

Type: String, HMITag

Tag in which the bit is set.

`BitNumber`

Type: UInt8, value range: 0-63, depending on the data type of the tag

Bit of tag which is set to "0" (False).

The bits are counted in a tag from right to left. The counting begins with 0.

Return value

ErrorCode

See also

SysFct (Page 1381)

SysFct.InvertBitInTag() (Page 1384)

SysFct.SetBitInTag() (Page 1386)

Tag.ResetBit() (Page 1350)

SysFct.SetBitInTag()

Description

The "SetBitInTag" method sets a bit in the specified tag to "1" (True).

After changing the specified bit, the system function transfers the entire tag back to the PLC. In the meantime it is not checked whether other bits in the tag have changed. Operator and PLC have read-only access to the specified tag until it is transferred back to the PLC.

Note

This function does not support data types of type UInt.

Syntax

```
[HMIRuntime.]Tags.SysFct.SetBitInTag(Tag,BitNumber);
```

Parameters

`Tag`

Type: String, HMITag

Tag in which the bit is set.

BitNumber

Type: UInt8, value range: 0-63, depending on the data type of the tag

Bit of tag which is set to "1" (True).

The bits are counted in a tag from right to left. The counting begins with 0.

Return value

ErrorCode

SysFct (Page 1381)

SysFct.InvertBitInTag() (Page 1384)

SysFct.ResetBitInTag() (Page 1385)

Tag.SetBit() (Page 1351)

SysFct.SetTagValue()

Description

The "SetTagValue" method assigns a new value to the specified tag.

Note

This system function can be used to assign strings and numbers, depending on the type of tag.

Note

The system function is only executed after a connection has been established.

Syntax

```
[HMIRuntime.]Tags.SysFct.SetTagValue(Tag,Value);
```

Parameters

Tag

Type: String, HMITag

Tag to which a value is assigned.

Value

Type: Variant

Value that is assigned.

Return value

ErrorCode

See also

SysFct (Page 1381)

SysFct.ShiftAndMask()

Description

The "ShiftAndMask" method converts the input bit pattern of a source tag into the output bit pattern of a target tag. This involves bit shifting and masking.

Note

If the source and target tag have a different number of bits, using the system function in the target tag can result in a violation of the value range.

Syntax

```
[HMIRuntime.]Tags.SysFct.ShiftAndMask(Source,Target,bitsToShift,bitP
attern);
```

Parameter

`Source`

Type: String, HMITag

Source tag that receives the input bit pattern. Tags of integer type are allowed.

The source and target tags must have the same number of bits.

`Target`

Type: String, HMITag

Target tag to which the output bit pattern is saved. Tags of integer type are allowed.

The source and target tags must have the same number of bits.

`bitsToShift`

Type: Int8

Number of bits by which the input bit pattern is shifted right. A negative value shifts the input bit pattern to the left.

The number of bits to be shifted must be less than the number of bits of the source and target tags.

Note

The left bit is "1" in a source tag of the data type with negative signed integer. This sign bit is padded with "0" when the bits are shifted right. The sign changes to "+".

bitPattern

Type: UInt32

Integer number that is used as bit mask. The bit pattern is used to multiply the shifted input bit pattern.

The bit mask must not have more bits than the source and target tags.

Return value

ErrorCode

Example

The source tag of the 16-bit integer type has the current value "72": 0000000001001000.

Shift bits

`bitsToShift` has the value "+3". The input bit pattern is shifted 3 bits to the right. Left is filled with "0". Three bits are truncated on the right: 0000000000001001. The new decimal value is "9".

Mask bits

`bitPattern` has the value "2478" with the bit pattern "0000100110101110". The shifted input bit pattern (0000000000001001) is multiplied by the bit mask, with bit-by-bit logical AND operation. The result is the decimal value "8".

Save result

The decimal value is stored in the target tag.

See also

SysFct (Page 1381)

SysFct.UpdateTag()

Description

The "UpdateTag" method reads from the PLC the current value of the tags with the specified update ID. An update ID can be used for several tags.

Note

Tags of the data type STRUCT are not supported.

Syntax

```
[HMIRuntime.]Tags.SysFct.UpdateTag(UpdateID);
```

Parameter

`UpdateID`

Type: UInt32, HMITagUpdateID

Specifies the Update ID.

Return value

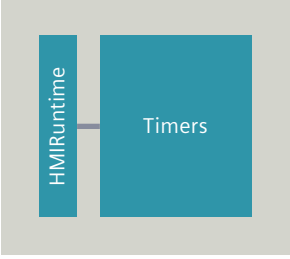
ErrorCode

See also

SysFct (Page 1381)

10.2.2.19 Timers

Description



The "Timers" object can time the script run by means of one-time or cyclic timers. You can execute individual functions delayed or repeatedly.

Object type

HMITimers

Properties

--

Methods

The "Timers" object has the following methods:

- **ClearInterval()**
  Deletes a timer object for cyclic execution of a function.
- **ClearTimeout()**
  Deletes a timer object for delayed execution of a function.
- **SetInterval()**
  Creates a timer object for the cyclic execution of a function.
- **SetTimeout()**
  Creates a timer object for delayed execution of a function.

Example

Execution of the "myFunc" function is delayed:

Copy code

```
function setDelay() {
    var timerId = HMIRuntime.Timers.SetTimeout(myFunc, 5000);
    function myFunc() {
        HMIRuntime.Trace("SetTimeout triggered");
    }
}
```

Timers.ClearInterval()

Description

The "ClearIntervall" method deletes a timer object for cyclic execution of a function. You can delete a timer object at any time prior to the next execution.

Syntax

```
HMIRuntime.Timers.ClearIntervall(TimerID);
```

Parameters

TimerID

Type: Int32

ID of the timer object to be deleted. The ID is returned by the "SetInterval" method during creation of the timer object.

Return value

--

Example

Create and delete a cyclic timer:

Copy code

```
var TimerID = HMIRuntime.Timers.SetInterval(update, 1000);
HMIRuntime.Timers.ClearInterval(TimerID);
```

See also

Timers (Page 1390)

Timers.SetInterval() (Page 1393)

Timers.ClearTimeout()

Description

The "ClearTimeout" method deletes a timer object for delayed execution of a function. You can delete a timer object at any time prior to the execution.

Syntax

```
HMIRuntime.Timers.ClearTimeout(TimerID);
```

Parameters

TimerID

Type: Int32

ID of the timer object to be deleted. The ID is returned by the "SetTimeout" method during creation of the timer object.

Return value

--

Example

Create and delete a one-time timer:

Copy code

```
var TimerID = HMIRuntime.Timers.SetTimeout(update,1000);
HMIRuntime.Timers.ClearTimeout(TimerID);
```

See also

Timers (Page 1390)

Timers.SetTimeout() (Page 1394)

Timers.SetInterval()

Description

The "SetIntervall" method creates a timer object for cyclic execution of a function and returns the ID of the timer object. When a time interval expires, a function is started and scheduled for a new execution according to the time interval.

Syntax

```
HMIRuntime.Timers.SetIntervall(CallbackFunction, DelayInMillisecs);
```

Parameters

CallbackFunction

Type: Function, HMIOnTimerCB

Function that is executed cyclically.

Required prototype of the callback function: `TimerCallback()`

DelayInMillisecs

Type: UInt32

Time interval in milliseconds in which the function is executed cyclically.

Return value

Int32

Example

Create a cyclic timer:

Copy code

```
var TimerID = HMIRuntime.Timers.SetInterval(update,1000);
```

See also

Timers (Page 1390)

Timers.ClearInterval() (Page 1391)

Timers.SetTimeout()

Description

The "SetTimeout" method creates a timer object for time-delayed execution of a function and returns the ID of the timer object. When a time interval has elapsed, a function is started.

Syntax

```
HMIRuntime.Timers.SetTimeout(CallbackFunction, DelayInMillisecs);
```

Parameters

CallbackFunction

Type: Function, HMIOnTimerCB

Function that is executed once.

Required prototype of the callback function: `TimerCallback()`

DelayInMillisecs

Type: UInt32

Time interval in milliseconds after which the function is executed delayed.

Return value

Int32

Example

Create a one-time timer:

Copy code

```
var TimerID = HMIRuntime.Timers.SetInterval(update,1000);
```

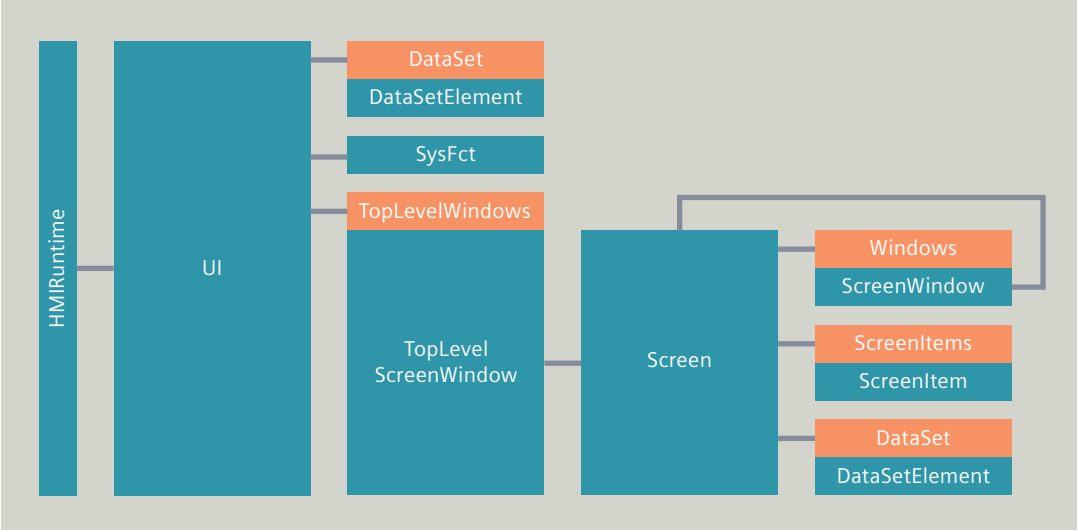
See also

Timers (Page 1390)

Timers.ClearTimeout() (Page 1392)

10.2.2.20 UI

Description



The "UI" object ("HMIUI" type) represents the user interface of the graphical runtime. You use the "UI" object to directly reference the currently active screen or the listing of the screen windows on the highest level.

Application

The "UI" object is used to reference the configured elements of the graphical runtime system, such as screen windows, screens or screen objects. This means that you have access to all the properties and methods of these elements.

To simplify the use of the "UI" object, you can also use the alias `UI` for `HMIRuntime.UI`.

Note

Several screens can be opened simultaneously in runtime. These screens are displayed in screen windows. Each screen window contains exactly one screen (Screen) that can contain any number of further screen windows (Screen Window). The resulting hierarchy can be mapped by using an object path, which is used in the "FindItem" method for addressing.

In the window arrangement of the runtime (Screen Window Layout), one screen window can be defined at the highest level (Top Level Screen Window) for each existing monitor.

Object type

HMIUI

Properties

The "UI" object has the following properties:

- **ActiveScreen**
  Returns the screen that has the input focus.
- **DataSet**
  Returns the global parameter set.
- **PopupScreenWindows**
  Returns the list of all popup screen windows.
- **RootWindow**
  Returns the top-level screen window (Top Level Screen Window) of the screen in which the script is executed.
- **Style**
  Specifies the style of the display and operating objects.
- **Windows**
  Returns the "Windows" object with the list of screen windows.

Methods

The "UI" object has the following methods:

- **FindItem()**
  Returns screen windows or screen objects through their object path.
- **GetClientInfo()**
  Returns information about the client.
- **OpenFaceplateInPopup()**
  Opens a faceplate in a popup window and sets the values of the faceplate interface.

Example

Modify the screen of the own screen window on the highest level:

```
UI.RootWindow.Screen = 'NewScreen';
```

or with the "FindItem" method and relative addressing:

```
UI.FindItem('~').Screen = 'NewScreen';
```

Reference and modify the screen of a screen window in absolute terms on the highest level outside of the own screen hierarchy:

```
UI.FindItem('/TopLevelWindow2').Screen = 'NewScreen';
```

UI.ActiveScreen

Description

The "ActiveScreen" property returns the screen that has the input focus.

Note

You access the screen with input focus via the "ActiveScreen" property without specification of an object path.

If the runtime loses the input focus, the "ActiveScreen" property references the screen that last had the input focus.

Type

Object, HmiScreen (Page 1397)

Access

Read-only

Syntax

```
[HMIRuntime.]UI.ActiveScreen
```

See also

UI (Page 1395)

Screen (Page 1397)

Screen

Description

The "Screen" object ("HMIScreen" type) displaya screen in runtime. A screen can contain any number of screen windows ("Window" objects) and screen objects ("ScreenItem" object).

You reference a "Screen" object via the properties `UI.ActiveScreen`, `Window.CurrentScreen`, `Screen.ParentScreen` or `ScreenItem.Parent`.

Use

You can use the "this" and "Item" objects in scripts. The "this" object refers in this case to the screen ("Screen" object) and the "Item" object to the screen object (ScreenItem) in which the script is created. For better clarity, you can also use the `Screen` alias for the "this" object.

Note

Several screens can be opened simultaneously in runtime. These screens are displayed in screen windows. Each screen window contains exactly one screen (Screen) that can contain any number of additional screen windows (Screen Window). The resulting hierarchy can be mapped by using an object path, which is used in the "FindItem" method for addressing.

You can specify one top level screen window (Top Level Screen Window) for each monitor in the window layout of the runtime system (Screen Window Layout).

Object type

HmiScreen

Properties

The "Screen" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BackFillPattern**
  Specifies the fill pattern of the background.
- **BackGraphic**
  Specifies the graphic for the image background.
- **BackGraphicStretchMode**
  Specifies the type of scaling of the background graphic in the screen.
- **BackgroundFillMode**
  Specifies the fill area of the background fill.
- **CurrentWindow**
  Returns the screen window which contains the current screen.
- **DataSet**
  Returns the parameter set of the screen.
- **DisplayName**
  Specifies the display name.
- **Enabled**
  Specifies whether the screen can be operated in runtime.

- **EnableExplicitUnlock**
  Returns which button must be pressed for the screen to be operable.
- **Height**
  Specifies the height.
- **HorizontalAlignment**
  Specifies the horizontal alignment.
- **HotKeys**
  Returns the hotkeys defined for the screen.
- **Items**
  Returns a list of all screen objects of the screen.
- **Layers**
  Returns a list of all layers of the screen.
- **Name**
  Returns the name of the screen.
- **Operability**
  Returns whether the screen is operable.
- **Parent**
  Returns the higher-level screen object (here: screen window).
- **ParentScreen**
  Returns the higher-level screen.
- **RequireExplicitUnlock**
  Returns whether the screen can only be operated while the associated button is being pressed.
- **ScreenMaster**
  Specifies the screen template of the screen.
- **ScreenNumber**
  Returns the screen number.
- **VerticalAlignment**
  Specifies the vertical alignment.
- **Width**
  Specifies the width.
- **Windows**
  Returns a list of all screen windows of the screen.

Methods

The "Screen" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the screen.
- **FindItem()**
  Returns screen windows or screen objects through their object path.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "Screen" object has the following events:

- **OnContextTapped()**
  Occurs when the screen is right-clicked or long-touched.
- **OnHotKey()**
  Occurs when a hotkey is pressed.
- **OnLoaded()**
  Occurs when the screen is fully loaded in runtime.
- **OnTapped()**
  Occurs when the screen is clicked with the left mouse button or short-touched.
- **OnUnloaded()**
  Occurs when the active screen on the HMI device is completely cleared.

Screen.AlternateBackColor

Description

The "AlternateBackColor" specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
Screen.AlternateBackColor
```

See also

Screen (Page 1397)

Screen.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the screen.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
Screen.Authorization
```

See also

Screen (Page 1397)

Screen.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
Screen.BackColor
```

See also

Screen (Page 1397)

Screen.BackFillPattern

Description

The "BackFillPattern" property specifies the fill pattern of the background.

Type

Int32, HmiFillPattern

Specifies the fill pattern:

- Solid (0): Solid
- Transparent (65536): Transparent. Depending on the runtime settings, visible objects in the background can be selected.
- Horizontal (131072): Horizontal
- Vertical (131073): Vertical
- ForwardDiagonal (131074): Forward diagonally striped
- BackwardDiagonal (131075): Backward diagonally striped
- Cross (131076): Cross
- DiagonalCross (131077): Diagonal cross
- GradientHorizontal (1048576): Horizontal gradient
- GradientVertical (1048577): Vertical gradient
- GradientForwardDiagonal (1048578): Gradient forward diagonal
- GradientBackwardDiagonal (1048579): Gradient backward diagonal
- GradientHorizontalTricolor (1048832): Horizontal tricolor gradient
- GradientVerticalTricolor (1048833): Gradient vertical tricolor
- GradientForwardDiagonalTricolor (1048834): Gradient forward diagonal tricolor
- GradientBackwardDiagonalTricolor (1048835): Gradient backward diagonal tricolor

Access

Read-write

Syntax

```
Screen.BackFillPattern
```

See also

Screen (Page 1397)

Screen.BackGraphic

Description

The "BackGraphic" property specifies the graphic for the screen background.

Type

String

Access

Read-write

Syntax

```
Screen.BackGraphic
```

See also

Screen (Page 1397)

Screen.BackGraphicStretchMode

Description

The "BackGraphicStretchMode" property specifies the type of scaling of the background graphic in the screen.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Screen.BackGraphicStretchMode
```

See also

Screen (Page 1397)

Screen.BackgroundFillMode

Description

The "BackgroundFillMode" property specifies the fill area of the background fill.

Type

Int32, HmiBackgroundFillMode

Specifies the type of background fill:

- Window (0): The filling is adapted to the size of the window.
- Screen (1): The filling is adapted to the size of the screen.

Access

Read-write

Syntax

```
Screen.BackgroundFillMode
```

See also

Screen (Page 1397)

Screen.CurrentWindow

Description

The "CurrentWindow" property returns the screen window which contains the current screen.

Type

Object, HmiScreenWindow (Page 1436)

Access

Read-only

Syntax

```
Screen.CurrentWindow
```

See also

Screen (Page 1397)

ScreenWindow (Page 1436)

ScreenWindow

Description

ScreenWindow (Page 1436)

Screen.DataSet

Description

The "DataSet" property returns the data set ("DataSet" object) of the screen.

Type

Object, HMIDataSet (Page 1405)

Access

Read-only

Syntax

```
Screen.DataSet
```

See also

Screen (Page 1397)

DataSet (Page 1405)

DataSet

Description

The "DataSet" object ("HMIDataSet" type) is a list of "DataSetElement" objects that enable data exchange in runtime.

A "DataSet" object is defined globally (on the "UI" object) or on a screen (the "Screen" object). You can access the data from any action.

You reference a "DataSet" object via the `UI.DataSet` property or via the respective screen with the `Screen.DataSet` property.

The "DataSet" object exists as long as the screen is displayed. The global object exists over the entire time period in which runtime runs.

Use

The "DataSet" object is a list which be counted and enumerated. You can access the "DataSet" list via the index or the element names.

Object type

HMIDataSet

Properties

The "DataSet" object has the following properties:

- **Count**
  Returns the number of elements of the "DataSet" list.

Methods

The "DataSet" object has the following methods:

- **Add()**
  Adds an element with value to the "DataSet" list.
- **Clear()**
  Removes all elements from the "DataSet" list.
- **Exists()**
  Checks whether an element is present in the "DataSet" list.
- **Item()**
  Returns the value of an element of the "DataSet" list.
- **Remove()**
  Removes an element by its name from the "DataSet" list.

DataSet.Count

Description

The "Count" property returns the number of elements in the "DataSet" list.

Type

UInt32

Access

Read-only

Syntax

```
DataSet.Count
```

See also

DataSet (Page 1405)

DataSet.Add()

Description

The "Add" method adds an element ("DataSetElement" object) to the "DataSet" list. The elements are referenced by name.

Syntax

```
DataSet.Add(name,value)
```

Parameters

name

Type: String

Name of the element that will be added to the list.

value

Type: Variant

Value of the element that will be added to the list.

Return value

--

See also

DataSet (Page 1405)

DataSet.Clear()

Description

The "Clear" method removes all elements ("DataSetElement" objects) from the "DataSet" list.

Syntax

```
DataSet.Clear()
```

Parameter

--

Return value

--

See also

DataSet (Page 1405)

DataSet.Exists()

Description

The "Exists" method searches for an element ("DataSetElement" object) in the "DataSet" list.

Syntax

```
DataSet.Exists(name)
```

Parameters

name

Type: String

Name of the element that is being searched for.

Return value

Bool

See also

DataSet (Page 1405)

DataSet.Item()

Description

The "Item" method returns the value of a "DataSetElement" object of the "DataSet" list.

Syntax

```
DataSet[.Item](name)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "DataSet" object.

Parameter

`name`

Type: String

Element name or index number (1...n) of an object "DataSetElement" of the list

Return value

Variant

See also

DataSet (Page 1405)

DataSetElement (Page 1410)

DataSet.Remove()

Description

The "Remove" method removes an element ("DataSetElement" object) from the "DataSet" list by its name.

Syntax

```
DataSet.Remove(name)
```

Parameters

`name`

Type: String

Name of the element that will be removed.

Return value

--

See also

DataSet (Page 1405)

DataSetElement

Description

The "DataSetElement" object represents a data set element in the "DataSet" list.

Object type

HMIDataSetElement

Properties

The "DataSetElement" object has the following properties:

- **Name**
  Returns the name of the element.
- **Value**
  Returns the value of the element.

Methods

--

DataSetElement.Name

Description

The "Name" property returns the name of the element ("DataSetElement" object).

Type

String

Access

Read-only

Syntax

```
DataSetElement.Name
```

See also

DataSetElement (Page 1410)

DataSetElement.Value

Description

The "Name" property returns the value of the element ("DataSetElement" object).

Type

Variant

Access

Read-only

Syntax

```
DataSetElement.Value
```

See also

DataSetElement (Page 1410)

Screen.DisplayName

Description

The "DisplayName" property specifies the display name of the screen.

Type

String

Access

Read-write

Syntax

```
Screen.DisplayName
```

See also

Screen (Page 1397)

Screen.Enabled

Description

The "Enabled" property specifies whether the screen can be operated with all screen objects in runtime.

Type

Bool

Access

Read-write

Syntax

```
Screen.Enabled
```

See also

Screen (Page 1397)

Screen.EnableExplicitUnlock

Description

The "EnableExplicitUnlock" property returns the button that must be pressed for the screen to be operable.

Type

Object, HmiButton (Page 1961)

Access

Read-only

Syntax

```
Screen.EnableExplicitUnlock
```

See also

Screen (Page 1397)

Button (Page 1961)

Button

Description

Button (Page 1961)

Screen.Height

Description

The "Height" property specifies the height of the screen in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Screen.Height
```

See also

Screen (Page 1397)

Screen.HorizontalAlignment

Description

The "HorizontalAlignment" property specifies the horizontal alignment of the screen. This property is used when the screen is smaller than the screen window.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Screen.HorizontalAlignment
```

See also

Screen (Page 1397)

Screen.Items

Description

The "Items" property returns a list of all screen objects of the screen.

Type

Object, HMIScreenItems (Page 1415)

Access

Read-only

Syntax

```
Screen.Items
```

See also

Screen (Page 1397)

ScreenItems (Page 1415)

ScreenItems

Description

The "ScreenItems" object is a list of all screen objects ("HmiScreenItemBase" objects) of the screen.

You reference a "ScreenItems" object via the `Screen.Items` property.

Use

The "ScreenItems" object is a list and can be enumerated. You can access the "ScreenItems" list using the index or the tag name.

Object type

HMIScreenItems

Properties

--

Methods

The "ScreenItems" object has the following methods:

- **Item()**
  Returns a screen object of the "ScreenItems" list.

ScreenItems.Item()

Description

The "Item" method returns a screen object of a screen window via the "ScreenItems" list.

Syntax

```
ScreenItems[.Item](ScreenItemName);
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "ScreenItems" object.

Parameters

`ScreenItemName`
Type: String, HmiScreenItemBase
Name of the screen object

Return value

Object, HmiScreenItemBase (Page 1571)

See also

ScreenItems (Page 1415)
Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

Screen.Layers

Description

The "Layers" property returns a list of all layers of the screen.

Type

Object, HmiLayerCollection (Page 1417)

Access

Read-only

Syntax

```
Screen.Layers
```

See also

Screen (Page 1397)
HmiLayerCollection (Page 1417)

HmiLayerCollection

Description

The "HmiLayerCollection" object is a list of all layers ("Layer" objects) of the screen.

You reference a "HmiLayerCollection" object via the `Screen.Layers` property.

Use

The "HmiLayerCollection" object is a list and can be counted and enumerated. You can access the "HmiLayerCollection" list using the index or the tag name.

Object type

HmiLayerCollection

Properties

The "HmiLayerCollection" object has the following properties:

- **Count**
  Returns the number of layers of the "HmiLayerCollection" list.

Methods

The "HmiLayerCollection" object has the following methods:

- **Item()**
  Returns a level of the "HmiLayerCollection" list.

HmiLayerCollection.Count

Description

The "Count" property returns the number of screen layers of the "HmiLayerCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiLayerCollection.Count
```

See also

HmiLayerCollection (Page 1417)

HmiLayerCollection.Item()

Description

The "Item" method returns a screen layer of the "HmiLayerCollection" list.

Syntax

```
HmiLayerCollection[.Item](HmiLayerName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiLayerCollection" object.

Parameters

`HmiLayerName`

Type: String, HmiLayerPart

Name of the screen layer

Return value

Object, HmiLayerPart (Page 1418)

See also

HmiLayerCollection (Page 1417)

Layer (Page 1418)

Layer

Description

The "Layer" object represents the layers of an object (e.g. screen).

Object type

HmiLayerPart

Properties

The "Layer" object has the following properties:

- **MaximumZoom**
  Specifies the maximum zoom of the screen up to which the level is to be seen.
- **MinimumZoom**
  Specifies the minimum zoom of the screen up to which the level is to be seen.
- **Name**
  Returns the name of the screen layer.
- **Visible**
  Specifies whether the screen layer and contained objects are visible.

Methods

--

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

Layer (Page 1418)
Layer.MinimumZoom (Page 1419)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

Layer (Page 1418)
Layer.MaximumZoom (Page 1419)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

Layer (Page 1418)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

Layer (Page 1418)

Screen.Name

Description

The "Name" property returns the name of the screen.

Type

String

Access

Read-only

Syntax

```
Screen.Name
```

See also

Screen (Page 1397)

Screen.Operability

Description

The "Operability" property returns whether the screen is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
Screen.Operability
```

See also

Screen (Page 1397)

Screen.Parent

Description

The "Parent" property specifies the parent screen object (here: screen window).

Type

Object, HmiScreenWindow (Page 1436)

Access

Read-only

Syntax

```
Screen.Parent
```

See also

Screen (Page 1397)

ScreenWindow (Page 1436)

ScreenWindow

Description

ScreenWindow (Page 1436)

Screen.ParentScreen

Description

The "ParentScreen" property returns the parent screen that contains the screen window of the current screen.

Type

Object, HmiScreen (Page 1397)

Access

Read-only

Syntax

```
Screen.ParentScreen
```

See also

Screen (Page 1397)

Screen

Description

Screen (Page 1397)

Screen.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the screen can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
Screen.RequireExplicitUnlock
```

See also

Screen (Page 1397)

Screen.ScreenMaster

Description

The "ScreenMaster" property specifies the screen template of the screen. All screen objects, layers and properties of the referenced screen template are inherited.

Type

Object, HmiScreenMaster (Page 1424)

Access

Read-write

Syntax

```
Screen.ScreenMaster
```

See also

Screen (Page 1397)

ScreenMaster (Page 1424)

ScreenMaster

Description

The "ScreenMaster" object is the screen template of a screen. All screen objects, layers and properties of a screen template are inherited by the screen. The screen template is a type of main layer of the screen.

Object type

HmiScreenMaster

Properties

The "ScreenMaster" object has the following properties:

- **DisplayName**
  Specifies the display name.
- **HotKeys**
  Returns the hotkeys specified for the screen template.
- **Layers**
  Returns a list of all layers of the screen template.
- **Name**
  Returns the name of the screen template.
- **Visible**
  Specifies whether the screen template is visible in the screen.

Methods

--

ScreenMaster.DisplayName

Description

The "DisplayName" property specifies the display name of the screen template.

Type

String

Access

Read-write

Syntax

```
ScreenMaster.DisplayName
```

See also

ScreenMaster (Page 1424)

ScreenMaster.Layers

Description

The "Layers" property returns a list of all layers of the screen template.

Type

Object, HmiLayerCollection (Page 1426)

Access

Read-only

Syntax

```
ScreenMaster.Layers
```

See also

ScreenMaster (Page 1424)

HmiLayerCollection (Page 1426)

HmiLayerCollection

Description

The "HmiLayerCollection" object is a list of all layers ("Layer" objects) of the screen.

You reference a "HmiLayerCollection" object via the `Screen.Layers` property.

Use

The "HmiLayerCollection" object is a list and can be counted and enumerated. You can access the "HmiLayerCollection" list using the index or the tag name.

Object type

HmiLayerCollection

Properties

The "HmiLayerCollection" object has the following properties:

- **Count**
  Returns the number of layers of the "HmiLayerCollection" list.

Methods

The "HmiLayerCollection" object has the following methods:

- **Item()**
  Returns a level of the "HmiLayerCollection" list.

HmiLayerCollection.Count

Description

The "Count" property returns the number of screen layers of the "HmiLayerCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiLayerCollection.Count
```

See also

HmiLayerCollection (Page 1426)

HmiLayerCollection.Item()

Description

The "Item" method returns a screen layer of the "HmiLayerCollection" list.

Syntax

```
HmiLayerCollection[.Item](HmiLayerName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiLayerCollection" object.

Parameters

`HmiLayerName`

Type: String, HmiLayerPart

Name of the screen layer

Return value

Object, HmiLayerPart (Page 1428)

See also

HmiLayerCollection (Page 1426)

Layer (Page 1428)

Layer

Description

The "Layer" object represents the layers of an object (e.g. screen).

Object type

HmiLayerPart

Properties

The "Layer" object has the following properties:

- **MaximumZoom**
  Specifies the maximum zoom of the screen up to which the level is to be seen.
- **MinimumZoom**
  Specifies the minimum zoom of the screen up to which the level is to be seen.
- **Name**
  Returns the name of the screen layer.
- **Visible**
  Specifies whether the screen layer and contained objects are visible.

Methods

--

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

Layer (Page 1428)

Layer.MinimumZoom (Page 1429)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

Layer (Page 1428)

Layer.MaximumZoom (Page 1429)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

Layer (Page 1428)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

Layer (Page 1428)

ScreenMaster.Name

Description

The "Name" property returns the name of the screen template.

Type

String

Access

Read-only

Syntax

```
ScreenMaster.Name
```

See also

ScreenMaster (Page 1424)

ScreenMaster.Visible

Description

The "Visible" property specifies whether the screen template is visible. The screen template is a type of main layer of a screen.

Type

Bool

Access

Read-write

Syntax

```
ScreenMaster.Visible
```

See also

ScreenMaster (Page 1424)

Screen.ScreenNumber

Description

The "ScreenNumber" property returns the screen number.

Type

UInt16

Access

Read-only

Syntax

```
Screen.ScreenNumber
```

See also

Screen (Page 1397)

Screen.VerticalAlignment

Description

The "VerticalAlignment" property specifies the vertical alignment.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Screen.VerticalAlignment
```

See also

Screen (Page 1397)

Screen.Width

Description

The "Width" property specifies the width of the screen in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Screen.Width
```

See also

Screen (Page 1397)

Screen.Windows

Description

The "Windows" returns a list of all screen windows of the screen.

Type

Object, HMIWindows (Page 1434)

Access

Read-only

Syntax

```
Screen.Windows
```

See also

Screen (Page 1397)

Windows (Page 1434)

Windows

Description

The "Windows" object is a list of all screen windows ("ScreenWindow" objects) of the screen.

You reference a "Windows" object via the `Screen.Windows` property.

Use

The "Windows" object is a list and can be counted and enumerated. You can access the "Windows" list using the index or the tag name.

Object type

HMIWindows

Properties

The "Windows" object has the following properties:

- **Count**
  Returns the number of screen windows of the "Windows" list.

Methods

The "Windows" object has the following methods:

- **Item()**
  Returns a screen window of the "Windows" list.

Windows.Count

Description

The "Count" property returns the number of screen windows in the "Windows" list.

Type

UInt32

Access

Read-only

Syntax

```
Windows.Count
```

See also

Windows (Page 1434)

Windows.Item()

Description

The "Item" method returns a screen window of the "Windows" list.

Syntax

```
Windows[.Item](WindowName);
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "Windows" object.

Parameters

`WindowName`

Type: String, HmiScreenWindow

Name of the screen window

Return value

Object, HmiScreenWindow (Page 1436)

See also

Windows (Page 1434)

ScreenWindow (Page 1436)

ScreenWindow

Description

The "ScreenWindow" object represents a screen window in runtime. A screen window contains exactly one screen ("Screen" object).

The "ScreenWindow" object is returned from the `Screen.Windows` list, the `FindItem()` method or the `Screen.CurrentWindow` and `Screen.Parent` properties.

Object type

HmiScreenWindow

Use

You use the "ScreenWindow" object to reference a "Screen" object and have access to all the objects and properties of a screen.

Note

Several screens can be opened simultaneously in runtime. These screens are displayed in screen windows. Each screen window contains exactly one screen (Screen) that can contain any number of additional screen windows (Screen Window). The resulting hierarchy can be mapped by using an object path, which is used in the "FindItem" method for addressing.

You can specify one top level screen window (Top Level Screen Window) for each monitor in the window layout of the runtime system (Screen Window Layout).

Properties

The "ScreenWindow" object has the following properties:

- **Adaption**
  Specifies how the window size adapts.
- **Caption**
  Specifies the text to be displayed in the title bar.
- **CaptionColor**
  Specifies the background color of the title bar.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the specified screen window.
- **CurrentScreen**
  Returns the screen of the current screen window.
- **CurrentZoomFactor**
  Specifies the zoom factor which is applied to the displayed screen.
- **Enabled**
  Specifies whether the specified object can be operated in runtime.

- **Height**
  Specifies the height.
- **HorizontalScrollBarPosition**
  Specifies the horizontal alignment for the scroll bar.
- **HorizontalScrollBarVisibility**
  Specifies the setting for the horizontal scroll bar of the window.
- **Icon**
  Specifies the icon.
- **InteractiveZooming**
  Specifies whether zooming is supported.
- **Layer**
  Returns the layer of the screen that contains the screen window.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin of the screen window.
- **Monitor**
  Returns the monitor on which the screen window is displayed.
- **Name**
  Returns the name of the screen window.
- **Parent**
  Returns the higher-level screen object (Parent container).
- **Path**
  Returns the absolute object path of the screen window.
- **RenderingTemplate**
  Returns the name of the template from which the object was created.
- **Screen**
  Specifies the name of the screen contained in the screen window.
- **ScreenName**
  Returns the screen name.
- **ScreenNumber**
  Returns the screen number.
- **ShowFocusVisual**
  Specifies whether the screen window is highlighted when in focus.
- **StartupPosition**
  Specifies the position of the screen window at runtime start.
- **StyleItemClass**
  Returns the style which is applied to the screen window.
- **System**
  Specifies the server prefix.
- **TabIndex**
  Returns the position of the screen window in the tab sequence.

- **TabIntoWindow**
  Specifies that the configured tab sequence of the displayed screen is resumed on activation via the tab sequence.
- **Top**
  Specifies the value of the Y coordinate.
- **VerticalScrollBarPosition**
  Specifies the vertical alignment for the scroll bar.
- **VerticalScrollBarVisibility**
  Specifies the setting for the vertical scroll bar of the window.
- **Visible**
  Specifies whether the screen window is visible.
- **Width**
  Specifies the width.
- **WindowFlags**
  Specifies the screen window configuration.

Methods

The "ScreenWindow" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the screen window.
- **Close()**
  Closes the screen window.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "ScreenWindow" object has the following events:

- **OnActivated()**
  Occurs when a screen window receives focus.
- **OnDeactivated()**
  Occurs when a screen window loses focus.

Example

Change the screen in the adjacent screen window "Window2":

```
Screen.ParentScreen.Windows('Window2').Screen = 'NewScreen';
```

or with the "FindItem" method and relative addressing:

```
Screen.FindItem('../Window2').Screen = 'NewScreen';
```

ScreenWindow.Adaption

Description

The "Adaption" property specifies how the window size adapts.

Type

Int32, HmiScreenWindowAdaption

Specifies how the window size adapts:

- None (0): No adaptation
- WindowToScreen (1): Window size corresponds to screen size
- ScreenToWindow (2): Screen is scaled to window size.

Access

Read-write

Syntax

```
ScreenWindow.Adaption
```

See also

ScreenWindow (Page 1436)

ScreenWindow.Caption

Description

The "Caption" property specifies the text to be displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
ScreenWindow.Caption
```

See also

ScreenWindow (Page 1436)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

ScreenWindow.Caption (Page 1439)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 1440)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 1440)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 1440)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 1440)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 1440)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 1440)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

ScreenWindow.Caption (Page 1439)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

ScreenWindow.Caption (Page 1439)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

ScreenWindow.Caption (Page 1439)

ScreenWindow.CaptionColor

Description

The "CaptionColor" property specifies the color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
ScreenWindow.CaptionColor
```

See also

ScreenWindow (Page 1436)

ScreenWindow.CurrentQuality

Description

The property "CurrentQuality" returns the current worst quality code of all tags which influence the specified screen window.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable. Quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
ScreenWindow.CurrentQuality
```

See also

ScreenWindow (Page 1436)

ScreenWindow.CurrentScreen

Description

The "CurrentScreen" property returns the screen of the current screen window.

Type

Object, HmiScreen (Page 1397)

Access

Read-only

Syntax

```
ScreenWindow.CurrentScreen
```

See also

Screen (Page 1397)

ScreenWindow (Page 1436)

Screen

Description

Screen (Page 1397)

ScreenWindow.CurrentZoomFactor

Description

The "CurrentZoomFactor" property specifies the zoom factor of the screen window. The zoom factor may differ from the containing screen. The value 1.0 corresponds to a zoom factor of 100%.

Type

Float

Access

Read-write

Syntax

```
ScreenWindow.CurrentZoomFactor
```

See also

ScreenWindow (Page 1436)

ScreenWindow.Enabled

Description

The "Enabled" property specifies whether the screen window can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ScreenWindow.Enabled
```

See also

ScreenWindow (Page 1436)

ScreenWindow.Height

Description

The "Height" property specifies the height of the screen window in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ScreenWindow.Height
```

See also

ScreenWindow (Page 1436)

ScreenWindow.HorizontalScrollBarPosition

Description

The "HorizontalScrollBarPosition" property specifies the horizontal alignment for the scroll bar.

Type

Int32

Access

Read-write

Syntax

```
ScreenWindow.HorizontalScrollBarPosition
```

See also

ScreenWindow (Page 1436)

ScreenWindow.HorizontalScrollBarVisibility (Page 1449)

ScreenWindow.HorizontalScrollBarVisibility

Description

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
ScreenWindow.HorizontalScrollBarVisibility
```

See also

ScreenWindow (Page 1436)

ScreenWindow.HorizontalScrollBarPosition (Page 1448)

ScreenWindow.Icon

Description

The "Icon" property specifies the icon of the screen window.

Type

String

Access

Read-write

Syntax

```
ScreenWindow.Icon
```

See also

ScreenWindow (Page 1436)

ScreenWindow.InteractiveZooming

Description

The "InteractiveZooming" property specifies whether zooming is supported.

Type

Bool

Access

Read-write

Syntax

```
ScreenWindow.InteractiveZooming
```

See also

ScreenWindow (Page 1436)

ScreenWindow.Layer

Description

The "Layer" property returns the layer of the screen that contains the screen window.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
ScreenWindow.Layer
```

See also

ScreenWindow (Page 1436)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

ScreenWindow.Layer (Page 1451)

Layer.MinimumZoom (Page 1452)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

ScreenWindow.Layer (Page 1451)
Layer.MaximumZoom (Page 1451)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

ScreenWindow.Layer (Page 1451)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

ScreenWindow.Layer (Page 1451)

ScreenWindow.Left

Description

The "Left" property specifies the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
ScreenWindow.Left
```

See also

ScreenWindow (Page 1436)

ScreenWindow.Margin

Description

The "Margin" property specifies the surrounding outer distance of the screen window.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ScreenWindow.Margin
```

See also

ScreenWindow (Page 1436)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ScreenWindow.Margin (Page 1454)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ScreenWindow.Margin (Page 1454)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ScreenWindow.Margin (Page 1454)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ScreenWindow.Margin (Page 1454)

ScreenWindow.Monitor

Description

The "Monitor" property returns the monitor on which the window is displayed.

Type

UInt8

Access

Read-only

Syntax

```
ScreenWindow.Monitor
```

See also

ScreenWindow (Page 1436)

ScreenWindow.Name

Description

The "Name" property returns the name of the screen window.

Type

String

Access

Read-only

Syntax

```
ScreenWindow.Name
```

See also

ScreenWindow (Page 1436)

ScreenWindow.Parent

Description

The "Parent" property returns the parent screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
ScreenWindow.Parent
```

See also

ScreenWindow (Page 1436)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

ScreenWindow.Path

Description

The "Path" property returns the absolute object path of a screen window in runtime starting from the screen window on the highest level.

Note

For the syntax of an object path, see the "FindItem" method (Page 1549).

Type

String

Access

Read-only

Syntax

```
ScreenWindow.Path
```

See also

UI.FindItem() (Page 1549)

ScreenWindow (Page 1436)

ScreenWindow.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the object has been created.

Type

String

Access

Read-only

Syntax

```
ScreenWindow.RenderingTemplate
```

See also

ScreenWindow (Page 1436)

ScreenWindow.Screen

Description

The "Screen" property specifies the name of the screen ("HMIScreen" type) that is contained in the screen window. Loads a new screen via its name into the screen window.

The "Screen" property returns a different value than the "CurrentScreen" when the referenced screen is not yet loaded completely or does not exist.

Type

String, HmiStoredScreen

Access

Read-write

Syntax

```
ScreenWindow.Screen
```

See also

ScreenWindow (Page 1436)

ScreenWindow.ScreenName

Description

The "ScreenName" property returns the screen name.

Type

String

Access

Read-only

Syntax

```
ScreenWindow.ScreenName
```

See also

ScreenWindow (Page 1436)

ScreenWindow.ScreenNumber

Description

The "ScreenNumber" property returns the screen number.

Type

UInt16

Access

Read-only

Syntax

```
ScreenWindow.ScreenNumber
```

See also

ScreenWindow (Page 1436)

ScreenWindow.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the screen window is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
ScreenWindow.ShowFocusVisual
```

See also

ScreenWindow (Page 1436)

ScreenWindow.StartupPosition

Description

The "StartupPosition" property sets the position of the screen window at runtime start.

Type

Int32, HmiWindowStartupPosition

Specifies the position of the screen window:

- None (0): Relative placement on the configured monitor via "Left" and "Top".
- CenteredMonitor (1): Centered on the configured monitor.
- Maximized (2): Maximized on the configured monitor.
- CenteredOwner (3): Centered on the displayed screen.

Access

Read-write

Syntax

```
ScreenWindow.StartupPosition
```

See also

ScreenWindow (Page 1436)

ScreenWindow.StyleItemClass

Description

The "StyleItemClass" property returns the style that is applied to the screen window.

Type

String

Access

Read-only

Syntax

```
ScreenWindow.StyleItemClass
```

See also

ScreenWindow (Page 1436)

ScreenWindow.System

Description

The "System" property specifies the server prefix.

Type

String, HmiSystem

Access

Read-write

Syntax

```
ScreenWindow.System
```

See also

ScreenWindow (Page 1436)

ScreenWindow.TabIndex

Description

The "TabIndex" returns the position of the screen window in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
ScreenWindow.TabIndex
```

See also

ScreenWindow (Page 1436)

ScreenWindow.TabIntoWindow

Description

The "TabIntoWindow" property specifies that the configured tab sequence of the displayed screen is resumed on activation via the configured tab sequence.

Type

Bool

Access

Read-write

Syntax

```
ScreenWindow.TabIntoWindow
```

See also

ScreenWindow (Page 1436)

ScreenWindow.Top

Description

The "Top" property specifies the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
ScreenWindow.Top
```

See also

ScreenWindow (Page 1436)

ScreenWindow.VerticalScrollBarPosition

Description

The "VerticalScrollBarPosition" property specifies the vertical position for the scroll bar.

Type

Int32

Access

Read-write

Syntax

```
ScreenWindow.VerticalScrollBarPosition
```

See also

ScreenWindow (Page 1436)

ScreenWindow.VerticalScrollBarVisibility (Page 1464)

ScreenWindow.VerticalScrollBarVisibility

Description

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the window.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
ScreenWindow.VerticalScrollBarVisibility
```

See also

ScreenWindow (Page 1436)

ScreenWindow.VerticalScrollBarPosition (Page 1464)

ScreenWindow.Visible

Description

The "Visible" property specifies whether the screen window is visible.

Type

Bool

Access

Read-write

Syntax

```
ScreenWindow.Visible
```

See also

ScreenWindow (Page 1436)

ScreenWindow.Width

Description

The "Width" property specifies the width of the screen window in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ScreenWindow.Width
```

See also

ScreenWindow (Page 1436)

ScreenWindow.WindowFlags

Description

The "WindowFlags" property specifies the screen window configuration.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

Enable multiple properties by adding the integer values or bit operators.

Access

Read-write

Syntax

```
ScreenWindow.WindowFlags
```

Example

Adapt the "windowFlags" tag depending on the window configuration:

Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose){
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

See also

ScreenWindow (Page 1436)

ScreenWindow.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the screen window.

Syntax

```
ScreenWindow.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

ScreenWindow (Page 1436)

ScreenWindow.Close()

Description

The "Close" method closes the screen window.

Syntax

```
ScreenWindow.Close()
```

Parameters

--

Return value

Bool

See also

ScreenWindow (Page 1436)

ScreenWindow.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing means the change between two values of a property.

Syntax

```
ScreenWindow.PropertyFlashing(propertyName,enable[,value]
[,alternateValue][,rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flashing frequency:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

ScreenWindow (Page 1436)

ScreenWindow_OnActivated()

Description

The "OnActivated" event occurs when a screen window receives focus:

- A screen window is selected via the configured tab sequence.
- A screen window that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and receives focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
ScreenWindow_OnActivated(item)
```

Context

`Item`

Type: Object

Screen window where the event occurs.

See also

ScreenWindow (Page 1436)

ScreenWindow_OnDeactivated()

Description

The "OnDeactivated" event occurs when a screen window loses focus when the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
ScreenWindow_OnDeactivated(item)
```

Context

`Item`

Type: Object

Screen window where the event occurs.

See also

ScreenWindow (Page 1436)

Screen.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the screen.

Syntax

```
Screen.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

Screen (Page 1397)

Screen.FindItem()

Description

The "FindItem" method returns screen windows or screen objects through their object path.

Syntax

```
Screen.FindItem(ScreenItemPath)
```

Parameter

`ScreenItemPath`

Type: String

Object path of the searched screen window or screen object.

Note

The "UI.FindItem" method has a global search context and requires absolute object paths. The "Screen.FindItem" method has the current screen as the search context and can also use relative object paths.

Formulation of the object path

The syntax of the object path orients itself to the notation of the file system paths. The object path consists of the names of the screen windows (Screen Windows) and screen objects (Screen Items). The names are connected via a slash ("/") according to the hierarchical positioning. Screens (Screens) and their names are not used in the formulation.

Relative and absolute object paths are distinguished by the prefix of the object path. The following prefixes can be used:

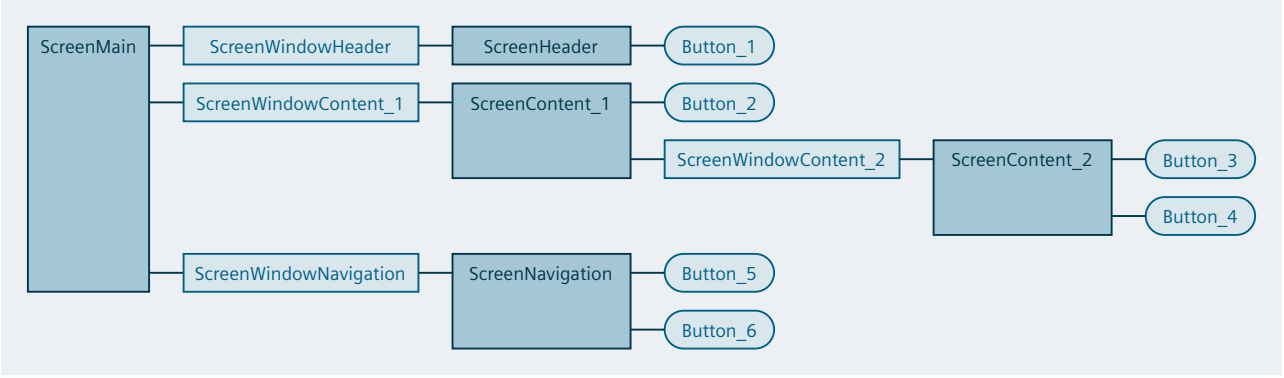
- Relative object path
  - "..": References the parent screen window (Parent) in the context of the current screen window.
  - ".": References the own screen window (Self).
  - "": A screen object of the current screen window is referenced without prefix.
- Absolute object path
  - "/": References a screen window on the highest level, whose name must follow.
  - "~": References the screen window on the highest level in the own screen hierarchy.

Additional rules for formulating an object path:

- The string ".." may be used several times in the object path, but only together at the beginning of the object path, for example, "../../Window5".
- If the object path does not end with a screen object name, a screen window is referenced.
- A search is performed for screen objects of the object path in the screens of the referenced screen window. It is not permitted to specify a screen name.

Examples of object paths

The following window / screen object hierarchy is adopted for the following examples:



The following objects paths for addressing the object result from this:

- Relative addressing:
  - "Button_2" changes the label of "Button_1":
    ```
    // Navigate one level up and find "Button_1" inside the
    "ScreenWindowHeader"
    Screen.FindItem("../ScreenWindowHeader/Button_1").Text =
    "Changed by Button_2"
    ```
  - "Button_3" changes the label of "Button_5":
    ```
    // Navigate two levels up and find "Button 2" inside the
    "ScreenWindowNavigation"
    Screen.FindItem("../../ScreenWindowNavigation/Button_5").Text =
    "Changed by Button_3"
    ```
  - "Button_3" changes the label of "Button_4":
    ```
    // Find "Button_4" in same screen ("ScreenContent_2")
    Screen.FindItem("Button_4").Text = "Changed by Button_3"
    Screen.FindItem("./Button_4").Text = "Changed by Button_3"
    ```
- Absolute addressing:
  - "Button_4" changes the label of "Button_6":
    ```
    // Navigate to the root screen and find "Button_6" inside the
    "ScreenWindowNavigation"
    Screen.FindItem("~/ScreenWindowNavigation/Button_6").Text =
    "Changed by Button_4"
    ```

Return value

Object, HmiScreenObjectBase (Page 1571)

Screen (Page 1397)

Screen Items (Page 1571)

Screen.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing means the change between two values of a property.

Syntax

```
Screen.PropertyFlashing(propertyName,enable[,value][,alternateValue]
[,rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flashing frequency:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

Screen (Page 1397)

Screen_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- Screen is clicked with the right mouse button.
- Screen is long-touched.

  Note

  The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
Screen_OnContextTapped(item,x,y,modifiers,trigger)
```

Context

Item

Type: Object

Image where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Screen (Page 1397)

Screen_OnHotKey()

Description

The "OnHotKey" event occurs when the operator presses a hotkey:

Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Syntax

```
Screen_OnHotKey(item,keyCode,modifiers)
```

Context

item

Type: Object

Image where the event occurs.

keyCode

Type: DInt

Numeric identifier of the pressed hotkey

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Screen (Page 1397)

Screen_OnLoaded()

Description

The "OnLoaded" event occurs when the screen is fully loaded in runtime.

Syntax

```
Screen_OnLoaded(item)
```

Context

Item

Type: Object

Image at which the event occurs.

See also

Screen (Page 1397)

Screen_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- Screen is clicked with the left mouse button.
- <RETURN> or <SPACE> key is pressed when a screen has the focus.
- Screen is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
Screen_OnTapped(item,x,y,modifiers,trigger)
```

Context

Item

Type: Object

Image where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

Screen (Page 1397)

Screen_OnUnloaded()

Description

The "OnUnloaded" event occurs when the active screen on the HMI device is completely removed.

Syntax

```
Screen_OnUnloaded(item)
```

Context

`Item`

Type: Object

Image at which the event occurs.

See also

Screen (Page 1397)

UI.Alarm

Description

The "Alarm" object enables access to the properties of a selected alarm in the alarm control.

Object type

HMIUIAlarm

Properties

--

Methods

The "Alarm" object has the following methods:

- **GetSelectedAlarmAttributes()**
  Returns all properties of a selected alarm in the alarm control.

Alarm.GetSelectedAlarmAttributes()

Description

The "GetSelectedAlarmAttributes" method returns all properties of a selected alarm in the alarm control.

This method executes an asynchronous read operation without blocking further script execution. In doing so, the method uses a promise object which has handlers for successful ("then()") and faulty ("catch()") execution of the read operation. Depending on the result, once execution is complete the corresponding handler of the promise pattern is called with the "AlarmResult" objects or the error code as parameter.

Syntax

```
[HMIRuntime.]UI.Alarm.GetSelectedAlarmAttributes(PathAlarmControl)
.then(function(HMIAlarmBlockResult[]) {
    ...
});
.catch(function(ErrorCode) {
    ...
});
```

Parameters

PathAlarmControl

Type: String, HmiAlarmControl

Path to the alarm control

Return value

Promise

Depending on the state of the promise object:

- Promise fulfilled
  Object, HMIAlarmBlockResult[] (Page 1481) as parameter of the "then()" handler.
- Promise rejected
  ErrorCode as parameter of the "catch()" handler.

UI.Alarm (Page 1480)

AlarmBlockResult (Page 1481)

AlarmBlockResult

Description

The "AlarmBlockResult" object enables access to the properties of a selected alarm. The "AlarmBlockResult" object is a pure data object which maps all the properties of a selected alarm.

Use

The "AlarmBlockResult" object only contains properties and no methods.

All texts of the "AlarmBlockResult" object are monolingual strings. The language is specified with the "HMIRuntime.Language" property.

Object type

HMIAlarmBlockResult

Properties

The "AlarmBlockResult" object has the following properties:

- **AcknowledgeTime**
  Returns the time of the alarm acknowledgment.
- **AlarmGroupID**
  Returns the alarm group ID.
- **AlarmState**
  Returns the status of the alarm.
- **AlarmText1**
  Returns the localized additional text 1 of the alarm.
- **AlarmText2**
  Returns the localized additional text 2 of the alarm.
- **AlarmText3**
  Returns the localized additional text 3 of the alarm.
- **AlarmText4**
  Returns the localized additional text 4 of the alarm.
- **AlarmText5**
  Returns the localized additional text 5 of the alarm.
- **AlarmText6**
  Returns the localized additional text 6 of the alarm.
- **AlarmText7**
  Returns the localized additional text 7 of the alarm.
- **AlarmText8**
  Returns the localized additional text 8 of the alarm.
- **AlarmText9**
  Returns the localized additional text 9 of the alarm.
- **Area**
  Returns the alarm area of origin.
- **AverageActiveActive**
  Returns the result of the alarm statistics, stating how many active alarms were active on average.
- **AverageActiveAcknowledged**
  Returns the result of the alarm statistics, stating how many active alarms were acknowledged on average.
- **AverageActiveInactive**
  Returns the result of the alarm statistics, stating how many active alarms were inactive on average.
- **Class**
  Returns the name of the alarm class.

- **ClassSymbol**
  Returns the icon of the alarm class.
- **ClearTime**
  Returns the time of the alarm reset.
- **Duration**
  Returns the duration of the alarm.
- **EventText**
  Returns a localized text describing an event to the alarm.
- **Frequency**
  Returns the result of the alarm statistics, stating how often the alarm occurred.
- **HostName**
  Returns the name of the PC on which the alarm was triggered.
- **ID**
  Returns the ID of the alarm that is also used in the display.
- **InfoText**
  Returns the text information.
- **LoopInAlarm**
  Returns the name of the function that navigates from the display of the alarm to its origin.
- **ModificationTime**
  Returns the time stamp of the last alarm state modification.
- **Name**
  Returns the name of the alarm.
- **Origin**
  Returns the origin of the alarm.
- **Priority**
  Returns the relevance of the alarm or of the machine status.
- **ProcessValue1**
  Returns process value 1 of the alarm.
- **ProcessValue2**
  Returns process value 2 of the alarm.
- **ProcessValue3**
  Returns process value 3 of the alarm.
- **ProcessValue4**
  Returns process value 4 of the alarm.
- **ProcessValue5**
  Returns process value 5 of the alarm.
- **ProcessValue6**
  Returns process value 6 of the alarm.
- **ProcessValue7**
  Returns process value 7 of the alarm.
- **ProcessValue8**
  Returns process value 8 of the alarm.

- **ProcessValue9**
  Returns process value 9 of the alarm.
- **ProcessValue10**
  Returns process value 10 of the alarm.
- **RaiseTime**
  Returns the raise time of the alarm.
- **ResetTime**
  Returns the time of the alarm reset.
- **SumActiveActive**
  Returns the result of the alarm statistics, stating how many active alarms are active in total.
- **SumActiveAcknowledged**
  Returns the result of the alarm statistics, stating how many active alarms were acknowledged in total.
- **SumActiveInactive**
  Returns the result of the alarm statistics, stating how many active alarms are inactive in total.
- **SuppressionState**
  Returns the visibility status of the alarm.
- **UserName**
  Returns the name of the user who triggered the alarm.
- **Value**
  Returns the process value of the alarm.
- **ValueLimit**
  Returns the limit of the process value of the alarm.
- **ValueQuality**
  Returns the quality level of the process value of the alarm.

AlarmBlockResult (Page 1481)

AlarmBlockResult.AlarmText7

Description

The "AlarmText7" property returns the localized additional text 7 of the alarm.

Type

String

Access

Read-only

Syntax

```
AlarmBlockResult.AlarmText7
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.AlarmText8

Description

The "AlarmText8" property returns the localized additional text 8 of the alarm.

Type

String

Access

Read-only

Syntax

```
AlarmBlockResult.AlarmText8
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.AlarmText9

Description

The "AlarmText9" property returns the localized additional text 9 of the alarm.

Type

String

Access

Read-only

Syntax

```
AlarmBlockResult.AlarmText9
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.Area

Description

The "Area" property specifies the alarm area of origin.

The "Area" property can be configured and, together with the "Origin" property, defines the source of an alarm. You can also use placeholders for context-sensitive format.

The "Area" property, for example, includes subsystem, application name, or PLC ID. You can sort and filter alarms using the "Area" context.

Type

String

Access

Read-only

Syntax

```
AlarmBlockResult.Area
```

AlarmBlockResult (Page 1481)

AlarmBlockResult.AverageActiveActive

Description

The "AverageActiveActive" property returns the result of the alarm statistics, stating how many active alarms are active on average.

Type

String

Access

Read-only

Syntax

```
AlarmBlockResult.AverageActiveActive
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.AverageActiveAcknowledged

Description

The "AverageActiveAcknowledged" property returns the result of the alarm statistics, stating how many active alarms were acknowledged on average.

Type

String

Access

Read-only

Syntax

```
AlarmBlockResult.AverageActiveAcknowledged
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.AverageActiveInactive

Description

The "AverageActiveInactive" property returns the result of the alarm statistics, stating how many active alarms were inactive on average.

Type

String

Access

Read-only

Syntax

```
AlarmBlockResult.AverageActiveInactive
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.Class

Description

The "Class" property returns the name of the alarm class.

Type

String

Access

Read-only

Syntax

```
AlarmBlockResult.Class
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.ClassSymbol

Description

The "ClassSymbol" property returns the icon of the alarm class.

Type

String

Access

Read-only

Syntax

```
AlarmBlockResult.ClassSymbol
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.ClearTime

Description

The "ClearTime" property returns the time of the alarm reset.

Type

DateTime

Access

Read-only

Syntax

```
AlarmBlockResult.ClearTime
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.Duration

Description

The "Duration" property returns the duration of the alarm.

Type

Time

Access

Read-only

Syntax

```
AlarmBlockResult.Duration
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.EventText

Description

The "EventText" property returns a localized text describing an event to the alarm.

Type

String

Access

Read-only

Syntax

```
AlarmBlockResult.EventText
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.Frequency

Description

The "Frequency" property returns the result of the alarm statistics, stating how often the alarm occurred.

Type

UInt32

Access

Read-only

Syntax

```
AlarmBlockResult.Frequency
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.HostName

Description

The "HostName" property returns the name of the PC on which the alarm was triggered.

Type

String

Access

Read-only

Syntax

```
AlarmBlockResult.HostName
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.ID

Description

The "ID" property returns the alarm ID.

Type

UInt32

Access

Read-only

Syntax

```
AlarmBlockResult.ID
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.InfoText

Description

The "InfoText" property returns the text information.

Type

String

Access

Read-only

Syntax

```
AlarmBlockResult.InfoText
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.LoopInAlarm

Description

The "LoopInAlarm" property returns the name of the function that navigates from the alarm display to its origin.

Type

String

Access

Read-only

Syntax

```
AlarmBlockResult.LoopInAlarm
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.ModificationTime

Description

The "ModificationTime" property returns the time stamp of the last modification to the alarm state.

Type

DateTime

Access

Read-only

Syntax

```
AlarmBlockResult.ModificationTime
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.Name

Description

The "Name" property returns the name of the alarm.

Type

String

Access

Read-only

Syntax

```
AlarmBlockResult.Name
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.Origin

Description

The "Origin" property returns the origin of the alarm.

For example, the "Origin" property contains the system name, data source, or CPU ID. You can sort and filter alarms using the "Origin" context.

The "Origin" property can be configured and, together with the "Area" property, defines the source of an alarm. You can also use placeholders for context-sensitive format.

Type

String

Access

Read-only

Syntax

```
AlarmBlockResult.Origin
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.Priority

Description

The "Priority" property returns the relevance of the alarm or of the machine status.

Type

UInt8

Access

Read-only

Syntax

```
AlarmBlockResult.Priority
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.ProcessValue1

Description

The "ProcessValue1" property returns process value 1 of the alarm.

Type

Variant

Access

Read-only

Syntax

```
AlarmBlockResult.ProcessValue1
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.ProcessValue2

Description

The "ProcessValue2" property returns process value 2 of the alarm.

Type

Variant

Access

Read-only

Syntax

```
AlarmBlockResult.ProcessValue2
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.ProcessValue3

Description

The "ProcessValue3" property returns process value 3 of the alarm.

Type

Variant

Access

Read-only

Syntax

```
AlarmBlockResult.ProcessValue3
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.ProcessValue4

Description

The "ProcessValue4" property returns process value 4 of the alarm.

Type

Variant

Access

Read-only

Syntax

```
AlarmBlockResult.ProcessValue4
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.ProcessValue5

Description

The "ProcessValue5" property returns process value 5 of the alarm.

Type

Variant

Access

Read-only

Syntax

```
AlarmBlockResult.ProcessValue5
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.ProcessValue6

Description

The "ProcessValue6" property returns process value 6 of the alarm.

Type

Variant

Access

Read-only

Syntax

```
AlarmBlockResult.ProcessValue6
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.ProcessValue7

Description

The "ProcessValue7" property returns process value 7 of the alarm.

Type

Variant

Access

Read-only

Syntax

```
AlarmBlockResult.ProcessValue7
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.ProcessValue8

Description

The "ProcessValue8" property returns process value 8 of the alarm.

Type

Variant

Access

Read-only

Syntax

```
AlarmBlockResult.ProcessValue8
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.ProcessValue9

Description

The "ProcessValue9" property returns process value 9 of the alarm.

Type

Variant

Access

Read-only

Syntax

```
AlarmBlockResult.ProcessValue9
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.ProcessValue10

Description

The "ProcessValue10" property returns process value 10 of the alarm.

Type

Variant

Access

Read-only

Syntax

```
AlarmBlockResult.ProcessValue10
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.RaiseTime

Description

The "RaiseTime" property returns the raise time of the alarm.

Type

DateTime

Access

Read-only

Syntax

```
AlarmBlockResult.RaiseTime
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.ResetTime

Description

The "ResetTime" property returns the time of the alarm reset.

Type

DateTime

Access

Read-only

Syntax

```
AlarmBlockResult.ResetTime
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.SumActiveAcknowledged

Description

The "SumActiveAcknowledged" property returns the result of the alarm statistics, stating how many active alarms were acknowledged in total.

Type

String

Access

Read-only

Syntax

```
AlarmBlockResult.SumActiveAcknowledged
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.SumActiveActive

Description

The "SumActiveActive" property returns the result of the alarm statistics, stating how many active alarms are active in total.

Type

String

Access

Read-only

Syntax

```
AlarmBlockResult.SumActiveActive
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.SumActiveInactive

Description

The "SumActiveInactive" property returns the result of the alarm statistics, stating how many active alarms are inactive in total.

Type

String

Access

Read-only

Syntax

```
AlarmBlockResult.SumActiveInactive
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.SuppressionState

Description

The "SuppressionState" property returns the visibility status of the alarm.

Value	SuppressionState	Description
0x0	Unsuppressed	Alarm is visible.
0x1	Suppressed	Alarm is configured as not visible.
0x3	Shelved	Alarm was hidden manually. The "Unshelve" and "Shelve" methods can be applied.

Type

UInt8

Access

Read-only

Syntax

```
AlarmBlockResult.SuppressionState
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.UserName

Description

The "UserName" property returns the name of the user who triggered the alarm.

Type

String

Access

Read-only

Syntax

```
AlarmBlockResult.UserName
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.Value

Description

The "Value" property returns the process value of the alarm.

Type

Variant

Access

Read-only

Syntax

```
AlarmBlockResult.Value
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.ValueLimit

Description

The "ValueLimit" property returns the limit of the alarm process value.

Type

Variant

Access

Read-only

Syntax

```
AlarmBlockResult.ValueLimit
```

See also

AlarmBlockResult (Page 1481)

AlarmBlockResult.ValueQuality

Description

The "ValueQuality" property returns the quality level of the process value of the alarm.

Type

UInt16

Access

Read-only

Syntax

```
AlarmBlockResult.ValueQuality
```

See also

AlarmBlockResult (Page 1481)

UI.DataSet

Description

The "DataSet" property returns the global data set ("DataSet" object) of the session.

Type

Object, HMIDataSet (Page 1510)

Access

Read-only

Syntax

```
[HMIRuntime.]UI.DataSet
```

See also

UI (Page 1395)

DataSet (Page 1510)

DataSet

Description

The "DataSet" object ("HMIDataSet" type) is a list of "DataSetElement" objects that enable data exchange in runtime.

A "DataSet" object is defined globally (on the "UI" object) or on a screen (the "Screen" object). You can access the data from any action.

You reference a "DataSet" object via the `UI.DataSet` property or via the respective screen with the `Screen.DataSet` property.

The "DataSet" object exists as long as the screen is displayed. The global object exists over the entire time period in which runtime runs.

Use

The "DataSet" object is a list which be counted and enumerated. You can access the "DataSet" list via the index or the element names.

Object type

HMIDataSet

Properties

The "DataSet" object has the following properties:

- **Count**
  Returns the number of elements of the "DataSet" list.

Methods

The "DataSet" object has the following methods:

- **Add()**
  Adds an element with value to the "DataSet" list.
- **Clear()**
  Removes all elements from the "DataSet" list.
- **Exists()**
  Checks whether an element is present in the "DataSet" list.
- **Item()**
  Returns the value of an element of the "DataSet" list.
- **Remove()**
  Removes an element by its name from the "DataSet" list.

DataSet.Count

Description

The "Count" property returns the number of elements in the "DataSet" list.

Type

UInt32

Access

Read-only

Syntax

```
DataSet.Count
```

See also

DataSet (Page 1510)

DataSet.Add()

Description

The "Add" method adds an element ("DataSetElement" object) to the "DataSet" list. The elements are referenced by name.

Syntax

```
DataSet.Add(name,value)
```

Parameters

name

Type: String

Name of the element that will be added to the list.

value

Type: Variant

Value of the element that will be added to the list.

Return value

--

See also

DataSet (Page 1510)

DataSet.Clear()

Description

The "Clear" method removes all elements ("DataSetElement" objects) from the "DataSet" list.

Syntax

```
DataSet.Clear()
```

Parameter

--

Return value

--

See also

DataSet (Page 1510)

DataSet.Remove() (Page 1514)

DataSet.Exists()

Description

The "Exists" method searches for an element ("DataSetElement" object) in the "DataSet" list.

Syntax

```
DataSet.Exists(name)
```

Parameters

name

Type: String

Name of the element that is being searched for.

Return value

Bool

See also

DataSet (Page 1510)

DataSet.Item()

Description

The "Item" method returns the value of a "DataSetElement" object of the "DataSet" list.

Syntax

```
DataSet[.Item](name)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "DataSet" object.

Parameter

`name`

Type: String

Element name or index number (1...n) of an object "DataSetElement" of the list

Return value

Variant

See also

DataSet (Page 1510)

DataSetElement (Page 1514)

DataSet.Remove()

Description

The "Remove" method removes an element ("DataSetElement" object) from the "DataSet" list by its name.

Syntax

```
DataSet.Remove(name)
```

Parameters

name

Type: String

Name of the element that will be removed.

Return value

--

See also

DataSet (Page 1510)

DataSet.Clear() (Page 1512)

DataSetElement

Description

The "DataSetElement" object represents a data set element in the "DataSet" list.

Object type

HMIDataSetElement

Properties

The "DataSetElement" object has the following properties:

- **Name**
  Returns the name of the element.
- **Value**
  Returns the value of the element.

Methods

--

DataSetElement.Name

Description

The "Name" property returns the name of the element ("DataSetElement" object).

Type

String

Access

Read-only

Syntax

```
DataSetElement.Name
```

See also

DataSetElement (Page 1514)

DataSetElement.Value

Description

The "Name" property returns the value of the element ("DataSetElement" object).

Type

Variant

Access

Read-only

Syntax

```
DataSetElement.Value
```

See also

DataSetElement (Page 1514)

UI.PopupScreenWindows

Description

The "Windows" property returns a list of all popup screen windows ("HMIPopupScreenWindows" objects).

Type

Object, HMIPopupScreenWindows (Page 1516)

Access

Read-only

Syntax

```
[HMIRuntime.]UI.PopupScreenWindows
```

See also

UI (Page 1395)

PopupScreenWindows (Page 1516)

PopupScreenWindows

Description

The "PopupScreenWindows" object is a list of all popup screen windows ("PopupScreenWindow" objects).

Use

The "PopupScreenWindows" object is a list which can be counted and enumerated. You can access the "PopupScreenWindows" list using the index or the tag names.

Object type

HMIPopupScreenWindows

Properties

The "PopupScreenWindows" object has the following properties:

- **Count**
  Returns the number of popup screen windows in the "PopupScreenWindows" list.

Methods

The "PopupScreenWindows" object has the following methods:

- **Item()**
  Returns a popup screen window of the "PopupScreenWindows" list.

See also

UI.PopupScreenWindows (Page 1516)

PopupScreenWindows.Count

Description

The "Count" property returns the number of popup screen windows in the "PopupScreenWindows" list.

Type

UInt32

Access

Read-only

Syntax

```
PopupScreenWindows.Count
```

See also

PopupScreenWindows (Page 1516)

PopupScreenWindows.Item()

Description

The "Item" method returns a popup screen window of the "PopupScreenWindows" list.

Syntax

```
PopupScreenWindows[.Item](WindowName);
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "PopupScreenWindows" object.

Parameter

`WindowName`

Type: String, HMIPopupScreenWindow

Name of the popup screen window

Return value

Object, HMIPopupScreenWindow (Page 4288)

See also

PopupScreenWindows (Page 1516)

PopupScreenWindow (Page 4288)

PopupScreenWindow

Description

PopupScreenWindow (Page 4288)

UI.RootWindow

Description

The "RootWindow" property returns the top level (Top Level Screen Window) screen window of the screen where the script is executed.

Type

Object, HmiTopLevelScreenWindow (Page 1522)

Access

Read-only

Syntax

```
[HMIRuntime.]UI.RootWindow
```

See also

UI (Page 1395)

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow

Description

TopLevelScreenWindow (Page 1522)

UI.Style

Description

The "Style" property specifies the style of the display and operating objects.

Type

String, HmiStyle

Access

Read-write

Syntax

```
[HMIRuntime.]UI.Style
```

Example

Switch all objects in runtime to the dark style and then output the style via the debug output:

Copy code

```
HMIRuntime.UI.Style = "FlatStyle_Dark";
HMIRuntime.Trace("Switched style to: " + HMIRuntime.UI.Style);
```

See also

UI (Page 1395)

UI.Windows

Description

The "Windows" property returns a list of all screen windows at the top level (Top Level Screen Window).

Type

Object, HMITopLevelWindows (Page 1520)

Access

Read-only

Syntax

```
[HMIRuntime.]UI.Windows
```

See also

UI (Page 1395)

TopLevelWindows (Page 1520)

TopLevelWindows

Description

The "TopLevelWindows" object is a list of "TopLevelScreenWindow" objects that provides access to the top-level screen windows in runtime.

You reference a "TopLevelWindows" object via the `UI.Windows` property.

Use

The "TopLevelWindows" object is a list and can be counted and enumerated. You can access the "TopLevelWindows" list using the index or the tag name.

Object type

HMITopLevelWindows

Properties

The "TopLevelWindows" object has the following properties:

- **Count**
  Returns the number of screen windows at the highest level of the "TopLevelWindows" list.

Methods

The "TopLevelWindows" object has the following methods:

- **Item()**
  Returns a screen window at the highest level of the "TopLevelWindows" list.

TopLevelWindows.Count

Description

The "Count" property returns the number of screen windows at the highest level of the "TopLevelWindows" list.

Type

UInt32

Access

Read-only

Syntax

```
TopLevelWindows.Count
```

See also

TopLevelWindows (Page 1520)

TopLevelWindows.Item()

Description

The "Item" method returns a screen window at the highest level of the "TopLevelWindows" list.

Syntax

```
TopLevelWindows[.Item](WindowName);
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "TopLevelWindows" object.

Parameter

`WindowName`

Type: String, HmiTopLevelScreenWindow

Name of the screen window at the highest level

Return value

Object, HmiTopLevelScreenWindow (Page 1522)

See also

TopLevelWindows (Page 1520)

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow

Description

The "TopLevelScreenWindows" object represents a screen window at the highest hierarchy level.

Object type

HmiTopLevelScreenWindow

Properties

The "TopLevelScreenWindow" object has the following properties:

- **Adaption**
  Specifies how the window size adapts.
- **Caption**
  Specifies the text to be displayed in the title bar.
- **CaptionColor**
  Specifies the background color of the title bar.

- **CurrentScreen**
  Returns the screen of the current screen window.
- **CurrentZoomFactor**
  Specifies the zoom factor which is applied to the displayed screen.
- **Enabled**
  Specifies whether the specified object can be operated in runtime.
- **Height**
  Specifies the height.
- **HorizontalScrollBarPosition**
  Specifies the horizontal alignment for the scroll bar.
- **HorizontalScrollBarVisibility**
  Specifies the setting for the horizontal scroll bar of the window.
- **Icon**
  Specifies the icon.
- **InteractiveZooming**
  Specifies whether zooming is supported.
- **Layer**
  Returns the layer of the screen that contains the screen window.
- **Left**
  Specifies the value of the X coordinate.
- **Monitor**
  Returns the monitor on which the screen window is displayed.
- **Name**
  Returns the name of the screen window.
- **Parent**
  Returns the parent screen object (Parent container).
- **Path**
  Returns the absolute object path of the screen window.
- **RenderingTemplate**
  Returns the name of the template from which the object was created.
- **Screen**
  Specifies the name of the screen contained in the referenced screen window.
- **ScreenName**
  Returns the screen name.
- **ScreenNumber**
  Returns the screen number.
- **StartupPosition**
  Specifies the position of the screen window at runtime start.
- **StyleItemClass**
  Returns the style that is applied to the screen window.
- **System**
  Specifies the server prefix.

- **TabIndex**
  Returns the position of the screen window in the tab sequence.
- **Top**
  Specifies the value of the Y coordinate.
- **VerticalScrollBarPosition**
  Specifies the vertical alignment for the scroll bar.
- **VerticalScrollBarVisibility**
  Specifies the setting for the vertical scroll bar of the window.
- **Visible**
  Specifies whether the screen window is visible.
- **Width**
  Specifies the width.
- **WindowFlags**
  Specifies the screen window configuration.

Methods

The "TopLevelScreenWindow" object has the following methods:

- **Close()**
  Closes the screen window.

TopLevelScreenWindow.Adaption

Description

The "Adaption" property specifies how the window size adapts.

Type

Int32, HmiScreenWindowAdaption

Specifies how the window size adapts:

- None (0): No adaptation
- WindowToScreen (1): Window size corresponds to screen size
- ScreenToWindow (2): Screen is scaled to window size.

Access

Read-write

Syntax

```
TopLevelScreenWindow.Adaption
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.Caption

Description

The "Caption" property specifies the text to be displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
TopLevelScreenWindow.Caption
```

See also

TopLevelScreenWindow (Page 1522)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

TopLevelScreenWindow.Caption (Page 1525)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 1525)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 1525)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 1525)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 1525)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 1525)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal

- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 1525)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

TopLevelScreenWindow.Caption (Page 1525)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

TopLevelScreenWindow.Caption (Page 1525)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

TopLevelScreenWindow.Caption (Page 1525)

TopLevelScreenWindow.CaptionColor

Description

The "CaptionColor" property specifies the color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
TopLevelScreenWindow.CaptionColor
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.CurrentScreen

Description

The "CurrentScreen" property returns the screen of the current screen window.

Type

Object, HmiScreen (Page 1397)

Access

Read-only

Syntax

```
TopLevelScreenWindow.CurrentScreen
```

See also

TopLevelScreenWindow (Page 1522)

Screen (Page 1397)

Screen

Description

Screen (Page 1397)

TopLevelScreenWindow.CurrentZoomFactor

Description

The "CurrentZoomFactor" property specifies the zoom factor of the screen window. The zoom factor may differ from the containing screen. The value 1.0 corresponds to a zoom factor of 100%.

Type

Float

Access

Read-write

Syntax

```
TopLevelScreenWindow.CurrentZoomFactor
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.Enabled

Description

The "Enabled" property specifies whether the screen window can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
TopLevelScreenWindow.Enabled
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.Height

Description

The "Height" property specifies the height of the screen window in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
TopLevelScreenWindow.Height
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.HorizontalScrollBarPosition

Description

The "HorizontalScrollBarPosition" property specifies the horizontal alignment for the scroll bar.

Type

Int32

Access

Read-write

Syntax

```
TopLevelScreenWindow.HorizontalScrollBarPosition
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.HorizontalScrollBarVisibility (Page 1534)

TopLevelScreenWindow.HorizontalScrollBarVisibility

Description

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
TopLevelScreenWindow.HorizontalScrollBarVisibility
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.HorizontalScrollBarPosition (Page 1533)

TopLevelScreenWindow.Icon

Description

The "Icon" property specifies the icon of the screen window.

Type

String

Access

Read-write

Syntax

```
TopLevelScreenWindow.Icon
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.InteractiveZooming

Description

The "InteractiveZooming" property specifies whether zooming is supported.

Type

Bool

Access

Read-write

Syntax

```
TopLevelScreenWindow.InteractiveZooming
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.Layer

Description

The "Layer" property returns the layer of the screen that contains the screen window.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
TopLevelScreenWindow.Layer
```

See also

TopLevelScreenWindow (Page 1522)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

Layer.MinimumZoom (Page 1536)

TopLevelScreenWindow.Layer (Page 1535)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

Layer.MaximumZoom (Page 1536)

TopLevelScreenWindow.Layer (Page 1535)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

TopLevelScreenWindow.Layer (Page 1535)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

TopLevelScreenWindow.Layer (Page 1535)

TopLevelScreenWindow.Left

Description

The "Left" property specifies the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
TopLevelScreenWindow.Left
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.Monitor

Description

The "Monitor" property returns the monitor on which the window is displayed.

Type

UInt8

Access

Read-only

Syntax

```
TopLevelScreenWindow.Monitor
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.Name

Description

The "Name" property returns the name of the screen window.

Type

String

Access

Read-only

Syntax

```
TopLevelScreenWindow.Name
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.Parent

Description

The "Parent" property returns the parent screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
TopLevelScreenWindow.Parent
```

See also

TopLevelScreenWindow (Page 1522)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

TopLevelScreenWindow.Path

Description

The "Path" property returns the absolute object path of a screen window in runtime starting from the screen window on the highest level.

Note

For the syntax of an object path, see the "FindItem" method (Page 1549).

Type

String

Access

Read-only

Syntax

```
TopLevelScreenWindow.Path
```

See also

UI.FindItem() (Page 1549)

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the object has been created.

Type

String

Access

Read-only

Syntax

```
TopLevelScreenWindow.RenderingTemplate
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.Screen

Description

The "Screen" property specifies the name of the screen ("HMIScreen" type) that is contained in the screen window. Loads a new screen via its name into the screen window.

The "Screen" property returns a different value than the "CurrentScreen" when the referenced screen is not yet loaded completely or does not exist.

Type

String, HmiStoredScreen

Access

Read-write

Syntax

```
TopLevelScreenWindow.Screen
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.ScreenName

Description

The "ScreenName" property returns the screen name.

Type

String

Access

Read-only

Syntax

```
TopLevelScreenWindow.ScreenName
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.ScreenNumber

Description

The "ScreenNumber" property returns the screen number.

Type

UInt16

Access

Read-only

Syntax

```
TopLevelScreenWindow.ScreenNumber
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.StartupPosition

Description

The "StartupPosition" property sets the position of the screen window at runtime start.

Type

Int32, HmiWindowStartupPosition

Specifies the position of the screen window:

- None (0): Relative placement on the configured monitor via "Left" and "Top".
- CenteredMonitor (1): Centered on the configured monitor.
- Maximized (2): Maximized on the configured monitor.
- CenteredOwner (3): Centered on the displayed screen.

Access

Read-write

Syntax

```
TopLevelScreenWindow.StartupPosition
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.StyleItemClass

Description

The "StyleItemClass" property returns the style that is applied to the screen window.

Type

String

Access

Read-only

Syntax

```
TopLevelScreenWindow.StyleItemClass
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.System

Description

The "System" property specifies the server prefix.

Type

String, HmiSystem

Access

Read-write

Syntax

```
TopLevelScreenWindow.System
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.TabIndex

Description

The "TabIndex" returns the position of the screen window in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
TopLevelScreenWindow.TabIndex
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.Top

Description

The "Top" property specifies the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
TopLevelScreenWindow.Top
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.VerticalScrollBarPosition

Description

The "VerticalScrollBarPosition" property specifies the vertical position for the scroll bar.

Type

Int32

Access

Read-write

Syntax

```
TopLevelScreenWindow.VerticalScrollBarPosition
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.VerticalScrollBarVisibility (Page 1546)

TopLevelScreenWindow.VerticalScrollBarVisibility

Description

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the window.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
TopLevelScreenWindow.VerticalScrollBarVisibility
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.VerticalScrollBarPosition (Page 1545)

TopLevelScreenWindow.Visible

Description

The "Visible" property specifies whether the screen window is visible.

Type

Bool

Access

Read-write

Syntax

```
TopLevelScreenWindow.Visible
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.Width

Description

The "Width" property specifies the width of the screen window in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
TopLevelScreenWindow.Width
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.WindowFlags

Description

The "WindowFlags" property specifies the screen window configuration.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

Enable multiple properties by adding the integer values or bit operators.

Access

Read-write

Syntax

```
TopLevelScreenWindow.WindowFlags
```

Example

Adapt the "windowFlags" tag depending on the window configuration:

Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose){
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

See also

TopLevelScreenWindow (Page 1522)

TopLevelScreenWindow.Close()

Description

The "Close" method closes the screen window.

Syntax

```
TopLevelScreenWindow.Close()
```

Parameters

--

Return value

Bool

See also

TopLevelScreenWindow (Page 1522)

UI.FindItem()

Description

The "FindItem" method returns screen windows or screen objects through their object path.

Syntax

```
[HMIRuntime.]UI.FindItem(ScreenItemPath);
```

Parameter

`ScreenItemPath`

Type: String

Object path of the searched screen window or screen object.

Note

The "UI.FindItem" method has a global search context and requires absolute object paths. The "Screen.FindItem" method has the current screen as the search context and can also use relative object paths.

Formulation of the object path

The syntax of the object path orients itself to the notation of the file system paths. The object path consists of the names of the screen windows (Screen Windows) and screen objects (Screen Items). The names are connected via a slash ("/") according to the hierarchical positioning. Screens (Screens) and their names are not used in the formulation.

Relative and absolute object paths are distinguished by the prefix of the object path. The following prefixes can be used:

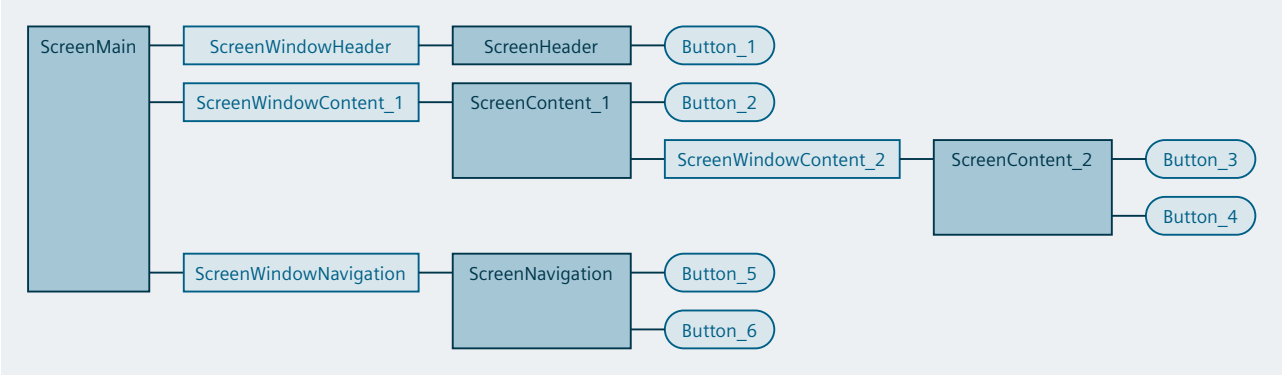
- Relative object path
  - "..": References the parent screen window (Parent) in the context of the current screen window.
  - ".": References the own screen window (Self).
  - "": A screen object of the current screen window is referenced without prefix.
- Absolute object path
  - "/": References a screen window on the highest level, whose name must follow.
  - "~": References the screen window on the highest level in the own screen hierarchy.

Additional rules for formulating an object path:

- The string ".." may be used several times in the object path, but only together at the beginning of the object path, for example, "../../Window5".
- If the object path does not end with a screen object name, a screen window is referenced.
- A search is performed for screen objects of the object path in the screens of the referenced screen window. It is not permitted to specify a screen name.

Examples of object paths

The following window / screen object hierarchy is adopted for the following examples:



The following objects paths for addressing the object result from this:

- Relative addressing:
  - "Button_2" changes the label of "Button_1":
    ```
    // Navigate one level up and find "Button_1" inside the
    "ScreenWindowHeader"
    Screen.FindItem("../ScreenWindowHeader/Button_1").Text =
    "Changed by Button_2"
    ```
  - "Button_3" changes the label of "Button_5":
    ```
    // Navigate two levels up and find "Button 2" inside the
    "ScreenWindowNavigation"
    Screen.FindItem("../../ScreenWindowNavigation/Button_5").Text =
    "Changed by Button_3"
    ```
  - "Button_3" changes the label of "Button_4":
    ```
    // Find "Button_4" in same screen ("ScreenContent_2")
    Screen.FindItem("Button_4").Text = "Changed by Button_3"
    Screen.FindItem("./Button_4").Text = "Changed by Button_3"
    ```
- Absolute addressing:
  - "Button_4" changes the label of "Button_6":
    ```
    // Navigate to the root screen and find "Button_6" inside the
    "ScreenWindowNavigation"
    Screen.FindItem("~/ScreenWindowNavigation/Button_6").Text =
    "Changed by Button_4"
    ```

Return value

Object, HmiScreenObjectBase (Page 1571)

See also

UI (Page 1395)

Screen Items (Page 1571)

UI.GetClientInfo()

Description

The "GetClientInfo" method returns information about the resolution of the screen.

Syntax

```
[HMIRuntime.]UI.GetClientInfo(infoType);
```

Parameters

`infoType`

Type: Int32, HmiClientInfoType

Specifies which information is requested:

- None (0): Does not return any information.
- PrimaryDisplayWidth (1): Returns the width of the screen in DIU (Device Independent Unit).
- PrimaryDisplayHeight (2): Returns the height of the screen in DIU (Device Independent Unit).
- PrimaryDisplayPixelRatio (3): Returns the ratio of the screen pixels in DIU (Device Independent Unit).

Return value

Variant

Example

Specify the screen window on the highest level depending on the resolution:

Copy code

```
let displayWidth = UI.GetClientInfo(UI.Enums.HmiClientInfoType.PrimaryDisplayWidth);
let displayHeight = UI.GetClientInfo(UI.Enums.HmiClientInfoType.PrimaryDisplayHeight);

if (displayHeight > displayWidth) {
   UI.RootWindow.Screen = "StartScreenPortrait";
} else {
   UI.RootWindow.Screen = "StartScreenLandscape";
}
```

See also

UI (Page 1395)

UI.OpenFaceplateInPopup()

Description

The "OpenFaceplateInPopup" method opens a faceplate from a screen in a popup window.

Syntax

```
[HMIRuntime.]UI.OpenFaceplateInPopup(faceplateType,title,interface[,
parentScreen][,invisible]);
```

Parameters

`faceplateType`

Type: String, HmiFaceplateType

Name of the faceplate type

Note

The version of the faceplate type preset as "Default" is automatically displayed in runtime.

`title`

Type: String

Title of the popup window

`interface`

Type: Object

Interface data of the faceplate in literal notation, e.g. `{Interface_Tag_1:{Tag:"HMI_Tag_1"}, Color_Property_1:0xff00ff00, ResourceList_Property_1:"@Default.Text_list_1"}`. The specification of the interface data by entering a graphics list is not supported.

`parentScreen`

Optional, type: Object, HmiScreen

Parent screen

`invisible`

Optional, type: Bool

Causes the faceplate to be configured so that it is invisible to the operator.

To then display the faceplate, set the property `visible=true`.

Return value

Object, HmiPopupScreenWindow (Page 4288)

See also

UI (Page 1395)

PopupScreenWindow (Page 4288)

ProDiag

Description

The "ProDiag" object

Object type

HMIUIProDiag

Properties

--

Methods

The "ProDiag" object has the following methods:

- **OpenTIAPortalFromAlarm()**
  Opens a TIA Portal project and jumps to the "GRAPH" details block.
- **OpenTIAPortalGRAPHDetails()**
  Opens a TIA Portal project and jumps to the "GRAPH" details block.
- **OpenTIAPortalProDiagDetailsByAssignment()**
  Opens a TIA Portal project and jumps to the "GRAPH" details block.
- **OpenTIAPortalProDiagDetailsByCall()**
  Opens a TIA Portal project and jumps to the "GRAPH" details block.
- **OpenTIAPortalProject()**
  Opens a TIA Portal project.

See also

UI (Page 1395)

ProDiag.OpenTIAPortalFromAlarm()

Description

The "OpenTIAPortalFromAlarm" method opens a TIA Portal project and jumps to the "GRAPH" details block.

Syntax

```
[HMIRuntime.]UI.ProDiag.OpenTIAPortalFromAlarm(DontUseModifiedProjec
t, ReadOnly, Online, AlarmView, pathToProject);
```

Parameters

`DontUseModifiedProject`

Type: Bool

If a changed project is already open, the project will not be opened.

ReadOnly

Type: Bool

Opens the project write-protected.

Online

Type: Bool

Goes into online mode after opening the block.

AlarmView

Type: String

Path of the alarm control

pathToProject

Type: String

Path of the project

Return value

ErrorCode

See also

ProDiag (Page 1553)

ProDiag.OpenTIAPortalGRAPHDetails()

Description

The "OpenTIAPortalGRAPHDetails" method opens a TIA Portal project and jumps to the "GRAPH" details block.

Syntax

```
[HMIRuntime.]UI.ProDiag.OpenTIAPortalGRAPHDetails(DontUseModifiedPro
ject, ReadOnly, Online, PlcName, Block, pathToProject);
```

Parameters

DontUseModifiedProject

Type: Bool

If a changed project is already open, the project will not be opened.

ReadOnly

Type: Bool

Opens the project write-protected.

`Online`

Type: Bool

Goes into online mode after opening the block.

`PlcName`

Type: String

Name of the PLC

`Block`

Type: String

Name of the block

`pathToProject`

Type: String

Path of the project

Return value

ErrorCode

See also

ProDiag (Page 1553)

ProDiag.OpenTIAPortalProDiagDetailsByAssignment()

Description

The "OpenTIAPortalProDiagDetailsByAssignment" method opens a TIA Portal project and jumps to the "GRAPH" details block.

Syntax

```
[HMIRuntime.]UI.ProDiag.OpenTIAPortalProDiagDetailsByAssignment(Dont
UseModifiedProject, ReadOnly, Online, PlcName, Block, Operand
pathToProject);
```

Parameters

`DontUseModifiedProject`

Type: Bool

If a changed project is already open, the project will not be opened.

`ReadOnly`

Type: Bool

Opens the project write-protected.

`Online`

Type:Bool

Goes into online mode after opening the block.

`PlcName`

Type: String

Name of the PLC

`Block`

Type: String

Name of the block

`Operand`

Type: String

Operand of the access point

`pathToProject`

Type: String

Path of the project

Return value

ErrorCode

See also

ProDiag (Page 1553)

ProDiag.OpenTIAPortalProDiagDetailsByCall()

Description

The "OpenTIAPortalProDiagDetailsByCall" method opens a TIA Portal project and jumps to the "GRAPH" details block.

Syntax

```
[HMIRuntime.]UI.ProDiag.OpenTIAPortalProDiagDetailsByCall(DontUseMod
ifiedProject, ReadOnly, Online, PlcName, ContainingBlock,
CalledBlock, Pin, pathToProject);
```

Parameters

`DontUseModifiedProject`

Type: Bool

If a changed project is already open, the project will not be opened.

`ReadOnly`

Type: Bool

Opens the project write-protected.

`Online`

Type: Bool

Goes into online mode after opening the block.

`PlcName`

Type: String

Name of the PLC

`ContainingBlock`

Type: String

Name of the contained block

`CalledBlock`

Type: String

Name of the called block

`Pin`

Type: String

Access point PIN

`pathToProject`

Type: String

Path of the project

Return value

ErrorCode

See also

ProDiag (Page 1553)

ProDiag.OpenTIAPortalProject()

Description

The "OpenTIAPortalProject" method opens a TIA Portal project.

Syntax

```
[HMIRuntime.]UI.ProDiag.OpenTIAPortalProject(DontUseModifiedProject,
 ReadOnly, pathToProject);
```

Parameters

DontUseModifiedProject

Type: Bool

If a changed project is already open, the project will not be opened.

ReadOnly

Type: Bool

Opens the project write-protected.

pathToProject

Type: String

Path of the project

Return value

ErrorCode

See also

ProDiag (Page 1553)

SysFct

Description

The "SysFct" object enables access to the system functions of the "ProDiag" object.

Object type

HMIUIProDiagSysFct

Properties

--

Methods

The "SysFct" object has the following methods:

- **IsJumpableAlarm()**
  Checks whether the alarm selected in the alarm control is a ProDiag alarm.
- **Next()**
  Executes the "Next" command in the PLC code viewer.
- **OpenPlcCodeViewByFCCall()**
  Represents the logic of a network input of a standard block in the PLC code viewer display taking the UDT instance into account.
- **OpenPlcCodeViewFromAlarm()**
  Opens the corresponding block in the PLC code view according to the selection in the alarm control.
- **OpenProDiagDetailsByAssignment()**
  Represents an assignment of an operand and its logic in the PLC code viewer display.
- **OpenProDiagDetailsByCall()**
  Represents the logic of a network input of a standard block in the PLC code viewer display.
- **OpenViewerGraphByBlock()**
  Jumps to the PLC code viewer and opens an S7 GRAPH step.
- **OpenViewerGraphFromOverview()**
  Jumps from a graph overview control to the PLC code viewer.
- **Previous()**
  Executes the "Previous" command in the PLC code viewer.
- **ResetToConfiguration()**
  Executes the "ResetToConfiguration" command in the PLC code viewer.
- **ToggleCriteriaAnalysis()**
  Executes the "ToggleCriteriaAnalysis" command in the PLC code viewer.
- **ToggleGRAPHViewerMode()**
  Executes the "ToggleGRAPHViewerMode" command in the PLC code viewer.
- **ToggleNetworkDisplay()**
  Executes the "ToggleNetworkDisplay" command in the PLC code viewer.
- **ZoomIn()**
  Executes the "ZoomIn" command in the PLC code viewer.
- **ZoomOut()**
  Executes the "ZoomOut" command in the PLC code viewer.

ProDiag (Page 1553)

SysFct.IsJumpableAlarm()

Description

The "IsJumpableAlarm" method checks whether the alarm selected in the alarm control is a ProDiag alarm. If yes, the specified screen entry is enabled. Otherwise it is disabled.

Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.IsJumpableAlarm(AlarmView,
screenItemPath);
```

Parameters

AlarmView

Type: String, HmiAlarmControl

Path of the alarm control with selected alarm

screenItemPath

Type: String, HmiScreenItemBase

Path of the code viewer display

Return value

ErrorCode

See also

SysFct (Page 1559)

SysFct.Next()

Description

The "Next" method executes the "Next" command in the PLC code viewer.

Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.Next(screenItemPathCodeViewer);
```

Parameters

screenItemPathCodeViewer

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path of the code viewer display

Return value

ErrorCode

See also

SysFct (Page 1559)

SysFct.OpenPlcCodeViewByFCCall()

Description

The "OpenPlcCodeViewByFCCall" represents the logic of a network input of a standard block in the PLC code viewer display, taking the UDT instance into account.

Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.OpenPlcCodeViewByFCCall(pinSubstringS
earch, plcName, containingBlock, calledBlock, pin, UdtInstance,
screenItemPath);
```

Parameters

pinSubstringSearch

Type: Bool

Specifies whether the pin name starts with the transferred pin parameter.

- True: Pin name starts with the transferred pin parameter
- False: Pin name must be the same as the pin parameter

plcName

Type: String

Name of the PLC

containingBlock

Type: String

Name of the contained block

calledBlock

Type: String

Name of the called block

pin

Type: String

Name of the input pin of the "CalledBlock".

UdtInstance

Type: String

UDT instance that is used to limit the display of FCs called multiple times.

screenItemPath

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path of the code viewer display

Return value

ErrorCode

See also

SysFct (Page 1559)

SysFct.OpenPlcCodeViewFromAlarm()

Description

The "OpenPlcCodeViewFromAlarm" method opens the corresponding block in the PLC code view according to the selection in the alarm control.

Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.OpenPlcCodeViewFromAlarm(AlarmView,
PlcCodeView);
```

Parameters

AlarmView

Type: String

Path of the alarm control

PlcCodeView

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path to the PLC code view.

Return value

ErrorCode

See also

SysFct (Page 1559)

SysFct.OpenProDiagDetailsByAssignment()

Description

The "OpenProDiagDetailsByAssignment" method represents an operand assignment and its logic in the PLC code viewer display.

Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.OpenProDiagDetailsByAssignment(plcNam
e, containingBlock, operand, screenItemPath);
```

Parameters

plcName

Type: String

Name of the PLC

containingBlock

Type: String

Name of the contained block

operand

Type: String

Operand of the access point

screenItemPath

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path of the code viewer display

Return value

ErrorCode

See also

SysFct (Page 1559)

SysFct.OpenProDiagDetailsByCall()

Description

The "OpenProDiagDetailsByCall" represents the logic of a network input of a standard block in the PLC code viewer display.

Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.OpenProDiagDetailsByCall(pinSubstring
Search, plcName, containingBlock, calledBlock, pin, screenItemPath);
```

Parameters

pinSubstringSearch

Type: Bool

Specifies whether the pin name starts with the transferred pin parameter.

- True: Pin name starts with the transferred pin parameter
- False: Pin name must be the same as the pin parameter

plcName

Type: String

Name of the PLC

containingBlock

Type: String

Name of the contained block

calledBlock

Type: String

Name of the called block

pin

Type: String

Name of the input pin of the "CalledBlock".

screenItemPath

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path of the code viewer display

Return value

ErrorCode

See also

SysFct (Page 1559)

SysFct.OpenViewerGraphByBlock()

Description

The "OpenViewerGraphByBlock" method jumps to the PLC code viewer and opens an S7 GRAPH step.

Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.OpenViewerGraphByBlock(plcName,
graphBlockName, stepNumber, screenItemPath);
```

Parameters

`plcName`

Type: String

Name of the PLC

`graphBlockName`

Type: String

Name of the GRAPH block

`stepNumber`

Type: UInt32

Step number

`screenItemPath`

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path of the code viewer display

Return value

ErrorCode

See also

SysFct (Page 1559)

SysFct.OpenViewerGraphFromOverview()

Description

The "OpenViewerGraphFromOverview" method jumps from a graph overview control to the PLC code viewer.

Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.OpenViewerGraphFromOverview(screenIte
mPathOverviewControl, screenItemPathCodeViewer);
```

Parameters

screenItemPathOverviewControl

Type: String, HmiProcessDiagnosisGraphOverviewControl

Path of the graph overview control

screenItemPathCodeViewer

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path of the code viewer display

Return value

ErrorCode

See also

SysFct (Page 1559)

SysFct.Previous()

Description

The "Previous" method executes the "Previous" command in the PLC code viewer.

Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.Previous(blub);
```

Parameters

screenItemPathCodeViewer

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path of the code viewer display

Return value

ErrorCode

See also

SysFct (Page 1559)

SysFct.ResetToConfiguration()

Description

The "ResetToConfiguration" method executes the "ResetToConfiguration" command in the PLC code viewer.

Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.ResetToConfiguration(screenItemPathCo
deViewer);
```

Parameters

`screenItemPathCodeViewer`

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path of the code viewer display

Return value

ErrorCode

See also

SysFct (Page 1559)

SysFct.ToggleCriteriaAnalysis()

Description

The "ToggleCriteriaAnalysis" method executes the "ToggleCriteriaAnalysis" command in the PLC code viewer.

Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.ToggleCriteriaAnalysis(screenItemPath
CodeViewer);
```

Parameters

`screenItemPathCodeViewer`

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path of the code viewer display

Return value

ErrorCode

See also

SysFct (Page 1559)

SysFct.ToggleGRAPHViewerMode()

Description

The "ToggleGRAPHViewerMode" method executes the "ToggleGRAPHViewerMode" command in the PLC code viewer.

Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.ToggleGRAPHViewerMode(screenItemPathC
odeViewer);
```

Parameters

`screenItemPathCodeViewer`

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path of the code viewer display

Return value

ErrorCode

See also

SysFct (Page 1559)

SysFct.ToggleNetworkDisplay()

Description

The "ToggleNetworkDisplay" method executes the "ToggleNetworkDisplay" command in the PLC code viewer.

Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.ToggleNetworkDisplay(screenItemPathCo
deViewer);
```

Parameters

screenItemPathCodeViewer

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path of the code viewer display

Return value

ErrorCode

See also

SysFct (Page 1559)

SysFct.ZoomIn()

Description

The "ZoomIn" method executes the "ZoomIn" command in the PLC code viewer.

Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.ZoomIn(screenItemPathCodeViewer);
```

Parameters

screenItemPathCodeViewer

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path of the code viewer display

Return value

ErrorCode

See also

SysFct (Page 1559)

SysFct.ZoomOut()

Description

The "ZoomOut" method executes the "ZoomOut" command in the PLC code viewer.

Syntax

```
[HMIRuntime.]UI.ProDiag.SysFct.ZoomOut(screenItemPathCodeViewer);
```

Parameters

`screenItemPathCodeViewer`

Type: String, HmiProcessDiagnosisPlcCodeViewerControl

Path of the code viewer display

Return value

ErrorCode

See also

SysFct (Page 1559)

Screen Items

AlarmControl

Description

The "AlarmControl" object represents an alarm control. It displays current or logged alarms of a plant in list form.

Object type

HMIAlarmControl

Properties

The "AlarmControl" object has the following properties:

- **AcknowledgmentFlashingRate**
  Specifies the flashing frequency for alarms that must be acknowledged.
- **ActiveAlarmsViewSetup**
  Specifies which predefined alarm filter is applied to pending alarms.
- **AlarmDefinitionViewSetup**
  Specifies which predefined alarm filter is applied for user-defined alarm definitions.
- **AlarmSourceType**
  Specifies the alarm source of the alarm control.
- **AlarmStatisticsSettings**
  Returns the "AlarmStatisticsSettings" object. Assigns parameters for the statistical calculations for logged alarms.
- **AlarmStatisticsView**
  Sets the "AlarmStatisticsView" object.
  Sets an alarm window with columns and alarm rows for statistical calculations on logged alarms.
- **AlarmView**
  Specifies the "AlarmView" object.
- **AlwaysShowRecent**
  Specifies whether the most recent alarm is displayed at the beginning or end of the list, depending on the sorting.
- **BackColor**
  Specifies the background color.
- **Caption**
  Specifies the text to be displayed in the title bar.
- **CaptionColor**
  Specifies the color of the title bar.
- **CurrentQuality**
  Returns the current worst quality code of all tags which influence the alarm control.
- **DefaultSortDirection**
  Specifies the sorting order of the time column if no other sorting is active.
- **Enabled**
  Specifies whether the alarm control can be operated in runtime.
- **Filter**
  Specifies a string for filtering alarms.
- **Height**
  Specifies the height of the alarm control.
- **Icon**
  Specifies the icon of the alarm control.
- **Layer**
  Returns the layer of the screen where the alarm control is located.

- **Left**
  Specifies the value of the X coordinate of the alarm control.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the alarm control.
- **Parent**
  Returns the higher-level screen object.
- **RenderingTemplate**
  Returns the name of the template from which the object was created.
- **ResetFlashingRate**
  Sets the flashing frequency for alarms that need to be reset.
- **ShowFocusVisual**
  Specifies whether the alarm control is highlighted when in focus.
- **StatusBar**
  Sets the information bar of the alarm control.
- **StyleItemClass**
  Returns the style which is applied to the alarm control.
- **SuppressFlashing**
  Specifies whether flashing is suppressed.
- **Systems**
  Specifies the name of the runtime system for the grouping of active alarms.
- **TabIndex**
  Returns the position of the alarm control in the tab sequence.
- **TimeZone**
  Specifies the time zone.
- **ToolBar**
  Sets the toolbar of the alarm control.
- **Top**
  Specifies the value of the Y coordinate of the alarm control.
- **UseAlarmColors**
  Specifies whether the configured color of the alarm is used.
- **Visible**
  Specifies whether the alarm control is visible.
- **Width**
  Specifies the width of the alarm control.
- **WindowFlags**
  Specifies the window configuration of the alarm control.

Methods

The "AlarmControl" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the alarm control.
- **FireCommand()**
  Executes the command of an element of the toolbar or information bar of the alarm control.
- **GetSelectedAlarmData()**
  Returns all the data of the selected alarm of the alarm control.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "AlarmControl" object has the following events:

- **OnActivated()**
  Occurs when an alarm control receives focus.
- **OnCommandFired()**
  Occurs when the operator has operated an element in the toolbar or information bar of the alarm control.
- **OnDeactivated()**
  Occurs when an alarm control loses focus.
- **OnInitialized()**
  Occurs when an alarm control has been successfully initialized and the data connection to the PLC has been established.
- **OnSelectionChanged()**
  Occurs when the selection in the alarm control changes.

AlarmControl.AcknowledgmentFlashingRate

Description

The "AcknowledgmentFlashingRate" property specifies the flashing frequency for alarms that must be acknowledged.

Type

Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Access

Read-write

Syntax

```
AlarmControl.AcknowledgmentFlashingRate
```

See also

AlarmControl (Page 1571)

AlarmControl.ActiveAlarmsViewSetup

Description

The "ActiveAlarmsViewSetup" property specifies which predefined alarm filter is applied to current alarms ("ActiveAlarms" alarm source).

Type

Int32, HmiVisibleAlarms

Specifies the displayed alarms:

- None (0): Show no alarms.
- UnSuppressed (1): Show all alarms that are not suppressed.
- Disabled (2): Show only locked alarms (only if alarm source "AlarmDefinition").
- SuppressedByDesign (4): Show only alarms suppressed by design.
- Shelved (8): Show only shelved alarms.

Access

Read-write

Syntax

```
AlarmControl.ActiveAlarmsViewSetup
```

See also

AlarmControl (Page 1571)

AlarmControl.AlarmDefinitionViewSetup

Description

The "AlarmDefinitionViewSetup" property specifies which predefined alarm filter is applied to displayed alarms from a configured alarm filter configuration (alarm source "AlarmDefinition").

Type

Int32, HmiVisibleAlarms

Specifies the displayed alarms:

- None (0): Show no alarms.
- UnSuppressed (1): Show all alarms that are not suppressed.
- Disabled (2): Show only locked alarms (only if alarm source "AlarmDefinition").
- SuppressedByDesign (4): Show only alarms suppressed by design.
- Shelved (8): Show only shelved alarms.

Access

Read-write

Syntax

```
AlarmControl.AlarmDefinitionViewSetup
```

See also

AlarmControl (Page 1571)

AlarmControl.AlarmSourceType

Description

The "AlarmSourceType" property specifies the alarm source of the alarm control.

Type

Int32, HmiAlarmSourceType

Specifies the alarm source:

- NotConfigured (0): Not defined
- ActiveAlarms (1): Pending alarms
- LoggedAlarms (2): Logged alarms

- LoggedAlarmsUpdated (3): Logged alarms with updates
- AlarmDefintion (4): Alarms from configured alarm filter configuration
- AlarmStatistics (5): Alarm statistics

Access

Read-write

Syntax

```
AlarmControl.AlarmSourceType
```

See also

AlarmControl (Page 1571)

AlarmControl.AlarmStatisticsSettings

Description

The "AlarmStatisticsSettings" property specifies time settings for statistical calculations on logged alarms.

Type

Object, HmiAlarmStatisticsSettingsPart

Access

Read-write

Syntax

```
AlarmControl.AlarmStatisticsSettings
```

See also

AlarmControl (Page 1571)

AlarmStatisticsSettings.BeginTime

Description

The "BeginTime" property specifies the date and time for the start time of the time range.

Type

DateTime

Access

Read-write

Syntax

```
AlarmStatisticsSettings.BeginTime
```

See also

AlarmControl.AlarmStatisticsSettings (Page 1577)

AlarmStatisticsSettings.MaximumRecords

Description

The "MaximumRecords" property specifies the maximum number of logged alarms.

Type

UInt16

Access

Read-write

Syntax

```
AlarmStatisticsSettings.MaximumRecords
```

See also

AlarmControl.AlarmStatisticsSettings (Page 1577)

AlarmStatisticsSettings.TimeRangeBase

Description

The "TimeRangeBase" property specifies the base of the time range.

Type

Int32, HmiTimeRangeBase

Specifies a time range:

- Undefined (0): Not defined
- Millisecond (1): Millisecond
- Second (2): Second
- Minute (3): Minute
- Hour (4): Hour
- Day (5): Day
- Month (6): Month
- Year (7): Year

Access

Read-write

Syntax

```
AlarmStatisticsSettings.TimeRangeBase
```

See also

AlarmControl.AlarmStatisticsSettings (Page 1577)

AlarmStatisticsSettings.TimeRangeFactor

Description

The "TimeRangeFactor" property specifies the factor of the time base for defining the time range.

Type

Int32

Access

Read-write

Syntax

```
AlarmStatisticsSettings.TimeRangeFactor
```

See also

AlarmControl.AlarmStatisticsSettings (Page 1577)

AlarmStatisticsSettings.TimeRangeStart

Description

The "TimeRangeStart" property specifies the start of the time range.

Type

Int32, HmiTimeRangeStart

Specifies the start of the time period:

- Now (0): Time period starts at the current time
- Fixed (1): Time period starts at a fixed time ("BeginTime" property)

Access

Read-write

Syntax

```
AlarmStatisticsSettings.TimeRangeStart
```

See also

AlarmControl.AlarmStatisticsSettings (Page 1577)

AlarmControl.AlarmStatisticsView

Description

The "AlarmStatisticsView" property specifies an alarm window with columns and alarm rows for statistical calculations on logged alarms.

Type

Object, HmiDataGridViewPart (Page 1630)

Access

Read-write

Syntax

```
AlarmControl.AlarmStatisticsView
```

See also

DataGridView (Page 1630)

DataGridView

DataGridView.AllowFilter

Description

The "AllowFilter" property specifies whether filtering of columns is permitted.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.AllowFilter
```

See also

AlarmControl.AlarmStatisticsView (Page 1580)

DataGridView.AllowSort

Description

The "AllowSort" property specifies whether the sorting of columns is permitted.

- True: Activates the sorting and sets the "AllowSort" property of all columns to "true".
- False: Disables the sorting for all columns. The individual column properties remain unchanged.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.AllowSort
```

See also

AlarmControl.AlarmStatisticsView (Page 1580)

DataGridView.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.AlternateBackColor
```

See also

AlarmControl.AlarmStatisticsView (Page 1580)

DataGridView.AlternateForeColor

Description

The "AlternateForeColor" property specifies the flashing color for the text.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.AlternateForeColor
```

See also

AlarmControl.AlarmStatisticsView (Page 1580)

DataGridView.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.BackColor
```

See also

AlarmControl.AlarmStatisticsView (Page 1580)

DataGridView.CellPadding

Description

The "CellPadding" property specifies the inner spacing of the content from the cell border.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
DataGridView.CellPadding
```

See also

AlarmControl.AlarmStatisticsView (Page 1580)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

DataGridView.CellPadding (Page 1583)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

DataGridView.CellPadding (Page 1583)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

DataGridView.CellPadding (Page 1583)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

DataGridView.CellPadding (Page 1583)

DataGridView.Columns

Description

The "Columns" property represents the quantity of columns.

Type

Object, HmiDataGridColumnCollection (Page 1586)

Access

Read-only

Syntax

```
DataGridView.Columns
```

See also

HmiDataGridColumnCollection (Page 1586)

AlarmControl.AlarmStatisticsView (Page 1580)

HmiDataGridColumnCollection

Description

The "HmiDataGridColumnCollection" object is a list of all columns ("DataGridColumn" objects) of the table.

You reference a "HmiDataGridColumnCollection" object via the `DataGridView.Columns` property.

Use

The "HmiDataGridColumnCollection" object is a list and can be counted and enumerated. You can access the "HmiDataGridColumnCollection" list using the index or the tag name.

Object type

HmiDataGridColumnCollection

Properties

The "HmiDataGridColumnCollection" object has the following properties:

- **Count**
  Returns the number of columns in the "HmiDataGridColumnCollection" list.

Methods

The "HmiDataGridColumnCollection" object has the following methods:

- **Item()**
  Returns a column of the "HmiDataGridColumnCollection" list.

HmiDataGridColumnCollection.Count

Description

The "Count" property returns the number of columns in the "HmiDataGridColumnCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiDataGridColumnCollection.Count
```

See also

HmiDataGridColumnCollection (Page 1586)

HmiDataGridColumnCollection.Item()

Description

The "Item" method returns a column of the "HmiDataGridColumnCollection" list.

Syntax

```
HmiDataGridColumnCollection[.Item](HmiDataGridColumnName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiDataGridColumnCollection" object.

Parameters

`HmiDataGridColumnName`

Type: String

Name of the column

Return value

Object, HmiDataGridColumnPartBase (Page 1588)

See also

HmiDataGridColumnCollection (Page 1586)

AlarmStatisticColumn (Page 1588)

AlarmStatisticColumn

Description

The "AlarmStatisticColumn" object represents a value column.

Object type

HmiAlarmStatisticColumnPart

Properties

The "AlarmStatisticColumn" object has the following properties:

- **AlarmStatisticBlock**
  Sets the property of the alarm that is displayed in the column.
- **AllowSort**
  Specifies whether the sorting of the column is permitted.
- **BackColor**
  Specifies the background color.
- **Content**
  Specifies display options for text and graphics.
- **Enabled**
  Specifies whether the column can be operated in runtime.
- **ForeColor**
  Specifies the font color of the text.
- **Header**
  Specifies the properties of the column header.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumWidth**
  Specifies the minimum width.
- **Name**
  Returns the name of the column.
- **OutputFormat**
  Specifies the format for displaying values.
- **SortDirection**
  Specifies the direction of the sorting.
- **SortOrder**
  Specifies the order of the sorting.
- **Visible**
  Specifies whether the column is visible.
- **Width**
  Specifies the width of the column in DIU (Device Independent Unit).

Methods

--

AlarmStatisticColumn.AlarmStatisticBlock

Description

The "AlarmStatisticBlock" property specifies the property of the alarm that is displayed in the column.

Type

Int32, HmiAlarmStatisticBlock

Specifies the alarm property:

- Undefined (0): Not defined
- AverageRaisedRaised (4097): Average time between the alarm and the resulting alarms
- AverageRaisedCleared (4098): Average time between the alarm and its clearance
- AverageRaisedAcknowledged (4099): Average time between the alarm and its acknowledgment
- AverageRaisedReset (4100): Average time between the alarm and its reset
- Frequency (4101): Number of alarms per unit of time
- SumRaisedRaised (4102): Sum of all alarms and resulting alarms
- SumRaisedCleared (4103): Sum of all alarms and their elimination
- SumRaisedAcknowledged (4104): Sum of all alarms and their acknowledgement
- SumRaisedReset (4105): Sum of all alarms and their resets
- ID (1): Alarm number
- Name (2): Alarm name
- Class (3): Alarm class
- Priority (4): Priority
- Group (5): Alarm group
- Origin (6): Origin
- Area (7): Area
- Comments (8): Alarm comment
- Information (9): Information text
- LoopInAlarm (10): Navigates to the screen in which the alarm was triggered.
- EventText (11): Alarm text
- AlarmText1...9 (12-20): User-defined alarm text
- AlarmState (21): Alarm state
- ModificationTime (22): Time of modification
- RaiseTime (23): Tripping time
- AcknowledgeTime (24): Time of acknowledgment

- ClearTime (25): Time of completion
- ResetTime (26): Reset time
- SuppressionState (27): Status of the alarm suppression
- EscalationLevel (28): Escalation level
- Context (29): Context
- Duration (30): Duration
- AcknowledgmentState (31): Acknowledgment state
- Value (32): Value
- ValueQuality (33): Quality code
- ValueLimit (34): Limit
- TagName (35): Name of the trigger tag
- HostName (36): PC name
- UserName (37): Logged-on user
- ProcessValue1...10 (38-47): Process value
- ClassSymbol (48): Alarm class icon
- StateText (49): Status text

Access

Read-write

Syntax

```
AlarmStatisticColumn.AlarmStatisticBlock
```

See also

AlarmStatisticColumn (Page 1588)

AlarmStatisticColumn.AllowSort

Description

The "AllowSort" property specifies whether the sorting of the column is permitted.

This property is ignored if the parent object has the "AllowSort" property set to "False".

Type

Bool

Access

Read-write

Syntax

```
AlarmStatisticColumn.AllowSort
```

See also

AlarmStatisticColumn (Page 1588)

AlarmStatisticColumn.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
AlarmStatisticColumn.BackColor
```

See also

AlarmStatisticColumn (Page 1588)

AlarmColumn.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
AlarmStatisticColumn.Content
```

See also

AlarmStatisticColumn (Page 1588)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

AlarmColumn.Content (Page 1592)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

AlarmColumn.Content (Page 1592)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

AlarmColumn.Content (Page 1592)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

AlarmColumn.Content (Page 1592)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

AlarmColumn.Content (Page 1592)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

AlarmColumn.Content (Page 1592)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

AlarmColumn.Content (Page 1592)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

AlarmColumn.Content (Page 1592)

AlarmStatisticColumn.Enabled

Description

The "Enabled" property specifies whether the column can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
AlarmStatisticColumn.Enabled
```

See also

AlarmStatisticColumn (Page 1588)

AlarmStatisticColumn.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
AlarmStatisticColumn.ForeColor
```

See also

AlarmStatisticColumn (Page 1588)

AlarmColumn.Header

Description

The "Header" property specifies the properties of the column header.

Type

Object, HmiDataGridColumnHeaderPart

Access

Read-write

Syntax

```
AlarmStatisticColumn.Header
```

See also

AlarmStatisticColumn (Page 1588)

DataGridColumnHeader.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
DataGridColumnHeader.Content
```

See also

AlarmColumn.Header (Page 1599)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

DataGridColumnHeader.Content (Page 1599)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.

- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

DataGridColumnHeader.Content (Page 1599)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

DataGridColumnHeader.Content (Page 1599)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

DataGridColumnHeader.Content (Page 1599)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

DataGridColumnHeader.Content (Page 1599)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

DataGridColumnHeader.Content (Page 1599)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

DataGridColumnHeader.Content (Page 1599)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

DataGridColumnHeader.Content (Page 1599)

DataGridColumnHeader.Graphic

Description

The "Graphic" property specifies the graphic of the column header.

Type

String

Access

Read-write

Syntax

```
DataGridColumnHeader.Graphic
```

See also

AlarmColumn.Header (Page 1599)

DataGridColumnHeader.Text

Description

The "Text" property specifies the label of the column header.

Type

String

Access

Read-write

Syntax

```
DataGridColumnHeader.Text
```

See also

AlarmColumn.Header (Page 1599)

AlarmStatisticColumn.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
AlarmStatisticColumn.MaximumWidth
```

See also

AlarmStatisticColumn (Page 1588)

AlarmStatisticColumn.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
AlarmStatisticColumn.MinimumWidth
```

See also

AlarmStatisticColumn (Page 1588)

AlarmStatisticColumn.Name

Description

The "Name" property returns the name of the column.

Type

String

Access

Read-only

Syntax

```
AlarmStatisticColumn.Name
```

See also

AlarmStatisticColumn (Page 1588)

AlarmStatisticColumn.OutputFormat

Description

The "OutputFormat" property specifies the format for displaying values.

Type

String

Access

Read-write

Syntax

```
AlarmStatisticColumn.OutputFormat
```

See also

AlarmStatisticColumn (Page 1588)

AlarmStatisticColumn.SortDirection

Description

The "SortDirection" property specifies the direction of the sorting.

Type

Int32, HmiSortDirection

Specifies the sorting order.

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

Access

Read-write

Syntax

```
AlarmStatisticColumn.SortDirection
```

See also

AlarmStatisticColumn (Page 1588)

AlarmStatisticColumn.SortOrder

Description

The "SortOrder" property specifies the order of the sorting.

The sorting index starts at "1" (highest priority) in ascending order. Zero is ignored.

Type

UInt16

Access

Read-write

Syntax

```
AlarmStatisticColumn.SortOrder
```

See also

AlarmStatisticColumn (Page 1588)

AlarmStatisticColumn.Visible

Description

The "Visible" property specifies whether the column is visible.

Type

Bool

Access

Read-write

Syntax

```
AlarmStatisticColumn.Visible
```

See also

AlarmStatisticColumn (Page 1588)

AlarmStatisticColumn.Width

Description

The "Width" property specifies the width of the column in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
AlarmStatisticColumn.Width
```

See also

AlarmStatisticColumn (Page 1588)

DataGridView.ColoringMode

Description

The "ColoringMode" property specifies whether alternate coloring of every other row or column is enabled.

Type

Int32, HmiGridColoringMode

Specifies the type of the coloring:

- None (0): None
- Columns (1): Color the columns alternately.
- Rows (2): Color the rows alternately.

Access

Read-write

Syntax

```
DataGridView.ColoringMode
```

See also

AlarmControl.AlarmStatisticsView (Page 1580)

DataGridView.Font

Description

The "Font" property specifies the font of the cells.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
DataGridView.Font
```

See also

AlarmControl.AlarmStatisticsView (Page 1580)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

DataGridView.Font (Page 1610)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

DataGridView.Font (Page 1610)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

DataGridView.Font (Page 1610)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

DataGridView.Font (Page 1610)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

DataGridView.Font (Page 1610)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal

- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

DataGridView.Font (Page 1610)

DataGridView.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.ForeColor
```

See also

AlarmControl.AlarmStatisticsView (Page 1580)

DataGridView.GridLineColor

Description

The "GridLineColor" property specifies the color of grid lines.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.GridLineColor
```

See also

AlarmControl.AlarmStatisticsView (Page 1580)

DataGridView.GridLineVisibility

Description

The "GridLineVisibility" property specifies the visibility of the grid lines.

Type

Int32, HmiSimpleGridLine

Specifies the grid lines:

- None (0): None
- Vertikal (1): Vertical
- Horizontal (2): Horizontal

Access

Read-write

Syntax

```
DataGridView.GridLineVisibility
```

See also

AlarmControl.AlarmStatisticsView (Page 1580)

DataGridView.GridLineWidth

Description

The "GridLineWidth" property specifies the thickness of the grid lines in pixels.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.GridLineWidth
```

See also

AlarmControl.AlarmStatisticsView (Page 1580)

DataGridView.GridSelectionMode

Description

The "GridSelectionMode" property specifies whether multiple selection is enabled in the table content.

Type

Int32, HmiGridSelectionMode

Specifies the type of the selection:

- None (0): None
- Single (1): Only single selection
- Multi (2): Multiple selection

Access

Read-write

Syntax

```
DataGridView.GridSelectionMode
```

See also

AlarmControl.AlarmStatisticsView (Page 1580)

DataGridView.HeaderSettings

Description

The "HeaderSettings" property specifies the settings for all column headers in the table.

Type

Object, HmiDataGridHeaderSettingsPart

Access

Read-write

Syntax

```
DataGridView.HeaderSettings
```

See also

AlarmControl.AlarmStatisticsView (Page 1580)

DataGridHeaderSettings.AllowColumnReorder

Description

The "AllowColumnReorder" property specifies whether the order of the columns can be changed.

Type

Bool

Access

Read-write

Syntax

```
DataGridHeaderSettings.AllowColumnReorder
```

See also

DataGridView.HeaderSettings (Page 1617)

DataGridHeaderSettings.AllowColumnResize

Description

The "AllowColumnResize" property specifies whether the width of the columns can be changed.

Type

Bool

Access

Read-write

Syntax

```
DataGridHeaderSettings.AllowColumnResize
```

See also

DataGridView.HeaderSettings (Page 1617)

DataGridHeaderSettings.ColumnHeaderType

Description

The "ColumnHeaderType" property specifies the type of content of a column header.

Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

Access

Read-write

Syntax

```
DataGridHeaderSettings.ColumnHeaderType
```

See also

DataGridView.HeaderSettings (Page 1617)

DataGridHeaderSettings.HeaderBackColor

Description

The "HeaderBackColor" property specifies the background color of the header.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderBackColor
```

See also

DataGridView.HeaderSettings (Page 1617)

DataGridHeaderSettings.HeaderForeColor

Description

The "HeaderForeColor" property specifies the font color of the headers.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderForeColor
```

See also

DataGridView.HeaderSettings (Page 1617)

DataGridHeaderSettings.HeaderGridLineColor

Description

The "HeaderGridLineColor" property specifies the color of the separation line between column headers.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderGridLineColor
```

See also

DataGridView.HeaderSettings (Page 1617)

DataGridHeaderSettings.HeaderSelectionBackColor

Description

The "HeaderSelectionBackColor" property specifies the background color of the header of a selected line or column.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderSelectionBackColor
```

See also

DataGridView.HeaderSettings (Page 1617)

DataGridHeaderSettings.HeaderSelectionForeColor

Description

The "HeaderSelectionForeColor" property specifies the font color of the header of a selected line or column.

Type

UInt32

Access

Read-write

Syntax

```
Object.HeaderSelectionForeColor
```

`Object`

Required. An object from the "Availability" section.

See also

DataGridView.HeaderSettings (Page 1617)

DataGridHeaderSettings.RowHeaderType

Description

The "RowHeaderType" property specifies the type of content of a row header.

Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

Access

Read-write

Syntax

```
DataGridHeaderSettings.RowHeaderType
```

See also

DataGridView.HeaderSettings (Page 1617)

DataGridHeaderSettings.Font

Description

The "Font" property specifies the font of the headers.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
DataGridHeaderSettings.Font
```

See also

DataGridView.HeaderSettings (Page 1617)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

DataGridHeaderSettings.Font (Page 1622)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

DataGridHeaderSettings.Font (Page 1622)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

DataGridHeaderSettings.Font (Page 1622)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

DataGridHeaderSettings.Font (Page 1622)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

DataGridHeaderSettings.Font (Page 1622)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

DataGridHeaderSettings.Font (Page 1622)

DataGridView.HorizontalScrollBarVisibility

Description

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar of the display.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
DataGridView.HorizontalScrollBarVisibility
```

See also

AlarmControl.AlarmStatisticsView (Page 1580)

DataGridView.RowHeight

Description

The "RowHeight" property specifies the height of all rows in the table in DIU (Device Independent Unit).

"0" corresponds to a automatic mechanism, which adjusts the height of each line according to the font size and number of paragraphs.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.RowHeight
```

See also

AlarmControl.AlarmStatisticsView (Page 1580)

DataGridView.SelectFullRow

Description

The "SelectFullRow" property specifies whether only the cell or the entire row is included in the selection.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.SelectFullRow
```

See also

AlarmControl.AlarmStatisticsView (Page 1580)

DataGridView.SelectionBackColor

Description

The "SelectionBackColor" property specifies the background color of the selected cells.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.SelectionBackColor
```

See also

AlarmControl.AlarmStatisticsView (Page 1580)

DataGridView.SelectionForeColor

Description

The "SelectionForeColor" property specifies the font color of the selected cells.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.SelectionForeColor
```

See also

AlarmControl.AlarmStatisticsView (Page 1580)

DataGridView.SelectionBorderColor

Description

The "SelectionBorderColor" property specifies the border color of the selected cells.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.SelectionBorderColor
```

See also

AlarmControl.AlarmStatisticsView (Page 1580)

DataGridView.VerticalScrollBarVisibility

Description

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the display.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
DataGridView.VerticalScrollBarVisibility
```

See also

AlarmControl.AlarmStatisticsView (Page 1580)

AlarmControl.AlarmView

Description

The "AlarmView" property specifies the alarm window with columns and alarm lines for alarms without statistical evaluation.

Type

Object, HmiDataGridViewPart (Page 1630)

Access

Read-write

Syntax

```
AlarmControl.AlarmView
```

See also

AlarmControl (Page 1571)

DataGridView (Page 1630)

DataGridView

DataGridView.AllowFilter

Description

The "AllowFilter" property specifies whether filtering of columns is permitted.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.AllowFilter
```

See also

AlarmControl.AlarmView (Page 1630)

DataGridView.AllowSort

Description

The "AllowSort" property specifies whether the sorting of columns is permitted.

- True: Activates the sorting and sets the "AllowSort" property of all columns to "true".
- False: Disables the sorting for all columns. The individual column properties remain unchanged.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.AllowSort
```

See also

AlarmControl.AlarmView (Page 1630)

DataGridView.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.AlternateBackColor
```

See also

AlarmControl.AlarmView (Page 1630)

DataGridView.AlternateForeColor

Description

The "AlternateForeColor" property specifies the flashing color for the text.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.AlternateForeColor
```

See also

AlarmControl.AlarmView (Page 1630)

DataGridView.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.BackColor
```

See also

AlarmControl.AlarmView (Page 1630)

DataGridView.CellPadding

Description

The "CellPadding" property specifies the inner spacing of the content from the cell border.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
DataGridView.CellPadding
```

See also

AlarmControl.AlarmView (Page 1630)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

DataGridView.CellPadding (Page 1633)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

DataGridView.CellPadding (Page 1633)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

DataGridView.CellPadding (Page 1633)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

DataGridView.CellPadding (Page 1633)

DataGridView.Columns

Description

The "Columns" property represents the quantity of columns.

Type

Object, HmiDataGridColumnCollection (Page 1636)

Access

Read-only

Syntax

```
DataGridView.Columns
```

See also

HmiDataGridColumnCollection (Page 1636)

AlarmControl.AlarmView (Page 1630)

HmiDataGridColumnCollection

Description

The "HmiDataGridColumnCollection" object is a list of all columns ("DataGridColumn" objects) of the table.

You reference a "HmiDataGridColumnCollection" object via the `DataGridView.Columns` property.

Use

The "HmiDataGridColumnCollection" object is a list and can be counted and enumerated. You can access the "HmiDataGridColumnCollection" list using the index or the tag name.

Object type

HmiDataGridColumnCollection

Properties

The "HmiDataGridColumnCollection" object has the following properties:

- **Count**
  Returns the number of columns in the "HmiDataGridColumnCollection" list.

Methods

The "HmiDataGridColumnCollection" object has the following methods:

- **Item()**
  Returns a column of the "HmiDataGridColumnCollection" list.

HmiDataGridColumnCollection.Count

Description

The "Count" property returns the number of columns in the "HmiDataGridColumnCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiDataGridColumnCollection.Count
```

See also

HmiDataGridColumnCollection (Page 1636)

HmiDataGridColumnCollection.Item()

Description

The "Item" method returns a column of the "HmiDataGridColumnCollection" list.

Syntax

```
HmiDataGridColumnCollection[.Item](HmiDataGridColumnName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiDataGridColumnCollection" object.

Parameters

`HmiDataGridColumnName`

Type: String

Name of the column

Return value

Object, HmiDataGridColumnPartBase (Page 1638)

See also

HmiDataGridColumnCollection (Page 1636)

AlarmColumn (Page 1638)

AlarmColumn

Description

The "AlarmColumn" object represents a value column.

Object type

HmiAlarmColumnPart

Properties

The "AlarmColumn" object has the following properties:

- **AlarmBlock**
  Specifies which property of the alarm is displayed.
- **AllowSort**
  Specifies whether the sorting of the column is permitted.
- **BackColor**
  Specifies the background color.
- **Content**
  Specifies display options for text and graphics.
- **Enabled**
  Specifies whether the column can be operated in runtime.
- **ForeColor**
  Specifies the font color of the text.
- **Header**
  Specifies the properties of the column header.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumWidth**
  Specifies the minimum width.
- **Name**
  Returns the name of the column.
- **OutputFormat**
  Specifies the format for displaying values.
- **SortDirection**
  Specifies the direction of the sorting.
- **SortOrder**
  Specifies the order of the sorting.
- **UseAlarmColors**
  Specifies whether the configured alarm colors are used.

- **Visible**
  Specifies whether the column is visible.
- **Width**
  Specifies the width of the column in DIU (Device Independent Unit).

Methods

--

AlarmColumn.AlarmBlock

Description

The "AlarmBlock" property specifies which property of the alarm is displayed.

Type

Int32, HmiAlarmBlock

Specifies the alarm property:

- Undefined (0): Not defined
- ID (1): Alarm number
- Name (2): Alarm name
- Class (3): Alarm class
- Priority (4): Priority
- Group (5): Alarm group
- Origin (6): Origin
- Area (7): Area
- Comments (8): Alarm comment
- Information (9): Information text
- LoopInAlarm (10): Navigates to the screen in which the alarm was triggered.
- EventText (11): Alarm text
- AlarmText1...9 (12-20): User-defined alarm text
- AlarmState (21): Alarm state
- ModificationTime (22): Time of modification
- RaiseTime (23): Tripping time
- AcknowledgeTime (24): Time of acknowledgment
- ClearTime (25): Time of completion
- ResetTime (26): Reset time
- SuppressionState (27): Status of the alarm suppression

- EscalationLevel (28): Escalation level
- Context (29): Context
- Duration (30): Duration
- AcknowledgmentState (31): Acknowledgment state
- Value (32): Value
- ValueQuality (33): Quality code
- ValueLimit (34): Limit
- HostName (36): PC name
- UserName (37): Logged-on user
- ProcessValue1...10 (38-47): Process value
- ClassSymbol (48): Alarm class icon
- StateText (49): Status text
- GroupID (50): Number of the alarm group

Access

Read-write

Syntax

```
AlarmColumn.AlarmBlock
```

See also

AlarmColumn (Page 1638)

AlarmColumn.AllowSort

Description

The "AllowSort" property specifies whether the sorting of the column is permitted.

This property is ignored if the parent object has the "AllowSort" property set to "False".

Type

Bool

Access

Read-write

Syntax

```
AlarmColumn.AllowSort
```

See also

AlarmColumn (Page 1638)

AlarmColumn.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
AlarmColumn.BackColor
```

See also

AlarmColumn (Page 1638)

AlarmColumn.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
AlarmColumn.Content
```

See also

AlarmColumn (Page 1638)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

AlarmColumn.Content (Page 1641)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

AlarmColumn.Content (Page 1641)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

AlarmColumn.Content (Page 1641)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

AlarmColumn.Content (Page 1641)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

AlarmColumn.Content (Page 1641)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

AlarmColumn.Content (Page 1641)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

AlarmColumn.Content (Page 1641)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

AlarmColumn.Content (Page 1641)

AlarmColumn.Enabled

Description

The "Enabled" property specifies whether the column can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
AlarmColumn.Enabled
```

See also

AlarmColumn (Page 1638)

AlarmColumn.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
AlarmColumn.ForeColor
```

See also

AlarmColumn (Page 1638)

AlarmColumn.Header

Description

The "Header" property specifies the properties of the column header.

Type

Object, HmiDataGridColumnHeaderPart

Access

Read-write

Syntax

```
AlarmColumn.Header
```

See also

AlarmColumn (Page 1638)

DataGridColumnHeader.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
DataGridColumnHeader.Content
```

See also

AlarmColumn.Header (Page 1648)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

DataGridColumnHeader.Content (Page 1648)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

DataGridColumnHeader.Content (Page 1648)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

DataGridColumnHeader.Content (Page 1648)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

DataGridColumnHeader.Content (Page 1648)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

DataGridColumnHeader.Content (Page 1648)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

DataGridColumnHeader.Content (Page 1648)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

DataGridColumnHeader.Content (Page 1648)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

DataGridColumnHeader.Content (Page 1648)

DataGridColumnHeader.Graphic

Description

The "Graphic" property specifies the graphic of the column header.

Type

String

Access

Read-write

Syntax

```
DataGridColumnHeader.Graphic
```

See also

AlarmColumn.Header (Page 1648)

DataGridColumnHeader.Text

Description

The "Text" property specifies the label of the column header.

Type

String

Access

Read-write

Syntax

```
DataGridColumnHeader.Text
```

See also

AlarmColumn.Header (Page 1648)

AlarmColumn.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
AlarmColumn.MaximumWidth
```

See also

AlarmColumn (Page 1638)

AlarmColumn.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
AlarmColumn.MinimumWidth
```

See also

AlarmColumn (Page 1638)

AlarmColumn.Name

Description

The "Name" property returns the name of the column.

Type

String

Access

Read-only

Syntax

```
AlarmColumn.Name
```

See also

AlarmColumn (Page 1638)

AlarmColumn.OutputFormat

Description

The "OutputFormat" property specifies the format for displaying values.

Type

String

Access

Read-write

Syntax

```
AlarmColumn.OutputFormat
```

See also

AlarmColumn (Page 1638)

AlarmColumn.SortDirection

Description

The "SortDirection" property specifies the direction of the sorting.

Type

Int32, HmiSortDirection

Specifies the sorting order.

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

Access

Read-write

Syntax

```
AlarmColumn.SortDirection
```

See also

AlarmColumn (Page 1638)

AlarmColumn.SortOrder

Description

The "SortOrder" property specifies the order of the sorting.

The sorting index starts at "1" (highest priority) in ascending order. Zero is ignored.

Type

UInt16

Access

Read-write

Syntax

```
AlarmColumn.SortOrder
```

See also

AlarmColumn (Page 1638)

AlarmColumn.UseAlarmColors

Description

The "UseAlarmColors" property specifies whether the configured alarm colors are used.

Type

Bool

Access

Read-write

Syntax

```
AlarmColumn.UseAlarmColors
```

See also

AlarmColumn (Page 1638)

AlarmColumn.Visible

Description

The "Visible" property specifies whether the column is visible.

Type

Bool

Access

Read-write

Syntax

```
AlarmColumn.Visible
```

See also

AlarmColumn (Page 1638)

AlarmColumn.Width

Description

The "Width" property specifies the width of the column in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
AlarmColumn.Width
```

See also

AlarmColumn (Page 1638)

DataGridView.ColoringMode

Description

The "ColoringMode" property specifies whether alternate coloring of every other row or column is enabled.

Type

Int32, HmiGridColoringMode

Specifies the type of the coloring:

- None (0): None
- Columns (1): Color the columns alternately.
- Rows (2): Color the rows alternately.

Access

Read-write

Syntax

```
DataGridView.ColoringMode
```

See also

AlarmControl.AlarmView (Page 1630)

DataGridView.Font

Description

The "Font" property specifies the font of the cells.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
DataGridView.Font
```

See also

AlarmControl.AlarmView (Page 1630)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

DataGridView.Font (Page 1660)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

DataGridView.Font (Page 1660)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

DataGridView.Font (Page 1660)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

DataGridView.Font (Page 1660)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

DataGridView.Font (Page 1660)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

DataGridView.Font (Page 1660)

DataGridView.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.ForeColor
```

See also

AlarmControl.AlarmView (Page 1630)

DataGridView.GridLineColor

Description

The "GridLineColor" property specifies the color of grid lines.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.GridLineColor
```

See also

AlarmControl.AlarmView (Page 1630)

DataGridView.GridLineVisibility

Description

The "GridLineVisibility" property specifies the visibility of the grid lines.

Type

Int32, HmiSimpleGridLine

Specifies the grid lines:

- None (0): None
- Vertikal (1): Vertical
- Horizontal (2): Horizontal

Access

Read-write

Syntax

```
DataGridView.GridLineVisibility
```

See also

AlarmControl.AlarmView (Page 1630)

DataGridView.GridLineWidth

Description

The "GridLineWidth" property specifies the thickness of the grid lines in pixels.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.GridLineWidth
```

See also

AlarmControl.AlarmView (Page 1630)

DataGridView.GridSelectionMode

Description

The "GridSelectionMode" property specifies whether multiple selection is enabled in the table content.

Type

Int32, HmiGridSelectionMode

Specifies the type of the selection:

- None (0): None
- Single (1): Only single selection
- Multi (2): Multiple selection

Access

Read-write

Syntax

```
DataGridView.GridSelectionMode
```

See also

AlarmControl.AlarmView (Page 1630)

DataGridView.HeaderSettings

Description

The "HeaderSettings" property specifies the settings for all column headers in the table.

Type

Object, HmiDataGridHeaderSettingsPart

Access

Read-write

Syntax

```
DataGridView.HeaderSettings
```

See also

AlarmControl.AlarmView (Page 1630)

DataGridHeaderSettings.AllowColumnReorder

Description

The "AllowColumnReorder" property specifies whether the order of the columns can be changed.

Type

Bool

Access

Read-write

Syntax

```
DataGridHeaderSettings.AllowColumnReorder
```

See also

DataGridView.HeaderSettings (Page 1666)

DataGridHeaderSettings.AllowColumnResize

Description

The "AllowColumnResize" property specifies whether the width of the columns can be changed.

Type

Bool

Access

Read-write

Syntax

```
DataGridHeaderSettings.AllowColumnResize
```

See also

DataGridView.HeaderSettings (Page 1666)

DataGridHeaderSettings.ColumnHeaderType

Description

The "ColumnHeaderType" property specifies the type of content of a column header.

Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

Access

Read-write

Syntax

```
DataGridHeaderSettings.ColumnHeaderType
```

See also

DataGridView.HeaderSettings (Page 1666)

DataGridHeaderSettings.HeaderBackColor

Description

The "HeaderBackColor" property specifies the background color of the header.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderBackColor
```

See also

DataGridView.HeaderSettings (Page 1666)

DataGridHeaderSettings.HeaderForeColor

Description

The "HeaderForeColor" property specifies the font color of the headers.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderForeColor
```

See also

DataGridView.HeaderSettings (Page 1666)

DataGridHeaderSettings.HeaderGridLineColor

Description

The "HeaderGridLineColor" property specifies the color of the separation line between column headers.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderGridLineColor
```

See also

DataGridView.HeaderSettings (Page 1666)

DataGridHeaderSettings.HeaderSelectionBackColor

Description

The "HeaderSelectionBackColor" property specifies the background color of the header of a selected line or column.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderSelectionBackColor
```

See also

DataGridView.HeaderSettings (Page 1666)

DataGridHeaderSettings.HeaderSelectionForeColor

Description

The "HeaderSelectionForeColor" property specifies the font color of the header of a selected line or column.

Type

UInt32

Access

Read-write

Syntax

```
Object.HeaderSelectionForeColor
```

`Object`
Required. An object from the "Availability" section.

See also

DataGridView.HeaderSettings (Page 1666)

DataGridHeaderSettings.RowHeaderType

Description

The "RowHeaderType" property specifies the type of content of a row header.

Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

Access

Read-write

Syntax

```
DataGridHeaderSettings.RowHeaderType
```

See also

DataGridView.HeaderSettings (Page 1666)

DataGridHeaderSettings.Font

Description

The "Font" property specifies the font of the headers.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
DataGridHeaderSettings.Font
```

See also

DataGridView.HeaderSettings (Page 1666)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

DataGridHeaderSettings.Font (Page 1671)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

DataGridHeaderSettings.Font (Page 1671)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

DataGridHeaderSettings.Font (Page 1671)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

DataGridHeaderSettings.Font (Page 1671)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

DataGridHeaderSettings.Font (Page 1671)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

DataGridHeaderSettings.Font (Page 1671)

DataGridView.HorizontalScrollBarVisibility

Description

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar of the display.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
DataGridView.HorizontalScrollBarVisibility
```

See also

AlarmControl.AlarmView (Page 1630)

DataGridView.RowHeight

Description

The "RowHeight" property specifies the height of all rows in the table in DIU (Device Independent Unit).

"0" corresponds to a automatic mechanism, which adjusts the height of each line according to the font size and number of paragraphs.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.RowHeight
```

See also

AlarmControl.AlarmView (Page 1630)

DataGridView.SelectFullRow

Description

The "SelectFullRow" property specifies whether only the cell or the entire row is included in the selection.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.SelectFullRow
```

See also

AlarmControl.AlarmView (Page 1630)

DataGridView.SelectionBackColor

Description

The "SelectionBackColor" property specifies the background color of the selected cells.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.SelectionBackColor
```

See also

AlarmControl.AlarmView (Page 1630)

DataGridView.SelectionForeColor

Description

The "SelectionForeColor" property specifies the font color of the selected cells.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.SelectionForeColor
```

See also

AlarmControl.AlarmView (Page 1630)

DataGridView.SelectionBorderColor

Description

The "SelectionBorderColor" property specifies the border color of the selected cells.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.SelectionBorderColor
```

See also

AlarmControl.AlarmView (Page 1630)

DataGridView.VerticalScrollBarVisibility

Description

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the display.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
DataGridView.VerticalScrollBarVisibility
```

See also

AlarmControl.AlarmView (Page 1630)

AlarmControl.AlwaysShowRecent

Description

The "AlwaysShowRecent" specifies whether the most recent alarm is displayed at the beginning or end of the list, depending on the sorting.

Type

Bool

Access

Read-write

Syntax

```
AlarmControl.AlwaysShowRecent
```

See also

AlarmControl (Page 1571)

AlarmControl.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
AlarmControl.BackColor
```

See also

AlarmControl (Page 1571)

AlarmControl.Caption

Description

The "Caption" property specifies the text to be displayed in the header.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
AlarmControl.Caption
```

See also

AlarmControl (Page 1571)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

AlarmControl.Caption (Page 1680)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 1681)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 1681)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 1681)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 1681)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 1681)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 1681)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

AlarmControl.Caption (Page 1680)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

AlarmControl.Caption (Page 1680)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

AlarmControl.Caption (Page 1680)

AlarmControl.CaptionColor

Description

The "CaptionColor" property specifies the color of the header.

Type

UInt32

Access

Read-write

Syntax

```
AlarmControl.CaptionColor
```

See also

AlarmControl (Page 1571)

AlarmControl.CurrentQuality

Description

The "CurrentQuality" property returns the current worst quality code of all tags which influence the alarm control.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable. Quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
AlarmControl.CurrentQuality
```

See also

AlarmControl (Page 1571)

AlarmControl.DefaultSortDirection

Description

The "DefaultSortDirection" property specifies the sorting order of the time column if no other sorting is active.

Type

Int32, HmiSortDirection

Specifies the sorting order.

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

Access

Read-write

Syntax

```
AlarmControl.DefaultSortDirection
```

See also

AlarmControl (Page 1571)

AlarmControl.Enabled

Description

The "Enabled" property specifies whether the alarm control can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
AlarmControl.Enabled
```

See also

AlarmControl (Page 1571)

AlarmControl.Filter

Description

The "Filter" property specifies a string for filtering alarms.

The syntax of the filter string corresponds to the WHERE clause of an SQL command.

Type

String

Access

Read-write

Syntax

```
AlarmControl.Filter
```

Supported alarm properties

The following properties of an alarm can be used in the filter string:

- AcknowledgementTime
- Alarm
- AlarmClassName
- AlarmClassSymbol
- AlarmParameterValues
- AlarmText1 ... 9
- Area
- BackColor
- ChangeReason
- ClearTime
- Connection
- EventText
- Flashing
- InfoText
- InstanceID
- LoopInAlarm
- ModificationTime
- Name
- Origin
- Priority
- RaiseTime
- ResetTime
- SourceID
- SourceType
- State
- StateMachine
- StateText
- SuppressionState
- SystemSeverity
- TextColor
- Value
- ValueLimit

Operators

The following operators can be used in the filter string:

Operator	Description	Example
=	equal to	AlarmClassName = 'demo'
IS NOT string	is not equal to the string *string*	AlarmText4 IS NOT 'Text5'
<>	not equal	Value <> 0.0
>	greater than	ModificationTime > '11.08.2016'
<	less than	Value < 75.0
>=	greater than or equal to	Value >= 25.0
<=	less than or equal to	Value <= 75.0
OR, ||	logical OR	State = 1 OR State = 3
AND, &&	logical AND	EventText = 'Text1' AND Origin = 'Motor'
BETWEEN	within a range	Value BETWEEN 25.0 AND 75.0
NOT BETWEEN	outside a range	Value NOT BETWEEN 25.0 AND 75.0
LIKE string	corresponds to the string *string*	Name LIKE 'Motor*'
NOT LIKE string	does not correspond to the string *string*	Name NOT LIKE 'Valve*'
IN (v1, v2, …)	corresponds to one or more values	State IN (1, 4, 7)
NOT IN (v1, v2, …)	does not correspond to one or more values	State NOT IN (0, 2, 3, 5, 6)
IS NULL	compares to zero (missing data)	Context IS NULL
IS NOT NULL	compares to zero (unknown data)	Context IS NOT NULL

Wildcards

The following wildcards can be used for characters of filter strings:

Wildcard	Description	Example
*	replaces 0, 1 or more characters	Name LIKE 'Motor*'
?	replaces exactly 1 character	Name = 'Recipe?'

See also

AlarmControl (Page 1571)

AlarmControl.Height

Description

The "Height" property specifies the height of the alarm control in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
AlarmControl.Height
```

See also

AlarmControl (Page 1571)

AlarmControl.Icon

Description

The "Icon" property specifies the icon of the alarm control.

Type

String

Access

Read-write

Syntax

```
AlarmControl.Icon
```

See also

AlarmControl (Page 1571)

AlarmControl.Layer

Description

The "Layer" property returns the layer of the screen in which the alarm control is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
AlarmControl.Layer
```

See also

AlarmControl (Page 1571)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

AlarmControl.Layer (Page 1691)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

AlarmControl.Layer (Page 1691)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

AlarmControl.Layer (Page 1691)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

AlarmControl.Layer (Page 1691)

AlarmControl.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
AlarmControl.Left
```

See also

AlarmControl (Page 1571)

AlarmControl.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the alarm control.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
AlarmControl.Margin
```

See also

AlarmControl (Page 1571)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

AlarmControl.Margin (Page 1694)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

AlarmControl.Margin (Page 1694)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

AlarmControl.Margin (Page 1694)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

AlarmControl.Margin (Page 1694)

AlarmControl.Name

Description

The "Name" property returns the name of the alarm control.

Type

String

Access

Read-only

Syntax

```
AlarmControl.Name
```

See also

AlarmControl (Page 1571)

AlarmControl.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
AlarmControl.Parent
```

See also

AlarmControl (Page 1571)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

AlarmControl.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the object has been created.

Type

String

Access

Read-only

Syntax

```
AlarmControl.RenderingTemplate
```

See also

AlarmControl (Page 1571)

AlarmControl.ResetFlashingRate

Description

The "ResetFlashingRate" property specifies the flashing frequency for alarms that need to be reset.

Type

Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Access

Read-write

Syntax

```
AlarmControl.ResetFlashingRate
```

See also

AlarmControl (Page 1571)

AlarmControl.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the alarm window is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
AlarmControl.ShowFocusVisual
```

See also

AlarmControl (Page 1571)

AlarmControl.StatusBar

Description

The "StatusBar" property specifies the Information bar of the alarm control.

Type

Object, HmiStatusBarPart

Access

Read-write

Syntax

```
AlarmControl.StatusBar
```

See also

AlarmControl (Page 1571)

StatusBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
StatusBar.BackColor
```

See also

AlarmControl.StatusBar (Page 1700)

StatusBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

Type

Object, HmiControlBarElementCollection (Page 1701)

Access

Read-only

Syntax

```
StatusBar.Elements
```

See also

AlarmControl.StatusBar (Page 1700)

HmiControlBarElementCollection (Page 1701)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 1701)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 1720)

See also

HmiControlBarElementCollection (Page 1701)

Control Bar Elements (Page 1720)

Control Bar Elements

Description

Control Bar Elements (Page 1720)

StatusBar.Enabled

Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Enabled
```

See also

AlarmControl.StatusBar (Page 1700)

StatusBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
StatusBar.Font
```

See also

AlarmControl.StatusBar (Page 1700)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

StatusBar.Font (Page 1704)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

StatusBar.Font (Page 1704)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

StatusBar.Font (Page 1704)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

StatusBar.Font (Page 1704)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

StatusBar.Font (Page 1704)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

StatusBar.Font (Page 1704)

StatusBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
StatusBar.Margin
```

See also

AlarmControl.StatusBar (Page 1700)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

StatusBar.Margin (Page 1708)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

StatusBar.Margin (Page 1708)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

StatusBar.Margin (Page 1708)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

StatusBar.Margin (Page 1708)

StatusBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
StatusBar.Padding
```

See also

AlarmControl.StatusBar (Page 1700)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

StatusBar.Padding (Page 1710)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

StatusBar.Padding (Page 1710)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

StatusBar.Padding (Page 1710)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

StatusBar.Padding (Page 1710)

StatusBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.ShowToolTips
```

See also

AlarmControl.StatusBar (Page 1700)

StatusBar.Visible

Description

The "Visible" property specifies whether the information bar is visible.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Visible
```

See also

AlarmControl.StatusBar (Page 1700)

AlarmControl.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the alarm control.

Type

String

Access

Read-only

Syntax

```
AlarmControl.StyleItemClass
```

See also

AlarmControl (Page 1571)

AlarmControl.SuppressFlashing

Description

The "SuppressFlashing" property suppresses all flashing of the alarm control.

Type

Bool

Access

Read-write

Syntax

```
AlarmControl.SuppressFlashing
```

See also

AlarmControl (Page 1571)

AlarmControl.Systems

Description

The "Systems" property specifies the name of the runtime system for compiling active alarms.

If no reference is specified, all known systems are used.

Type

String[] | Int32[]

Access

Read-write

Syntax

```
AlarmControl.Systems
```

See also

AlarmControl (Page 1571)

AlarmControl.TabIndex

Description

The "TabIndex" property returns the position of the alarm control in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
AlarmControl.TabIndex
```

See also

AlarmControl (Page 1571)

AlarmControl.TimeZone

Description

The "TimeZone" property specifies the time zone.

Type

Int32, HmiTimeZone

Access

Read-write

Syntax

```
AlarmControl.TimeZone
```

See also

AlarmControl (Page 1571)

AlarmControl.ToolBar

Description

The "ToolBar" property specifies the toolbar of the alarm control.

Type

Object, HmiToolBarPart

Access

Read-write

Syntax

```
AlarmControl.ToolBar
```

See also

AlarmControl (Page 1571)

ToolBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ToolBar.BackColor
```

See also

AlarmControl.ToolBar (Page 1716)

ToolBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

Type

Object, HmiControlBarElementCollection (Page 1718)

Access

Read-only

Syntax

```
ToolBar.Elements
```

See also

AlarmControl.ToolBar (Page 1716)

HmiControlBarElementCollection (Page 1718)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 1718)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 1720)

See also

HmiControlBarElementCollection (Page 1718)

Control Bar Elements (Page 1720)

Control Bar Elements

ControlBarButton

Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarButtonPart

Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the label of the button.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the button can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.

- **HotKey**
  Returns the hotkey specified for the button.
- **Mapping**
  Returns the function of the button.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the button is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the button is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarButton.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBackColor
```

See also

ControlBarButton (Page 1720)

ControlBarButton.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBorderColor
```

See also

ControlBarButton (Page 1720)

ControlBarButton.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarButton.Authorization
```

See also

ControlBarButton (Page 1720)

ControlBarButton.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BackColor
```

See also

ControlBarButton (Page 1720)

ControlBarButton.Badge

Description

The "Badge" property specifies the label of the button.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarButton.Badge
```

See also

ControlBarButton (Page 1720)

ControlBarButton.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BorderColor
```

See also

ControlBarButton (Page 1720)

ControlBarButton.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarButton.BorderWidth
```

See also

ControlBarButton (Page 1720)

ControlBarButton.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarButton.Content
```

See also

ControlBarButton (Page 1720)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarButton.Content (Page 1725)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarButton.Content (Page 1725)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarButton.Content (Page 1725)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarButton.Content (Page 1725)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarButton.Content (Page 1725)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above

- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarButton.Content (Page 1725)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarButton.Content (Page 1725)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarButton.Content (Page 1725)

ControlBarButton.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarButton.CustomID
```

See also

ControlBarButton (Page 1720)

ControlBarButton.Enabled

Description

The "Enabled" property specifies whether the button can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Enabled
```

See also

ControlBarButton (Page 1720)

ControlBarButton.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
