  Specifies the tooltip text.
- **Visible**
  Specifies whether the button is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarButton.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBackColor
```

See also

ControlBarButton (Page 4909)

ControlBarButton.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBorderColor
```

See also

ControlBarButton (Page 4909)

ControlBarButton.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarButton.Authorization
```

See also

ControlBarButton (Page 4909)

ControlBarButton.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BackColor
```

See also

ControlBarButton (Page 4909)

ControlBarButton.Badge

Description

The "Badge" property specifies the label of the button.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarButton.Badge
```

See also

ControlBarButton (Page 4909)

ControlBarButton.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BorderColor
```

See also

ControlBarButton (Page 4909)

ControlBarButton.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarButton.BorderWidth
```

See also

ControlBarButton (Page 4909)

ControlBarButton.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarButton.Content
```

See also

ControlBarButton (Page 4909)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarButton.Content (Page 4915)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarButton.Content (Page 4915)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarButton.Content (Page 4915)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarButton.Content (Page 4915)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarButton.Content (Page 4915)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarButton.Content (Page 4915)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarButton.Content (Page 4915)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarButton.Content (Page 4915)

ControlBarButton.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarButton.CustomID
```

See also

ControlBarButton (Page 4909)

ControlBarButton.Enabled

Description

The "Enabled" property specifies whether the button can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Enabled
```

See also

ControlBarButton (Page 4909)

ControlBarButton.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.ForeColor
```

See also

ControlBarButton (Page 4909)

ControlBarButton.Graphic

Description

The "Graphic" property specifies the graphic of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Graphic
```

See also

ControlBarButton (Page 4909)

ControlBarButton.Height

Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Height
```

See also

ControlBarButton (Page 4909)

ControlBarButton.HotKey

Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
ControlBarButton.HotKey
```

See also

ControlBarButton (Page 4909)

ControlBarButton.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent

- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms

- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarButton.Mapping
```

See also

ControlBarButton (Page 4909)

ControlBarButton.Margin

Description

The "Margin" property specifies the surrounded outer distance of the button.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarButton.Margin
```

See also

ControlBarButton (Page 4909)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarButton.Margin (Page 4925)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarButton.Margin (Page 4925)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarButton.Margin (Page 4925)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarButton.Margin (Page 4925)

ControlBarButton.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumHeight
```

See also

ControlBarButton (Page 4909)

ControlBarButton.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumWidth
```

See also

ControlBarButton (Page 4909)

ControlBarButton.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumHeight
```

See also

ControlBarButton (Page 4909)

ControlBarButton.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumWidth
```

See also

ControlBarButton (Page 4909)

ControlBarButton.Operability

Description

The "Operability" property returns whether the button is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarButton.Operability
```

See also

ControlBarButton (Page 4909)

ControlBarButton.Padding

Description

The "Padding" property specifies the distance of the content from the border of the button.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarButton.Padding
```

See also

ControlBarButton (Page 4909)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarButton.Padding (Page 4930)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarButton.Padding (Page 4930)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarButton.Padding (Page 4930)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarButton.Padding (Page 4930)

ControlBarButton.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarButton.RequireExplicitUnlock
```

See also

ControlBarButton (Page 4909)

ControlBarButton.Text

Description

The "Text" property specifies the label of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Text
```

See also

ControlBarButton (Page 4909)

ControlBarButton.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.ToolTipText
```

See also

ControlBarButton (Page 4909)

ControlBarButton.Visible

Description

The "Visible" property specifies whether the button is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Visible
```

See also

ControlBarButton (Page 4909)

ControlBarButton.Width

Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Width
```

See also

ControlBarButton (Page 4909)

ControlBarDisplay

Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarDisplayPart

Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the display area is enabled in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the display area.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the display area is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.

- **Visible**
  Specifies whether the display area is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarDisplay.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarDislay.Authorization
```

See also

ControlBarDisplay (Page 4935)

ControlBarDisplay.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarDislay.Content
```

See also

ControlBarDisplay (Page 4935)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarDisplay.Content (Page 4937)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarDisplay.Content (Page 4937)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarDisplay.Content (Page 4937)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarDisplay.Content (Page 4937)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarDisplay.Content (Page 4937)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarDisplay.Content (Page 4937)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarDisplay.Content (Page 4937)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarDisplay.Content (Page 4937)

ControlBarDisplay.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarDislay.CustomID
```

See also

ControlBarDisplay (Page 4935)

ControlBarDisplay.Enabled

Description

The "Enabled" property specifies whether the display is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Enabled
```

See also

ControlBarDisplay (Page 4935)

ControlBarDisplay.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.ForeColor
```

See also

ControlBarDisplay (Page 4935)

ControlBarDisplay.Graphic

Description

The "Graphic" property specifies the graphic of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Graphic
```

See also

ControlBarDisplay (Page 4935)

ControlBarDisplay.Height

Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Height
```

See also

ControlBarDisplay (Page 4935)

ControlBarDisplay.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarDislay.Mapping
```

See also

ControlBarDisplay (Page 4935)

ControlBarDisplay.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the display.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarDislay.Margin
```

See also

ControlBarDisplay (Page 4935)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarDisplay.Margin (Page 4947)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarDisplay.Margin (Page 4947)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarDisplay.Margin (Page 4947)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarDisplay.Margin (Page 4947)

ControlBarDisplay.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumHeight
```

See also

ControlBarDisplay (Page 4935)

ControlBarDisplay.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumWidth
```

See also

ControlBarDisplay (Page 4935)

ControlBarDisplay.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumHeight
```

See also

ControlBarDisplay (Page 4935)

ControlBarDisplay.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumWidth
```

See also

ControlBarDisplay (Page 4935)

ControlBarDisplay.Operability

Description

The "Operability" property returns whether the display is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarDislay.Operability
```

See also

ControlBarDisplay (Page 4935)

ControlBarDisplay.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the display.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarDislay.Padding
```

See also

ControlBarDisplay (Page 4935)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarDisplay.Padding (Page 4952)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarDisplay.Padding (Page 4952)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarDisplay.Padding (Page 4952)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarDisplay.Padding (Page 4952)

ControlBarDisplay.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarDislay.RequireExplicitUnlock
```

See also

ControlBarDisplay (Page 4935)

ControlBarDisplay.Text

Description

The "Text" property specifies the label of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Text
```

See also

ControlBarDisplay (Page 4935)

ControlBarDisplay.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.ToolTipText
```

See also

ControlBarDisplay (Page 4935)

ControlBarDisplay.Visible

Description

The "Visible" property specifies whether the display is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Visible
```

See also

ControlBarDisplay (Page 4935)

ControlBarDisplay.Width

Description

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Width
```

See also

ControlBarDisplay (Page 4935)

ControlBarLabel

Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar.

You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarLabelPart

Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the identifier can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the identifier.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the identifier is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.

- **Visible**
  Specifies whether the identifier is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarLabel.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarLabel.Authorization
```

See also

ControlBarLabel (Page 4957)

ControlBarLabel.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarLabel.CustomID
```

See also

ControlBarLabel (Page 4957)

ControlBarLabel.Enabled

Description

The "Enabled" property specifies whether the identifier is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Enabled
```

See also

ControlBarLabel (Page 4957)

ControlBarLabel.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.ForeColor
```

See also

ControlBarLabel (Page 4957)

ControlBarLabel.Height

Description

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Height
```

See also

ControlBarLabel (Page 4957)

ControlBarLabel.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

See also

ControlBarLabel (Page 4957)

ControlBarLabel.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms

- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export

- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarLabel.Mapping
```

See also

ControlBarLabel (Page 4957)

ControlBarLabel.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarLabel.Margin
```

See also

ControlBarLabel (Page 4957)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarLabel.Margin (Page 4964)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarLabel.Margin (Page 4964)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarLabel.Margin (Page 4964)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarLabel.Margin (Page 4964)

ControlBarLabel.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumHeight
```

See also

ControlBarLabel (Page 4957)

ControlBarLabel.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumWidth
```

See also

ControlBarLabel (Page 4957)

ControlBarLabel.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumHeight
```

See also

ControlBarLabel (Page 4957)

ControlBarLabel.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumWidth
```

See also

ControlBarLabel (Page 4957)

ControlBarLabel.Operability

Description

The "Operability" property returns whether the identifier is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarLabel.Operability
```

See also

ControlBarLabel (Page 4957)

ControlBarLabel.Padding

Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarLabel.Padding
```

See also

ControlBarLabel (Page 4957)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarLabel.Padding (Page 4969)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarLabel.Padding (Page 4969)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarLabel.Padding (Page 4969)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarLabel.Padding (Page 4969)

ControlBarLabel.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarLabel.RequireExplicitUnlock
```

See also

ControlBarLabel (Page 4957)

ControlBarLabel.Text

Description

The "Text" property specifies the label of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.Text
```

See also

ControlBarLabel (Page 4957)

ControlBarLabel.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.ToolTipText
```

See also

ControlBarLabel (Page 4957)

ControlBarLabel.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.VerticalTextAlignment
```

See also

ControlBarLabel (Page 4957)

ControlBarLabel.Visible

Description

The "Visible" property specifies whether the identifier is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Visible
```

See also

ControlBarLabel (Page 4957)

ControlBarLabel.Width

Description

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Width
```

See also

ControlBarLabel (Page 4957)

ControlBarSeparator

Description

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarSeparatorPart

Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the disconnector can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the separator.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.

- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the separator is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the disconnector is only operable while the associated button is being pressed.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the disconnector is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarSeparator.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarSeparator.Authorization
```

See also

ControlBarSeparator (Page 4975)

ControlBarSeparator.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarSeparator.CustomID
```

See also

ControlBarSeparator (Page 4975)

ControlBarSeparator.Enabled

Description

The "Enabled" property specifies whether the separator is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Enabled
```

See also

ControlBarSeparator (Page 4975)

ControlBarSeparator.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.ForeColor
```

See also

ControlBarSeparator (Page 4975)

ControlBarSeparator.Height

Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Height
```

See also

ControlBarSeparator (Page 4975)

ControlBarSeparator.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarSeparator.Mapping
```

See also

ControlBarSeparator (Page 4975)

ControlBarSeparator.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the separator.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarSeparator.Margin
```

See also

ControlBarSeparator (Page 4975)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarSeparator.Margin (Page 4981)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarSeparator.Margin (Page 4981)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarSeparator.Margin (Page 4981)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarSeparator.Margin (Page 4981)

ControlBarSeparator.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumHeight
```

See also

ControlBarSeparator (Page 4975)

ControlBarSeparator.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumWidth
```

See also

ControlBarSeparator (Page 4975)

ControlBarSeparator.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumHeight
```

See also

ControlBarSeparator (Page 4975)

ControlBarSeparator.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumWidth
```

See also

ControlBarSeparator (Page 4975)

ControlBarSeparator.Operability

Description

The "Operability" property returns whether the separator is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarSeparator.Operability
```

See also

ControlBarSeparator (Page 4975)

ControlBarSeparator.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the separator.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarSeparator.Padding
```

See also

ControlBarSeparator (Page 4975)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarSeparator.Padding (Page 4986)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarSeparator.Padding (Page 4986)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarSeparator.Padding (Page 4986)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarSeparator.Padding (Page 4986)

ControlBarSeparator.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the disconnector can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarSeparator.RequireExplicitUnlock
```

See also

ControlBarSeparator (Page 4975)

ControlBarSeparator.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

Type

String

Access

Read-write

Syntax

```
ControlBarSeparator.ToolTipText
```

See also

ControlBarSeparator (Page 4975)

ControlBarSeparator.Visible

Description

The "Visible" property specifies whether the separator is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Visible
```

See also

ControlBarSeparator (Page 4975)

ControlBarSeparator.Width

Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Width
```

See also

ControlBarSeparator (Page 4975)

ControlBarTextBox

Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarTextBoxPart

Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the text box can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Mapping**
  Returns the function of the text box.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.

- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the text box is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **Readonly**
  Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**
  Returns whether the text box is only operable while the associated button is being pressed.
- **Text**
  Specifies the labeling.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the text box is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarTextBox.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.AlternateBorderColor
```

See also

ControlBarTextBox (Page 4991)

ControlBarTextBox.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarTextBox.Authorization
```

See also

ControlBarTextBox (Page 4991)

ControlBarTextBox.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BackColor
```

See also

ControlBarTextBox (Page 4991)

ControlBarTextBox.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BorderColor
```

See also

ControlBarTextBox (Page 4991)

ControlBarTextBox.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarTextBox.BorderWidth
```

See also

ControlBarTextBox (Page 4991)

ControlBarTextBox.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarTextBox.CustomID
```

See also

ControlBarTextBox (Page 4991)

ControlBarTextBox.Enabled

Description

The "Enabled" property specifies whether the text box can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Enabled
```

See also

ControlBarTextBox (Page 4991)

ControlBarTextBox.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.ForeColor
```

See also

ControlBarTextBox (Page 4991)

ControlBarTextBox.Height

Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Height
```

See also

ControlBarTextBox (Page 4991)

ControlBarTextBox.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

See also

ControlBarTextBox (Page 4991)

ControlBarTextBox.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarTextBox.Mapping
```

See also

ControlBarTextBox (Page 4991)

ControlBarTextBox.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the text box.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarTextBox.Margin
```

See also

ControlBarTextBox (Page 4991)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarTextBox.Margin (Page 5000)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarTextBox.Margin (Page 5000)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarTextBox.Margin (Page 5000)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarTextBox.Margin (Page 5000)

ControlBarTextBox.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumHeight
```

See also

ControlBarTextBox (Page 4991)

ControlBarTextBox.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumWidth
```

See also

ControlBarTextBox (Page 4991)

ControlBarTextBox.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumHeight
```

See also

ControlBarTextBox (Page 4991)

ControlBarTextBox.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumWidth
```

See also

ControlBarTextBox (Page 4991)

ControlBarTextBox.Operability

Description

The "Operability" property returns whether the text box is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarTextBox.Operability
```

See also

ControlBarTextBox (Page 4991)

ControlBarTextBox.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the text box.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarTextBox.Padding
```

See also

ControlBarTextBox (Page 4991)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarTextBox.Padding (Page 5005)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarTextBox.Padding (Page 5005)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarTextBox.Padding (Page 5005)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarTextBox.Padding (Page 5005)

ControlBarTextBox.ReadOnly

Description

The "ReadOnly" property specifies whether the text box is read-only.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.ReadOnly
```

See also

ControlBarTextBox (Page 4991)

ControlBarTextBox.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

See also

ControlBarTextBox (Page 4991)

ControlBarTextBox.Text

Description

The "Text" property specifies the label of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.Text
```

See also

ControlBarTextBox (Page 4991)

ControlBarTextBox.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.ToolTipText
```

See also

ControlBarTextBox (Page 4991)

ControlBarTextBox.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

See also

ControlBarTextBox (Page 4991)

ControlBarTextBox.Visible

Description

The "Visible" property specifies whether the text box is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Visible
```

See also

ControlBarTextBox (Page 4991)

ControlBarTextBox.Width

Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Width
```

See also

ControlBarTextBox (Page 4991)

ControlBarToggleSwitch

Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar.

You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarToggleSwitchPart

Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **AlternateGraphic**
  Specifies the graphic for the "pressed" state.
- **AlternateText**
  Specifies the text for the "pressed" state.
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the identifier of the switch.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.

- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the switch can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the switch.
- **IsAlternateState**
  Specifies the current state of the switch.
- **Mapping**
  Returns the function of the switch.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the switch is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the switch is only operable while the associated button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the switch is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarToggleSwitch.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.AlternateGraphic

Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateGraphic
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.AlternateText

Description

The "AlternateText" property specifies the text of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateText
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Authorization
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BackColor
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.Badge

Description

The "Badge" property specifies the identifier of the switch.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Badge
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderColor
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderWidth
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Content
```

See also

ControlBarToggleSwitch (Page 5011)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarToggleSwitch.Content (Page 5017)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.

- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarToggleSwitch.Content (Page 5017)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 5017)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarToggleSwitch.Content (Page 5017)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarToggleSwitch.Content (Page 5017)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarToggleSwitch.Content (Page 5017)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarToggleSwitch.Content (Page 5017)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 5017)

ControlBarToggleSwitch.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarToggleSwitch.CustomID
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.Enabled

Description

The "Enabled" property specifies whether the switch can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Enabled
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ForeColor
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.Graphic

Description

The "Graphic" property specifies the graphic of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Graphic
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.Height

Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Height
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.HotKey

Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
Button.HotKey
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.IsAlternateState

Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment

- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms

- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Mapping
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the switch.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Margin
```

See also

ControlBarToggleSwitch (Page 5011)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarToggleSwitch.Margin (Page 5028)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarToggleSwitch.Margin (Page 5028)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarToggleSwitch.Margin (Page 5028)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarToggleSwitch.Margin (Page 5028)

ControlBarToggleSwitch.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumHeight
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumWidth
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumHeight
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumWidth
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.Operability

Description

The property "Operability" returns whether the switch is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Operability
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the switch.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Padding
```

See also

ControlBarToggleSwitch (Page 5011)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarToggleSwitch.Padding (Page 5033)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarToggleSwitch.Padding (Page 5033)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarToggleSwitch.Padding (Page 5033)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarToggleSwitch.Padding (Page 5033)

ControlBarToggleSwitch.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.Text

Description

The "Text" property specifies the label of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Text
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ToolTipText
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.Visible

Description

The "Visible" property specifies whether the switch is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Visible
```

See also

ControlBarToggleSwitch (Page 5011)

ControlBarToggleSwitch.Width

Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Width
```

See also

ControlBarToggleSwitch (Page 5011)

ToolBar.Enabled

Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Enabled
```

See also

ProcessDiagnosisGraphOverviewControl.ToolBar (Page 4906)

ToolBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ToolBar.Font
```

See also

ProcessDiagnosisGraphOverviewControl.ToolBar (Page 4906)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ToolBar.Font (Page 5039)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ToolBar.Font (Page 5039)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ToolBar.Font (Page 5039)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ToolBar.Font (Page 5039)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ToolBar.Font (Page 5039)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ToolBar.Font (Page 5039)

ToolBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the toolbar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ToolBar.Margin
```

See also

ProcessDiagnosisGraphOverviewControl.ToolBar (Page 4906)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ToolBar.Margin (Page 5043)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ToolBar.Margin (Page 5043)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ToolBar.Margin (Page 5043)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ToolBar.Margin (Page 5043)

ToolBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ToolBar.Padding
```

See also

ProcessDiagnosisGraphOverviewControl.ToolBar (Page 4906)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ToolBar.Padding (Page 5045)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ToolBar.Padding (Page 5045)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ToolBar.Padding (Page 5045)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ToolBar.Padding (Page 5045)

ToolBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.ShowToolTips
```

See also

ProcessDiagnosisGraphOverviewControl.ToolBar (Page 4906)

ToolBar.UseHotKeys

Description

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.UseHotKeys
```

See also

ProcessDiagnosisGraphOverviewControl.ToolBar (Page 4906)

ToolBar.Visible

Description

The "Visible" property specifies whether the toolbar is visible.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Visible
```

See also

ProcessDiagnosisGraphOverviewControl.ToolBar (Page 4906)

ProcessDiagnosisGraphOverviewControl.Top

Description

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.Top
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl.Visible

Description

The "Visible" property specifies whether the process diagnostics view is visible.

Type

Bool

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.Visible
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl.Width

Description

The "Width" property specifies the width in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.Width
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl.WindowFlags

Description

The "WindowFlags" property specifies the window configuration of the process diagnostics view.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

You can enable multiple properties by adding integer values or bit operators.

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.WindowFlags
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the process diagnostics view.

Syntax

```
ProcessDiagnosisGraphOverviewControl.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl.FireCommand()

Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the process diagnostics view for graphic overview.

Syntax

```
ProcessDiagnosisGraphOverviewControl.FireCommand(commandId, custom)
```

Parameters

commandId

Type: Int32

ID of the element of the toolbar or information bar

custom

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

Return value

--

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
ProcessDiagnosisGraphOverviewControl.PropertyFlashing(propertyName,
enable[, value][, alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

`alternateValue`

Optional, type: Variant

Specifies the second value for flashing.

`rate`

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl_AlarmViewButtonTapped()

Description

The "AlarmViewButtonTapped"event occurs when the "AlarmView" button is pressed.

Syntax

```
ProcessDiagnosisGraphOverviewControl_AlarmViewButtonTapped(item)
```

Context

`item`

Type: Object

Button at which the event occurs.

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl_PlcCodeViewerButtonTapped()

Description

The "PlcCodeViewerButtonTapped"event occurs when the "PlcCodeViewer" button is pressed.

Syntax

```
ProcessDiagnosisGraphOverviewControl_PlcCodeViewerButtonTapped(item)
```

Context

item

Type: Object

Button at which the event occurs.

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl_TIAPortalButtonTapped()

Description

The "TIAPortalButtonTapped"event occurs when the "TIAPortal" button is pressed.

Syntax

```
ProcessDiagnosisGraphOverviewControl_TIAPortalButtonTapped(item)
```

Context

item

Type: Object

Button at which the event occurs.

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisOverviewControl

Description

The "ProcessDiagnosisOverviewControl" object represents a process diagnostics overview in runtime.

Object type

HmiProcessDiagnosisOverviewControl

Properties

The "Object" object has the following properties:

- **BackColor**
  Specifies the background color.
- **Caption**
  Specifies the text that is displayed in the title bar.
- **CaptionColor**
  Specifies the background color of the title bar.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the process diagnostics overview.
- **Enabled**
  Specifies whether the process diagnostics overview can be operated in runtime.
- **Font**
  Specifies the font of the text.
- **ForeColor**
  Specifies the font color of the text.
- **Height**
  Specifies the height.
- **Icon**
  Specifies the icon of the process diagnostics overview.
- **Layer**
  Returns the screen layer in which the process diagnostics overview is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the process diagnostics overview.
- **Parent**
  Returns the higher-level screen object.

- **PDiagCategories**
  Specifies the category of the process diagnostics overview.
- **PDiagSupervisionTypes**
  Specifies the supervision types of the process diagnostics overview.
- **PlcSource**
  Specifies the PLC source.
- **RenderingTemplate**
  Returns the name of the template from which the process diagnostics overview was created.
- **ShowFocusVisual**
  Specifies whether the process diagnostics overview is highlighted when in focus.
- **StatusBar**
  Specifies the information bar of the process diagnostics overview.
- **StyleItemClass**
  Returns the style which is applied to the process diagnostics overview.
- **TabIndex**
  Returns the position of the process diagnostics overview in the tab sequence.
- **ToolBar**
  Specifies the toolbar of the process diagnostics overview.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the process diagnostics overview is visible.
- **Width**
  Specifies the width.
- **WindowFlags**
  Specifies the window configuration of the process diagnostics overview.

Methods

The "ProcessDiagnosisOverviewControl" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the process diagnostics overview.
- **FireCommand()**
  Configures the occurrence of an event for an element.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "ProcessDiagnosisOverviewControl" object has the following events:

- **AlarmViewButtonTapped()**
  Occurs when the "AlarmView" button is pressed.

ProcessDiagnosisOverviewControl.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewControl.BackColor
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisOverviewControl.Caption

Description

The "Caption" property specifies the text that is displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewControl.Caption
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

ProcessDiagnosisOverviewControl.Caption (Page 5058)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 5059)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 5059)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 5059)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 5059)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 5059)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 5059)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

ProcessDiagnosisOverviewControl.Caption (Page 5058)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

ProcessDiagnosisOverviewControl.Caption (Page 5058)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

ProcessDiagnosisOverviewControl.Caption (Page 5058)

ProcessDiagnosisOverviewControl.CaptionColor

Description

The "CaptionColor" property specifies the color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewControl.CaptionColor
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisOverviewControl.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the process diagnostics overview.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
ProcessDiagnosisOverviewControl.CurrentQuality
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisOverviewControl.Enabled

Description

The "Enabled" property specifies whether the process diagnostics overview can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewControl.Enabled
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisOverviewControl.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewControl.Font
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ProcessDiagnosisOverviewControl.Font (Page 5066)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ProcessDiagnosisOverviewControl.Font (Page 5066)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ProcessDiagnosisOverviewControl.Font (Page 5066)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ProcessDiagnosisOverviewControl.Font (Page 5066)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ProcessDiagnosisOverviewControl.Font (Page 5066)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ProcessDiagnosisOverviewControl.Font (Page 5066)

ProcessDiagnosisOverviewControl.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewControl.ForeColor
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisOverviewControl.Height

Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewControl.Height
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisOverviewControl.Icon

Description

The "Icon" property specifies the icon of the process diagnostics overview.

Type

String

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewControl.Icon
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisOverviewControl.Layer

Description

The "Layer" property returns the screen layer in which the process diagnostics overview is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
ProcessDiagnosisOverviewControl.Layer
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

ProcessDiagnosisOverviewControl.Layer (Page 5071)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

ProcessDiagnosisOverviewControl.Layer (Page 5071)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

ProcessDiagnosisOverviewControl.Layer (Page 5071)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

ProcessDiagnosisOverviewControl.Layer (Page 5071)

ProcessDiagnosisOverviewControl.Left

Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewControl.Left
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisOverviewControl.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewControl.Margin
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ProcessDiagnosisOverviewControl.Margin (Page 5074)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ProcessDiagnosisOverviewControl.Margin (Page 5074)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ProcessDiagnosisOverviewControl.Margin (Page 5074)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ProcessDiagnosisOverviewControl.Margin (Page 5074)

ProcessDiagnosisOverviewControl.Name

Description

The "Name" property returns the name of the process diagnostics overview.

Type

String

Access

Read-only

Syntax

```
ProcessDiagnosisOverviewControl.Name
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisOverviewControl.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
ProcessDiagnosisOverviewControl.Parent
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

ProcessDiagnosisOverviewControl.PDiagCategories

Description

The "PDiagCategories" property specifies the category of the process diagnostics overview.

Type

Object, HmiProcessDiagnosisOverviewPart

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewControl.PDiagCategories
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisOverview.Label

Description

The "Label" property specifies the label.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
ProcessDiagnosisOverview.Label
```

See also

ProcessDiagnosisOverviewControl.PDiagCategories (Page 5077)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

ProcessDiagnosisOverview.Label (Page 5078)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 5078)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 5078)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 5078)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 5078)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 5078)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 5078)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

ProcessDiagnosisOverview.Label (Page 5078)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

ProcessDiagnosisOverview.Label (Page 5078)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

ProcessDiagnosisOverview.Label (Page 5078)

ProcessDiagnosisOverview.PDiagElements

Description

The "PDiagElements" property represents the quantity of elements.

Type

Object, HmiProcessDiagnosisOverviewElementCollection (Page 5084)

Access

Read-only

Syntax

```
ProcessDiagnosisOverview.PDiagElements
```

See also

ProcessDiagnosisOverviewControl.PDiagCategories (Page 5077)

HmiProcessDiagnosisOverviewElementCollection (Page 5084)

HmiProcessDiagnosisOverviewElementCollection

Description

The "HmiProcessDiagnosisOverviewElementCollection" object is a list of all process diagnostics overview elements ("ProcessDiagnosisOverviewElement" objects).

Use

The "HmiProcessDiagnosisOverviewElementCollection" object is a list and can be counted and enumerated. You can access the "HmiProcessDiagnosisOverviewElementCollection" list using the index or the tag names.

Object type

HmiProcessDiagnosisOverviewElementCollection

Properties

The "HmiProcessDiagnosisOverviewElementCollection" object has the following properties:

- **Count**
  Returns the number of process diagnostics overview elements in the "HmiProcessDiagnosisOverviewElementCollection" list.

Methods

The "HmiProcessDiagnosisOverviewElementCollection" object has the following methods:

- **Item()**
  Returns a process diagnostics overview element of the "HmiProcessDiagnosisOverviewElementCollection" list.

See also

ProcessDiagnosisOverview.PDiagElements (Page 5084)

HmiProcessDiagnosisOverviewElementCollection.Count

Description

The "Count" property returns the number of process diagnostics overview elements in the "HmiProcessDiagnosisOverviewElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiProcessDiagnosisOverviewElementCollection.Count
```

See also

HmiProcessDiagnosisOverviewElementCollection (Page 5084)

HmiProcessDiagnosisOverviewElementCollection.Item()

Description

The "Item" method returns a process diagnostics overview element of the "HmiProcessDiagnosisOverviewElementCollection" list.

Syntax

```
HmiProcessDiagnosisOverviewElementCollection[.Item]
(HmiProcessDiagnosisOverviewElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiProcessDiagnosisOverviewElementCollection" object.

Parameters

`HmiProcessDiagnosisOverviewElementName`

Type: String

Name of the process diagnostics overview element

Return value

Object, HmiProcessDiagnosisOverviewElementPart (Page 5086)

See also

HmiProcessDiagnosisOverviewElementCollection (Page 5084)

ProcessDiagnosisOverviewElement (Page 5086)

ProcessDiagnosisOverviewElement

Description

The "ProcessDiagnosisOverviewElement" object represents a process diagnostics overview element.

Object type

HmiProcessDiagnosisOverviewElementPart

Properties

The "ProcessDiagnosisOverviewElement" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateForeColor**
  Specifies the flashing color for the text.
- **BackColor**
  Specifies the background color.
- **FlashingRate**
  Specifies the flash rate.

- **ForeColor**
  Specifies the font color of the text.
- **Text**
  Specifies the labeling of the process diagnostics overview element.
- **Visible**
  Specifies whether the process diagnostics overview element is visible.

Methods

--

See also

HmiProcessDiagnosisOverviewElementCollection.Item() (Page 5085)

ProcessDiagnosisOverviewElement.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewElement.AlternateBackColor
```

See also

ProcessDiagnosisOverviewElement (Page 5086)

ProcessDiagnosisOverviewElement.AlternateForeColor

Description

The "AlternateForeColor" property specifies the flashing color for the text.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewElement.AlternateForeColor
```

See also

ProcessDiagnosisOverviewElement (Page 5086)

ProcessDiagnosisOverviewElement.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewElement.BackColor
```

See also

ProcessDiagnosisOverviewElement (Page 5086)

ProcessDiagnosisOverviewElement.FlashingRate

Description

The "FlashingRate" property specifies the flash rate.

Type

Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewElement.FlashingRate
```

See also

ProcessDiagnosisOverviewElement (Page 5086)

ProcessDiagnosisOverviewElement.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewElement.ForeColor
```

See also

ProcessDiagnosisOverviewElement (Page 5086)

ProcessDiagnosisOverviewElement.Text

Description

The "Text" property specifies the labeling of the process diagnostics overview element.

Type

String

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewElement.Text
```

See also

ProcessDiagnosisOverviewElement (Page 5086)

ProcessDiagnosisOverviewElement.Visible

Description

The "Visible" property specifies whether the process diagnostics overview element is visible.

Type

Bool

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewElement.Visible
```

See also

ProcessDiagnosisOverviewElement (Page 5086)

ProcessDiagnosisOverview.SymbolFont

Description

The "SymbolFont" property specifies the font of the symbol text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ProcessDiagnosisOverview.SymbolFont
```

See also

ProcessDiagnosisOverviewControl.PDiagCategories (Page 5077)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ProcessDiagnosisOverview.SymbolFont (Page 5090)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ProcessDiagnosisOverview.SymbolFont (Page 5090)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ProcessDiagnosisOverview.SymbolFont (Page 5090)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ProcessDiagnosisOverview.SymbolFont (Page 5090)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ProcessDiagnosisOverview.SymbolFont (Page 5090)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ProcessDiagnosisOverview.SymbolFont (Page 5090)

ProcessDiagnosisOverview.Visible

Description

The "Visible" property specifies whether the process diagnostics view is visible.

Type

Bool

Access

Read-write

Syntax

```
ProcessDiagnosisOverview.Visible
```

See also

ProcessDiagnosisOverviewControl.PDiagCategories (Page 5077)

ProcessDiagnosisOverviewControl.PDiagSupervisionTypes

Description

The "PDiagSupervisionTypes" property specifies the supervision types of the process diagnostics overview.

Type

Object, HmiProcessDiagnosisOverviewPart

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewControl.PDiagSupervisionTypes
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisOverview.Label

Description

The "Label" property specifies the label.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
ProcessDiagnosisOverview.Label
```

See also

ProcessDiagnosisOverviewControl.PDiagSupervisionTypes (Page 5095)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

ProcessDiagnosisOverview.Label (Page 5095)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 5096)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 5096)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 5096)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 5096)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 5096)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 5096)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

ProcessDiagnosisOverview.Label (Page 5095)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

ProcessDiagnosisOverview.Label (Page 5095)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

ProcessDiagnosisOverview.Label (Page 5095)

ProcessDiagnosisOverview.PDiagElements

Description

The "PDiagElements" property represents the quantity of elements.

Type

Object, HmiProcessDiagnosisOverviewElementCollection (Page 5101)

Access

Read-only

Syntax

```
ProcessDiagnosisOverview.PDiagElements
```

See also

ProcessDiagnosisOverviewControl.PDiagSupervisionTypes (Page 5095)

HmiProcessDiagnosisOverviewElementCollection (Page 5101)

HmiProcessDiagnosisOverviewElementCollection

Description

The "HmiProcessDiagnosisOverviewElementCollection" object is a list of all process diagnostics overview elements ("ProcessDiagnosisOverviewElement" objects).

Use

The "HmiProcessDiagnosisOverviewElementCollection" object is a list and can be counted and enumerated. You can access the "HmiProcessDiagnosisOverviewElementCollection" list using the index or the tag names.

Object type

HmiProcessDiagnosisOverviewElementCollection

Properties

The "HmiProcessDiagnosisOverviewElementCollection" object has the following properties:

- **Count**
  Returns the number of process diagnostics overview elements in the "HmiProcessDiagnosisOverviewElementCollection" list.

Methods

The "HmiProcessDiagnosisOverviewElementCollection" object has the following methods:

- **Item()**
  Returns a process diagnostics overview element of the "HmiProcessDiagnosisOverviewElementCollection" list.

See also

ProcessDiagnosisOverview.PDiagElements (Page 5101)

HmiProcessDiagnosisOverviewElementCollection.Count

Description

The "Count" property returns the number of process diagnostics overview elements in the "HmiProcessDiagnosisOverviewElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiProcessDiagnosisOverviewElementCollection.Count
```

See also

HmiProcessDiagnosisOverviewElementCollection (Page 5101)

HmiProcessDiagnosisOverviewElementCollection.Item()

Description

The "Item" method returns a process diagnostics overview element of the "HmiProcessDiagnosisOverviewElementCollection" list.

Syntax

```
HmiProcessDiagnosisOverviewElementCollection[.Item]
(HmiProcessDiagnosisOverviewElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiProcessDiagnosisOverviewElementCollection" object.

Parameters

`HmiProcessDiagnosisOverviewElementName`

Type: String

Name of the process diagnostics overview element

Return value

Object, HmiProcessDiagnosisOverviewElementPart (Page 5103)

See also

HmiProcessDiagnosisOverviewElementCollection (Page 5101)

ProcessDiagnosisOverviewElement (Page 5103)

ProcessDiagnosisOverviewElement

Description

The "ProcessDiagnosisOverviewElement" object represents a process diagnostics overview element.

Object type

HmiProcessDiagnosisOverviewElementPart

Properties

The "ProcessDiagnosisOverviewElement" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateForeColor**
  Specifies the flashing color for the text.
- **BackColor**
  Specifies the background color.
- **FlashingRate**
  Specifies the flash rate.
- **ForeColor**
  Specifies the font color of the text.
- **Text**
  Specifies the labeling of the process diagnostics overview element.
- **Visible**
  Specifies whether the process diagnostics overview element is visible.

Methods

--

See also

HmiProcessDiagnosisOverviewElementCollection.Item() (Page 5103)

ProcessDiagnosisOverviewElement.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewElement.AlternateBackColor
```

See also

ProcessDiagnosisOverviewElement (Page 5103)

ProcessDiagnosisOverviewElement.AlternateForeColor

Description

The "AlternateForeColor" property specifies the flashing color for the text.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewElement.AlternateForeColor
```

See also

ProcessDiagnosisOverviewElement (Page 5103)

ProcessDiagnosisOverviewElement.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewElement.BackColor
```

See also

ProcessDiagnosisOverviewElement (Page 5103)

ProcessDiagnosisOverviewElement.FlashingRate

Description

The "FlashingRate" property specifies the flash rate.

Type

Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewElement.FlashingRate
```

See also

ProcessDiagnosisOverviewElement (Page 5103)

ProcessDiagnosisOverviewElement.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewElement.ForeColor
```

See also

ProcessDiagnosisOverviewElement (Page 5103)

ProcessDiagnosisOverviewElement.Text

Description

The "Text" property specifies the labeling of the process diagnostics overview element.

Type

String

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewElement.Text
```

See also

ProcessDiagnosisOverviewElement (Page 5103)

ProcessDiagnosisOverviewElement.Visible

Description

The "Visible" property specifies whether the process diagnostics overview element is visible.

Type

Bool

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewElement.Visible
```

See also

ProcessDiagnosisOverviewElement (Page 5103)

ProcessDiagnosisOverview.SymbolFont

Description

The "SymbolFont" property specifies the font of the symbol text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ProcessDiagnosisOverview.SymbolFont
```

See also

ProcessDiagnosisOverviewControl.PDiagSupervisionTypes (Page 5095)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ProcessDiagnosisOverview.SymbolFont (Page 5108)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ProcessDiagnosisOverview.SymbolFont (Page 5108)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ProcessDiagnosisOverview.SymbolFont (Page 5108)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ProcessDiagnosisOverview.SymbolFont (Page 5108)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ProcessDiagnosisOverview.SymbolFont (Page 5108)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ProcessDiagnosisOverview.SymbolFont (Page 5108)

ProcessDiagnosisOverview.Visible

Description

The "Visible" property specifies whether the process diagnostics view is visible.

Type

Bool

Access

Read-write

Syntax

```
ProcessDiagnosisOverview.Visible
```

See also

ProcessDiagnosisOverviewControl.PDiagSupervisionTypes (Page 5095)

ProcessDiagnosisOverviewControl.PlcSource

Description

The "PlcSource" property specifies the PLC source.

Type

Object, HmiPlcDataSourcePart

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewControl.PlcSource
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

PlcDataSource.Connection

Description

The "Connection" property returns the connection.

Type

Object, HmiConnection (Page 1148)

Access

Read-only

Syntax

```
PlcDataSource.Connection
```

See also

ProcessDiagnosisOverviewControl.PlcSource (Page 5112)

Connection (Page 1148)

Connection

Description

Connection (Page 1148)

PlcDataSource.DB_Name

Description

The "DB_Name" property returns the name of the database.

Type

String

Access

Read-only

Syntax

```
PlcDataSource.DB_Name
```

See also

ProcessDiagnosisOverviewControl.PlcSource (Page 5112)

PlcDataSource.HmiConnectionName

Description

The "HmiConnectionName" property specifies the connection name.

Type

String

Access

Read-write

Syntax

```
PlcDataSource.HmiConnectionName
```

See also

ProcessDiagnosisOverviewControl.PlcSource (Page 5112)

PlcDataSource.Tag

Description

The "Tag" property returns the tag.

Type

String, HMITag (Page 1338)

Access

Read-only

Syntax

```
PlcDataSource.Tag
```

See also

ProcessDiagnosisOverviewControl.PlcSource (Page 5112)

Tag (Page 1338)

Tag

Description

Tag (Page 1338)

ProcessDiagnosisOverviewControl.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the process diagnostics overview was created.

Type

String

Access

Read-only

Syntax

```
ProcessDiagnosisOverviewControl.RenderingTemplate
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisOverviewControl.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the process diagnostics overview is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewControl.ShowFocusVisual
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisOverviewControl.StatusBar

Description

The "StatusBar" property specifies the information bar of the process diagnostics overview.

Type

Object, HmiStatusBarPart

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewControl.StatusBar
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

StatusBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
StatusBar.BackColor
```

See also

ProcessDiagnosisOverviewControl.StatusBar (Page 5116)

StatusBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

Type

Object, HmiControlBarElementCollection (Page 5117)

Access

Read-only

Syntax

```
StatusBar.Elements
```

See also

ProcessDiagnosisOverviewControl.StatusBar (Page 5116)

HmiControlBarElementCollection (Page 5117)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

StatusBar.Elements (Page 5117)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 5117)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 5134)

See also

HmiControlBarElementCollection (Page 5117)

Control Bar Elements (Page 5134)

Control Bar Elements

Description

Control Bar Elements (Page 5134)

StatusBar.Enabled

Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Enabled
```

See also

ProcessDiagnosisOverviewControl.StatusBar (Page 5116)

StatusBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
StatusBar.Font
```

See also

ProcessDiagnosisOverviewControl.StatusBar (Page 5116)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

StatusBar.Font (Page 5120)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

StatusBar.Font (Page 5120)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

StatusBar.Font (Page 5120)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

StatusBar.Font (Page 5120)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

StatusBar.Font (Page 5120)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

StatusBar.Font (Page 5120)

StatusBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
StatusBar.Margin
```

See also

ProcessDiagnosisOverviewControl.StatusBar (Page 5116)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

StatusBar.Margin (Page 5124)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

StatusBar.Margin (Page 5124)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

StatusBar.Margin (Page 5124)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

StatusBar.Margin (Page 5124)

StatusBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
StatusBar.Padding
```

See also

ProcessDiagnosisOverviewControl.StatusBar (Page 5116)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

StatusBar.Padding (Page 5126)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

StatusBar.Padding (Page 5126)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

StatusBar.Padding (Page 5126)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

StatusBar.Padding (Page 5126)

StatusBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.ShowToolTips
```

See also

ProcessDiagnosisOverviewControl.StatusBar (Page 5116)

StatusBar.Visible

Description

The "Visible" property specifies whether the information bar is visible.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Visible
```

See also

ProcessDiagnosisOverviewControl.StatusBar (Page 5116)

ProcessDiagnosisOverviewControl.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the process diagnostics overview.

Type

String

Access

Read-only

Syntax

```
ProcessDiagnosisOverviewControl.StyleItemClass
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisOverviewControl.TabIndex

Description

The "TabIndex" property returns the position of the process diagnostics overview in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
ProcessDiagnosisOverviewControl.TabIndex
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisOverviewControl.ToolBar

Description

The property "ToolBar" specifies the toolbar of the process diagnostics overview.

Type

Object, HmiToolBarPart

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewControl.ToolBar
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

ToolBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ToolBar.BackColor
```

See also

ProcessDiagnosisOverviewControl.ToolBar (Page 5131)

ToolBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

Type

Object, HmiControlBarElementCollection (Page 5132)

Access

Read-only

Syntax

```
ToolBar.Elements
```

See also

ProcessDiagnosisOverviewControl.ToolBar (Page 5131)

HmiControlBarElementCollection (Page 5132)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

ToolBar.Elements (Page 5132)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 5132)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 5134)

See also

HmiControlBarElementCollection (Page 5132)

Control Bar Elements (Page 5134)

Control Bar Elements

ControlBarButton

Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarButtonPart

Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the label of the button.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the button can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the button.
- **Mapping**
  Returns the function of the button.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.

- **Operability**
  Returns whether the button is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the button is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarButton.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBackColor
```

See also

ControlBarButton (Page 5134)

ControlBarButton.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBorderColor
```

See also

ControlBarButton (Page 5134)

ControlBarButton.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarButton.Authorization
```

See also

ControlBarButton (Page 5134)

ControlBarButton.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BackColor
```

See also

ControlBarButton (Page 5134)

ControlBarButton.Badge

Description

The "Badge" property specifies the label of the button.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarButton.Badge
```

See also

ControlBarButton (Page 5134)

ControlBarButton.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BorderColor
```

See also

ControlBarButton (Page 5134)

ControlBarButton.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarButton.BorderWidth
```

See also

ControlBarButton (Page 5134)

ControlBarButton.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarButton.Content
```

See also

ControlBarButton (Page 5134)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarButton.Content (Page 5140)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarButton.Content (Page 5140)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarButton.Content (Page 5140)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarButton.Content (Page 5140)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarButton.Content (Page 5140)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarButton.Content (Page 5140)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarButton.Content (Page 5140)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarButton.Content (Page 5140)

ControlBarButton.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarButton.CustomID
```

See also

ControlBarButton (Page 5134)

ControlBarButton.Enabled

Description

The "Enabled" property specifies whether the button can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Enabled
```

See also

ControlBarButton (Page 5134)

ControlBarButton.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.ForeColor
```

See also

ControlBarButton (Page 5134)

ControlBarButton.Graphic

Description

The "Graphic" property specifies the graphic of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Graphic
```

See also

ControlBarButton (Page 5134)

ControlBarButton.Height

Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Height
```

See also

ControlBarButton (Page 5134)

ControlBarButton.HotKey

Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
ControlBarButton.HotKey
```

See also

ControlBarButton (Page 5134)

ControlBarButton.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent

- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms

- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarButton.Mapping
```

See also

ControlBarButton (Page 5134)

ControlBarButton.Margin

Description

The "Margin" property specifies the surrounded outer distance of the button.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarButton.Margin
```

See also

ControlBarButton (Page 5134)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarButton.Margin (Page 5150)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarButton.Margin (Page 5150)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarButton.Margin (Page 5150)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarButton.Margin (Page 5150)

ControlBarButton.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumHeight
```

See also

ControlBarButton (Page 5134)

ControlBarButton.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumWidth
```

See also

ControlBarButton (Page 5134)

ControlBarButton.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumHeight
```

See also

ControlBarButton (Page 5134)

ControlBarButton.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumWidth
```

See also

ControlBarButton (Page 5134)

ControlBarButton.Operability

Description

The "Operability" property returns whether the button is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarButton.Operability
```

See also

ControlBarButton (Page 5134)

ControlBarButton.Padding

Description

The "Padding" property specifies the distance of the content from the border of the button.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarButton.Padding
```

See also

ControlBarButton (Page 5134)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarButton.Padding (Page 5155)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarButton.Padding (Page 5155)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarButton.Padding (Page 5155)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarButton.Padding (Page 5155)

ControlBarButton.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarButton.RequireExplicitUnlock
```

See also

ControlBarButton (Page 5134)

ControlBarButton.Text

Description

The "Text" property specifies the label of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Text
```

See also

ControlBarButton (Page 5134)

ControlBarButton.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.ToolTipText
```

See also

ControlBarButton (Page 5134)

ControlBarButton.Visible

Description

The "Visible" property specifies whether the button is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Visible
```

See also

ControlBarButton (Page 5134)

ControlBarButton.Width

Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Width
```

See also

ControlBarButton (Page 5134)

ControlBarDisplay

Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarDisplayPart

Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the display area is enabled in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the display area.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the display area is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.

- **Visible**
  Specifies whether the display area is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarDisplay.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarDislay.Authorization
```

See also

ControlBarDisplay (Page 5160)

ControlBarDisplay.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarDislay.Content
```

See also

ControlBarDisplay (Page 5160)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarDisplay.Content (Page 5162)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarDisplay.Content (Page 5162)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarDisplay.Content (Page 5162)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarDisplay.Content (Page 5162)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarDisplay.Content (Page 5162)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarDisplay.Content (Page 5162)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarDisplay.Content (Page 5162)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarDisplay.Content (Page 5162)

ControlBarDisplay.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarDislay.CustomID
```

See also

ControlBarDisplay (Page 5160)

ControlBarDisplay.Enabled

Description

The "Enabled" property specifies whether the display is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Enabled
```

See also

ControlBarDisplay (Page 5160)

ControlBarDisplay.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.ForeColor
```

See also

ControlBarDisplay (Page 5160)

ControlBarDisplay.Graphic

Description

The "Graphic" property specifies the graphic of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Graphic
```

See also

ControlBarDisplay (Page 5160)

ControlBarDisplay.Height

Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Height
```

See also

ControlBarDisplay (Page 5160)

ControlBarDisplay.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarDislay.Mapping
```

See also

ControlBarDisplay (Page 5160)

ControlBarDisplay.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the display.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarDislay.Margin
```

See also

ControlBarDisplay (Page 5160)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarDisplay.Margin (Page 5172)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarDisplay.Margin (Page 5172)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarDisplay.Margin (Page 5172)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarDisplay.Margin (Page 5172)

ControlBarDisplay.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumHeight
```

See also

ControlBarDisplay (Page 5160)

ControlBarDisplay.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumWidth
```

See also

ControlBarDisplay (Page 5160)

ControlBarDisplay.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumHeight
```

See also

ControlBarDisplay (Page 5160)

ControlBarDisplay.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumWidth
```

See also

ControlBarDisplay (Page 5160)

ControlBarDisplay.Operability

Description

The "Operability" property returns whether the display is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarDislay.Operability
```

See also

ControlBarDisplay (Page 5160)

ControlBarDisplay.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the display.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarDislay.Padding
```

See also

ControlBarDisplay (Page 5160)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarDisplay.Padding (Page 5177)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarDisplay.Padding (Page 5177)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarDisplay.Padding (Page 5177)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarDisplay.Padding (Page 5177)

ControlBarDisplay.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarDislay.RequireExplicitUnlock
```

See also

ControlBarDisplay (Page 5160)

ControlBarDisplay.Text

Description

The "Text" property specifies the label of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Text
```

See also

ControlBarDisplay (Page 5160)

ControlBarDisplay.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.ToolTipText
```

See also

ControlBarDisplay (Page 5160)

ControlBarDisplay.Visible

Description

The "Visible" property specifies whether the display is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Visible
```

See also

ControlBarDisplay (Page 5160)

ControlBarDisplay.Width

Description

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Width
```

See also

ControlBarDisplay (Page 5160)

ControlBarLabel

Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar.

You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarLabelPart

Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the identifier can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the identifier.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the identifier is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.

- **Visible**
  Specifies whether the identifier is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarLabel.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarLabel.Authorization
```

See also

ControlBarLabel (Page 5182)

ControlBarLabel.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarLabel.CustomID
```

See also

ControlBarLabel (Page 5182)

ControlBarLabel.Enabled

Description

The "Enabled" property specifies whether the identifier is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Enabled
```

See also

ControlBarLabel (Page 5182)

ControlBarLabel.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.ForeColor
```

See also

ControlBarLabel (Page 5182)

ControlBarLabel.Height

Description

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Height
```

See also

ControlBarLabel (Page 5182)

ControlBarLabel.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

See also

ControlBarLabel (Page 5182)

ControlBarLabel.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms

- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export

- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarLabel.Mapping
```

See also

ControlBarLabel (Page 5182)

ControlBarLabel.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarLabel.Margin
```

See also

ControlBarLabel (Page 5182)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarLabel.Margin (Page 5189)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarLabel.Margin (Page 5189)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarLabel.Margin (Page 5189)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarLabel.Margin (Page 5189)

ControlBarLabel.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumHeight
```

See also

ControlBarLabel (Page 5182)

ControlBarLabel.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumWidth
```

See also

ControlBarLabel (Page 5182)

ControlBarLabel.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumHeight
```

See also

ControlBarLabel (Page 5182)

ControlBarLabel.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumWidth
```

See also

ControlBarLabel (Page 5182)

ControlBarLabel.Operability

Description

The "Operability" property returns whether the identifier is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarLabel.Operability
```

See also

ControlBarLabel (Page 5182)

ControlBarLabel.Padding

Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarLabel.Padding
```

See also

ControlBarLabel (Page 5182)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarLabel.Padding (Page 5194)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarLabel.Padding (Page 5194)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarLabel.Padding (Page 5194)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarLabel.Padding (Page 5194)

ControlBarLabel.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarLabel.RequireExplicitUnlock
```

See also

ControlBarLabel (Page 5182)

ControlBarLabel.Text

Description

The "Text" property specifies the label of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.Text
```

See also

ControlBarLabel (Page 5182)

ControlBarLabel.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.ToolTipText
```

See also

ControlBarLabel (Page 5182)

ControlBarLabel.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.VerticalTextAlignment
```

See also

ControlBarLabel (Page 5182)

ControlBarLabel.Visible

Description

The "Visible" property specifies whether the identifier is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Visible
```

See also

ControlBarLabel (Page 5182)

ControlBarLabel.Width

Description

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Width
```

See also

ControlBarLabel (Page 5182)

ControlBarSeparator

Description

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarSeparatorPart

Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the disconnector can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the separator.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.

- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the separator is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the disconnector is only operable while the associated button is being pressed.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the disconnector is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarSeparator.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarSeparator.Authorization
```

See also

ControlBarSeparator (Page 5200)

ControlBarSeparator.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarSeparator.CustomID
```

See also

ControlBarSeparator (Page 5200)

ControlBarSeparator.Enabled

Description

The "Enabled" property specifies whether the separator is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Enabled
```

See also

ControlBarSeparator (Page 5200)

ControlBarSeparator.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.ForeColor
```

See also

ControlBarSeparator (Page 5200)

ControlBarSeparator.Height

Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Height
```

See also

ControlBarSeparator (Page 5200)

ControlBarSeparator.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarSeparator.Mapping
```

See also

ControlBarSeparator (Page 5200)

ControlBarSeparator.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the separator.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarSeparator.Margin
```

See also

ControlBarSeparator (Page 5200)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarSeparator.Margin (Page 5206)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarSeparator.Margin (Page 5206)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarSeparator.Margin (Page 5206)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarSeparator.Margin (Page 5206)

ControlBarSeparator.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumHeight
```

See also

ControlBarSeparator (Page 5200)

ControlBarSeparator.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumWidth
```

See also

ControlBarSeparator (Page 5200)

ControlBarSeparator.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumHeight
```

See also

ControlBarSeparator (Page 5200)

ControlBarSeparator.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumWidth
```

See also

ControlBarSeparator (Page 5200)

ControlBarSeparator.Operability

Description

The "Operability" property returns whether the separator is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarSeparator.Operability
```

See also

ControlBarSeparator (Page 5200)

ControlBarSeparator.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the separator.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarSeparator.Padding
```

See also

ControlBarSeparator (Page 5200)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarSeparator.Padding (Page 5211)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarSeparator.Padding (Page 5211)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarSeparator.Padding (Page 5211)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarSeparator.Padding (Page 5211)

ControlBarSeparator.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the disconnector can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarSeparator.RequireExplicitUnlock
```

See also

ControlBarSeparator (Page 5200)

ControlBarSeparator.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

Type

String

Access

Read-write

Syntax

```
ControlBarSeparator.ToolTipText
```

See also

ControlBarSeparator (Page 5200)

ControlBarSeparator.Visible

Description

The "Visible" property specifies whether the separator is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Visible
```

See also

ControlBarSeparator (Page 5200)

ControlBarSeparator.Width

Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Width
```

See also

ControlBarSeparator (Page 5200)

ControlBarTextBox

Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarTextBoxPart

Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the text box can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Mapping**
  Returns the function of the text box.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.

- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the text box is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **Readonly**
  Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**
  Returns whether the text box is only operable while the associated button is being pressed.
- **Text**
  Specifies the labeling.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the text box is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarTextBox.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.AlternateBorderColor
```

See also

ControlBarTextBox (Page 5216)

ControlBarTextBox.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarTextBox.Authorization
```

See also

ControlBarTextBox (Page 5216)

ControlBarTextBox.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BackColor
```

See also

ControlBarTextBox (Page 5216)

ControlBarTextBox.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BorderColor
```

See also

ControlBarTextBox (Page 5216)

ControlBarTextBox.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarTextBox.BorderWidth
```

See also

ControlBarTextBox (Page 5216)

ControlBarTextBox.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarTextBox.CustomID
```

See also

ControlBarTextBox (Page 5216)

ControlBarTextBox.Enabled

Description

The "Enabled" property specifies whether the text box can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Enabled
```

See also

ControlBarTextBox (Page 5216)

ControlBarTextBox.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.ForeColor
```

See also

ControlBarTextBox (Page 5216)

ControlBarTextBox.Height

Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Height
```

See also

ControlBarTextBox (Page 5216)

ControlBarTextBox.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

See also

ControlBarTextBox (Page 5216)

ControlBarTextBox.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarTextBox.Mapping
```

See also

ControlBarTextBox (Page 5216)

ControlBarTextBox.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the text box.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarTextBox.Margin
```

See also

ControlBarTextBox (Page 5216)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarTextBox.Margin (Page 5225)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarTextBox.Margin (Page 5225)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarTextBox.Margin (Page 5225)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarTextBox.Margin (Page 5225)

ControlBarTextBox.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumHeight
```

See also

ControlBarTextBox (Page 5216)

ControlBarTextBox.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumWidth
```

See also

ControlBarTextBox (Page 5216)

ControlBarTextBox.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumHeight
```

See also

ControlBarTextBox (Page 5216)

ControlBarTextBox.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumWidth
```

See also

ControlBarTextBox (Page 5216)

ControlBarTextBox.Operability

Description

The "Operability" property returns whether the text box is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarTextBox.Operability
```

See also

ControlBarTextBox (Page 5216)

ControlBarTextBox.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the text box.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarTextBox.Padding
```

See also

ControlBarTextBox (Page 5216)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarTextBox.Padding (Page 5230)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarTextBox.Padding (Page 5230)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarTextBox.Padding (Page 5230)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarTextBox.Padding (Page 5230)

ControlBarTextBox.ReadOnly

Description

The "ReadOnly" property specifies whether the text box is read-only.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.ReadOnly
```

See also

ControlBarTextBox (Page 5216)

ControlBarTextBox.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

See also

ControlBarTextBox (Page 5216)

ControlBarTextBox.Text

Description

The "Text" property specifies the label of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.Text
```

See also

ControlBarTextBox (Page 5216)

ControlBarTextBox.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.ToolTipText
```

See also

ControlBarTextBox (Page 5216)

ControlBarTextBox.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

See also

ControlBarTextBox (Page 5216)

ControlBarTextBox.Visible

Description

The "Visible" property specifies whether the text box is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Visible
```

See also

ControlBarTextBox (Page 5216)

ControlBarTextBox.Width

Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Width
```

See also

ControlBarTextBox (Page 5216)

ControlBarToggleSwitch

Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar.

You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarToggleSwitchPart

Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **AlternateGraphic**
  Specifies the graphic for the "pressed" state.
- **AlternateText**
  Specifies the text for the "pressed" state.
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the identifier of the switch.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.

- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the switch can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the switch.
- **IsAlternateState**
  Specifies the current state of the switch.
- **Mapping**
  Returns the function of the switch.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the switch is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the switch is only operable while the associated button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the switch is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarToggleSwitch.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.AlternateGraphic

Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateGraphic
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.AlternateText

Description

The "AlternateText" property specifies the text of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateText
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Authorization
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BackColor
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.Badge

Description

The "Badge" property specifies the identifier of the switch.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Badge
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderColor
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderWidth
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Content
```

See also

ControlBarToggleSwitch (Page 5236)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarToggleSwitch.Content (Page 5242)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.

- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarToggleSwitch.Content (Page 5242)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 5242)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarToggleSwitch.Content (Page 5242)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarToggleSwitch.Content (Page 5242)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarToggleSwitch.Content (Page 5242)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarToggleSwitch.Content (Page 5242)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 5242)

ControlBarToggleSwitch.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarToggleSwitch.CustomID
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.Enabled

Description

The "Enabled" property specifies whether the switch can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Enabled
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ForeColor
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.Graphic

Description

The "Graphic" property specifies the graphic of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Graphic
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.Height

Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Height
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.HotKey

Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
Button.HotKey
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.IsAlternateState

Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment

- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row

- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms

- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Mapping
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the switch.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Margin
```

See also

ControlBarToggleSwitch (Page 5236)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarToggleSwitch.Margin (Page 5253)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarToggleSwitch.Margin (Page 5253)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarToggleSwitch.Margin (Page 5253)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarToggleSwitch.Margin (Page 5253)

ControlBarToggleSwitch.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumHeight
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumWidth
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumHeight
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumWidth
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.Operability

Description

The property "Operability" returns whether the switch is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Operability
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the switch.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Padding
```

See also

ControlBarToggleSwitch (Page 5236)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarToggleSwitch.Padding (Page 5258)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarToggleSwitch.Padding (Page 5258)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarToggleSwitch.Padding (Page 5258)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarToggleSwitch.Padding (Page 5258)

ControlBarToggleSwitch.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.Text

Description

The "Text" property specifies the label of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Text
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ToolTipText
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.Visible

Description

The "Visible" property specifies whether the switch is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Visible
```

See also

ControlBarToggleSwitch (Page 5236)

ControlBarToggleSwitch.Width

Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Width
```

See also

ControlBarToggleSwitch (Page 5236)

ToolBar.Enabled

Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Enabled
```

See also

ProcessDiagnosisOverviewControl.ToolBar (Page 5131)

ToolBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ToolBar.Font
```

See also

ProcessDiagnosisOverviewControl.ToolBar (Page 5131)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ToolBar.Font (Page 5264)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ToolBar.Font (Page 5264)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ToolBar.Font (Page 5264)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ToolBar.Font (Page 5264)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ToolBar.Font (Page 5264)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ToolBar.Font (Page 5264)

ToolBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the toolbar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ToolBar.Margin
```

See also

ProcessDiagnosisOverviewControl.ToolBar (Page 5131)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ToolBar.Margin (Page 5268)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ToolBar.Margin (Page 5268)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ToolBar.Margin (Page 5268)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ToolBar.Margin (Page 5268)

ToolBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ToolBar.Padding
```

See also

ProcessDiagnosisOverviewControl.ToolBar (Page 5131)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ToolBar.Padding (Page 5270)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ToolBar.Padding (Page 5270)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ToolBar.Padding (Page 5270)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ToolBar.Padding (Page 5270)

ToolBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.ShowToolTips
```

See also

ProcessDiagnosisOverviewControl.ToolBar (Page 5131)

ToolBar.UseHotKeys

Description

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.UseHotKeys
```

See also

ProcessDiagnosisOverviewControl.ToolBar (Page 5131)

ToolBar.Visible

Description

The "Visible" property specifies whether the toolbar is visible.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Visible
```

See also

ProcessDiagnosisOverviewControl.ToolBar (Page 5131)

ProcessDiagnosisOverviewControl.Top

Description

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewControl.Top
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisOverviewControl.Visible

Description

The "Visible" property specifies whether the process diagnostics view is visible.

Type

Bool

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewControl.Visible
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisOverviewControl.Width

Description

The "Width" property specifies the width in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewControl.Width
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisOverviewControl.WindowFlags

Description

The "WindowFlags" property specifies the window configuration of the process diagnostics overview.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

You can enable multiple properties by adding integer values or bit operators.

Access

Read-write

Syntax

```
ProcessDiagnosisOverviewControl.WindowFlags
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisOverviewControl.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the process diagnostics overview.

Syntax

```
ProcessDiagnosisOverviewControl.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisOverviewControl.FireCommand()

Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the process diagnostics overview.

Syntax

```
ProcessDiagnosisOverviewControl.FireCommand(commandId, custom)
```

Parameters

commandId

Type: Int32

ID of the element of the toolbar or information bar

custom

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

Return value

--

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisOverviewControl.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
ProcessDiagnosisOverviewControl.PropertyFlashing(propertyName,
enable[, value][, alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisOverviewControl_AlarmViewButtonTapped()

Description

The "AlarmViewButtonTapped"event occurs when the "AlarmView" button is pressed.

Syntax

```
ProcessDiagnosisOverviewControl_AlarmViewButtonTapped(item)
```

Context

item

Type: Object

Button at which the event occurs.

See also

ProcessDiagnosisOverviewControl (Page 5056)

ProcessDiagnosisPlcCodeViewerControl

Description

The "ProcessDiagnosisPlcCodeViewerControl" object represents a PLC code view in runtime.

Object type

HmiProcessDiagnosisPlcCodeViewerControl

Properties

The "ProcessDiagnosisPlcCodeViewerControl" object has the following properties:

- **BackColor**
  Specifies the background color.
- **Caption**
  Specifies the text to be displayed in the title bar.
- **CaptionColor**
  Specifies the background color of the title bar.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the PLC code view.
- **CurrentZoomFactor**
  Specifies the zoom factor of the PLC code view.
- **Enabled**
  Specifies whether the PLC code view can be operated in runtime.
- **Height**
  Specifies the height.
- **Icon**
  Specifies the icon of the PLC code view.
- **Layer**
  Returns the screen layer in which the PLC code view is located.
- **Left**
  Specifies the value of the X coordinate.
- **LineColors**
  Returns the line colors.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the PLC code view.

- **OverviewDetailRatio**
  Specifies how much space the detail view takes up in the PLC code view.
- **Parent**
  Returns the higher-level screen object.
- **RenderingTemplate**
  Returns the name of the template from which the PLC code view was created.
- **ShowFocusVisual**
  Specifies whether the PLC code view is highlighted when in focus.
- **ShowSymbolLine**
  Specifies whether the symbol line is displayed.
- **StatusBar**
  Specifies the information bar of the PLC code view.
- **StyleItemClass**
  Returns the style which is applied to the PLC code view.
- **SymbolLineBackColor**
  Specifies the background color of the symbol line.
- **SymbolLineFont**
  Specifies the font of the text in the symbol line.
- **SymbolLineForeColor**
  Specifies the text font color of the symbol line.
- **TabIndex**
  Returns the position of the PLC code view in the tab sequence.
- **ToolBar**
  Specifies the toolbar of the PLC code view.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the PLC code view is visible.
- **Width**
  Specifies the width of the PLC code view.
- **WindowFlags**
  Specifies the window configuration of the PLC code view.

Methods

The "SystemDiagnosisControl" object has the following methods:

- **FireCommand()**
  Configures the occurrence of an event for an element.
- **Next()**
  Navigates to the next network.
- **OpenCodeViewerFromAlarm()**
  Opens the corresponding block in the PLC code view according to the selection in the alarm control.

- **OpenGRAPHDetails()**
  Opens the "GRAPH" details block in the PLC code view.
- **OpenGRAPHDetailsByConnectionName()**
  Opens the "GRAPH" details block in the PLC code view.
- **OpenProDiagDetailsFB()**
  Represents the logic of a network input of a function block in the PLC code view.
- **OpenProDiagDetailsFC()**
  Represents the logic of a function in the PLC code view, taking the UDT instance into account.
- **OpenProDiagDetailsNetwork()**
  Represents a network and its logic in the PLC code view.
- **Previous()**
  Navigates to the previous network.
- **ResetToConfiguration()**
  Executes the "ResetToConfiguration" command in the PLC code view.
- **ToggleCriteriaAnalysis()**
  Executes the "ToggleCriteriaAnalysis" command in the PLC code view.
- **ToggleGRAPHViewerMode()**
  Executes the "ToggleGRAPHViewerMode" command in the PLC code view.
- **ToggleNetworkDisplay()**
  Executes the "ToggleNetworkDisplay" command in the PLC code view.
- **ZoomIn()**
  Executes the "ZoomIn" command in the PLC code view.
- **ZoomOut()**
  Executes the "ZoomOut" command in the PLC code view.

Events

The "SystemDiagnosisControl" object has the following events:

- **OnActivated()**
  Occurs when a system diagnostics control receives focus.
- **OnCommandFired()**
  Occurs when the operator has operated an element in the toolbar or information bar of the system diagnostics control.
- **OnDeactivated()**
  Occurs when a system diagnostics control loses focus.
- **OnInitialized()**
  Occurs when a system diagnostics control has been successfully initialized and the data connection to the PLC has been established.

ProcessDiagnosisPlcCodeViewerControl.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.BackColor
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.Caption

Description

The "Caption" property specifies the text to be displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.Caption
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

ProcessDiagnosisPlcCodeViewerControl.Caption (Page 5283)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 5284)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 5284)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 5284)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 5284)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 5284)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 5284)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

ProcessDiagnosisPlcCodeViewerControl.Caption (Page 5283)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

ProcessDiagnosisPlcCodeViewerControl.Caption (Page 5283)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

ProcessDiagnosisPlcCodeViewerControl.Caption (Page 5283)

ProcessDiagnosisPlcCodeViewerControl.CaptionColor

Description

The "CaptionColor" property specifies the background color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.CaptionColor
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the PLC code view.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.CurrentQuality
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.CurrentZoomFactor

Description

The "CurrentZoomFactor" property specifies the zoom factor of the PLC code view. The zoom factor may differ from the containing screen. The value 1.0 corresponds to a zoom factor of 100%.

Type

Float

Access

Read-write

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.CurrentZoomFactor
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.Enabled

Description

The "Enabled" property specifies whether the PLC code view can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.Enabled
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.Height

Description

The "Height" property specifies the height.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.Height
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.Icon

Description

The "Icon" property specifies the icon of the PLC code view.

Type

String

Access

Read-write

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.Icon
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.Layer

Description

The "Layer" property returns the screen layer in which the PLC code view is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.Layer
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

ProcessDiagnosisPlcCodeViewerControl.Layer (Page 5292)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

ProcessDiagnosisPlcCodeViewerControl.Layer (Page 5292)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

ProcessDiagnosisPlcCodeViewerControl.Layer (Page 5292)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

ProcessDiagnosisPlcCodeViewerControl.Layer (Page 5292)

ProcessDiagnosisPlcCodeViewerControl.Left

Description

The "Left" property specifies the value of the X coordinate.

Type

Int32

Access

Read-write

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.Left
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.LineColors

Description

The "LineColors" property returns the line colors.

Type

Object, HmiLineColorPart

Access

Read-only

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.LineColors
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

LineColor.ActiveLine

Description

The "ActiveLine" property returns the active line.

Type

UInt32

Access

Read-only

Syntax

```
LineColor.ActiveLine
```

See also

ProcessDiagnosisPlcCodeViewerControl.LineColors (Page 5295)

LineColor.InactiveLine

Description

The "InactiveLine" property returns the inactive line.

Type

UInt32

Access

Read-only

Syntax

```
LineColor.InactiveLine
```

See also

ProcessDiagnosisPlcCodeViewerControl.LineColors (Page 5295)

LineColor.NormalLine

Description

The "NormalLine" property returns the normal line.

Type

UInt32

Access

Read-only

Syntax

```
LineColor.NormalLine
```

See also

ProcessDiagnosisPlcCodeViewerControl.LineColors (Page 5295)

ProcessDiagnosisPlcCodeViewerControl.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.Margin
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ProcessDiagnosisPlcCodeViewerControl.Margin (Page 5297)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ProcessDiagnosisPlcCodeViewerControl.Margin (Page 5297)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ProcessDiagnosisPlcCodeViewerControl.Margin (Page 5297)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ProcessDiagnosisPlcCodeViewerControl.Margin (Page 5297)

ProcessDiagnosisPlcCodeViewerControl.Name

Description

The "Name" property returns the name of the PLC code view.

Type

String

Access

Read-only

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.Name
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.OverviewDetailRatio

Description

The "OverviewDetailRatio" property specifies how much space the detail view takes up in the PLC code view.

Type

Float

Access

Read-write

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.OverviewDetailRatio
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 5301)

Access

Read-only

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.Parent
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

Screen Items (Page 5301)

Screen Items

Description

Screen Items (Page 1571)

ProcessDiagnosisPlcCodeViewerControl.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the PLC code view was created.

Type

String

Access

Read-only

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.RenderingTemplate
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the PLC code view is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.ShowFocusVisual
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.ShowSymbolLine

Description

The "ShowSymbolLine" property specifies whether the symbol line is displayed.

Type

Bool

Access

Read-write

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.ShowSymbolLine
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.StatusBar

Description

The "StatusBar" property specifies the information bar.

Type

Object, HmiStatusBarPart

Access

Read-write

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.StatusBar
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

StatusBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
StatusBar.BackColor
```

See also

ProcessDiagnosisPlcCodeViewerControl.StatusBar (Page 5303)

StatusBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

Type

Object, HmiControlBarElementCollection (Page 5304)

Access

Read-only

Syntax

```
StatusBar.Elements
```

See also

ProcessDiagnosisPlcCodeViewerControl.StatusBar (Page 5303)

HmiControlBarElementCollection (Page 5304)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

StatusBar.Elements (Page 5304)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 5304)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 5306)

See also

HmiControlBarElementCollection (Page 5304)

Control Bar Elements (Page 5306)

Control Bar Elements

ControlBarButton

Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarButtonPart

Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the label of the button.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the button can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the button.
- **Mapping**
  Returns the function of the button.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.

- **Operability**
  Returns whether the button is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the button is visible.
- **Width**
  Specifies the width.

Methods

See also

HmiControlBarElementCollection (Page 5304)

ControlBarButton.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBackColor
```

See also

ControlBarButton (Page 5306)

ControlBarButton.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBorderColor
```

See also

ControlBarButton (Page 5306)

ControlBarButton.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarButton.Authorization
```

See also

ControlBarButton (Page 5306)

ControlBarButton.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BackColor
```

See also

ControlBarButton (Page 5306)

ControlBarButton.Badge

Description

The "Badge" property specifies the label of the button.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarButton.Badge
```

See also

ControlBarButton (Page 5306)

ControlBarButton.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BorderColor
```

See also

ControlBarButton (Page 5306)

ControlBarButton.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarButton.BorderWidth
```

See also

ControlBarButton (Page 5306)

ControlBarButton.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarButton.Content
```

See also

ControlBarButton (Page 5306)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarButton.Content (Page 5312)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarButton.Content (Page 5312)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarButton.Content (Page 5312)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarButton.Content (Page 5312)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarButton.Content (Page 5312)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarButton.Content (Page 5312)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarButton.Content (Page 5312)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarButton.Content (Page 5312)

ControlBarButton.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarButton.CustomID
```

See also

ControlBarButton (Page 5306)

ControlBarButton.Enabled

Description

The "Enabled" property specifies whether the button can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Enabled
```

See also

ControlBarButton (Page 5306)

ControlBarButton.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.ForeColor
```

See also

ControlBarButton (Page 5306)

ControlBarButton.Graphic

Description

The "Graphic" property specifies the graphic of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Graphic
```

See also

ControlBarButton (Page 5306)

ControlBarButton.Height

Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Height
```

See also

ControlBarButton (Page 5306)

ControlBarButton.HotKey

Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
ControlBarButton.HotKey
```

See also

ControlBarButton (Page 5306)

ControlBarButton.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent

- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms

- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarButton.Mapping
```

See also

ControlBarButton (Page 5306)

ControlBarButton.Margin

Description

The "Margin" property specifies the surrounded outer distance of the button.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarButton.Margin
```

See also

ControlBarButton (Page 5306)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarButton.Margin (Page 5322)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarButton.Margin (Page 5322)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarButton.Margin (Page 5322)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarButton.Margin (Page 5322)

ControlBarButton.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumHeight
```

See also

ControlBarButton (Page 5306)

ControlBarButton.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumWidth
```

See also

ControlBarButton (Page 5306)

ControlBarButton.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumHeight
```

See also

ControlBarButton (Page 5306)

ControlBarButton.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumWidth
```

See also

ControlBarButton (Page 5306)

ControlBarButton.Operability

Description

The "Operability" property returns whether the button is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarButton.Operability
```

See also

ControlBarButton (Page 5306)

ControlBarButton.Padding

Description

The "Padding" property specifies the distance of the content from the border of the button.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarButton.Padding
```

See also

ControlBarButton (Page 5306)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarButton.Padding (Page 5327)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarButton.Padding (Page 5327)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarButton.Padding (Page 5327)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarButton.Padding (Page 5327)

ControlBarButton.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarButton.RequireExplicitUnlock
```

See also

ControlBarButton (Page 5306)

ControlBarButton.Text

Description

The "Text" property specifies the label of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Text
```

See also

ControlBarButton (Page 5306)

ControlBarButton.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.ToolTipText
```

See also

ControlBarButton (Page 5306)

ControlBarButton.Visible

Description

The "Visible" property specifies whether the button is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Visible
```

See also

ControlBarButton (Page 5306)

ControlBarButton.Width

Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Width
```

See also

ControlBarButton (Page 5306)

ControlBarDisplay

Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarDisplayPart

Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the display area is enabled in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the display area.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the display area is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.

- **Visible**
  Specifies whether the display area is visible.
- **Width**
  Specifies the width.

ControlBarDisplay.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarDislay.Authorization
```

See also

ControlBarDisplay (Page 5332)

ControlBarDisplay.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarDislay.Content
```

See also

ControlBarDisplay (Page 5332)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarDisplay.Content (Page 5334)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarDisplay.Content (Page 5334)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarDisplay.Content (Page 5334)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarDisplay.Content (Page 5334)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarDisplay.Content (Page 5334)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarDisplay.Content (Page 5334)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarDisplay.Content (Page 5334)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarDisplay.Content (Page 5334)

ControlBarDisplay.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarDislay.CustomID
```

See also

ControlBarDisplay (Page 5332)

ControlBarDisplay.Enabled

Description

The "Enabled" property specifies whether the display is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Enabled
```

See also

ControlBarDisplay (Page 5332)

ControlBarDisplay.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.ForeColor
```

See also

ControlBarDisplay (Page 5332)

ControlBarDisplay.Graphic

Description

The "Graphic" property specifies the graphic of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Graphic
```

See also

ControlBarDisplay (Page 5332)

ControlBarDisplay.Height

Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Height
```

See also

ControlBarDisplay (Page 5332)

ControlBarDisplay.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment

- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms

- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarDislay.Mapping
```

See also

ControlBarDisplay (Page 5332)

ControlBarDisplay.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the display.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarDislay.Margin
```

See also

ControlBarDisplay (Page 5332)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarDisplay.Margin (Page 5344)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarDisplay.Margin (Page 5344)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarDisplay.Margin (Page 5344)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarDisplay.Margin (Page 5344)

ControlBarDisplay.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumHeight
```

See also

ControlBarDisplay (Page 5332)

ControlBarDisplay.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumWidth
```

See also

ControlBarDisplay (Page 5332)

ControlBarDisplay.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumHeight
```

See also

ControlBarDisplay (Page 5332)

ControlBarDisplay.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumWidth
```

See also

ControlBarDisplay (Page 5332)

ControlBarDisplay.Operability

Description

The "Operability" property returns whether the display is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarDislay.Operability
```

See also

ControlBarDisplay (Page 5332)

ControlBarDisplay.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the display.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarDislay.Padding
```

See also

ControlBarDisplay (Page 5332)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarDisplay.Padding (Page 5349)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarDisplay.Padding (Page 5349)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarDisplay.Padding (Page 5349)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarDisplay.Padding (Page 5349)

ControlBarDisplay.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarDislay.RequireExplicitUnlock
```

See also

ControlBarDisplay (Page 5332)

ControlBarDisplay.Text

Description

The "Text" property specifies the label of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Text
```

See also

ControlBarDisplay (Page 5332)

ControlBarDisplay.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.ToolTipText
```

See also

ControlBarDisplay (Page 5332)

ControlBarDisplay.Visible

Description

The "Visible" property specifies whether the display is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Visible
```

See also

ControlBarDisplay (Page 5332)

ControlBarDisplay.Width

Description

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Width
```

See also

ControlBarDisplay (Page 5332)

ControlBarLabel

Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar.

You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarLabelPart

Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the identifier can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the identifier.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the identifier is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.

- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the identifier is visible.
- **Width**
  Specifies the width.

Methods

HmiControlBarElementCollection (Page 5304)

ControlBarLabel.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarLabel.Authorization
```

See also

ControlBarLabel (Page 5354)

ControlBarLabel.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarLabel.CustomID
```

See also

ControlBarLabel (Page 5354)

ControlBarLabel.Enabled

Description

The "Enabled" property specifies whether the identifier is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Enabled
```

See also

ControlBarLabel (Page 5354)

ControlBarLabel.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.ForeColor
```

See also

ControlBarLabel (Page 5354)

ControlBarLabel.Height

Description

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Height
```

See also

ControlBarLabel (Page 5354)

ControlBarLabel.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

See also

ControlBarLabel (Page 5354)

ControlBarLabel.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarLabel.Mapping
```

See also

ControlBarLabel (Page 5354)

ControlBarLabel.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarLabel.Margin
```

See also

ControlBarLabel (Page 5354)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarLabel.Margin (Page 5361)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarLabel.Margin (Page 5361)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarLabel.Margin (Page 5361)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarLabel.Margin (Page 5361)

ControlBarLabel.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumHeight
```

See also

ControlBarLabel (Page 5354)

ControlBarLabel.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumWidth
```

See also

ControlBarLabel (Page 5354)

ControlBarLabel.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumHeight
```

See also

ControlBarLabel (Page 5354)

ControlBarLabel.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumWidth
```

See also

ControlBarLabel (Page 5354)

ControlBarLabel.Operability

Description

The "Operability" property returns whether the identifier is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarLabel.Operability
```

See also

ControlBarLabel (Page 5354)

ControlBarLabel.Padding

Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarLabel.Padding
```

See also

ControlBarLabel (Page 5354)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarLabel.Padding (Page 5366)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarLabel.Padding (Page 5366)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarLabel.Padding (Page 5366)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarLabel.Padding (Page 5366)

ControlBarLabel.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarLabel.RequireExplicitUnlock
```

See also

ControlBarLabel (Page 5354)

ControlBarLabel.Text

Description

The "Text" property specifies the label of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.Text
```

See also

ControlBarLabel (Page 5354)

ControlBarLabel.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.ToolTipText
```

See also

ControlBarLabel (Page 5354)

ControlBarLabel.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.VerticalTextAlignment
```

See also

ControlBarLabel (Page 5354)

ControlBarLabel.Visible

Description

The "Visible" property specifies whether the identifier is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Visible
```

See also

ControlBarLabel (Page 5354)

ControlBarLabel.Width

Description

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Width
```

See also

ControlBarLabel (Page 5354)

ControlBarSeparator

Description

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarSeparatorPart

Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the disconnector can be operated in runtime.
- **ForeColor**
  Specifies the font color.

- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the separator.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the separator is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the disconnector is only operable while the associated button is being pressed.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the disconnector is visible.
- **Width**
  Specifies the width.

Methods

--

See also

HmiControlBarElementCollection (Page 5304)

ControlBarSeparator.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarSeparator.Authorization
```

See also

ControlBarSeparator (Page 5372)

ControlBarSeparator.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarSeparator.CustomID
```

See also

ControlBarSeparator (Page 5372)

ControlBarSeparator.Enabled

Description

The "Enabled" property specifies whether the separator is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Enabled
```

See also

ControlBarSeparator (Page 5372)

ControlBarSeparator.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.ForeColor
```

See also

ControlBarSeparator (Page 5372)

ControlBarSeparator.Height

Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Height
```

See also

ControlBarSeparator (Page 5372)

ControlBarSeparator.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help

Access

Read-only

Syntax

```
ControlBarSeparator.Mapping
```

See also

ControlBarSeparator (Page 5372)

ControlBarSeparator.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the separator.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarSeparator.Margin
```

See also

ControlBarSeparator (Page 5372)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarSeparator.Margin (Page 5378)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarSeparator.Margin (Page 5378)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarSeparator.Margin (Page 5378)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarSeparator.Margin (Page 5378)

ControlBarSeparator.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumHeight
```

See also

ControlBarSeparator (Page 5372)

ControlBarSeparator.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumWidth
```

See also

ControlBarSeparator (Page 5372)

ControlBarSeparator.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumHeight
```

See also

ControlBarSeparator (Page 5372)

ControlBarSeparator.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumWidth
```

See also

ControlBarSeparator (Page 5372)

ControlBarSeparator.Operability

Description

The "Operability" property returns whether the separator is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarSeparator.Operability
```

See also

ControlBarSeparator (Page 5372)

ControlBarSeparator.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the separator.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarSeparator.Padding
```

See also

ControlBarSeparator (Page 5372)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarSeparator.Padding (Page 5383)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarSeparator.Padding (Page 5383)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarSeparator.Padding (Page 5383)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarSeparator.Padding (Page 5383)

ControlBarSeparator.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the disconnector can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarSeparator.RequireExplicitUnlock
```

See also

ControlBarSeparator (Page 5372)

ControlBarSeparator.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

Type

String

Access

Read-write

Syntax

```
ControlBarSeparator.ToolTipText
```

See also

ControlBarSeparator (Page 5372)

ControlBarSeparator.Visible

Description

The "Visible" property specifies whether the separator is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Visible
```

See also

ControlBarSeparator (Page 5372)

ControlBarSeparator.Width

Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Width
```

See also

ControlBarSeparator (Page 5372)

ControlBarTextBox

Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarTextBoxPart

Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the text box can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Mapping**
  Returns the function of the text box.
- **Margin**
  Specifies the margin.

- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the text box is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **Readonly**
  Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**
  Returns whether the text box is only operable while the associated button is being pressed.
- **Text**
  Specifies the labeling.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the text box is visible.
- **Width**
  Specifies the width.

ControlBarTextBox.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.AlternateBorderColor
```

See also

ControlBarTextBox (Page 5388)

ControlBarTextBox.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarTextBox.Authorization
```

See also

ControlBarTextBox (Page 5388)

ControlBarTextBox.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BackColor
```

See also

ControlBarTextBox (Page 5388)

ControlBarTextBox.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BorderColor
```

See also

ControlBarTextBox (Page 5388)

ControlBarTextBox.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarTextBox.BorderWidth
```

See also

ControlBarTextBox (Page 5388)

ControlBarTextBox.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarTextBox.CustomID
```

See also

ControlBarTextBox (Page 5388)

ControlBarTextBox.Enabled

Description

The "Enabled" property specifies whether the text box can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Enabled
```

See also

ControlBarTextBox (Page 5388)

ControlBarTextBox.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.ForeColor
```

See also

ControlBarTextBox (Page 5388)

ControlBarTextBox.Height

Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Height
```

See also

ControlBarTextBox (Page 5388)

ControlBarTextBox.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

See also

ControlBarTextBox (Page 5388)

ControlBarTextBox.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

ControlBarTextBox.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the text box.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarTextBox.Margin
```

See also

ControlBarTextBox (Page 5388)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarTextBox.Margin (Page 5397)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarTextBox.Margin (Page 5397)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarTextBox.Margin (Page 5397)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarTextBox.Margin (Page 5397)

ControlBarTextBox.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumHeight
```

See also

ControlBarTextBox (Page 5388)

ControlBarTextBox.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumWidth
```

See also

ControlBarTextBox (Page 5388)

ControlBarTextBox.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumHeight
```

See also

ControlBarTextBox (Page 5388)

ControlBarTextBox.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumWidth
```

See also

ControlBarTextBox (Page 5388)

ControlBarTextBox.Operability

Description

The "Operability" property returns whether the text box is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarTextBox.Operability
```

See also

ControlBarTextBox (Page 5388)

ControlBarTextBox.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the text box.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarTextBox.Padding
```

See also

ControlBarTextBox (Page 5388)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarTextBox.Padding (Page 5402)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarTextBox.Padding (Page 5402)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarTextBox.Padding (Page 5402)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarTextBox.Padding (Page 5402)

ControlBarTextBox.ReadOnly

Description

The "ReadOnly" property specifies whether the text box is read-only.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.ReadOnly
```

See also

ControlBarTextBox (Page 5388)

ControlBarTextBox.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

See also

ControlBarTextBox (Page 5388)

ControlBarTextBox.Text

Description

The "Text" property specifies the label of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.Text
```

See also

ControlBarTextBox (Page 5388)

ControlBarTextBox.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.ToolTipText
```

See also

ControlBarTextBox (Page 5388)

ControlBarTextBox.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

See also

ControlBarTextBox (Page 5388)

ControlBarTextBox.Visible

Description

The "Visible" property specifies whether the text box is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Visible
```

See also

ControlBarTextBox (Page 5388)

ControlBarTextBox.Width

Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Width
```

See also

ControlBarTextBox (Page 5388)

ControlBarToggleSwitch

Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar.

You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarToggleSwitchPart

Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **AlternateGraphic**
  Specifies the graphic for the "pressed" state.
- **AlternateText**
  Specifies the text for the "pressed" state.

- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the identifier of the switch.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the switch can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the switch.
- **IsAlternateState**
  Specifies the current state of the switch.
- **Mapping**
  Returns the function of the switch.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the switch is operable.
- **Padding**
  Specifies the distance of the content from the border.

- **RequireExplicitUnlock**
  Returns whether the switch is only operable while the associated button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the switch is visible.
- **Width**
  Specifies the width.

ControlBarToggleSwitch.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.AlternateGraphic

Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateGraphic
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.AlternateText

Description

The "AlternateText" property specifies the text of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateText
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Authorization
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BackColor
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.Badge

Description

The "Badge" property specifies the identifier of the switch.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Badge
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderColor
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderWidth
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Content
```

See also

ControlBarToggleSwitch (Page 5408)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarToggleSwitch.Content (Page 5415)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarToggleSwitch.Content (Page 5415)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 5415)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarToggleSwitch.Content (Page 5415)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarToggleSwitch.Content (Page 5415)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarToggleSwitch.Content (Page 5415)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarToggleSwitch.Content (Page 5415)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 5415)

ControlBarToggleSwitch.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarToggleSwitch.CustomID
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.Enabled

Description

The "Enabled" property specifies whether the switch can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Enabled
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ForeColor
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.Graphic

Description

The "Graphic" property specifies the graphic of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Graphic
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.Height

Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Height
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.HotKey

Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
Button.HotKey
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.IsAlternateState

Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Mapping
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the switch.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Margin
```

See also

ControlBarToggleSwitch (Page 5408)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarToggleSwitch.Margin (Page 5426)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarToggleSwitch.Margin (Page 5426)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarToggleSwitch.Margin (Page 5426)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarToggleSwitch.Margin (Page 5426)

ControlBarToggleSwitch.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumHeight
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumWidth
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumHeight
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumWidth
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.Operability

Description

The property "Operability" returns whether the switch is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Operability
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the switch.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Padding
```

See also

ControlBarToggleSwitch (Page 5408)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarToggleSwitch.Padding (Page 5431)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarToggleSwitch.Padding (Page 5431)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarToggleSwitch.Padding (Page 5431)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarToggleSwitch.Padding (Page 5431)

ControlBarToggleSwitch.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.Text

Description

The "Text" property specifies the label of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Text
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ToolTipText
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.Visible

Description

The "Visible" property specifies whether the switch is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Visible
```

See also

ControlBarToggleSwitch (Page 5408)

ControlBarToggleSwitch.Width

Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Width
```

See also

ControlBarToggleSwitch (Page 5408)

StatusBar.Enabled

Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Enabled
```

See also

ProcessDiagnosisPlcCodeViewerControl.StatusBar (Page 5303)

StatusBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
StatusBar.Font
```

See also

ProcessDiagnosisPlcCodeViewerControl.StatusBar (Page 5303)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

StatusBar.Font (Page 5437)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

StatusBar.Font (Page 5437)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

StatusBar.Font (Page 5437)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

StatusBar.Font (Page 5437)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

StatusBar.Font (Page 5437)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

StatusBar.Font (Page 5437)

StatusBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
StatusBar.Margin
```

See also

ProcessDiagnosisPlcCodeViewerControl.StatusBar (Page 5303)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

StatusBar.Margin (Page 5440)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

StatusBar.Margin (Page 5440)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

StatusBar.Margin (Page 5440)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

StatusBar.Margin (Page 5440)

StatusBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
StatusBar.Padding
```

See also

ProcessDiagnosisPlcCodeViewerControl.StatusBar (Page 5303)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

StatusBar.Padding (Page 5443)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

StatusBar.Padding (Page 5443)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

StatusBar.Padding (Page 5443)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

StatusBar.Padding (Page 5443)

StatusBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.ShowToolTips
```

See also

ProcessDiagnosisPlcCodeViewerControl.StatusBar (Page 5303)

StatusBar.Visible

Description

The "Visible" property specifies whether the information bar is visible.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Visible
```

See also

ProcessDiagnosisPlcCodeViewerControl.StatusBar (Page 5303)

ProcessDiagnosisPlcCodeViewerControl.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the PLC code view.

Type

String

Access

Read-only

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.StyleItemClass
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.SymbolLineBackColor

Description

The "SymbolLineBackColor" property specifies the background color of the symbol line.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.SymbolLineBackColor
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.SymbolLineFont

Description

The "SymbolLineFont" property specifies the font of the text in the symbol line.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.SymbolLineFont
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ProcessDiagnosisPlcCodeViewerControl.SymbolLineFont (Page 5447)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ProcessDiagnosisPlcCodeViewerControl.SymbolLineFont (Page 5447)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ProcessDiagnosisPlcCodeViewerControl.SymbolLineFont (Page 5447)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ProcessDiagnosisPlcCodeViewerControl.SymbolLineFont (Page 5447)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ProcessDiagnosisPlcCodeViewerControl.SymbolLineFont (Page 5447)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ProcessDiagnosisPlcCodeViewerControl.SymbolLineFont (Page 5447)

ProcessDiagnosisPlcCodeViewerControl.SymbolLineForeColor

Description

The "SymbolLineForeColor" property specifies the text font color of the symbol line.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.SymbolLineForeColor
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.TabIndex

Description

The "TabIndex" property returns the position of the PLC code view in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.TabIndex
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.ToolBar

Description

The "ToolBar" property specifies the toolbar of the PLC code view.

Type

Object, HmiToolBarPart

Access

Read-write

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.ToolBar
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ToolBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ToolBar.BackColor
```

See also

ProcessDiagnosisPlcCodeViewerControl.ToolBar (Page 5452)

ToolBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

Type

Object, HmiControlBarElementCollection (Page 5454)

Access

Read-only

Syntax

```
ToolBar.Elements
```

See also

ProcessDiagnosisPlcCodeViewerControl.ToolBar (Page 5452)

HmiControlBarElementCollection (Page 5454)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

ToolBar.Elements (Page 5453)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 5454)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 5456)

See also

HmiControlBarElementCollection (Page 5454)

Control Bar Elements (Page 5456)

Control Bar Elements

Description

Control Bar Elements (Page 5306)

ToolBar.Enabled

Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Enabled
```

See also

ProcessDiagnosisPlcCodeViewerControl.ToolBar (Page 5452)

ToolBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ToolBar.Font
```

See also

ProcessDiagnosisPlcCodeViewerControl.ToolBar (Page 5452)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ToolBar.Font (Page 5456)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ToolBar.Font (Page 5456)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ToolBar.Font (Page 5456)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ToolBar.Font (Page 5456)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ToolBar.Font (Page 5456)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal

- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ToolBar.Font (Page 5456)

ToolBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the toolbar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ToolBar.Margin
```

See also

ProcessDiagnosisPlcCodeViewerControl.ToolBar (Page 5452)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ToolBar.Margin (Page 5460)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ToolBar.Margin (Page 5460)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ToolBar.Margin (Page 5460)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ToolBar.Margin (Page 5460)

ToolBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ToolBar.Padding
```

See also

ProcessDiagnosisPlcCodeViewerControl.ToolBar (Page 5452)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ToolBar.Padding (Page 5462)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ToolBar.Padding (Page 5462)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ToolBar.Padding (Page 5462)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ToolBar.Padding (Page 5462)

ToolBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.ShowToolTips
```

See also

ProcessDiagnosisPlcCodeViewerControl.ToolBar (Page 5452)

ToolBar.UseHotKeys

Description

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.UseHotKeys
```

See also

ProcessDiagnosisPlcCodeViewerControl.ToolBar (Page 5452)

ToolBar.Visible

Description

The "Visible" property specifies whether the toolbar is visible.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Visible
```

See also

ProcessDiagnosisPlcCodeViewerControl.ToolBar (Page 5452)

ProcessDiagnosisPlcCodeViewerControl.Top

Description

The "Top" property specifies the value of the Y coordinate.

Type

Int32

Access

Read-write

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.Top
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.Visible

Description

The "Visible" property specifies whether the PLC code view is visible.

Type

Bool

Access

Read-write

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.Visible
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.Width

Description

The "Width" property specifies the width.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.Width
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.WindowFlags

Description

The "WindowFlags" property specifies the window configuration of the system PLC code view.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

You can enable multiple properties by adding integer values or bit operators.

Access

Read-write

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.WindowFlags
```

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.FireCommand()

Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the PLC code view.

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.FireCommand(commandId, custom)
```

Parameters

commandId

Type: Int32

ID of the element of the toolbar or information bar

custom

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

Return value

--

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.Next()

Description

The "Next" method navigates to the next network.

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.Next()
```

Parameters

--

Return value

--

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.OpenCodeViewerFromAlarm()

Description

The "OpenCodeViewerFromAlarm" method opens the corresponding block in the PLC code view according to the selection in the alarm control.

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.OpenCodeViewerFromAlarm(HmiConn
ectionName, CpuAlarmID, TextlistIndex)
```

Parameters

HmiConnectionName

Type: String

Connection name

CpuAlarmID

Type: Object, HMIUint64

ID of the CPU alarm

TextlistIndex

Type: Object, HMIUint64

Index of the text list

Return value

--

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.OpenGRAPHDetails()

Description

The "OpenGRAPHDetails" method opens the "GRAPH" details block in the PLC code view.

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.OpenGRAPHDetails(PlcName,
Block, StepNumber)
```

Parameters

PlcName

Type: String

Name of the PLC

Block

Type: String

Name of the block

StepNumber

Type: UInt16

Step number

Return value

--

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.OpenGRAPHDetailsByConnectionName()

Description

The "OpenGRAPHDetailsByConnectionName" method opens the "GRAPH" details block in the PLC code view.

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.OpenGRAPHDetailsByConnectionNam
e(HmiConnectionName, Block, StepNumber)
```

Parameters

HmiConnectionName

Type: String

Connection name

Block

Type: String

Name of the block

StepNumber

Type: UInt16

Step number

Return value

--

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.OpenProDiagDetailsFB()

Description

The "OpenProDiagDetailsFB" method represents the logic of a network input of a function block in the PLC code view.

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.OpenProDiagDetailsFB(PlcName,
ContainingBlock, CallBlock, Pin, PinSubstringSearch)
```

Parameters

PlcName

Type: String

Name of the PLC.

ContainingBlock

Type: String

Name of the contained block

`CallBlock`

Type: String

Name of the called block

`Pin`

Type: String

Name of the input pin of the "CallBlock".

`PinSubstringSearch`

Type: Bool

Specifies whether the pin name starts with the transferred pin parameter.

- True: Pin name starts with the transferred pin parameter.
- False: Pin name must be the same as the pin parameter.

Return value

--

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.OpenProDiagDetailsFC()

Description

The "OpenProDiagDetailsFC" represents the logic of a function in the PLC code view, taking the UDT instance into account.

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.OpenProDiagDetailsFC(PlcName,
ContainingBlock, CallBlock, Pin, UdtInstance, PinSubstringSearch)
```

Parameters

PlcName

Type: String

Name of the PLC.

ContainingBlock

Type: String

Name of the contained block

CallBlock

Type: String

Name of the called block

Pin

Type: String

Name of the input pin of the "CallBlock".

UdtInstance

Type: String

UDT instance that is used to limit the display of FCs called multiple times.

PinSubstringSearch

Type: Bool

Specifies whether the pin name starts with the transferred pin parameter.

- True: Pin name starts with the transferred pin parameter
- False: Pin name must be the same as the pin parameter

Return value

--

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.OpenProDiagDetailsNetwork()

Description

The "OpenProDiagDetailsNetwork" method represents a network and its logic in the PLC code view.

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.OpenProDiagDetailsNetwork(PlcName, ContainingBlock, Operand)
```

Parameters

PlcName

Type: String

Name of the PLC

ContainingBlock

Type: String

Name of the contained block

Operand

Type: String

Operand of the access point

Return value

--

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.Previous()

Description

The "Previous" method navigates to the previous network.

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.Previous()
```

Parameters

--

Return value

--

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.ResetToConfiguration()

Description

The "ResetToConfiguration" method executes the "ResetToConfiguration" command in der PLC code view.

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.ResetToConfiguration()
```

Parameters

--

Return value

--

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.ToggleCriteriaAnalysis()

Description

The "ToggleCriteriaAnalysis" method executes the "ToggleCriteriaAnalysis" command in der PLC code view.

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.ToggleCriteriaAnalysis()
```

Parameters

--

Return value

--

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.ToggleGRAPHViewerMode()

Description

The "ToggleGRAPHViewerMode" method executes the "ToggleGRAPHViewerMode" command in der PLC code view.

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.ToggleGRAPHViewerMode()
```

Parameters

--

Return value

--

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.ToggleNetworkDisplay()

Description

The "ToggleNetworkDisplay" method executes the "ToggleNetworkDisplay" command in der PLC code view.

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.ToggleNetworkDisplay()
```

Parameters

--

Return value

--

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.ZoomIn()

Description

The "ZoomIn" method executes the "ZoomIn" command in der PLC code view.

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.ZoomIn()
```

Parameters

--

Return value

--

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

ProcessDiagnosisPlcCodeViewerControl.ZoomOut()

Description

The "ZoomOut" method executes the "ZoomOut" command in der PLC code view.

Syntax

```
ProcessDiagnosisPlcCodeViewerControl.ZoomOut()
```

Parameters

--

Return value

--

See also

ProcessDiagnosisPlcCodeViewerControl (Page 5280)

RadioButtonGroup

Description

The "RadioButtonGroup" object represents an option button in runtime.

Object type

HmiRadioButtonGroup

Properties

The "RadioButtonGroup" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the border color.
- **BorderWidth**
  Specifies the border thickness.
- **Content**
  Specifies the display options for text and graphics.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the option button.
- **Enabled**
  Specifies whether the option button can be operated in runtime.
- **Font**
  Specifies the font of the text.
- **ForeColor**
  Specifies the font color of the text.
- **Height**
  Specifies the height.
- **Layer**
  Returns the layer of the screen in which the option button is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the option button.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the option button is operable.
- **Padding**
  Specifies the distance of the content from the border of the option button.
- **Parent**
  Returns the higher-level screen object.

- **ProcessValue**
  Specifies the process value.
- **RenderingTemplate**
  Returns the name of the template from which the option button was created.
- **RequireExplicitUnlock**
  Returns whether the option button is only operable while the associated button is being pressed.
- **RotationAngle**
  Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the option button rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **SelectionItemHeight**
  Specifies the height of the option button entries.
- **SelectionItems**
  Returns the list of all option button entries.
- **SelectorPosition**
  Specifies the horizontal alignment of the option button entries.
- **ShowFocusVisual**
  Specifies whether the option button is highlighted when in focus.
- **StyleItemClass**
  Returns the style which is applied to the option button.
- **TabIndex**
  Returns the position of the option button in the tab sequence.
- **ToolTipText**
  Specifies the tooltip text.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the option button is visible.
- **VisualizeQuality**
  Specifies whether the connection quality of the process value is displayed.
- **Width**
  Specifies the width.

Methods

The "RadioButtonGroup" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the option button.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "RadioButtonGroup" object has the following events:

- **OnActivated()**
  Occurs when an option button receives focus.
- **OnContextTapped()**
  Occurs when an option button is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when an option button loses focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the option button is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the option button is in focus.
- **OnTapped()**
  Occurs when an option button is left-clicked or short-touched.

RadioButtonGroup.AlternateBackColor

Description

The "AlternateBackColor" specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
RadioButtonGroup.AlternateBackColor
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
RadioButtonGroup.AlternateBorderColor
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
RadioButtonGroup.Authorization
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
RadioButtonGroup.BackColor
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
RadioButtonGroup.BorderColor
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
RadioButtonGroup.BorderWidth
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.Content

Description

The "Content" property specifies the display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
RadioButtonGroup.Content
```

See also

RadioButtonGroup (Page 5478)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

RadioButtonGroup.Content (Page 5484)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

RadioButtonGroup.Content (Page 5484)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

RadioButtonGroup.Content (Page 5484)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

RadioButtonGroup.Content (Page 5484)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

RadioButtonGroup.Content (Page 5484)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

RadioButtonGroup.Content (Page 5484)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

RadioButtonGroup.Content (Page 5484)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

RadioButtonGroup.Content (Page 5484)

RadioButtonGroup.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the option button.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
RadioButtonGroup.CurrentQuality
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.Enabled

Description

The "Enabled" property specifies whether the option button can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
RadioButtonGroup.Enabled
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
RadioButtonGroup.Font
```

See also

RadioButtonGroup (Page 5478)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

RadioButtonGroup.Font (Page 5491)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

RadioButtonGroup.Font (Page 5491)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

RadioButtonGroup.Font (Page 5491)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

RadioButtonGroup.Font (Page 5491)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

RadioButtonGroup.Font (Page 5491)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

RadioButtonGroup.Font (Page 5491)

RadioButtonGroup.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
RadioButtonGroup.ForeColor
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
RadioButtonGroup.Height
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.Layer

Description

The "Layer" property returns the layer of the screen in which the option button is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
RadioButtonGroup.Layer
```

See also

RadioButtonGroup (Page 5478)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

RadioButtonGroup.Layer (Page 5495)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

RadioButtonGroup.Layer (Page 5495)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

RadioButtonGroup.Layer (Page 5495)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

RadioButtonGroup.Layer (Page 5495)

RadioButtonGroup.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
RadioButtonGroup.Left
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
RadioButtonGroup.Margin
```

See also

RadioButtonGroup (Page 5478)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

RadioButtonGroup.Margin (Page 5498)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

RadioButtonGroup.Margin (Page 5498)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

RadioButtonGroup.Margin (Page 5498)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

RadioButtonGroup.Margin (Page 5498)

RadioButtonGroup.Name

Description

The "Name" property returns the name of the option button.

Type

String

Access

Read-only

Syntax

```
RadioButtonGroup.Name
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.Opacity

Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

Type

Float

Access

Read-write

Syntax

```
RadioButtonGroup.Opacity
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.Operability

Description

The "Operability" property returns whether the option button is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
RadioButtonGroup.Operability
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.Padding

Description

The "Padding" property specifies the distance of the content from the border of the option button.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
RadioButtonGroup.Padding
```

See also

RadioButtonGroup (Page 5478)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

RadioButtonGroup.Padding (Page 5502)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

RadioButtonGroup.Padding (Page 5502)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

RadioButtonGroup.Padding (Page 5502)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

RadioButtonGroup.Padding (Page 5502)

RadioButtonGroup.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
RadioButtonGroup.Parent
```

See also

RadioButtonGroup (Page 5478)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

RadioButtonGroup.ProcessValue

Description

The "ProcessValue" property specifies the process value.

Type

Variant

Access

Read-write

Syntax

```
RadioButtonGroup.ProcessValue
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the option button was created.

Type

String

Access

Read-only

Syntax

```
RadioButtonGroup.RenderingTemplate
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the option button can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
RadioButtonGroup.RequireExplicitUnlock
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
RadioButtonGroup.RotationAngle
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.RotationCenterPlacement (Page 5508)

RadioButtonGroup.RotationCenterX (Page 5508)

RadioButtonGroup.RotationCenterY (Page 5509)

RadioButtonGroup.RotationCenterPlacement

Description

The "RotationCenterPlacement" property sets the reference point around which the option button rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
RadioButtonGroup.RotationCenterPlacement
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.RotationAngle (Page 5507)

RadioButtonGroup.RotationCenterX (Page 5508)

RadioButtonGroup.RotationCenterY (Page 5509)

RadioButtonGroup.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
RadioButtonGroup.RotationCenterX
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.RotationAngle (Page 5507)

RadioButtonGroup.RotationCenterPlacement (Page 5508)

RadioButtonGroup.RotationCenterY (Page 5509)

RadioButtonGroup.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
RadioButtonGroup.RotationCenterY
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.RotationAngle (Page 5507)

RadioButtonGroup.RotationCenterPlacement (Page 5508)

RadioButtonGroup.RotationCenterX (Page 5508)

RadioButtonGroup.SelectionItemHeight

Description

The "SelectionItemHeight" property specifies the height of the option button entries. The value "0" indicates that the height is calculated automatically.

Type

UInt16

Access

Read-write

Syntax

```
RadioButtonGroup.SelectionItemHeight
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.SelectionItems

Description

The "SelectionItems" property returns the list of all option button entries ("SelectionItem" objects).

Type

Object, HmiSelectionItemCollection (Page 5511)

Access

Read-only

Syntax

```
RadioButtonGroup.SelectionItems
```

See also

RadioButtonGroup (Page 5478)

HmiSelectionItemCollection (Page 5511)

HmiSelectionItemCollection

Description

The "HmiSelectionItemCollection" object is a list of all entries ("SelectionItem" objects) of a list object.

Use

The "HmiSelectionItemCollection" object is a list and can be counted and enumerated. You can access the "HmiSelectionItemCollection" list using the index or the tag name.

Object type

HmiSelectionItemCollection

Properties

The "HmiSelectionItemCollection" object has the following properties:

- **Count**
  Returns the number of list entries of the "HmiSelectionItemCollection" list.

Methods

The "HmiSelectionItemCollection" object has the following methods:

- **Item()**
  Returns a list entry of the "HmiSelectionItemCollection" list.

See also

RadioButtonGroup.SelectionItems (Page 5510)

HmiSelectionItemCollection.Count

Description

The "Count" property returns the number of list entries in the "HmiSelectionItemCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiSelectionItemCollection.Count
```

See also

HmiSelectionItemCollection (Page 5511)

HmiSelectionItemCollection.Item()

Description

The "Item" method returns a list entry of the "HmiSelectionItemCollection" list.

Syntax

```
HmiSelectionItemCollection[.Item](HmiSelectionItemName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiSelectionItemCollection" object.

Parameters

`HmiSelectionItemName`

Type: String

Name of the list entry

Return value

Object, HmiSelectionItemPart (Page 5512)

See also

HmiSelectionItemCollection (Page 5511)

SelectionItem (Page 5512)

SelectionItem

Description

The "SelectionItem" object represents a list entry.

Object type

HmiSelectionItemPart

Properties

The "SelectionItem" object has the following properties:

- **Graphic**
  Specifies the graphic of the list entry.
- **IsSelected**
  Specifies whether the list entry is selected.
- **Text**
  Specifies the list entry text.

Methods

--

SelectionItem.Graphic

Description

The "Graphic" property specifies the graphic of the list entry.

Type

String

Access

Read-write

Syntax

```
SelectionItem.Graphic
```

See also

SelectionItem (Page 5512)

SelectionItem.IsSelected

Description

The "IsSelected" property specifies whether the list entry is selected.

Type

Bool

Access

Read-write

Syntax

```
SelectionItem.IsSelected
```

See also

SelectionItem (Page 5512)

SelectionItem.Text

Description

The "Text" property specifies the text of the list entry.

Type

String

Access

Read-write

Syntax

```
SelectionItem.Text
```

See also

SelectionItem (Page 5512)

RadioButtonGroup.SelectorPosition

Description

The "SelectorPosition" property specifies the horizontal alignment of the option button entries.

Type

Int32, HmiHorizontalAlignment

Specifies the text alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched. Can only be used with layout containers, Fallback behaves like Center

Access

Read-write

Syntax

```
RadioButtonGroup.SelectorPosition
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the option button is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
RadioButtonGroup.ShowFocusVisual
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the option button.

Type

String

Access

Read-only

Syntax

```
RadioButtonGroup.StyleItemClass
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.TabIndex

Description

The "TabIndex" property returns the position of the option button in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
RadioButtonGroup.TabIndex
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
RadioButtonGroup.ToolTipText
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
RadioButtonGroup.Top
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.Visible

Description

The "Visible" property specifies whether the option button is visible.

Type

Bool

Access

Read-write

Syntax

```
RadioButtonGroup.Visible
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.VisualizeQuality

Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

Type

Bool

Access

Read-write

Syntax

```
RadioButtonGroup.VisualizeQuality
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
RadioButtonGroup.Width
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the option button.

Syntax

```
RadioButtonGroup.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
RadioButtonGroup.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

`propertyName`

Type: String

Name of the property for which flashing is configured.

`enable`

Type: Bool

Specifies that flashing is activated.

`value`

Optional, type: Variant

Value of the property for which flashing is configured.

`alternateValue`

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup_OnActivated()

Description

The "OnActivated" event occurs when an option button receives focus:

- An option button is selected via the configured tab sequence.
- An option button that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
RadioButtonGroup_OnActivated(item)
```

Context

item

Type: Object

Option button where the event occurs.

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- An option button is right-clicked.
- An option button is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
RadioButtonGroup_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Option button where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key

- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup_OnDeactivated()

Description

The "OnDeactivated" event occurs when the option button loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
RadioButtonGroup_OnDeactivated(item)
```

Context

`item`

Type: Object

Option button where the event occurs.

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the option button is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
RadioButtonGroup_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

Option button where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the option button is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
RadioButtonGroup_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Option button where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

RadioButtonGroup (Page 5478)

RadioButtonGroup_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- An option button is left-clicked.
- The <RETURN> or <SPACE> key is pressed when an option button has the focus.
- An option button is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
RadioButtonGroup_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Option button where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

RadioButtonGroup (Page 5478)

Rectangle

Description

The "Rectangle" object represents a rectangle in runtime.

Object type

HmiRectangle

Properties

The "Rectangle" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BackFillPattern**
  Specifies the pattern of the background or the fill.
- **BorderColor**
  Specifies the border color.
- **BorderWidth**
  Specifies the border thickness.
- **Corners**
  Specifies the rounding of the rectangle corners.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the rectangle.
- **DashType**
  Specifies the stroke style of the border or line.
- **Enabled**
  Specifies whether the rectangle can be operated in runtime.
- **FillDirection**
  Specifies the direction from which the rectangle is filled.
- **FillLevel**
  Specifies the fill of the rectangle in percent.
- **Height**
  Specifies the height.
- **Layer**
  Returns the layer of the screen in which the rectangle is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the rectangle.

- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the rectangle is operable.
- **Parent**
  Returns the higher-level screen object.
- **RequireExplicitUnlock**
  Returns whether the rectangle is only operable while the associated button is being pressed.
- **RotationAngle**
  Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the rectangle rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ShowFillLevel**
  Specifies whether the fill level is displayed.
- **ShowFocusVisual**
  Specifies whether the rectangle is highlighted when in focus.
- **StyleItemClass**
  Returns the style which is applied to the rectangle.
- **TabIndex**
  Returns the position of the rectangle in the tab sequence.
- **ToolTipText**
  Specifies the tooltip text.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the rectangle is visible.
- **Width**
  Specifies the width.

Methods

The "Rectangle" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the rectangle.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "Rectangle" object has the following events:

- **OnActivated()**
  Occurs when a rectangle receives focus.
- **OnContextTapped()**
  Occurs when a rectangle is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when a rectangle loses focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the rectangle is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the rectangle is in focus.
- **OnTapped()**
  Occurs when a rectangle is left-clicked or short-touched.

Rectangle.AlternateBackColor

Description

The "AlternateBackColor" specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
Rectangle.AlternateBackColor
```

See also

Rectangle (Page 5527)

Rectangle.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
Rectangle.AlternateBorderColor
```

See also

Rectangle (Page 5527)

Rectangle.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
Rectangle.Authorization
```

See also

Rectangle (Page 5527)

Rectangle.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
Rectangle.BackColor
```

See also

Rectangle (Page 5527)

Rectangle.BackFillPattern

Description

The "BackFillPattern" property specifies the pattern of the background or the fill.

Type

Int32, HmiFillPattern

Specifies the filling:

- Solid (0): Solid
- Transparent (65536): Transparent
- Horizontal (131072): Horizontal
- Vertical (131073): Vertical
- ForwardDiagonal (131074): Forward diagonal stripe
- BackwardDiagonal (131075): Backward diagonal stripe
- Cross (131076): Cross
- DiagonalCross (131077): Diagonal cross
- GradientHorizontal (1048576): Horizontal gradient
- GradientVertical (1048577): Vertical gradient
- GradientForwardDiagonal (1048578): Gradient forward diagonal
- GradientBackwardDiagonal (1048579): Gradient backward diagonal
- GradientHorizontalTricolor (1048832): Horizontal tricolor gradient
- GradientVerticalTricolor (1048833): Vertical tricolor gradient
- GradientForwardDiagonalTricolor (1048834): Forward diagonal tricolor gradient
- GradientBackwardDiagonalTricolor (1048835): Backward diagonal tricolor gradient

Access

Read-write

Syntax

```
Rectangle.BackFillPattern
```

See also

Rectangle (Page 5527)

Rectangle.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
Rectangle.BorderColor
```

See also

Rectangle (Page 5527)

Rectangle.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
Rectangle.BorderWidth
```

See also

Rectangle (Page 5527)

Rectangle.Corners

Description

The "Corners" property specifies the rounding of the rectangle corners.

Type

Object, HmiCornersPart

Access

Read-write

Syntax

```
Rectangle.Corners
```

See also

Rectangle (Page 5527)

Corners.BottomLeftRadius

Description

The "BottomLeftRadius" property specifies the radius of the rounding of the bottom-left corner.

Type

UInt32

Access

Read-write

Syntax

```
Corners.BottomLeftRadius
```

See also

Rectangle.Corners (Page 5534)

Corners.BottomRightRadius

Description

The "BottomRightRadius" property specifies the radius of the rounding of the bottom-right corner.

Type

UInt32

Access

Read-write

Syntax

```
Corners.BottomRightRadius
```

See also

Rectangle.Corners (Page 5534)

Corners.TopLeftRadius

Description

The "TopLeftRadius" property specifies the radius of the rounding of the top-left corner.

Type

UInt32

Access

Read-write

Syntax

```
Corners.TopLeftRadius
```

See also

Rectangle.Corners (Page 5534)

Corners.TopRightRadius

Description

The "TopRightRadius" property specifies the radius of the rounding of the top-right corner.

Type

UInt32

Access

Read-write

Syntax

```
Corners.TopRightRadius
```

See also

Rectangle.Corners (Page 5534)

Rectangle.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the rectangle.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
Rectangle.CurrentQuality
```

See also

Rectangle (Page 5527)

Rectangle.DashType

Description

The "DashType" property specifies the stroke type of the border or line.

Type

Int32, HmiDashType

Specifies the stroke style:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted
- DashDot (3): Dash-dotted
- DashDotDot (4): Dash-dot-dot

Access

Read-write

Syntax

```
Rectangle.DashType
```

See also

Rectangle (Page 5527)

Rectangle.Enabled

Description

The "Enabled" property specifies whether the rectangle can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
Rectangle.Enabled
```

See also

Rectangle (Page 5527)

Rectangle.FillDirection

Description

The "FillDirection" property specifies the direction from which the rectangle is filled.

Type

Int32, HmiFillDirection

Specifies the filling direction:

- BottomToTop (0): From bottom to top
- TopToBottom (1): From top to bottom
- LeftToRight (2): From left to right
- RightToLeft (3): From right to left

Access

Read-write

Syntax

```
Rectangle.FillDirection
```

See also

Rectangle (Page 5527)

Rectangle.FillLevel

Description

The "FillLevel" property specifies the fill level of the rectangle in percent.

Type

UInt8

Access

Read-write

Syntax

```
Rectangle.FillLevel
```

See also

Rectangle (Page 5527)

Rectangle.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Rectangle.Height
```

See also

Rectangle (Page 5527)

Rectangle.Layer

Description

The "Layer" property returns the layer of the screen in which the rectangle is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
Rectangle.Layer
```

See also

Rectangle (Page 5527)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

Rectangle.Layer (Page 5540)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

Rectangle.Layer (Page 5540)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

Rectangle.Layer (Page 5540)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

Rectangle.Layer (Page 5540)

Rectangle.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
Rectangle.Left
```

See also

Rectangle (Page 5527)

Rectangle.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
Rectangle.Margin
```

See also

Rectangle (Page 5527)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

Rectangle.Margin (Page 5543)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

Rectangle.Margin (Page 5543)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

Rectangle.Margin (Page 5543)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

Rectangle.Margin (Page 5543)

Rectangle.Name

Description

The "Name" property returns the name of the rectangle.

Type

String

Access

Read-only

Syntax

```
Rectangle.Name
```

See also

Rectangle (Page 5527)

Rectangle.Opacity

Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

Type

Float

Access

Read-write

Syntax

```
Rectangle.Opacity
```

See also

Rectangle (Page 5527)

Rectangle.Operability

Description

The "Operability" property returns whether the rectangle is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
Rectangle.Operability
```

See also

Rectangle (Page 5527)

Rectangle.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
Rectangle.Parent
```

See also

Rectangle (Page 5527)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

Rectangle.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the rectangle can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
Rectangle.RequireExplicitUnlock
```

See also

Rectangle (Page 5527)

Rectangle.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
Rectangle.RotationAngle
```

See also

Rectangle (Page 5527)

Rectangle.RotationCenterPlacement (Page 5548)

Rectangle.RotationCenterX (Page 5549)

Rectangle.RotationCenterY (Page 5550)

Rectangle.RotationCenterPlacement

Description

The "RotationCenterPlacement" property sets the reference point around which the rectangle rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
Rectangle.RotationCenterPlacement
```

See also

Rectangle (Page 5527)

Rectangle.RotationAngle (Page 5548)

Rectangle.RotationCenterX (Page 5549)

Rectangle.RotationCenterY (Page 5550)

Rectangle.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
Rectangle.RotationCenterX
```

See also

Rectangle (Page 5527)

Rectangle.RotationAngle (Page 5548)

Rectangle.RotationCenterPlacement (Page 5548)

Rectangle.RotationCenterY (Page 5550)

Rectangle.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
Rectangle.RotationCenterY
```

See also

Rectangle (Page 5527)

Rectangle.RotationAngle (Page 5548)

Rectangle.RotationCenterPlacement (Page 5548)

Rectangle.RotationCenterX (Page 5549)

Rectangle.ShowFillLevel

Description

The "ShowFillLevel" property specifies whether the fill level is displayed.

Type

Bool

Access

Read-write

Syntax

```
Rectangle.ShowFillLevel
```

See also

Rectangle (Page 5527)

Rectangle.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the rectangle is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
Rectangle.ShowFocusVisual
```

See also

Rectangle (Page 5527)

Rectangle.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the rectangle.

Type

String

Access

Read-only

Syntax

```
Rectangle.StyleItemClass
```

See also

Rectangle (Page 5527)

Rectangle.TabIndex

Description

The "TabIndex" property returns the position of the rectangle in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
Rectangle.TabIndex
```

See also

Rectangle (Page 5527)

Rectangle.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
Rectangle.ToolTipText
```

See also

Rectangle (Page 5527)

Rectangle.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
Rectangle.Top
```

See also

Rectangle (Page 5527)

Rectangle.Visible

Description

The "Visible" property specifies whether the rectangle is visible.

Type

Bool

Access

Read-write

Syntax

```
Rectangle.Visible
```

See also

Rectangle (Page 5527)

Rectangle.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Rectangle.Width
```

See also

Rectangle (Page 5527)

Rectangle.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the rectangle.

Syntax

```
Rectangle.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

Rectangle (Page 5527)

Rectangle.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
Rectangle.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

Rectangle (Page 5527)

Rectangle_OnActivated()

Description

The "OnActivated" event occurs when a rectangle receives focus:

- A rectangle is selected via the configured tab sequence.
- A rectangle that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
Rectangle_OnActivated(item)
```

Context

item

Type: Object

Rectangle where the event occurs.

See also

Rectangle (Page 5527)

Rectangle_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A rectangle is right-clicked.
- A rectangle is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
Rectangle_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Rectangle where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key

- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Rectangle (Page 5527)

Rectangle_OnDeactivated()

Description

The "OnDeactivated" event occurs when the rectangle loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
Rectangle_OnDeactivated(item)
```

Context

`item`

Type: Object

Rectangle where the event occurs.

See also

Rectangle (Page 5527)

Rectangle_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the rectangle is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Rectangle_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

Rectangle where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Rectangle (Page 5527)

Rectangle_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the rectangle is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Rectangle_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Rectangle where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Rectangle (Page 5527)

Rectangle_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A rectangle is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a rectangle has the focus.
- A rectangle is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
Rectangle_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Rectangle where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

Rectangle (Page 5527)

ScreenWindow

Description

ScreenWindow (Page 1436)

Slider

Description

The "Slider" object represents a slider for monitoring of process values in runtime.

Object type

HmiSlider

Properties

The "Slider" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BarMode**
  Specifies the color display of the slider.
- **BorderColor**
  Specifies the border color.
- **BorderWidth**
  Specifies the border thickness.
- **ComputedMaxPeakValue**
  Returns the highest process value that occurred.
- **ComputedMinPeakValue**
  Returns the lowest process value that occurred.
- **ComputedValueTendency**
  Returns the change of the process value.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the slider.
- **Enabled**
  Specifies whether the slider can be operated in runtime.
- **Font**
  Specifies the font of the text.
- **Height**
  Specifies the height.
- **Label**
  Specifies the labeling below the slider.

- **Layer**
  Returns the layer of the screen in which the slider is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the slider.
- **NormalRangeColor**
  Specifies the color of the normal range.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the slider is operable.
- **OriginValue**
  Specifies the output value of the normal range that is visualized.
- **OutputFormat**
  Specifies the format for displaying the process values.
- **Parent**
  Returns the higher-level screen object.
- **PeakIndicators**
  Specifies whether the highest and lowest process value up to this time are displayed.
- **ProcessValue**
  Specifies the process value.
- **ProcessValueIndicatorBackColor**
  Specifies the background color for the process value.
- **ProcessValueIndicatorForeColor**
  Specifies the foreground color for the process value.
- **ProcessValueIndicatorMode**
  Specifies the type of display of the current process value.
- **RelativeToOrigin**
  Specifies whether the output value is an absolute or a percentage value between the minimum and maximum value.
- **RenderingTemplate**
  Returns the name of the template from which the slider was created.
- **RequireExplicitUnlock**
  Returns whether the slider is only operable while the associated button is being pressed.
- **RotationAngle**
  Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the slider rotates.

- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ScaleBackColor**
  Specifies the background color of the scale.
- **ScaleForeColor**
  Specifies the foreground color of the scale.
- **ShowFocusVisual**
  Specifies whether the slider is highlighted when in focus.
- **ShowTrendIndicator**
  Specifies whether the tendency (rising or falling) of the process value to be monitored is indicated by means of a small arrow.
- **ShowValue**
  Specifies whether the process value is additionally output as text.
- **StraightScale**
  Specifies the scale of the slider.
- **StyleItemClass**
  Returns the style which is applied to the slider.
- **TabIndex**
  Returns the position of the slider in the tab sequence.
- **ThresholdIndicators**
  Specifies how parameterized limit values are visualized.
- **Thresholds**
  Returns the list of all limit values of the slider.
- **ThumbBackColor**
  Specifies the background color of the slider.
- **ThumbForeColor**
  Specifies the foreground color of the slider.
- **Title**
  Specifies the caption which appears as the title.
- **ToolTipText**
  Specifies the tooltip text.
- **Top**
  Specifies the value of the Y coordinate.
- **TrendIndicatorColor**
  Specifies the color of the trend indicator.
- **ValuePosition**
  Specifies where the value of the current slider position is additionally displayed numerically.
- **Visible**
  Specifies whether the slider is visible.

- **VisualizeQuality**
  Specifies whether the connection quality of the process value is displayed.
- **Width**
  Specifies the width.
- **WriteDuringChange**
  Specifies when changes are transferred.

Methods

The "Slider" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the slider.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "Slider" object has the following events:

- **OnActivated()**
  Occurs when a slider receives focus.
- **OnContextTapped()**
  Occurs when a slider is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when a slider loses focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the slider is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the slider is in focus.
- **OnTapped()**
  Occurs when a slider is left-clicked or short-touched.

Slider.AlternateBackColor

Description

The "AlternateBackColor" specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
Slider.AlternateBackColor
```

See also

Slider (Page 5563)

Slider.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
Slider.AlternateBorderColor
```

See also

Slider (Page 5563)

Slider.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
Slider.Authorization
```

See also

Slider (Page 5563)

Slider.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
Slider.BackColor
```

See also

Slider (Page 5563)

Slider.BarMode

Description

The "BarMode" property specifies the color of the slider.

Type

Int32, HmiBarMode

Specifies the bar mode:

- Segmented (0): Bar changes color according to the bar segments.
- Unicolor (1): Entire bar has same color.

- SegmentedStatic (2): Bar segments in the background, process value indicator in front of the bar segments.
- UnicolorStatic (3): Background color changes according to the process value and the limit colors, process value indicator runs in front of the bar segments.

Access

Read-write

Syntax

```
Slider.BarMode
```

See also

Slider (Page 5563)

Slider.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
Slider.BorderColor
```

See also

Slider (Page 5563)

Slider.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
Slider.BorderWidth
```

See also

Slider (Page 5563)

Slider.ComputedMaxPeakValue

Description

The "ComputedMaxPeakValue" property returns the highest process value that occurred.

Type

Variant

Access

Read-only

Syntax

```
Slider.ComputedMaxPeakValue
```

See also

Slider (Page 5563)

Slider.ComputedMinPeakValue (Page 5570)

Slider.ComputedMinPeakValue

Description

The "ComputedMinPeakValue" property returns the lowest process value which occurred.

Type

Variant

Access

Read-only

Syntax

```
Slider.ComputedMinPeakValue
```

See also

Slider (Page 5563)

Slider.ComputedMaxPeakValue (Page 5570)

Slider.ComputedValueTendency

Description

The "ComputedValueTendency" property returns the change in the process value.

Type

Int32, HmiValueTendency

Returns the modification:

- Steady (0): No change
- Upwards (1): Change upwards
- Downwards (2): Change downwards

Access

Read-only

Syntax

```
Slider.ComputedValueTendency
```

See also

Slider (Page 5563)

Slider.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the slider.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
Slider.CurrentQuality
```

See also

Slider (Page 5563)

Slider.Enabled

Description

The "Enabled" property specifies whether the slider can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
Slider.Enabled
```

See also

Slider (Page 5563)

Slider.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Slider.Font
```

See also

Slider (Page 5563)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Slider.Font (Page 5573)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Slider.Font (Page 5573)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Slider.Font (Page 5573)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Slider.Font (Page 5573)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Slider.Font (Page 5573)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Slider.Font (Page 5573)

Slider.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Slider.Height
```

See also

Slider (Page 5563)

Slider.Label

Description

The "Label" property specifies the labeling below the slider.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
Slider.Label
```

See also

Slider (Page 5563)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

Slider.Label (Page 5577)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 5577)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 5577)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 5577)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 5577)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 5577)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 5577)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

Slider.Label (Page 5577)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

Slider.Label (Page 5577)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

Slider.Label (Page 5577)

Slider.Layer

Description

The "Layer" property returns the layer of the screen in which the slider is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
Slider.Layer
```

See also

Slider (Page 5563)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

Slider.Layer (Page 5583)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

Slider.Layer (Page 5583)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

Slider.Layer (Page 5583)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

Slider.Layer (Page 5583)

Slider.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
Slider.Left
```

See also

Slider (Page 5563)

Slider.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
Slider.Margin
```

See also

Slider (Page 5563)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

Slider.Margin (Page 5586)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

Slider.Margin (Page 5586)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

Slider.Margin (Page 5586)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

Slider.Margin (Page 5586)

Slider.Name

Description

The "Name" property returns the name of the slider.

Type

String

Access

Read-only

Syntax

```
Slider.Name
```

See also

Slider (Page 5563)

Slider.NormalRangeColor

Description

The "NormalRangeColor" property specifies the color of the normal range.

Type

UInt32

Access

Read-write

Syntax

```
Slider.NormalRangeColor
```

See also

Slider (Page 5563)

Slider.Opacity

Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

Type

Float

Access

Read-write

Syntax

```
Slider.Opacity
```

See also

Slider (Page 5563)

Slider.Operability

Description

The "Operability" property returns whether the slider is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
Slider.Operability
```

See also

Slider (Page 5563)

Slider.OriginValue

Description

The "OriginValue" property specifies the output value of the normal range to be visualized.

Type

Float

Access

Read-write

Syntax

```
Slider.OriginValue
```

See also

Slider (Page 5563)

Slider.OutputFormat

Description

The "OutputFormat" property specifies the format for displaying the process values, e.g. "{0000}" for a 4-digit integer with leading zeros.

Type

String

Access

Read-write

Syntax

```
Slider.OutputFormat
```

See also

Slider (Page 5563)

Slider.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
Slider.Parent
```

See also

Slider (Page 5563)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

Slider.PeakIndicators

Description

The "PeakIndicators" property specifies whether the highest and lowest process value up to this time are displayed.

Type

Int32, HmiPeakIndicator

Specifies the display of the peak indicator:

- None (0): No display
- Low (1): Only the lowest process value
- High (2): Only the highest process value

Access

Read-write

Syntax

```
Slider.PeakIndicators
```

See also

Slider (Page 5563)

Slider.ProcessValue

Description

The "ProcessValue" property specifies the process value.

Type

Variant

Access

Read-write

Syntax

```
Slider.ProcessValue
```

See also

Slider (Page 5563)

Slider.ProcessValueIndicatorBackColor

Description

The "ProcessValueIndicatorBackColor" property specifies the background color for the process value indicator.

Type

UInt32

Access

Read-write

Syntax

```
Slider.ProcessValueIndicatorBackColor
```

See also

Slider (Page 5563)

Slider.ProcessValueIndicatorForeColor (Page 5593)

Slider.ProcessValueIndicatorForeColor

Description

The "ProcessValueIndicatorForeColor" property specifies the foreground color for the process value indicator.

Type

UInt32

Access

Read-write

Syntax

```
Slider.ProcessValueIndicatorForeColor
```

See also

Slider (Page 5563)

Slider.ProcessValueIndicatorBackColor (Page 5593)

Slider.ProcessValueIndicatorMode

Description

The "ProcessValueIndicatorMode" property specifies the type of display of the current process value.

Type

Int32, HmiProcessIndicatorMode

Specifies the type of display:

- Bar (0): Bar only
- Indicator (1): Hair line or needle, no numerical display of the process value.
- DetailedIndicator (2): Detailed display with numerical value
- BarWithDetailedIndicator (3): Bar with numerical value

Access

Read-write

Syntax

```
Slider.ProcessValueIndicatorMode
```

See also

Slider (Page 5563)

Slider.RelativeToOrigin

Description

The "RelativeToOrigin" property specifies whether the output value is an absolute or a percentage value between minimum and maximum value.

Type

Bool

Access

Read-write

Syntax

```
Slider.RelativeToOrigin
```

See also

Slider (Page 5563)

Slider.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the slider was created.

Type

String

Access

Read-only

Syntax

```
Slider.RenderingTemplate
```

See also

Slider (Page 5563)

Slider.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the slider can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
Slider.RequireExplicitUnlock
```

See also

Slider (Page 5563)

Slider.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
Slider.RotationAngle
```

See also

Slider (Page 5563)

Slider.RotationCenterPlacement (Page 5597)

Slider.RotationCenterX (Page 5597)

Slider.RotationCenterY (Page 5598)

Slider.RotationCenterPlacement

Description

The "RotationCenterPlacement" property sets the reference point around which the slider rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
Slider.RotationCenterPlacement
```

See also

Slider (Page 5563)

Slider.RotationAngle (Page 5596)

Slider.RotationCenterX (Page 5597)

Slider.RotationCenterY (Page 5598)

Slider.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
Slider.RotationCenterX
```

See also

Slider (Page 5563)

Slider.RotationAngle (Page 5596)

Slider.RotationCenterPlacement (Page 5597)

Slider.RotationCenterY (Page 5598)

Slider.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
Slider.RotationCenterY
```

See also

Slider (Page 5563)

Slider.RotationAngle (Page 5596)

Slider.RotationCenterPlacement (Page 5597)

Slider.RotationCenterX (Page 5597)

Slider.ScaleBackColor

Description

The "ScaleBackColor" property specifies the background color of the scale.

Type

UInt32

Access

Read-write

Syntax

```
Slider.ScaleBackColor
```

See also

Slider (Page 5563)

Slider.ScaleForeColor (Page 5599)

Slider.ScaleForeColor

Description

The "ScaleForeColor" property specifies the foreground color of the scale.

Type

UInt32

Access

Read-write

Syntax

```
Slider.ScaleForeColor
```

See also

Slider (Page 5563)

Slider.ScaleBackColor (Page 5599)

Slider.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the slider is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
Slider.ShowFocusVisual
```

See also

Slider (Page 5563)

Slider.ShowTrendIndicator

Description

The "ShowTrendIndicator" property specifies whether the tendency (rising or falling) of the process value to be monitored is indicated by means of a small arrow.

Type

Bool

Access

Read-write

Syntax

```
Slider.ShowTrendIndicator
```

See also

Slider (Page 5563)

Slider.ShowValue

Description

The "ShowValue" property specifies whether the process value is additionally output as text.

Type

Bool

Access

Read-write

Syntax

```
Slider.ShowValue
```

See also

Slider (Page 5563)

Slider.StraightScale

Description

The "StraightScale" property specifies the scale of the slider.

Type

Object, HmiStraightScalePart

Access

Read-write

Syntax

```
Slider.StraightScale
```

See also

Slider (Page 5563)

StraightScale.AutoScaling

Description

The "AutoScaling" property specifies whether automatic scaling is activated.

Type

Bool

Access

Read-write

Syntax

```
StraightScale.AutoScaling
```

See also

Slider.StraightScale (Page 5601)

StraightScale.BeginValue

Description

The "BeginValue" property specifies the start of a value range or value range section.

Type

Float

Access

Read-write

Syntax

```
StraightScale.BeginValue
```

See also

Slider.StraightScale (Page 5601)

StraightScale.DivisionCount

Description

The "DivisionCount" property specifies the number of main units with subdivisions. To this purpose the automatic scaling must be switched off.

Type

Int32

Access

Read-write

Syntax

```
StraightScale.DivisionCount
```

See also

Slider.StraightScale (Page 5601)

StraightScale.EndValue

Description

The "EndValue" property specifies the end of a value range or value range section.

Type

Float

Access

Read-write

Syntax

```
StraightScale.EndValue
```

See also

Slider.StraightScale (Page 5601)

StraightScale.LabelColor

Description

The "LabelColor" property specifies the color of the labeling.

Type

UInt32

Access

Read-write

Syntax

```
StraightScale.LabelColor
```

See also

Slider.StraightScale (Page 5601)

StraightScale.LabelFont

Description

The "LabelFont" property specifies the font of the labeling.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
StraightScale.LabelFont
```

See also

Slider.StraightScale (Page 5601)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

StraightScale.LabelFont (Page 5604)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

StraightScale.LabelFont (Page 5604)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

StraightScale.LabelFont (Page 5604)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

StraightScale.LabelFont (Page 5604)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

StraightScale.LabelFont (Page 5604)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

StraightScale.LabelFont (Page 5604)

StraightScale.LargeTickLabelingStep

Description

The "LargeTickLabelingStep" property specifies the interval at which scale sections are labeled.

Type

UInt8

Access

Read-write

Syntax

```
StraightScale.LargeTickLabelingStep
```

See also

Slider.StraightScale (Page 5601)

StraightScale.MeasurementUnit

Description

The "MeasurementUnit" property returns the displayed unit.

Type

String

Access

Read-only

Syntax

```
StraightScale.MeasurementUnit
```

See also

Slider.StraightScale (Page 5601)

StraightScale.MeasurementUnitType

Description

The "MeasurementUnitType" property specifies the display format of the unit.

Type

Int32, HmiMeasurementUnit

Specifies the display format:

- None (0): No unit
- Name (1): Unit name, for example "kilogram"
- Symbol (2): Unit, for example "kg"

Access

Read-write

Syntax

```
StraightScale.MeasurementUnitType
```

See also

Slider.StraightScale (Page 5601)

StraightScale.Orientation

Description

The "Orientation" property specifies the orientation of the scale.

Type

Int32, HmiOrientation

Specifies the alignment:

- Horizontal (0): Horizontal
- Vertical (1): Vertical

Access

Read-write

Syntax

```
StraightScale.Orientation
```

See also

Slider.StraightScale (Page 5601)

StraightScale.OutputFormat

Description

The "OutputFormat" property specifies the format for displaying the process values, e.g. "{0000}" for a 4-digit integer with leading zeros.

Type

String

Access

Read-write

Syntax

```
StraightScale.OutputFormat
```

See also

Slider.StraightScale (Page 5601)

StraightScale.ScaleMode

Description

The "ScaleMode" property specifies the type of scaling.

Type

Int32, HmiScaleMode

Specifies the scaling:

- None (0): None
- Labels (1): Labels
- Ticks (2): Tick marks

Access

Read-write

Syntax

```
StraightScale.ScaleMode
```

See also

Slider.StraightScale (Page 5601)

StraightScale.ScalingType

Description

The "ScalingType" property specifies the scaling.

Type

Int32, HmiScalingType

Specifies the scaling:

- Linear (0): Linear
- Logarithmic (1): Logarithmic
- NegativeLogarithmic (2): Negative logarithmic
- Tangent (4): Tangential
- Quadratic (5): Square
- Cubic (6): Cubic

Access

Read-write

Syntax

```
StraightScale.ScalingType
```

See also

Slider.StraightScale (Page 5601)

StraightScale.SubDivisionCount

Description

The "SubDivisionCount" property specifies the number of subdivisions of the main units.

Type

Int32

Access

Read-write

Syntax

```
StraightScale.SubDivisionCount
```

See also

Slider.StraightScale (Page 5601)

StraightScale.TickColor

Description

The "TickColor" property specifies the color of the tick marks.

Type

UInt32

Access

Read-write

Syntax

```
StraightScale.TickColor
```

See also

Slider.StraightScale (Page 5601)

Slider.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the slider.

Type

String

Access

Read-only

Syntax

```
Slider.StyleItemClass
```

See also

Slider (Page 5563)

Slider.TabIndex

Description

The "TabIndex" property returns the position of the slider in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
Slider.TabIndex
```

See also

Slider (Page 5563)

Slider.ThresholdIndicators

Description

The "ThresholdIndicators" property specifies how parameterized limit values are visualized.

Type

Int32, HmiThresholdIndicator

Specifies the visualization:

- None (0): None
- Lines (1): Lines
- Markers (2): Markers

Access

Read-write

Syntax

```
Slider.ThresholdIndicators
```

See also

Slider (Page 5563)

Slider.Thresholds

Description

The "Thresholds" property returns the list of all limit values ("Threshold" objects) of the slider.

Type

Object, HmiThresholdCollection (Page 5615)

Access

Read-only

Syntax

```
Slider.Thresholds
```

See also

Slider (Page 5563)

HmiThresholdCollection (Page 5615)

HmiThresholdCollection

Description

The "HmiThresholdCollection" object is a list of all limit values ("Threshold" objects).

Use

The "HmiThresholdCollection" object is a list and can be counted and enumerated. You can access the "HmiThresholdCollection" list using the index or the tag name.

Object type

HmiThresholdCollection

Properties

The "HmiThresholdCollection" object has the following properties:

- **Count**
  Returns the number of limit values of the "HmiThresholdCollection" list.

Methods

The "HmiThresholdCollection" object has the following methods:

- **Item()**
  Returns a limit value of the "HmiThresholdCollection" list.

See also

Slider.Thresholds (Page 5614)

HmiThresholdCollection.Count

Description

The "Count" property returns the number of limit values in the "HmiThresholdCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiThresholdCollection.Count
```

See also

HmiThresholdCollection (Page 5615)

HmiThresholdCollection.Item()

Description

The "Item" method returns a limit value of the "HmiThresholdCollection" list.

Syntax

```
HmiThresholdCollection[.Item](HmiThresholdName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiThresholdCollection" object.

Parameters

`HmiThresholdName`

Type: String

Name of the limit value

Return value

Object, HmiThresholdPart (Page 5617)

See also

HmiThresholdCollection (Page 5615)

Threshold (Page 5617)

Threshold

Description

The "Threshold" object represents a limit value.

Object type

HmiThresholdPart

Properties

The "Threshold" object has the following properties:

- **Color**
  Specifies the color of the limit value.
- **DisplayName**
  Specifies the display name of the limit value.
- **Name**
  Specifies the name of the limit value.
- **ThresholdMode**
  Specifies the type of limit value.
- **Value**
  Returns the limit value.

Methods

--

See also

HmiThresholdCollection (Page 5615)

Threshold.Color

Description

The "Color" property specifies the color of the limit value.

Type

UInt32

Access

Read-write

Syntax

```
Threshold.Color
```

See also

Threshold (Page 5617)

Threshold.DisplayName

Description

The "DisplayName" property specifies the display name of the limit value.

Type

String

Access

Read-write

Syntax

```
Threshold.DisplayName
```

See also

Threshold (Page 5617)

Threshold.Name

Description

The "Name" property specifies the name of the limit value.

Type

String

Access

Read-write

Syntax

```
Threshold.Name
```

See also

Threshold (Page 5617)

Threshold.ThresholdMode

Description

The "ThresholdMode" property specifies the type of limit value.

Type

Int32, HmiThresholdMode

Specifies the threshold value:

- Undefined (0): Undefined
- Upper (1): Upper threshold
- Lower (2): Lower threshold
- Normal (3): Normal threshold
- Minimum (4): Minimum threshold
- Maximum (5): Maximum threshold

Access

Read-write

Syntax

```
Threshold.ThresholdMode
```

See also

Threshold (Page 5617)

Threshold.Value

Description

The "Value" property returns the limit value of the tag.

Type

Float

Access

Read-only

Syntax

```
Threshold.Value
```

See also

Threshold (Page 5617)

Slider.ThumbBackColor

Description

The "ThumbBackColor" property specifies the background color of the handle of the slider.

Type

UInt32

Access

Read-write

Syntax

```
Slider.ThumbBackColor
```

See also

Slider (Page 5563)

Slider.ThumbForeColor (Page 5620)

Slider.ThumbForeColor

Description

The "ThumbForeColor" property specifies the foreground color of the handle of the slider.

Type

UInt32

Access

Read-write

Syntax

```
Slider.ThumbForeColor
```

See also

Slider (Page 5563)

Slider.ThumbBackColor (Page 5620)

Slider.Title

Description

The "Title" property specifies the caption that appears as the title.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
Slider.Title
```

See also

Slider (Page 5563)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

Slider.Title (Page 5621)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 5621)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 5621)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 5621)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 5621)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 5621)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 5621)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

Slider.Title (Page 5621)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

Slider.Title (Page 5621)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

Slider.Title (Page 5621)

Slider.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
Slider.ToolTipText
```

See also

Slider (Page 5563)

Slider.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
Slider.Top
```

See also

Slider (Page 5563)

Slider.TrendIndicatorColor

Description

The "TrendIndicatorColor" property specifies the color of the trend indicator. The trend indicator uses a small arrow to represent the tendency (rising or falling) of the process value to be monitored. To activate the trend indicator, the "ShowTrendIndicator" property must be activated.

Type

UInt32

Access

Read-write

Syntax

```
Slider.TrendIndicatorColor
```

See also

Slider (Page 5563)

Slider.ValuePosition

Description

The "ValuePosition" property specifies where the value of the current slider position is additionally displayed numerically.

Type

Int32, HmiSimplePosition

Specifies the position:

- LeftOrTop (0): Left for vertical alignment, top for horizontal alignment
- RightOrBottom (1): Right for vertical alignment, bottom for horizontal alignment

Access

Read-write

Syntax

```
Slider.ValuePosition
```

See also

Slider (Page 5563)

Slider.Visible

Description

The "Visible" property specifies whether the slider is visible.

Type

Bool

Access

Read-write

Syntax

```
Slider.Visible
```

See also

Slider (Page 5563)

Slider.VisualizeQuality

Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

Type

Bool

Access

Read-write

Syntax

```
Slider.VisualizeQuality
```

See also

Slider (Page 5563)

Slider.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Slider.Width
```

See also

Slider (Page 5563)

Slider.WriteDuringChange

Description

The "WriteDuringChange" property specifies when changes are transferred.

- True: Even during the modification of the slider.
- False: Only after the slider has been released.

Type

Bool

Access

Read-write

Syntax

```
Slider.WriteDuringChange
```

See also

Slider (Page 5563)

Slider.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the slider.

Syntax

```
Slider.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

Slider (Page 5563)

Slider.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
Slider.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

`propertyName`

Type: String

Name of the property for which flashing is configured.

`enable`

Type: Bool

Specifies that flashing is activated.

`value`

Optional, type: Variant

Value of the property for which flashing is configured.

`alternateValue`

Optional, type: Variant

Specifies the second value for flashing.

`rate`

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

Slider (Page 5563)

Slider_OnActivated()

Description

The "OnActivated" event occurs when a slider receives focus:

- A slider is selected via the configured tab sequence.
- A slider that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
Slider_OnActivated(item)
```

Context

item

Type: Object

Slider where the event occurs.

See also

Slider (Page 5563)

Slider_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A slider is right-clicked.
- A slider is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
Slider_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

`item`

Type: Object

Slider where the event occurs.

`x`

Type: DInt

X-coordinate of the input point

`y`

Type: DInt

Y-coordinate of the input point

`modifiers`

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Slider (Page 5563)

Slider_OnDeactivated()

Description

The "OnDeactivated" event occurs when the slider loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
Slider_OnDeactivated(item)
```

Context

item

Type: Object

Slider where the event occurs.

See also

Slider (Page 5563)

Slider_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the slider is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Slider_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

Slider where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Slider (Page 5563)

Slider_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the slider is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Slider_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Slider where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Slider (Page 5563)

Slider_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A slider is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a slider has the focus.
- A slider is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
Slider_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Slider where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

Slider (Page 5563)

SwacContainer

Description

The "SwacContainer" object represents a container for SWAC components (Siemens Web Application Collaboration) in runtime.

Object type

HmiSwacContainer

Properties

The "SwacContainer" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **Caption**
  Specifies the text that is displayed in the title bar.
- **CaptionColor**
  Specifies the background color of the title bar.
- **ContainedType**
  Returns the type of the contained objects.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the container.
- **Enabled**
  Specifies whether the container can be operated in runtime.
- **Height**
  Specifies the height.
- **Icon**
  Specifies the icon of the container.
- **Layer**
  Returns the screen layer in which the container is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the container.
- **Operability**
  Returns whether the container is operable.
- **Parent**
  Returns the higher-level screen object.
- **Properties**
  allows access to the dynamic properties of the SWAC component.
- **RenderingTemplate**
  Returns the name of the template from which the container was created.
- **RequireExplicitUnlock**
  Returns whether the container is only operable while the corresponding button is being pressed.
- **ShowFocusVisual**
  Specifies whether the container is highlighted when in focus.
- **StyleItemClass**
  Returns the style which is applied to the container.

- **TabIndex**
  Returns the position of the container in the tab sequence.
- **Top**
  Specifies the value of the Y coordinate.
- **Url**
  Specifies the URL displayed by the container.
- **Visible**
  Specifies whether the container is visible.
- **Width**
  Specifies the width.
- **WindowFlags**
  Specifies the window configuration of the container.

Methods

The "SwacContainer" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the container.
- **PropertyFlashing()**
  Configures flashing of a property.

SwacContainer.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
SwacContainer.Authorization
```

See also

SwacContainer (Page 5639)

SwacContainer.Caption

Description

The "Caption" property specifies the text that is displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
SwacContainer.Caption
```

See also

SwacContainer (Page 5639)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

SwacContainer.Caption (Page 5642)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 5642)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 5642)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 5642)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 5642)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 5642)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 5642)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

SwacContainer.Caption (Page 5642)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

SwacContainer.Caption (Page 5642)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

SwacContainer.Caption (Page 5642)

SwacContainer.CaptionColor

Description

The "CaptionColor" property specifies the color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
SwacContainer.CaptionColor
```

See also

SwacContainer (Page 5639)

SwacContainer.ContainedType

Description

The "ContainedType" property returns the type of the contained objects (CustomControl, SwacComponent, or WidgetType).

Type

String

Access

Read-only

Syntax

```
SwacContainer.ContainedType
```

See also

SwacContainer (Page 5639)

SwacContainer.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the container.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
SwacContainer.CurrentQuality
```

See also

SwacContainer (Page 5639)

SwacContainer.Enabled

Description

The "Enabled" property specifies whether the container can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
SwacContainer.Enabled
```

See also

SwacContainer (Page 5639)

SwacContainer.Height

Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
SwacContainer.Height
```

See also

SwacContainer (Page 5639)

SwacContainer.Icon

Description

The "Icon" property specifies the icon of the container.

Type

String

Access

Read-write

Syntax

```
SwacContainer.Icon
```

See also

SwacContainer (Page 5639)

SwacContainer.Layer

Description

The "Layer" property returns the screen layer in which the container is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
SwacContainer.Layer
```

See also

SwacContainer (Page 5639)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

SwacContainer.Layer (Page 5651)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

SwacContainer.Layer (Page 5651)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

SwacContainer.Layer (Page 5651)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

SwacContainer.Layer (Page 5651)

SwacContainer.Left

Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
SwacContainer.Left
```

See also

SwacContainer (Page 5639)

SwacContainer.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
SwacContainer.Margin
```

See also

SwacContainer (Page 5639)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

SwacContainer.Margin (Page 5654)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

SwacContainer.Margin (Page 5654)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

SwacContainer.Margin (Page 5654)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

SwacContainer.Margin (Page 5654)

SwacContainer.Name

Description

The "Name" property returns the name of the container.

Type

String

Access

Read-only

Syntax

```
SwacContainer.Name
```

See also

SwacContainer (Page 5639)

SwacContainer.Operability

Description

The "Operability" property returns whether the container is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
SwacContainer.Operability
```

See also

SwacContainer (Page 5639)

SwacContainer.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
SwacContainer.Parent
```

See also

SwacContainer (Page 5639)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

SwacContainer.Properties

Description

The "Properties" property allows access to the dynamic properties of the SWAC component.

Type

Object, HmiDynamicPropertyPart

Access

Read-write

Syntax

```
SwacContainer.Properties
```

See also

SwacContainer (Page 5639)

SwacContainer.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the container was created.

Type

String

Access

Read-only

Syntax

```
SwacContainer.RenderingTemplate
```

See also

SwacContainer (Page 5639)

SwacContainer.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the container is only operable while the corresponding button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
SwacContainer.RequireExplicitUnlock
```

See also

SwacContainer (Page 5639)

SwacContainer.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the container is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
SwacContainer.ShowFocusVisual
```

See also

SwacContainer (Page 5639)

SwacContainer.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the container.

Type

String

Access

Read-only

Syntax

```
SwacContainer.StyleItemClass
```

See also

SwacContainer (Page 5639)

SwacContainer.TabIndex

Description

The "TabIndex" property returns the position of the container in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
SwacContainer.TabIndex
```

See also

SwacContainer (Page 5639)

SwacContainer.Top

Description

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
SwacContainer.Top
```

See also

SwacContainer (Page 5639)

SwacContainer.Url

Description

The "Url" property specifies the URL displayed by the container.

Type

String

Access

Read-write

Syntax

```
SwacContainer.Url
```

See also

SwacContainer (Page 5639)

SwacContainer.Visible

Description

The "Visible" property specifies whether the container is visible.

Type

Bool

Access

Read-write

Syntax

```
SwacContainer.Visible
```

See also

SwacContainer (Page 5639)

SwacContainer.Width

Description

The "Width" property specifies the width in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
SwacContainer.Width
```

See also

SwacContainer (Page 5639)

SwacContainer.WindowFlags

Description

The "WindowFlags" property specifies the window configuration of the container.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

You can enable multiple properties by adding integer values or bit operators.

Access

Read-write

Syntax

```
SwacContainer.WindowFlags
```

Example

Adapting the "windowFlags" tag depending on the window configuration:

Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose){
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

See also

SwacContainer (Page 5639)

SwacContainer.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the container.

Syntax

```
SwacContainer.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

SwacContainer (Page 5639)

SwacContainer.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
SwacContainer.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

SwacContainer (Page 5639)

SymbolContainer

Description

The "SymbolContainer" object represents a container for displaying the project graphics in runtime.

Object type

HmiSymbolContainer

Properties

The "SymbolContainer" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **ContainedType**
  Returns the type of the contained objects.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the container.
- **Effect**
  Specifies the effect for the display of the container surface.
- **EffectColor**
  Specifies the color of the container surface.
- **Enabled**
  Specifies whether the container can be operated in runtime.
- **Flip**
  Specifies whether the symbol is mirrored.
- **Height**
  Specifies the height.
- **Layer**
  Returns the screen layer in which the container is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the container.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the container is operable.

- **Parent**
  Returns the higher-level screen object.
- **ProcessValue**
  Specifies the process value.
- **Properties**
  Allows access to the dynamic properties of the project graphics.
- **RenderingTemplate**
  Returns the name of the template from which the container was created.
- **RequireExplicitUnlock**
  Returns whether the container is only operable while the corresponding button is being pressed.
- **RotationAngle**
  Specifies the rotation angle in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the container rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**
  Specifies whether the container is highlighted when in focus.
- **StyleItemClass**
  Returns the style which is applied to the container.
- **TabIndex**
  Returns the position of the container in the tab sequence.
- **Thresholds**
  Returns the list of all limit values of the container.
- **ToolTipText**
  Specifies the tooltip text.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the container is visible.
- **VisualizeQuality**
  Specifies whether the connection quality of the process value is displayed.
- **Width**
  Specifies the width.

Methods

The "SymbolContainer" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the container.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "SymbolContainer" object has the following events:

- **OnContextTapped()**
  Occurs when a container is right-clicked or long-touched.
- **OnKeyDown()**
  Occurs when a key is pressed while the container is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the container is in focus.
- **OnTapped()**
  Occurs when a container is left-clicked or short-touched.

SymbolContainer.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
SymbolContainer.Authorization
```

See also

SymbolContainer (Page 5666)

SymbolContainer.ContainedType

Description

The "ContainedType" property returns the type of the contained objects (CustomControl, SwacComponent, or WidgetType).

Type

String

Access

Read-only

Syntax

```
SymbolContainer.ContainedType
```

See also

SymbolContainer (Page 5666)

SymbolContainer.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the container.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
SymbolContainer.CurrentQuality
```

See also

SymbolContainer (Page 5666)

SymbolContainer.Effect

Description

The "Effect" property specifies the effect for the display of the container surface.

Type

Int32, HmiSymbolEffect

Specifies the effect.

- None (0): None
- UseEffectColor (1): Uses the "EffectColor".

Access

Read-write

Syntax

```
SymbolContainer.Effect
```

See also

SymbolContainer (Page 5666)

SymbolContainer.EffectColor

Description

The "EffectColor" property specifies the color of the container surface.

Type

UInt32

Access

Read-write

Syntax

```
SymbolContainer.EffectColor
```

See also

SymbolContainer (Page 5666)

SymbolContainer.Enabled

Description

The "Enabled" property specifies whether the container can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
SymbolContainer.Enabled
```

See also

SymbolContainer (Page 5666)

SymbolContainer.Flip

Description

The "Flip" property specifies whether the symbol is mirrored.

Type

Int32, HmiFlipMode

Specifies the mirroring:

- None (0): None
- Horizontal (1): Horizontal (mirrored at vertical axis)

Access

Read-write

Syntax

```
SymbolContainer.Flip
```

See also

SymbolContainer (Page 5666)

SymbolContainer.Height

Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
SymbolContainer.Height
```

See also

SymbolContainer (Page 5666)

SymbolContainer.Layer

Description

The "Layer" property returns the screen layer in which the container is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
SymbolContainer.Layer
```

See also

SymbolContainer (Page 5666)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

SymbolContainer.Layer (Page 5672)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

SymbolContainer.Layer (Page 5672)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

SymbolContainer.Layer (Page 5672)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

SymbolContainer.Layer (Page 5672)

SymbolContainer.Left

Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
SymbolContainer.Left
```

See also

SymbolContainer (Page 5666)

SymbolContainer.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
SymbolContainer.Margin
```

See also

SymbolContainer (Page 5666)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

SymbolContainer.Margin (Page 5675)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

SymbolContainer.Margin (Page 5675)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

SymbolContainer.Margin (Page 5675)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

SymbolContainer.Margin (Page 5675)

SymbolContainer.Name

Description

The "Name" property returns the name of the container.

Type

String

Access

Read-only

Syntax

```
SymbolContainer.Name
```

See also

SymbolContainer (Page 5666)

SymbolContainer.Opacity

Description

The "Opacity" property specifies the opacity. The "0" value indicates completely transparency.

Type

Float

Access

Read-write

Syntax

```
SymbolContainer.Opacity
```

See also

SymbolContainer (Page 5666)

SymbolContainer.Operability

Description

The "Operability" property returns whether the container is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
SymbolContainer.Operability
```

See also

SymbolContainer (Page 5666)

SymbolContainer.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
SymbolContainer.Parent
```

See also

SymbolContainer (Page 5666)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

SymbolContainer.ProcessValue

Description

The "ProcessValue" property specifies the process value.

Type

Variant

Access

Read-write

Syntax

```
SymbolContainer.ProcessValue
```

See also

SymbolContainer (Page 5666)

SymbolContainer.Properties

Description

The "Properties" property allows access to the dynamic properties of the project graphics.

Type

Object, HmiDynamicPropertyPart

Access

Read-write

Syntax

```
SymbolContainer.Properties
```

See also

SymbolContainer (Page 5666)

SymbolContainer.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the container was created.

Type

String

Access

Read-only

Syntax

```
SymbolContainer.RenderingTemplate
```

See also

SymbolContainer (Page 5666)

SymbolContainer.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the container is only operable while the corresponding button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
SymbolContainer.RequireExplicitUnlock
```

See also

SymbolContainer (Page 5666)

SymbolContainer.RotationAngle

Description

The "RotationAngle" property specifies the rotation angle in degrees.

Type

Int16

Access

Read-write

Syntax

```
SymbolContainer.RotationAngle
```

See also

SymbolContainer (Page 5666)

SymbolContainer.RotationCenterPlacement (Page 5682)

SymbolContainer.RotationCenterX (Page 5683)

SymbolContainer.RotationCenterY (Page 5684)

SymbolContainer.RotationCenterPlacement

Description

The "RotationCenterPlacement" property sets the reference point around which the container rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in the DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
SymbolContainer.RotationCenterPlacement
```

See also

SymbolContainer (Page 5666)

SymbolContainer.RotationAngle (Page 5682)

SymbolContainer.RotationCenterX (Page 5683)

SymbolContainer.RotationCenterY (Page 5684)

SymbolContainer.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
SymbolContainer.RotationCenterX
```

See also

SymbolContainer (Page 5666)

SymbolContainer.RotationAngle (Page 5682)

SymbolContainer.RotationCenterPlacement (Page 5682)

SymbolContainer.RotationCenterY (Page 5684)

SymbolContainer.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
SymbolContainer.RotationCenterY
```

See also

SymbolContainer (Page 5666)

SymbolContainer.RotationAngle (Page 5682)

SymbolContainer.RotationCenterPlacement (Page 5682)

SymbolContainer.RotationCenterX (Page 5683)

SymbolContainer.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the container is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
SymbolContainer.ShowFocusVisual
```

See also

SymbolContainer (Page 5666)

SymbolContainer.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the container.

Type

String

Access

Read-only

Syntax

```
SymbolContainer.StyleItemClass
```

See also

SymbolContainer (Page 5666)

SymbolContainer.TabIndex

Description

The "TabIndex" property returns the position of the container in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
SymbolContainer.TabIndex
```

See also

SymbolContainer (Page 5666)

SymbolContainer.Thresholds

Description

The "Thresholds" property returns the list of all limit values ("Threshold" objects) of the container.

Type

Object, HmiThresholdCollection (Page 5686)

Access

Read-only

Syntax

```
SymbolContainer.Thresholds
```

See also

SymbolContainer (Page 5666)

HmiThresholdCollection (Page 5686)

HmiThresholdCollection

Description

The "HmiThresholdCollection" object is a list of all limit values ("Threshold" objects).

Use

The "HmiThresholdCollection" object is a list and can be counted and enumerated. You can access the "HmiThresholdCollection" list using the index or the tag name.

Object type

HmiThresholdCollection

Properties

The "HmiThresholdCollection" object has the following properties:

- **Count**
  Returns the number of limit values of the "HmiThresholdCollection" list.

Methods

The "HmiThresholdCollection" object has the following methods:

- **Item()**
  Returns a limit value of the "HmiThresholdCollection" list.

See also

SymbolContainer.Thresholds (Page 5686)

HmiThresholdCollection.Count

Description

The "Count" property returns the number of limit values in the "HmiThresholdCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiThresholdCollection.Count
```

See also

HmiThresholdCollection (Page 5686)

HmiThresholdCollection.Item()

Description

The "Item" method returns a limit value of the "HmiThresholdCollection" list.

Syntax

```
HmiThresholdCollection[.Item](HmiThresholdName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiThresholdCollection" object.

Parameters

`HmiThresholdName`

Type: String

Name of the limit value

Return value

Object, HmiThresholdPart (Page 5688)

See also

HmiThresholdCollection (Page 5686)

Threshold (Page 5688)

Threshold

Description

The "Threshold" object represents a limit value.

Object type

HmiThresholdPart

Properties

The "Threshold" object has the following properties:

- **Color**
  Specifies the color of the limit value.
- **DisplayName**
  Specifies the display name of the limit value.
- **Name**
  Specifies the name of the limit value.

- **ThresholdMode**
  Specifies the type of limit value.
- **Value**
  Returns the limit value.

Methods

--

See also

HmiThresholdCollection (Page 5686)

Threshold.Color

Description

The "Color" property specifies the color of the limit value.

Type

UInt32

Access

Read-write

Syntax

```
Threshold.Color
```

See also

Threshold (Page 5688)

Threshold.DisplayName

Description

The "DisplayName" property specifies the display name of the limit value.

Type

String

Access

Read-write

Syntax

```
Threshold.DisplayName
```

See also

Threshold (Page 5688)

Threshold.Name

Description

The "Name" property specifies the name of the limit value.

Type

String

Access

Read-write

Syntax

```
Threshold.Name
```

See also

Threshold (Page 5688)

Threshold.ThresholdMode

Description

The "ThresholdMode" property specifies the type of limit value.

Type

Int32, HmiThresholdMode

Specifies the threshold value:

- Undefined (0): Undefined
- Upper (1): Upper threshold

- Lower (2): Lower threshold
- Normal (3): Normal threshold
- Minimum (4): Minimum threshold
- Maximum (5): Maximum threshold

Access

Read-write

Syntax

```
Threshold.ThresholdMode
```

See also

Threshold (Page 5688)

Threshold.Value

Description

The "Value" property returns the limit value of the tag.

Type

Float

Access

Read-only

Syntax

```
Threshold.Value
```

See also

Threshold (Page 5688)

SymbolContainer.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
SymbolContainer.ToolTipText
```

See also

SymbolContainer (Page 5666)

SymbolContainer.Top

Description

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
SymbolContainer.Top
```

See also

SymbolContainer (Page 5666)

SymbolContainer.Visible

Description

The "Visible" property specifies whether the container is visible.

Type

Bool

Access

Read-write

Syntax

```
SymbolContainer.Visible
```

See also

SymbolContainer (Page 5666)

SymbolContainer.VisualizeQuality

Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

Type

Bool

Access

Read-write

Syntax

```
SymbolContainer.VisualizeQuality
```

See also

SymbolContainer (Page 5666)

SymbolContainer.Width

Description

The "Width" property specifies the width in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
SymbolContainer.Width
```

See also

SymbolContainer (Page 5666)

SymbolContainer.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the container.

Syntax

```
SymbolContainer.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

SymbolContainer (Page 5666)

SymbolContainer.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
SymbolContainer.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

SymbolContainer (Page 5666)

SymbolContainer_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A container is right-clicked.
- A container is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
SymbolContainer_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Container where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key

- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

SymbolContainer (Page 5666)

SymbolContainer_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the container is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
SymbolContainer_OnKeyDown(item, keyCode, modifiers)
```

Context

`item`

Type: Object

Container where the event occurs.

`keyCode`

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

`modifiers`

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

SymbolContainer (Page 5666)

SymbolContainer_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the container is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
SymbolContainer_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Container where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

SymbolContainer (Page 5666)

SymbolContainer_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A container type is left-clicked.
- The <RETURN> or <SPACE> key is pressed when an container has the focus.
- A container is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
SymbolContainer_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Container where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

SymbolContainer (Page 5666)

SymbolicIOField

Description

The "SymbolicIOField" object represents a symbolic I/O field for the input and display of text or graphic objects as a list in runtime.

Object type

HmiSymbolicIOField

Properties

The "SymbolicIOField" object has the following properties:

- **AcceptExplicitely**
  Specifies whether the process value is only written by explicit triggering of double-click, enter key, or tab.
- **AcceptOnDeactivated**
  Specifies whether the process value is written when the symbolic I/O field loses the input focus.
- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.

- **AutoTabOnAccept**
  Specifies whether a switch to the next object in the configured tab sequence occurs automatically after a value is entered.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the border color.
- **BorderWidth**
  Specifies the border thickness.
- **Content**
  Specifies the display options for text and graphics.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the symbolic I/O field.
- **Enabled**
  Specifies whether the symbolic I/O field can be operated in runtime.
- **ExpandOnActivate**
  Specifies whether the list drops down when the symbolic I/O field receives focus.
- **Font**
  Specifies the font of the text.
- **ForeColor**
  Specifies the font color of the text.
- **Graphic**
  Returns the graphic of the graphics list according to the process value.
- **Height**
  Specifies the height.
- **IOFieldType**
  Specifies the mode of the symbolic I/O field.
- **Layer**
  Returns the layer of the screen in which the symbolic I/O field is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the symbolic I/O field.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the symbolic I/O field is operable.
- **Padding**
  Specifies the distance of the content from the border of the symbolic I/O field.

- **Parent**
  Returns the higher-level screen object.
- **ProcessValue**
  Specifies the process value.
- **RenderingTemplate**
  Returns the name of the template from which the symbolic I/O field was created.
- **RequireExplicitUnlock**
  Returns whether the symbolic I/O field is only operable while the associated button is being pressed.
- **ResourceList**
  Specifies the text or graphics list.
- **RotationAngle**
  Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the symbolic I/O field rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **SelectedIndex**
  Specifies the index for the selected list entry.
- **SelectionBackColor**
  Specifies the background color of the selected list entry.
- **SelectionForeColor**
  Specifies the font color of the text of the selected list entry.
- **ShowFocusVisual**
  Specifies whether the symbolic I/O field is highlighted when in focus.
- **StyleItemClass**
  Returns the style which is applied to the symbolic I/O field.
- **TabIndex**
  Returns the position of the symbolic I/O field in the tab sequence.
- **Text**
  Returns the text of the text list according to the process value.
- **ToolTipText**
  Specifies the tooltip text.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the symbolic I/O field is visible.

- **VisualizeQuality**
  Specifies whether the connection quality of the process value is displayed.
- **Width**
  Specifies the width.

Methods

The "SymbolicIOField" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the symbolic I/O field.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "SymbolicIOField" object has the following events:

- **OnActivated()**
  Occurs when a symbolic I/O field receives focus.
- **OnContextTapped()**
  Occurs when a symbolic I/O field is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when a symbolic I/O field loses the focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the symbolic I/O field is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the symbolic I/O field is in focus.
- **OnTapped()**
  Occurs when a symbolic I/O field is left-clicked or short-touched.

SymbolicIOField.AcceptExplicitely

Description

The "AcceptExplicitely" property specifies whether the process value is only written by explicit triggering of double-click, Enter key, or tab.

Type

Bool

Access

Read-write

Syntax

```
SymbolicIOField.AcceptExplicitely
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.AcceptOnDeactivated

Description

The "AcceptOnDeactivated" property specifies whether the process value is written when the symbolic I/O field loses the input focus.

Type

Bool

Access

Read-write

Syntax

```
SymbolicIOField.AcceptOnDeactivated
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.AlternateBackColor

Description

The "AlternateBackColor" specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
SymbolicIOField.AlternateBackColor
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
SymbolicIOField.AlternateBorderColor
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
SymbolicIOField.Authorization
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.AutoTabOnAccept

Description

The "AutoTabOnAccept" property specifies whether a switch to the next object in the configured tab sequence occurs automatically after a value is entered.

Type

Bool

Access

Read-write

Syntax

```
SymbolicIOField.AutoTabOnAccept
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
SymbolicIOField.BackColor
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
SymbolicIOField.BorderColor
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
SymbolicIOField.BorderWidth
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.Content

Description

The "Content" property specifies the display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
SymbolicIOField.Content
```

See also

SymbolicIOField (Page 5701)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

SymbolicIOField.Content (Page 5709)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

SymbolicIOField.Content (Page 5709)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

SymbolicIOField.Content (Page 5709)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

SymbolicIOField.Content (Page 5709)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

SymbolicIOField.Content (Page 5709)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

SymbolicIOField.Content (Page 5709)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

SymbolicIOField.Content (Page 5709)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

SymbolicIOField.Content (Page 5709)

SymbolicIOField.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the symbolic I/O field.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
SymbolicIOField.CurrentQuality
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.Enabled

Description

The "Enabled" property specifies whether the symbolic I/O field can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
SymbolicIOField.Enabled
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.ExpandOnActivate

Description

The "ExpandOnActivate" property specifies whether the list drops down when the symbolic I/O field receives focus.

Type

Bool

Access

Read-write

Syntax

```
SymbolicIOField.ExpandOnActivate
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
SymbolicIOField.Font
```

See also

SymbolicIOField (Page 5701)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

SymbolicIOField.Font (Page 5716)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

SymbolicIOField.Font (Page 5716)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

SymbolicIOField.Font (Page 5716)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

SymbolicIOField.Font (Page 5716)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

SymbolicIOField.Font (Page 5716)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

SymbolicIOField.Font (Page 5716)

SymbolicIOField.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
SymbolicIOField.ForeColor
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.Graphic

Description

The "Graphic" property returns the graphic of the graphics list according to the process value.

Type

String

Access

Read-only

Syntax

```
SymbolicIOField.Graphic
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
SymbolicIOField.Height
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.IOFieldType

Description

The "IOFieldType" property specifies the mode of the symbolic I/O field.

Type

Int32, HmiIOFieldType

Specifies the type:

- Output (0): Output only
- InputOutput (2): Input and output

Access

Read-write

Syntax

```
SymbolicIOField.IOFieldType
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.Layer

Description

The "Layer" property returns the layer of the screen in which the symbolic I/O field is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
SymbolicIOField.Layer
```

See also

SymbolicIOField (Page 5701)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

SymbolicIOField.Layer (Page 5721)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

SymbolicIOField.Layer (Page 5721)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

SymbolicIOField.Layer (Page 5721)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

SymbolicIOField.Layer (Page 5721)

SymbolicIOField.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
SymbolicIOField.Left
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
SymbolicIOField.Margin
```

See also

SymbolicIOField (Page 5701)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

SymbolicIOField.Margin (Page 5724)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

SymbolicIOField.Margin (Page 5724)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

SymbolicIOField.Margin (Page 5724)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

SymbolicIOField.Margin (Page 5724)

SymbolicIOField.Name

Description

The "Name" property returns the name of the symbolic I/O field.

Type

String

Access

Read-only

Syntax

```
SymbolicIOField.Name
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.Opacity

Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

Type

Float

Access

Read-write

Syntax

```
SymbolicIOField.Opacity
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.Operability

Description

The "Operability" property returns whether the symbolic I/O field is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
SymbolicIOField.Operability
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.Padding

Description

The "Padding" property specifies the distance of the content from the border of the symbolic I/O field.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
SymbolicIOField.Padding
```

See also

SymbolicIOField (Page 5701)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

SymbolicIOField.Padding (Page 5728)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

SymbolicIOField.Padding (Page 5728)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

SymbolicIOField.Padding (Page 5728)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

SymbolicIOField.Padding (Page 5728)

SymbolicIOField.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
SymbolicIOField.Parent
```

See also

SymbolicIOField (Page 5701)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

SymbolicIOField.ProcessValue

Description

The "ProcessValue" property specifies the process value.

Type

Variant

Access

Read-write

Syntax

```
SymbolicIOField.ProcessValue
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the symbolic I/O field was created.

Type

String

Access

Read-only

Syntax

```
SymbolicIOField.RenderingTemplate
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the symbolic I/O field can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
SymbolicIOField.RequireExplicitUnlock
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.ResourceList

Description

The "ResourceList" property specifies the text or graphics list.

Type

String, HmiResourceList

Access

Read-write

Syntax

```
SymbolicIOField.ResourceList
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
SymbolicIOField.RotationAngle
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.RotationCenterPlacement (Page 5734)

SymbolicIOField.RotationCenterX (Page 5735)

SymbolicIOField.RotationCenterY (Page 5736)

SymbolicIOField.RotationCenterPlacement

Description

The "RotationCenterPlacement" property sets the reference point around which the symbolic I/O field rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
SymbolicIOField.RotationCenterPlacement
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.RotationAngle (Page 5734)

SymbolicIOField.RotationCenterX (Page 5735)

SymbolicIOField.RotationCenterY (Page 5736)

SymbolicIOField.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
SymbolicIOField.RotationCenterX
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.RotationAngle (Page 5734)

SymbolicIOField.RotationCenterPlacement (Page 5734)

SymbolicIOField.RotationCenterY (Page 5736)

SymbolicIOField.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
SymbolicIOField.RotationCenterY
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.RotationAngle (Page 5734)

SymbolicIOField.RotationCenterPlacement (Page 5734)

SymbolicIOField.RotationCenterX (Page 5735)

SymbolicIOField.SelectedIndex

Description

The "SelectedIndex" property specifies the index of the selected list entry. Returns the index according to the process value. The index is "-1", if no selection is available or the process value does not match.

Type

Int32

Access

Read-write

Syntax

```
SymbolicIOField.SelectedIndex
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.SelectionBackColor

Description

The "SelectionBackColor" property specifies the background color of the selected list entry

Type

UInt32

Access

Read-write

Syntax

```
SymbolicIOField.SelectionBackColor
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.SelectionForeColor

Description

The "SelectionForeColor" property specifies the font color of the text of the selected list entry.

Type

UInt32

Access

Read-write

Syntax

```
SymbolicIOField.SelectionForeColor
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the symbolic I/O field is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
SymbolicIOField.ShowFocusVisual
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the symbolic I/O field.

Type

String

Access

Read-only

Syntax

```
SymbolicIOField.StyleItemClass
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.TabIndex

Description

The "TabIndex" property returns the position of the symbolic I/O field in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
SymbolicIOField.TabIndex
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.Text

Description

The "Text" property returns the text of the text list according to the process value.

Type

String

Access

Read-only

Syntax

```
SymbolicIOField.Text
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
SymbolicIOField.ToolTipText
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
SymbolicIOField.Top
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.Visible

Description

The "Visible" property specifies whether the symbolic I/O field is visible.

Type

Bool

Access

Read-write

Syntax

```
SymbolicIOField.Visible
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.VisualizeQuality

Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

Type

Bool

Access

Read-write

Syntax

```
SymbolicIOField.VisualizeQuality
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
SymbolicIOField.Width
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the symbolic I/O field.

Syntax

```
SymbolicIOField.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

SymbolicIOField (Page 5701)

SymbolicIOField.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
SymbolicIOField.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

SymbolicIOField (Page 5701)

SymbolicIOField_OnActivated()

Description

The "OnActivated" event occurs when a symbolic I/O field receives focus:

- A symbolic I/O field is selected via the configured tab sequence.
- A symbolic I/O field that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
SymbolicIOField_OnActivated(item)
```

Context

item

Type: Object

Symbolic I/O field where the event occurs.

See also

SymbolicIOField (Page 5701)

SymbolicIOField_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A symbolic I/O field is right-clicked.
- A symbolic I/O field is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
SymbolicIOField_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Symbolic I/O field where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key

- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

SymbolicIOField (Page 5701)

SymbolicIOField_OnDeactivated()

Description

The "OnDeactivated" event occurs when the symbolic I/O field loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
SymbolicIOField_OnDeactivated(item)
```

Context

`item`

Type: Object

Symbolic I/O field where the event occurs.

See also

SymbolicIOField (Page 5701)

SymbolicIOField_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the symbolic I/O field is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
SymbolicIOField_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

Symbolic I/O field where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

SymbolicIOField (Page 5701)

SymbolicIOField_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the symbolic I/O field is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
SymbolicIOField_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Symbolic I/O field where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

SymbolicIOField (Page 5701)

SymbolicIOField_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A symbolic I/O field is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a symbolic I/O field has the focus.
- A symbolic I/O field is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
SymbolicIOField_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Symbolic I/O field where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

SymbolicIOField (Page 5701)

SystemDiagnosisControl

Description

The "SystemDiagnosisControl" object represents a system diagnostics control in runtime.

Object type

HmiSystemDiagnosisControl

Properties

The "SystemDiagnosisControl" object has the following properties:

- **BackColor**
  Specifies the background color.
- **Caption**
  Specifies the text to be displayed in the title bar.
- **CaptionColor**
  Specifies the background color of the title bar.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the system diagnostics control.
- **DiagnosisBufferPathText**
  Specifies the path to the diagnostic buffer.
- **DiagnosisOverviewPathText**
  Specifies the path to the diagnostics overview.
- **Enabled**
  Specifies whether the system diagnostics control can be operated in runtime.
- **Height**
  Specifies the height.
- **Icon**
  Specifies the icon of the system diagnostics control.
- **Layer**
  Returns the screen layer in which the system diagnostics control is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **MatrixView**
  Specifies the matrix view of the system diagnostics control.
- **Name**
  Returns the name of the system diagnostics control.
- **Parent**
  Returns the higher-level screen object.
- **RenderingTemplate**
  Returns the name of the template from which the system diagnostics control was created.
- **ShowFocusVisual**
  Specifies whether the system diagnostics control is highlighted when in focus.
- **ShowStatusPath**
  Specifies that the status path is displayed.

- **StatusBar**
  Specifies the information bar of the system diagnostics control.
- **StyleItemClass**
  Returns the style which is applied to the system diagnostics control.
- **SystemDiagnosisView**
  Specifies the table layout.
- **SystemDiagnosisViewType**
  Specifies the type of table layout.
- **TabIndex**
  Returns the position of the system diagnostics control in the tab sequence.
- **TimeZone**
  Specifies the time zone.
- **ToolBar**
  Specifies the toolbar of the system diagnostics control.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the system diagnostics control is visible.
- **Width**
  Specifies the width.
- **WindowFlags**
  Specifies the window configuration of the system diagnostics control.

Methods

The "SystemDiagnosisControl" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the system diagnostics control.
- **FireCommand()**
  Configures the occurrence of an event for an element.
- **GoToPlc()**
  Navigates to the next PLC.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "SystemDiagnosisControl" object has the following events:

- **OnActivated()**
  Occurs when a system diagnostics control receives focus.
- **OnCommandFired()**
  Occurs when the operator has operated an element in the toolbar or information bar of the system diagnostics control.

- **OnDeactivated()**
  Occurs when a system diagnostics control loses focus.
- **OnInitialized()**
  Occurs when a system diagnostics control has been successfully initialized and the data connection to the PLC has been established.

SystemDiagnosisControl.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
SystemDiagnosisControl.BackColor
```

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.Caption

Description

The "Caption" property specifies the text to be displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
SystemDiagnosisControl.Caption
```

See also

SystemDiagnosisControl (Page 5750)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

SystemDiagnosisControl.Caption (Page 5753)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 5754)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 5754)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 5754)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 5754)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 5754)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 5754)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

SystemDiagnosisControl.Caption (Page 5753)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

SystemDiagnosisControl.Caption (Page 5753)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

SystemDiagnosisControl.Caption (Page 5753)

SystemDiagnosisControl.CaptionColor

Description

The "CaptionColor" property specifies the background color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
SystemDiagnosisControl.CaptionColor
```

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the system diagnostics control.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
SystemDiagnosisControl.CurrentQuality
```

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.DiagnosisBufferPathText

Description

The "DiagnosisBufferPathText" property specifies the path to the diagnostic buffer.

Type

String

Access

Read-write

Syntax

```
SystemDiagnosisControl.DiagnosisBufferPathText
```

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.DiagnosisOverviewPathText

Description

The "DiagnosisOverviewPathText" property specifies the path to the diagnostics overview.

Type

String

Access

Read-write

Syntax

```
SystemDiagnosisControl.DiagnosisOverviewPathText
```

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.Enabled

Description

The "Enabled" property specifies whether the system diagnostics control can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
SystemDiagnosisControl.Enabled
```

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.Height

Description

The "Height" property specifies the height.

Type

UInt32

Access

Read-write

Syntax

```
SystemDiagnosisControl.Height
```

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.Icon

Description

The "Icon" property specifies the icon of the system diagnostics control.

Type

String

Access

Read-write

Syntax

```
SystemDiagnosisControl.Icon
```

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.Layer

Description

The "Layer" property returns the screen layer in which the system diagnostics control is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
SystemDiagnosisControl.Layer
```

See also

SystemDiagnosisControl (Page 5750)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

SystemDiagnosisControl.Layer (Page 5763)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

SystemDiagnosisControl.Layer (Page 5763)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

SystemDiagnosisControl.Layer (Page 5763)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

SystemDiagnosisControl.Layer (Page 5763)

SystemDiagnosisControl.Left

Description

The "Left" property specifies the value of the X coordinate.

Type

Int32

Access

Read-write

Syntax

```
SystemDiagnosisControl.Left
```

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
SystemDiagnosisControl.Margin
```

See also

SystemDiagnosisControl (Page 5750)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

SystemDiagnosisControl.Margin (Page 5766)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

SystemDiagnosisControl.Margin (Page 5766)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

SystemDiagnosisControl.Margin (Page 5766)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

SystemDiagnosisControl.Margin (Page 5766)

SystemDiagnosisControl.MatrixView

Description

The "MatrixView" property specifies the matrix view of the system diagnostics control.

Type

Object, HmiMatrixViewPart

Access

Read-write

Syntax

```
SystemDiagnosisControl.MatrixView
```

See also

SystemDiagnosisControl (Page 5750)

MatrixView.TileBorderWidth

Description

The "TileBorderWidth" property specifies the border width of the tile.

Type

UInt8

Access

Read-write

Syntax

```
MatrixView.TileBorderWidth
```

See also

SystemDiagnosisControl.MatrixView (Page 5768)

MatrixView.TileHeightMax

Description

The "TileHeightMax" property specifies the maximum height of the tile.

Type

UInt16

Access

Read-write

Syntax

```
MatrixView.TileHeightMax
```

See also

SystemDiagnosisControl.MatrixView (Page 5768)

MatrixView.TileHeightMin

Description

The "TileHeightMin" property specifies the minimum height of the tile.

Type

UInt16

Access

Read-write

Syntax

```
MatrixView.TileHeightMin
```

See also

SystemDiagnosisControl.MatrixView (Page 5768)

MatrixView.TileWidthMax

Description

The "TileWidthMax" property specifies the maximum width of the tile.

Type

UInt16

Access

Read-write

Syntax

```
MatrixView.TileWidthMax
```

See also

SystemDiagnosisControl.MatrixView (Page 5768)

MatrixView.TileWidthMin

Description

The "TileWidthMin" property specifies the minimum width of the tile.

Type

UInt16

Access

Read-write

Syntax

```
MatrixView.TileWidthMin
```

See also

SystemDiagnosisControl.MatrixView (Page 5768)

MatrixView.HardwareDetails

Description

The "HardwareDetails" property returns a list of the HMI device hardware details.

Type

Object, HmiSystemDiagnosisHardwareDetailCollection (Page 5772)

Access

Read-only

Syntax

```
MatrixView.HardwareDetails
```

See also

SystemDiagnosisControl.MatrixView (Page 5768)

HmiSystemDiagnosisHardwareDetailCollection (Page 5772)

HmiSystemDiagnosisHardwareDetailCollection

Description

The "HmiSystemDiagnosisHardwareDetailCollection" object is a list of all hardware details ("HmiSystemDiagnosisHardwareDetailPart" objects) of the HMI device on which the system diagnostics were activated.

You can reference the "HmiSystemDiagnosisHardwareDetailCollection" object via the "`MatrixView.HardwareDetails`" property.

Use

The "HmiSystemDiagnosisHardwareDetailCollection" object is a list which can be counted and enumerated. You can access the "HmiSystemDiagnosisHardwareDetailCollection" list using the index or the tag names.

Object type

HmiSystemDiagnosisHardwareDetailCollection

Properties

The "HmiSystemDiagnosisHardwareDetailCollection" object has the following properties:

- **Count**
  Returns the number of hardware details of the "HmiSystemDiagnosisHardwareDetailCollection" list.

Methods

The "HmiSystemDiagnosisHardwareDetailCollection" object has the following methods:

- **Item()**
  Returns the name of a hardware detail.

See also

MatrixView.HardwareDetails (Page 5771)

SystemDiagnosisControl.MatrixView (Page 5768)

HmiSystemDiagnosisHardwareDetailCollection.Count

Description

The "Count" property returns the number of hardware details of the "HmiSystemDiagnosisHardwareDetailCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiSystemDiagnosisHardwareDetailCollection.Count
```

See also

HmiSystemDiagnosisHardwareDetailCollection (Page 5772)

MatrixView.HardwareDetails (Page 5771)

HmiSystemDiagnosisHardwareDetailCollection.Item()

Description

The "Item" method returns a hardware detail of the "HmiSystemDiagnosisHardwareDetailCollection" list.

Syntax

```
HmiSystemDiagnosisHardwareDetailCollection[.Item]
(HmiSystemDiagnosisHardwareDetailName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiSystemDiagnosisHardwareDetailCollection" object.

Parameters

HmiSystemDiagnosisHardwareDetailName

Type: String

Name of a hardware detail

Return value

Object, HmiSystemDiagnosisHardwareDetailPart (Page 5774)

See also

HmiSystemDiagnosisHardwareDetailCollection (Page 5772)

SystemDiagnosisHardwareDetail (Page 5774)

SystemDiagnosisHardwareDetail

Description

The "SystemDiagnosisHardwareDetail" object represents a hardware detail.

Object type

HmiSystemDiagnosisHardwareDetailPart

Properties

The "SystemDiagnosisHardwareDetail" object has the following properties:

- **SystemDiagnosisMatrixBlock**
  Sets the matrix block of the system diagnostics control.
- **Visible**
  Specifies whether the hardware detail is visible.

Methods

--

See also

HmiSystemDiagnosisHardwareDetailCollection (Page 5772)

MatrixView.HardwareDetails (Page 5771)

SystemDiagnosisHardwareDetail.SystemDiagnosisMatrixBlock

Description

The "SystemDiagnosisMatrixBlock" property specifies the matrix block of a hardware detail.

Type

Int32, HmiSystemDiagnosisMatrixBlock

Specifies the type of matrix block.

- Undefined (0): None
- Status (1): Status

- Name (2): Name
- OperatingState (3): Operating state
- Rack (4): Rack
- Slot (5): Slot
- OrderNumber (6): Order number
- Address (7): Address
- PlantDesignation (8): Plant Designation
- LocationIdentifier (9): Location identifier
- Subsystem (10): Subsystem
- Station (11): Station
- Subslot (12): Subslot
- SubAddress (13): Subaddress
- SoftwareVersion (14): Software Version
- Installation (15): Installation
- AdditionalInformation (16): Additional information
- ErrorDescription (17): Error description
- ManufacturerID (18): Manufacturer ID
- HardwareVersion (19): Hardware version
- ProfileID (20): Profile ID
- SpecificProfileData (21): Specific profile data
- IandMDataVersion (22): I and M Data Version
- SerialNumber (23): Serial number
- RevisionCounter (24): Version counter
- Type (25): Type
- IPAddress (32): IP addresses

Access

Read-write

Syntax

```
SystemDiagnosisHardwareDetail.SystemDiagnosisMatrixBlock
```

See also

SystemDiagnosisHardwareDetail (Page 5774)

HmiSystemDiagnosisHardwareDetailCollection (Page 5772)

SystemDiagnosisHardwareDetail.Visible

Description

The "Visible" property specifies whether the hardware detail is visible.

Type

Bool

Access

Read-write

Syntax

```
SystemDiagnosisHardwareDetail.Visible
```

See also

SystemDiagnosisHardwareDetail (Page 5774)
HmiSystemDiagnosisHardwareDetailCollection (Page 5772)

MatrixView.SystemDiagnosisHardwareDetailView

Description

The "SystemDiagnosisHardwareDetailView" property specifies the view of the hardware detail.

Type

Object, HmiSystemDiagnosisDetailViewPart

Access

Read-write

Syntax

```
MatrixView.SystemDiagnosisHardwareDetailView
```

See also

SystemDiagnosisControl.MatrixView (Page 5768)
SystemDiagnosisControl (Page 5750)

SystemDiagnosisDetailView.AllowFilter

Description

The "AllowFilter" property specifies whether filtering of columns is permitted.

Type

Bool

Access

Read-write

Syntax

```
SystemDiagnosisDetailView.AllowFilter
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

SystemDiagnosisDetailView.AllowSort

Description

The "AllowSort" property specifies whether the sorting of columns is permitted.

- True: Activates the sorting and sets the "AllowSort" property of all columns to "True".
- False: Disables the sorting for all columns. The individual column properties remain unchanged.

Type

Bool

Access

Read-write

Syntax

```
SystemDiagnosisDetailView.AllowSort
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

SystemDiagnosisDetailView.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
SystemDiagnosisDetailView.AlternateBackColor
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

SystemDiagnosisDetailView.AlternateForeColor

Description

The "AlternateForeColor" property specifies the second foreground color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
SystemDiagnosisDetailView.AlternateForeColor
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

SystemDiagnosisDetailView.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
SystemDiagnosisDetailView.BackColor
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

SystemDiagnosisDetailView.CellPadding

Description

The "CellPadding" property specifies the inner spacing of the content from the cell border.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
SystemDiagnosisDetailView.CellPadding
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

SystemDiagnosisDetailView.CellPadding (Page 5779)
MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

SystemDiagnosisDetailView.CellPadding (Page 5779)
MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

SystemDiagnosisDetailView.CellPadding (Page 5779)
MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

SystemDiagnosisDetailView.CellPadding (Page 5779)

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

SystemDiagnosisDetailView.ColoringMode

Description

The "ColoringMode" property specifies whether alternate coloring of every other row or column is enabled.

Type

Int32, HmiGridColoringMode

Specifies the type of the coloring:

- None (0): None
- Columns (1): Color the columns alternately.
- Rows (2): Color the rows alternately.

Access

Read-write

Syntax

```
SystemDiagnosisDetailView.ColoringMode
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

SystemDiagnosisDetailView.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
SystemDiagnosisDetailView.Font
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

SystemDiagnosisDetailView.Font (Page 5782)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

SystemDiagnosisDetailView.Font (Page 5782)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

SystemDiagnosisDetailView.Font (Page 5782)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

SystemDiagnosisDetailView.Font (Page 5782)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

SystemDiagnosisDetailView.Font (Page 5782)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

SystemDiagnosisDetailView.Font (Page 5782)

SystemDiagnosisDetailView.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
SystemDiagnosisDetailView.ForeColor
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

SystemDiagnosisDetailView.GridLineColor

Description

The "GridLineColor" property specifies the color of grid lines.

Type

UInt32

Access

Read-write

Syntax

```
SystemDiagnosisDetailView.GridLineColor
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

SystemDiagnosisDetailView.GridLineVisibility

Description

The "GridLineVisibility" property specifies whether the grid lines are visible.

Type

Int32, HmiSimpleGridLine

Specifies the visibility of the grid lines:

- None (0): None
- Vertikal (1): Vertical grid lines visible
- Horizontal (2): Horizontal grid lines visible

Access

Read-write

Syntax

```
SystemDiagnosisDetailView.GridLineVisibility
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

SystemDiagnosisDetailView.GridLineWidth

Description

The "GridLineWidth" property specifies the thickness of the grid lines in pixels.

Type

UInt8

Access

Read-write

Syntax

```
SystemDiagnosisDetailView.GridLineWidth
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

SystemDiagnosisDetailView.GridSelectionMode

Description

The "GridSelectionMode" property specifies whether multiple selection is enabled in the table content.

Type

Int32, HmiGridSelectionMode

Specifies the type of the selection:

- None (0): None
- Single (1): Only single selection
- Multi (2): Multiple selection

Access

Read-write

Syntax

```
SystemDiagnosisDetailView.GridSelectionMode
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

SystemDiagnosisDetailView.HardwareDetails

Description

The "HardwareDetails" property returns a list of all hardware details.

Type

Object, HmiSystemDiagnosisHardwareDetailCollection (Page 5789)

Access

Read-only

Syntax

```
SystemDiagnosisDetailView.HardwareDetails
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

HmiSystemDiagnosisHardwareDetailCollection (Page 5789)

HmiSystemDiagnosisHardwareDetailCollection

Description

The "HmiSystemDiagnosisHardwareDetailCollection" object is a list of all hardware details ("HmiSystemDiagnosisHardwareDetailPart" objects) of the HMI device on which the system diagnostics were activated.

You can reference the "HmiSystemDiagnosisHardwareDetailCollection" object via the "`SystemDiagnosisDetailView.HardwareDetails`" property.

Use

The "HmiSystemDiagnosisHardwareDetailCollection" object is a list which can be counted and enumerated. You can access the "HmiSystemDiagnosisHardwareDetailCollection" list using the index or the tag names.

Object type

HmiSystemDiagnosisHardwareDetailCollection

Properties

The "HmiSystemDiagnosisHardwareDetailCollection" object has the following properties:

- **Count**
  Returns the number of hardware details of the "HmiSystemDiagnosisHardwareDetailCollection" list.

Methods

The "HmiSystemDiagnosisHardwareDetailCollection" object has the following methods:

- **Item()**
  Returns the name of a hardware detail.

See also

SystemDiagnosisDetailView.HardwareDetails (Page 5789)

HmiSystemDiagnosisHardwareDetailCollection.Count

Description

The "Count" property returns the number of hardware details of the "HmiSystemDiagnosisHardwareDetailCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiSystemDiagnosisHardwareDetailCollection.Count
```

See also

HmiSystemDiagnosisHardwareDetailCollection (Page 5789)

HmiSystemDiagnosisHardwareDetailCollection.Item()

Description

The "Item" method returns a hardware detail of the "HmiSystemDiagnosisHardwareDetailCollection" list.

Syntax

```
HmiSystemDiagnosisHardwareDetailCollection[.Item]
(HmiSystemDiagnosisHardwareDetailName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiSystemDiagnosisHardwareDetailCollection" object.

Parameters

HmiSystemDiagnosisHardwareDetailName

Type: String

Name of a hardware detail

Return value

Object, HmiSystemDiagnosisHardwareDetailPart (Page 5791)

See also

HmiSystemDiagnosisHardwareDetailCollection (Page 5789)

SystemDiagnosisHardwareDetail (Page 5791)

SystemDiagnosisHardwareDetail

Description

SystemDiagnosisHardwareDetail (Page 5774)

SystemDiagnosisDetailView.HeaderSettings

Description

The "HeaderSettings" property specifies the settings for all column headers in the table.

Type

Object, HmiDataGridHeaderSettingsPart

Access

Read-write

Syntax

```
SystemDiagnosisDetailView.HeaderSettings
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

DataGridHeaderSettings.AllowColumnReorder

Description

The "AllowColumnReorder" property specifies whether the order of the columns can be changed.

Type

Bool

Access

Read-write

Syntax

```
DataGridHeaderSettings.AllowColumnReorder
```

See also

SystemDiagnosisDetailView.HeaderSettings (Page 5791)

DataGridHeaderSettings.AllowColumnResize

Description

The "AllowColumnResize" property specifies whether the width of the columns can be changed.

Type

Bool

Access

Read-write

Syntax

```
DataGridHeaderSettings.AllowColumnResize
```

See also

SystemDiagnosisDetailView.HeaderSettings (Page 5791)

DataGridHeaderSettings.ColumnHeaderType

Description

The "ColumnHeaderType" property specifies the type of content of a column header.

Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

Access

Read-write

Syntax

```
DataGridHeaderSettings.ColumnHeaderType
```

See also

SystemDiagnosisDetailView.HeaderSettings (Page 5791)

DataGridHeaderSettings.Font

Description

The "Font" property specifies the font of the headers.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
DataGridHeaderSettings.Font
```

See also

SystemDiagnosisDetailView.HeaderSettings (Page 5791)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

DataGridHeaderSettings.Font (Page 5794)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

DataGridHeaderSettings.Font (Page 5794)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

DataGridHeaderSettings.Font (Page 5794)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

DataGridHeaderSettings.Font (Page 5794)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

DataGridHeaderSettings.Font (Page 5794)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

DataGridHeaderSettings.Font (Page 5794)

DataGridHeaderSettings.HeaderBackColor

Description

The "HeaderBackColor" property specifies the background color of the header.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderBackColor
```

See also

SystemDiagnosisDetailView.HeaderSettings (Page 5791)

DataGridHeaderSettings.HeaderForeColor

Description

The "HeaderForeColor" property specifies the font color of the headers.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderForeColor
```

See also

SystemDiagnosisDetailView.HeaderSettings (Page 5791)

DataGridHeaderSettings.HeaderGridLineColor

Description

The "HeaderGridLineColor" property specifies the color of the separation line between column headers.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderGridLineColor
```

See also

SystemDiagnosisDetailView.HeaderSettings (Page 5791)

DataGridHeaderSettings.HeaderSelectionBackColor

Description

The "HeaderSelectionBackColor" property specifies the background color of the header of a selected line or column.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderSelectionBackColor
```

See also

SystemDiagnosisDetailView.HeaderSettings (Page 5791)

DataGridHeaderSettings.HeaderSelectionForeColor

Description

The "HeaderSelectionForeColor" property specifies the font color of the header of a selected line or column.

Type

UInt32

Access

Read-write

Syntax

```
Object.HeaderSelectionForeColor
```

`Object`

Required. An object from the "Availability" section.

See also

SystemDiagnosisDetailView.HeaderSettings (Page 5791)

DataGridHeaderSettings.RowHeaderType

Description

The "RowHeaderType" property specifies the type of content of a row header.

Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

Access

Read-write

Syntax

```
DataGridHeaderSettings.RowHeaderType
```

See also

SystemDiagnosisDetailView.HeaderSettings (Page 5791)

SystemDiagnosisDetailView.HorizontalScrollBarVisibility

Description

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar of the display.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
SystemDiagnosisDetailView.HorizontalScrollBarVisibility
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

SystemDiagnosisDetailView.RowHeight

Description

The "RowHeight" property specifies the height of all rows in the table in DIU (Device Independent Unit).

"0" corresponds to a automatic mechanism, which adjusts the height of each line according to the font size and number of paragraphs.

Type

UInt8

Access

Read-write

Syntax

```
SystemDiagnosisDetailView.RowHeight
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

SystemDiagnosisDetailView.SelectFullRow

Description

The "SelectFullRow" property specifies whether only the cell or the entire row is included in the selection.

Type

Bool

Access

Read-write

Syntax

```
SystemDiagnosisDetailView.SelectFullRow
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

SystemDiagnosisDetailView.SelectionBackColor

Description

The "SelectionBackColor" property specifies the background color of the selected cells.

Type

UInt32

Access

Read-write

Syntax

```
SystemDiagnosisDetailView.SelectionBackColor
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

SystemDiagnosisDetailView.SelectionBorderColor

Description

The "SelectionBorderColor" property specifies the border color of the selected cells.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.SelectionBorderColor
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

SystemDiagnosisDetailView.SelectionBorderWidth

Description

The "SelectionBorderWidth" property specifies the border width of the selected cells.

Type

UInt8

Access

Read-write

Syntax

```
SystemDiagnosisDetailView.SelectionBorderWidth
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

SystemDiagnosisDetailView.SelectionForeColor

Description

The "SelectionForeColor" property specifies the font color of the selected cells.

Type

UInt32

Access

Read-write

Syntax

```
SystemDiagnosisDetailView.SelectionForeColor
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

SystemDiagnosisDetailView.VerticalScrollBarVisibility

Description

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the display.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
SystemDiagnosisDetailView.VerticalScrollBarVisibility
```

See also

MatrixView.SystemDiagnosisHardwareDetailView (Page 5776)

SystemDiagnosisControl.Name

Description

The "Name" property returns the name of the system diagnostics control.

Type

String

Access

Read-only

Syntax

```
SystemDiagnosisControl.Name
```

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 5750)

Access

Read-only

Syntax

```
SystemDiagnosisControl.Parent
```

See also

SystemDiagnosisControl (Page 5750)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

SystemDiagnosisControl.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the system diagnostics control was created.

Type

String

Access

Read-only

Syntax

```
SystemDiagnosisControl.RenderingTemplate
```

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the system diagnostics control is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
SystemDiagnosisControl.ShowFocusVisual
```

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.ShowStatusPath

Description

The "ShowStatusPath" property specifies that the status path is displayed.

Type

Bool

Access

Read-write

Syntax

```
SystemDiagnosisControl.ShowStatusPath
```

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.StatusBar

Description

The "StatusBar" property specifies the information bar.

Type

Object, HmiStatusBarPart

Access

Read-write

Syntax

```
SystemDiagnosisControl.StatusBar
```

See also

SystemDiagnosisControl (Page 5750)

StatusBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
StatusBar.BackColor
```

See also

SystemDiagnosisControl.StatusBar (Page 5808)

StatusBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

Type

Object, HmiControlBarElementCollection (Page 5809)

Access

Read-only

Syntax

```
StatusBar.Elements
```

See also

SystemDiagnosisControl.StatusBar (Page 5808)

HmiControlBarElementCollection (Page 5809)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

StatusBar.Elements (Page 5809)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 5809)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 5811)

See also

HmiControlBarElementCollection (Page 5809)

Control Bar Elements (Page 5811)

Control Bar Elements

ControlBarButton

Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarButtonPart

Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the label of the button.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the button can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the button.
- **Mapping**
  Returns the function of the button.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.

- **Operability**
  Returns whether the button is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the button is visible.
- **Width**
  Specifies the width.

Methods

--

See also

HmiControlBarElementCollection (Page 5809)

ControlBarButton.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBackColor
```

See also

ControlBarButton (Page 5811)

ControlBarButton.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBorderColor
```

See also

ControlBarButton (Page 5811)

ControlBarButton.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarButton.Authorization
```

See also

ControlBarButton (Page 5811)

ControlBarButton.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BackColor
```

See also

ControlBarButton (Page 5811)

ControlBarButton.Badge

Description

The "Badge" property specifies the label of the button.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarButton.Badge
```

See also

ControlBarButton (Page 5811)

ControlBarButton.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BorderColor
```

See also

ControlBarButton (Page 5811)

ControlBarButton.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarButton.BorderWidth
```

See also

ControlBarButton (Page 5811)

ControlBarButton.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarButton.Content
```

See also

ControlBarButton (Page 5811)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarButton.Content (Page 5817)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarButton.Content (Page 5817)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarButton.Content (Page 5817)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarButton.Content (Page 5817)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarButton.Content (Page 5817)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarButton.Content (Page 5817)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarButton.Content (Page 5817)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarButton.Content (Page 5817)

ControlBarButton.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarButton.CustomID
```

See also

ControlBarButton (Page 5811)

ControlBarButton.Enabled

Description

The "Enabled" property specifies whether the button can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Enabled
```

See also

ControlBarButton (Page 5811)

ControlBarButton.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.ForeColor
```

See also

ControlBarButton (Page 5811)

ControlBarButton.Graphic

Description

The "Graphic" property specifies the graphic of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Graphic
```

See also

ControlBarButton (Page 5811)

ControlBarButton.Height

Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Height
```

See also

ControlBarButton (Page 5811)

ControlBarButton.HotKey

Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
ControlBarButton.HotKey
```

See also

ControlBarButton (Page 5811)

ControlBarButton.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent

- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms

- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarButton.Mapping
```

See also

ControlBarButton (Page 5811)

ControlBarButton.Margin

Description

The "Margin" property specifies the surrounded outer distance of the button.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarButton.Margin
```

See also

ControlBarButton (Page 5811)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarButton.Margin (Page 5827)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarButton.Margin (Page 5827)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarButton.Margin (Page 5827)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarButton.Margin (Page 5827)

ControlBarButton.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumHeight
```

See also

ControlBarButton (Page 5811)

ControlBarButton.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumWidth
```

See also

ControlBarButton (Page 5811)

ControlBarButton.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumHeight
```

See also

ControlBarButton (Page 5811)

ControlBarButton.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumWidth
```

See also

ControlBarButton (Page 5811)

ControlBarButton.Operability

Description

The "Operability" property returns whether the button is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarButton.Operability
```

See also

ControlBarButton (Page 5811)

ControlBarButton.Padding

Description

The "Padding" property specifies the distance of the content from the border of the button.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarButton.Padding
```

See also

ControlBarButton (Page 5811)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarButton.Padding (Page 5832)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarButton.Padding (Page 5832)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarButton.Padding (Page 5832)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarButton.Padding (Page 5832)

ControlBarButton.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarButton.RequireExplicitUnlock
```

See also

ControlBarButton (Page 5811)

ControlBarButton.Text

Description

The "Text" property specifies the label of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Text
```

See also

ControlBarButton (Page 5811)

ControlBarButton.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.ToolTipText
```

See also

ControlBarButton (Page 5811)

ControlBarButton.Visible

Description

The "Visible" property specifies whether the button is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Visible
```

See also

ControlBarButton (Page 5811)

ControlBarButton.Width

Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Width
```

See also

ControlBarButton (Page 5811)

ControlBarDisplay

Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarDisplayPart

Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the display area is enabled in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the display area.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the display area is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.

- **Visible**
  Specifies whether the display area is visible.
- **Width**
  Specifies the width.

Methods

--

HmiControlBarElementCollection (Page 5809)

ControlBarDisplay.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarDislay.Authorization
```

See also

ControlBarDisplay (Page 5837)

ControlBarDisplay.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarDislay.Content
```

See also

ControlBarDisplay (Page 5837)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarDisplay.Content (Page 5839)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarDisplay.Content (Page 5839)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarDisplay.Content (Page 5839)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarDisplay.Content (Page 5839)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarDisplay.Content (Page 5839)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarDisplay.Content (Page 5839)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarDisplay.Content (Page 5839)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarDisplay.Content (Page 5839)

ControlBarDisplay.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarDislay.CustomID
```

See also

ControlBarDisplay (Page 5837)

ControlBarDisplay.Enabled

Description

The "Enabled" property specifies whether the display is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Enabled
```

See also

ControlBarDisplay (Page 5837)

ControlBarDisplay.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.ForeColor
```

See also

ControlBarDisplay (Page 5837)

ControlBarDisplay.Graphic

Description

The "Graphic" property specifies the graphic of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Graphic
```

See also

ControlBarDisplay (Page 5837)

ControlBarDisplay.Height

Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Height
```

See also

ControlBarDisplay (Page 5837)

ControlBarDisplay.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment

- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms

- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarDislay.Mapping
```

See also

ControlBarDisplay (Page 5837)

ControlBarDisplay.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the display.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarDislay.Margin
```

See also

ControlBarDisplay (Page 5837)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarDisplay.Margin (Page 5849)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarDisplay.Margin (Page 5849)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarDisplay.Margin (Page 5849)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarDisplay.Margin (Page 5849)

ControlBarDisplay.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumHeight
```

See also

ControlBarDisplay (Page 5837)

ControlBarDisplay.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumWidth
```

See also

ControlBarDisplay (Page 5837)

ControlBarDisplay.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumHeight
```

See also

ControlBarDisplay (Page 5837)

ControlBarDisplay.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumWidth
```

See also

ControlBarDisplay (Page 5837)

ControlBarDisplay.Operability

Description

The "Operability" property returns whether the display is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarDislay.Operability
```

See also

ControlBarDisplay (Page 5837)

ControlBarDisplay.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the display.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarDislay.Padding
```

See also

ControlBarDisplay (Page 5837)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarDisplay.Padding (Page 5854)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarDisplay.Padding (Page 5854)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarDisplay.Padding (Page 5854)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarDisplay.Padding (Page 5854)

ControlBarDisplay.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarDislay.RequireExplicitUnlock
```

See also

ControlBarDisplay (Page 5837)

ControlBarDisplay.Text

Description

The "Text" property specifies the label of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Text
```

See also

ControlBarDisplay (Page 5837)

ControlBarDisplay.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.ToolTipText
```

See also

ControlBarDisplay (Page 5837)

ControlBarDisplay.Visible

Description

The "Visible" property specifies whether the display is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Visible
```

See also

ControlBarDisplay (Page 5837)

ControlBarDisplay.Width

Description

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Width
```

See also

ControlBarDisplay (Page 5837)

ControlBarLabel

Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar.

You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarLabelPart

Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the identifier can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the identifier.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the identifier is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.

- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the identifier is visible.
- **Width**
  Specifies the width.

ControlBarLabel.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarLabel.Authorization
```

See also

ControlBarLabel (Page 5859)

ControlBarLabel.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarLabel.CustomID
```

See also

ControlBarLabel (Page 5859)

ControlBarLabel.Enabled

Description

The "Enabled" property specifies whether the identifier is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Enabled
```

See also

ControlBarLabel (Page 5859)

ControlBarLabel.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.ForeColor
```

See also

ControlBarLabel (Page 5859)

ControlBarLabel.Height

Description

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Height
```

See also

ControlBarLabel (Page 5859)

ControlBarLabel.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

See also

ControlBarLabel (Page 5859)

ControlBarLabel.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarLabel.Mapping
```

ControlBarLabel.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarLabel.Margin
```

See also

ControlBarLabel (Page 5859)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarLabel.Margin (Page 5866)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarLabel.Margin (Page 5866)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarLabel.Margin (Page 5866)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarLabel.Margin (Page 5866)

ControlBarLabel.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumHeight
```

See also

ControlBarLabel (Page 5859)

ControlBarLabel.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumWidth
```

See also

ControlBarLabel (Page 5859)

ControlBarLabel.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumHeight
```

See also

ControlBarLabel (Page 5859)

ControlBarLabel.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumWidth
```

See also

ControlBarLabel (Page 5859)

ControlBarLabel.Operability

Description

The "Operability" property returns whether the identifier is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarLabel.Operability
```

See also

ControlBarLabel (Page 5859)

ControlBarLabel.Padding

Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarLabel.Padding
```

See also

ControlBarLabel (Page 5859)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarLabel.Padding (Page 5871)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarLabel.Padding (Page 5871)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarLabel.Padding (Page 5871)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarLabel.Padding (Page 5871)

ControlBarLabel.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarLabel.RequireExplicitUnlock
```

See also

ControlBarLabel (Page 5859)

ControlBarLabel.Text

Description

The "Text" property specifies the label of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.Text
```

See also

ControlBarLabel (Page 5859)

ControlBarLabel.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.ToolTipText
```

See also

ControlBarLabel (Page 5859)

ControlBarLabel.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.VerticalTextAlignment
```

See also

ControlBarLabel (Page 5859)

ControlBarLabel.Visible

Description

The "Visible" property specifies whether the identifier is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Visible
```

See also

ControlBarLabel (Page 5859)

ControlBarLabel.Width

Description

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Width
```

See also

ControlBarLabel (Page 5859)

ControlBarSeparator

Description

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarSeparatorPart

Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the disconnector can be operated in runtime.
- **ForeColor**
  Specifies the font color.

- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the separator.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the separator is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the disconnector is only operable while the associated button is being pressed.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the disconnector is visible.
- **Width**
  Specifies the width.

Methods

HmiControlBarElementCollection (Page 5809)

ControlBarSeparator.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarSeparator.Authorization
```

See also

ControlBarSeparator (Page 5877)

ControlBarSeparator.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarSeparator.CustomID
```

See also

ControlBarSeparator (Page 5877)

ControlBarSeparator.Enabled

Description

The "Enabled" property specifies whether the separator is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Enabled
```

See also

ControlBarSeparator (Page 5877)

ControlBarSeparator.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.ForeColor
```

See also

ControlBarSeparator (Page 5877)

ControlBarSeparator.Height

Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Height
```

See also

ControlBarSeparator (Page 5877)

ControlBarSeparator.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line

- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time

- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarSeparator.Mapping
```

See also

ControlBarSeparator (Page 5877)

ControlBarSeparator.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the separator.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarSeparator.Margin
```

See also

ControlBarSeparator (Page 5877)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarSeparator.Margin (Page 5883)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarSeparator.Margin (Page 5883)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarSeparator.Margin (Page 5883)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarSeparator.Margin (Page 5883)

ControlBarSeparator.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumHeight
```

See also

ControlBarSeparator (Page 5877)

ControlBarSeparator.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumWidth
```

See also

ControlBarSeparator (Page 5877)

ControlBarSeparator.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumHeight
```

See also

ControlBarSeparator (Page 5877)

ControlBarSeparator.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumWidth
```

See also

ControlBarSeparator (Page 5877)

ControlBarSeparator.Operability

Description

The "Operability" property returns whether the separator is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarSeparator.Operability
```

See also

ControlBarSeparator (Page 5877)

ControlBarSeparator.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the separator.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarSeparator.Padding
```

See also

ControlBarSeparator (Page 5877)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarSeparator.Padding (Page 5888)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarSeparator.Padding (Page 5888)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarSeparator.Padding (Page 5888)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarSeparator.Padding (Page 5888)

ControlBarSeparator.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the disconnector can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarSeparator.RequireExplicitUnlock
```

See also

ControlBarSeparator (Page 5877)

ControlBarSeparator.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

Type

String

Access

Read-write

Syntax

```
ControlBarSeparator.ToolTipText
```

See also

ControlBarSeparator (Page 5877)

ControlBarSeparator.Visible

Description

The "Visible" property specifies whether the separator is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Visible
```

See also

ControlBarSeparator (Page 5877)

ControlBarSeparator.Width

Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Width
```

See also

ControlBarSeparator (Page 5877)

ControlBarTextBox

Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarTextBoxPart

Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the text box can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Mapping**
  Returns the function of the text box.
- **Margin**
  Specifies the margin.

- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the text box is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **Readonly**
  Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**
  Returns whether the text box is only operable while the associated button is being pressed.
- **Text**
  Specifies the labeling.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the text box is visible.
- **Width**
  Specifies the width.

ControlBarTextBox.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.AlternateBorderColor
```

See also

ControlBarTextBox (Page 5893)

ControlBarTextBox.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarTextBox.Authorization
```

See also

ControlBarTextBox (Page 5893)

ControlBarTextBox.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```

```

See also

ControlBarTextBox (Page 5893)

ControlBarTextBox.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BorderColor
```

See also

ControlBarTextBox (Page 5893)

ControlBarTextBox.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarTextBox.BorderWidth
```

See also

ControlBarTextBox (Page 5893)

ControlBarTextBox.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarTextBox.CustomID
```

See also

ControlBarTextBox (Page 5893)

ControlBarTextBox.Enabled

Description

The "Enabled" property specifies whether the text box can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Enabled
```

See also

ControlBarTextBox (Page 5893)

ControlBarTextBox.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```

```

See also

ControlBarTextBox (Page 5893)

ControlBarTextBox.Height

Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Height
```

See also

ControlBarTextBox (Page 5893)

ControlBarTextBox.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

See also

ControlBarTextBox (Page 5893)

ControlBarTextBox.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

ControlBarTextBox.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the text box.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarTextBox.Margin
```

See also

ControlBarTextBox (Page 5893)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarTextBox.Margin (Page 5902)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarTextBox.Margin (Page 5902)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarTextBox.Margin (Page 5902)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarTextBox.Margin (Page 5902)

ControlBarTextBox.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumHeight
```

See also

ControlBarTextBox (Page 5893)

ControlBarTextBox.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumWidth
```

See also

ControlBarTextBox (Page 5893)

ControlBarTextBox.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumHeight
```

See also

ControlBarTextBox (Page 5893)

ControlBarTextBox.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumWidth
```

See also

ControlBarTextBox (Page 5893)

ControlBarTextBox.Operability

Description

The "Operability" property returns whether the text box is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarTextBox.Operability
```

See also

ControlBarTextBox (Page 5893)

ControlBarTextBox.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the text box.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarTextBox.Padding
```

See also

ControlBarTextBox (Page 5893)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarTextBox.Padding (Page 5907)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarTextBox.Padding (Page 5907)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarTextBox.Padding (Page 5907)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarTextBox.Padding (Page 5907)

ControlBarTextBox.ReadOnly

Description

The "ReadOnly" property specifies whether the text box is read-only.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.ReadOnly
```

See also

ControlBarTextBox (Page 5893)

ControlBarTextBox.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

See also

ControlBarTextBox (Page 5893)

ControlBarTextBox.Text

Description

The "Text" property specifies the label of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.Text
```

See also

ControlBarTextBox (Page 5893)

ControlBarTextBox.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.ToolTipText
```

See also

ControlBarTextBox (Page 5893)

ControlBarTextBox.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

See also

ControlBarTextBox (Page 5893)

ControlBarTextBox.Visible

Description

The "Visible" property specifies whether the text box is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Visible
```

See also

ControlBarTextBox (Page 5893)

ControlBarTextBox.Width

Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Width
```

See also

ControlBarTextBox (Page 5893)

ControlBarToggleSwitch

Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar.

You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarToggleSwitchPart

Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **AlternateGraphic**
  Specifies the graphic for the "pressed" state.
- **AlternateText**
  Specifies the text for the "pressed" state.

- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the identifier of the switch.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the switch can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the switch.
- **IsAlternateState**
  Specifies the current state of the switch.
- **Mapping**
  Returns the function of the switch.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the switch is operable.
- **Padding**
  Specifies the distance of the content from the border.

- **RequireExplicitUnlock**
  Returns whether the switch is only operable while the associated button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the switch is visible.
- **Width**
  Specifies the width.

HmiControlBarElementCollection (Page 5809)

ControlBarToggleSwitch.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.AlternateGraphic

Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateGraphic
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.AlternateText

Description

The "AlternateText" property specifies the text of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateText
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Authorization
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BackColor
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.Badge

Description

The "Badge" property specifies the identifier of the switch.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Badge
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderColor
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderWidth
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Content
```

See also

ControlBarToggleSwitch (Page 5913)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarToggleSwitch.Content (Page 5920)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarToggleSwitch.Content (Page 5920)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 5920)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarToggleSwitch.Content (Page 5920)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarToggleSwitch.Content (Page 5920)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarToggleSwitch.Content (Page 5920)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarToggleSwitch.Content (Page 5920)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 5920)

ControlBarToggleSwitch.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarToggleSwitch.CustomID
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.Enabled

Description

The "Enabled" property specifies whether the switch can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Enabled
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ForeColor
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.Graphic

Description

The "Graphic" property specifies the graphic of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Graphic
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.Height

Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Height
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.HotKey

Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
Button.HotKey
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.IsAlternateState

Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Mapping
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the switch.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Margin
```

See also

ControlBarToggleSwitch (Page 5913)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarToggleSwitch.Margin (Page 5931)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarToggleSwitch.Margin (Page 5931)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarToggleSwitch.Margin (Page 5931)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarToggleSwitch.Margin (Page 5931)

ControlBarToggleSwitch.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumHeight
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumWidth
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumHeight
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumWidth
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.Operability

Description

The property "Operability" returns whether the switch is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Operability
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the switch.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Padding
```

See also

ControlBarToggleSwitch (Page 5913)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarToggleSwitch.Padding (Page 5936)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarToggleSwitch.Padding (Page 5936)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarToggleSwitch.Padding (Page 5936)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarToggleSwitch.Padding (Page 5936)

ControlBarToggleSwitch.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.Text

Description

The "Text" property specifies the label of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Text
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ToolTipText
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.Visible

Description

The "Visible" property specifies whether the switch is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Visible
```

See also

ControlBarToggleSwitch (Page 5913)

ControlBarToggleSwitch.Width

Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Width
```

See also

ControlBarToggleSwitch (Page 5913)

StatusBar.Enabled

Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Enabled
```

See also

SystemDiagnosisControl.StatusBar (Page 5808)

StatusBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
StatusBar.Font
```

See also

SystemDiagnosisControl.StatusBar (Page 5808)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

StatusBar.Font (Page 5942)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

StatusBar.Font (Page 5942)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

StatusBar.Font (Page 5942)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

StatusBar.Font (Page 5942)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

StatusBar.Font (Page 5942)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

StatusBar.Font (Page 5942)

StatusBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
StatusBar.Margin
```

See also

SystemDiagnosisControl.StatusBar (Page 5808)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

StatusBar.Margin (Page 5945)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

StatusBar.Margin (Page 5945)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

StatusBar.Margin (Page 5945)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

StatusBar.Margin (Page 5945)

StatusBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
StatusBar.Padding
```

See also

SystemDiagnosisControl.StatusBar (Page 5808)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

StatusBar.Padding (Page 5948)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

StatusBar.Padding (Page 5948)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

StatusBar.Padding (Page 5948)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

StatusBar.Padding (Page 5948)

StatusBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.ShowToolTips
```

See also

SystemDiagnosisControl.StatusBar (Page 5808)

StatusBar.Visible

Description

The "Visible" property specifies whether the information bar is visible.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Visible
```

See also

SystemDiagnosisControl.StatusBar (Page 5808)

SystemDiagnosisControl.StyleItemClass

Description

The "StyleItemClass" property returns the style that is applied to the system diagnostics control.

Type

String

Access

Read-only

Syntax

```
SystemDiagnosisControl.StyleItemClass
```

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.SystemDiagnosisView

Description

The "SystemDiagnosisView" property specifies the system diagnostics control.

Type

Object, HmiDataGridViewPart

Access

Read-write

Syntax

```
SystemDiagnosisControl.SystemDiagnosisView
```

See also

SystemDiagnosisControl (Page 5750)

DataGridView.AllowFilter

Description

The "AllowFilter" property specifies whether filtering of columns is permitted.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.AllowFilter
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)

DataGridView.AllowSort

Description

The "AllowSort" property specifies whether the sorting of columns is permitted.

- True: Activates the sorting and sets the "AllowSort" property of all columns to "true".
- False: Disables the sorting for all columns. The individual column properties remain unchanged.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.AllowSort
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)

DataGridView.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.AlternateBackColor
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)

DataGridView.AlternateForeColor

Description

The "AlternateForeColor" property specifies the flashing color for the text.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.AlternateForeColor
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)

DataGridView.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.BackColor
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)

DataGridView.CellPadding

Description

The "CellPadding" property specifies the inner spacing of the content from the cell border.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
DataGridView.CellPadding
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

DataGridView.CellPadding (Page 5955)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

DataGridView.CellPadding (Page 5955)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

DataGridView.CellPadding (Page 5955)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

DataGridView.CellPadding (Page 5955)

DataGridView.ColoringMode

Description

The "ColoringMode" property specifies whether alternate coloring of every other row or column is enabled.

Type

Int32, HmiGridColoringMode

Specifies the type of the coloring:

- None (0): None
- Columns (1): Color the columns alternately.
- Rows (2): Color the rows alternately.

Access

Read-write

Syntax

```
DataGridView.ColoringMode
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)

DataGridView.Columns

Description

The "Columns" property represents the quantity of columns.

Type

Object, HmiDataGridColumnCollection (Page 5959)

Access

Read-only

Syntax

```
DataGridView.Columns
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)
HmiDataGridColumnCollection (Page 5959)

HmiDataGridColumnCollection

Description

The "HmiDataGridColumnCollection" object is a list of all columns ("DataGridColumn" objects) of the table.

You reference a "HmiDataGridColumnCollection" object via the `DataGridView.Columns` property.

Use

The "HmiDataGridColumnCollection" object is a list and can be counted and enumerated. You can access the "HmiDataGridColumnCollection" list using the index or the tag name.

Object type

HmiDataGridColumnCollection

Properties

The "HmiDataGridColumnCollection" object has the following properties:

- **Count**
  Returns the number of columns in the "HmiDataGridColumnCollection" list.

Methods

The "HmiDataGridColumnCollection" object has the following methods:

- **Item()**
  Returns a column of the "HmiDataGridColumnCollection" list.

See also

DataGridView.Columns (Page 5958)

HmiDataGridColumnCollection.Count

Description

The "Count" property returns the number of columns in the "HmiDataGridColumnCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiDataGridColumnCollection.Count
```

See also

HmiDataGridColumnCollection (Page 5959)

HmiDataGridColumnCollection.Item()

Description

The "Item" method returns a column of the "HmiDataGridColumnCollection" list.

Syntax

```
HmiDataGridColumnCollection[.Item](HmiDataGridColumnName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiDataGridColumnCollection" object.

Parameters

`HmiDataGridColumnName`

Type: String

Name of the column

Return value

Object, HmiDataGridColumnPartBase (Page 5961)

See also

SystemDiagnosisControlColumn (Page 5961)

SystemDiagnosisControlColumn

Description

The "SystemDiagnosisControlColumn" object represents a value column.

Object type

HmiSystemDiagnosisControlColumnPart

Properties

The "SystemDiagnosisControlColumn" object has the following properties:

- **AllowSort**
  Specifies whether column sorting is allowed.
- **BackColor**
  Specifies the background color.
- **Content**
  Specifies the display options for text and graphics.
- **Enabled**
  Specifies whether the column can be operated in runtime.
- **ForeColor**
  Specifies the font color of the text.
- **Header**
  Specifies the properties of the column header.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumWidth**
  Specifies the minimum width.
- **Name**
  Returns the name of the column.
- **OutputFormat**
  Specifies the format for displaying values.
- **SortDirection**
  Specifies the sorting direction.
- **SortOrder**
  Specifies the sorting order.
- **SystemDiagnosisControlBlock**
  Specifies property that will be displayed in the column.
- **Visible**
  Specifies whether the column is visible.
- **Width**
  Specifies the width.

Methods

--

See also

HmiDataGridColumnCollection (Page 5959)

HmiDataGridColumnCollection.Item() (Page 5960)

SystemDiagnosisControlColumn.AllowSort

Description

The "AllowSort" property specifies whether column sorting is permitted.

This property is ignored if the parent object has the "AllowSort" property set to "False".

Type

Bool

Access

Read-write

Syntax

```
SystemDiagnosisControlColumn.AllowSort
```

See also

SystemDiagnosisControlColumn (Page 5961)

SystemDiagnosisControlColumn.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
SystemDiagnosisControlColumn.BackColor
```

See also

SystemDiagnosisControlColumn (Page 5961)

SystemDiagnosisControlColumn.Content

Description

The "Content" property specifies the display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
SystemDiagnosisControlColumn.Content
```

See also

SystemDiagnosisControlColumn (Page 5961)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

SystemDiagnosisControlColumn.Content (Page 5963)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

SystemDiagnosisControlColumn.Content (Page 5963)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

SystemDiagnosisControlColumn.Content (Page 5963)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

SystemDiagnosisControlColumn.Content (Page 5963)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

SystemDiagnosisControlColumn.Content (Page 5963)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

SystemDiagnosisControlColumn.Content (Page 5963)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

SystemDiagnosisControlColumn.Content (Page 5963)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

SystemDiagnosisControlColumn.Content (Page 5963)

SystemDiagnosisControlColumn.Enabled

Description

The "Enabled" property specifies whether the column can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
SystemDiagnosisControlColumn.Enabled
```

See also

SystemDiagnosisControlColumn (Page 5961)

SystemDiagnosisControlColumn.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
SystemDiagnosisControlColumn.ForeColor
```

See also

SystemDiagnosisControlColumn (Page 5961)

SystemDiagnosisControlColumn.Header

Description

The "Header" property specifies the properties of the column header.

Type

Object, HmiDataGridColumnHeaderPart

Access

Read-write

Syntax

```
SystemDiagnosisControlColumn.Header
```

See also

SystemDiagnosisControlColumn (Page 5961)

DataGridColumnHeader.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
DataGridColumnHeader.Content
```

See also

SystemDiagnosisControlColumn.Header (Page 5969)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

DataGridColumnHeader.Content (Page 5970)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

DataGridColumnHeader.Content (Page 5970)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

DataGridColumnHeader.Content (Page 5970)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

DataGridColumnHeader.Content (Page 5970)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

DataGridColumnHeader.Content (Page 5970)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

DataGridColumnHeader.Content (Page 5970)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

DataGridColumnHeader.Content (Page 5970)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

DataGridColumnHeader.Content (Page 5970)

DataGridColumnHeader.Graphic

Description

The "Graphic" property specifies the graphic of the column header.

Type

String

Access

Read-write

Syntax

```
DataGridColumnHeader.Graphic
```

See also

SystemDiagnosisControlColumn.Header (Page 5969)

DataGridColumnHeader.Text

Description

The "Text" property specifies the label of the column header.

Type

String

Access

Read-write

Syntax

```
DataGridColumnHeader.Text
```

See also

SystemDiagnosisControlColumn.Header (Page 5969)

SystemDiagnosisControlColumn.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
SystemDiagnosisControlColumn.MaximumWidth
```

See also

SystemDiagnosisControlColumn (Page 5961)

SystemDiagnosisControlColumn.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
SystemDiagnosisControlColumn.MinimumWidth
```

See also

SystemDiagnosisControlColumn (Page 5961)

SystemDiagnosisControlColumn.Name

Description

The "Name" property returns the name of the column.

Type

String

Access

Read-only

Syntax

```
SystemDiagnosisControlColumn.Name
```

See also

SystemDiagnosisControlColumn (Page 5961)

SystemDiagnosisControlColumn.OutputFormat

Description

The "OutputFormat" property specifies the format for displaying values.

Type

String

Access

Read-write

Syntax

```
SystemDiagnosisControlColumn.OutputFormat
```

See also

SystemDiagnosisControlColumn (Page 5961)

SystemDiagnosisControlColumn.SortDirection

Description

The "SortDirection" property specifies the sorting direction.

Type

Int32, HmiSortDirection

Specifies the sorting order:

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

Access

Read-write

Syntax

```
SystemDiagnosisControlColumn.SortDirection
```

See also

SystemDiagnosisControlColumn (Page 5961)

SystemDiagnosisControlColumn.SortOrder

Description

The "SortOrder" property specifies the sorting order.

The sorting index begins at "`1`" (highest priority) in ascending order. `0` is ignored.

Type

UInt16

Access

Read-write

Syntax

```
SystemDiagnosisControlColumn.SortOrder
```

See also

SystemDiagnosisControlColumn (Page 5961)

SystemDiagnosisControlColumn.SystemDiagnosisControlBlock

Description

The "SystemDiagnosisControlBlock" specifies the property that will be displayed in the column.

Type

Int32, HmiSystemDiagnosisControlBlock

Specifies the control block:

- Undefined (0): Not defined
- Number (1): Number
- DateTime (2): Time information
- EventMessage (3): Event message
- EventType (4): Event type
- EventState (5): Event state

Access

Read-write

Syntax

```
SystemDiagnosisControlColumn.SystemDiagnosisControlBlock
```

See also

SystemDiagnosisControlColumn (Page 5961)

SystemDiagnosisControlColumn.Visible

Description

The "Visible" property specifies whether the column is visible.

Type

Bool

Access

Read-write

Syntax

```
SystemDiagnosisControlColumn.Visible
```

See also

SystemDiagnosisControlColumn (Page 5961)

SystemDiagnosisControlColumn.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
SystemDiagnosisControlColumn.Width
```

See also

SystemDiagnosisControlColumn (Page 5961)

DataGridView.Font

Description

The "Font" property specifies the font of the cells.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
DataGridView.Font
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

DataGridView.Font (Page 5981)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

DataGridView.Font (Page 5981)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

DataGridView.Font (Page 5981)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

DataGridView.Font (Page 5981)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

DataGridView.Font (Page 5981)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

DataGridView.Font (Page 5981)

DataGridView.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.ForeColor
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)

DataGridView.GridLineColor

Description

The "GridLineColor" property specifies the color of grid lines.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.GridLineColor
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)

DataGridView.GridLineVisibility

Description

The "GridLineVisibility" property specifies the visibility of the grid lines.

Type

Int32, HmiSimpleGridLine

Specifies the grid lines:

- None (0): None
- Vertikal (1): Vertical
- Horizontal (2): Horizontal

Access

Read-write

Syntax

```
DataGridView.GridLineVisibility
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)

DataGridView.GridLineWidth

Description

The "GridLineWidth" property specifies the thickness of the grid lines in pixels.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.GridLineWidth
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)

DataGridView.GridSelectionMode

Description

The "GridSelectionMode" property specifies whether multiple selection is enabled in the table content.

Type

Int32, HmiGridSelectionMode

Specifies the type of the selection:

- None (0): None
- Single (1): Only single selection
- Multi (2): Multiple selection

Access

Read-write

Syntax

```
DataGridView.GridSelectionMode
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)

DataGridView.HeaderSettings

Description

The "HeaderSettings" property specifies the settings for all column headers in the table.

Type

Object, HmiDataGridHeaderSettingsPart

Access

Read-write

Syntax

```
DataGridView.HeaderSettings
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)

DataGridHeaderSettings.AllowColumnReorder

Description

The "AllowColumnReorder" property specifies whether the order of the columns can be changed.

Type

Bool

Access

Read-write

Syntax

```
DataGridHeaderSettings.AllowColumnReorder
```

See also

DataGridView.HeaderSettings (Page 5987)

DataGridHeaderSettings.AllowColumnResize

Description

The "AllowColumnResize" property specifies whether the width of the columns can be changed.

Type

Bool

Access

Read-write

Syntax

```
DataGridHeaderSettings.AllowColumnResize
```

See also

DataGridView.HeaderSettings (Page 5987)

DataGridHeaderSettings.ColumnHeaderType

Description

The "ColumnHeaderType" property specifies the type of content of a column header.

Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

Access

Read-write

Syntax

```
DataGridHeaderSettings.ColumnHeaderType
```

See also

DataGridView.HeaderSettings (Page 5987)

DataGridHeaderSettings.Font

Description

The "Font" property specifies the font of the headers.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
DataGridHeaderSettings.Font
```

See also

DataGridView.HeaderSettings (Page 5987)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

DataGridHeaderSettings.Font (Page 5989)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

DataGridHeaderSettings.Font (Page 5989)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

DataGridHeaderSettings.Font (Page 5989)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

DataGridHeaderSettings.Font (Page 5989)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

DataGridHeaderSettings.Font (Page 5989)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

DataGridHeaderSettings.Font (Page 5989)

DataGridHeaderSettings.HeaderBackColor

Description

The "HeaderBackColor" property specifies the background color of the header.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderBackColor
```

See also

DataGridView.HeaderSettings (Page 5987)

DataGridHeaderSettings.HeaderForeColor

Description

The "HeaderForeColor" property specifies the font color of the headers.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderForeColor
```

See also

DataGridView.HeaderSettings (Page 5987)

DataGridHeaderSettings.HeaderGridLineColor

Description

The "HeaderGridLineColor" property specifies the color of the separation line between column headers.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderGridLineColor
```

See also

DataGridView.HeaderSettings (Page 5987)

DataGridHeaderSettings.HeaderSelectionBackColor

Description

The "HeaderSelectionBackColor" property specifies the background color of the header of a selected line or column.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderSelectionBackColor
```

See also

DataGridView.HeaderSettings (Page 5987)

DataGridHeaderSettings.HeaderSelectionForeColor

Description

The "HeaderSelectionForeColor" property specifies the font color of the header of a selected line or column.

Type

UInt32

Access

Read-write

Syntax

```
Object.HeaderSelectionForeColor
```

`Object`

Required. An object from the "Availability" section.

See also

DataGridView.HeaderSettings (Page 5987)

DataGridHeaderSettings.RowHeaderType

Description

The "RowHeaderType" property specifies the type of content of a row header.

Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

Access

Read-write

Syntax

```
DataGridHeaderSettings.RowHeaderType
```

See also

DataGridView.HeaderSettings (Page 5987)

DataGridView.HorizontalScrollBarVisibility

Description

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar of the display.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
DataGridView.HorizontalScrollBarVisibility
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)

DataGridView.RowHeight

Description

The "RowHeight" property specifies the height of all rows in the table in DIU (Device Independent Unit).

"0" corresponds to a automatic mechanism, which adjusts the height of each line according to the font size and number of paragraphs.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.RowHeight
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)

DataGridView.SelectFullRow

Description

The "SelectFullRow" property specifies whether only the cell or the entire row is included in the selection.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.SelectFullRow
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)

DataGridView.SelectionBackColor

Description

The "SelectionBackColor" property specifies the background color of the selected cells.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.SelectionBackColor
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)

DataGridView.SelectionBorderColor

Description

The "SelectionBorderColor" property specifies the border color of the selected cells.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.SelectionBorderColor
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)

DataGridView.SelectionBorderWidth

Description

The "SelectionBorderWidth" property specifies the border width of the selected cells.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.SelectionBorderWidth
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)

DataGridView.SelectionForeColor

Description

The "SelectionForeColor" property specifies the font color of the selected cells.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.SelectionForeColor
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)

DataGridView.VerticalScrollBarVisibility

Description

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the display.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
DataGridView.VerticalScrollBarVisibility
```

See also

SystemDiagnosisControl.SystemDiagnosisView (Page 5952)

SystemDiagnosisControl.SystemDiagnosisViewType

Description

The "SystemDiagnosisViewType" property specifies the type of system diagnostics control.

Type

Int32, HmiSystemDiagnosisViewType

Specifies the type of system diagnostics control.

- Diagnosis (0): Diagnostic view
- Matrix (1): Matrix view

Access

Read-write

Syntax

```
SystemDiagnosisControl.SystemDiagnosisViewType
```

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.TabIndex

Description

The "TabIndex" property returns the position of the system diagnostics control in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
SystemDiagnosisControl.TabIndex
```

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.TimeZone

Description

The "TimeZone" property specifies the time zone.

Type

HmiTimeZone

Access

Read-write

Syntax

```
SystemDiagnosisControl.TimeZone
```

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.ToolBar

Description

The "ToolBar" property specifies the toolbar.

Type

Object, HmiToolBarPart

Access

Read-write

Syntax

```
SystemDiagnosisControl.ToolBar
```

See also

SystemDiagnosisControl (Page 5750)

ToolBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ToolBar.BackColor
```

See also

SystemDiagnosisControl.ToolBar (Page 6002)

ToolBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

Type

Object, HmiControlBarElementCollection (Page 6004)

Access

Read-only

Syntax

```
ToolBar.Elements
```

See also

SystemDiagnosisControl.ToolBar (Page 6002)

HmiControlBarElementCollection (Page 6004)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

ToolBar.Elements (Page 6003)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 6004)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 5811)

See also

HmiControlBarElementCollection (Page 6004)

Control Bar Elements (Page 5811)

Control Bar Elements

Description

Control Bar Elements (Page 5811)

ToolBar.Enabled

Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Enabled
```

See also

SystemDiagnosisControl.ToolBar (Page 6002)

Toolbar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ToolBar.Font
```

See also

SystemDiagnosisControl.ToolBar (Page 6002)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Toolbar.Font (Page 6006)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Toolbar.Font (Page 6006)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Toolbar.Font (Page 6006)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Toolbar.Font (Page 6006)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Toolbar.Font (Page 6006)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Toolbar.Font (Page 6006)

Toolbar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the toolbar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ToolBar.Margin
```

See also

SystemDiagnosisControl.ToolBar (Page 6002)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

Toolbar.Margin (Page 6010)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

Toolbar.Margin (Page 6010)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

Toolbar.Margin (Page 6010)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

Toolbar.Margin (Page 6010)

Toolbar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ToolBar.Padding
```

See also

SystemDiagnosisControl.ToolBar (Page 6002)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

Toolbar.Padding (Page 6013)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

Toolbar.Padding (Page 6013)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

Toolbar.Padding (Page 6013)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

Toolbar.Padding (Page 6013)

ToolBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.ShowToolTips
```

See also

SystemDiagnosisControl.ToolBar (Page 6002)

ToolBar.UseHotKeys

Description

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.UseHotKeys
```

See also

SystemDiagnosisControl.ToolBar (Page 6002)

ToolBar.Visible

Description

The "Visible" property specifies whether the toolbar is visible.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Visible
```

See also

SystemDiagnosisControl.ToolBar (Page 6002)

SystemDiagnosisControl.Top

Description

The "Top" property specifies the value of the Y coordinate.

Type

Int32

Access

Read-write

Syntax

```
SystemDiagnosisControl.Top
```

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.Visible

Description

The "Visible" property specifies whether the system diagnostics control is visible.

Type

Bool

Access

Read-write

Syntax

```
SystemDiagnosisControl.Visible
```

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.Width

Description

The "Width" property specifies the width.

Type

UInt32

Access

Read-write

Syntax

```
SystemDiagnosisControl.Width
```

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.WindowFlags

Description

The "WindowFlags" property specifies the window configuration of the system diagnostics control.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

You can enable multiple properties by adding integer values or bit operators.

Type

HmiWindowFlag

Access

Read-write

Syntax

```
SystemDiagnosisControl.WindowFlags
```

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the system diagnostics control.

Syntax

```
SystemDiagnosisControl.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.FireCommand()

Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the system diagnostics control.

Syntax

```
SystemDiagnosisControl.FireCommand(commandId, custom)
```

Parameters

`commandId`

Type: Int32

ID of the element of the toolbar or information bar

`custom`

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

Return value

--

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.GoToPlc()

Description

The "GoToPlc" method navigates to the next PLC.

Syntax

```
SystemDiagnosisControl.GoToPlc()
```

Parameters

--

Return value

--

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
SystemDiagnosisControl.PropertyFlashing(propertyName, enable[,
value][, alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl_OnActivated()

Description

The "OnActivated" event occurs when a system diagnostics control receives focus:

- A system diagnostics control is selected via the configured tab sequence.
- A system diagnostics control that had no focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
SystemDiagnosisControl_OnActivated(item)
```

Context

item

Type: Object

System diagnostics control where the event occurs.

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl_OnCommandFired()

Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the system diagnostics control.

Syntax

```
SystemDiagnosisControl_OnCommandFired(item, commandId, custom)
```

Context

item

Type: Object

System diagnostics control where the event occurs.

commandId

Type: DInt

ID of the element of the toolbar or information bar that was operated.

custom

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl_OnDeactivated()

Description

The "OnDeactivated" event occurs when the system diagnostics control loses focus because the operator has pressed the <TAB> key or executed another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
SystemDiagnosisControl_OnDeactivated(item)
```

Context

item

Type: Object

System diagnostics control where the event occurs.

See also

SystemDiagnosisControl (Page 5750)

SystemDiagnosisControl_OnInitialized()

Description

The "OnInitialized" event occurs when a system diagnostics control has been successfully initialized and the data connection to the PLC has been established.

Syntax

```
SystemDiagnosisControl_OnInitialized(item)
```

Context

item

Type: Object

System diagnostics control where the event occurs.

See also

SystemDiagnosisControl (Page 5750)

Text

Description

The "Text" object represents a text box without frame and background.

Object type

HmiText

Properties

The "Text" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the text box.
- **Enabled**
  Specifies whether the text box can be operated in runtime.
- **Font**
  Specifies the font of the text.
- **ForeColor**
  Specifies the font color of the text.
- **Height**
  Specifies the height in the (Device Independent Unit).
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Layer**
  Returns the screen layer in which the text box is located.
- **Left**
  Specifies the value of the X coordinate in the (Device Independent Unit).
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the text box.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the text box is operable.

- **Parent**
  Returns the higher-level screen object (Parent container).
- **RequireExplicitUnlock**
  Returns whether the text box is only operable while the associated button is being pressed.
- **RotationAngle**
  Specifies the rotation angle of the text box in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the text box rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**
  Specifies whether the text box is highlighted when in focus.
- **StyleItemClass**
  Specifies the style which is applied to the text box.
- **TabIndex**
  Returns the position of the text box in the tab sequence.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Top**
  Specifies the value of the Y coordinate.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the text box is visible.
- **Width**
  Specifies the width in (Device Independent Unit).

Methods

The "Text" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the text box.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "Text" object has the following events:

- **OnActivated()**
  Occurs when a text box receives focus.
- **OnContextTapped()**
  Occurs when the text box is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when a text box loses focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the text box is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the text box is in focus.
- **OnTapped()**
  Occurs when the text box is left-clicked or short-touched.

Text.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
Text.Authorization
```

See also

Text (Page 6025)

Text.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the text box.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
Text.CurrentQuality
```

See also

Text (Page 6025)

Text.Enabled

Description

The "Enabled" property specifies whether the text box can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
Text.Enabled
```

See also

Text (Page 6025)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

Text (Page 6025)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 6029)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 6029)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 6029)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 6029)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 6029)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 6029)

Text.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

Text (Page 6025)

Text.Height

Description

The "Height" property specifies the height in the (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Text.Height
```

See also

Text (Page 6025)

Text.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the text alignment:

- Left (0): Left
- Center (1): Centered

- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Text.HorizontalTextAlignment
```

See also

Text (Page 6025)

Text.Layer

Description

The "Layer" property returns the screen layer in which the text box is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
Text.Layer
```

See also

Text (Page 6025)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

Text.Layer (Page 6034)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

Text.Layer (Page 6034)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

Text.Layer (Page 6034)

Text.Left

Description

The "Left" property sets the value of the X coordinate in the (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
Text.Left
```

See also

Text (Page 6025)

Text.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
Text.Margin
```

See also

Text (Page 6025)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

Text.Margin (Page 6037)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

Text.Margin (Page 6037)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

Text.Margin (Page 6037)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

Text.Margin (Page 6037)

Text.Name

Description

The "Name" property returns the name of the text box.

Type

String

Access

Read-only

Syntax

```
Text.Name
```

See also

Text (Page 6025)

Text.Opacity

Description

The "Opacity" property specifies the opacity. The "0" value indicates completely transparency.

Type

Float

Access

Read-write

Syntax

```
Text.Opacity
```

See also

Text (Page 6025)

Text.Operability

Description

The "Operability" property returns whether the text box is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
Text.Operability
```

See also

Text (Page 6025)

Text.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
Text.Parent
```

See also

Text (Page 6025)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

Text.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
Text.RequireExplicitUnlock
```

See also

Text (Page 6025)

Text.RotationAngle

Description

The "RotationAngle" property specifies the rotation angle of the text box in degrees.

Type

Int16

Access

Read-write

Syntax

```
Text.RotationAngle
```

See also

Text (Page 6025)
Text.RotationCenterPlacement (Page 6043)
Text.RotationCenterY (Page 6044)
Text.RotationCenterX (Page 6043)

Text.RotationCenterPlacement

Description

The "RotationCenterPlacement" property sets the reference point around which the text box rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in the DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
Text.RotationCenterPlacement
```

See also

Text (Page 6025)

Text.RotationAngle (Page 6042)

Text.RotationCenterX (Page 6043)

Text.RotationCenterY (Page 6044)

Text.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point.

Type

Float

Access

Read-write

Syntax

```
Text.RotationCenterX
```

See also

Text (Page 6025)
Text.RotationAngle (Page 6042)
Text.RotationCenterPlacement (Page 6043)
Text.RotationCenterY (Page 6044)

Text.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point.

Type

Float

Access

Read-write

Syntax

```
Text.RotationCenterY
```

See also

Text (Page 6025)
Text.RotationAngle (Page 6042)
Text.RotationCenterPlacement (Page 6043)
Text.RotationCenterX (Page 6043)

Text.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the text box is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
Text.ShowFocusVisual
```

See also

Text (Page 6025)

Text.StyleItemClass

Description

The "StyleItemClass" property specifies the style which is applied to the text box.

Type

String

Access

Read-only

Syntax

```
Text.StyleItemClass
```

See also

Text (Page 6025)

Text.TabIndex

Description

The "TabIndex" property returns the position of the text box in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
Text.TabIndex
```

See also

Text (Page 6025)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

Text (Page 6025)

Text.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
Text.ToolTipText
```

See also

Text (Page 6025)

Text.Top

Description

The "Top" property specifies the value of the Y coordinate.

Type

Int32

Access

Read-write

Syntax

```
Text.Top
```

See also

Text (Page 6025)

Text.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Text.VerticalTextAlignment
```

See also

Text (Page 6025)

Text.Visible

Description

The "Visible" property specifies whether the text box is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

Text (Page 6025)

Text.Width

Description

The "Width" property specifies the width in the (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Text.Width
```

Text (Page 6025)

Text.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the text box.

Syntax

```
Text.CheckAuthorization()
```

Parameters

-

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

Text (Page 6025)

Text.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
Text.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

`propertyName`

Type: String

Name of the property for which flashing is configured.

`enable`

Type: Bool

Specifies that flashing is activated.

`value`

Optional, type: Variant

Value of the property for which flashing is configured.

`alternateValue`

Optional, type: Variant

Specifies the second value for flashing.

`rate`

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

Text (Page 6025)

Text_OnActivated()

Description

The "OnActivated" event occurs when a text box receives focus:

- A text box is selected via the configured tab sequence.
- A text box that had no focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
Text_OnActivated(item)
```

Context

item

Type: Object

Text box where the event occurs.

See also

Text (Page 6025)

Text_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A text box is right-clicked.
- A text box is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
Text_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

`item`

Type: Object

Text box where the event occurs.

`x`

Type: DInt

X-coordinate of the input point

`y`

Type: DInt

Y-coordinate of the input point

`modifiers`

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Text (Page 6025)

Text_OnDeactivated()

Description

The "OnDeactivated" event occurs when the text box loses focus because the operator has pressed the <TAB> key or executed another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
Text_OnDeactivated(item)
```

Context

item

Type: Object

Text box where the event occurs.

See also

Text (Page 6025)

Text_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the text box is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Text_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

Text box where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Text (Page 6025)

Text_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the text box is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Text_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Text box where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Text (Page 6025)

Text_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A text box is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a text box has the focus.
- A text box is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
Text_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Text box where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

Text (Page 6025)

TextBox

Description

The "TextBox" object represents a text box in runtime.

Object type

HmiTextBox

Properties

The "TextBox" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the border color.
- **BorderWidth**
  Specifies the border thickness.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the text box.
- **Enabled**
  Specifies whether the text box can be operated in runtime.
- **Font**
  Specifies the font of the text.
- **ForeColor**
  Specifies the font color of the text.
- **Height**
  Specifies the height.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Layer**
  Returns the layer of the screen in which the text box is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the text box.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the text box is operable.
- **Padding**
  Specifies the distance of the content from the border of the text box.
- **Parent**
  Returns the higher-level screen object.

- **ReadOnly**
  Specifies whether the text box is write-protected.
- **RenderingTemplate**
  Returns the name of the template from which the text box was created.
- **RequireExplicitUnlock**
  Returns whether the text box is only operable while the associated button is being pressed.
- **RotationAngle**
  Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the text box rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**
  Specifies whether the text box is highlighted when in focus.
- **StyleItemClass**
  Returns the style which is applied to the text box.
- **TabIndex**
  Returns the position of the text box in the tab sequence.
- **Text**
  Specifies the labeling of the text box.
- **TextTrimming**
  Specifies the type of text trimming if space is not sufficient.
- **TextWrapping**
  Specifies how text is wrapped if there is insufficient space.
- **ToolTipText**
  Specifies the tooltip text.
- **Top**
  Specifies the value of the Y coordinate.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the text box is visible.
- **VisualizeQuality**
  Specifies whether the connection quality of the process value is displayed.
- **Width**
  Specifies the width.

Methods

The "TextBox" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the text box.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "TextBox" object has the following events:

- **OnActivated()**
  Occurs when a text box receives focus.
- **OnContextTapped()**
  Occurs when a text box is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when a text box loses focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the text box is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the text box is in focus.
- **OnTapped()**
  Occurs when a text box is left-clicked or short-touched.

TextBox.AlternateBackColor

Description

The "AlternateBackColor" specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
TextBox.AlternateBackColor
```

See also

TextBox (Page 6057)

TextBox.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
TextBox.AlternateBorderColor
```

See also

TextBox (Page 6057)

TextBox.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
TextBox.Authorization
```

See also

TextBox (Page 6057)

TextBox.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
TextBox.BackColor
```

See also

TextBox (Page 6057)

TextBox.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
TextBox.BorderColor
```

See also

TextBox (Page 6057)

TextBox.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
TextBox.BorderWidth
```

See also

TextBox (Page 6057)

TextBox.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the text box.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
TextBox.CurrentQuality
```

See also

TextBox (Page 6057)

TextBox.Enabled

Description

The "Enabled" property specifies whether the text box can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
TextBox.Enabled
```

See also

TextBox (Page 6057)

TextBox.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
TextBox.Font
```

See also

TextBox (Page 6057)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

TextBox.Font (Page 6064)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

TextBox.Font (Page 6064)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

TextBox.Font (Page 6064)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

TextBox.Font (Page 6064)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

TextBox.Font (Page 6064)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal

- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

TextBox.Font (Page 6064)

TextBox.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
TextBox.ForeColor
```

See also

TextBox (Page 6057)

TextBox.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

Uint32

Access

Read-write

Syntax

```
TextBox.Height
```

See also

TextBox (Page 6057)

TextBox.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the text alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched. Can only be used with layout containers, Fallback behaves like Center

Access

Read-write

Syntax

```
TextBox.HorizontalTextAlignment
```

See also

TextBox (Page 6057)

TextBox.Layer

Description

The "Layer" property returns the layer of the screen in which the text box is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
TextBox.Layer
```

See also

TextBox (Page 6057)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

TextBox.Layer (Page 6070)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

TextBox.Layer (Page 6070)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

TextBox.Layer (Page 6070)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

TextBox.Layer (Page 6070)

TextBox.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
TextBox.Left
```

See also

TextBox (Page 6057)

TextBox.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
TextBox.Margin
```

See also

TextBox (Page 6057)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

TextBox.Margin (Page 6073)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

TextBox.Margin (Page 6073)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

TextBox.Margin (Page 6073)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

TextBox.Margin (Page 6073)

TextBox.Name

Description

The "Name" property returns the name of the text box.

Type

String

Access

Read-only

Syntax

```
TextBox.Name
```

See also

TextBox (Page 6057)

TextBox.Opacity

Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

Type

Float

Access

Read-write

Syntax

```
TextBox.Opacity
```

See also

TextBox (Page 6057)

TextBox.Operability

Description

The "Operability" property returns whether the text box is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
TextBox.Operability
```

See also

TextBox (Page 6057)

TextBox.Padding

Description

The "Padding" property specifies the distance of the content from the border of the text box.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
TextBox.Padding
```

See also

TextBox (Page 6057)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

TextBox.Padding (Page 6077)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

TextBox.Padding (Page 6077)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

TextBox.Padding (Page 6077)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

TextBox.Padding (Page 6077)

TextBox.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
TextBox.Parent
```

See also

TextBox (Page 6057)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

TextBox.ReadOnly

Description

The "ReadOnly" property specifies whether the text box is read-only.

Type

Bool

Access

Read-write

Syntax

```
TextBox.ReadOnly
```

See also

TextBox (Page 6057)

TextBox.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the text box was created.

Type

String

Access

Read-only

Syntax

```
TextBox.RenderingTemplate
```

See also

TextBox (Page 6057)

TextBox.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
TextBox.RequireExplicitUnlock
```

See also

TextBox (Page 6057)

TextBox.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
TextBox.RotationAngle
```

See also

TextBox (Page 6057)

TextBox.RotationCenterPlacement (Page 6082)

TextBox.RotationCenterX (Page 6083)

TextBox.RotationCenterY (Page 6083)

TextBox.RotationCenterPlacement

Description

The "RotationCenterPlacement" property sets the reference point around which the text box rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
TextBox.RotationCenterPlacement
```

See also

TextBox (Page 6057)

TextBox.RotationCenterX (Page 6083)

TextBox.RotationCenterY (Page 6083)

TextBox.RotationAngle (Page 6081)

TextBox.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
TextBox.RotationCenterX
```

See also

TextBox (Page 6057)

TextBox.RotationCenterPlacement (Page 6082)

TextBox.RotationAngle (Page 6081)

TextBox.RotationCenterY (Page 6083)

TextBox.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
TextBox.RotationCenterY
```

See also

TextBox (Page 6057)

TextBox.RotationCenterPlacement (Page 6082)

TextBox.RotationAngle (Page 6081)

TextBox.RotationCenterX (Page 6083)

TextBox.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the text box is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
TextBox.ShowFocusVisual
```

See also

TextBox (Page 6057)

TextBox.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the text box.

Type

String

Access

Read-only

Syntax

```
TextBox.StyleItemClass
```

See also

TextBox (Page 6057)

TextBox.TabIndex

Description

The "TabIndex" property returns the position of the text box in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
TextBox.TabIndex
```

See also

TextBox (Page 6057)

TextBox.Text

Description

The "Text" property specifies the labeling of the text box.

Type

String

Access

Read-write

Syntax

```
TextBox.Text
```

See also

TextBox (Page 6057)

TextBox.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
TextBox.TextTrimming
```

See also

TextBox (Page 6057)

TextBox.TextWrapping

Description

The "TextWrapping" property specifies how text is wrapped if there is insufficient space.

Type

Int32, HmiTextWrapping

Specifies the text break:

- NoWrap (0): No text break
- WordWrap (1): Text break at the end of the line

Access

Read-write

Syntax

```
TextBox.TextWrapping
```

See also

TextBox (Page 6057)

TextBox.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
TextBox.ToolTipText
```

See also

TextBox (Page 6057)

TextBox.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
TextBox.Top
```

See also

TextBox (Page 6057)

TextBox.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the text alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched. Can only be used with layout containers, Fallback behaves like Center

Access

Read-write

Syntax

```
TextBox.VerticalTextAlignment
```

See also

TextBox (Page 6057)

TextBox.Visible

Description

The "Visible" property specifies whether the text box is visible.

Type

Bool

Access

Read-write

Syntax

```
TextBox.Visible
```

See also

TextBox (Page 6057)

TextBox.VisualizeQuality

Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

Type

Bool

Access

Read-write

Syntax

```
TextBox.VisualizeQuality
```

See also

TextBox (Page 6057)

TextBox.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
TextBox.Width
```

See also

TextBox (Page 6057)

TextBox.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the text box.

Syntax

```
TextBox.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

TextBox (Page 6057)

TextBox.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
TextBox.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

TextBox (Page 6057)

TextBox_OnActivated()

Description

The "OnActivated" event occurs when a text box receives focus:

- A text box is selected via the configured tab sequence.
- A text box that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
TextBox_OnActivated(item)
```

Context

item

Type: Object

Text box where the event occurs.

See also

TextBox (Page 6057)

TextBox_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A text box is right-clicked.
- A text box is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
TextBox_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Text box where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

TextBox (Page 6057)

TextBox_OnDeactivated()

Description

The "OnDeactivated" event occurs when the text box loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
TextBox_OnDeactivated(item)
```

Context

item

Type: Object

Text box where the event occurs.

See also

TextBox (Page 6057)

TextBox_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the text box is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
TextBox_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

Text box where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

TextBox (Page 6057)

TextBox_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the text box is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
TextBox_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Text box where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

TextBox (Page 6057)

TextBox_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A text box is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a text box has the focus.
- A text box is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
TextBox_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Text box where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

TextBox (Page 6057)

ToggleSwitch

Description

The "ToggleSwitch" object represents a switch in runtime.

Object type

HmiToggleSwitch

Properties

The "ToggleSwitch" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **AlternateGraphic**
  Specifies the graphic for the "pressed" state.
- **AlternateText**
  Specifies the text for the "pressed" state.
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the border color.
- **BorderWidth**
  Specifies the border width.
- **Content**
  Specifies the display options for text and graphics.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the switch.
- **Enabled**
  Specifies whether the switch can be operated in runtime.
- **Font**
  Specifies the font of the text.
- **ForeColor**
  Specifies the font color of the text.
- **Graphic**
  Specifies the graphic for the "not pressed" state.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the switch.
- **IsAlternateState**
  Specifies the state of the switch.
- **Layer**
  Returns the screen layer in which the switch is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.

- **Name**
  Returns the name of the switch.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the switch is operable.
- **Padding**
  Specifies the distance of the content from the border of the switch.
- **Parent**
  Returns the higher-level screen object.
- **RenderingTemplate**
  Returns the name of the template from which the switch was created.
- **RequireExplicitUnlock**
  Returns whether the switch is only operable while the associated button is being pressed.
- **RotationAngle**
  Specifies the rotation angle in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the switch rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**
  Specifies whether the switch is highlighted when in focus.
- **StyleItemClass**
  Returns the style which is applied to the switch.
- **TabIndex**
  Returns the position of the switch in the tab sequence.
- **Text**
  Specifies the text for the "not pressed" state.
- **ToolTipText**
  Specifies the tooltip text.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the switch is visible.
- **VisualizeQuality**
  Specifies whether the connection quality of the process value is displayed.
- **Width**
  Specifies the width.

Methods

The "ToggleSwitch" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the switch.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "ToggleSwitch" object has the following events:

- **OnActivated()**
  Occurs when a switch receives focus.
- **OnContextTapped()**
  Occurs when a switch is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when a switch loses focus.
- **OnDown()**
  Occurs when the operator presses a switch.
- **OnKeyDown()**
  Occurs when a key is pressed while the switch is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the switch is in focus.
- **OnStateChanged()**
  Occurs if the state of a switch changes.
- **OnTapped()**
  Occurs when a switch is left-clicked or short-touched.
- **OnUp()**
  Occurs when the operator resolves the pressure on a switch via the input device.

ToggleSwitch.AlternateBackColor

Description

The "AlternateBackColor" specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ToggleSwitch.AlternateBackColor
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ToggleSwitch.AlternateBorderColor
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.AlternateGraphic

Description

The "AlternateGraphic" property specifies the graphic for the "pressed" state.

Type

String

Access

Read-write

Syntax

```
ToggleSwitch.AlternateGraphic
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.AlternateText

Description

The "AlternateText" property specifies the text for the "pressed" state.

Type

String

Access

Read-write

Syntax

```
ToggleSwitch.AlternateText
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ToggleSwitch.Authorization
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ToggleSwitch.BackColor
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ToggleSwitch.BorderColor
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ToggleSwitch.BorderWidth
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.Content

Description

The "Content" property specifies the display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ToggleSwitch.Content
```

See also

ToggleSwitch (Page 6098)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ToggleSwitch.Content (Page 6105)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ToggleSwitch.Content (Page 6105)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ToggleSwitch.Content (Page 6105)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ToggleSwitch.Content (Page 6105)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ToggleSwitch.Content (Page 6105)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ToggleSwitch.Content (Page 6105)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ToggleSwitch.Content (Page 6105)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ToggleSwitch.Content (Page 6105)

ToggleSwitch.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the switch.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
ToggleSwitch.CurrentQuality
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.Enabled

Description

The "Enabled" property specifies whether the switch can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ToggleSwitch.Enabled
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ToggleSwitch.Font
```

See also

ToggleSwitch (Page 6098)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ToggleSwitch.Font (Page 6112)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ToggleSwitch.Font (Page 6112)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ToggleSwitch.Font (Page 6112)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ToggleSwitch.Font (Page 6112)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ToggleSwitch.Font (Page 6112)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ToggleSwitch.Font (Page 6112)

ToggleSwitch.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ToggleSwitch.ForeColor
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.Graphic

Description

The "Graphic" property specifies the graphic for the "not pressed" state.

Type

String

Access

Read-write

Syntax

```
ToggleSwitch.Graphic
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ToggleSwitch.Height
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.HotKey

Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
ToggleSwitch.HotKey
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.IsAlternateState

Description

The "IsAlternateState" property specifies the state of the switch:

- True: Pressed
- False: Not pressed

Type

Bool

Access

Read-write

Syntax

```
ToggleSwitch.IsAlternateState
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.Layer

Description

The "Layer" property returns the layer of the screen in which the switch is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
ToggleSwitch.Layer
```

See also

ToggleSwitch (Page 6098)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

ToggleSwitch.Layer (Page 6118)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

ToggleSwitch.Layer (Page 6118)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

ToggleSwitch.Layer (Page 6118)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

ToggleSwitch.Layer (Page 6118)

ToggleSwitch.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
ToggleSwitch.Left
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ToggleSwitch.Margin
```

See also

ToggleSwitch (Page 6098)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ToggleSwitch.Margin (Page 6121)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ToggleSwitch.Margin (Page 6121)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ToggleSwitch.Margin (Page 6121)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ToggleSwitch.Margin (Page 6121)

ToggleSwitch.Name

Description

The "Name" property returns the name of the switch.

Type

String

Access

Read-only

Syntax

```
ToggleSwitch.Name
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.Opacity

Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

Type

Float

Access

Read-write

Syntax

```
ToggleSwitch.Opacity
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.Operability

Description

The "Operability" property returns whether the switch is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ToggleSwitch.Operability
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.Padding

Description

The "Padding" property specifies the distance of the content from the border of the switch.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ToggleSwitch.Padding
```

See also

ToggleSwitch (Page 6098)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ToggleSwitch.Padding (Page 6125)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ToggleSwitch.Padding (Page 6125)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ToggleSwitch.Padding (Page 6125)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ToggleSwitch.Padding (Page 6125)

ToggleSwitch.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
ToggleSwitch.Parent
```

See also

ToggleSwitch (Page 6098)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

ToggleSwitch.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the switch was created.

Type

String

Access

Read-only

Syntax

```
ToggleSwitch.RenderingTemplate
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ToggleSwitch.RequireExplicitUnlock
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
ToggleSwitch.RotationAngle
```

See also

ToggleSwitch.RotationCenterX (Page 6130)
ToggleSwitch.RotationCenterY (Page 6131)

ToggleSwitch.RotationCenterPlacement

Description

The "RotationCenterPlacement" property sets the reference point around which the switch rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
ToggleSwitch.RotationCenterPlacement
```

ToggleSwitch (Page 6098)

ToggleSwitch.RotationAngle (Page 6129)

ToggleSwitch.RotationCenterX (Page 6130)

ToggleSwitch.RotationCenterY (Page 6131)

ToggleSwitch.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
ToggleSwitch.RotationCenterX
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.RotationAngle (Page 6129)

ToggleSwitch.RotationCenterPlacement (Page 6130)

ToggleSwitch.RotationCenterY (Page 6131)

ToggleSwitch.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
ToggleSwitch.RotationCenterY
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.RotationAngle (Page 6129)

ToggleSwitch.RotationCenterPlacement (Page 6130)

ToggleSwitch.RotationCenterX (Page 6130)

ToggleSwitch.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the switch is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
ToggleSwitch.ShowFocusVisual
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the switch.

Type

String

Access

Read-only

Syntax

```
ToggleSwitch.StyleItemClass
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.TabIndex

Description

The "TabIndex" property returns the position of the switch in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
ToggleSwitch.TabIndex
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.Text

Description

The "Text" property specifies the text for the "not pressed" state.

Type

String

Access

Read-write

Syntax

```
ToggleSwitch.Text
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
ToggleSwitch.ToolTipText
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
ToggleSwitch.Top
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.Visible

Description

The "Visible" property specifies whether the switch is visible.

Type

Bool

Access

Read-write

Syntax

```
ToggleSwitch.Visible
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.VisualizeQuality

Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

Type

Bool

Access

Read-write

Syntax

```
ToggleSwitch.VisualizeQuality
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ToggleSwitch.Width
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the switch.

Syntax

```
ToggleSwitch.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

ToggleSwitch (Page 6098)

ToggleSwitch.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
ToggleSwitch.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

ToggleSwitch (Page 6098)

ToggleSwitch_OnActivated()

Description

The "OnActivated" event occurs when a switch receives focus:

- A switch is selected via the configured tab sequence.
- A switch that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
ToggleSwitch_OnActivated(item)
```

Context

item

Type: Object

Switch where the event occurs.

See also

ToggleSwitch (Page 6098)

ToggleSwitch_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A switch is right-clicked.
- A switch is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnDown
2. OnUp
3. OnContextTapped

Syntax

```
ToggleSwitch_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Switch where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

ToggleSwitch (Page 6098)

ToggleSwitch_OnDeactivated()

Description

The "OnDeactivated" event occurs when the switch loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
ToggleSwitch_OnDeactivated(item)
```

Context

item

Type: Object

Switch where the event occurs.

See also

ToggleSwitch (Page 6098)

ToggleSwitch_OnDown()

Description

The "OnDown" event occurs when the operator presses a switch:

- A switch is clicked with a mouse button.
- The <RETURN> or <SPACE> key is pressed when a switch has the focus.
- A switch is touched.

Order

The events are triggered in the following order:

1. OnDown
2. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
3. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
4. OnUp

Syntax

```
ToggleSwitch_OnDown(item, x, y, modifiers, trigger)
```

Context

Item

Type: Object

Switch where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

ToggleSwitch (Page 6098)

ToggleSwitch_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the switch is in focus. If the key is <RETURN> or <SPACE>, an "OnKeyDown" event is triggered before an "OnDown" event.

Order

The events are triggered in the following order:

1. OnDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyDown
3. OnKeyUp
4. OnUp (if triggered by the <RETURN> or <SPACE> key)

Syntax

```
ToggleSwitch_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

Switch where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

ToggleSwitch (Page 6098)

ToggleSwitch_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the switch is in focus. If the key is <RETURN> or <SPACE>, an "OnUp" event is triggered after the "OnKeyUp" event.

Order

The events are triggered in the following order:

1. OnDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyDown
3. OnKeyUp
4. OnUp (if triggered by the <RETURN> or <SPACE> key)

Syntax

```
ToggleSwitch_OnKeyUp(item, keyCode, modifiers)
```

Context

`item`

Type:

Switch where the event occurs.

`keyCode`

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

`modifiers`

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

ToggleSwitch (Page 6098)

ToggleSwitch_OnStateChanged()

Description

The "OnStateChanged" event occurs when the state of a switch changes, for example, from "On" to "Off".

Syntax

```
ToggleSwitch_OnStateChanged(item, isAlternate)
```

Context

item

Type: Object

Switch where the event occurs.

isAlternate

Type: Bool

Specifies the state of the switch.

See also

ToggleSwitch (Page 6098)

ToggleSwitch_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A switch is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a switch has the focus.
- A switch is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnDown
2. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
3. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
4. OnUp
5. OnTapped

Syntax

```
ToggleSwitch_OnTapped(item, x, y, modifiers, trigger)
```

Context

`item`

Type: Object

Switch where the event occurs.

`x`

Type: DInt

X-coordinate of the input point

`y`

Type: DInt

Y-coordinate of the input point

`modifiers`

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

ToggleSwitch (Page 6098)

ToggleSwitch_OnUp()

Description

The event "OnUp" occurs when the operator releases the pressure on a switch via the input device:

- The mouse button is released via a switch.
- The <RETURN> or <SPACE> key is released when a switch has the focus.
- The touch of a switch is canceled.
- A switch is exited while pressed.

This event does not occur as long as the operator keeps the switch pressed.

Order

The events are triggered in the following order:

1. OnDown
2. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
3. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
4. OnUp

Syntax

```
ToggleSwitch_OnUp(item, x, y, modifiers, trigger)
```

Context

`Item`

Type: Object

Switch where the event occurs.

`x`

Type: DInt

X-coordinate of the input point

`y`

Type: DInt

Y-coordinate of the input point

`modifiers`

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

ToggleSwitch (Page 6098)

TopLevelScreenWindow

Description

TopLevelScreenWindow (Page 1522)

TouchArea

Description

The "TouchArea" object represents a touch area in runtime.

Object type

HmiTouchArea

Properties

The "TouchArea" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Enabled**
  Specifies whether the touch area can be operated in runtime.
- **Height**
  Specifies the height.
- **Layer**
  Returns the layer of the screen in which the touch area is located.
- **Left**
  Specifies the value of the X coordinate.
- **Name**
  Returns the name of the touch area.
- **Operability**
  Returns whether the touch area is operable.
- **Parent**
  Returns the higher-level screen object.
- **RequireExplicitUnlock**
  Returns whether the touch area is only operable while the associated button is being pressed.

- **StyleItemClass**
  Returns the style which is applied to the touch area.
- **TabIndex**
  Returns the position of the touch area in the tab sequence.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the touch area is visible.
- **Width**
  Specifies the width.

Methods

The "TouchArea" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the touch area.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "TouchArea" object has the following events:

- **OnGestureDetected()**
  Occurs when the operator performs a touch gesture.

TouchArea.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
TouchArea.Authorization
```

See also

TouchArea (Page 6149)

TouchArea.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
TouchArea.BackColor
```

See also

TouchArea (Page 6149)

TouchArea.Enabled

Description

The "Enabled" property specifies whether the touch area can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
TouchArea.Enabled
```

See also

TouchArea (Page 6149)

TouchArea.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
TouchArea.Height
```

See also

TouchArea (Page 6149)

TouchArea.Layer

Description

The "Layer" property returns the layer of the screen in which the touch area is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
TouchArea.Layer
```

See also

TouchArea (Page 6149)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

TouchArea.Layer (Page 6152)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

TouchArea.Layer (Page 6152)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

TouchArea.Layer (Page 6152)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

TouchArea.Layer (Page 6152)

TouchArea.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
TouchArea.Left
```

See also

TouchArea (Page 6149)

TouchArea.Name

Description

The "Name" property returns the name of the touch area.

Type

String

Access

Read-only

Syntax

```
TouchArea.Name
```

See also

TouchArea (Page 6149)

TouchArea.Operability

Description

The "Operability" property returns whether the option button is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
TouchArea.Operability
```

See also

TouchArea (Page 6149)

TouchArea.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
TouchArea.Parent
```

See also

TouchArea (Page 6149)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

TouchArea.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the touch area can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
TouchArea.RequireExplicitUnlock
```

See also

TouchArea (Page 6149)

TouchArea.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the touch area.

Type

String

Access

Read-only

Syntax

```
TouchArea.StyleItemClass
```

See also

TouchArea (Page 6149)

TouchArea.TabIndex

Description

The "TabIndex" property returns the position of the touch area in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
TouchArea.TabIndex
```

See also

TouchArea (Page 6149)

TouchArea.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
TouchArea.Top
```

See also

TouchArea (Page 6149)

TouchArea.Visible

Description

The "Visible" property specifies whether the touch area is visible.

Type

Bool

Access

Read-write

Syntax

```
TouchArea.Visible
```

See also

TouchArea (Page 6149)

TouchArea.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
TouchArea.Width
```

See also

TouchArea (Page 6149)

TouchArea.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the touch area.

Syntax

```
TouchArea.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

TouchArea (Page 6149)

TouchArea.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
TouchArea.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

TouchArea (Page 6149)

TouchArea_OnGestureDetected()

Description

The "OnGestureDetected" event occurs when the operator performs a touch gesture:

Syntax

```
TouchArea_OnGestureDetected(item, gesture)
```

Context

item

Type: Object

Touch area where the event occurs.

gesture

Type: Int32, HmiGesture

Touch gesture which is detected:

- Unknown (0): Unknown
- SwipeLeft (1): Swipe to the left
- SwipeRight (2): Swipe to the right
- SwipeUp (3): Swipe upwards
- SwipeDown (4): Swipe downwards

Example

Set the value of the "MyTag1" tag depending on the detected gesture:

Copy code

```
export function Touch_area_1_OnGestureDetected(item, gesture) {
// value of tag ‚MyTag1‘ will be set depending on the detected gesture
   if(gesture == UI.Enums.HmiGesture.SwipeRight)
   {
      UI.RootWindow.Screen = 'ScreenRight';
      let tag1 = Tags('tag1');
      tag1.Write(1); //write value '1234' to tag 'MyTag1'
   }
   if(gesture == UI.Enums.HmiGesture.SwipeLeft)
   {
      UI.RootWindow.Screen = 'ScreenLeft';
      let tag1 = Tags('tag1');
      tag1.Write(2); //write value '1234' to tag 'MyTag1'
   }
   if(gesture == UI.Enums.HmiGesture.SwipeUp)
   {
      UI.RootWindow.Screen = 'ScreenUp';
      let tag1 = Tags('tag1');
      tag1.Write(3); //write value '1234' to tag 'MyTag1'
   }
   if(gesture == UI.Enums.HmiGesture.SwipeDown)
   {
      UI.RootWindow.Screen = 'ScreenDown';
      let tag1 = Tags('tag1');
      tag1.Write(4); //write value '1234' to tag 'MyTag1'
   }
   if(gesture == UI.Enums.HmiGesture.Unknown)
   {
      let tag1 = Tags('tag1');
      tag1.Write(0); //write value '1234' to tag 'MyTag1'
   }
}
```

TouchArea (Page 6149)

TrendCompanion

Description

The "TrendCompanion" object represents a value table in runtime.

Object type

HmiTrendCompanion

Properties

The "TrendCompanion" object has the following properties:

- **BackColor**
  Specifies the background color.
- **Caption**
  Specifies the text to be displayed in the title bar.
- **CaptionColor**
  Specifies the color of the title bar.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the value table.
- **Enabled**
  Specifies whether the value table can be operated in runtime.
- **Height**
  Specifies the height in the (Device Independent Unit).
- **Icon**
  Specifies the icon of the value table.
- **Layer**
  Returns the screen layer in which the value table is located.
- **Left**
  Specifies the value of the X coordinate in the (Device Independent Unit).
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the value table.
- **Parent**
  Returns the higher-level screen object (Parent container).
- **RenderingTemplate**
  Returns the name of the template from which the value table was created.
- **ShowAlways**
  Specifies whether the value table can be closed.
- **ShowFocusVisual**
  Specifies whether the value table is highlighted when in focus.
- **SnapToSourceControl**
  Specifies whether the value table snaps to the window of the associated data source.
- **SourceTrendControl**
  Specifies the data source.
- **StatusBar**
  Specifies the information bar of the value table.
- **StyleItemClass**
  Specifies the style which is applied to the value table.
- **TabIndex**
  Returns the position of the value table in the tab sequence.

- **TimeZone**
  Specifies the time zone.
- **ToolBar**
  Specifies the toolbar of the value table.
- **Top**
  Specifies the value of the Y coordinate.
- **TrendCompanionMode**
  Specifies the window display of the value table.
- **TrendRulerView**
  Specifies the ruler window of the value table.
- **TrendStatisticAreaView**
  Specifies the view of the statistics area.
- **TrendStatisticResultView**
  Specifies the view of the statistics mode.
- **UseSourceControlBackColor**
  Specifies whether the background color of the value table is taken from the associated data source.
- **UseSourceControlTrendColors**
  Specifies whether the font color of the value table is taken from the associated data source.
- **Visible**
  Specifies whether the value table is visible.
- **Width**
  Specifies the width in (Device Independent Unit).
- **WindowFlags**
  Specifies the window configuration of the value table.

Methods

The "TrendCompanion" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the value table.
- **FireCommand()**
  Executes the command of an element of the toolbar or information bar of the value table.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "TrendCompanion" object has the following events:

- **OnActivated()**
  Occurs when the value table receives focus.
- **OnCommandFired()**
  Occurs when the operator has operated an element in the toolbar or information bar of the value table.
- **OnDeactivated()**
  Occurs when the value table loses focus.
- **OnInitialized()**
  Occurs when the value table has been successfully initialized and the data connection to the PLC has been established.

TrendCompanion.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
TrendCompanion.BackColor
```

See also

TrendCompanion (Page 6163)

TrendCompanion.Caption

Description

The "Caption" property specifies the text to be displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
TrendCompanion.Caption
```

See also

TrendCompanion (Page 6163)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

TrendCompanion.Caption (Page 6166)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 6167)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 6167)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 6167)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 6167)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 6167)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 6167)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

TrendCompanion.Caption (Page 6166)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

TrendCompanion.Caption (Page 6166)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

TrendCompanion.Caption (Page 6166)

TrendCompanion.CaptionColor

Description

The "CaptionColor" property specifies the color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
TrendCompanion.CaptionColor
```

See also

TrendCompanion (Page 6163)

TrendCompanion.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the value table.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
TrendCompanion.CurrentQuality
```

See also

TrendCompanion (Page 6163)

TrendCompanion.Enabled

Description

The "Enabled" property specifies whether the value table can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
TrendCompanion.Enabled
```

See also

TrendCompanion (Page 6163)

TrendCompanion.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
TrendCompanion.Height
```

See also

TrendCompanion (Page 6163)

TrendCompanion.Icon

Description

The "Icon" property specifies the icon of the value table.

Type

String

Access

Read-write

Syntax

```
TrendCompanion.Icon
```

See also

TrendCompanion (Page 6163)

TrendCompanion.Layer

Description

The "Layer" property returns the screen layer in which the value table is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
TrendCompanion.Layer
```

See also

TrendCompanion (Page 6163)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

TrendCompanion.Layer (Page 6175)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

TrendCompanion.Layer (Page 6175)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

TrendCompanion.Layer (Page 6175)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

TrendCompanion.Layer (Page 6175)

TrendCompanion.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
TrendCompanion.Left
```

See also

TrendCompanion (Page 6163)

TrendCompanion.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
TrendCompanion.Margin
```

See also

TrendCompanion (Page 6163)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

TrendCompanion.Margin (Page 6178)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

TrendCompanion.Margin (Page 6178)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

TrendCompanion.Margin (Page 6178)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

TrendCompanion.Margin (Page 6178)

TrendCompanion.Name

Description

The "Name" property returns the name of the value table.

Type

String

Access

Read-only

Syntax

```
TrendCompanion.Name
```

See also

TrendCompanion (Page 6163)

TrendCompanion.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
TrendCompanion.Parent
```

See also

TrendCompanion (Page 6163)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

TrendCompanion.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the value table was created.

Type

String

Access

Read-only

Syntax

```
TrendCompanion.RenderingTemplate
```

See also

TrendCompanion (Page 6163)

TrendCompanion.ShowAlways

Description

The "ShowAlways" property specifies whether the value table can be closed.

Type

Bool

Access

Read-write

Syntax

```
TrendCompanion.ShowAlways
```

See also

TrendCompanion (Page 6163)

TrendCompanion.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the value table is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
TrendCompanion.ShowFocusVisual
```

See also

TrendCompanion (Page 6163)

TrendCompanion.SnapToSourceControl

Description

The "SnapToSourceControl" property specifies whether the value table snaps to the window of the associated data source.

Type

Bool

Access

Read-write

Syntax

```
TrendCompanion.SnapToSourceControl
```

See also

TrendCompanion (Page 6163)

TrendCompanion.SourceTrendControl

Description

The "SourceTrendControl" property specifies the data source.

Type

Object, HmiTrendControlBase (Page 6374)

Access

Read-write

Syntax

```
TrendCompanion.SourceTrendControl
```

See also

TrendCompanion (Page 6163)

TrendControl (Page 6374)

TrendControl

Description

TrendControl (Page 6374)

TrendCompanion.StatusBar

Description

The "StatusBar" property specifies the information bar of the value table.

Type

Object, HmiStatusBarPart

Access

Read-write

Syntax

```
TrendCompanion.StatusBar
```

See also

TrendCompanion (Page 6163)

StatusBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
StatusBar.BackColor
```

See also

TrendCompanion.StatusBar (Page 6184)

StatusBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

Type

Object, HmiControlBarElementCollection (Page 6185)

Access

Read-only

Syntax

```
StatusBar.Elements
```

See also

TrendCompanion.StatusBar (Page 6184)

HmiControlBarElementCollection (Page 6185)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

StatusBar.Elements (Page 6185)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 6185)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 6187)

See also

HmiControlBarElementCollection (Page 6185)

Control Bar Elements (Page 6187)

Control Bar Elements

ControlBarButton

Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarButtonPart

Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the label of the button.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the button can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the button.
- **Mapping**
  Returns the function of the button.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.

- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the button is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the button is visible.
- **Width**
  Specifies the width.

Methods

--

See also

HmiControlBarElementCollection (Page 6185)

ControlBarButton.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBackColor
```

See also

ControlBarButton (Page 6187)

ControlBarButton.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBorderColor
```

See also

ControlBarButton (Page 6187)

ControlBarButton.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarButton.Authorization
```

See also

ControlBarButton (Page 6187)

ControlBarButton.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BackColor
```

See also

ControlBarButton (Page 6187)

ControlBarButton.Badge

Description

The "Badge" property specifies the label of the button.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarButton.Badge
```

See also

ControlBarButton (Page 6187)

ControlBarButton.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BorderColor
```

See also

ControlBarButton (Page 6187)

ControlBarButton.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarButton.BorderWidth
```

See also

ControlBarButton (Page 6187)

ControlBarButton.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarButton.Content
```

See also

ControlBarButton (Page 6187)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarButton.Content (Page 6193)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarButton.Content (Page 6193)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarButton.Content (Page 6193)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarButton.Content (Page 6193)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarButton.Content (Page 6193)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarButton.Content (Page 6193)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarButton.Content (Page 6193)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarButton.Content (Page 6193)

ControlBarButton.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarButton.CustomID
```

See also

ControlBarButton (Page 6187)

ControlBarButton.Enabled

Description

The "Enabled" property specifies whether the button can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Enabled
```

See also

ControlBarButton (Page 6187)

ControlBarButton.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.ForeColor
```

See also

ControlBarButton (Page 6187)

ControlBarButton.Graphic

Description

The "Graphic" property specifies the graphic of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Graphic
```

See also

ControlBarButton (Page 6187)

ControlBarButton.Height

Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Height
```

See also

ControlBarButton (Page 6187)

ControlBarButton.HotKey

Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
ControlBarButton.HotKey
```

See also

ControlBarButton (Page 6187)

ControlBarButton.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent

- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms

- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarButton.Mapping
```

See also

ControlBarButton (Page 6187)

ControlBarButton.Margin

Description

The "Margin" property specifies the surrounded outer distance of the button.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarButton.Margin
```

See also

ControlBarButton (Page 6187)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarButton.Margin (Page 6203)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarButton.Margin (Page 6203)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarButton.Margin (Page 6203)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarButton.Margin (Page 6203)

ControlBarButton.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumHeight
```

See also

ControlBarButton (Page 6187)

ControlBarButton.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumWidth
```

See also

ControlBarButton (Page 6187)

ControlBarButton.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumHeight
```

See also

ControlBarButton (Page 6187)

ControlBarButton.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumWidth
```

See also

ControlBarButton (Page 6187)

ControlBarButton.Operability

Description

The "Operability" property returns whether the button is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarButton.Operability
```

See also

ControlBarButton (Page 6187)

ControlBarButton.Padding

Description

The "Padding" property specifies the distance of the content from the border of the button.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarButton.Padding
```

See also

ControlBarButton (Page 6187)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarButton.Padding (Page 6208)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarButton.Padding (Page 6208)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarButton.Padding (Page 6208)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarButton.Padding (Page 6208)

ControlBarButton.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarButton.RequireExplicitUnlock
```

See also

ControlBarButton (Page 6187)

ControlBarButton.Text

Description

The "Text" property specifies the label of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Text
```

See also

ControlBarButton (Page 6187)

ControlBarButton.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.ToolTipText
```

See also

ControlBarButton (Page 6187)

ControlBarButton.Visible

Description

The "Visible" property specifies whether the button is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Visible
```

See also

ControlBarButton (Page 6187)

ControlBarButton.Width

Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Width
```

See also

ControlBarButton (Page 6187)

ControlBarDisplay

Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarDisplayPart

Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the display area is enabled in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the display area.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the display area is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.

- **Visible**
  Specifies whether the display area is visible.
- **Width**
  Specifies the width.

Methods

--

HmiControlBarElementCollection (Page 6185)

ControlBarDisplay.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarDislay.Authorization
```

See also

ControlBarDisplay (Page 6213)

ControlBarDisplay.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarDislay.Content
```

See also

ControlBarDisplay (Page 6213)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarDisplay.Content (Page 6215)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarDisplay.Content (Page 6215)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarDisplay.Content (Page 6215)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarDisplay.Content (Page 6215)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarDisplay.Content (Page 6215)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarDisplay.Content (Page 6215)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarDisplay.Content (Page 6215)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarDisplay.Content (Page 6215)

ControlBarDisplay.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarDislay.CustomID
```

See also

ControlBarDisplay (Page 6213)

ControlBarDisplay.Enabled

Description

The "Enabled" property specifies whether the display is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Enabled
```

See also

ControlBarDisplay (Page 6213)

ControlBarDisplay.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.ForeColor
```

See also

ControlBarDisplay (Page 6213)

ControlBarDisplay.Graphic

Description

The "Graphic" property specifies the graphic of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Graphic
```

See also

ControlBarDisplay (Page 6213)

ControlBarDisplay.Height

Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Height
```

ControlBarDisplay.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarDislay.Mapping
```

See also

ControlBarDisplay (Page 6213)

ControlBarDisplay.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the display.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarDislay.Margin
```

See also

ControlBarDisplay (Page 6213)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarDisplay.Margin (Page 6225)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarDisplay.Margin (Page 6225)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarDisplay.Margin (Page 6225)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarDisplay.Margin (Page 6225)

ControlBarDisplay.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumHeight
```

See also

ControlBarDisplay (Page 6213)

ControlBarDisplay.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumWidth
```

See also

ControlBarDisplay (Page 6213)

ControlBarDisplay.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumHeight
```

See also

ControlBarDisplay (Page 6213)

ControlBarDisplay.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumWidth
```

See also

ControlBarDisplay (Page 6213)

ControlBarDisplay.Operability

Description

The "Operability" property returns whether the display is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarDislay.Operability
```

See also

ControlBarDisplay (Page 6213)

ControlBarDisplay.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the display.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarDislay.Padding
```

See also

ControlBarDisplay (Page 6213)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarDisplay.Padding (Page 6230)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarDisplay.Padding (Page 6230)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarDisplay.Padding (Page 6230)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarDisplay.Padding (Page 6230)

ControlBarDisplay.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarDislay.RequireExplicitUnlock
```

See also

ControlBarDisplay (Page 6213)

ControlBarDisplay.Text

Description

The "Text" property specifies the label of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Text
```

See also

ControlBarDisplay (Page 6213)

ControlBarDisplay.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.ToolTipText
```

See also

ControlBarDisplay (Page 6213)

ControlBarDisplay.Visible

Description

The "Visible" property specifies whether the display is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Visible
```

See also

ControlBarDisplay (Page 6213)

ControlBarDisplay.Width

Description

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Width
```

See also

ControlBarDisplay (Page 6213)

ControlBarLabel

Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar.

You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarLabelPart

Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the identifier can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the identifier.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the identifier is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.

- **Visible**
  Specifies whether the identifier is visible.
- **Width**
  Specifies the width.

ControlBarLabel.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarLabel.Authorization
```

See also

ControlBarLabel (Page 6235)

ControlBarLabel.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarLabel.CustomID
```

See also

ControlBarLabel (Page 6235)

ControlBarLabel.Enabled

Description

The "Enabled" property specifies whether the identifier is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Enabled
```

See also

ControlBarLabel (Page 6235)

ControlBarLabel.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.ForeColor
```

See also

ControlBarLabel (Page 6235)

ControlBarLabel.Height

Description

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Height
```

See also

ControlBarLabel (Page 6235)

ControlBarLabel.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

See also

ControlBarLabel (Page 6235)

ControlBarLabel.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

ControlBarLabel.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarLabel.Margin
```

See also

ControlBarLabel (Page 6235)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarLabel.Margin (Page 6242)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarLabel.Margin (Page 6242)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarLabel.Margin (Page 6242)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarLabel.Margin (Page 6242)

ControlBarLabel.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumHeight
```

See also

ControlBarLabel (Page 6235)

ControlBarLabel.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumWidth
```

See also

ControlBarLabel (Page 6235)

ControlBarLabel.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumHeight
```

See also

ControlBarLabel (Page 6235)

ControlBarLabel.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumWidth
```

See also

ControlBarLabel (Page 6235)

ControlBarLabel.Operability

Description

The "Operability" property returns whether the identifier is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarLabel.Operability
```

See also

ControlBarLabel (Page 6235)

ControlBarLabel.Padding

Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarLabel.Padding
```

See also

ControlBarLabel (Page 6235)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarLabel.Padding (Page 6247)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarLabel.Padding (Page 6247)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarLabel.Padding (Page 6247)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarLabel.Padding (Page 6247)

ControlBarLabel.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarLabel.RequireExplicitUnlock
```

See also

ControlBarLabel (Page 6235)

ControlBarLabel.Text

Description

The "Text" property specifies the label of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.Text
```

ControlBarLabel.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.ToolTipText
```

See also

ControlBarLabel (Page 6235)

ControlBarLabel.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.VerticalTextAlignment
```

ControlBarLabel.Visible

Description

The "Visible" property specifies whether the identifier is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Visible
```

ControlBarLabel.Width

Description

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Width
```

See also

ControlBarLabel (Page 6235)

ControlBarSeparator

Description

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarSeparatorPart

Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the disconnector can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the separator.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the separator is operable.

- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the disconnector is only operable while the associated button is being pressed.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the disconnector is visible.
- **Width**
  Specifies the width.

Methods

HmiControlBarElementCollection (Page 6185)

ControlBarSeparator.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarSeparator.Authorization
```

See also

ControlBarSeparator (Page 6253)

ControlBarSeparator.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarSeparator.CustomID
```

See also

ControlBarSeparator (Page 6253)

ControlBarSeparator.Enabled

Description

The "Enabled" property specifies whether the separator is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Enabled
```

See also

ControlBarSeparator (Page 6253)

ControlBarSeparator.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.ForeColor
```

See also

ControlBarSeparator (Page 6253)

ControlBarSeparator.Height

Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Height
```

See also

ControlBarSeparator (Page 6253)

ControlBarSeparator.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarSeparator.Mapping
```

See also

ControlBarSeparator (Page 6253)

ControlBarSeparator.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the separator.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarSeparator.Margin
```

See also

ControlBarSeparator (Page 6253)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarSeparator.Margin (Page 6259)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarSeparator.Margin (Page 6259)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarSeparator.Margin (Page 6259)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarSeparator.Margin (Page 6259)

ControlBarSeparator.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumHeight
```

See also

ControlBarSeparator (Page 6253)

ControlBarSeparator.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumWidth
```

See also

ControlBarSeparator (Page 6253)

ControlBarSeparator.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumHeight
```

See also

ControlBarSeparator (Page 6253)

ControlBarSeparator.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumWidth
```

See also

ControlBarSeparator (Page 6253)

ControlBarSeparator.Operability

Description

The "Operability" property returns whether the separator is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarSeparator.Operability
```

See also

ControlBarSeparator (Page 6253)

ControlBarSeparator.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the separator.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarSeparator.Padding
```

See also

ControlBarSeparator (Page 6253)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarSeparator.Padding (Page 6264)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarSeparator.Padding (Page 6264)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarSeparator.Padding (Page 6264)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarSeparator.Padding (Page 6264)

ControlBarSeparator.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the disconnector can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarSeparator.RequireExplicitUnlock
```

See also

ControlBarSeparator (Page 6253)

ControlBarSeparator.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

Type

String

Access

Read-write

Syntax

```
ControlBarSeparator.ToolTipText
```

See also

ControlBarSeparator (Page 6253)

ControlBarSeparator.Visible

Description

The "Visible" property specifies whether the separator is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Visible
```

See also

ControlBarSeparator (Page 6253)

ControlBarSeparator.Width

Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Width
```

See also

ControlBarSeparator (Page 6253)

ControlBarTextBox

Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarTextBoxPart

Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the text box can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Mapping**
  Returns the function of the text box.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the text box is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **Readonly**
  Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**
  Returns whether the text box is only operable while the associated button is being pressed.

- **Text**
  Specifies the labeling.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the text box is visible.
- **Width**
  Specifies the width.

ControlBarTextBox.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.AlternateBorderColor
```

See also

ControlBarTextBox (Page 6268)

ControlBarTextBox.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarTextBox.Authorization
```

See also

ControlBarTextBox (Page 6268)

ControlBarTextBox.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```

```

See also

ControlBarTextBox (Page 6268)

ControlBarTextBox.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BorderColor
```

See also

ControlBarTextBox (Page 6268)

ControlBarTextBox.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarTextBox.BorderWidth
```

See also

ControlBarTextBox (Page 6268)

ControlBarTextBox.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarTextBox.CustomID
```

See also

ControlBarTextBox (Page 6268)

ControlBarTextBox.Enabled

Description

The "Enabled" property specifies whether the text box can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Enabled
```

See also

ControlBarTextBox (Page 6268)

ControlBarTextBox.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

```

See also

ControlBarTextBox (Page 6268)

ControlBarTextBox.Height

Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Height
```

See also

ControlBarTextBox (Page 6268)

ControlBarTextBox.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

See also

ControlBarTextBox (Page 6268)

ControlBarTextBox.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the text box.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarTextBox.Margin
```

See also

ControlBarTextBox (Page 6268)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarTextBox.Margin (Page 6275)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarTextBox.Margin (Page 6275)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarTextBox.Margin (Page 6275)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarTextBox.Margin (Page 6275)

ControlBarTextBox.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```

See also

ControlBarTextBox (Page 6268)

ControlBarTextBox.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumWidth
```

See also

ControlBarTextBox (Page 6268)

ControlBarTextBox.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumHeight
```

See also

ControlBarTextBox (Page 6268)

ControlBarTextBox.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumWidth
```

See also

ControlBarTextBox (Page 6268)

ControlBarTextBox.Operability

Description

The "Operability" property returns whether the text box is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarTextBox.Operability
```

See also

ControlBarTextBox (Page 6268)

ControlBarTextBox.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the text box.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarTextBox.Padding
```

See also

ControlBarTextBox (Page 6268)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarTextBox.Padding (Page 6282)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarTextBox.Padding (Page 6282)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarTextBox.Padding (Page 6282)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarTextBox.Padding (Page 6282)

ControlBarTextBox.ReadOnly

Description

The "ReadOnly" property specifies whether the text box is read-only.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.ReadOnly
```

See also

ControlBarTextBox (Page 6268)

ControlBarTextBox.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

See also

ControlBarTextBox (Page 6268)

ControlBarTextBox.Text

Description

The "Text" property specifies the label of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.Text
```

See also

ControlBarTextBox (Page 6268)

ControlBarTextBox.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.ToolTipText
```

See also

ControlBarTextBox (Page 6268)

ControlBarTextBox.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

See also

ControlBarTextBox (Page 6268)

ControlBarTextBox.Visible

Description

The "Visible" property specifies whether the text box is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Visible
```

See also

ControlBarTextBox (Page 6268)

ControlBarTextBox.Width

Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Width
```

See also

ControlBarTextBox (Page 6268)

ControlBarToggleSwitch

Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar.

You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarToggleSwitchPart

Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **AlternateGraphic**
  Specifies the graphic for the "pressed" state.
- **AlternateText**
  Specifies the text for the "pressed" state.
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the identifier of the switch.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the switch can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.

- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the switch.
- **IsAlternateState**
  Specifies the current state of the switch.
- **Mapping**
  Returns the function of the switch.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the switch is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the switch is only operable while the associated button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the switch is visible.
- **Width**
  Specifies the width.

Methods

HmiControlBarElementCollection (Page 6185)

ControlBarToggleSwitch.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.AlternateGraphic

Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateGraphic
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.AlternateText

Description

The "AlternateText" property specifies the text of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateText
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Authorization
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BackColor
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.Badge

Description

The "Badge" property specifies the identifier of the switch.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Badge
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderColor
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderWidth
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Content
```

See also

ControlBarToggleSwitch (Page 6289)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarToggleSwitch.Content (Page 6295)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarToggleSwitch.Content (Page 6295)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 6295)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarToggleSwitch.Content (Page 6295)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarToggleSwitch.Content (Page 6295)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarToggleSwitch.Content (Page 6295)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarToggleSwitch.Content (Page 6295)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 6295)

ControlBarToggleSwitch.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarToggleSwitch.CustomID
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.Enabled

Description

The "Enabled" property specifies whether the switch can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Enabled
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ForeColor
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.Graphic

Description

The "Graphic" property specifies the graphic of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Graphic
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.Height

Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Height
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.HotKey

Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
Button.HotKey
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.IsAlternateState

Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment

- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms

- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Mapping
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the switch.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Margin
```

See also

ControlBarToggleSwitch (Page 6289)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarToggleSwitch.Margin (Page 6306)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarToggleSwitch.Margin (Page 6306)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarToggleSwitch.Margin (Page 6306)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarToggleSwitch.Margin (Page 6306)

ControlBarToggleSwitch.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumHeight
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumWidth
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumHeight
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumWidth
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.Operability

Description

The property "Operability" returns whether the switch is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Operability
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the switch.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Padding
```

See also

ControlBarToggleSwitch (Page 6289)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarToggleSwitch.Padding (Page 6311)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarToggleSwitch.Padding (Page 6311)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarToggleSwitch.Padding (Page 6311)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarToggleSwitch.Padding (Page 6311)

ControlBarToggleSwitch.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.Text

Description

The "Text" property specifies the label of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Text
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ToolTipText
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.Visible

Description

The "Visible" property specifies whether the switch is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Visible
```

See also

ControlBarToggleSwitch (Page 6289)

ControlBarToggleSwitch.Width

Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Width
```

See also

ControlBarToggleSwitch (Page 6289)

StatusBar.Enabled

Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Enabled
```

See also

TrendCompanion.StatusBar (Page 6184)

StatusBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
StatusBar.Font
```

See also

TrendCompanion.StatusBar (Page 6184)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

StatusBar.Font (Page 6317)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

StatusBar.Font (Page 6317)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

StatusBar.Font (Page 6317)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

StatusBar.Font (Page 6317)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

StatusBar.Font (Page 6317)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

StatusBar.Font (Page 6317)

StatusBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
StatusBar.Margin
```

See also

TrendCompanion.StatusBar (Page 6184)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

StatusBar.Margin (Page 6321)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

StatusBar.Margin (Page 6321)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

StatusBar.Margin (Page 6321)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

StatusBar.Margin (Page 6321)

StatusBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
StatusBar.Padding
```

See also

TrendCompanion.StatusBar (Page 6184)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

StatusBar.Padding (Page 6323)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

StatusBar.Padding (Page 6323)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

StatusBar.Padding (Page 6323)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

StatusBar.Padding (Page 6323)

StatusBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.ShowToolTips
```

See also

TrendCompanion.StatusBar (Page 6184)

StatusBar.Visible

Description

The "Visible" property specifies whether the information bar is visible.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Visible
```

See also

TrendCompanion.StatusBar (Page 6184)

TrendCompanion.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the value table.

Type

String

Access

Read-only

Syntax

```
TrendCompanion.StyleItemClass
```

See also

TrendCompanion (Page 6163)

TrendCompanion.TabIndex

Description

The "TabIndex" property returns the position of the value table in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
TrendCompanion.TabIndex
```

See also

TrendCompanion (Page 6163)

TrendCompanion.TimeZone

Description

The "TimeZone" property specifies the time zone.

Type

HmiTimeZone

Access

Read-write

Syntax

```
TrendCompanion.TimeZone
```

See also

TrendCompanion (Page 6163)

TrendCompanion.ToolBar

Description

The "ToolBar" property specifies the toolbar of the value table.

Type

Object, HmiToolBarPart

Access

Read-write

Syntax

```
TrendCompanion.ToolBar
```

See also

TrendCompanion (Page 6163)

ToolBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ToolBar.BackColor
```

See also

TrendCompanion.ToolBar (Page 6328)

ToolBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

Type

Object, HmiControlBarElementCollection (Page 6330)

Access

Read-only

Syntax

```
ToolBar.Elements
```

See also

TrendCompanion.ToolBar (Page 6328)

HmiControlBarElementCollection (Page 6330)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

ToolBar.Elements (Page 6329)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 6330)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 6332)

See also

HmiControlBarElementCollection (Page 6330)

Control Bar Elements (Page 6332)

Control Bar Elements

Description

Control Bar Elements (Page 6187)

ToolBar.Enabled

Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Enabled
```

See also

TrendCompanion.ToolBar (Page 6328)

ToolBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ToolBar.Font
```

See also

TrendCompanion.ToolBar (Page 6328)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ToolBar.Font (Page 6332)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ToolBar.Font (Page 6332)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ToolBar.Font (Page 6332)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ToolBar.Font (Page 6332)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ToolBar.Font (Page 6332)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ToolBar.Font (Page 6332)

ToolBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the toolbar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ToolBar.Margin
```

See also

TrendCompanion.ToolBar (Page 6328)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ToolBar.Margin (Page 6336)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ToolBar.Margin (Page 6336)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ToolBar.Margin (Page 6336)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ToolBar.Margin (Page 6336)

ToolBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ToolBar.Padding
```

See also

TrendCompanion.ToolBar (Page 6328)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ToolBar.Padding (Page 6339)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ToolBar.Padding (Page 6339)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ToolBar.Padding (Page 6339)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ToolBar.Padding (Page 6339)

ToolBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.ShowToolTips
```

See also

TrendCompanion.ToolBar (Page 6328)

ToolBar.UseHotKeys

Description

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.UseHotKeys
```

See also

TrendCompanion.ToolBar (Page 6328)

ToolBar.Visible

Description

The "Visible" property specifies whether the toolbar is visible.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Visible
```

See also

TrendCompanion.ToolBar (Page 6328)

TrendCompanion.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
TrendCompanion.Top
```

See also

TrendCompanion (Page 6163)

TrendCompanion.TrendCompanionMode

Description

The "TrendCompanionMode" property specifies the window display of the value table.

Type

HmiTrendCompanionMode

Specifies the window display of the value table:

- Ruler (0): Ruler as reading aid
- StatisticArea (1): Statistics area
- StatisticResult (2): Statistics result

Access

Read-write

Syntax

```
TrendCompanion.TrendCompanionMode
```

See also

TrendCompanion (Page 6163)

TrendCompanion.TrendRulerView

Description

The "TrendRulerView" property specifies the ruler window of the value table.

Type

Object, HmiTrendColumnPart (Page 6344)

Access

Read-write

Syntax

```
TrendCompanion.TrendRulerView
```

See also

TrendCompanion (Page 6163)

TrendColumn (Page 6344)

TrendColumn

Description

The "TrendColumn" object represents a column in the trend view.

Object type

HmiTrendColumnPart

Properties

The "TrendColumn" object has the following properties:

- **AllowSort**
  Specifies whether column sorting is allowed.
- **BackColor**
  Specifies the background color.

- **Content**
  Specifies display options for text and graphics.
- **Enabled**
  Specifies whether the column can be operated in runtime.
- **ForeColor**
  Specifies the font color of the text.
- **Header**
  Specifies the properties of the column header.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumWidth**
  Specifies the minimum width.
- **Name**
  Returns the name of the column.
- **OutputFormat**
  Specifies the format for displaying values.
- **SortDirection**
  Specifies the sorting direction.
- **SortOrder**
  Specifies the sorting order.
- **TrendInfoBlock**
  Specifies the info block.
- **Visible**
  Specifies whether the column is visible.
- **Width**
  Specifies the width of the column in the DIU (Device Independent Unit).

Methods

--

See also

TrendCompanion.TrendRulerView (Page 6344)

TrendColumn.AllowSort

Description

The "AllowSort" property specifies whether the sorting of the column is permitted.

This property is ignored if the parent object has the "AllowSort" property set to "False".

Type

Bool

Access

Read-write

Syntax

```
TrendColumn.AllowSort
```

See also

TrendColumn (Page 6344)

TrendColumn.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
TrendColumn.BackColor
```

See also

TrendColumn (Page 6344)

TrendColumn.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
TrendColumn.Content
```

See also

TrendColumn (Page 6344)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

TrendColumn.Content (Page 6346)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

TrendColumn.Content (Page 6346)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered

- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

TrendColumn.Content (Page 6346)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

TrendColumn.Content (Page 6346)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

TrendColumn.Content (Page 6346)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

TrendColumn.Content (Page 6346)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

TrendColumn.Content (Page 6346)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

TrendColumn.Content (Page 6346)

TrendColumn.Enabled

Description

The "Enabled" property specifies whether the column can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
TrendColumn.Enabled
```

See also

TrendColumn (Page 6344)

TrendColumn.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
TrendColumn.ForeColor
```

See also

TrendColumn (Page 6344)

TrendColumn.Header

Description

The "Header" property specifies the properties of the column header.

Type

Object, HmiDataGridColumnHeaderPart

Access

Read-write

Syntax

```
TrendColumn.Header
```

See also

TrendColumn (Page 6344)

DataGridColumnHeader.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
DataGridColumnHeader.Content
```

See also

TrendColumn.Header (Page 6353)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

DataGridColumnHeader.Content (Page 6353)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

DataGridColumnHeader.Content (Page 6353)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

DataGridColumnHeader.Content (Page 6353)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

DataGridColumnHeader.Content (Page 6353)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

DataGridColumnHeader.Content (Page 6353)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

DataGridColumnHeader.Content (Page 6353)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

DataGridColumnHeader.Content (Page 6353)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

DataGridColumnHeader.Content (Page 6353)

DataGridColumnHeader.Graphic

Description

The "Graphic" property specifies the graphic of the column header.

Type

String

Access

Read-write

Syntax

```
DataGridColumnHeader.Graphic
```

See also

TrendColumn.Header (Page 6353)

DataGridColumnHeader.Text

Description

The "Text" property specifies the label of the column header.

Type

String

Access

Read-write

Syntax

```
DataGridColumnHeader.Text
```

See also

TrendColumn.Header (Page 6353)

TrendColumn.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
TrendColumn.MaximumWidth
```

See also

TrendColumn (Page 6344)

TrendColumn.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
TrendColumn.MinimumWidth
```

See also

TrendColumn (Page 6344)

TrendColumn.Name

Description

The "Name" property returns the name of the column.

Type

String

Access

Read-only

Syntax

```
TrendColumn.Name
```

See also

TrendColumn (Page 6344)

TrendColumn.OutputFormat

Description

The "OutputFormat" property specifies the format for displaying values.

Type

String

Access

Read-write

Syntax

```
TrendColumn.OutputFormat
```

See also

TrendColumn (Page 6344)

TrendColumn.SortDirection

Description

The "SortDirection" property specifies the direction of the sorting.

Type

Int32, HmiSortDirection

Specifies the sorting order.

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

Access

Read-write

Syntax

```
TrendColumn.SortDirection
```

See also

TrendColumn (Page 6344)

TrendColumn.SortOrder

Description

The "SortOrder" property specifies the order of the sorting.

The sorting index starts at "1" (highest priority) in ascending order. Zero is ignored.

Type

UInt16

Access

Read-write

Syntax

```
TrendColumn.SortOrder
```

See also

TrendColumn (Page 6344)

TrendColumn.TrendInfoBlock

Description

The "TrendInfoBlock" property specifies the info block.

Type

Int32, HmiTrendInfoBlock

Specifies the info block:

- None (0): None
- Name (1): Name
- Index (2): Index
- Label (3): Labels
- Show (4): Show
- TagNameY (5): Tag name X
- TagNameX (6): Tag name Y
- YValue (7): Y value
- XValueOrTimestamp (8): X values or time stamp
- YValueLowerLimit (9): Y value low limit
- TimestampLowerLimit (10): Time stamp low limit
- YValueUpperLimit (11): Y value high limit
- TimestampUpperLimit (12): Time stamp low limit
- Minimum (13): Minimum
- MinimumTimestamp (14): Minimum time stamp
- Maximum (15): Maximum
- MaximumTimestamp (16): Maximum time stamp
- Average (17): Average
- StandardDeviation (18): Standard deviation
- Integral (19): Integral
- WeightedAverageValue (20): Weighted mean
- Duration (21): Duration
- NumberOfValues (22): Number of values
- AreaName (23): Area name

- AreaNameLL (24): Area name (LL)
- AreaNameHL (25): Area name (HL)
- Sum (32): Total

Access

Read-write

Syntax

```
TrendColumn.TrendInfoBlock
```

See also

TrendColumn (Page 6344)

TrendColumn.Visible

Description

The "Visible" property specifies whether the column is visible.

Type

Bool

Access

Read-write

Syntax

```
TrendColumn.Visible
```

See also

TrendColumn (Page 6344)

TrendColumn.Width

Description

The "Width" property specifies the width of the column in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
TrendColumn.Width
```

See also

TrendColumn (Page 6344)

TrendCompanion.TrendStatisticAreaView

Description

The "TrendStatisticAreaView" property specifies the view of the statistics area.

Type

Object, HmiTrendColumnPart (Page 6365)

Access

Read-write

Syntax

```
TrendCompanion.TrendStatisticAreaView
```

See also

TrendCompanion (Page 6163)

TrendColumn (Page 6365)

TrendColumn

Description

TrendColumn (Page 6344)

TrendCompanion.TrendStatisticResultView

Description

The "TrendStatisticResultView" property specifies the view of the statistics mode.

Type

Object, HmiTrendColumnPart (Page 6366)

Access

Read-write

Syntax

```
TrendCompanion.TrendStatisticResultView
```

See also

TrendCompanion (Page 6163)

TrendColumn (Page 6366)

TrendColumn

Description

TrendColumn (Page 6344)

TrendCompanion.UseSourceControlBackColor

Description

The "UseSourceControlBackColor" property specifies whether the background color of the value table is taken from the associated data source.

Type

Bool

Access

Read-write

Syntax

```
TrendCompanion.UseSourceControlBackColor
```

See also

TrendCompanion (Page 6163)

TrendCompanion.UseSourceControlTrendColors

Description

The "UseSourceControlTrendColors"property specifies whether the font color of the value table is taken from the associated data source.

Type

Bool

Access

Read-write

Syntax

```
TrendCompanion.UseSourceControlTrendColors
```

See also

TrendCompanion (Page 6163)

TrendCompanion.Visible

Description

The "Visible" property specifies whether the value table is visible.

Type

Bool

Access

Read-write

Syntax

```
TrendCompanion.Visible
```

See also

TrendCompanion (Page 6163)

TrendCompanion.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
TrendCompanion.Width
```

See also

TrendCompanion (Page 6163)

TrendCompanion.WindowFlags

Description

The "WindowFlags" property specifies the window configuration of the value table.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized

- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

Enable multiple properties by adding the integer values or bit operators.

Access

Read-write

Syntax

```
TrendCompanion.WindowFlags
```

Example

Adapt the "windowFlags" tag depending on the window configuration:

Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose){
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

See also

TrendCompanion (Page 6163)

TrendCompanion.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the value table.

Syntax

```
TrendCompanion.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

TrendCompanion (Page 6163)

TrendCompanion.FireCommand()

Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the value table.

Syntax

```
TrendCompanion.FireCommand(commandId, custom)
```

Parameters

commandId

Type: Int32

ID of the element of the toolbar or information bar

custom

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

Return value

--

See also

TrendCompanion (Page 6163)

TrendCompanion.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
TrendCompanion.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

TrendCompanion (Page 6163)

TrendCompanion_OnActivated()

Description

The "OnActivated" event occurs when a value table receives focus:

- A value table is selected via the configured tab sequence.
- A value table that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
TrendCompanion_OnActivated(item)
```

Context

`item`

Type: Object

Value table where the event occurs.

See also

TrendCompanion (Page 6163)

TrendCompanion_OnCommandFired()

Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the value table.

Syntax

```
TrendCompanion_OnCommandFired(item, commandId, custom)
```

Context

item

Type: Object

Value table where the event occurs.

commandId

Type: DInt

ID of the element of the toolbar or information bar that was operated.

custom

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

See also

TrendCompanion (Page 6163)

TrendCompanion_OnDeactivated()

Description

The "OnDeactivated" event occurs when a value table loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

Syntax

```
TrendCompanion_OnDeactivated(item)
```

Context

item

Type: Object

Value table where the event occurs.

See also

TrendCompanion (Page 6163)

TrendCompanion_OnInitialized()

Description

The "OnInitialized" event occurs when a value table has been successfully initialized and the data connection to the PLC has been established.

Syntax

```
TrendCompanion_OnInitialized(item)
```

Context

item

Type: Object

Value table where the event occurs.

See also

TrendCompanion (Page 6163)

TrendControl

Description

The "TrendControl" object represents a trend control of tag values from the current process or the archive in runtime.

Object type

HmiTrendControl

Properties

The "TrendControl" object has the following properties:

- **AreaSpacing**
  Specifies the distance between trend areas.
- **BackColor**
  Specifies the background color.
- **Caption**
  Specifies the text to be displayed in the title bar.
- **CaptionColor**
  Specifies the color of the title bar.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the trend control.
- **Enabled**
  Specifies whether the trend control can be operated in runtime.
- **ExtendRulerToAxis**
  Specifies whether the ruler is extended into the axis.
- **Height**
  Specifies the height.
- **Icon**
  Specifies the icon of the trend control.
- **Layer**
  Returns the screen layer in which the trend control is located.
- **Left**
  Specifies the value of the X coordinate.
- **Legend**
  Specifies the appearance of the legend.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the trend control.
- **Online**
  Specifies the start and stop of the trend control updating.
- **Parent**
  Returns the higher-level screen object.
- **RenderingTemplate**
  Returns the name of the template from which the trend control was created.
- **ShiftAxis**
  Specifies whether to swap the x axis and y axis of the trend control.

- **ShowFocusVisual**
  Specifies whether the trend control is highlighted when in focus.
- **ShowRuler**
  Specifies whether the ruler is displayed for determining a trend value.
- **ShowStatisticRulers**
  Specifies whether to display the two rulers for specifying the statistics area.
- **StatusBar**
  Sets the information bar of the trend control.
- **StyleItemClass**
  Returns the style which is applied to the trend control.
- **TabIndex**
  Returns the position of the trend control in the tab sequence.
- **TimeZone**
  Specifies the time zone.
- **ToolBar**
  Specifies the toolbar of the trend control.
- **Top**
  Specifies the value of the Y coordinate.
- **TrendAreas**
  Returns the trend areas of the trend control.
- **Visible**
  Specifies whether the trend control is visible.
- **Width**
  Specifies the width.
- **WindowFlags**
  Specifies the window configuration of the trend control.

Methods

The "TrendControl" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the trend control.
- **FireCommand()**
  Executes the command of an element of the toolbar or information bar of the trend view.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "TrendControl" object has the following events:

- **OnActivated()**
  Occurs when a trend control receives focus.
- **OnCommandFired()**
  Occurs when the operator has operated an element in the toolbar or information bar of the trend control.
- **OnDeactivated()**
  Occurs when a trend control loses focus.
- **OnInitialized()**
  Occurs when a trend control has been successfully initialized and the data connection to the PLC has been established.

TrendControl.AreaSpacing

Description

The "AreaSpacing" property specifies the spacing between trend areas.

Type

UInt16

Access

Read-write

Syntax

```
TrendControl.AreaSpacing
```

See also

TrendControl (Page 6374)

TrendControl.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
TrendControl.BackColor
```

See also

TrendControl (Page 6374)

TrendControl.Caption

Description

The "Caption" property specifies the text to be displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
TrendControl.Caption
```

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

TrendControl.Caption (Page 6378)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 6378)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 6378)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 6378)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 6378)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 6378)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 6378)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

TrendControl.Caption (Page 6378)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

TrendControl.Caption (Page 6378)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

TrendControl.Caption (Page 6378)

TrendControl.CaptionColor

Description

The "CaptionColor" property specifies the color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
TrendControl.CaptionColor
```

See also

TrendControl (Page 6374)

TrendControl.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the trend view.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
TrendControl.CurrentQuality
```

See also

TrendControl (Page 6374)

TrendControl.Enabled

Description

The "Enabled" property specifies whether the trend view can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
TrendControl.Enabled
```

See also

TrendControl (Page 6374)

TrendControl.ExtendRulerToAxis

Description

The "ExtendRulerToAxis" property specifies whether the ruler is extended to the axis.

Type

Bool

Access

Read-write

Syntax

```
TrendControl.ExtendRulerToAxis
```

See also

TrendControl (Page 6374)

TrendControl.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
TrendControl.Height
```

See also

TrendControl (Page 6374)

TrendControl.Icon

Description

The "Icon" property specifies the icon of the trend view.

Type

String

Access

Read-write

Syntax

```
TrendControl.Icon
```

See also

TrendControl (Page 6374)

TrendControl.Layer

Description

The "Layer" property returns the layer of the screen in which the trend view is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
TrendControl.Layer
```

See also

TrendControl (Page 6374)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

TrendControl.Layer (Page 6387)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

TrendControl.Layer (Page 6387)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

TrendControl.Layer (Page 6387)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

TrendControl.Layer (Page 6387)

TrendControl.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
TrendControl.Left
```

See also

TrendControl (Page 6374)

TrendControl.Legend

Description

The "Legend" property specifies the appearance of the legend ("Legend" object).

Type

Object, HmiLegendPart

Access

Read-write

Syntax

```
TrendControl.Legend
```

See also

TrendControl (Page 6374)

Legend.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Legend.ForeColor
```

See also

TrendControl.Legend (Page 6390)

Legend.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Legend.Font
```

See also

TrendControl.Legend (Page 6390)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Legend.Font (Page 6391)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Legend.Font (Page 6391)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Legend.Font (Page 6391)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Legend.Font (Page 6391)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Legend.Font (Page 6391)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Legend.Font (Page 6391)

Legend.Visible

Description

The "Visible" property specifies whether the legend is visible.

Type

Bool

Access

Read-write

Syntax

```
Legend.Visible
```

See also

TrendControl.Legend (Page 6390)

TrendControl.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
TrendControl.Margin
```

See also

TrendControl (Page 6374)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

TrendControl.Margin (Page 6395)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

TrendControl.Margin (Page 6395)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

TrendControl.Margin (Page 6395)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

TrendControl.Margin (Page 6395)

TrendControl.Name

Description

The "Name" property returns the name of the trend view.

Type

String

Access

Read-only

Syntax

```
TrendControl.Name
```

See also

TrendControl (Page 6374)

TrendControl.Online

Description

The "Online" property specifies the start and stop of the updating of the trend view.

- True: Online. The trend view is updated with new values.
- False: Offline. No new values are added to the trend view.

Type

Bool

Access

Read-write

Syntax

```
TrendControl.Online
```

See also

TrendControl (Page 6374)

TrendControl.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
TrendControl.Parent
```

See also

TrendControl (Page 6374)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

TrendControl.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the trend view was created.

Type

String

Access

Read-only

Syntax

```
TrendControl.RenderingTemplate
```

See also

TrendControl (Page 6374)

TrendControl.ShiftAxis

Description

The "ShiftAxis" property specifies whether to swap the x axis and y axis of the trend view.

Type

Bool

Access

Read-write

Syntax

```
TrendControl.ShiftAxis
```

See also

TrendControl (Page 6374)

TrendControl.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the trend view is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
TrendControl.ShowFocusVisual
```

See also

TrendControl (Page 6374)

TrendControl.ShowRuler

Description

The "ShowRuler" property specifies whether the ruler is displayed for determining a trend value.

Type

Bool

Access

Read-write

Syntax

```
TrendControl.ShowRuler
```

See also

TrendControl (Page 6374)

TrendControl.ShowStatisticRulers

Description

The "ShowStatisticRulers" property specifies whether to display the two rulers for specifying the statistics area.

Type

Bool

Access

Read-write

Syntax

```
TrendControl.ShowStatisticRulers
```

See also

TrendControl (Page 6374)

TrendControl.StatusBar

Description

The "StatusBar" property specifies the information bar of the trend view.

Type

Object, HmiStatusBarPart

Access

Read-write

Syntax

```
TrendControl.StatusBar
```

See also

TrendControl (Page 6374)

StatusBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
StatusBar.BackColor
```

See also

TrendControl.StatusBar (Page 6402)

StatusBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

Type

Object, HmiControlBarElementCollection (Page 6403)

Access

Read-only

Syntax

```
StatusBar.Elements
```

See also

HmiControlBarElementCollection (Page 6403)

TrendControl.StatusBar (Page 6402)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

StatusBar.Elements (Page 6403)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 6403)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 6421)

See also

HmiControlBarElementCollection (Page 6403)

Control Bar Elements (Page 6421)

Control Bar Elements

Description

Control Bar Elements (Page 6421)

StatusBar.Enabled

Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Enabled
```

See also

TrendControl.StatusBar (Page 6402)

StatusBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
StatusBar.Font
```

See also

TrendControl.StatusBar (Page 6402)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

StatusBar.Font (Page 6406)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

StatusBar.Font (Page 6406)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

StatusBar.Font (Page 6406)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

StatusBar.Font (Page 6406)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

StatusBar.Font (Page 6406)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

StatusBar.Font (Page 6406)

StatusBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
StatusBar.Margin
```

See also

TrendControl.StatusBar (Page 6402)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

StatusBar.Margin (Page 6410)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

StatusBar.Margin (Page 6410)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

StatusBar.Margin (Page 6410)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

StatusBar.Margin (Page 6410)

StatusBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
StatusBar.Padding
```

See also

TrendControl.StatusBar (Page 6402)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

StatusBar.Padding (Page 6412)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

StatusBar.Padding (Page 6412)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

StatusBar.Padding (Page 6412)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

StatusBar.Padding (Page 6412)

StatusBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.ShowToolTips
```

See also

TrendControl.StatusBar (Page 6402)

StatusBar.Visible

Description

The "Visible" property specifies whether the information bar is visible.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Visible
```

See also

TrendControl.StatusBar (Page 6402)

TrendControl.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the trend view.

Type

String

Access

Read-only

Syntax

```
TrendControl.StyleItemClass
```

See also

TrendControl (Page 6374)

TrendControl.TabIndex

Description

The "TabIndex" property returns the position of the trend view in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
TrendControl.TabIndex
```

See also

TrendControl (Page 6374)

TrendControl.TimeZone

Description

The "TimeZone" property specifies the time zone.

Positive numbers according to the Microsoft time zone index value specification, negative numbers from CHROM (-1 = RH local)

Type

HmiTimeZone

Values according to the Microsoft Time Zone Index Value specification. "-1" stands for local time.

Access

Read-write

Syntax

```
TrendControl.TimeZone
```

See also

TrendControl (Page 6374)

TrendControl.ToolBar

Description

The "ToolBar" property specifies the toolbar of the trend view.

Type

Object, HmiToolBarPart

Access

Read-write

Syntax

```
TrendControl.ToolBar
```

See also

TrendControl (Page 6374)

ToolBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ToolBar.BackColor
```

See also

TrendControl.ToolBar (Page 6417)

ToolBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

Type

Object, HmiControlBarElementCollection (Page 6419)

Access

Read-only

Syntax

```
ToolBar.Elements
```

See also

HmiControlBarElementCollection (Page 6419)

TrendControl.ToolBar (Page 6417)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

ToolBar.Elements (Page 6418)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 6419)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 6421)

See also

HmiControlBarElementCollection (Page 6419)

Control Bar Elements (Page 6421)

Control Bar Elements

ControlBarButton

Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarButtonPart

Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the label of the button.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the button can be operated in runtime.

- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the button.
- **Mapping**
  Returns the function of the button.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the button is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the button is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarButton.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBackColor
```

See also

ControlBarButton (Page 6421)

ControlBarButton.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBorderColor
```

See also

ControlBarButton (Page 6421)

ControlBarButton.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarButton.Authorization
```

See also

ControlBarButton (Page 6421)

ControlBarButton.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BackColor
```

See also

ControlBarButton (Page 6421)

ControlBarButton.Badge

Description

The "Badge" property specifies the label of the button.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarButton.Badge
```

See also

ControlBarButton (Page 6421)

ControlBarButton.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BorderColor
```

See also

ControlBarButton (Page 6421)

ControlBarButton.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarButton.BorderWidth
```

See also

ControlBarButton (Page 6421)

ControlBarButton.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarButton.Content
```

See also

ControlBarButton (Page 6421)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarButton.Content (Page 6426)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarButton.Content (Page 6426)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarButton.Content (Page 6426)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarButton.Content (Page 6426)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarButton.Content (Page 6426)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarButton.Content (Page 6426)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarButton.Content (Page 6426)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarButton.Content (Page 6426)

ControlBarButton.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarButton.CustomID
```

See also

ControlBarButton (Page 6421)

ControlBarButton.Enabled

Description

The "Enabled" property specifies whether the button can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Enabled
```

See also

ControlBarButton (Page 6421)

ControlBarButton.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.ForeColor
```

See also

ControlBarButton (Page 6421)

ControlBarButton.Graphic

Description

The "Graphic" property specifies the graphic of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Graphic
```

See also

ControlBarButton (Page 6421)

ControlBarButton.Height

Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Height
```

See also

ControlBarButton (Page 6421)

ControlBarButton.HotKey

Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
ControlBarButton.HotKey
```

See also

ControlBarButton (Page 6421)

ControlBarButton.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarButton.Mapping
```

See also

ControlBarButton (Page 6421)

ControlBarButton.Margin

Description

The "Margin" property specifies the surrounded outer distance of the button.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarButton.Margin
```

See also

ControlBarButton (Page 6421)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarButton.Margin (Page 6437)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarButton.Margin (Page 6437)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarButton.Margin (Page 6437)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarButton.Margin (Page 6437)

ControlBarButton.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumHeight
```

See also

ControlBarButton (Page 6421)

ControlBarButton.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumWidth
```

See also

ControlBarButton (Page 6421)

ControlBarButton.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumHeight
```

See also

ControlBarButton (Page 6421)

ControlBarButton.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumWidth
```

See also

ControlBarButton (Page 6421)

ControlBarButton.Operability

Description

The "Operability" property returns whether the button is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarButton.Operability
```

See also

ControlBarButton (Page 6421)

ControlBarButton.Padding

Description

The "Padding" property specifies the distance of the content from the border of the button.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarButton.Padding
```

See also

ControlBarButton (Page 6421)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarButton.Padding (Page 6442)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarButton.Padding (Page 6442)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarButton.Padding (Page 6442)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarButton.Padding (Page 6442)

ControlBarButton.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarButton.RequireExplicitUnlock
```

See also

ControlBarButton (Page 6421)

ControlBarButton.Text

Description

The "Text" property specifies the label of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Text
```

See also

ControlBarButton (Page 6421)

ControlBarButton.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.ToolTipText
```

See also

ControlBarButton (Page 6421)

ControlBarButton.Visible

Description

The "Visible" property specifies whether the button is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Visible
```

See also

ControlBarButton (Page 6421)

ControlBarButton.Width

Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Width
```

See also

ControlBarButton (Page 6421)

ControlBarDisplay

Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarDisplayPart

Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the display area is enabled in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the display area.

- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the display area is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the display area is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarDisplay.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarDislay.Authorization
```

See also

ControlBarDisplay (Page 6447)

ControlBarButton.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarDislay.Content
```

See also

ControlBarDisplay (Page 6447)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarButton.Content (Page 6449)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarButton.Content (Page 6449)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarButton.Content (Page 6449)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarButton.Content (Page 6449)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarButton.Content (Page 6449)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarButton.Content (Page 6449)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarButton.Content (Page 6449)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarButton.Content (Page 6449)

ControlBarDisplay.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarDislay.CustomID
```

See also

ControlBarDisplay (Page 6447)

ControlBarDisplay.Enabled

Description

The "Enabled" property specifies whether the display is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Enabled
```

See also

ControlBarDisplay (Page 6447)

ControlBarDisplay.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.ForeColor
```

See also

ControlBarDisplay (Page 6447)

ControlBarDisplay.Graphic

Description

The "Graphic" property specifies the graphic of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Graphic
```

See also

ControlBarDisplay (Page 6447)

ControlBarDisplay.Height

Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Height
```

See also

ControlBarDisplay (Page 6447)

ControlBarDisplay.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarDislay.Mapping
```

See also

ControlBarDisplay (Page 6447)

ControlBarButton.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the display.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarDislay.Margin
```

See also

ControlBarDisplay (Page 6447)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarButton.Margin (Page 6459)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarButton.Margin (Page 6459)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarButton.Margin (Page 6459)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarButton.Margin (Page 6459)

ControlBarDisplay.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumHeight
```

See also

ControlBarDisplay (Page 6447)

ControlBarDisplay.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumWidth
```

See also

ControlBarDisplay (Page 6447)

ControlBarDisplay.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumHeight
```

See also

ControlBarDisplay (Page 6447)

ControlBarDisplay.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumWidth
```

See also

ControlBarDisplay (Page 6447)

ControlBarDisplay.Operability

Description

The "Operability" property returns whether the display is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarDislay.Operability
```

See also

ControlBarDisplay (Page 6447)

ControlBarButton.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the display.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarDislay.Padding
```

See also

ControlBarDisplay (Page 6447)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarButton.Padding (Page 6464)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarButton.Padding (Page 6464)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarButton.Padding (Page 6464)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarButton.Padding (Page 6464)

ControlBarDisplay.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarDislay.RequireExplicitUnlock
```

See also

ControlBarDisplay (Page 6447)

ControlBarDisplay.Text

Description

The "Text" property specifies the label of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Text
```

See also

ControlBarDisplay (Page 6447)

ControlBarDisplay.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.ToolTipText
```

See also

ControlBarDisplay (Page 6447)

ControlBarDisplay.Visible

Description

The "Visible" property specifies whether the display is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Visible
```

See also

ControlBarDisplay (Page 6447)

ControlBarDisplay.Width

Description

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Width
```

See also

ControlBarDisplay (Page 6447)

ControlBarLabel

Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar.

You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarLabelPart

Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the identifier can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the identifier.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.

- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the identifier is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the identifier is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarLabel.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarLabel.Authorization
```

See also

ControlBarLabel (Page 6469)

ControlBarLabel.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarLabel.CustomID
```

See also

ControlBarLabel (Page 6469)

ControlBarLabel.Enabled

Description

The "Enabled" property specifies whether the identifier is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Enabled
```

See also

ControlBarLabel (Page 6469)

ControlBarLabel.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.ForeColor
```

See also

ControlBarLabel (Page 6469)

ControlBarLabel.Height

Description

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Height
```

See also

ControlBarLabel (Page 6469)

ControlBarLabel.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

See also

ControlBarLabel (Page 6469)

ControlBarLabel.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarLabel.Mapping
```

See also

ControlBarLabel (Page 6469)

ControlBarLabel.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarLabel.Margin
```

See also

ControlBarLabel (Page 6469)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarLabel.Margin (Page 6476)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarLabel.Margin (Page 6476)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarLabel.Margin (Page 6476)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarLabel.Margin (Page 6476)

ControlBarLabel.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumHeight
```

See also

ControlBarLabel (Page 6469)

ControlBarLabel.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumWidth
```

See also

ControlBarLabel (Page 6469)

ControlBarLabel.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumHeight
```

See also

ControlBarLabel (Page 6469)

ControlBarLabel.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumWidth
```

See also

ControlBarLabel (Page 6469)

ControlBarLabel.Operability

Description

The "Operability" property returns whether the identifier is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarLabel.Operability
```

See also

ControlBarLabel (Page 6469)

ControlBarLabel.Padding

Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarLabel.Padding
```

See also

ControlBarLabel (Page 6469)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarLabel.Padding (Page 6481)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarLabel.Padding (Page 6481)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarLabel.Padding (Page 6481)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarLabel.Padding (Page 6481)

ControlBarLabel.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarLabel.RequireExplicitUnlock
```

See also

ControlBarLabel (Page 6469)

ControlBarLabel.Text

Description

The "Text" property specifies the label of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.Text
```

See also

ControlBarLabel (Page 6469)

ControlBarLabel.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.ToolTipText
```

See also

ControlBarLabel (Page 6469)

ControlBarLabel.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.VerticalTextAlignment
```

See also

ControlBarLabel (Page 6469)

ControlBarLabel.Visible

Description

The "Visible" property specifies whether the identifier is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Visible
```

See also

ControlBarLabel (Page 6469)

ControlBarLabel.Width

Description

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Width
```

See also

ControlBarLabel (Page 6469)

ControlBarSeparator

Description

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarSeparatorPart

Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the disconnector can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the separator.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the separator is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the disconnector is only operable while the associated button is being pressed.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the disconnector is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarSeparator.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarSeparator.Authorization
```

See also

ControlBarSeparator (Page 6486)

ControlBarSeparator.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarSeparator.CustomID
```

See also

ControlBarSeparator (Page 6486)

ControlBarSeparator.Enabled

Description

The "Enabled" property specifies whether the separator is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Enabled
```

See also

ControlBarSeparator (Page 6486)

ControlBarSeparator.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.ForeColor
```

See also

ControlBarSeparator (Page 6486)

ControlBarSeparator.Height

Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Height
```

See also

ControlBarSeparator (Page 6486)

ControlBarSeparator.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarSeparator.Mapping
```

See also

ControlBarSeparator (Page 6486)

ControlBarSeparator.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the separator.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarSeparator.Margin
```

See also

ControlBarSeparator (Page 6486)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarSeparator.Margin (Page 6492)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarSeparator.Margin (Page 6492)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarSeparator.Margin (Page 6492)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarSeparator.Margin (Page 6492)

ControlBarSeparator.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumHeight
```

See also

ControlBarSeparator (Page 6486)

ControlBarSeparator.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumWidth
```

See also

ControlBarSeparator (Page 6486)

ControlBarSeparator.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumHeight
```

See also

ControlBarSeparator (Page 6486)

ControlBarSeparator.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumWidth
```

See also

ControlBarSeparator (Page 6486)

ControlBarSeparator.Operability

Description

The "Operability" property returns whether the separator is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarSeparator.Operability
```

See also

ControlBarSeparator (Page 6486)

ControlBarSeparator.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the separator.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarSeparator.Padding
```

See also

ControlBarSeparator (Page 6486)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarSeparator.Padding (Page 6497)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarSeparator.Padding (Page 6497)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarSeparator.Padding (Page 6497)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarSeparator.Padding (Page 6497)

ControlBarSeparator.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the disconnector can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarSeparator.RequireExplicitUnlock
```

See also

ControlBarSeparator (Page 6486)

ControlBarSeparator.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

Type

String

Access

Read-write

Syntax

```
ControlBarSeparator.ToolTipText
```

See also

ControlBarSeparator (Page 6486)

ControlBarSeparator.Visible

Description

The "Visible" property specifies whether the separator is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Visible
```

See also

ControlBarSeparator (Page 6486)

ControlBarSeparator.Width

Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Width
```

See also

ControlBarSeparator (Page 6486)

ControlBarTextBox

Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarTextBoxPart

Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the text box can be operated in runtime.
- **ForeColor**
  Specifies the font color.

- **Height**
  Specifies the height.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Mapping**
  Returns the function of the text box.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the text box is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **Readonly**
  Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**
  Returns whether the text box is only operable while the associated button is being pressed.
- **Text**
  Specifies the labeling.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the text box is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarTextBox.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.AlternateBorderColor
```

See also

ControlBarTextBox (Page 6502)

ControlBarTextBox.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarTextBox.Authorization
```

See also

ControlBarTextBox (Page 6502)

ControlBarTextBox.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BackColor
```

See also

ControlBarTextBox (Page 6502)

ControlBarTextBox.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BorderColor
```

See also

ControlBarTextBox (Page 6502)

ControlBarTextBox.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarTextBox.BorderWidth
```

See also

ControlBarTextBox (Page 6502)

ControlBarTextBox.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarTextBox.CustomID
```

See also

ControlBarTextBox (Page 6502)

ControlBarTextBox.Enabled

Description

The "Enabled" property specifies whether the text box can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Enabled
```

See also

ControlBarTextBox (Page 6502)

ControlBarTextBox.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.ForeColor
```

See also

ControlBarTextBox (Page 6502)

ControlBarTextBox.Height

Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Height
```

See also

ControlBarTextBox (Page 6502)

ControlBarTextBox.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

See also

ControlBarTextBox (Page 6502)

ControlBarTextBox.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarTextBox.Mapping
```

See also

ControlBarTextBox (Page 6502)

ControlBarTextBox.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the text box.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarTextBox.Margin
```

See also

ControlBarTextBox (Page 6502)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarTextBox.Margin (Page 6511)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarTextBox.Margin (Page 6511)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarTextBox.Margin (Page 6511)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarTextBox.Margin (Page 6511)

ControlBarTextBox.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumHeight
```

See also

ControlBarTextBox (Page 6502)

ControlBarTextBox.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumWidth
```

See also

ControlBarTextBox (Page 6502)

ControlBarTextBox.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumHeight
```

See also

ControlBarTextBox (Page 6502)

ControlBarTextBox.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumWidth
```

See also

ControlBarTextBox (Page 6502)

ControlBarTextBox.Operability

Description

The "Operability" property returns whether the text box is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarTextBox.Operability
```

See also

ControlBarTextBox (Page 6502)

ControlBarTextBox.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the text box.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarTextBox.Padding
```

See also

ControlBarTextBox (Page 6502)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarTextBox.Padding (Page 6516)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarTextBox.Padding (Page 6516)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarTextBox.Padding (Page 6516)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarTextBox.Padding (Page 6516)

ControlBarTextBox.ReadOnly

Description

The "ReadOnly" property specifies whether the text box is read-only.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.ReadOnly
```

See also

ControlBarTextBox (Page 6502)

ControlBarTextBox.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

See also

ControlBarTextBox (Page 6502)

ControlBarTextBox.Text

Description

The "Text" property specifies the label of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.Text
```

See also

ControlBarTextBox (Page 6502)

ControlBarTextBox.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.ToolTipText
```

See also

ControlBarTextBox (Page 6502)

ControlBarTextBox.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

See also

ControlBarTextBox (Page 6502)

ControlBarTextBox.Visible

Description

The "Visible" property specifies whether the text box is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Visible
```

See also

ControlBarTextBox (Page 6502)

ControlBarTextBox.Width

Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Width
```

See also

ControlBarTextBox (Page 6502)

ControlBarToggleSwitch

Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar.

You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarToggleSwitchPart

Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".

- **AlternateGraphic**
  Specifies the graphic for the "pressed" state.
- **AlternateText**
  Specifies the text for the "pressed" state.
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the identifier of the switch.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the switch can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the switch.
- **IsAlternateState**
  Specifies the current state of the switch.
- **Mapping**
  Returns the function of the switch.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.

- **Operability**
  Returns whether the switch is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the switch is only operable while the associated button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the switch is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarToggleSwitch.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.AlternateGraphic

Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateGraphic
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.AlternateText

Description

The "AlternateText" property specifies the text of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateText
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Authorization
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BackColor
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.Badge

Description

The "Badge" property specifies the identifier of the switch.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Badge
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderColor
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderWidth
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Content
```

See also

ControlBarToggleSwitch (Page 6522)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarToggleSwitch.Content (Page 6529)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarToggleSwitch.Content (Page 6529)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 6529)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarToggleSwitch.Content (Page 6529)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarToggleSwitch.Content (Page 6529)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarToggleSwitch.Content (Page 6529)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarToggleSwitch.Content (Page 6529)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 6529)

ControlBarToggleSwitch.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarToggleSwitch.CustomID
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.Enabled

Description

The "Enabled" property specifies whether the switch can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Enabled
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ForeColor
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.Graphic

Description

The "Graphic" property specifies the graphic of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Graphic
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.Height

Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Height
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.HotKey

Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
Button.HotKey
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.IsAlternateState

Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Mapping
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the switch.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Margin
```

See also

ControlBarToggleSwitch (Page 6522)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarToggleSwitch.Margin (Page 6540)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarToggleSwitch.Margin (Page 6540)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarToggleSwitch.Margin (Page 6540)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarToggleSwitch.Margin (Page 6540)

ControlBarToggleSwitch.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumHeight
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumWidth
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumHeight
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumWidth
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.Operability

Description

The property "Operability" returns whether the switch is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Operability
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the switch.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Padding
```

See also

ControlBarToggleSwitch (Page 6522)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarToggleSwitch.Padding (Page 6545)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarToggleSwitch.Padding (Page 6545)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarToggleSwitch.Padding (Page 6545)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarToggleSwitch.Padding (Page 6545)

ControlBarToggleSwitch.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.Text

Description

The "Text" property specifies the label of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Text
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ToolTipText
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.Visible

Description

The "Visible" property specifies whether the switch is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Visible
```

See also

ControlBarToggleSwitch (Page 6522)

ControlBarToggleSwitch.Width

Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Width
```

See also

ControlBarToggleSwitch (Page 6522)

ToolBar.Enabled

Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Enabled
```

See also

TrendControl.ToolBar (Page 6417)

ToolBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ToolBar.Font
```

See also

TrendControl.ToolBar (Page 6417)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ToolBar.Font (Page 6551)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ToolBar.Font (Page 6551)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ToolBar.Font (Page 6551)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ToolBar.Font (Page 6551)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ToolBar.Font (Page 6551)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ToolBar.Font (Page 6551)

ToolBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the toolbar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ToolBar.Margin
```

See also

TrendControl.ToolBar (Page 6417)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ToolBar.Margin (Page 6554)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ToolBar.Margin (Page 6554)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ToolBar.Margin (Page 6554)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ToolBar.Margin (Page 6554)

ToolBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ToolBar.Padding
```

See also

TrendControl.ToolBar (Page 6417)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ToolBar.Padding (Page 6557)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ToolBar.Padding (Page 6557)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ToolBar.Padding (Page 6557)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ToolBar.Padding (Page 6557)

ToolBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.ShowToolTips
```

See also

TrendControl.ToolBar (Page 6417)

ToolBar.UseHotKeys

Description

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.UseHotKeys
```

See also

TrendControl.ToolBar (Page 6417)

ToolBar.Visible

Description

The "Visible" property specifies whether the toolbar is visible.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Visible
```

See also

TrendControl.ToolBar (Page 6417)

TrendControl.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
TrendControl.Top
```

See also

TrendControl (Page 6374)

TrendControl.TrendAreas

Description

The "TrendAreas" property returns the trend areas ("TrendArea" objects) of the trend control.

Type

Object, HmiTrendAreaCollection (Page 6562)

Access

Read-only

Syntax

```
TrendControl.TrendAreas
```

See also

TrendControl (Page 6374)

HmiTrendAreaCollection (Page 6562)

HmiTrendAreaCollection

Description

The "HmiTrendAreaCollection" object is a list of all trend areas ("TrendArea" objects) of the trend view.

Use

The "HmiTrendAreaCollection" object is a list and can be counted and enumerated. You can access the "HmiTrendAreaCollection" list using the index or the tag name.

Object type

HmiTrendAreaCollection

Properties

The "HmiTrendAreaCollection" object has the following properties:

- **Count**
  Returns the number of trend areas of the "HmiTrendAreaCollection" list.

Methods

The "HmiTrendAreaCollection" object has the following methods:

- **Item()**
  Returns a trend area of the "HmiTrendAreaCollection" list.

See also

TrendControl.TrendAreas (Page 6561)

HmiTrendAreaCollection.Count

Description

The "Count" property returns the number of trend areas in the "HmiTrendAreaCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiTrendAreaCollection.Count
```

See also

HmiTrendAreaCollection (Page 6562)

HmiTrendAreaCollection.Item()

Description

The "Item" method returns a trend area of the "HmiTrendAreaCollection" list.

Syntax

```
HmiTrendAreaCollection[.Item](HmiTrendAreaName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiTrendAreaCollection" object.

Parameters

`HmiTrendAreaName`

Type: String

Name of the trend area

Return value

Object, HmiTrendAreaPart (Page 6564)

See also

HmiTrendAreaCollection (Page 6562)

TrendArea (Page 6564)

TrendArea

Description

The "TrendArea" object represents a trend view of the trend display.

Object type

HmiTrendAreaPart

Properties

The "TrendArea" object has the following properties:

- **BackColor**
  Specifies the background color.
- **BottomTimeAxes**
  Returns the lower time axes of the trend area.
- **GridLines**
  Specifies the grid lines of the trend area.
- **LeftValueAxes**
  Returns the left value axes of the trend area.
- **MajorGridLinesColor**
  Specifies the color of the main grid lines.
- **MinorGridLinesColor**
  Specifies the color of the auxiliary grid lines.
- **Name**
  Returns the name of the trend area.
- **RightValueAxes**
  Returns the right value axes of the trend area.
- **Ruler**
  Specifies the appearance of the ruler to determine the trend value.
- **SelectedTrend**
  Specifies the selected trend of the trend area.
- **SizeFactor**
  Specifies the scaling factor of the trend area relative to its height.

- **StatisticRulers**
  Specifies the two rulers for specifying the statistics area.
- **TopTimeAxes**
  Returns the upper time axes of the trend area.
- **Trends**
  Returns the trends of the trend area.
- **Visible**
  Specifies whether the trend area is visible.

Methods

--

TrendArea.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
TrendArea.BackColor
```

See also

TrendArea (Page 6564)

TrendArea.BottomTimeAxes

Description

The "BottomTimeAxes" property returns the lower time axes of the trend area.

Type

Object, HmiTimeAxisCollection (Page 6566)

Access

Read-only

Syntax

```
TrendArea.BottomTimeAxes
```

See also

TrendArea (Page 6564)

HmiTimeAxisCollection (Page 6566)

HmiTimeAxisCollection

Description

The "HmiTimeAxisCollection" object is a list of all time axes ("TimeAxis" objects) of the trend area.

Use

The "HmiTimeAxisCollection" object is a list and can be counted and enumerated. You can access the "HmiTimeAxisCollection" list using the index or the tag name.

Object type

HmiTimeAxisCollection

Properties

The "HmiTimeAxisCollection" object has the following properties:

- **Count**
  Returns the number of time axes of the "HmiTimeAxisCollection" list.

Methods

The "HmiTimeAxisCollection" object has the following methods:

- **Item()**
  Returns a time axis of the "HmiTimeAxisCollection" list.

See also

TrendArea.BottomTimeAxes (Page 6565)

HmiTimeAxisCollection.Count

Description

The "Count" property returns the number of time axes in the "HmiTimeAxisCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiTimeAxisCollection.Count
```

See also

HmiTimeAxisCollection (Page 6566)

HmiTimeAxisCollection.Item()

Description

The "Item" method returns a time axis of the "HmiTimeAxisCollection" list.

Syntax

```
HmiTimeAxisCollection[.Item](HmiTimeAxisName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiTimeAxisCollection" object.

Parameters

`HmiTimeAxisName`

Type: String

Name of the time axis

Return value

Object, HmiTimeAxisPart (Page 6568)

See also

HmiTimeAxisCollection (Page 6566)

TimeAxis (Page 6568)

TimeAxis

Description

The "TimeAxis" object represents a time axis of the trend area.

Object type

HmiTimeAxisPart

Properties

The "TimeAxis" object has the following properties:

- **AlwaysShowRecent**
  Specifies whether the area with the youngest value is always displayed.
- **AutoScaling**
  Specifies whether the automatic scaling is activated.
- **AxisColor**
  Specifies the color of the time axis.
- **BeginTime**
  Specifies the date and time for the start time of the time range.
- **DisplayName**
  Specifies the display name of the time axis.
- **EndTime**
  Specifies the date and time for the end time of the time range.
- **LabelColor**
  Specifies the color of the axis labeling.
- **LabelFont**
  Specifies the font of the axis labeling.
- **OutputFormat**
  Specifies the format for displaying the time axis values.
- **PointCount**
  Specifies the number of measurement points from the start time.
- **RangeType**
  Specifies the type of time range.

- **ScaleMode**
  Specifies the type of scaling.
- **TickColor**
  Specifies the color of the tick marks.
- **TimeRangeBase**
  Specifies the basis of the time range.
- **TimeRangeFactor**
  Specifies the factor of the time base for defining the time range.
- **Visible**
  Specifies whether the time axis is visible.

Methods

--

TimeAxis.AlwaysShowRecent

Description

The "AlwaysShowRecent" property specifies whether the area with the most recent value is always displayed.

Type

Bool

Access

Read-write

Syntax

```
TimeAxis.AlwaysShowRecent
```

See also

TimeAxis (Page 6568)

TimeAxis.AutoScaling

Description

The "AutoScaling" property specifies whether automatic scaling is activated.

Type

Bool

Access

Read-write

Syntax

```
TimeAxis.AutoScaling
```

See also

TimeAxis (Page 6568)

TimeAxis.AxisColor

Description

The "AxisColor" property specifies the color of the time axis.

Type

UInt32

Access

Read-write

Syntax

```
TimeAxis.BackColor
```

See also

TimeAxis (Page 6568)

TimeAxis.BeginTime

Description

The "BeginTime" property specifies the date and time for the start time of the time range.

Type

DateTime

Access

Read-write

Syntax

```
TimeAxis.BeginValue
```

See also

TimeAxis (Page 6568)

TimeAxis.DisplayName

Description

The "DisplayName" property specifies the display name of the time axis.

Type

String

Access

Read-write

Syntax

```
TimeAxis.DisplayName
```

See also

TimeAxis (Page 6568)

TimeAxis.EndTime

Description

The "EndTime" property specifies the date and time for the end time of the time range.

Type

DateTime

Access

Read-write

Syntax

```
TimeAxis.EndValue
```

See also

TimeAxis (Page 6568)

TimeAxis.LabelColor

Description

The "LabelColor" property specifies the color of the axis labeling.

Type

UInt32

Access

Read-write

Syntax

```
TimeAxis.LabelColor
```

See also

TimeAxis (Page 6568)

TimeAxis.LabelFont

Description

The "LabelFont" property specifies the font of the axis labeling.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
TimeAxis.LabelFont
```

See also

TimeAxis (Page 6568)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

TimeAxis.LabelFont (Page 6572)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

TimeAxis.LabelFont (Page 6572)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

TimeAxis.LabelFont (Page 6572)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

TimeAxis.LabelFont (Page 6572)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

TimeAxis.LabelFont (Page 6572)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal

- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

TimeAxis.LabelFont (Page 6572)

TimeAxis.OutputFormat

Description

The "OutputFormat" property specifies the format for displaying the axis values, e.g. "{0000}" for a 4-digit integer with leading zeros.

Type

String

Access

Read-write

Syntax

```
TimeAxis.OutputFormat
```

See also

TimeAxis (Page 6568)

TimeAxis.PointCount

Description

The "PointCount" property specifies the number of measurement points from the start time.

Type

Int32

Access

Read-write

Syntax

```
TimeAxis.PointCount
```

See also

TimeAxis (Page 6568)

TimeAxis.RangeType

Description

The "RangeType" property specifies the type of time range.

Type

Int32, HmiTimeRangeType

Specifies the time range:

- TimeRange (0): Any time range
- FromBeginToEnd (1): Total time range
- PointCount (2): Number of measurement points

Access

Read-write

Syntax

```
TimeAxis.RangeType
```

See also

TimeAxis (Page 6568)

TimeAxis.ScaleMode

Description

The "ScaleMode" property specifies the type of scaling.

Type

Int32, HmiScaleMode

Specifies the scaling:

- None (0): None
- Labels (1): Labels
- Ticks (2): Tick marks

Access

Read-write

Syntax

```
TimeAxis.ScaleMode
```

See also

TimeAxis (Page 6568)

TimeAxis.TickColor

Description

The "TickColor" property specifies the color of the tick marks.

Type

UInt32

Access

Read-write

Syntax

```
TimeAxis.TickColor
```

See also

TimeAxis (Page 6568)

TimeAxis.TimeRangeBase

Description

The "TimeRangeBase" property specifies the base of the time range.

Type

Int32, HmiTimeRangeBase

Specifies a time range:

- Undefined (0): Not defined
- Millisecond (1): Millisecond
- Second (2): Second
- Minute (3): Minute
- Hour (4): Hour
- Day (5): Day
- Month (6): Month
- Year (7): Year

Access

Read-write

Syntax

```
TimeAxis.TimeRangeBase
```

See also

TimeAxis (Page 6568)

TimeAxis.TimeRangeFactor

Description

The "TimeRangeFactor" property specifies the factor of the time base for defining the time range.

Type

Int32

Access

Read-write

Syntax

```
TimeAxis.TimeRangeFactor
```

See also

TimeAxis (Page 6568)

TimeAxis.Visible

Description

The "Visible" property specifies whether the time axis is visible.

Type

Bool

Access

Read-write

Syntax

```
TimeAxis.Visible
```

See also

TimeAxis (Page 6568)

TrendArea.GridLines

Description

The "GridLines" property specifies the grid lines of the trend area.

Type

Int32, HmiGridLine

Specifies the display of the grid lines:

- None (0): None
- VerticalMajor (1): Vertical, coarse
- HorizontalMajor (2): Horizontal, coarse
- VerticalMinor (4): Vertical, fine
- HorizontalMinor (8): Horizontal, fine

Access

Read-write

Syntax

```
TrendArea.GridLines
```

See also

TrendArea (Page 6564)

TrendArea.LeftValueAxes

Description

The "LeftValueAxes" property returns the left value axes of the trend area.

Type

Object, HmiYValueAxisCollection (Page 6582)

Access

Read-only

Syntax

```
TrendArea.LeftValueAxes
```

See also

TrendArea (Page 6564)

HmiYValueAxisCollection (Page 6582)

HmiYValueAxisCollection

Description

The "HmiYValueAxisCollection" object is a list of all value axes ("YValueAxis" objects) of the trend area.

Use

The "HmiYValueAxisCollection" object is a list and can be counted and enumerated. You can access the "HmiYValueAxisCollection" list using the index or the tag name.

Object type

HmiYValueAxisCollection

Properties

The "HmiYValueAxisCollection" object has the following properties:

- **Count**
  Returns the number of value axes in the "HmiYValueAxisCollection" list.

Methods

The "HmiYValueAxisCollection" object has the following methods:

- **Item()**
  Returns a value axis of the "HmiYValueAxisCollection" list.

See also

TrendArea.LeftValueAxes (Page 6581)

HmiYValueAxisCollection.Count

Description

The "Count" property returns the number of value axes in the "HmiYValueAxisCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiYValueAxisCollection.Count
```

See also

HmiYValueAxisCollection (Page 6582)

HmiYValueAxisCollection.Item()

Description

The "Item" method returns a value axis of the "HmiYValueAxisCollection" list.

Syntax

```
HmiYValueAxisCollection[.Item](HmiYValueAxisName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiYValueAxisCollection" object.

Parameters

`HmiYValueAxisName`

Type: String

Name of the value axis

Return value

Object, HmiYValueAxisPart (Page 6583)

See also

HmiYValueAxisCollection (Page 6582)

YValueAxis (Page 6583)

YValueAxis

Description

The "YValueAxis" object represents a value axis of the trend area.

Object type

HmiYValueAxisPart

Properties

The "YValueAxis" object has the following properties:

- **ApplyScalingEntries**
  Specifies whether the user scaling of the axis section is applied.
- **AutoRange**
  Specifies whether automatic determination of the value range is activated by the minimum and maximum value of the trend.
- **AutoScaling**
  Specifies whether the automatic scaling is activated.
- **AxisColor**
  Specifies the color of the value axis.
- **BeginValue**
  Specifies the start of a value range or value range section.
- **DisplayName**
  Specifies the display name of the value axis.
- **DivisionCount**
  Specifies the number of main units with subdivisions.
- **EndValue**
  Specifies the end of a value range or value range section.
- **HelpLines**
  Returns the appearance of the help lines.
- **LabelColor**
  Specifies the color of the axis labeling.
- **LabelFont**
  Specifies the font of the axis labeling.
- **LargeTickLabelingStep**
  Specifies the interval at which scale sections are labeled.
- **MeasurementUnit**
  Returns the displayed unit.
- **MeasurementUnitType**
  Specifies the display format of the unit.
- **OutputFormat**
  Specifies the format for displaying the axis values.
- **ScalingEntries**
  Returns the specification of the user scaling of the axis sections.
- **ScaleMode**
  Specifies the scale mode:

- **ScalingType**
  Specifies the scaling.
- **ShowScalingDisplayNames**
  Specifies whether the display names of the user scaling are used.
- **SubDivisionCount**
  Specifies the number of divisions of the main units.
- **TickColor**
  Specifies the color of the tick marks.
- **Visible**
  Specifies whether the value axis is visible.

Methods

--

YValueAxis.ApplyScalingEntries

Description

The "ApplyScalingEntries" property specifies whether the user scaling of the axis sections is applied.

Type

Bool

Access

Read-write

Syntax

```
YValueAxis.ApplyScalingEntries
```

See also

YValueAxis (Page 6583)

YValueAxis.AutoRange

Description

The "AutoRange" property specifies whether automatic determination of the value range is activated by the minimum and maximum value of the trend.

Type

Bool

Access

Read-write

Syntax

```
YValueAxis.AutoRange
```

See also

YValueAxis (Page 6583)

YValueAxis.AutoScaling

Description

The "AutoScaling" property specifies whether automatic scaling is activated.

Type

Bool

Access

Read-write

Syntax

```
YValueAxis.AutoScaling
```

See also

YValueAxis (Page 6583)

YValueAxis.AxisColor

Description

The "AxisColor" property specifies the color of the value axis.

Type

UInt32

Access

Read-write

Syntax

```
YValueAxis.BackColor
```

See also

YValueAxis (Page 6583)

YValueAxis.BeginValue

Description

The "BeginValue" property specifies the start of a value range or value range section.

Type

Float

Access

Read-write

Syntax

```
YValueAxis.BeginValue
```

See also

YValueAxis (Page 6583)

YValueAxis.DisplayName

Description

The "DisplayName" property specifies the display name of the value axis.

Type

String

Access

Read-write

Syntax

```
YValueAxis.DisplayName
```

See also

YValueAxis (Page 6583)

YValueAxis.DivisionCount

Description

The "DivisionCount" property specifies the number of main units with subdivisions. To this purpose the automatic scaling must be switched off.

Type

Int32

Access

Read-write

Syntax

```
YValueAxis.DivisionCount
```

See also

YValueAxis (Page 6583)

YValueAxis.EndValue

Description

The "EndValue" property specifies the end of a value range or value range section.

Type

Float

Access

Read-write

Syntax

```
YValueAxis.EndValue
```

See also

YValueAxis (Page 6583)

YValueAxis.HelpLines

Description

The "HelpLines" property returns the appearance of the help lines.

Type

Object, HmiHelpLineCollection (Page 6589)

Access

Read-only

Syntax

```
YValueAxis.HelpLines
```

See also

YValueAxis (Page 6583)

HmiHelpLineCollection (Page 6589)

HmiHelpLineCollection

Description

The "HmiHelpLineCollection" object is a list of all help lines ("HelpLine" objects).

Use

The "HmiHelpLineCollection" object is a list and can be counted and enumerated. You can access the "HmiHelpLineCollection" list using the index or the tag name.

Object type

HmiHelpLineCollection

Properties

The "HmiHelpLineCollection" object has the following properties:

- **Count**
  Returns the number of help lines of the "HmiHelpLineCollection" list.

Methods

The "HmiHelpLineCollection" object has the following methods:

- **Item()**
  Returns a help line of the "HmiHelpLineCollection" list.

See also

YValueAxis.HelpLines (Page 6589)

HmiHelpLineCollection.Count

Description

The "Count" property returns the number of help lines in the "HmiHelpLineCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiHelpLineCollection.Count
```

See also

HmiHelpLineCollection (Page 6589)

HmiHelpLineCollection.Item()

Description

The "Item" method returns help line of the "HmiHelpLineCollection" list.

Syntax

```
HmiHelpLineCollection[.Item](HmiHelpLineName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiHelpLineCollection" object.

Parameters

HmiHelpLineName

Type: String

Name of the help line

Return value

Object, HmiHelpLinePart (Page 6591)

See also

HmiHelpLineCollection (Page 6589)

HelpLine (Page 6591)

HelpLine

Description

The "HelpLine" object represents a help line of the value axis.

Object type

HmiHelpLinePart

Properties

The "HelpLine" object has the following properties:

- **Value**
  Specifies the value of the help line.
- **Visible**
  Specifies whether the help line is visible.

Methods

--

HelpLine.Value

Description

The "Value" property sets the value of the help line.

Type

Float

Access

Read-write

Syntax

```
HelpLine.Value
```

See also

HelpLine (Page 6591)

HelpLine.Visible

Description

The "Visible" property specifies whether the help line is visible.

Type

Bool

Access

Read-write

Syntax

```
HelpLine.Visible
```

See also

HelpLine (Page 6591)

YValueAxis.LabelColor

Description

The "LabelColor" property specifies the color of the axis labeling.

Type

UInt32

Access

Read-write

Syntax

```
YValueAxis.LabelColor
```

See also

YValueAxis (Page 6583)

YValueAxis.LabelFont

Description

The "LabelFont" property specifies the font of the axis labeling.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
YValueAxis.LabelFont
```

See also

YValueAxis (Page 6583)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

YValueAxis.LabelFont (Page 6593)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

YValueAxis.LabelFont (Page 6593)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

YValueAxis.LabelFont (Page 6593)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

YValueAxis.LabelFont (Page 6593)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

YValueAxis.LabelFont (Page 6593)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

YValueAxis.LabelFont (Page 6593)

YValueAxis.LargeTickLabelingStep

Description

The "LargeTickLabelingStep" property specifies the interval at which scale sections are labeled.

Type

UInt8

Access

Read-write

Syntax

```
YValueAxis.LargeTickLabelingStep
```

See also

YValueAxis (Page 6583)

YValueAxis.MeasurementUnit

Description

The "MeasurementUnit" property returns the displayed unit.

Type

String

Access

Read-only

Syntax

```
YValueAxis.MeasurementUnit
```

See also

YValueAxis (Page 6583)

YValueAxis.MeasurementUnitType

Description

The "MeasurementUnitType" property specifies the display format of the unit.

Type

Int32, HmiMeasurementUnit

Specifies the display format:

- None (0): No unit
- Name (1): Unit name, for example "kilogram"
- Symbol (2): Unit, for example "kg"

Access

Read-write

Syntax

```
YValueAxis.MeasurementUnitType
```

See also

YValueAxis (Page 6583)

YValueAxis.OutputFormat

Description

The "OutputFormat" property specifies the format for displaying the axis values, e.g. "{0000}" for a 4-digit integer with leading zeros.

Type

String

Access

Read-write

Syntax

```
YValueAxis.OutputFormat
```

See also

YValueAxis (Page 6583)

YValueAxis.ScalingEntries

Description

The "ScalingEntries" property returns the user scaling of the axes sections.

Type

Object, HmiScalingEntryCollection (Page 6600)

Access

Read-only

Syntax

```
YValueAxis.ScalingEntries
```

See also

YValueAxis (Page 6583)

HmiScalingEntryCollection (Page 6600)

HmiScalingEntryCollection

Description

The "HmiScalingEntryCollection" object is a list of all user-defined axis sections ("ScalingEntry" objects).

Use

The "HmiScalingEntryCollection" object is a list and can be counted and enumerated. You can access the "HmiScalingEntryCollection" list using the index or the tag name.

Object type

HmiHelpLineCollection

Properties

The "HmiScalingEntryCollection" object has the following properties:

- **Count**
  Returns the number of user-defined axis sections of the "HmiScalingEntryCollection" list.

Methods

The "HmiScalingEntryCollection" object has the following methods:

- **Item()**
  Returns a user-defined axis section of the "HmiScalingEntryCollection" list.

See also

YValueAxis.ScalingEntries (Page 6599)

HmiScalingEntryCollection.Count

Description

The "Count" property returns the number of the user-defined axis sections in the "HmiScalingEntryCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiScalingEntryCollection.Count
```

See also

HmiScalingEntryCollection (Page 6600)

HmiScalingEntryCollection.Item()

Description

The "Item" method returns a user-defined axis section of the "HmiScalingEntryCollection" list.

Syntax

```
HmiScalingEntryCollection[.Item](HmiScalingEntryName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiScalingEntryCollection" object.

Parameters

`HmiScalingEntryName`

Type: String

Name of the user-defined axis section

Return value

Object, HmiScalingEntryPart (Page 6602)

See also

HmiScalingEntryCollection (Page 6600)

Scaling Entry (Page 6602)

Scaling Entry

Description

The "ScalingEntry" object represents a user-defined axis section of the value axis.

Object type

HmiScalingEntryPart

Properties

The "YValueAxis" object has the following properties:

- **BeginValue**
  Specifies the start of a value range section.
- **BeginValueTarget**
  Specifies the scaled value for the start of a value range section.
- **DisplayName**
  Specifies the display name of an axis section.
- **EndValue**
  Specifies the end of a value range section.
- **EndValueTarget**
  Specifies the scaled value for the end of a value range section.

Methods

--

ScalingEntry.BeginValue

Description

The "BeginValue" property specifies the start of a value range section.

Type

Float

Access

Read-write

Syntax

```
ScalingEntry.BeginValue
```

See also

Scaling Entry (Page 6602)

ScalingEntry.BeginValueTarget

Description

The"BeginValueTarget" property specifies the scaled value for the start of a value range section.

Type

Float

Access

Read-write

Syntax

```
ScalingEntry.BeginValueTarget
```

See also

Scaling Entry (Page 6602)

ScalingEntry.DisplayName

Description

The "DisplayName" property specifies the display name of an axis section.

Type

String

Access

Read-write

Syntax

```
ScalingEntry.DisplayName
```

See also

Scaling Entry (Page 6602)

ScalingEntry.EndValue

Description

The "EndValue" property specifies the end of a value range section.

Type

Float

Access

Read-write

Syntax

```
ScalingEntry.EndValue
```

See also

Scaling Entry (Page 6602)

ScalingEntry.EndValueTarget

Description

The"EndValueTarget" property specifies the scaled value for the end of a value range section.

Type

Float

Access

Read-write

Syntax

```
ScalingEntry.EndValueTarget
```

See also

Scaling Entry (Page 6602)

YValueAxis.ScaleMode

Description

The "ScaleMode" property specifies the scale mode.

Type

Int32, HmiScaleMode

Specifies the scale mode:

- None (0): None
- Labels (1): Labels
- Ticks (2): Tick marks

Access

Read-write

Syntax

```
YValueAxis.ScaleMode
```

See also

YValueAxis (Page 6583)

YValueAxis.ScalingType

Description

The "ScalingType" property specifies the scaling.

Type

Int32, HmiScalingType

Specifies the scaling:

- Linear (0): Linear
- Logarithmic (1): Logarithmic
- NegativeLogarithmic (2): Negative logarithmic
- Tangent (4): Tangential
- Quadratic (5): Square
- Cubic (6): Cubic

Access

Read-write

Syntax

```
YValueAxis.ScalingType
```

See also

YValueAxis (Page 6583)

YValueAxis.ShowScalingDisplayNames

Description

The "ShowScalingDisplayNames" property specifies whether the display names of the user scaling are used.

Type

Bool

Access

Read-write

Syntax

```
YValueAxis.ShowScalingDisplayNames
```

See also

YValueAxis (Page 6583)

YValueAxis.SubDivisionCount

Description

The "SubDivisionCount" property specifies the number of subdivisions of the main units.

Type

Int32

Access

Read-write

Syntax

```
YValueAxis.SubDivisionCount
```

See also

YValueAxis (Page 6583)

YValueAxis.TickColor

Description

The "TickColor" property specifies the color of the tick marks.

Type

UInt32

Access

Read-write

Syntax

```
YValueAxis.TickColor
```

See also

YValueAxis (Page 6583)

YValueAxis.Visible

Description

The "Visible" property specifies whether the value axis is visible.

Type

Bool

Access

Read-write

Syntax

```
YValueAxis.Visible
```

See also

YValueAxis (Page 6583)

TrendArea.MajorGridLinesColor

Description

The "MajorGridLinesColor" property specifies the color of the main grid lines.

Type

UInt32

Access

Read-write

Syntax

```
TrendArea.MajorGridLinesColor
```

See also

TrendArea (Page 6564)

TrendArea.MinorGridLinesColor

Description

The "MinorGridLinesColor" specifies the color of the auxiliary grid lines.

Type

UInt32

Access

Read-write

Syntax

```
TrendArea.MinorGridLinesColor
```

See also

TrendArea (Page 6564)

TrendArea.Name

Description

The "Name" property returns the name of the trend view.

Type

String

Access

Read-only

Syntax

```
TrendArea.Name
```

See also

TrendArea (Page 6564)

TrendArea.RightValueAxes

Description

The "RightValueAxes" property returns the right value axes of the trend area.

Type

Object, HmiYValueAxisCollection (Page 6610)

Access

Read-only

Syntax

```
TrendArea.RightValueAxes
```

See also

TrendArea (Page 6564)

HmiYValueAxisCollection (Page 6610)

HmiYValueAxisCollection

Description

The "HmiYValueAxisCollection" object is a list of all value axes ("YValueAxis" objects) of the trend area.

Use

The "HmiYValueAxisCollection" object is a list and can be counted and enumerated. You can access the "HmiYValueAxisCollection" list using the index or the tag name.

Object type

HmiYValueAxisCollection

Properties

The "HmiYValueAxisCollection" object has the following properties:

- **Count**
  Returns the number of value axes in the "HmiYValueAxisCollection" list.

Methods

The "HmiYValueAxisCollection" object has the following methods:

- **Item()**
  Returns a value axis of the "HmiYValueAxisCollection" list.

See also

TrendArea.RightValueAxes (Page 6609)

HmiYValueAxisCollection.Count

Description

The "Count" property returns the number of value axes in the "HmiYValueAxisCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiYValueAxisCollection.Count
```

See also

HmiYValueAxisCollection (Page 6610)

HmiYValueAxisCollection.Item()

Description

The "Item" method returns a value axis of the "HmiYValueAxisCollection" list.

Syntax

```
HmiYValueAxisCollection[.Item](HmiYValueAxisName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiYValueAxisCollection" object.

Parameters

`HmiYValueAxisName`

Type: String

Name of the value axis

Return value

Object, HmiYValueAxisPart (Page 6583)

See also

HmiYValueAxisCollection (Page 6610)

YValueAxis (Page 6583)

YValueAxis

Description

YValueAxis (Page 6583)

TrendArea.Ruler

Description

The "Ruler" property specifies the appearance of the ruler for determining the trend value.

Type

Object, HmiRulerPart

Access

Read-write

Syntax

```
TrendArea.Ruler
```

See also

TrendArea (Page 6564)

Ruler.Color

Description

The "Color" property specifies the color of the ruler.

Type

UInt32

Access

Read-write

Syntax

```
Ruler.Color
```

See also

TrendArea.Ruler (Page 6612)

Ruler.Width

Description

The "Width" property specifies the width of the ruler.

Type

UInt32

Access

Read-write

Syntax

```
Ruler.Width
```

See also

TrendArea.Ruler (Page 6612)

TrendArea.SelectedTrend

Description

The "SelectedTrend" property specifies the selected trend of the trend area.

Type

Object, HmiTrendPart (Page 6621)

Access

Read-write

Syntax

```
TrendArea.SelectedTrend
```

See also

TrendArea (Page 6564)

Trend (Page 6621)

Trend

Description

Trend (Page 6621)

TrendArea.SizeFactor

Description

The "SizeFactor" property specifies the scaling factor of the trend area relative to its height.

Type

UInt16

Access

Read-write

Syntax

```
TrendArea.SizeFactor
```

See also

TrendArea (Page 6564)

TrendArea.StatisticRulers

Description

The "StatisticRulers" property specifies the two rulers for specifying the statistics area.

Type

Object, HmiRulerPart

Access

Read-write

Syntax

```
TrendArea.StatisticRulers
```

See also

TrendArea (Page 6564)

Ruler.Color

Description

The "Color" property specifies the color of the ruler.

Type

UInt32

Access

Read-write

Syntax

```
Ruler.Color
```

See also

TrendArea.StatisticRulers (Page 6615)

Ruler.Width

Description

The "Width" property specifies the width of the ruler.

Type

UInt32

Access

Read-write

Syntax

```
Ruler.Width
```

See also

TrendArea.StatisticRulers (Page 6615)

TrendArea.TopTimeAxes

Description

The "TopTimeAxes" property returns the upper value axes of the trend area.

Type

Object, HmiTimeAxisCollection (Page 6617)

Access

Read-only

Syntax

```
TrendArea.TopTimeAxes
```

See also

TrendArea (Page 6564)

HmiTimeAxisCollection (Page 6617)

HmiTimeAxisCollection

Description

The "HmiTimeAxisCollection" object is a list of all time axes ("TimeAxis" objects) of the trend area.

Use

The "HmiTimeAxisCollection" object is a list and can be counted and enumerated. You can access the "HmiTimeAxisCollection" list using the index or the tag name.

Object type

HmiTimeAxisCollection

Properties

The "HmiTimeAxisCollection" object has the following properties:

- **Count**
  Returns the number of time axes of the "HmiTimeAxisCollection" list.

Methods

The "HmiTimeAxisCollection" object has the following methods:

- **Item()**
  Returns a time axis of the "HmiTimeAxisCollection" list.

See also

TrendArea.TopTimeAxes (Page 6616)

HmiTimeAxisCollection.Count

Description

The "Count" property returns the number of time axes in the "HmiTimeAxisCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiTimeAxisCollection.Count
```

See also

HmiTimeAxisCollection (Page 6617)

HmiTimeAxisCollection.Item()

Description

The "Item" method returns a time axis of the "HmiTimeAxisCollection" list.

Syntax

```
HmiTimeAxisCollection[.Item](HmiTimeAxisName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiTimeAxisCollection" object.

Parameters

`HmiTimeAxisName`

Type: String

Name of the time axis

Return value

Object, HmiTimeAxisPart (Page 6568)

See also

HmiTimeAxisCollection (Page 6617)

TimeAxis (Page 6568)

TimeAxis

Description

TimeAxis (Page 6568)

TrendArea.Trends

Description

The "Trends" property returns the trends ("Trend" objects) of the trend area.

Type

Object, HmiTrendCollection (Page 6619)

Access

Read-only

Syntax

```
TrendArea.Trends
```

See also

TrendArea (Page 6564)

HmiTrendCollection (Page 6619)

HmiTrendCollection

Description

The "HmiTrendCollection" object is a list of all trends ("Trend" objects) of the trend view.

Use

The "HmiTrendCollection" object is a list and can be counted and enumerated. You can access the "HmiTrendCollection" list using the index or the tag name.

Object type

HmiTrendCollection

Properties

The "HmiTrendCollection" object has the following properties:

- **Count**
  Returns the number of trends of the "HmiTrendCollection" list.

Methods

The "HmiTrendCollection" object has the following methods:

- **Item()**
  Returns a trend of the "HmiTrendCollection" list.

See also

TrendArea.Trends (Page 6619)

HmiTrendCollection.Count

Description

The "Count" property returns the number of curves in the "HmiTrendCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiTrendCollection.Count
```

See also

HmiTrendCollection (Page 6619)

HmiTrendCollection.Item()

Description

The "Item" method returns a trend of the "HmiTrendCollection" list.

Syntax

```
HmiTrendCollection[.Item](HmiTrendName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiTrendCollection" object.

Parameters

`HmiTrendName`

Type: String

Trend name

Return value

Object, HmiTrendPart (Page 6621)

See also

HmiTrendCollection (Page 6619)

Trend (Page 6621)

Trend

Description

The "Trend" object represents a trend of the trend area.

Object type

HmiTrendPart

Properties

The "Trend" object has the following properties:

- **AggregationMode**
  Specifies the compression of values for logging tags.
- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **BackColor**
  Specifies the background color.
- **BackFillPattern**
  Specifies the pattern of the background or the fill.
- **DashType**
  Specifies the stroke style of the trend.
- **DataSourceY**
  Specifies the tag for the data source of the value axis.
- **DisplayName**
  Specifies the display name of the trend.

- **LineColor**
  Specifies the line color.
- **LineWidth**
  Specifies the line thickness.
- **MarkerColor**
  Specifies the color of the trend points.
- **MarkerDimension**
  Specifies the width of the trend points.
- **MarkerGraphic**
  Specifies a graphic object as a trend point.
- **MarkerType**
  Specifies the type of the trend points.
- **QualityVisualization**
  Specifies the colors for values of a specific quality.
- **ShowLoggedDataImmediately**
  Specifies which logged values are displayed.
- **Thresholds**
  Returns the list of all limit values of the trend.
- **TimeAxis**
  References a time axis of the trend.
- **TrendMode**
  Specifies the type of trend view.
- **Visible**
  Specifies whether the trend is visible.
- **YValueAxis**
  References a value axis of the trend.

Methods

--

Trend.AggregationMode

Description

The "AggregationMode" property specifies the compression of values for logging tags.

Type

Int32, HmiAggregationMode

Specifies the type of compression:

- None (0): None
- TimeAverageStepped (1): Average over time displayed in steps
- MinMax (2): Lowest and highest value from defined period

Access

Read-write

Syntax

```
Trend.AggregationMode
```

See also

Trend (Page 6621)

Trend.AlternateBackColor

Description

The "AlternateBackColor" specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
Trend.AlternateBackColor
```

See also

Trend (Page 6621)

Trend.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
Trend.BackColor
```

See also

Trend (Page 6621)

Trend.BackFillPattern

Description

The "BackFillPattern" property specifies the pattern of the background or the fill.

Type

Int32, HmiFillPattern

Specifies the filling:

- Solid (0): Solid
- Transparent (65536): Transparent
- Horizontal (131072): Horizontal
- Vertical (131073): Vertical
- ForwardDiagonal (131074): Forward diagonal stripe
- BackwardDiagonal (131075): Backward diagonal stripe
- Cross (131076): Cross
- DiagonalCross (131077): Diagonal cross
- GradientHorizontal (1048576): Horizontal gradient
- GradientVertical (1048577): Vertical gradient
- GradientForwardDiagonal (1048578): Gradient forward diagonal
- GradientBackwardDiagonal (1048579): Gradient backward diagonal
- GradientHorizontalTricolor (1048832): Horizontal tricolor gradient
- GradientVerticalTricolor (1048833): Vertical tricolor gradient

- GradientForwardDiagonalTricolor (1048834): Forward diagonal tricolor gradient
- GradientBackwardDiagonalTricolor (1048835): Backward diagonal tricolor gradient

Access

Read-write

Syntax

```
Trend.BackFillPattern
```

See also

Trend (Page 6621)

Trend.DashType

Description

The "DashType" property specifies the stroke style type of the trend.

Type

Int32, HmiDashType

Specifies the stroke style:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted
- DashDot (3): Dash-dot
- DashDotDot (4): Dash-dot-dot

Access

Read-write

Syntax

```
Trend.DashType
```

See also

Trend (Page 6621)

Trend.DataSourceY

Description

The "DataSourceY" property specifies the tag for the data source of the values axis.

Type

Object, HmiDataSourcePart

Access

Read-write

Syntax

```
Trend.DataSourceX
```

See also

Trend (Page 6621)

DataSource.Source

Description

The "Source" property specifies the data source, e.g. a tag or logging tag.

Type

String

Access

Read-write

Syntax

```
DataSource.Source
```

See also

Trend.DataSourceY (Page 6626)

DataSource.VisualizeQuality

Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

Type

Bool

Access

Read-write

Syntax

```
DataSource.VisualizeQuality
```

See also

Trend.DataSourceY (Page 6626)

Trend.DisplayName

Description

The "DisplayName" property specifies the display name of the trend.

Type

String

Access

Read-write

Syntax

```
Trend.DisplayName
```

See also

Trend (Page 6621)

Trend.LineColor

Description

The "LineColor" property specifies the line color.

Type

UInt32

Access

Read-write

Syntax

```
Trend.LineColor
```

See also

Trend (Page 6621)

Trend.LineWidth

Description

The "LineWidth" property specifies the line thickness.

Type

UInt8

Access

Read-write

Syntax

```
Trend.LineWidth
```

See also

Trend (Page 6621)

Trend.MarkerColor

Description

The "MarkerColor" property specifies the color of the trend points.

Type

UInt32

Access

Read-write

Syntax

```
Trend.MarkerColor
```

See also

Trend (Page 6621)

Trend.MarkerDimension

Description

The "MarkerDimension" property specifies the width of the trend points.

Type

UInt32

Access

Read-write

Syntax

```
Trend.MarkerDimension
```

See also

Trend (Page 6621)

Trend.MarkerGraphic

Description

The "MarkerGraphic" property specifies a graphic object as a trend point.

Type

String

Access

Read-write

Syntax

```
Trend.MarkerGraphic
```

See also

Trend (Page 6621)

Trend.MarkerType

Description

The "MarkerType" property specifies the type of trend points.

Type

Int32, HmiMarkerType

Specifies the type of the trend points:

- None (0): None
- Points (1): Dots
- Square (2): Square
- Circle (3): Circles
- Graphic (4): Graphic

Access

Read-write

Syntax

```
Trend.MarkerType
```

See also

Trend (Page 6621)

Trend.QualityVisualization

Description

The "QualityVisualization" property specifies the colors for values of a specific quality.

Type

Object, HmiQualityPart

Access

Read-write

Syntax

```
Trend.QualityVisualization
```

See also

Trend (Page 6621)

Quality.BadColor

Description

The "BadColor" property specifies the color for values of the quality "Bad". Values of this quality cannot be used.

Type

UInt32

Access

Read-write

Syntax

```
Quality.BadColor
```

See also

Trend.QualityVisualization (Page 6631)

Quality.UncertainColor

Description

The "UncertainColor" property specifies the color for values of the quality "Uncertain". The quality of this level's values is worse than usual. It might still be possible to use the values, however.

Type

UInt32

Access

Read-write

Syntax

```
Quality.UncertainColor
```

See also

Trend.QualityVisualization (Page 6631)

Quality.Visible

Description

The "Visible" property specifies whether the colors are visible.

Type

Bool

Access

Read-write

Syntax

```
Quality.Visible
```

See also

Trend.QualityVisualization (Page 6631)

Trend.ShowLoggedDataImmediately

Description

The "ShowLoggedDataImmediately" property specifies which logged values are displayed:

- True: Entire visible range
- False: Only from current time

Type

Bool

Access

Read-write

Syntax

```
Trend.ShowLoggedDataImmediately
```

See also

Trend (Page 6621)

Trend.Thresholds

Description

The "Thresholds" property returns the list of all limit values ("Threshold" objects) of the trend.

Type

Object, HmiThresholdCollection (Page 6634)

Access

Read-only

Syntax

```
Trend.Thresholds
```

See also

Trend (Page 6621)

HmiThresholdCollection (Page 6634)

HmiThresholdCollection

Description

The "HmiThresholdCollection" object is a list of all limit values ("Threshold" objects).

Use

The "HmiThresholdCollection" object is a list and can be counted and enumerated. You can access the "HmiThresholdCollection" list using the index or the tag name.

Object type

HmiThresholdCollection

Properties

The "HmiThresholdCollection" object has the following properties:

- **Count**
  Returns the number of limit values of the "HmiThresholdCollection" list.

Methods

The "HmiThresholdCollection" object has the following methods:

- **Item()**
  Returns a limit value of the "HmiThresholdCollection" list.

See also

Trend.Thresholds (Page 6633)

HmiThresholdCollection.Count

Description

The "Count" property returns the number of limit values in the "HmiThresholdCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiThresholdCollection.Count
```

See also

HmiThresholdCollection (Page 6634)

HmiThresholdCollection.Item()

Description

The "Item" method returns a limit value of the "HmiThresholdCollection" list.

Syntax

```
HmiThresholdCollection[.Item](HmiThresholdName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiThresholdCollection" object.

Parameters

`HmiThresholdName`

Type: String

Name of the limit value

Return value

Object, HmiThresholdPart (Page 6636)

See also

HmiThresholdCollection (Page 6634)

Threshold (Page 6636)

Threshold

Description

The "Threshold" object represents a limit value.

Object type

HmiThresholdPart

Properties

The "Threshold" object has the following properties:

- **Color**
  Specifies the color of the limit value.
- **DisplayName**
  Specifies the display name of the limit value.
- **Name**
  Specifies the name of the limit value.
- **ThresholdMode**
  Specifies the type of limit value.
- **Value**
  Returns the limit value.

Methods

--

Threshold.Color

Description

The "Color" property specifies the color of the limit value.

Type

UInt32

Access

Read-write

Syntax

```
Threshold.Color
```

See also

Threshold (Page 6636)

Threshold.DisplayName

Description

The "DisplayName" property specifies the display name of the limit value.

Type

String

Access

Read-write

Syntax

```
Threshold.DisplayName
```

See also

Threshold (Page 6636)

Threshold.Name

Description

The "Name" property specifies the name of the limit value.

Type

String

Access

Read-write

Syntax

```
Threshold.Name
```

See also

Threshold (Page 6636)

Threshold.ThresholdMode

Description

The "ThresholdMode" property specifies the type of limit value.

Type

Int32, HmiThresholdMode

Specifies the threshold value:

- Undefined (0): Undefined
- Upper (1): Upper threshold
- Lower (2): Lower threshold
- Normal (3): Normal threshold
- Minimum (4): Minimum threshold
- Maximum (5): Maximum threshold

Access

Read-write

Syntax

```
Threshold.ThresholdMode
```

See also

Threshold (Page 6636)

Threshold.Value

Description

The "Value" property returns the limit value of the tag.

Type

Float

Access

Read-only

Syntax

```
Threshold.Value
```

See also

Threshold (Page 6636)

Trend.TimeAxis

Description

The "TimeAxis" property references a time axis of the trend.

Type

Object, HmiTimeAxisPart (Page 6568)

Access

Read-write

Syntax

```
Trend.TimeAxis
```

See also

Trend (Page 6621)

TimeAxis (Page 6568)

TimeAxis

Description

TimeAxis (Page 6568)

Trend.TrendMode

Description

The "TrendMode" property specifies the type of trend view.

Type

Int32, HmiTrendMode

Specifies the trend type:

- Points (0): Dots
- Interpolated (1): Interpolated
- Stepped (2): Levels
- Bar (3): Bar
- Value (4): Values

Access

Read-write

Syntax

```
Trend.TrendMode
```

See also

Trend (Page 6621)

Trend.Visible

Description

The "Visible" property specifies whether the trend is visible.

Type

Bool

Access

Read-write

Syntax

```
Trend.Visible
```

See also

Trend (Page 6621)

Trend.YValueAxis

Description

The "YValueAxis" property references a value axis of the trend.

Type

Object, HmiYValueAxisPart (Page 6583)

Access

Read-write

Syntax

```
Trend.YValueAxis
```

See also

Trend (Page 6621)

YValueAxis (Page 6583)

YValueAxis

Description

YValueAxis (Page 6583)

TrendArea.Visible

Description

The "Visible" property specifies whether the trend area is visible.

Type

Bool

Access

Read-write

Syntax

```
TrendArea.Visible
```

See also

TrendArea (Page 6564)

TrendControl.Visible

Description

The "Visible" property specifies whether the trend view is visible.

Type

Bool

Access

Read-write

Syntax

```
TrendControl.Visible
```

See also

TrendControl (Page 6374)

TrendControl.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
TrendControl.Width
```

See also

TrendControl (Page 6374)

TrendControl.WindowFlags

Description

The "WindowFlags" property specifies the window configuration of the trend view.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

Enable multiple properties by adding the integer values or bit operators.

Access

Read-write

Syntax

```
TrendControl.WindowFlags
```

Example

Adapt the "windowFlags" tag depending on the window configuration:

Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose){
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

See also

TrendControl (Page 6374)

TrendControl.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the trend view.

Syntax

```
TrendControl.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

TrendControl (Page 6374)

TrendControl.FireCommand()

Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the trend view.

Syntax

```
TrendControl.FireCommand(commandId, custom)
```

Parameters

commandId

Type: Int32

ID of the element of the toolbar or information bar

custom

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

Return value

--

See also

TrendControl (Page 6374)

TrendControl.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
TrendControl.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

`propertyName`

Type: String

Name of the property for which flashing is configured.

`enable`

Type: Bool

Specifies that flashing is activated.

`value`

Optional, type: Variant

Value of the property for which flashing is configured.

`alternateValue`

Optional, type: Variant

Specifies the second value for flashing.

`rate`

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

TrendControl (Page 6374)

TrendControl_OnActivated()

Description

The "OnActivated" event occurs when a trend view receives focus:

- A trend view is selected via the configured tab sequence.
- A trend view that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
TrendControl_OnActivated(item)
```

Context

item

Type: Object

Trend view where the event occurs.

See also

TrendControl (Page 6374)

TrendControl_OnCommandFired()

Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the trend control.

Syntax

```
TrendControl_OnCommandFired(item, commandId, custom)
```

Context

item

Type: Object

Trend control where the event occurs.

commandId

Type: DInt

ID of the element of the toolbar or information bar that was operated.

custom

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

See also

TrendControl (Page 6374)

TrendControl_OnDeactivated()

Description

The "OnDeactivated" event occurs when a trend view loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

Syntax

```
TrendControl_OnDeactivated(item)
```

Context

item

Type: Object

Trend view where the event occurs.

See also

TrendControl (Page 6374)

TrendControl_OnInitialized()

Description

The "OnInitialized" event occurs when a trend view has been successfully initialized and the data connection to the PLC has been established.

Syntax

```
TrendControl_OnInitialized(item)
```

Context

item

Type: Object

Trend view where the event occurs.

See also

TrendControl (Page 6374)

WebControl

Description

The "WebControl" object represents a web browser in runtime.

Object type

HmiWebControl

Properties

The "WebControl" object has the following properties:

- **BackColor**
  Specifies the background color.
- **Caption**
  Specifies the text that is displayed in the title bar.
- **CaptionColor**
  Specifies the background color of the title bar.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the web browser.
- **Enabled**
  Specifies whether the web browser can be operated in runtime.

- **Height**
  Specifies the height.
- **Icon**
  Specifies the icon of the web browser.
- **Layer**
  Returns the screen layer in which the web browser is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the web browser.
- **Parent**
  Returns the higher-level screen object.
- **RenderingTemplate**
  Returns the name of the template from which the web browser was created.
- **ShowFocusVisual**
  Specifies whether the web browser is highlighted when in focus.
- **StatusBar**
  Specifies the information bar of the web browser.
- **StyleItemClass**
  Returns the style which is applied to the web browser.
- **TabIndex**
  Returns the position of the web browser in the tab sequence.
- **ToolBar**
  Specifies the toolbar of the web browser.
- **Top**
  Specifies the value of the Y coordinate.
- **Url**
  Specifies the URL displayed by the web browser.
- **Visible**
  Specifies whether the web browser is visible.
- **Width**
  Specifies the width.
- **WindowFlags**
  Specifies the window configuration of the web browser.

Methods

The "WebControl" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the web browser.
- **FireCommand()**
  Configures the occurrence of an event for an element.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "WebControl" object has the following events:

- **OnActivated()**
  Occurs when a web browser receives focus.
- **OnCommandFired()**
  Occurs when the operator has operated an element in the toolbar or information bar of the web browser.
- **OnDeactivated()**
  Occurs when a web browser loses focus.
- **OnInitialized()**
  Occurs when a web browser has been successfully initialized and the data connection to the PLC has been established.

WebControl.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
WebControl.BackColor
```

See also

WebControl (Page 6649)

WebControl.Caption

Description

The "Caption" property specifies the text that is displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
WebControl.Caption
```

See also

WebControl (Page 6649)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

WebControl.Caption (Page 6652)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 6652)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 6652)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 6652)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 6652)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 6652)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 6652)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

WebControl.Caption (Page 6652)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

WebControl.Caption (Page 6652)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

WebControl.Caption (Page 6652)

WebControl.CaptionColor

Description

The "CaptionColor" property specifies the color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
WebControl.CaptionColor
```

See also

WebControl (Page 6649)

WebControl.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the web browser.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
WebControl.CurrentQuality
```

See also

WebControl (Page 6649)

WebControl.Enabled

Description

The "Enabled" property specifies whether the web browser can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
WebControl.Enabled
```

See also

WebControl (Page 6649)

WebControl.Height

Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
WebControl.Height
```

See also

WebControl (Page 6649)

WebControl.Icon

Description

The "Icon" property specifies the icon of the web browser.

Type

String

Access

Read-write

Syntax

```
WebControl.Icon
```

See also

WebControl (Page 6649)

WebControl.Layer

Description

The "Layer" property returns the screen layer in which the web browser is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
WebControl.Layer
```

See also

WebControl (Page 6649)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

WebControl.Layer (Page 6660)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

WebControl.Layer (Page 6660)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

WebControl.Layer (Page 6660)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

WebControl.Layer (Page 6660)

WebControl.Left

Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
WebControl.Left
```

See also

WebControl (Page 6649)

WebControl.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
WebControl.Margin
```

See also

WebControl (Page 6649)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

WebControl.Margin (Page 6663)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

WebControl.Margin (Page 6663)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

WebControl.Margin (Page 6663)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

WebControl.Margin (Page 6663)

WebControl.Name

Description

The "Name" property returns the name of the web browser.

Type

String

Access

Read-only

Syntax

```
WebControl.Name
```

See also

WebControl (Page 6649)

WebControl.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
WebControl.Parent
```

See also

WebControl (Page 6649)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

WebControl.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the web browser was created.

Type

String

Access

Read-only

Syntax

```
WebControl.RenderingTemplate
```

See also

WebControl (Page 6649)

WebControl.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the web browser is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
WebControl.ShowFocusVisual
```

See also

WebControl (Page 6649)

WebControl.StatusBar

Description

The "StatusBar" property specifies the information bar of the web browser.

Type

Object, HmiStatusBarPart

Access

Read-write

Syntax

```
WebControl.StatusBar
```

See also

WebControl (Page 6649)

StatusBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
StatusBar.BackColor
```

See also

WebControl.StatusBar (Page 6668)

StatusBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

Type

Object, HmiControlBarElementCollection (Page 6669)

Access

Read-only

Syntax

```
StatusBar.Elements
```

See also

WebControl.StatusBar (Page 6668)

HmiControlBarElementCollection (Page 6669)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

StatusBar.Elements (Page 6669)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 6669)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 6686)

See also

HmiControlBarElementCollection (Page 6669)

Control Bar Elements (Page 6686)

Control Bar Elements

Description

Control Bar Elements (Page 6686)

StatusBar.Enabled

Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Enabled
```

See also

WebControl.StatusBar (Page 6668)

StatusBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
StatusBar.Font
```

See also

WebControl.StatusBar (Page 6668)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

StatusBar.Font (Page 6672)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

StatusBar.Font (Page 6672)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

StatusBar.Font (Page 6672)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

StatusBar.Font (Page 6672)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

StatusBar.Font (Page 6672)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

StatusBar.Font (Page 6672)

StatusBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
StatusBar.Margin
```

See also

WebControl.StatusBar (Page 6668)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

StatusBar.Margin (Page 6676)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

StatusBar.Margin (Page 6676)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

StatusBar.Margin (Page 6676)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

StatusBar.Margin (Page 6676)

StatusBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
StatusBar.Padding
```

See also

WebControl.StatusBar (Page 6668)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

StatusBar.Padding (Page 6678)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

StatusBar.Padding (Page 6678)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

StatusBar.Padding (Page 6678)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

StatusBar.Padding (Page 6678)

StatusBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.ShowToolTips
```

See also

WebControl.StatusBar (Page 6668)

StatusBar.Visible

Description

The "Visible" property specifies whether the information bar is visible.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Visible
```

See also

WebControl.StatusBar (Page 6668)

WebControl.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the web browser.

Type

String

Access

Read-only

Syntax

```
WebControl.StyleItemClass
```

See also

WebControl (Page 6649)

WebControl.TabIndex

Description

The "TabIndex" property returns the position of the web browser in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
WebControl.TabIndex
```

See also

WebControl (Page 6649)

WebControl.ToolBar

Description

The "ToolBar" property specifies the toolbar of the web browser.

Type

Object, HmiToolBarPart

Access

Read-write

Syntax

```
WebControl.ToolBar
```

See also

WebControl (Page 6649)

ToolBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ToolBar.BackColor
```

See also

WebControl.ToolBar (Page 6683)

ToolBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

Type

Object, HmiControlBarElementCollection (Page 6684)

Access

Read-only

Syntax

```
ToolBar.Elements
```

See also

WebControl.ToolBar (Page 6683)

HmiControlBarElementCollection (Page 6684)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

ToolBar.Elements (Page 6684)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 6684)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 6686)

See also

HmiControlBarElementCollection (Page 6684)

Control Bar Elements (Page 6686)

Control Bar Elements

ControlBarButton

Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarButtonPart

Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the label of the button.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the button can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the button.
- **Mapping**
  Returns the function of the button.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.

- **Operability**
  Returns whether the button is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the button is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarButton.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBackColor
```

See also

ControlBarButton (Page 6686)

ControlBarButton.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBorderColor
```

See also

ControlBarButton (Page 6686)

ControlBarButton.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarButton.Authorization
```

See also

ControlBarButton (Page 6686)

ControlBarButton.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BackColor
```

See also

ControlBarButton (Page 6686)

ControlBarButton.Badge

Description

The "Badge" property specifies the label of the button.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarButton.Badge
```

See also

ControlBarButton (Page 6686)

ControlBarButton.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BorderColor
```

See also

ControlBarButton (Page 6686)

ControlBarButton.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarButton.BorderWidth
```

See also

ControlBarButton (Page 6686)

ControlBarButton.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarButton.Content
```

See also

ControlBarButton (Page 6686)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarButton.Content (Page 6692)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarButton.Content (Page 6692)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarButton.Content (Page 6692)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarButton.Content (Page 6692)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarButton.Content (Page 6692)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarButton.Content (Page 6692)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarButton.Content (Page 6692)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarButton.Content (Page 6692)

ControlBarButton.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarButton.CustomID
```

See also

ControlBarButton (Page 6686)

ControlBarButton.Enabled

Description

The "Enabled" property specifies whether the button can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Enabled
```

See also

ControlBarButton (Page 6686)

ControlBarButton.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.ForeColor
```

See also

ControlBarButton (Page 6686)

ControlBarButton.Graphic

Description

The "Graphic" property specifies the graphic of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Graphic
```

See also

ControlBarButton (Page 6686)

ControlBarButton.Height

Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Height
```

See also

ControlBarButton (Page 6686)

ControlBarButton.HotKey

Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
ControlBarButton.HotKey
```

See also

ControlBarButton (Page 6686)

ControlBarButton.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent

- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms

- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarButton.Mapping
```

See also

ControlBarButton (Page 6686)

ControlBarButton.Margin

Description

The "Margin" property specifies the surrounded outer distance of the button.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarButton.Margin
```

See also

ControlBarButton (Page 6686)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarButton.Margin (Page 6702)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarButton.Margin (Page 6702)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarButton.Margin (Page 6702)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarButton.Margin (Page 6702)

ControlBarButton.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumHeight
```

See also

ControlBarButton (Page 6686)

ControlBarButton.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumWidth
```

See also

ControlBarButton (Page 6686)

ControlBarButton.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumHeight
```

See also

ControlBarButton (Page 6686)

ControlBarButton.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumWidth
```

See also

ControlBarButton (Page 6686)

ControlBarButton.Operability

Description

The "Operability" property returns whether the button is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarButton.Operability
```

See also

ControlBarButton (Page 6686)

ControlBarButton.Padding

Description

The "Padding" property specifies the distance of the content from the border of the button.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarButton.Padding
```

See also

ControlBarButton (Page 6686)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarButton.Padding (Page 6707)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarButton.Padding (Page 6707)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarButton.Padding (Page 6707)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarButton.Padding (Page 6707)

ControlBarButton.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarButton.RequireExplicitUnlock
```

See also

ControlBarButton (Page 6686)

ControlBarButton.Text

Description

The "Text" property specifies the label of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Text
```

See also

ControlBarButton (Page 6686)

ControlBarButton.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.ToolTipText
```

See also

ControlBarButton (Page 6686)

ControlBarButton.Visible

Description

The "Visible" property specifies whether the button is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Visible
```

See also

ControlBarButton (Page 6686)

ControlBarButton.Width

Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Width
```

See also

ControlBarButton (Page 6686)

ControlBarDisplay

Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarDisplayPart

Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the display area is enabled in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the display area.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the display area is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.

- **Visible**
  Specifies whether the display area is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarDisplay.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarDislay.Authorization
```

See also

ControlBarDisplay (Page 6712)

ControlBarDisplay.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarDislay.Content
```

See also

ControlBarDisplay (Page 6712)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarDisplay.Content (Page 6714)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarDisplay.Content (Page 6714)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarDisplay.Content (Page 6714)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarDisplay.Content (Page 6714)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarDisplay.Content (Page 6714)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarDisplay.Content (Page 6714)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarDisplay.Content (Page 6714)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarDisplay.Content (Page 6714)

ControlBarDisplay.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarDislay.CustomID
```

See also

ControlBarDisplay (Page 6712)

ControlBarDisplay.Enabled

Description

The "Enabled" property specifies whether the display is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Enabled
```

See also

ControlBarDisplay (Page 6712)

ControlBarDisplay.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.ForeColor
```

See also

ControlBarDisplay (Page 6712)

ControlBarDisplay.Graphic

Description

The "Graphic" property specifies the graphic of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Graphic
```

See also

ControlBarDisplay (Page 6712)

ControlBarDisplay.Height

Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Height
```

See also

ControlBarDisplay (Page 6712)

ControlBarDisplay.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarDislay.Mapping
```

See also

ControlBarDisplay (Page 6712)

ControlBarDisplay.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the display.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarDislay.Margin
```

See also

ControlBarDisplay (Page 6712)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarDisplay.Margin (Page 6724)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarDisplay.Margin (Page 6724)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarDisplay.Margin (Page 6724)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarDisplay.Margin (Page 6724)

ControlBarDisplay.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumHeight
```

See also

ControlBarDisplay (Page 6712)

ControlBarDisplay.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumWidth
```

See also

ControlBarDisplay (Page 6712)

ControlBarDisplay.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumHeight
```

See also

ControlBarDisplay (Page 6712)

ControlBarDisplay.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumWidth
```

See also

ControlBarDisplay (Page 6712)

ControlBarDisplay.Operability

Description

The "Operability" property returns whether the display is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarDislay.Operability
```

See also

ControlBarDisplay (Page 6712)

ControlBarDisplay.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the display.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarDislay.Padding
```

See also

ControlBarDisplay (Page 6712)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarDisplay.Padding (Page 6729)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarDisplay.Padding (Page 6729)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarDisplay.Padding (Page 6729)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarDisplay.Padding (Page 6729)

ControlBarDisplay.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarDislay.RequireExplicitUnlock
```

See also

ControlBarDisplay (Page 6712)

ControlBarDisplay.Text

Description

The "Text" property specifies the label of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Text
```

See also

ControlBarDisplay (Page 6712)

ControlBarDisplay.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.ToolTipText
```

See also

ControlBarDisplay (Page 6712)

ControlBarDisplay.Visible

Description

The "Visible" property specifies whether the display is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Visible
```

See also

ControlBarDisplay (Page 6712)

ControlBarDisplay.Width

Description

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Width
```

See also

ControlBarDisplay (Page 6712)

ControlBarLabel

Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar.

You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarLabelPart

Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the identifier can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the identifier.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the identifier is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.

- **Visible**
  Specifies whether the identifier is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarLabel.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarLabel.Authorization
```

See also

ControlBarLabel (Page 6734)

ControlBarLabel.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarLabel.CustomID
```

See also

ControlBarLabel (Page 6734)

ControlBarLabel.Enabled

Description

The "Enabled" property specifies whether the identifier is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Enabled
```

See also

ControlBarLabel (Page 6734)

ControlBarLabel.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.ForeColor
```

See also

ControlBarLabel (Page 6734)

ControlBarLabel.Height

Description

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Height
```

See also

ControlBarLabel (Page 6734)

ControlBarLabel.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

See also

ControlBarLabel (Page 6734)

ControlBarLabel.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms

- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export

- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarLabel.Mapping
```

See also

ControlBarLabel (Page 6734)

ControlBarLabel.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarLabel.Margin
```

See also

ControlBarLabel (Page 6734)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarLabel.Margin (Page 6741)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarLabel.Margin (Page 6741)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarLabel.Margin (Page 6741)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarLabel.Margin (Page 6741)

ControlBarLabel.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumHeight
```

See also

ControlBarLabel (Page 6734)

ControlBarLabel.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumWidth
```

See also

ControlBarLabel (Page 6734)

ControlBarLabel.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumHeight
```

See also

ControlBarLabel (Page 6734)

ControlBarLabel.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumWidth
```

See also

ControlBarLabel (Page 6734)

ControlBarLabel.Operability

Description

The "Operability" property returns whether the identifier is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarLabel.Operability
```

See also

ControlBarLabel (Page 6734)

ControlBarLabel.Padding

Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarLabel.Padding
```

See also

ControlBarLabel (Page 6734)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarLabel.Padding (Page 6746)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarLabel.Padding (Page 6746)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarLabel.Padding (Page 6746)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarLabel.Padding (Page 6746)

ControlBarLabel.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarLabel.RequireExplicitUnlock
```

See also

ControlBarLabel (Page 6734)

ControlBarLabel.Text

Description

The "Text" property specifies the label of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.Text
```

See also

ControlBarLabel (Page 6734)

ControlBarLabel.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.ToolTipText
```

See also

ControlBarLabel (Page 6734)

ControlBarLabel.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.VerticalTextAlignment
```

See also

ControlBarLabel (Page 6734)

ControlBarLabel.Visible

Description

The "Visible" property specifies whether the identifier is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Visible
```

See also

ControlBarLabel (Page 6734)

ControlBarLabel.Width

Description

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Width
```

See also

ControlBarLabel (Page 6734)

ControlBarSeparator

Description

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarSeparatorPart

Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the disconnector can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the separator.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.

- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the separator is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the disconnector is only operable while the associated button is being pressed.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the disconnector is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarSeparator.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarSeparator.Authorization
```

See also

ControlBarSeparator (Page 6752)

ControlBarSeparator.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarSeparator.CustomID
```

See also

ControlBarSeparator (Page 6752)

ControlBarSeparator.Enabled

Description

The "Enabled" property specifies whether the separator is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Enabled
```

See also

ControlBarSeparator (Page 6752)

ControlBarSeparator.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.ForeColor
```

See also

ControlBarSeparator (Page 6752)

ControlBarSeparator.Height

Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Height
```

See also

ControlBarSeparator (Page 6752)

ControlBarSeparator.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarSeparator.Mapping
```

See also

ControlBarSeparator (Page 6752)

ControlBarSeparator.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the separator.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarSeparator.Margin
```

See also

ControlBarSeparator (Page 6752)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarSeparator.Margin (Page 6758)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarSeparator.Margin (Page 6758)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarSeparator.Margin (Page 6758)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarSeparator.Margin (Page 6758)

ControlBarSeparator.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumHeight
```

See also

ControlBarSeparator (Page 6752)

ControlBarSeparator.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumWidth
```

See also

ControlBarSeparator (Page 6752)

ControlBarSeparator.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumHeight
```

See also

ControlBarSeparator (Page 6752)

ControlBarSeparator.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumWidth
```

See also

ControlBarSeparator (Page 6752)

ControlBarSeparator.Operability

Description

The "Operability" property returns whether the separator is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarSeparator.Operability
```

See also

ControlBarSeparator (Page 6752)

ControlBarSeparator.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the separator.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarSeparator.Padding
```

See also

ControlBarSeparator (Page 6752)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarSeparator.Padding (Page 6763)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarSeparator.Padding (Page 6763)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarSeparator.Padding (Page 6763)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarSeparator.Padding (Page 6763)

ControlBarSeparator.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the disconnector can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarSeparator.RequireExplicitUnlock
```

See also

ControlBarSeparator (Page 6752)

ControlBarSeparator.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

Type

String

Access

Read-write

Syntax

```
ControlBarSeparator.ToolTipText
```

See also

ControlBarSeparator (Page 6752)

ControlBarSeparator.Visible

Description

The "Visible" property specifies whether the separator is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Visible
```

See also

ControlBarSeparator (Page 6752)

ControlBarSeparator.Width

Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Width
```

See also

ControlBarSeparator (Page 6752)

ControlBarTextBox

Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarTextBoxPart

Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the text box can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Mapping**
  Returns the function of the text box.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.

- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the text box is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **Readonly**
  Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**
  Returns whether the text box is only operable while the associated button is being pressed.
- **Text**
  Specifies the labeling.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the text box is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarTextBox.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.AlternateBorderColor
```

See also

ControlBarTextBox (Page 6768)

ControlBarTextBox.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarTextBox.Authorization
```

See also

ControlBarTextBox (Page 6768)

ControlBarTextBox.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BackColor
```

See also

ControlBarTextBox (Page 6768)

ControlBarTextBox.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BorderColor
```

See also

ControlBarTextBox (Page 6768)

ControlBarTextBox.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarTextBox.BorderWidth
```

See also

ControlBarTextBox (Page 6768)

ControlBarTextBox.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarTextBox.CustomID
```

See also

ControlBarTextBox (Page 6768)

ControlBarTextBox.Enabled

Description

The "Enabled" property specifies whether the text box can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Enabled
```

See also

ControlBarTextBox (Page 6768)

ControlBarTextBox.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.ForeColor
```

See also

ControlBarTextBox (Page 6768)

ControlBarTextBox.Height

Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Height
```

See also

ControlBarTextBox (Page 6768)

ControlBarTextBox.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

See also

ControlBarTextBox (Page 6768)

ControlBarTextBox.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarTextBox.Mapping
```

See also

ControlBarTextBox (Page 6768)

ControlBarTextBox.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the text box.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarTextBox.Margin
```

See also

ControlBarTextBox (Page 6768)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarTextBox.Margin (Page 6777)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarTextBox.Margin (Page 6777)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarTextBox.Margin (Page 6777)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarTextBox.Margin (Page 6777)

ControlBarTextBox.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumHeight
```

See also

ControlBarTextBox (Page 6768)

ControlBarTextBox.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumWidth
```

See also

ControlBarTextBox (Page 6768)

ControlBarTextBox.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumHeight
```

See also

ControlBarTextBox (Page 6768)

ControlBarTextBox.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumWidth
```

See also

ControlBarTextBox (Page 6768)

ControlBarTextBox.Operability

Description

The "Operability" property returns whether the text box is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarTextBox.Operability
```

See also

ControlBarTextBox (Page 6768)

ControlBarTextBox.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the text box.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarTextBox.Padding
```

See also

ControlBarTextBox (Page 6768)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarTextBox.Padding (Page 6782)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarTextBox.Padding (Page 6782)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarTextBox.Padding (Page 6782)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarTextBox.Padding (Page 6782)

ControlBarTextBox.ReadOnly

Description

The "ReadOnly" property specifies whether the text box is read-only.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.ReadOnly
```

See also

ControlBarTextBox (Page 6768)

ControlBarTextBox.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

See also

ControlBarTextBox (Page 6768)

ControlBarTextBox.Text

Description

The "Text" property specifies the label of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.Text
```

See also

ControlBarTextBox (Page 6768)

ControlBarTextBox.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.ToolTipText
```

See also

ControlBarTextBox (Page 6768)

ControlBarTextBox.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

See also

ControlBarTextBox (Page 6768)

ControlBarTextBox.Visible

Description

The "Visible" property specifies whether the text box is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Visible
```

See also

ControlBarTextBox (Page 6768)

ControlBarTextBox.Width

Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Width
```

See also

ControlBarTextBox (Page 6768)

ControlBarToggleSwitch

Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar.

You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarToggleSwitchPart

Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **AlternateGraphic**
  Specifies the graphic for the "pressed" state.
- **AlternateText**
  Specifies the text for the "pressed" state.
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the identifier of the switch.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.

- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the switch can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the switch.
- **IsAlternateState**
  Specifies the current state of the switch.
- **Mapping**
  Returns the function of the switch.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the switch is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the switch is only operable while the associated button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the switch is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarToggleSwitch.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.AlternateGraphic

Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateGraphic
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.AlternateText

Description

The "AlternateText" property specifies the text of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateText
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Authorization
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BackColor
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.Badge

Description

The "Badge" property specifies the identifier of the switch.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Badge
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderColor
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderWidth
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Content
```

See also

ControlBarToggleSwitch (Page 6788)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarToggleSwitch.Content (Page 6794)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.

- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarToggleSwitch.Content (Page 6794)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 6794)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarToggleSwitch.Content (Page 6794)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarToggleSwitch.Content (Page 6794)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarToggleSwitch.Content (Page 6794)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarToggleSwitch.Content (Page 6794)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 6794)

ControlBarToggleSwitch.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarToggleSwitch.CustomID
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.Enabled

Description

The "Enabled" property specifies whether the switch can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Enabled
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ForeColor
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.Graphic

Description

The "Graphic" property specifies the graphic of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Graphic
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.Height

Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Height
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.HotKey

Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
Button.HotKey
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.IsAlternateState

Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment

- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms

- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Mapping
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the switch.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Margin
```

See also

ControlBarToggleSwitch (Page 6788)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarToggleSwitch.Margin (Page 6805)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarToggleSwitch.Margin (Page 6805)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarToggleSwitch.Margin (Page 6805)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarToggleSwitch.Margin (Page 6805)

ControlBarToggleSwitch.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumHeight
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumWidth
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumHeight
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumWidth
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.Operability

Description

The property "Operability" returns whether the switch is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Operability
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the switch.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Padding
```

See also

ControlBarToggleSwitch (Page 6788)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarToggleSwitch.Padding (Page 6810)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarToggleSwitch.Padding (Page 6810)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarToggleSwitch.Padding (Page 6810)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarToggleSwitch.Padding (Page 6810)

ControlBarToggleSwitch.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.Text

Description

The "Text" property specifies the label of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Text
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ToolTipText
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.Visible

Description

The "Visible" property specifies whether the switch is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Visible
```

See also

ControlBarToggleSwitch (Page 6788)

ControlBarToggleSwitch.Width

Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Width
```

See also

ControlBarToggleSwitch (Page 6788)

ToolBar.Enabled

Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Enabled
```

See also

WebControl.ToolBar (Page 6683)

ToolBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ToolBar.Font
```

See also

WebControl.ToolBar (Page 6683)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ToolBar.Font (Page 6816)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ToolBar.Font (Page 6816)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ToolBar.Font (Page 6816)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ToolBar.Font (Page 6816)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ToolBar.Font (Page 6816)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ToolBar.Font (Page 6816)

ToolBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the toolbar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ToolBar.Margin
```

See also

WebControl.ToolBar (Page 6683)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ToolBar.Margin (Page 6820)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ToolBar.Margin (Page 6820)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ToolBar.Margin (Page 6820)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ToolBar.Margin (Page 6820)

ToolBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ToolBar.Padding
```

See also

WebControl.ToolBar (Page 6683)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ToolBar.Padding (Page 6822)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ToolBar.Padding (Page 6822)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ToolBar.Padding (Page 6822)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ToolBar.Padding (Page 6822)

ToolBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.ShowToolTips
```

See also

WebControl.ToolBar (Page 6683)

ToolBar.UseHotKeys

Description

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.UseHotKeys
```

See also

WebControl.ToolBar (Page 6683)

ToolBar.Visible

Description

The "Visible" property specifies whether the toolbar is visible.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Visible
```

See also

WebControl.ToolBar (Page 6683)

WebControl.Top

Description

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
WebControl.Top
```

See also

WebControl (Page 6649)

WebControl.Url

Description

The "Url" property specifies the URL displayed by the web browser.

Type

String

Access

Read-write

Syntax

```
WebControl.Url
```

See also

WebControl (Page 6649)

WebControl.Visible

Description

The "Visible" property specifies whether the web browser is visible.

Type

Bool

Access

Read-write

Syntax

```
WebControl.Visible
```

See also

WebControl (Page 6649)

WebControl.Width

Description

The "Width" property specifies the width in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
WebControl.Width
```

See also

WebControl (Page 6649)

WebControl.WindowFlags

Description

The "WindowFlags" property specifies the window configuration of the web browser.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be moved
- CanMaximize (32): Can be maximized

- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

You can enable multiple properties by adding integer values or bit operators.

Access

Read-write

Syntax

```
WebControl.WindowFlags
```

See also

WebControl (Page 6649)

WebControl.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the web browser.

Syntax

```
WebControl.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

WebControl (Page 6649)

WebControl.FireCommand()

Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the browser.

Syntax

```
WebControl.FireCommand(commandId, custom)
```

Parameters

commandId

Type: Int32

ID of the element of the toolbar or information bar

custom

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

Return value

--

See also

WebControl (Page 6649)

WebControl.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
WebControl.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

WebControl (Page 6649)

WebControl_OnActivated()

Description

The "OnActivated" event occurs when a web browser receives focus:

- A web browser is selected via the configured tab sequence.
- A web browser that had no focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
Ellipse_OnActivated(item)
```

Context

item

Type: Object

Web browser where the event occurs.

See also

WebControl (Page 6649)

WebControl_OnCommandFired()

Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the web browser.

Syntax

```
WebControl_OnCommandFired(item, commandId, custom)
```

Context

item

Type: Object

Web browser where the event occurs.

commandId

Type: DInt

ID of the element of the toolbar or information bar that was operated.

custom

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

See also

WebControl (Page 6649)

WebControl_OnDeactivated()

Description

The "OnDeactivated" event occurs when a web browser loses focus because the operator presses the <TAB> key or executes a different action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
WebControl_OnDeactivated(item)
```

Context

item

Type: Object

Web browser where the event occurs.

See also

WebControl (Page 6649)

WebControl_OnInitialized()

Description

The "OnInitialized" event occurs when a web browser has been successfully initialized and the data connection to the PLC has been established.

Syntax

```
WebControl_OnInitialized(item)
```

Context

item

Type: Object

Web browser where the event occurs.

WebControl (Page 6649)

SysDiag

Description

The "SysDiag" object enables access to the system diagnostics control.

Object type

HMIUISysDiag

Properties

--

Methods

--

See also

UI (Page 1395)

SysFct

Description

The "SysFct" object enables access to the system functions of the "SysDiag" object.

Object type

HMIUISysDiagSysFct

Properties

--

Methods

The "SysFct" object has the following methods:

- **GoToPlc()**
  Calls the "GoToPlc" method of the system diagnostics control.

See also

SysDiag (Page 6834)

SysFct.GoToPlc()

Description

The "GoToPlc" calls the "GoToPlc" method of the system diagnostics control.

Syntax

```
[HMIRuntime.]UI.SysDiag.SysFct.GoToPlc(screenItemPath);
```

Parameters

`screenItemPath`

Type: String, HmiSystemDiagnosisControl

Path of the system diagnostics control

Return value

ErrorCode

See also

SysFct (Page 6835)

SysFct

Description

The "SysFct" object ("HMIUISysFct" type) enables access to the system functions of the "UI" object.

Object type

HMIUISysFct

Properties

--

Methods

The "SysFct" object has the following methods:

- **ChangeScreen()**
  Loads a new screen into a screen window.
- **ChangeScreenAsync()**
  Loads a new screen asynchronously into a screen window.
- **ChangeScreenAsyncByNumber()**
  Loads a new screen asynchronously into a screen window.
- **ChangeScreenByNumber()**
  Loads a new screen into a screen window.
- **ClosePopup()**
  Closes a popup window in runtime.
- **GetPropertyValue()**
  Returns the current value of a property of a screen object.
- **LogOff()**
  Logs off the current user.
- **OpenScreenByNumberInPopup()**
  Opens a screen in a popup window.
- **OpenScreenInPopup()**
  Opens a screen in a popup window.

- **SetLanguage()**
  Sets a new current runtime language.
- **SetPropertyValue()**
  Sets the current value of a property of a screen object.
- **ToggleLanguage()**
  Changes the runtime language to the next one in the list of configured languages.

See also

UI (Page 1395)

SysFct.ChangeScreen()

Description

The "ChangeScreen" method loads a new screen into a screen window.

Syntax

```
[HMIRuntime.]UI.SysFct.ChangeScreen(screenName, screenWindowPath);
```

Parameters

screenName

Type: String, HmiScreen

Name of the new screen

screenWindowPath

Type: String, HmiScreenWindow

Object path of the screen window

Return value

ErrorCode

See also

SysFct (Page 6836)

SysFct.ChangeScreenAsync()

Description

The "ChangeScreenAsync" method loads a new screen asynchronously into a screen window.

This method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
[HMIRuntime.]UI.SysFct.ChangeScreenAsync(screenName,
screenWindowPath)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

screenName

Type: String, HmiScreen

Name of the new screen

screenWindowPath

Type: String, HmiScreenWindow

Object path of the screen window

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler.
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler.

See also

SysFct (Page 6836)

SysFct.ChangeScreenAsyncByNumber()

Description

The "ChangeScreenAsyncByNumber" method loads a new screen asynchronously into a screen window.

This method executes an asynchronous operation without blocking further script execution. To do this, the method uses a Promise object which has handlers for the successful (then()) and faulty (catch()) execution of the operation. Depending on the result, the corresponding handler of the Promise pattern is called after the operation.

Syntax

```
[HMIRuntime.]UI.SysFct.ChangeScreenAsyncByNumber(screenNumber,
screenWindowPath)
.then(function() {
    ...
})
.catch(function(errorCode) {
    ...
})
```

Parameters

screenNumber

Type: UInt32

Unique number (> 0) of the new screen

screenWindowPath

Type: String, HmiScreenWindow

Object path of the screen window

Return value

Promise

Depending on the state of the Promise object:

- Promise fulfilled (fulfilled)
  No return for the "then()" handler.
- Promise rejected (rejected)
  ErrorCode as parameter of the "catch()" handler.

Example

Load the screen with the number "6" asynchronously into the screen window "ScreenWindow_1":

Copy code

```
HMIRuntime.UI.SysFct.ChangeScreenAsyncByNumber(6,"~/ScreenWindow_1")
.then(function () {
   HMIRuntime.Trace("Screen changed!");
})
.catch((error) => {
   let errMsg = HMIRuntime.GetDetailedErrorDescription(error);
       HMIRuntime.Trace("ChangeScreen failed! Error = " + error + " " +
errMsg);
});
```

See also

SysFct (Page 6836)

SysFct.ChangeScreenByNumber()

Description

The "ChangeScreenByNumber" method loads a new screen into a screen window.

Syntax

```
[HMIRuntime.]UI.SysFct.ChangeScreenByNumber(screenNumber,
screenWindowPath);
```

Parameters

screenNumber

Type: UInt32

Unique number (> 0) of the new screen

screenWindowPath

Type: String, HmiScreenWindow

Object path of the screen window

Return value

ErrorCode

Example

Load the screen with the number "6" into the screen window "ScreenWindow_1":

Copy code

```
let err = HMIRuntime.UI.SysFct.ChangeScreenByNumber(6, "~/ScreenWindow_1");
```

See also

SysFct (Page 6836)

SysFct.ClosePopup()

Description

The "ClosePopup" method closes a popup window in runtime.

Syntax

```
[HMIRuntime.]UI.SysFct.ClosePopup(popupWindowPath);
```

Parameter

popupWindowPath

Type: String, HmiPopupScreenPath

Object path of the popup window to be closed

Return value

ErrorCode

See also

SysFct (Page 6836)

SysFct.GetPropertyValue()

Description

The "GetPropertyValue" method returns the current value of a property of a screen object.

Syntax

```
[HMIRuntime.]UI.SysFct.GetPropertyValue(screenItemPath,
screenItemPropertyName);
```

Parameters

`screenItemPath`

Type: String, HmiScreenItemBase

Screen object path

`screenItemPropertyName`

Type: String

Name of the property of the screen object

Return value

Variant

See also

SysFct (Page 6836)

SysFct.LogOff()

Description

The "LogOff" method logs off the current user.

Syntax

```
[HMIRuntime.]UI.SysFct.LogOff();
```

Parameters

--

Return value

ErrorCode

See also

SysFct (Page 6836)

SysFct.OpenScreenByNumberInPopup()

Description

The "OpenScreenByNumberInPopup" method opens a screen in a popup window.

Syntax

```
[HMIRuntime.]UI.SysFct.OpenScreenByNumberInPopup(popupWindowName,
screenNumber, toggleOpen, caption, left, top, hideCloseButton[,
parentScreenPath]);
```

Parameters

popupWindowName

Type: String, HmiPopupScreenName

Name of the popup window. The name must be unique within the parent screen.

screenNumber

Type: UInt32

Unique number (> 0) of the screen that will be loaded into the popup window.

toggleOpen

Type: Bool

Specifies the behavior of the popup window when it is reopened:

- True: If the window is open, it will be closed.
- False: If the window is open, it remains open.

caption

Type: String

Specifies the window title of the popup window.

left

Type: Int32

Specifies the window position as offset from the left-hand margin.

top

Type: Int32

Specifies the window position as offset from the top margin.

hideCloseButton

Type: Bool

Specifies whether the Close button is displayed:

- True: Close button is not displayed.
- False: Close button is displayed.

parentScreenPath

Optional, type: String, HmiParentScreen

Object path of the parent screen. If this value is left empty, the popup window is global and will not close along with the parent screen.

Return value

ErrorCode

Example

Load the screen with the number "6" into the screen window "ScreenWindow_1":

Copy code

```
let err = HMIRuntime.UI.SysFct.OpenScreenByNumberInPopup("popup", 6,
false, "popup caption", 20, 30, false, undefined);
```

SysFct (Page 6836)

SysFct.OpenScreenInPopup()

Description

The "OpenScreenInPopup" method opens a screen in a popup window.

Syntax

```
[HMIRuntime.]UI.SysFct.OpenScreenInPopup(popupWindowName,
screenName, toggleOpen, caption, left, top, hideCloseButton[,
parentScreenPath]);
```

Parameters

popupWindowName

Type: String, HMIPopupScreenWindow

Name of the popup window. The name must be unique within the parent screen.

screenName

Type: String, HMIScreen

Name of the screen that will be loaded into the popup window.

toggleOpen

Type: Bool

Specifies the behavior of the popup window when it is reopened:

- True: If the window is open, it will be closed.
- False: If the window is open, it remains open.

caption

Type: String

Specifies the window title of the popup window.

left

Type: Int32

Specifies the window position as offset from the left-hand margin.

top

Type: Int32

Specifies the window position as offset from the top margin.

hideCloseButton

Type: Bool

Specifies whether the Close button is displayed:

- True: Close button is not displayed.
- False: Close button is displayed.

parentScreenPath

Optional, type: String, HmiParentScreen

Object path of the parent screen. If this value is left empty, the popup window is global and will not close along with the parent screen.

Return value

ErrorCode

SysFct (Page 6836)

SysFct.SetLanguage()

Description

The "SetLanguage" method specifies a new current runtime language.

Syntax

```
[HMIRuntime.]UI.SysFct.SetLanguage(lcid);
```

Parameters

`lcid`

Type: UInt32, HMILCID

ID of the new language

Return value

ErrorCode

Locale IDs (HMILCID)

The following table contains the Microsoft locale IDs of the languages supported in runtime:

Language	Country/Region	Locale ID
Afrikaans	South Africa	1078
Albanian	Albania	1052
Armenian	Armenia	1067
Azerbaijani (Cyrillic)	Azerbaijan	2092
Azerbaijani (Latin)	Azerbaijan	1068
Basque	Basque country	1069

SysFct.SetPropertyValue()

Description

The "SetPropertyValue" method sets the current value of a property of a screen object.

Syntax

```
[HMIRuntime.]UI.SysFct.SetPropertyValue(screenItemPath,
screenItemPropertyName, value);
```

Parameters

screenItemPath

Type: String, HmiScreenItemBase

Object path of the screen object

screenItemPropertyName

Type: String

Name of the property of the screen object

value

Type: Variant

New value of the property of the screen object

Return value

ErrorCode

See also

SysFct (Page 6836)

SysFct.ToggleLanguage()

Description

The "ToggleLanguage" method toggles the runtime language to the next in the list of configured languages.

Syntax

```
[HMIRuntime.]UI.SysFct.ToggleLanguage();
```

Parameters

--

Return value

ErrorCode

See also

SysFct (Page 6836)

10.2.2.21 UserManagement

Description

The "UserManagement" object allows the roles of the current user to be checked.

Object type

HMIUserManagement

Properties

--

Methods

The "UserManagement" object has the following methods:

- **GetRolesFromUser()**
  Returns the roles of the current user.
- **HasUserRole()**
  returns whether the current user has the selected role.

UserManagement.GetRolesFromUser()

Description

The "GetRolesFromUser" method returns the roles of the current user.

Syntax

```
HMIRuntime.UserManagement.GetRolesFromUser();
```

Parameters

--

Return value

String[], HMIUserRole[]

See also

UserManagement (Page 6850)

UserManagement.HasUserRole()

Description

The "HasUserRole" method returns whether the current user has the selected role.

Syntax

```
HMIRuntime.UserManagement.HasUserRole(RoleName);
```

Parameters

`RoleName`

Type: String, HMIUserRole

Name of the role.

Return value

Bool

See also

UserManagement (Page 6850)

Planning tasks 11

11.1 Basics

11.1.1 Field of application of the Scheduler

In the Scheduler, you configure tasks that are executed in the background regardless of the screen. You create tasks by linking scripts to a trigger. The linked functions will be called when the triggering event occurs.

Application example

You use Scheduled tasks to execute event-controlled tasks automatically. For example, you use a task to automate the following:

- Regular swap out of log data
- Printout of an alarm report when an alarm buffer overflow occurs
- Printout of a report at shift end
- Monitoring a tag
- Monitoring of a user change

Note

The availability of the listed examples is dependent on the HMI device.

11.1.2 Basic of the scheduler

Definition

You use Scheduled tasks to configure tasks which are only to be executed cyclically or at a specific condition. Each task has a trigger and an action.

Triggers

You use the triggers to define when and how often the task is to be processed during runtime. The following triggers are supported:

Triggers	Type	Description
Time	Cyclic	Executed cyclically at the set time from runtime start, for example, every 2 seconds with "T2s".
Daily Weekly Monthly Yearly	Cyclic	Is executed in cycles starting from runtime start, in each case at the configured time, for example "Daily, 12:00:00 h".
Once	Acyclic	Is executed exactly once at the configured time.
Tags	Acyclic	Executed when the value of one of the projected tags changes.
Alarms	Acyclic	Executed when the state of one of the following alarm properties changes: • Alarm class, for example "Warning" • Alarm state, for example "Incoming" • Priority, for example "4"

Note

Local session tags cannot be used as triggers.

Trigger an action

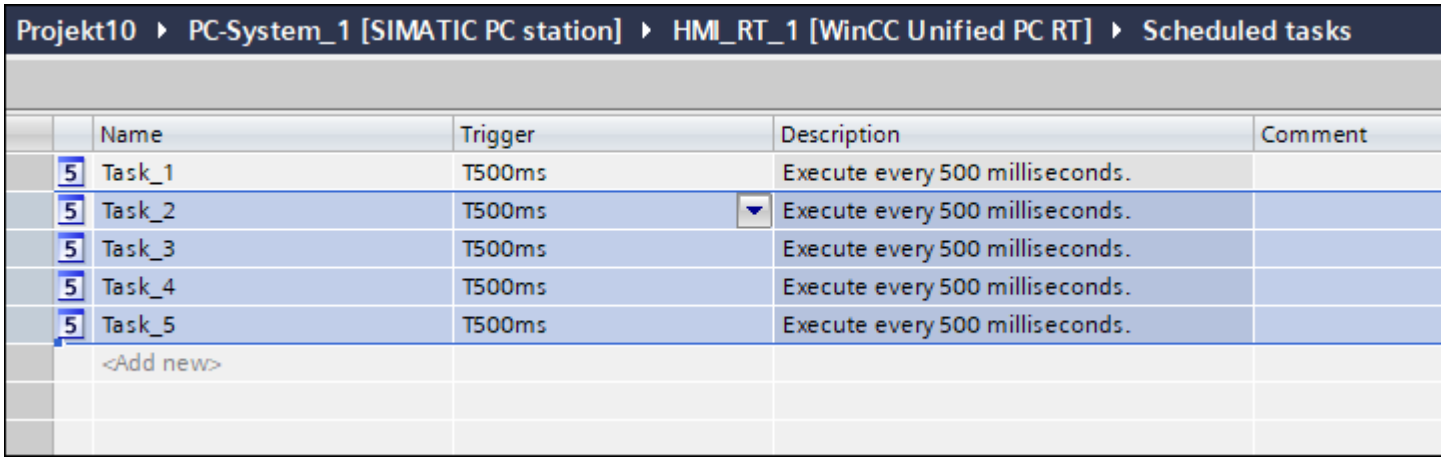
If the configured trigger condition is fulfilled, the event "Update" is triggered. You configure a local script, which triggers one or more actions.

Filling out property values of one or more tasks automatically

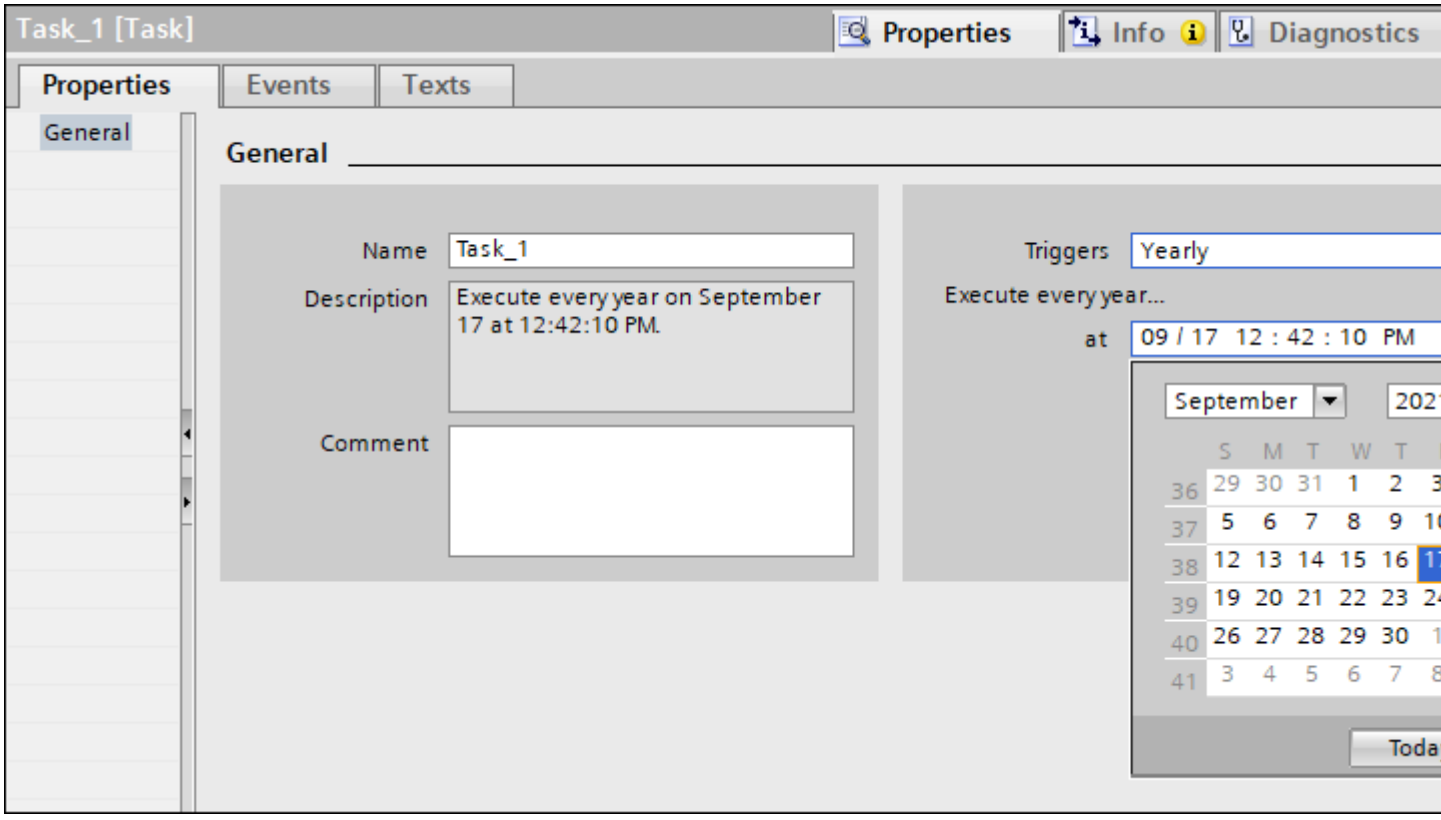
When planning new tasks, Scheduled tasks allows the property values of already defined tasks to be used. Bulk creation of property values is possible in the Scheduled tasks editor. This functionality saves the time that would be needed to create individual tasks.

Follow these steps to fill out the property values of one or more tasks automatically:

1. In the Task editor, select the "Name" or "Trigger" cell.
2. Use the mouse to drag the bottom right-hand corner downwards. The values are transferred to the destination cells.

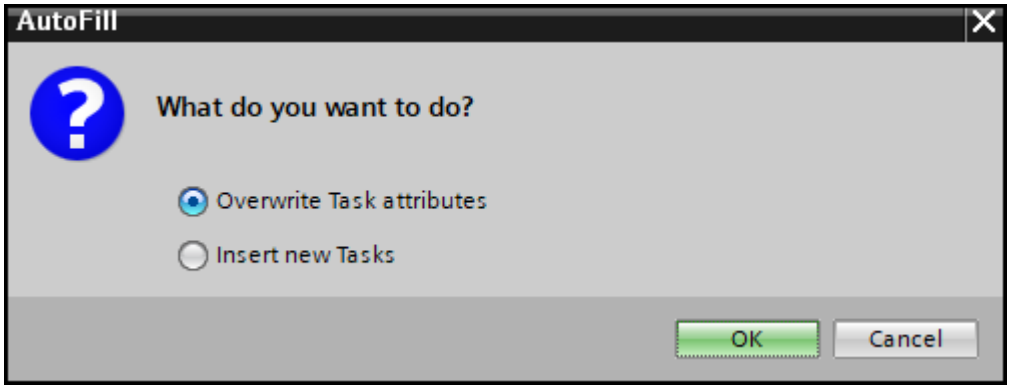


3. To change the attributes, use the text boxes in the editor or the text boxes under "Properties > Properties > General". In the latter, you can also define the time specifications, for example, time, day, month and year.



Overwriting property values of one or more tasks automatically

1. In the "Trigger" column, select the cell whose value you want to change. Select the desired value from the list.
2. To overwrite the changed value in tasks below, select the source cell in the "Trigger" column.
3. Use the mouse to drag the bottom right-hand corner downwards.
4. In the dialog box, confirm your choice with OK. The values are overwritten in the destination cells.



Sorting values in the Scheduler editor

By clicking the column header, the table is sorted alphabetically in the selected column.

Creating tasks with the "Tags" trigger (Page 6857)

Creating tasks with the "Alarms" trigger (Page 6857)

11.2 Creating tasks with the "Time" trigger

Requirement

- The "Scheduler" editor is open.

Procedure

Follow these steps to create a task with the trigger "Time":

1. Create a new task with "Add".
2. Select the required cycle as the "Trigger", for example "T250ms" for 250 ms.

Result

The task with the "Time" trigger has been created.

See also

Basic of the scheduler (Page 6853)

Creating tasks with the "Alarms" trigger (Page 6857)

11.3 Creating tasks with the "Tags" trigger

Requirement

- The "Scheduler" editor is open.
- You have created a tag that is monitored for changes in value.

Procedure

Follow these steps to create a task with the trigger "Tags":

1. Create a new task with "Add".
2. Select the option "Tags" as the "Trigger."
3. Select "Properties > Properties > General" in the Inspector window to select the tag.

Result

The task with the "Tags" trigger has been created.

See also

Basic of the scheduler (Page 6853)
Creating tasks with the "Time" trigger (Page 6856)
Creating tasks with the "Alarms" trigger (Page 6857)

11.4 Creating tasks with the "Alarms" trigger

Requirement

- The "Scheduler" editor is open.

Procedure

Follow these steps to create a task with the trigger "Alarms":

1. Create a new task with "Add".
2. Select the option "Alarms" as the "Trigger".
3. Configure the trigger under "Properties > Properties > General" in the Inspector window.
   - Select the "Criterion", for example "Alarm class".
   - Select the "Condition", for example "Not equal".
   - Select the "Operand", for example "Alarm".

Result

The task with the "Alarms" trigger has been created.

Using the diagnostics functions 12

12.1 Configuring system diagnostics objects

12.1.1 Activating system diagnostics (S7-1200/1500)

Introduction

An integrated HMI connection must exist between the controller and the HMI device so that the controller can send error messages to the system diagnostics view. In addition, the system diagnostics must be enabled both in the PLC and on the HMI device.

With an HMI connection to a SIMATIC S7-1200/1500 controller, the system diagnostics on the HMI device can be activated and deactivated by default.

The following describes how to activate system diagnostics in a controller and on an HMI device, if necessary.

Note

System diagnostics works only for integrated connections.

Requirement

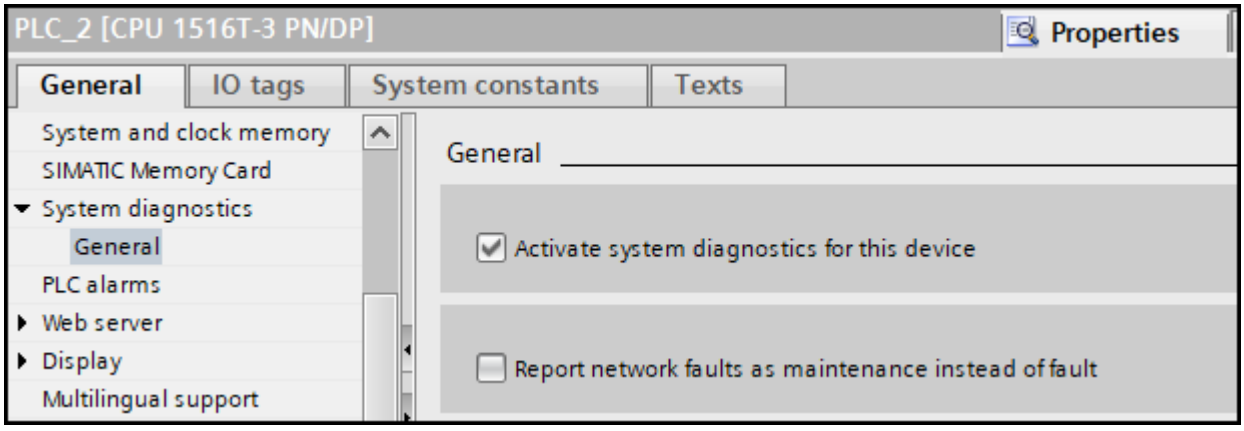
- There is an integrated HMI connection between the S7-1200/1500 controller and the HMI device (WinCC Unified PC or WinCC Unified Panel).

Activating system diagnostics in the controller

To activate the system diagnostics in a controller, proceed as follows:

1. Open the "Device configuration" of the controller in the project tree.
2. In the "Device view" tab, select the CPU on the rack.
3. Select "Properties > General > System diagnostics" in the Inspector window.

4. Activate the option "Activate system diagnostics for this device".



5. Right-click the controller in the project tree and select "Compile > Hardware (rebuild all)" in the shortcut menu.

Activating system diagnostics on the HMI device

To activate the system diagnostics on an HMI device, proceed as follows:

1. Open the "Runtime settings" of the HMI device in the project tree.
2. Select the option "System diagnostics" under "Alarms > Controller alarms".
   The display of system diagnostic alarms is enabled in Runtime.

Note

When an upload is performed from the PLC to the TIA Portal, the uploaded PLC must be compiled to HMI RT before it is compiled and downloaded.

This is system behavior, because the runtime data file is created during compiling.

12.1.2 Configuring diagnostics indicators (S7-1200/1500)

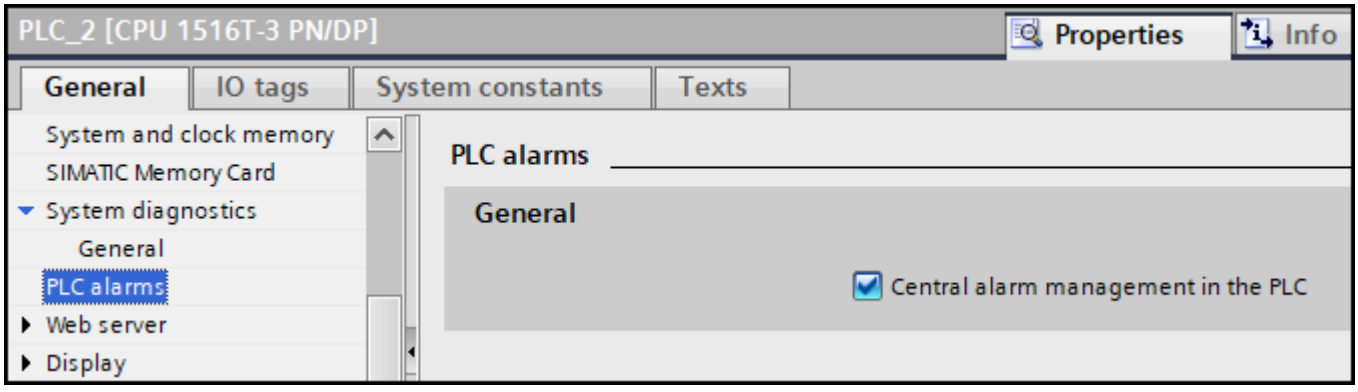
Showing the overall status of HMI connections via traffic light SVGs

The diagnostic status is represented by a system tag named "@DiagnosticsIndicatorTag". The "System" is notified of the diagnostic status of the configured PLCs.

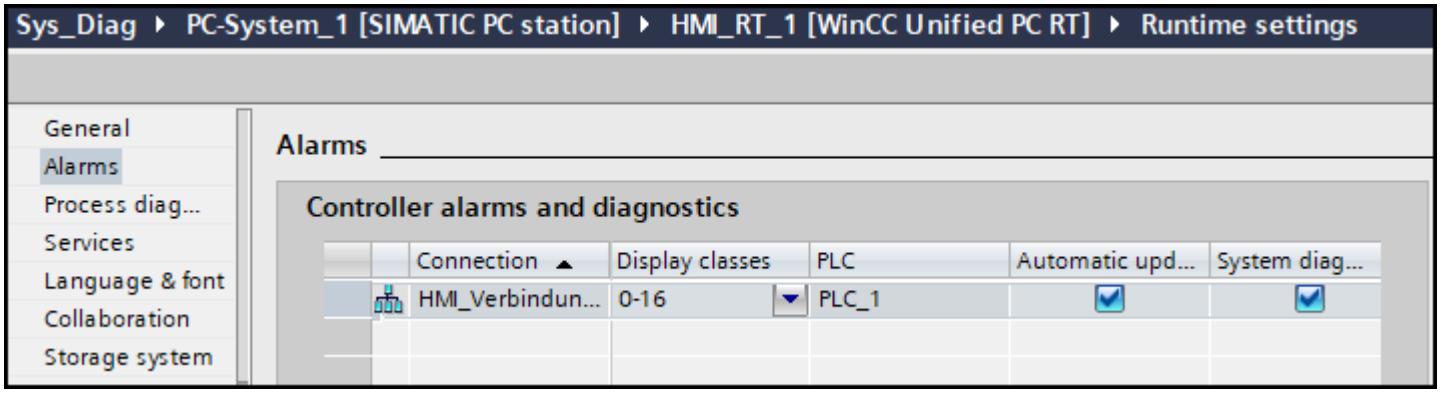
The diagnostic status contains the overall status of all relevant PLCs. The merged state always corresponds to the worst state of all relevant PLCs.

Requirements

- Integrated HMI connection with PLC S7-1200/1500.
- PLC setting "Central alarm management in the PLC" is enabled.



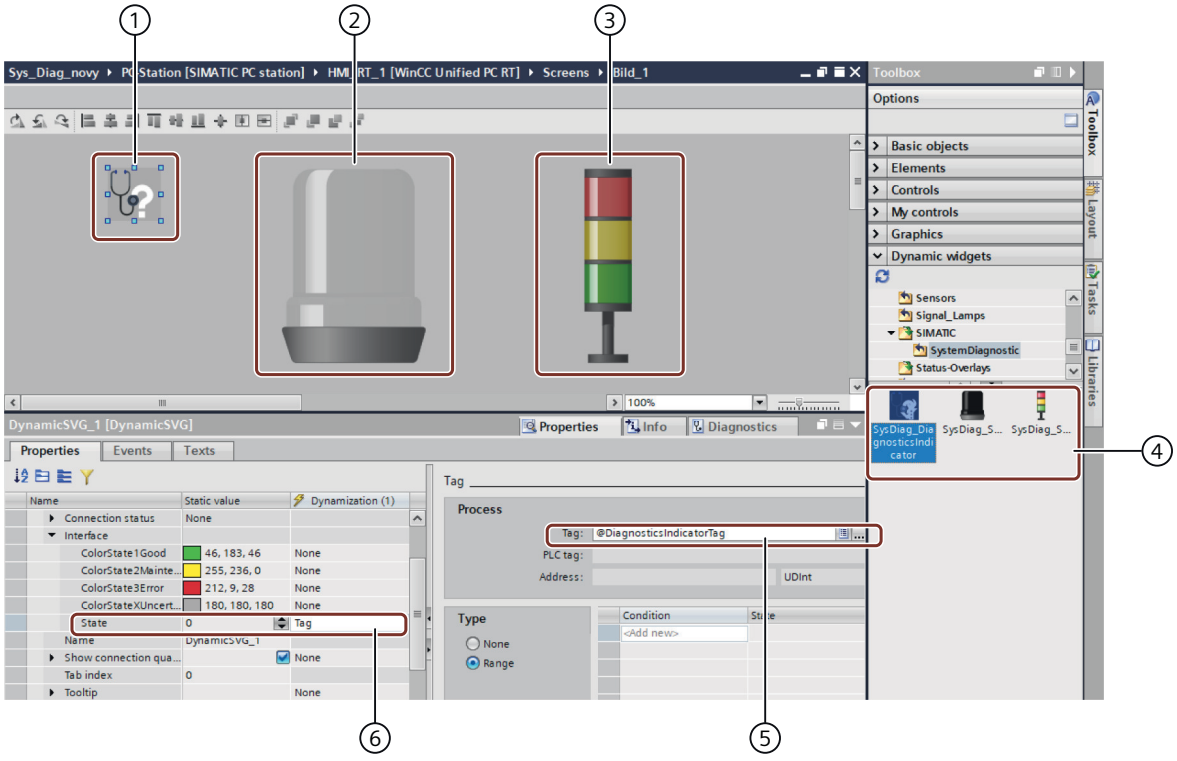
- "Automatic update" and "System diagnostics" are enabled for the controller alarms of the HMI connection.



Using dynamic SVGs

System diagnostics for RT Unified provides 3 pre-programmed dynamic SVGs for S7-1200/1500 PLCs as tools for dynamic widgets:

- Diagnostics indicator ①
- Signal lamp ②
- Signal tower ③



To create a diagnostics indicator, proceed as follows:

1. Open the "Toolbox" and find "IndustryGraphicLibrary > Dynamic widgets > SIMATIC > SystemDiagnostic" ④.
2. Select one of the 3 pre-programmed SVGs:
   - "SysDiag_DiagnosticsIndicator"
   - "SysDiag_SignalLamp"
   - "SysDiag_SignalTower"
3. Double-click or drag-and-drop the selected SVG over to the screen. The object is added to the screen.
4. Open the properties of the object in the Inspector window. Assign the "Tag" dynamization to the interface element "State" ⑥.
5. Dynamize the State property with the tag "@DiagnosticsIndicatorTag" ⑤.

The color of the dynamized SVG changes according to the defined tag values in Runtime.

Table 12-1 Possible diagnostic values

Status	Diagnostic value	Color
Uncertain	0	Gray
Good	1	Green
Maintenance	2	Yellow
Error	3	Red

12.1.3 Configuring system diagnostics of the controller (S7-1200/1500)

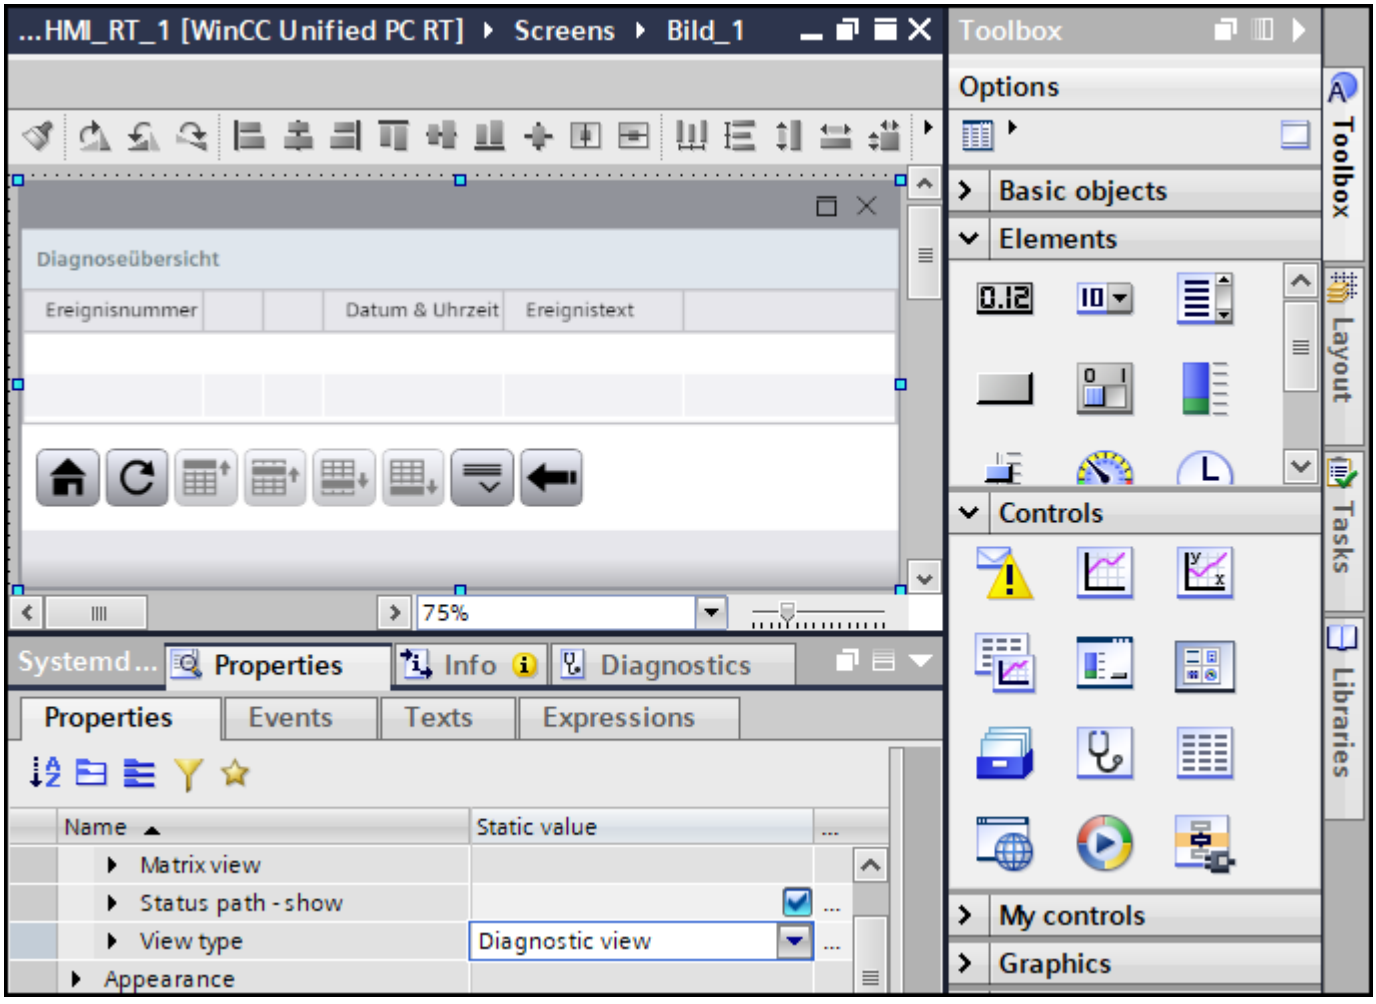
The system diagnostics control shows the diagnostic events of the configured PLCs in your HMI device. When loading the screen, the control displays the diagnostic buffer of the PLC with the most serious status. Navigation buttons can be used to navigate to the next PLC.

Requirements

- At least one S7-1200/1500 PLC is configured. The S7-1200 PLC is supported as of firmware version 4.0.
- PLC setting "Central alarm management in the PLC" is enabled.
- An HMI device has been configured.
- An integrated HMI connection has been established between the S7-1200/1500 PLC and the HMI device.
- "Automatic update" and "System diagnostics" are enabled for the controller alarms of the HMI connection.
- System diagnostics is enabled in every controller and on the HMI device.
- A screen has been created.
- The Inspector window is open.

Procedure

Double-click the icon of the "System diagnostics control" object in the "Controls" section of the "Toolbox" task card, or drag it into the screen using drag-and-drop. The object is added to the screen.



You can change the setting for the position, geometry, style, color, and font of the object in the Inspector window. You can adapt the following properties in particular:

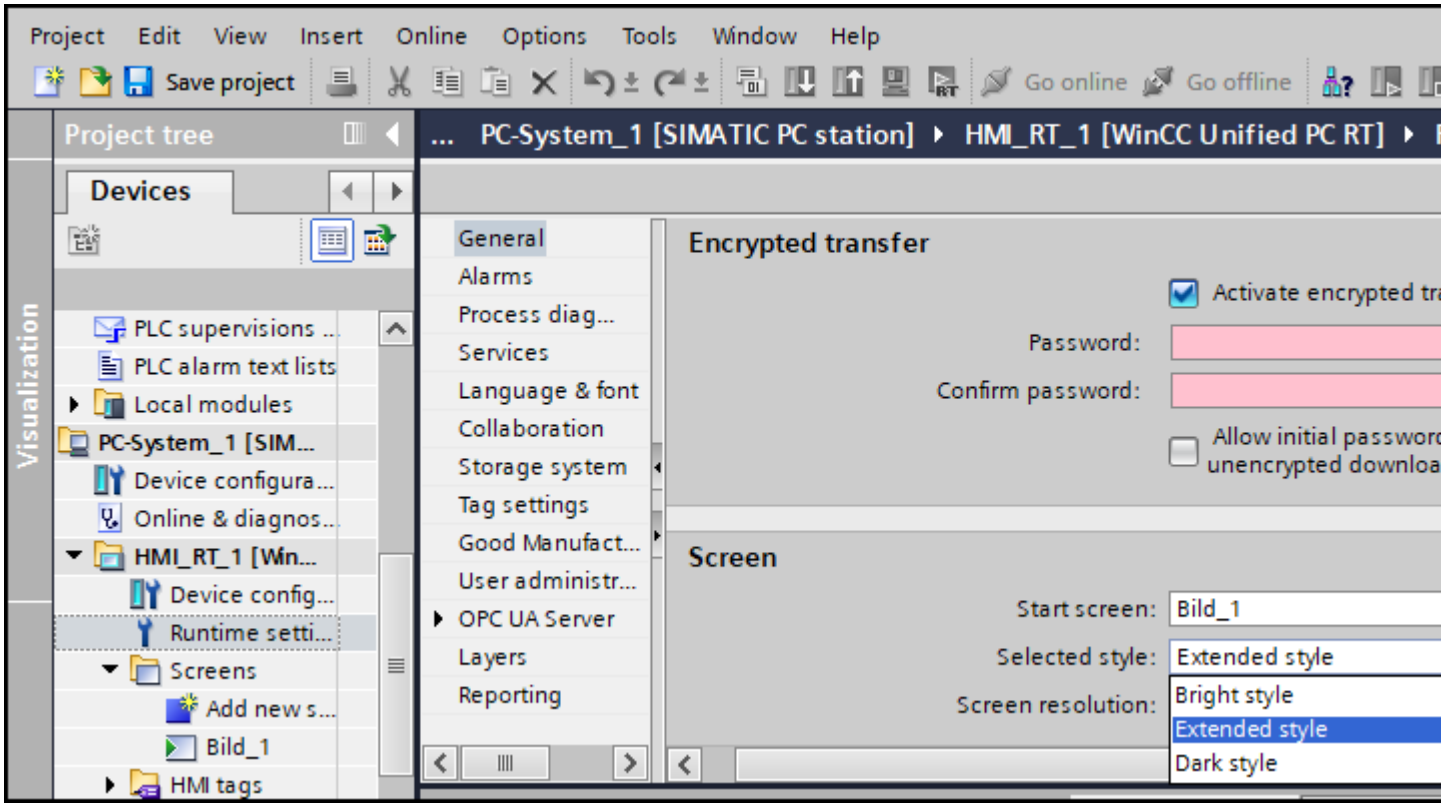
- "View type": Switches between the diagnostic view and the matrix view.
- "Information bar": Specifies the representation of the information bar.
- "Toolbar": Specifies the buttons of the system diagnostics control.

Setting pre-defined styles

You can assign pre-defined styles to the object in Runtime: "Dark Style", "Extended Style" or "Bright Style". You can use pre-defined styles to change the background color of the object.

To assign a style, follow these steps:

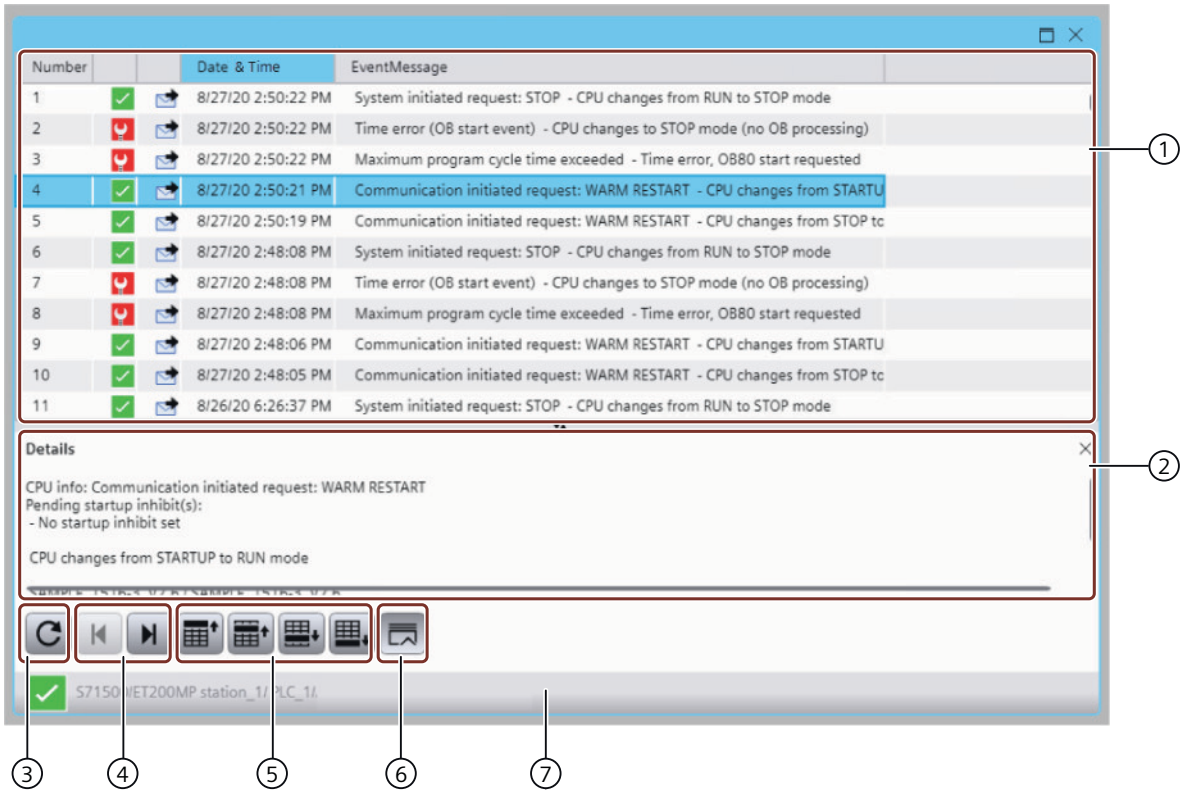
1. Open the runtime settings of the HMI device.



2. In the "General > Screen > Selected style" tab, select one of the following options: "Bright style", "Extended style" or "Dark style" to use the style.

Result

The "System diagnostics control" has been added to the screen. The system diagnostics can access the data of the integrated HMI connections to S7-1200/1500 PLCs. In Runtime, the diagnostic alarms of the selected PLC are displayed in the "System diagnostics control". The selected PLC can be changed using the buttons ④. Once Runtime has started, the events of the PLC with the most serious error are displayed.



① Grid view
② Detail view
③ Update the view of the diagnostics event
④ Switch to the next or previous PLC
⑤ Navigation buttons for the grid view:
jump to the first line
jump to the previous line
jump to the next line
jump to the last line
⑥ Enable/disable detail view
⑦ Status text field

The diagnostic buffer displays the diagnostics events of a PLC in a grid view ①. The grid view shows the last 200 diagnostics events of the PLC.

The first column shows the number of the entry.

The symbols in the second column indicate the event type of the PLC:

	Device in operation
	Maintenance required
	Maintenance necessary
	Error in the device

You can see the symbols of the incoming or outgoing status in the third column:

	Incoming event
	Outgoing event
	Incoming event for which there is no independent outgoing event
	User-defined diagnostics event

The fourth column shows the date and time of the event. You can see the event information in the last column.

Below the grid view, the detail view ② of the selected row from the grid view is displayed. You can enable or disable the detail view with the button ⑥.

When the screen is loaded, the "System diagnostics control" shows the PLC with the most severe error. If several PLCs are configured for system diagnostics, you can use the toolbar buttons ④ to switch to the next or previous PLC.

To update the "System diagnostics control", select the toolbar button ③. For performance reasons, no automatic update is performed. You need to perform the update manually.

At the bottom of the window, a status field ⑦ is displayed with the diagnostic status and the name of the station/PLC.

Note

Rearranging columns

You have the option of changing the column order configured in the engineering system. You can find more detailed information in the "AUTOHOTSPOT" manual in the section "Rearranging columns at runtime (Page 7451)".

Languages in Runtime

The alarms are displayed in the RT language selected by the user in the screen logon dialog. The Runtime language and the PLC language should be identical.

The PLC supports only three languages, which can be configured by the user in the engineering. If the PLC language and the runtime language are different, the event text is displayed as follows according to the fallback mechanism:

- English US
- English UK
- the standard text "## text is missing ##"

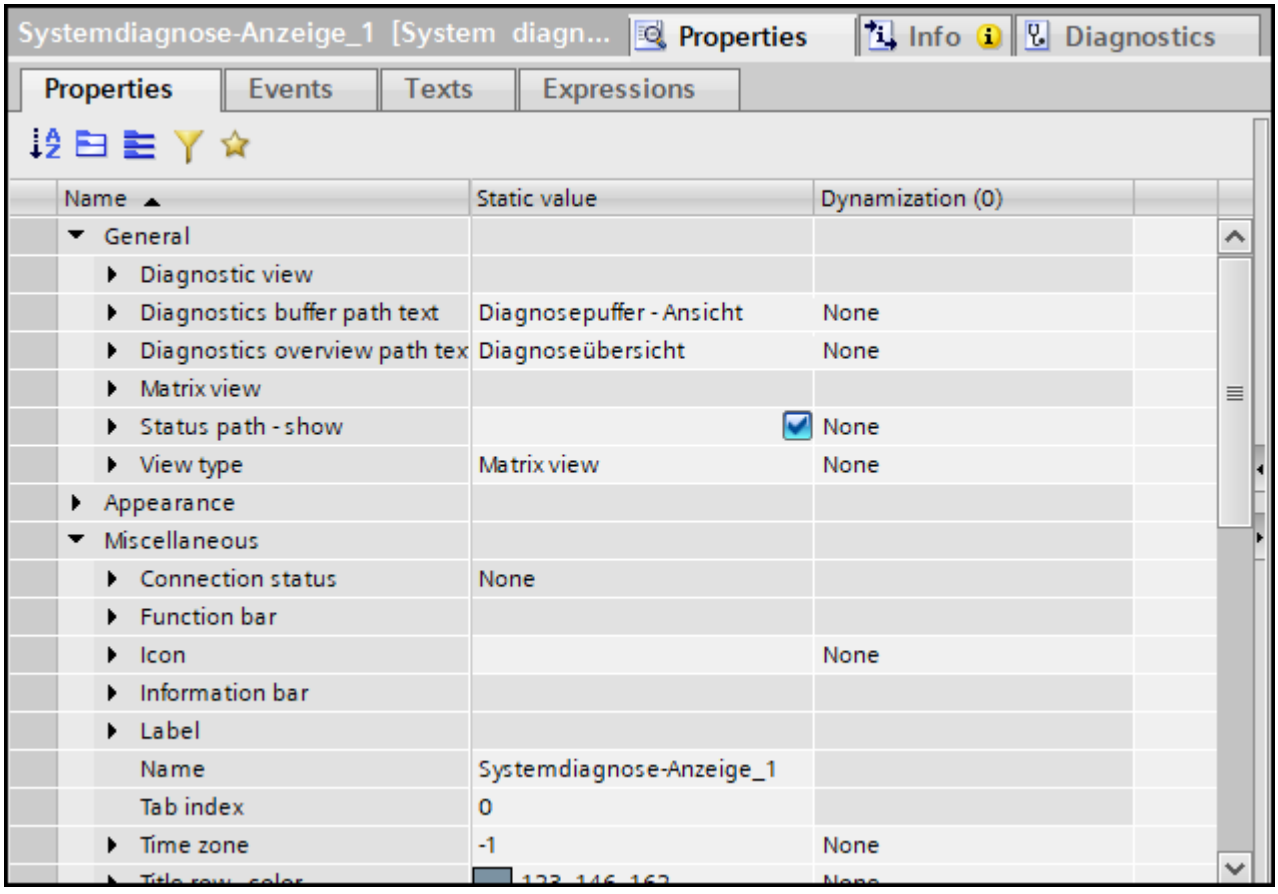
12.1.4 System diagnostics display

Use

You can use the "System diagnostics control" object to display the diagnostic status of several PLCs using traffic light SVGs. The diagnostic status contains the overall status of all relevant PLCs. The merged state is always the worst state of all PLCs.

Defining the properties of the system diagnostics control

You define the properties of the system diagnostics control in the Inspector window under "Properties > Properties".



Selecting the view type

You select the view type in the following way:

1. Click "Properties > Properties > General > View type" in the Inspector window.
2. Choose between the "Matrix view" and the "Diagnostic view".

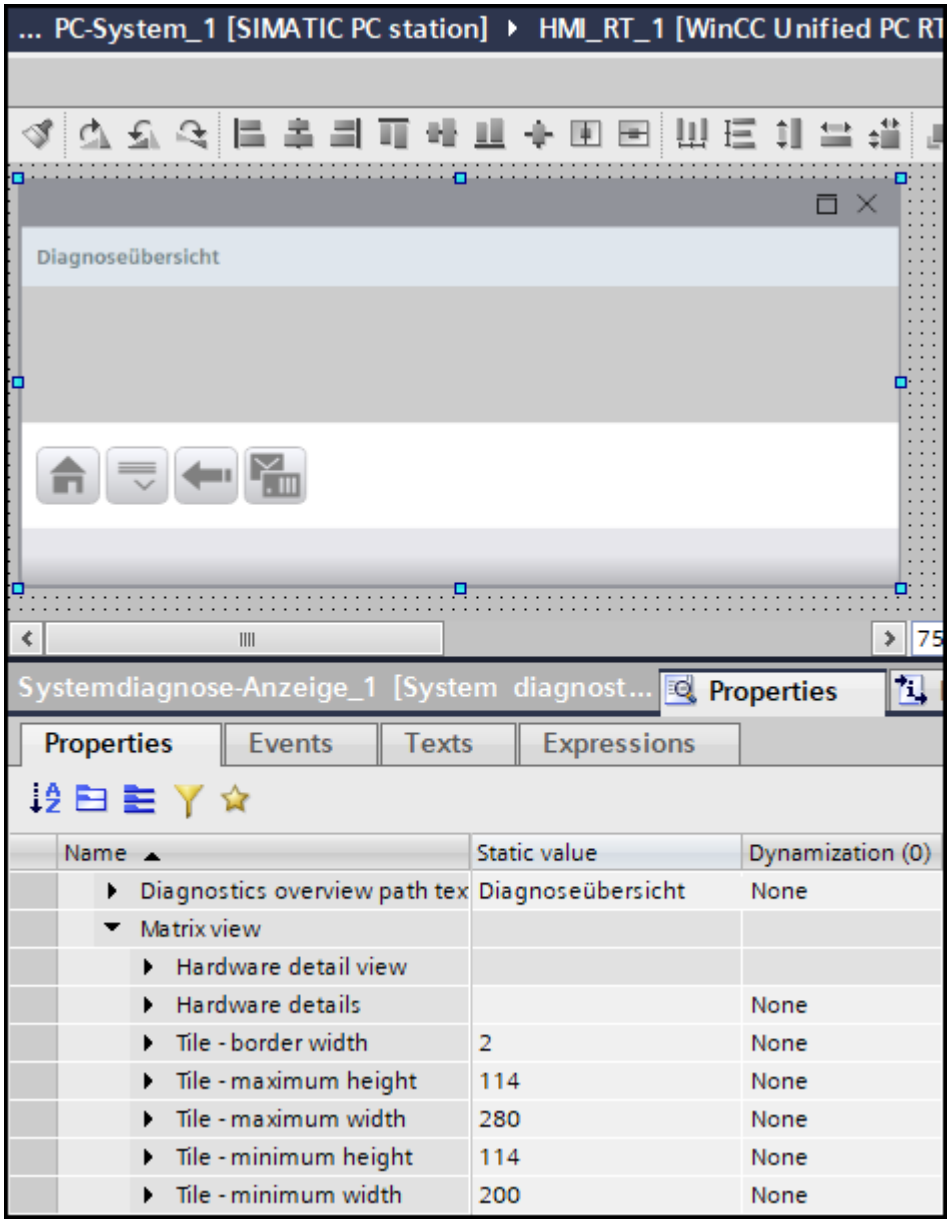
Selection of the matrix view as start view is recommended. From the matrix view, you can switch to the diagnostic view using the corresponding button in the toolbar.

Matrix view

With the matrix view, you have the possibility to check the status of your PLCs and their lower-level hardware components.

All hardware components are displayed as tiles. You can configure the display as well as the content of the tiles:

Make the settings for hardware details and tiles under "Properties > Properties > General > Matrix view".



Diagnostic view

The diagnostic view shows the diagnostic buffer of the PLC with the diagnostic events of the currently selected PLC.

It is not possible to switch between different PLCs in Runtime. Navigating to the diagnostic view via the selected PLC in the matrix view is recommended.

Under "Properties > Properties > General > Diagnostic view", you make the settings for the rows, header, grid lines, scroll bar, cells and columns.

Setting up column sorting

To set up the column sorting in the diagnostic view, follow these steps:

1. In the Inspector window, click "Properties > Properties > General > Diagnostic view > Columns > [0] Column".
2. Select the sorting direction and sorting order for the individual columns.

Dynamization of graphic properties with tags or scripts

You can dynamize the following properties containing a graphic with a tag or with a script:

- Graphic
- Icon

Access protection in Runtime

Configure access protection with the property "Operator control - allow" in the Inspector window under "Properties > Properties > Security". A logged-in user having the required authorization can acknowledge and edit the system diagnostics control using the buttons in the system diagnostics control.

Configuring the information bar

The information bar of the system diagnostics control shows the connection status and path.

The connection status is not displayed while the PLC is starting.

To configure the information bar, follow these steps:

1. Configure the general properties of the information bar, such as the font and background color, under "Properties > Properties > Miscellaneous > Information bar".
2. Configure the display of the information bar elements under "Properties > Properties > Miscellaneous > Information bar > Elements".

Toolbar

You can define the buttons of the system diagnostics control in Runtime and their operator authorizations in the Inspector window under "Properties > Properties > Miscellaneous > Toolbar > Elements". Some buttons are enabled by default. To display additional buttons in the object, activate the "Visibility" property in the settings of the corresponding button.

The following buttons are available for the system diagnostics control:

Button		Function
	Home	Shows the home page.
	Reload	Updates the view of the diagnostic event.

Button		Function
	First line	Selects the first of the pending diagnostic events. The visible area of the view is moved.
	Previous line	Selects the previous diagnostic event, starting from the currently selected diagnostic event. The visible area of the view is moved.
	Next line	Selects the next diagnostic event, starting from the currently selected diagnostic event. The visible area of the view is moved.
	Last line	Selects the last of the pending diagnostic events. The visible area of the view is moved.
	Share view	Enables/disables the detail view.
	Previous	Navigates to the previous PLC.
	Show diagnostic buffer	Changes from the matrix view to the diagnostic view. The diagnostic view shows the diagnostics buffer of the PLC. This button is only enabled if a PLC or one of its lower-level modules is shown in the matrix view.

Setting the time zone

Under Properties > Properties > Miscellaneous > Time zone, you set the desired time zone by entering a decimal value for the time zone.

- "0" and positive numerical values: The values correspond to the index values of the Microsoft time zones.
- "-1": The local time zone of the device.

Note

In Runtime, you also have the option of setting the time zone via a selection list.

12.2 Example: System diagnostics with all objects

12.2.1 Example: Procedures overview

Introduction

- A controller and an HMI device have been created.
- An HMI connection has been established between the controller and HMI device.
- System diagnostics is activated in the controller and on the HMI device.

Configuration steps

To get a quick view of errors, create an overview screen with the various objects for displaying diagnostic alarms.

The following example shows how to efficiently use the objects of the "Tools" or "Libraries" task cards in your project.

The example is divided into several steps:

- Creating screens
  The project engineer creates multiple screens for system diagnostics:
  - Overview screen with all objects for system diagnostics
  - Screen for the alarm view
  - Screen for the system diagnostics view
- Inserting objects in the screens
  The project engineer inserts various objects in the screens:
  - Alarm view in the "Alarm" screen
  - Screen window for displaying the alarm view and system diagnostics view
- Configuring objects
  The project engineer connects objects to enable targeted navigation to the cause of the error in runtime.
  - System diagnostics indicator with screen window of the system diagnostics view
  - Goto button with the screen window of the alarm view and the system diagnostics view.

12.3 Process diagnostics

12.3.1 Basics of supervision with ProDiag

Introduction

The TIA Portal functionality, ProDiag (Process Diagnostics), is used to monitor and determine errors that occur in your plant or machine. You can use ProDiag to show the type of error, the cause of the error and the location of the error on the HMI device.

Use

You can use ProDiag functions to monitor your plant and to visualize it on an HMI device. The main objective of ProDiag is the reduction of downtime and loss of production after an error occurs, and the avoidance of errors using timely warnings. Diagnostic and display objects provide specific information for the operator for troubleshooting and show the processes on an HMI device on site.

Principle

In STEP 7, you create operand supervisions and configure the settings according to your requirements. When an error occurs, a supervision alarm is generated based on the criteria you have configured. The configured supervision instances are stored in the preset ProDiag function block. You can use the automatically generated ProDiag FBs or create and configure your own ProDiag FBs.

Advantages

ProDiag enables you to configure supervisions and monitor your plant without changing the user program code.

You perform plant diagnostics on your HMI device. The data is automatically synchronized in order to keep the display on your HMI device always up-to-date.

12.3.2 Requirements and licensing

Introduction

You configure the ProDiag supervisions in TIA Portal with STEP 7 and create the screen objects for monitoring and diagnostics with WinCC. You need a license to use the ProDiag functionality and the corresponding screen objects.

Software requirements

To configure ProDiag supervisions, you need the following products:

- TIA Portal STEP 7 Professional
- WinCC Unified

Hardware requirements

ProDiag functionality is available for CPUs of the S7-1500 series with firmware version 2.0 or higher.

The objects for the supervision and diagnostics of plants are available for the following HMI devices:

- WinCC Unified

Note

Objects for supervision and diagnostics of plants can be used under the "Full access" and "Read access" protection levels configured in the CPU.

ProDiag objects under the "HMI access" and "No access" protection levels cannot be used.

Licensing of ProDiag supervisions

The number of ProDiag monitors that you configure with STEP 7 is licensed. You do not need a license for the first 25 supervisions, licenses must be used for additional supervisions.

Number of supervisions	**<= 25**	**<= 250**	**<= 500**	**<= 750**	**<= 1000**	**> 1000**
Number of licenses	None	1	2	3	4	5

Licensing of ProjDiag objects

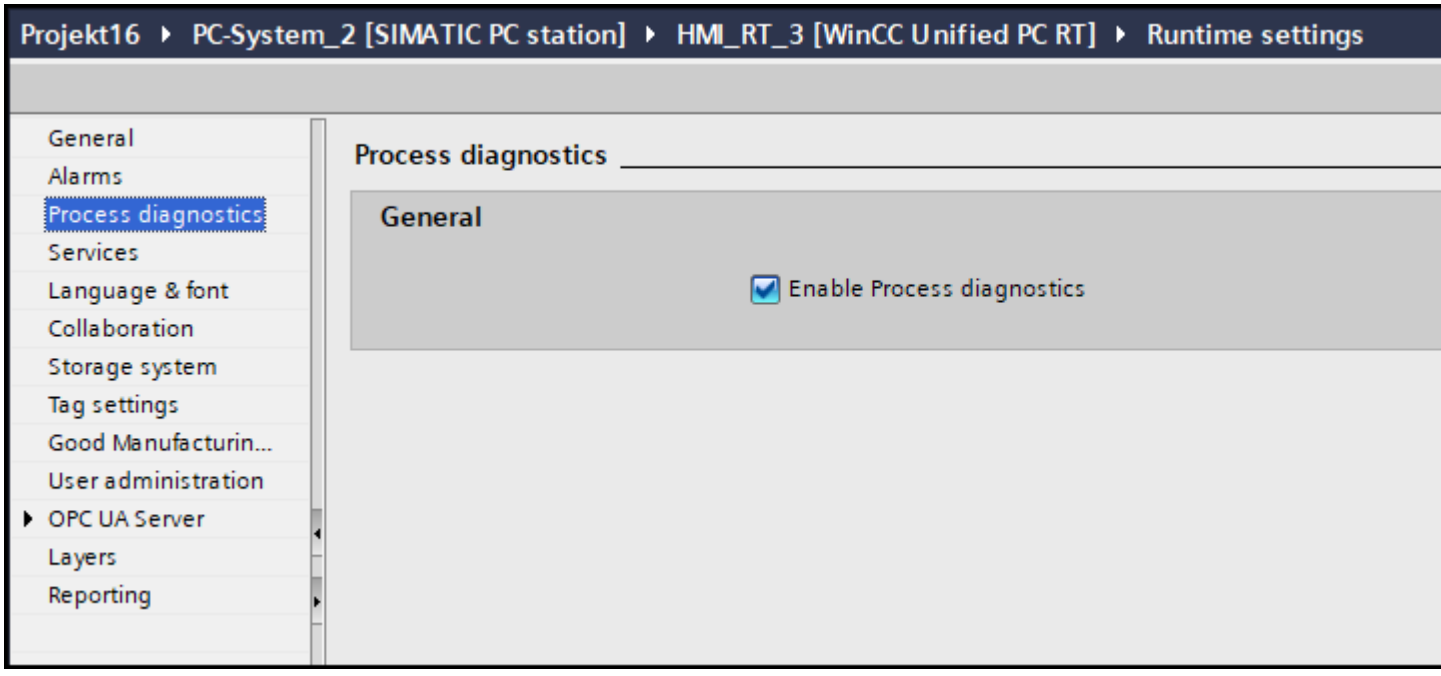
To use the objects for the diagnostics and supervision in conjunction with the ProDiag supervision in your program, you need a ProDiag license, specifically the WinCC Unified Runtime license.

Enable process diagnostics

To activate process diagnostics on an HMI device, follow these steps:

1. Open the "Runtime settings" of the HMI device in the project tree.
2. Under Process diagnostics, select the "Enable process diagnostics" option.

The display of process diagnostic alarms is enabled in runtime.



12.3.3 Objects for the supervision and diagnostics of plants

Introduction

WinCC offers the following objects for displaying the current monitoring status and for fault diagnostics in the program code:

- GRAPH overview
- PLC code view

GRAPH overview

The "GRAPH overview" object is used to display the current program status for executed steps of the GRAPH sequencer.

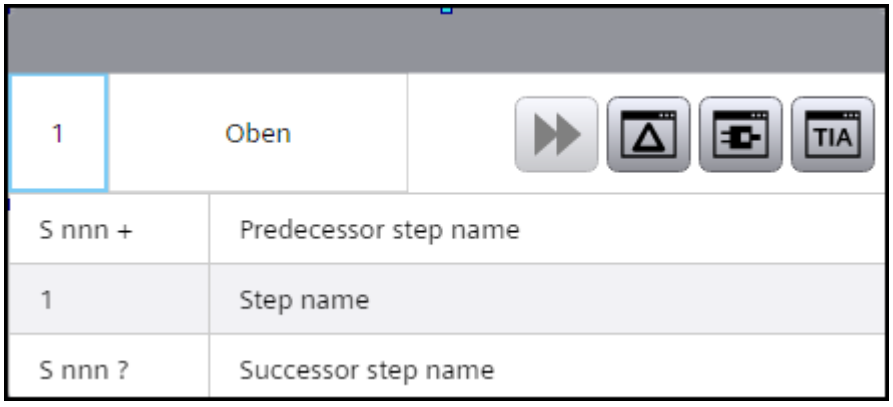
PLC code view

The "PLC code viewer" object is used to display the current program status of user programs that have been programmed in the GRAPH programming language.

12.3.4 GRAPH overview

Use

The "GRAPH Overview" object is used to display the current program status for executed steps of the GRAPH sequencer. Errors during execution of a program are displayed directly at the corresponding step.



The following information is displayed in the "GRAPH Overview" object:

- Name and status of the function block
- Status of initial and simultaneous steps
- Number and name of the first step currently executed step
- Operating mode for running the GRAPH sequencer

WinCC supports the display of step names for the GRAPH blocks in multiple languages starting from Version 6.0. The step names will then be displayed in the selected Runtime language following a language changeover in Runtime. If the selected language is not available in the GRAPH block, the names are displayed in the default language (English).

Note

Device dependency of the "GRAPH Overview" object

The "GRAPH overview" object is available for Unified PC.

Note

Requirement for display in GRAPH overview

For the display of the program status of an S7 GRAPH instance data block in the "GRAPH overview" object to be possible, the instance-specific properties of the block must be set as "Visible in HMI" and "Accessible from HMI".

Layout

In the Inspector window, you customize the position, style, colors and font types of the object. You can adapt the following properties in particular:

- Assigned GRAPH DB tag
- Buttons of the toolbar

Operating mode

Four operating modes are available for running the GRAPH sequence:

- AUTO (default setting) - Automatically switches to the next step when the transition is fulfilled.
- TAP - Automatically switches to the next step when the transition is fulfilled and there is an edge change from "0" to "1" at the T_PUSH parameter.
- TOP - Automatically switches to the next step when the transition is fulfilled or there is an edge change from "0" to "1" at the T_PUSH parameter.
- MAN - The next step is not automatically enabled when the transition is fulfilled. The steps can be selected and deselected manually.

Note

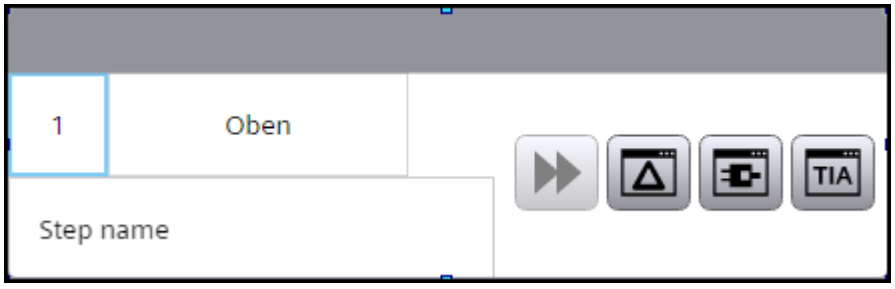
You set the operating mode by modifying the interface parameters of the GRAPH block in your control program.

In WinCC Unified Runtime, you have the option to customize the name for the operating mode that is displayed in the GRAPH overview.

Configuring a compact view

You can also configure a slim GRAPH overview without toolbar buttons and operating mode display.

To display a slim GRAPH overview in single-line compatibility mode, drag the control to the desired size.



Symbols

The symbols displayed in the GRAPH overview are pre-defined:

Symbol	Name	Function
	Error	Indicates that an error has occurred during the execution of a step.
	Initial step	Indicates that the currently executing step is the first step in the GRAPH block.
	Simultaneous step	Shows that there are other simultaneous steps in the GRAPH block in addition to the current one.

Buttons

You specify the buttons that are displayed in the GRAPH overview under "Properties > Miscellaneous > Toolbar > Elements".

Button	Name	Function
	Next Step	Jumps to the next step in parallel step. When you get to the last step, you can jump back to the first step.
	Jump to Alarm Control	Opens the configured alarm view with the error alarm in WinCC Unified. The button is intended to be populated with appropriate system functions/ scripts.
	Jump To PLC Code Viewer	Opens the configured PLC code view. The button is intended to be populated with appropriate system functions/ scripts. Ideally, use the "OpenViewerGraphFromOverview" system function.
	Jump to TIA Portal	Several system functions are available for opening the TIA Portal.

12.3.5 Configuring a GRAPH overview

Introduction

You can use the GRAPH overview to view the current program status for the executed steps of a GRAPH sequencer.

Requirement

- A PLC including a GRAPH instance data block has been created.
- GRAPH instance data block contains at least one tag which is visible in HMI and accessible from HMI.

  Note

  The process tag you are using for the GRAPH overview must be visible in HMI and accessible from HMI.

  To identify the tags of the GRAPH data block as visible and accessible for HMI, open the GRAPH function block, select the block in the work area, and select "Edit > Internal parameters visible/ accessible from HMI" in the menu bar. Then compile the program blocks.

- An HMI device has been created.
- You have created a screen.
- The Inspector window is open.

Procedure

1. Drag-and-drop the GRAPH overview from the toolbox view into the configured screen.
2. In the Inspector window, click "Properties > Properties > Miscellaneous".
3. Open the selection button under "PLC Source > Tag".
   The "Add new object" dialog opens.
4. Select the corresponding PLC in the "Program blocks" folder.
5. Select the corresponding PLC tag of the GRAPH instance data block.

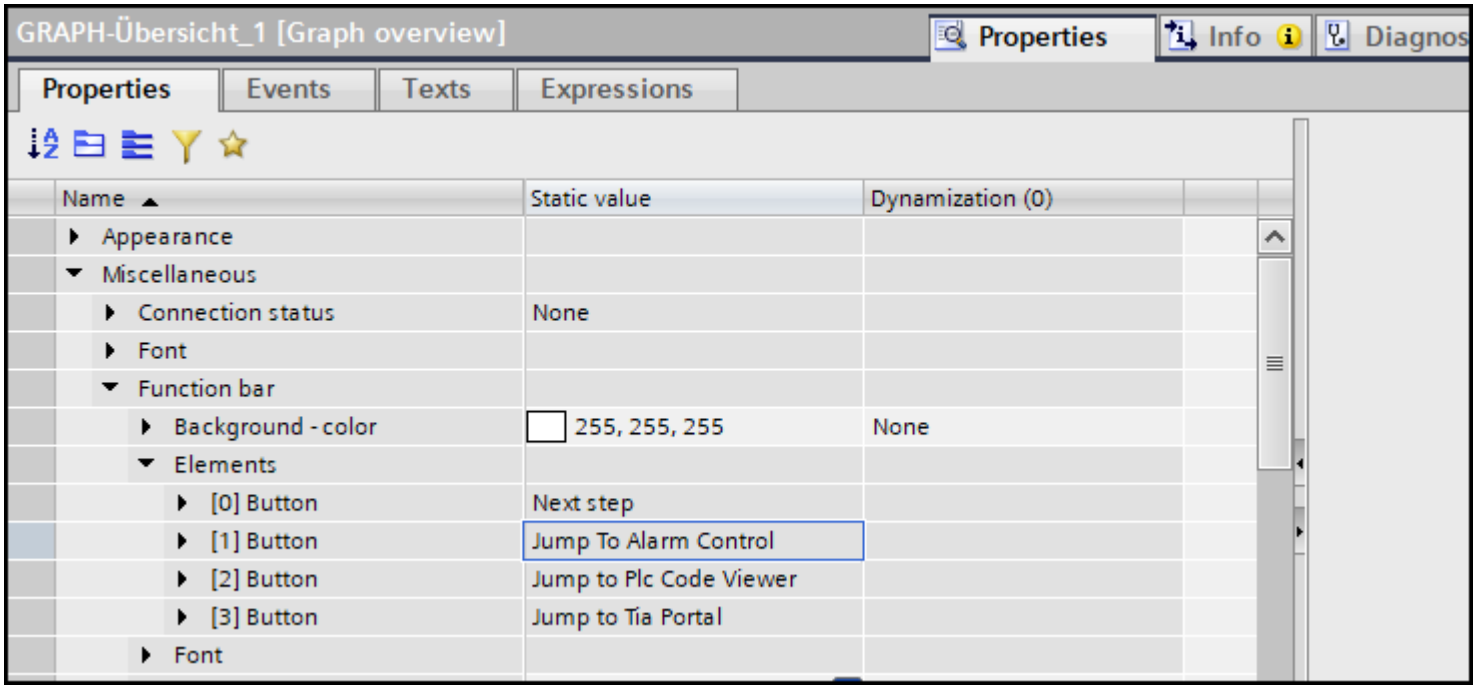
   Note

   If no connection was configured between the HMI device and the selected PLC, a connection is set up automatically.

   In addition, an HMI tag is created which is connected to the PLC tag.

6. To display the GRAPH overview in compatibility mode without toolbar buttons and operating mode display, drag the control to the desired size, whereby several basic views are possible.

7. Under "Properties > Properties > Miscellaneous > Toolbar > Elements", specify the buttons to be displayed in the object.



8. Under "Properties > Events" you can assign system functions or scripts to the buttons in the GRAPH overview in order to jump to the alarm control and the PLC code display in runtime and to open the TIA Portal.

Result

The GRAPH overview is inserted in the screen. The current status of the GRAPH step sequence is displayed in Runtime.

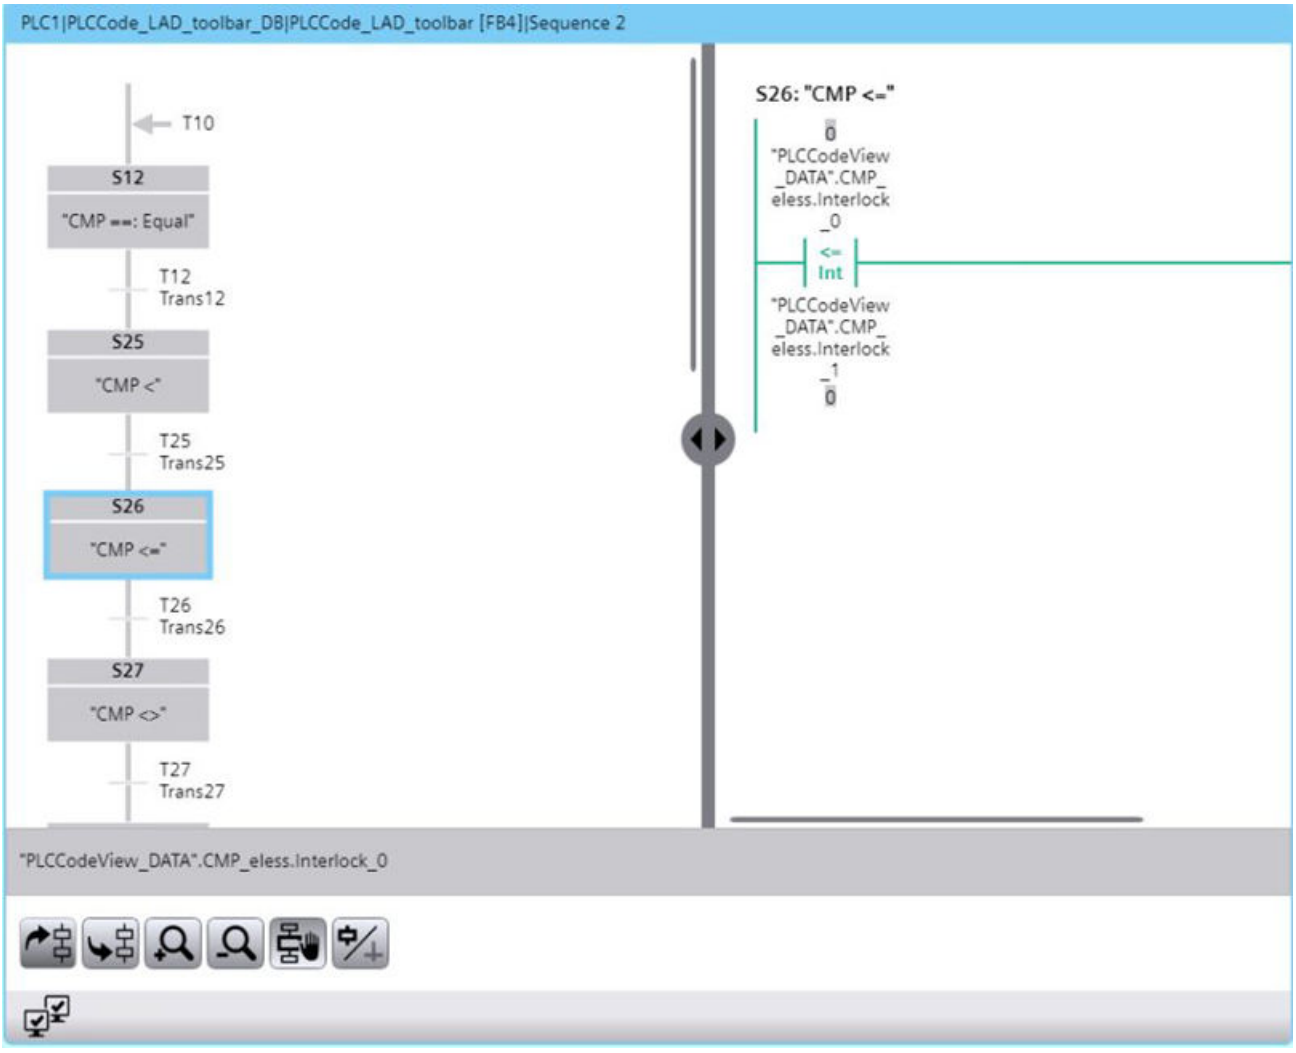
12.3.6 PLC code view

Use

The "PLC code viewer" object is used to display the current program status of user programs that have been programmed in the GRAPH programming language.

In the PLC code view, you display various items of information about the user program:

- Information area
- Toolbar
- Detail view
- Transition/Interlock view



Information area

The information area shows the GRAPH sequence in the left area and the details, e.g. for the step or for the transition, in the right area.

Toolbar

The toolbar shows information about the first or the selected icon.

Buttons of the toolbar

The table below shows the buttons on the toolbar and their meaning.

Operating element	Description	Function
	"Previous network"	Navigates to the previous network.
	"Next network"	Navigates to the next network.
	"Zoom in"	Enlarges the information area.
	"Zoom out"	Reduces the information area.
	"Step mode"	Switches between manual and automatic step selection for the active step.
	"Transition or Interlock"	Switches between the transition and interlock networks.

12.3.7 Configuring the PLC code view

Introduction

To display the PLC program networks in the GRAPH programming language in Runtime, insert a PLC code viewer control into your project.

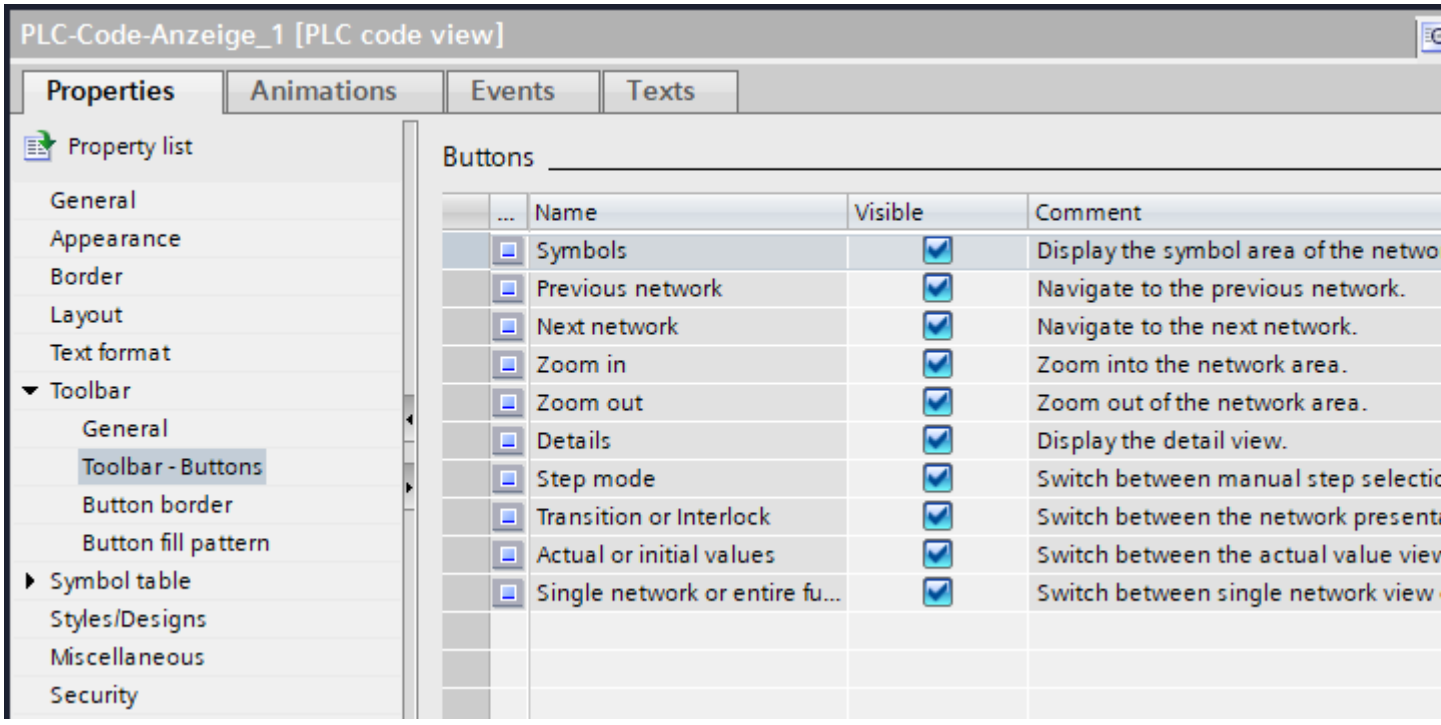
Requirement

- At least one PLC has been created.
- An HMI device has been created.
- An HMI connection has been established between the controller and HMI device.
- The system diagnostics is activated on all devices
- You have created a screen.

Procedure

1. Drag-and-drop the PLC code view from the toolbox view.
2. In the Inspector window, click "Properties > Properties > Toolbar".

3. Select the buttons that you require in Runtime, for example: Next network, Previous network, Step mode.



4. Select an authorization for operator input in "Properties > Properties > Security".

Result

The PLC code view is inserted in the screen. In Runtime, PLC user programs that are programmed in the GRAPH programming language can be displayed.

You can populate the PLC code viewer using system functions, e.g. jump from the GRAPH overview, or you can select the corresponding parameters directly.

Configuring users and roles 13

13.1 Basics

13.1.1 User management in the TIA Portal

The user management in the TIA Portal allows for the plant-wide, central user management including optional connection of Microsoft Active Directories. The user management forms the basis for an efficient and integrated management of personalized access rights in the plant. The safety risks are significantly reduced through this approach. Thanks to the specific assignment of roles and rights to individuals, maintenance is minimized while achieving a high degree of transparency.

Functions

The user management in the TIA Portal offers:

- Central, cross-project management of user groups and users in the system.
- Import of user groups and users from Microsoft Active Directory.
- Failsafe performance thanks to redundant design of a User Management Control domain (UMC domain).
- Load distribution thanks to multiple UMC stations in one UMC domain.

You can also find this information on the Internet in the "Centralized user management in TIA Portal" tile on the Software in TIA Portal (https://new.siemens.com/global/en/products/automation/industry-software/automation-software/tia-portal/software/tia-portal-options.html) page.

You can configure the user management for:

- Engineering System
- Runtime

In the engineering system, you specify whether you are using a local or a central user management. By default, the use of the local user management is specified in the engineering system.

Protection in the engineering system

In the engineering system, you can protect the project from unintentional or unauthorized changes.

When you set up project protection in the engineering system, you will become the project administrator. Only authorized users can open and edit the protected project.

To protect the project, follow these steps:

1. Click "Security settings > Settings > Password policies" in the project tree.
2. You can define your own password policies.
3. Click on "Project protection > Protect this project".
4. Specify the login information for the project administrator.
5. The project administrator with the system-defined role "Engineering administrator" is created. The project is protected.

Project protection cannot be revoked.

Protection in Runtime

In Runtime, you can protect:

- Access to Runtime.
- Operation of objects from authorized use.

You can also use the user management without project protection. The system-defined engineering roles are not available in an unprotected project.

User management for the runtime

All information for user management in runtime is available in the following sections.

See also

Configuring user management in the engineering system for Runtime (Page 6894)

13.1.2 Central user management and UMC

The TIA User Management Component (UMC) option allows for the setup of a project-wide, central user management. You can also apply user groups and users from a Microsoft Active Directory.

From the TIA Portal, you can add the centrally defined user groups and users to the user management of the project. To add user groups and users from UMC, the corresponding rights are required in UMC.

Installing the User Management Component UMC

To use the central user management, install the "User Management Component UMC" software package. The UMC installation file and the UMC documentation in English is available on the TIA Portal installation data storage medium ("..\support", "...\Documents\Readme\English").

Install the UMC files on the PC on which you are managing the data of the central user management.

Note

We highly recommend that you read the UMC documentation completely before you start working with the user management, especially the sections on "Secure Application Data Support (SADS)". SADS is mandatory for working with the user management in the TIA Portal.

Licenses for central user management

The number of UMC domains is cumulative.

The license is free for up to 10 users.

The following licenses are available if you are managing more users:

Software/license	Article number
TIA Portal User Management Component (UMC) Rental license for 100 user accounts and 365 days	6ES7823-1UE30-0YA0
TIA Portal User Management Component (UMC) Rental license for 4000 user accounts and 365 days	6ES7823-1UE10-0YA0

- Certificates of license (https://mall.industry.siemens.com/mall/en/WW/Catalog/Search?searchTerm=user%20management%20component&tab=Product)
- Details about license concepts: Software and licenses (https://new.siemens.com/global/en/products/automation/topic-areas/simatic/licenses.html)
- Trial license (https://support.industry.siemens.com/cs/ww/en/view/109772992) for registered users in the Siemens Industry Online Support. The software is subject to export restrictions.

13.1.3 Local and central user management

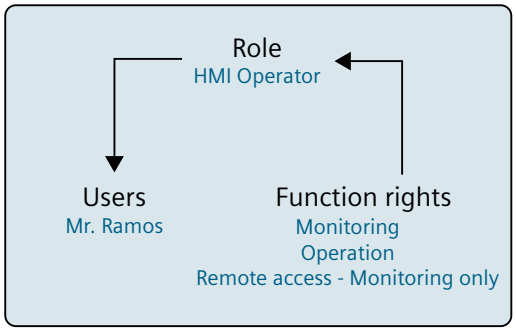
In the engineering system, you specify whether you are using a local or a central user management. By default, the use of the local user management is specified in the engineering system.

Local users and local user management

You define and manage the local users in a TIA Portal project. The local users are only valid for this project. You assign users different functions with system-defined or user-defined roles. You assign the function rights to the roles.

You cannot configure user groups in the local user management.

The following figure shows how you assign a role to a user and how you assign different function rights to the role:

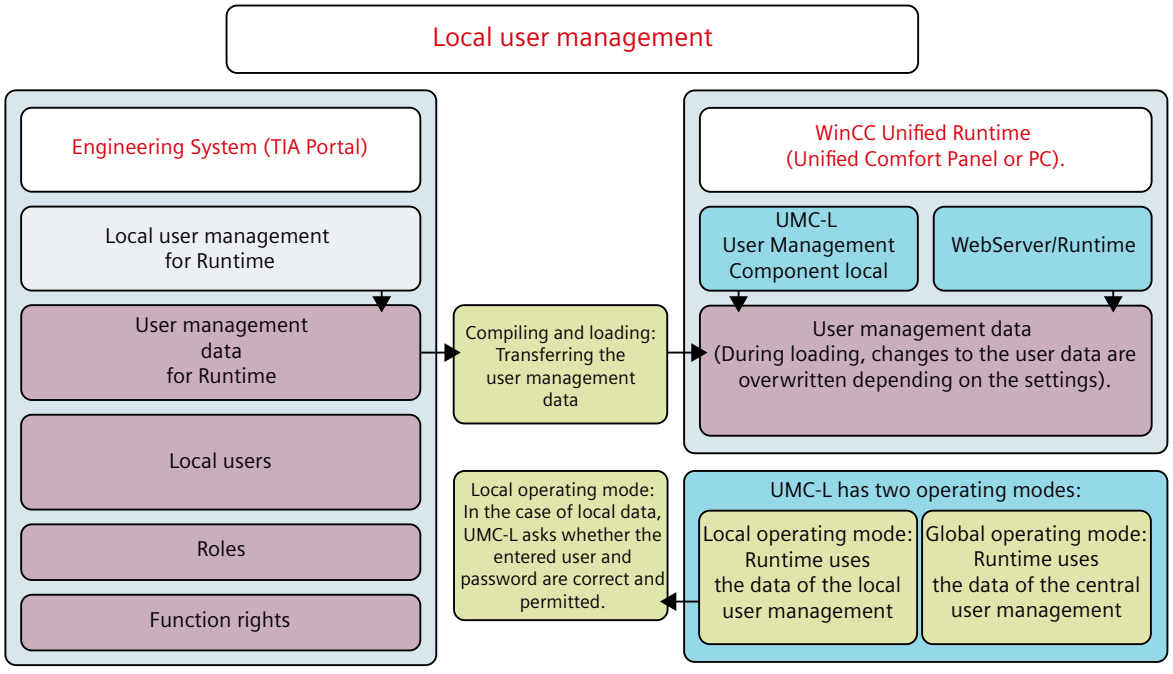


Options for local user management

A local user management is always part of the specific project in which the user management is configured.

The following figure shows the options of the local user management.

- Engineering system:
  - Configuring local users.
  - Adding roles and assigning function rights to the roles.
  - Assigning the roles to local users.
- WinCC Unified Runtime:
  - Managing local users.
  - Managing data of the local users.
  - Assigning the available roles to local users.



Logon via RFID with local user management for Unified PCs

If local user management is used, WinCC Unified Runtime supports login with RFID and PM-LOGON for local web clients.

The prerequisite is that PM-LOGON is installed on the UMC server and the teach-in of the RFID cards has been completed.

Additional information on licensing and installing PM-LOGON as well as on the teach-in for the RFID cards is available in the PM-LOGON Operating Manual (https://support.industry.siemens.com/cs/de/en/view/109810587).

Logon via RFID with local user management for Unified Control Panels

Additional information on using RFID on Unified Control Panels is available in the Unified Comfort Panels (https://support.industry.siemens.com/cs/ww/en/view/109810754) Operating Instructions TIA V18 or higher.

Central user groups, users and central user management

Outside of the TIA Portal, you define and manage the following in the central user management:

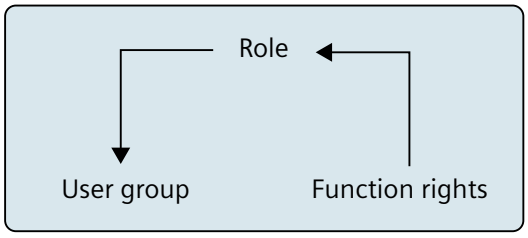
- User groups
- Central users

You organize the users in various user groups.

In the TIA Portal, you assign:

- The different functions to the user groups with the help of system-defined or user-defined roles.
- The function rights to the roles.

The following figure shows you how to you assign a role to a user group and function rights to the role:

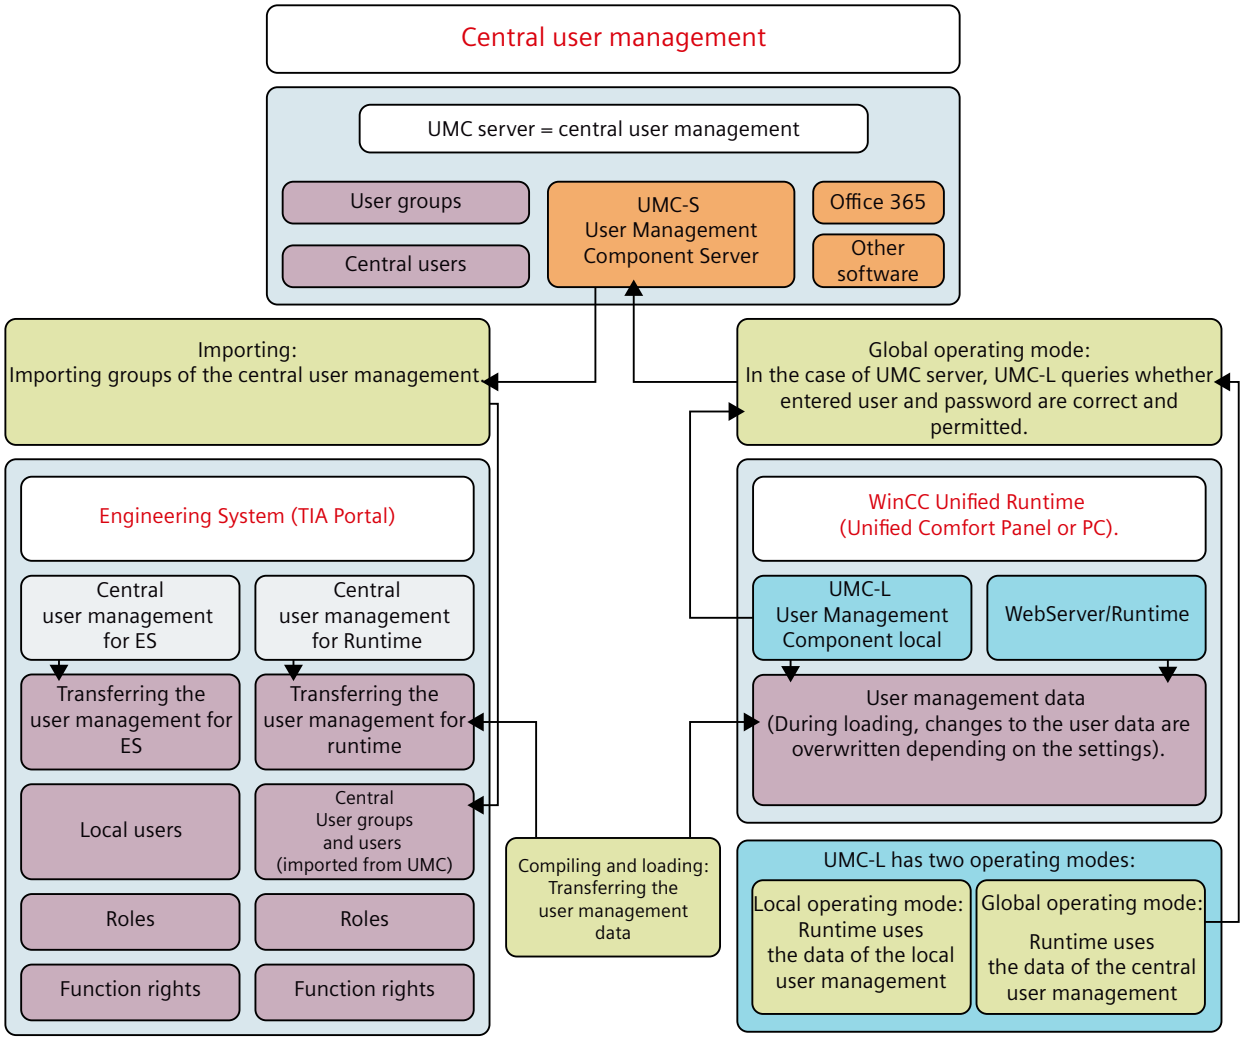


You can repeatedly import the user groups and central users from the central user management into the TIA Portal projects. You require the corresponding rights in the central user management for importing.

Options of the central user management

The following figure shows the options of the central user management.

- Engineering system:
  - Importing user groups and central users into a TIA Portal project.
- Central user management:
  - Managing user groups and their data.
  - Managing central users and their data.



See also

Examples (Page 6918)

13.1.4 Roles and function rights

In the user management, you assign users or user groups different functions through system-defined or user-defined roles. The roles are assigned system-defined and user-defined function rights by the system or by you.

- System-defined roles are specified by the system.
  You cannot rename or delete the system-defined roles. The function rights are assigned to the roles by the system. You cannot change the assignment.
- You can add user-defined roles.
  You can rename or delete the user-defined roles. You assign different function rights to a role.

Relevant roles in the engineering system

The system creates the following system-defined roles that are relevant for the engineering system.

Engineering roles:

- Engineering administrator
- Engineering standard

The roles are only available in a protected project.

Relevant roles in runtime

The system creates the following system-defined roles that are relevant for runtime.

HMI roles:

- HMI Administrator
- HMI Operator
- HMI Monitor
- HMI Monitor Client

The roles are also available in an unprotected project.

Function rights

The function rights specify which functions a user or a user group may use in a specific role. You can link different function rights to multiple roles. You can also add user-specific runtime rights.

You can assign multiple function rights to a role.

Note

User - Role - Function right

If you do not assign a role to a user or a function right to a role, the user or role is not downloaded to the device.

13.2 Configuring user management in the engineering system for Runtime

13.2.1 Specifying local or central user management

In the engineering system, you specify whether you are using local or central user management. By default, the use of the local user management is specified in the engineering system.

Requirement

- A project is open.
- A device has been created.
- Password settings for Runtime and engineering are defined.

Specify password settings

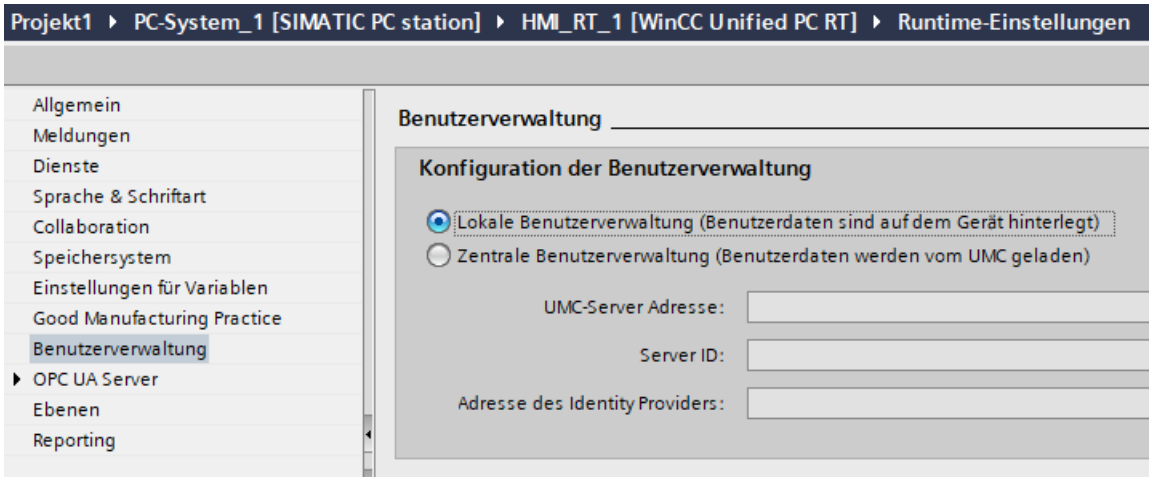
To set the password settings for the runtime and engineering, follow these steps:

1. Open "Security settings > Settings" in the project tree.
2. In the "Settings" editor, select the "Password policies" menu command.
3. Specify the password settings.

Specifying the user management

To define the user management, follow these steps:

1. Open the "Runtime settings" of the device in the project tree of the project.
2. Under "User management > User management configuration", select:
   - Local user management
     User data is stored on the device.
   - Central user management
     User data is loaded from the UMC.



See also

Managing local users (Page 6900)

Managing central users and user groups (Page 6903)

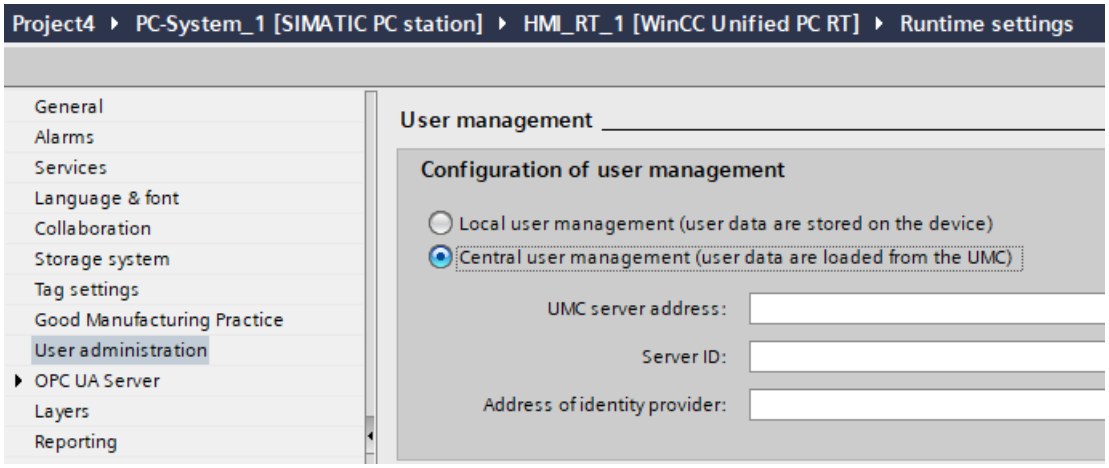
13.2.2 Configuring a connection to the central user management

You have specified in the Engineering System that you are using central user management.

Configuring a connection to the central user management

Follow these steps to configure the connection to the central user management:

1. Enter the UMC server address in "User management configuration".
2. Enter the server ID. The server ID can be determined from the configuration of the UMC server.
   The server ID is the fingerprint of the web certificate (https) on which the UMC server is installed. For more information, refer to Server ID (Page 6896).
3. Enter the address of the identity provider.



You are connected with the central user management.

Note

If you cannot connect to the central user management or you do not know the server ID, leave the entry field for the server ID empty.

The configuration is nevertheless downloaded to Runtime. Enter the server ID:

1. On the PC using Runtime Manager.
2. On the Panel using the Control Panel.

13.2.3 Server ID

The WinCC Unified PC station or the Unified Comfort Panel communicate via an encrypted HTTPS connection to the UMC server to verify the authentication.

The server ID is the fingerprint of the Internet Information Service (IIS) web certificate (HTTPS) on the computer where the UMC server is installed.

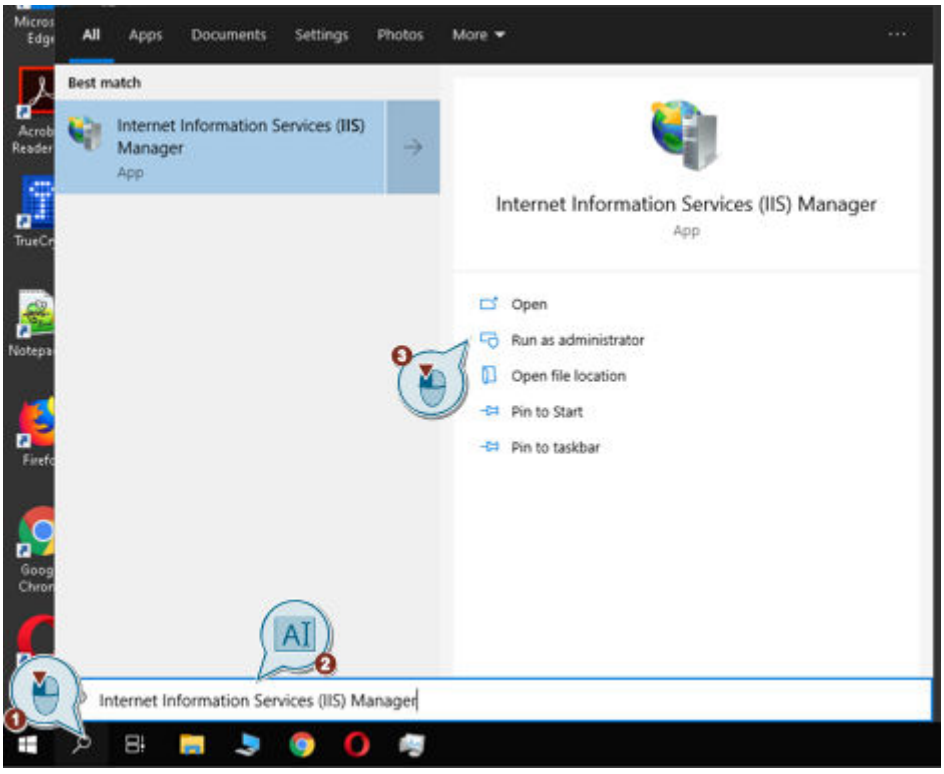
Note

In a distributed UMC domain with UMC ring server and multiple UMC servers / UMC RT servers, you decide which server of the UMC domain is used for user authentication of the respective Unified Station.

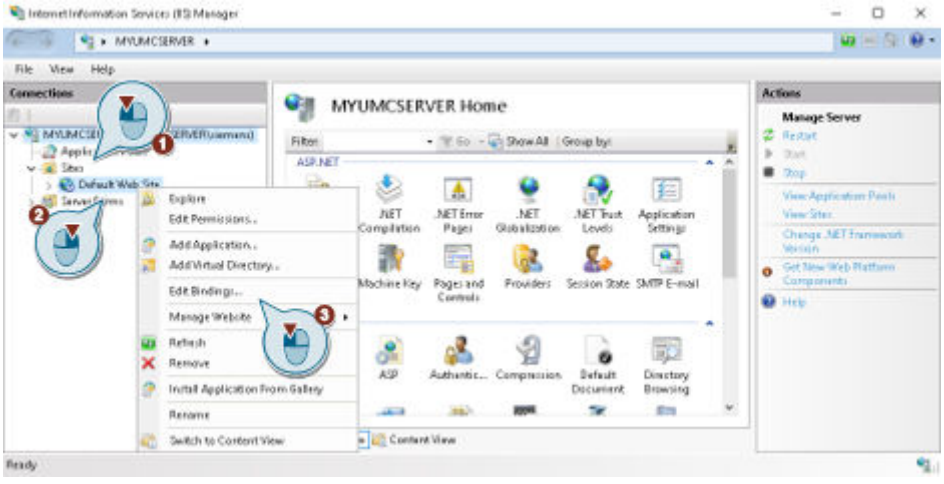
Take over server ID via the IIS Manager

If you want to apply the server ID via the IIS Manager, follow these steps:

1. Open the IIS Manager on the computer to which the WinCC Unified PC station or the SIMATIC WinCC Unified Comfort Panel is to connect for authentication.



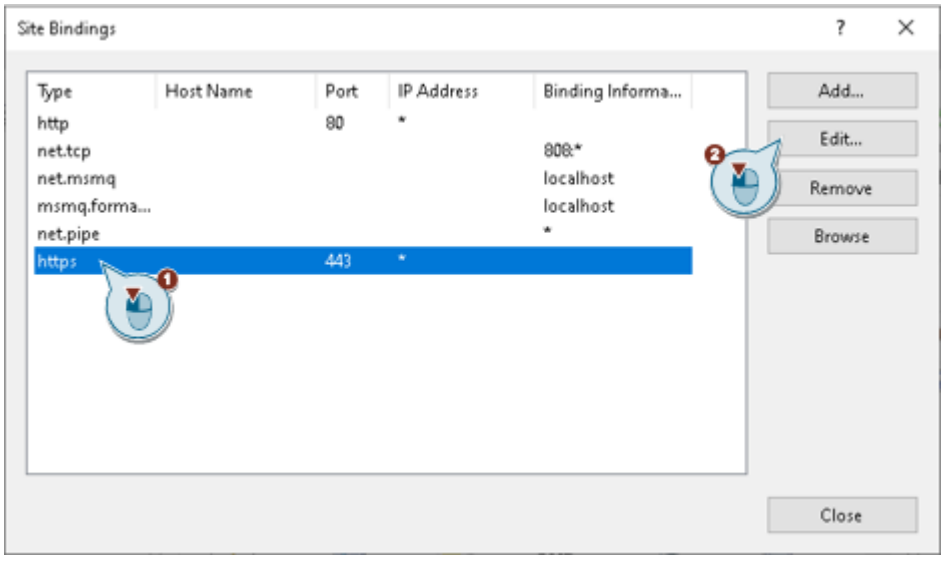
2. Edit the bindings of the default web page in IIS.



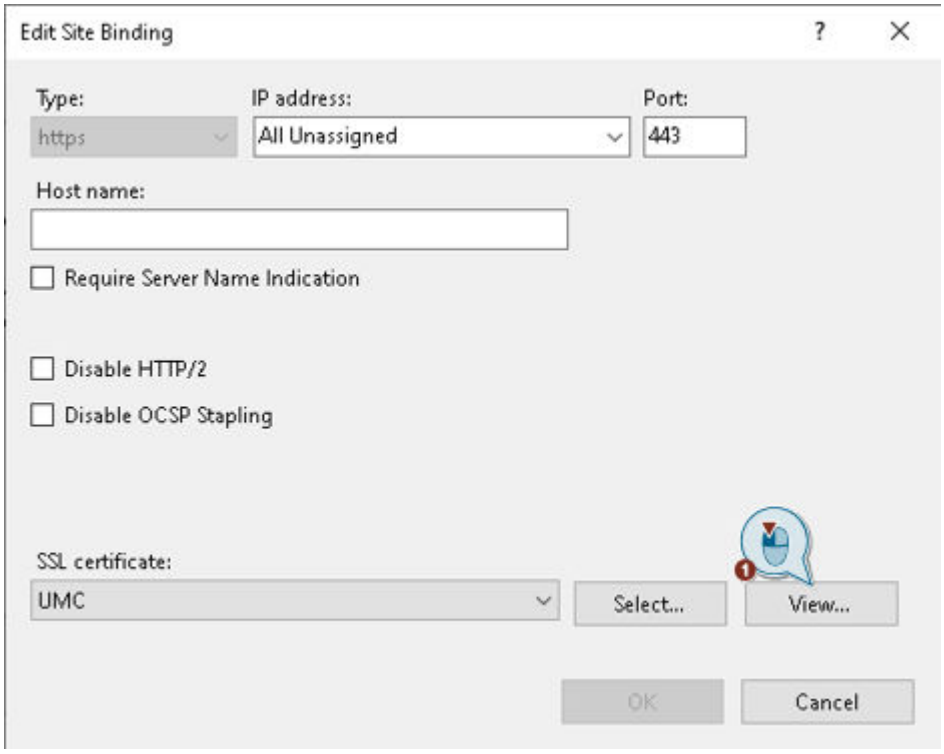
Note

If WinCC Unified is already installed on the same computer (single-user station system), select the "WinCC Unified SCADA" web page as the web page.

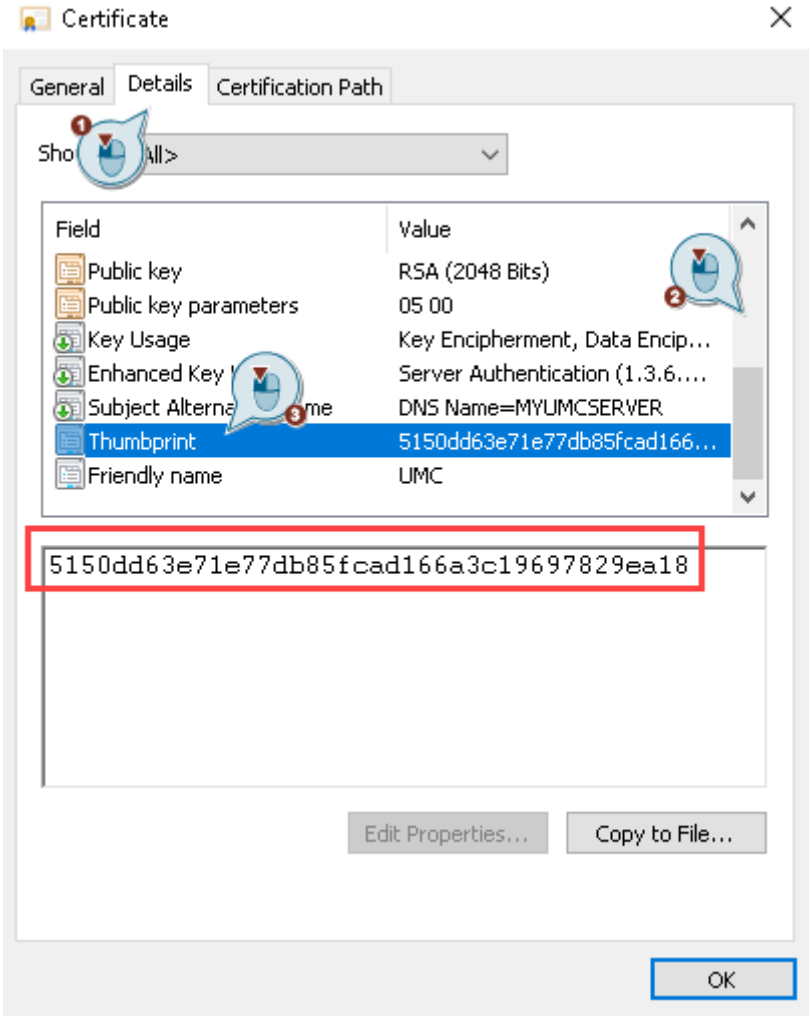
3. Edit the bindings of the 'HTTPS' type.



4. Open the stored SSL certificate.



5. Open the details of the SSL certificate. Scroll to the "Fingerprint" attribute.



6. Transfer the fingerprint of the certificate into the runtime settings of the WinCC Unified Station.

Take over server ID via a browser

You can also take over the server ID via a browser and without administrator rights.

You can find the procedure under the following link to "Fingerprints (https://www.grc.com/fingerprints.htm)" in the section "How to display this page's (or any page's) SSL certificate fingerprint".

13.2.4 Users and user groups

13.2.4.1 Managing local users

You have specified in the Engineering System that you are using local user management. To manage the local users in your project, you have the option of:

- Adding users
- Specifying data of a user:
  - User name
  - Password
  - Authentication procedure
  - Runtime timeout
  - Comment
- Copying, pasting, deleting users

Requirement

- A project is open.
- The "Security Settings > Users and Roles" editor is open.
- The "Users" tab is open.

Restrictions

Please note the following restrictions:

- You can add a maximum of 256 users.
- The user name may not exceed 255 characters.
- The password may not exceed 120 characters and must meet the defined password guidelines.
- The comment may not exceed 1000 characters.

Note

Permissible characters for user names and passwords

You can use the following numbers, letters and special characters for user names and passwords:

- 0123456789
- A...Z a...z
- !#$%&()*+,-./:;<=>?@\[]^_`{}~|
- Spaces within the user name or password

Adding users

To add a user, follow these steps:

1. Click "Add new user".
2. Click "Add new local user" in the submenu.
3. Enter a user name according to the password policies.
4. Select the authentication procedure for the user:
   - Password: Enter a password according to the password policies. Enter the password again to confirm.
   - Radius: The logon is made via a RADIUS server on which the password is saved. This option is only used for devices that support logon using a RADIUS server.
5. Set the runtime timeout for the user. This setting is only effective on the Unified Comfort Panel. Observe the notes in the individual manuals.
6. You can enter a comment for the project user.

A new project user has been created. Assign the roles to the user.

	**Tips for an efficient procedure**
• You can also create a new user by copying an existing user. As a result, the assigned roles are also assigned to the copied user. You must re-assign the password for the copied user.	

"Anonymous" user

In V18, a default "Anonymous" user is available. When enabled, the "Anonymous" user does not require a password.

You cannot use the "Anonymous" user to log in to Runtime.

Changing the user data

To change the data of a user, follow these steps:

1. In the "Users" tab, click the field whose data you want to change.
2. Change the user name, password, authentication procedure, runtime timeout or comment.

Deleting users

To delete a project user, proceed as follows:

1. Select the user in the "Users" tab that is open.
2. In the shortcut menu, select the "Delete" command or press the <Del> key.

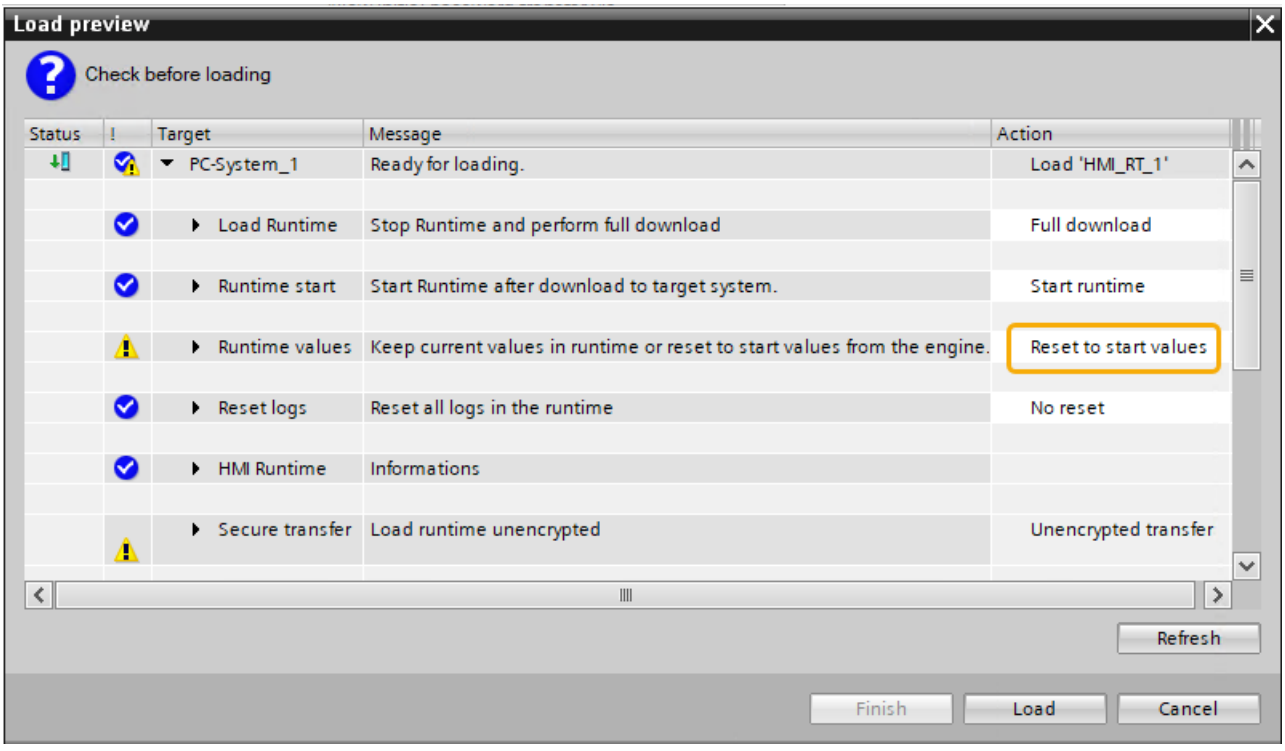
13.2.4.2 Downloading local user management

You have added at least one user. Compile and download the local user management.

Compiling and downloading local user management

To load the local user management for the first time, follow these steps:

1. Select the device in the project tree.
2. Select "Download to device > Software (all)" from the shortcut menu.
   The compilation of the project is checked and content that has not been compiled is compiled. The compilation result is displayed in the Inspector window under "Info > Compile".
3. The "Load Preview" dialog is displayed.
4. Check the displayed defaults and change the settings if necessary:
   - Specify whether runtime should start on the target system after the download.
   - Before the download, specify whether existing data is retained. When downloading for the first time, select "Reset to initial values".
   - Specify whether all logs are reset in runtime.
     The setting is only accepted when you have selected "Start runtime".



5. Click "Download".

Runtime starts after loading the settings.

Note

For the first download of a TIA Portal project to a runtime device, select the option "Reset to start values" when downloading the user data.

For all subsequent loading processes, select "Keep current values".

On the runtime device, the user configuration is not project-specific, but device-specific. The defined user management is used in all projects in a device.

All system-defined roles are included in each runtime project.

Keep current values during download

To keep the current values during the next download, select "Keep current values" during download.

The following user management data is kept:

- User name
- Password
- Password guidelines
- Comment
- Language
- Function rights
- User role
- User group
- User management mode - local or central
- Data of the central user management: Server address, server ID, identity provider address

See also

Managing local users (Page 6900)

13.2.4.3 Managing central users and user groups

You have specified in the Engineering System that you are using central user management.

You can add central users and user groups that were created in the central user management to a project. Central users and user groups are managed in the central user management. The changes affect the project to which these users or user groups belong.

You can synchronize the user management in the engineering system with the central user management or check the synchronization status.

Main advantage of the central user management

The main advantage of the central user management is the management of the user groups.

- In the user groups, you manage the central users independent of the engineering system. You add the central users to the user groups.
- The function rights of a user are known via the role assignment in the user group in the Unified Runtime.
- Changes to the user data are effective in Runtime even without loading the project.
- When you import the user group into the TIA Portal, the users and their data including passwords is automatically imported into the project.

Requirement

- A project is open.
- The connection to the central user management is configured.
- You have a user account with the corresponding rights in the central user management.
- The "Security Settings > Users and Roles" editor is open.
- The "User groups" tab is open.

Restrictions

Please note the following restrictions:

- You can add a maximum of 256 central users.
- You can add a maximum of 50 central user groups.
- You cannot copy central users and user groups.

Information about user groups and users

You can display the following information for central users and user groups:

- User groups: The users they contain and whether they have already been imported into the user management.
- User: The user groups of which the user is a member and whether they have already been imported into the user management.

Adding user group

To add a user group from the central user management to a TIA Portal project, follow these steps:

1. Open the "User groups" tab.
2. Click "Add new user group".
   If you have not yet logged in to the central user management yet, the "UMC Login" dialog opens:
   - Enter your UMC user name and the corresponding password.
   - Click "OK".
3. If you are logged in to the central user management, the "Add new user group from UMC" dialog opens. All available user groups from the central user management are displayed. Already added user groups are activated and write-protected.
4. Activate the user groups that you want to add to the TIA Portal project. Click "OK".
5. The selected user groups are added as central user groups. Their data is write-protected, and you cannot change the data within the TIA Portal project.

Deleting a user group

To delete a user group from the TIA Portal project, follow these steps:

1. Open the "User groups" tab.
2. Select one or more user groups.
3. In the shortcut menu, select the "Delete" command or press the <Del> key.

Adding central users

You can also import the individual central users into a TIA Portal project.

To add a central user from the central user management, follow these steps:

1. Open the "Users" tab.
2. Click "Add new user".
3. Click "Add global users" in the submenu.
   If you have not yet logged in to the central user management yet, the "UMC Login" dialog opens:
   - Enter your UMC user name and the corresponding password.
   - Click "OK".

   If you are logged in to the central user management, the "Add new user from UMC" dialog opens. All available users from the central user management are displayed. Already activated users are activated and write-protected.
4. Activate the user that you want to add to the TIA Portal project. Click "OK".
5. The selected users are added as central users. Their data is write-protected, and you cannot change the data within the TIA Portal project.

	Tips for effective procedure
•	To find the required users, filter the table by the columns "Name" and "Long name". Enter the name in the first line. All users with this name are displayed. To cancel filtering, click on the "Filter" button or select "*" in the drop-down list.

Deleting a central user

To delete a central user from the TIA Portal project, follow these steps:

1. Open the "Users" tab.
2. Select one or more central users.
3. In the shortcut menu, select the "Delete" command or press the <Del> key.

See also

Server ID (Page 6896)

13.2.4.4 Loading central user management

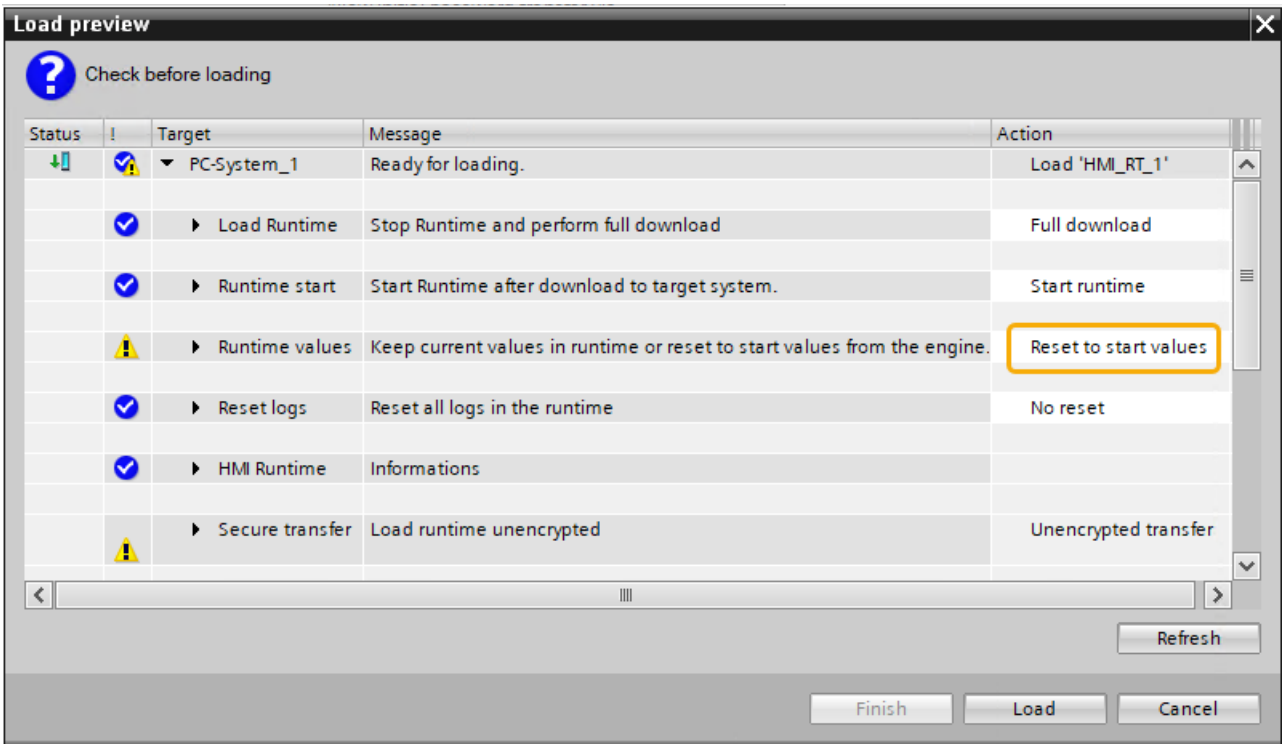
You have added at least one user group. Compile and load the central user management.

Compiling and loading central user management

To download all data of the central user management, follow these steps:

1. Select the device in the project tree.
2. Select "Download to device > Software (all)" from the shortcut menu.
   The compilation of the project is checked and content that has not been compiled is compiled. The compilation result is displayed in the Inspector window under "Info > Compile".
3. The "Load Preview" dialog is displayed.

4. Check the displayed defaults and change the settings if necessary:
   - Specify whether runtime should start on the target system after the download.
   - Before the download, specify whether existing data is retained. When downloading for the first time, select "Reset to start values".
   - Specify whether all logs are reset in runtime.
     The setting is only accepted when you have selected "Start runtime".



5. Click "Download".

The connection to the central user management is established after loading the settings.

Depending on the selected options, runtime is started during loading.

Note

For the first download of a TIA Portal project to a runtime device, select the option "Reset to start values" when downloading the user data.

For all subsequent loading processes, select "Keep current values".

On the runtime device, the user configuration is not project-specific, but device-specific. The defined user management is used in all projects in a device.

All system-defined roles are included in each runtime project.

Note

Enter the settings loaded for the central user management:

- On the PC in the SIMATIC Runtime Manager
- On the Panel in the Control Panel.

Depending on the setting, data is overwritten during loading.

Keep current values during download

If you want to keep the current values during the next download, select "Keep current values" during download.

The following user management data is kept:

- User name
- Password
- Password guidelines
- Comment
- Language
- Function rights
- User role
- User group
- User management mode - local or central
- Data of the central user management: Server address, server ID, identity provider address

Behavior of the runtime after the download

If all your entries are correct, runtime uses the downloaded settings.

If the entries are incomplete or incorrect, runtime exhibits the following behavior:

- If the data of the central user management has already been downloaded successfully once before, runtime uses the user data that was downloaded last.
  Enter missing settings for central user management:
  - On the PC in the SIMATIC Runtime Manager
  - On the Panel in the Control Panel.
- If the data of the central user management has never been downloaded, runtime does not start.
  Enter missing settings for central user management:
  - On the PC in the SIMATIC Runtime Manager
  - On the Panel in the Control Panel.

13.2.5 HMI roles

13.2.5.1 Managing HMI roles

You assign users the roles with the function rights. You can manage the user-defined HMI roles in your project.

System-defined roles relevant for HMI

System-defined HMI roles without engineering function rights are created in an unprotected project:

- HMI Administrator
- HMI Operator
- HMI Monitor
- HMI Monitor Client

You cannot rename or delete system-defined HMI roles. Also, you cannot change the assignment of the function rights to system-defined roles.

User-defined roles relevant for HMI

You can perform the following actions to manage the user-defined HMI roles in your project:

- Add a new user-defined role.
- Change the data of the user-defined role:
  - Name
  - Runtime timeout
  - Comment
- Assign the function rights to the role.
- Change or delete the assignment of the function rights.
- Delete a role.

Requirement

- A project is open.
- A device has been created.
- The "Security Settings > Users and Roles" editor is open.
- The "Roles" tab is open.

Adding a user-defined HMI role

To add a user-defined HMI role, follow these steps:

1. Double-click "Add new role".
2. Enter a name, runtime timeout and a comment, if required.

A user-defined HMI role has been created. Assign the function rights to the role.

	**Tips for effective procedure**
• You can also create a user-defined HMI role by copying an existing HMI role. As a result, the assigned function rights are also assigned to the copied HMI role.	

Change the data of a user-defined role

To change the data of a user-defined role, follow these steps:

1. Click in the field whose data you want to change.
2. Change the role name, runtime timeout or comment.

Note

When setting the runtime timeout, observe the notes in the individual manuals.

Delete user-defined role

To delete a user-defined role, follow these steps:

1. Select the user-defined role.
2. In the shortcut menu, select the "Delete" command or press the <Del> key.

13.2.5.2 Assigning HMI roles

You can assign HMI roles with different function rights to local users and global user groups.

Requirement

- A project is open.
- A device has been created.
- Users and user groups have been created.
- The "Security Settings > Users and Roles" editor is open.

Assigning HMI roles to local users

To assign roles to a user, follow these steps:

1. Open the "Users" tab.
2. Select the user.
3. Activate the desired HMI roles in the "Assigned roles" tab.

Assigning HMI roles to global user groups

To assign roles to a global user group, follow these steps:

1. Open the "User groups" tab.
2. Select the user group.
3. Activate the desired HMI roles in the "Assigned roles" tab.

Revoking role assignments for local users

To revoke a role for a user, follow these steps:

1. Open the "Users" tab.
2. Select the user.
3. In the "Assigned roles" tab, disable the roles that you no longer want to assign to the user.

Revoking role assignments for global user groups

To revoke a role assignment for a global user group, follow these steps:

1. Open the "User groups" tab.
2. Select the user group. Note that you cannot use multiple selection.
3. In the "Assigned roles" tab, clear the roles that you no longer want to assign to the user group.

13.2.5.3 HMI role "HMI Monitor Client"

The system-defined role "HMI Monitor Client" contains the function right "WinCC Unified Client Monitor - Limited Access". No other function rights can be assigned to this role.

The "HMI Monitor Client" role allows you to monitor and analyze the production process without influencing the processes in the PLC unintentionally or without authorization.

The following description applies to Unified PC and Unified Comfort Panel.

Note

To operate the "HMI Monitor Client", you need one or more "HMI Monitor Client" licenses depending on the number of accesses.

Important notes

The "HMI Monitor Client" HMI role is superior to all other roles and their function rights. A user who is assigned the "HMI Monitor Client" role is only granted the functional rights of this role. Function rights with a higher precedence, of other roles that are assigned to the user, are lost.

Restrictions of the "HMI Monitor Client" role

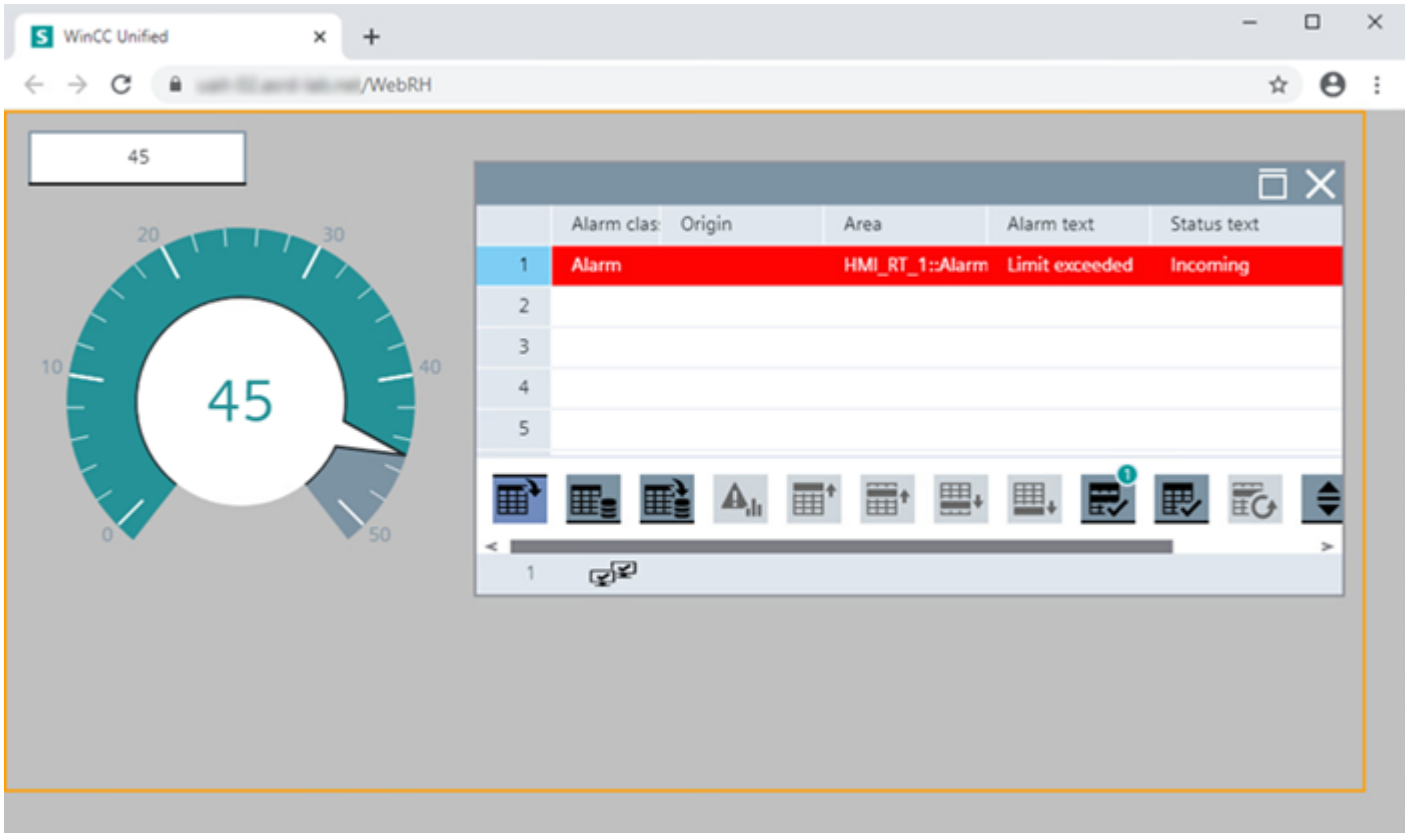
A user with the function right "WinCC Unified Client Monitor - Limited access" may monitor the processes but only operate them to a limited extent.

The following table shows which operations the user cannot carry out:

Tags	Transfer value changes from external tags (PowerTags) to the PLC
Data logging	Clear logs
	Write log values manually
	Comment log values
	Write correction values
Alarms	Acknowledge active alarms
	Reset active alarms
	Disable alarms
	Enable alarms
Alarm logging	Delete alarm log
	Comment logged alarms
Parameter set control	Process values cannot be written to the PLC with the "Write to PLC" button of the parameter set control.
	Process values cannot be written to the PLC with the system function "LoadAndWriteParameterSet".
	Process values cannot be written to the PLC with the snippet "Load Parameter Set from storage and write to PLC".
	Parameters sets cannot be loaded from the parameter set memory using control tags. Process values cannot be written to the PLC using control tags.

Visualization in Runtime

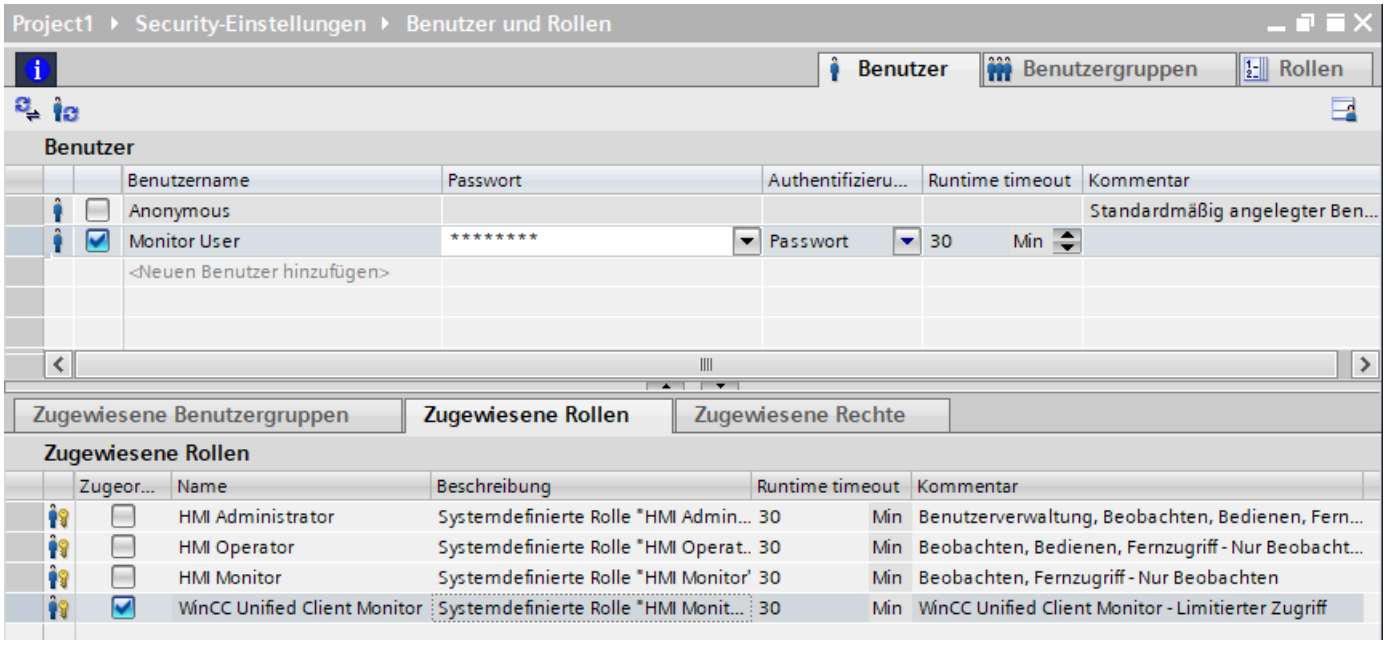
In Runtime, the Monitor Client mode is visualized by an orange frame around the root screen.



Activating Monitor Client mode

To activate the Monitor Client mode, follow these steps:

1. Create a user or select an existing user.
2. Assign one of the following roles to the user:
   - The system-defined role "HMI Monitor Client".
   - A user-defined role that contains the function right "WinCC Unified Client Monitor - Limited access".



3. The user logs on to Runtime.
4. The Monitor Client mode is activated.

The user is allowed to monitor the process but not to change any values that are relevant for the process. These values are listed at the top of the table.

System-defined function rights (Page 6914)

Managing HMI roles (Page 6909)

13.2.6 Function rights

13.2.6.1 System-defined function rights

You can assign the different function rights to the HMI roles. These function rights specify which functions a user may use in Runtime.

System-defined function rights

The following table shows an overview of the system-defined function rights in the TIA Portal. The function rights are automatically checked and activate the associated functionality.

You cannot rename or delete the system-defined runtime rights.

Function right	Description	HMI roles
Importing and exporting users	The user may import and export user management data in runtime. The function right is not supported on a Unified Comfort Panel.	User-defined role
User management	The user has permission to manage the existing users and add and manage the new users in Runtime.	HMI Administrator
Enable HMI Monitor Client	The user may observe the process on an HMI device to a limited extent without unintentionally or unauthorizedly influencing the processes in the PLC.	HMI Monitor Client
OPC UA read and write access	The user may access the data of a different device with read and write permission via OPC UA.	HMI Administrator
Openness Runtime read and write access	The user may access the data of a Unified runtime with read and write permission via Openness.	HMI Administrator
Reset UMC password	The user may reset the UMC password.	User-defined role
Control Panel access	The user may change the settings in the Control Panel of a Unified Comfort Panel.	HMI Administrator

Additional function rights may be available that are associated with additional products and options that are installed.

Function rights to the screen objects

The following table shows an overview of the function rights that are set on the screen objects. These function rights have no pre-defined meaning.

The meaning of the function rights comes from the objects that are protected and trigger an action.

Function right	Example application	HMI roles
Operate	The user may operate access-protected objects in runtime.	HMI Administrator HMI Operator
Monitor	The user may only monitor but not operate the objects.	HMI Administrator HMI Operator HMI Monitor
Remote access	The user may use Unified Collaboration to access an HMI device.	HMI Administrator
Remote access - Monitor only	The user may use Unified Collaboration to access an HMI device. The user may only monitor but not operate the objects.	HMI Administrator HMI Operator HMI Monitor

Protecting the Control Panel from being accessed (Page 6926)

HMI role "HMI Monitor Client" (Page 6911)

13.2.6.2 User-defined function rights

You can assign different runtime rights to the HMI roles. These function rights specify which functions a user may use in WinCC Unified Runtime in Runtime.

You can implement your protection concepts with the user-defined runtime rights.

Restrictions

Please note the following restrictions:

- You can add a maximum of 999 user-defined Runtime rights.
- The name of the user-defined runtime right and the name of the group of runtime rights can be up to 128 characters long.
- The comment may not exceed 1000 characters.

Note

You can use the following numbers, letters, and special characters for the names and groups of the user-defined runtime rights:

- 0123456789
- A...Z a...z
- !#$%&()*+,-./:;<=>?@\\[]^_`{}~|
- Spaces within the user name or password

Requirement

- A project is open.
- A device has been created.
- The "Security Settings > Users and Roles" editor is open.
- The "Roles" tab is open.

Adding a user-defined Runtime right

To add a user-defined runtime right, follow these steps:

1. Click on the "User defined runtime rights" tab.
2. In the "Function rights" area, double-click "Add new right" in the "Name" column.
3. Enter a name, a group and a comment, if required.

Note

The "Group" column is used to group the user-defined runtime rights in the engineering system. The assignment of the runtime rights to a group has no effect on the runtime.

A user-defined runtime right has been created. Assign the runtime right to a role.

	Tips for effective procedure
•	You can also create a user-defined runtime right by copying an existing runtime right.

Changing the data of a user-defined runtime right

To change the data of a user-defined runtime right, follow these steps:

1. Click in the field whose data you want to change.
2. Change the name, the group or the comment.

Deleting a user-defined runtime right

To delete a user-defined runtime right, follow these steps:

1. Select the user-defined runtime right.
2. In the shortcut menu, select the "Delete" command or press the <Del> key.

13.2.6.3 Assigning function rights to an HMI role

You assign the function rights to the roles.

Assign function rights to a user-defined role

To assign the function rights to a user-defined role, follow these steps:

1. Select the user-defined role.
2. In the "Runtime rights" tab, open the category from which you want to assign the function rights.
3. In the "Function rights" area, enable the function rights that you want to assign to the role.

Changing or deleting the assignment of the function rights

To change or delete the assignment of the function rights to a user-defined role, follow these steps:

1. Select the user-defined role.
2. In the "Runtime rights" tab, open the category from which you want to assign the function rights or revoke the assignment:
   - In the "Function rights" area, enable the function rights that you want to assign to the role.
   - In the "Function rights" area, disable the function rights that you no longer want to assign to the role.

Displaying assigned function rights of a local user

To display the assigned function rights of a local user, follow these steps:

1. Open the "Users" tab.
2. Select the user.
3. Open the "Assigned rights" tab in the lower area.
4. Expand the categories of function rights in the "Categories of function rights" column.
   The assigned function rights are displayed in the "List of rights" column.
   The roles by which the function rights are assigned to the user are displayed in the "Rights derived from role" column.

Display assigned function rights of a global user group

To display the assigned function rights of a global user group, follow these steps:

1. Open the "User groups" tab.
2. Select the global user group.
3. The assigned function rights are displayed in the lower area of the "Assigned rights" tab.

13.2.7 Examples

13.2.7.1 Example: Setup of the local user management

Task

In the following example, you set up a user management for different users. The example orientates itself to a typical requirement profile from manufacturing engineering.

Principle

Users with various roles are involved in a project. Create the users and assign them to the roles.

You can reproduce different views through the roles.

Example:

- Organizational view: Commissioners, Operators, Shift I, Shift II.
- Technological view: Axis control, Tool changers, Plant North, Plant South.

The following example orientates itself to the organizational view.

Each user has function rights for specific applications.

In the example, you create Mr. Meier, Ms. Ramos, Ms. Greenwood, Messrs. Peters and Santini. You assign roles to each user.

Requirements

- A new project has been created.
- The "Users and roles" editor in "Security settings" is open.

Procedures overview

To assign the users one or more roles, follow these steps:

1. Create the users.
2. Create the roles and assign the users one or more roles. Note the following information:
   - The function rights have been defined for the system-defined roles.
   - You assign the required function rights to the user-defined roles.
3. Configure a button with access protection.

Result

The goal is the following structure of the user management consisting of users, roles and function rights:

The user "Meier" has the "HMI administrator" role.

Note

Not all function rights that have been specified for the system-defined "HMI Administrator" role are displayed in the table.

Users	Role	Function rights		
		User management	Operation	Remote access
Meier	HMI Administrator	x	x	x

You assign the required roles to the other persons.

Users	Role	Function rights							
		Operation	Monitoring	Remote access	User-defined runtime right Screen change	User-defined runtime right Toggle language	User-defined runtime right Change parameter sets	User-defined runtime right Delete parameter sets	User-defined runtime right Stop Runtime
Ramos	HMI Operator	x	x	x					
Greenwood	Operator				x	x			
Peters	Line-Manager				x	x	x	x	
Santini	Service				x	x	x	x	x

13.2.7.2 Example: Add user and assign to a role

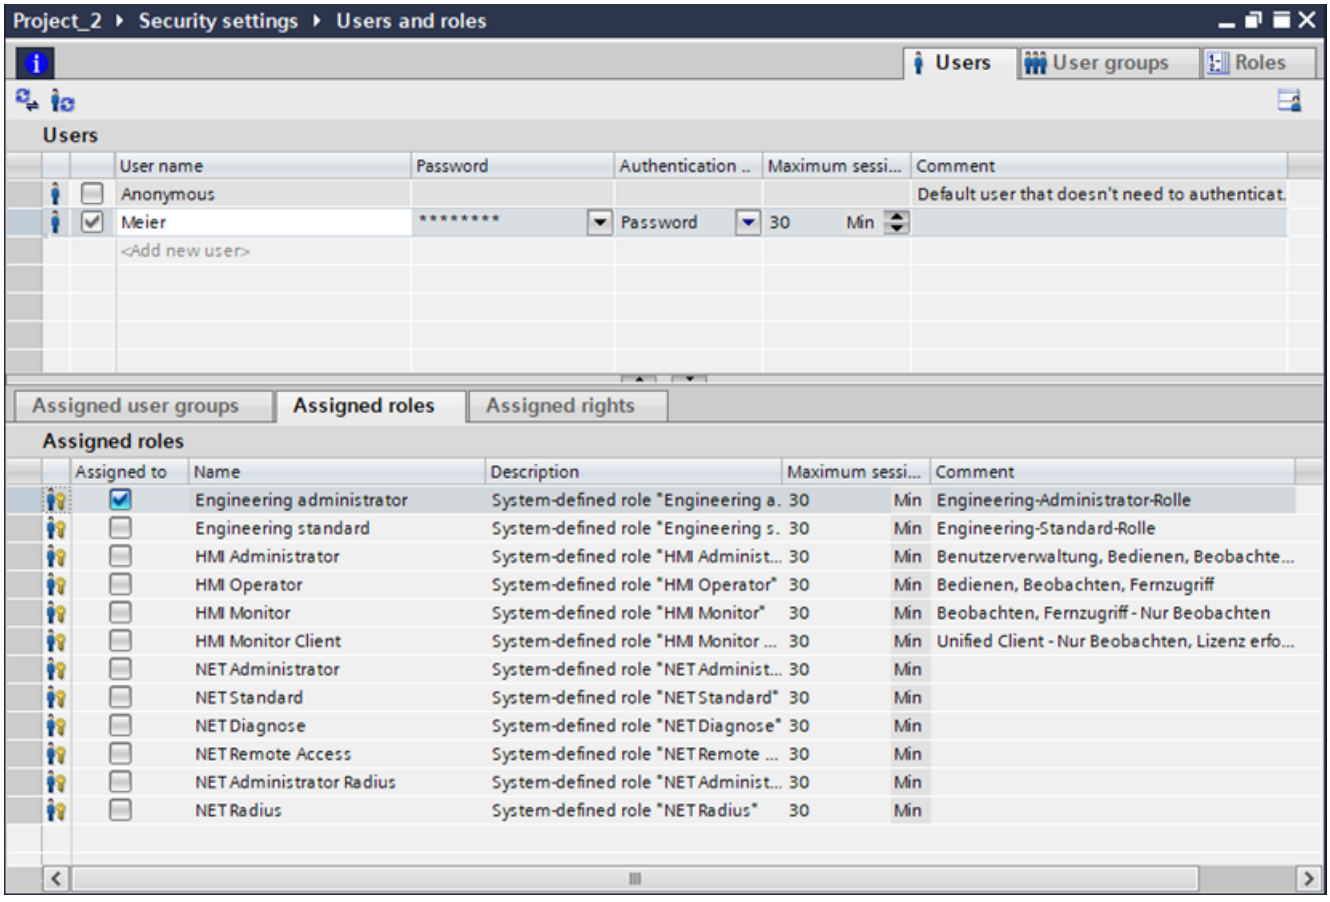
Task

In the following example, you create the users and assign them to their roles. The users are sorted alphabetically immediately after the name has been entered.

Procedure

1. Open the "Users" work area.
2. Double-click "Add new user" in the "Users" table.
3. Enter "Meier" as the user name.
4. Click the  button in the "Password" column. The dialog box for entering the password is opened.
5. Enter "Meier123" as the password. The password must meet the defined password policies.
6. To confirm the password, enter it a second time in the lower field.
7. Close the dialog box by using the  icon.
8. Enable the "HMI Administrator" role in the "Assigned Roles" table.

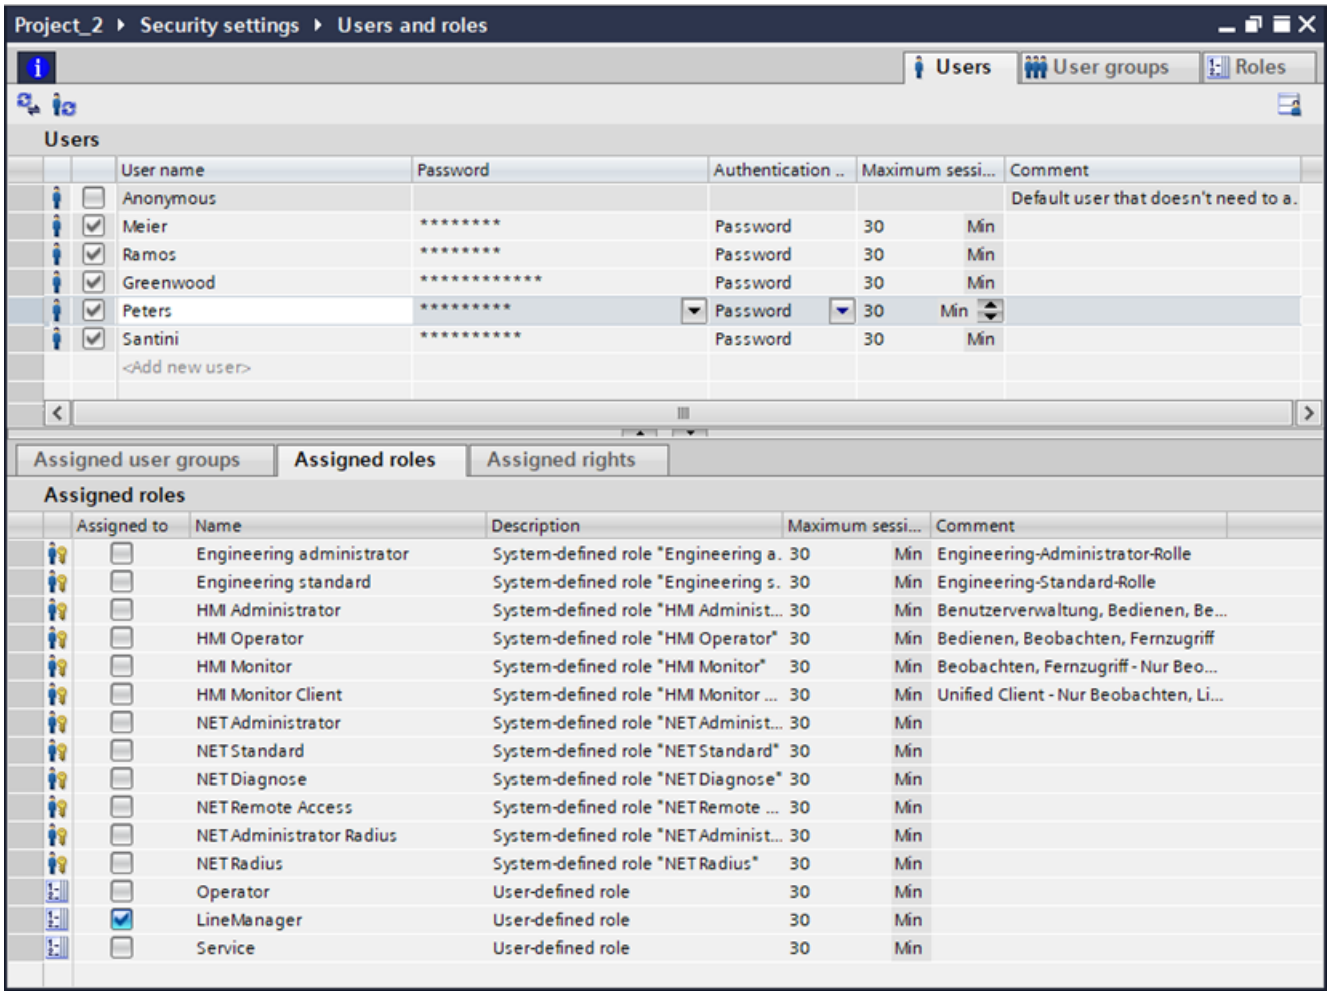
Interim result



Procedure

1. Double-click "Add new user" in the "Users" table.
2. Enter "Ramos" as the user name.
3. Click the button in the "Password" column. The dialog box for entering the password is opened.
4. Enter "Ramos123" as the password.
5. To confirm the password, enter it a second time in the lower field.
6. Close the dialog box by using the icon.
7. Enable the "HMI Operator" role in the "Assigned Roles" table.
8. Repeat steps 2 to 6 for the users "Greenwood", "Peters" and "Santini".
9. Enable the user-defined roles "Operator", "LineManager" and "Service" of the individual users in the "Assigned Roles" table.

Result



13.2.7.3 Example: Add roles and assign function rights

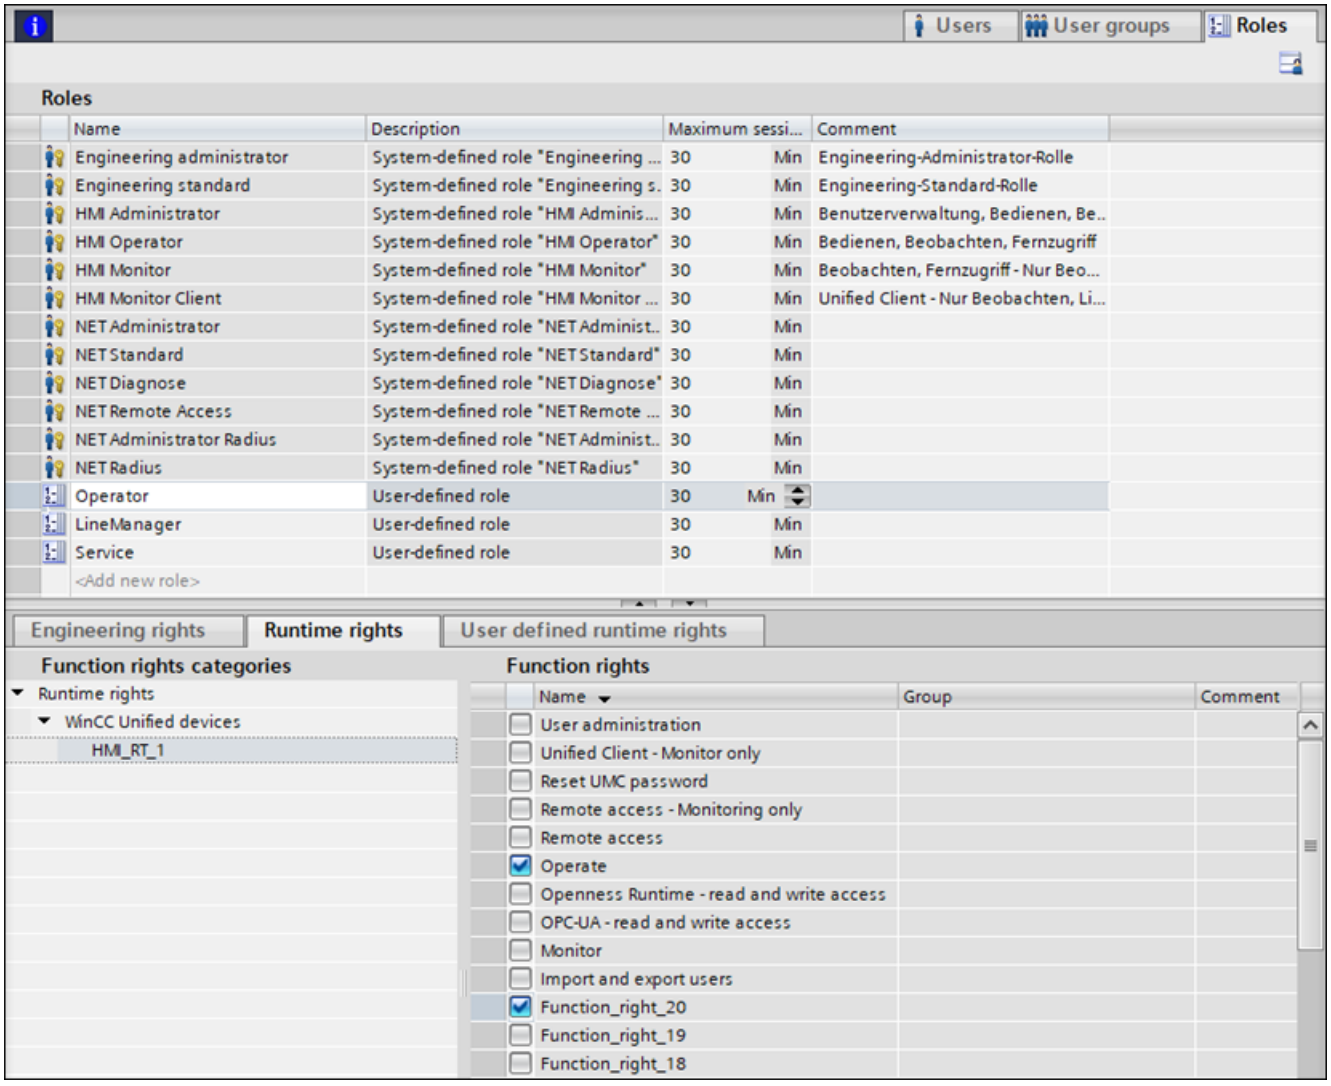
Task

In the following example, you create the roles and assign the function rights to the roles.

Procedure

1. Open the "Roles" work area.
2. Double-click "Add new role" in the "Roles" table and enter a name for the role.
3. In the "Runtime rights" table, click on "Runtime rights > WinCC Unified devices > HMI_RT_1" in the "Categories of function rights" column.
4. In the "Function rights" column, assign the desired function rights to the role.

Result



13.2.7.4 Example: Configuring a button with access protection

Task

In the following example, you use a system function to create a button for a screen change. You protect the "To Recipe view" button against unauthorized operation. To do so, you configure the "Change parameter sets" function right at the "To Recipe view" button.

Requirements

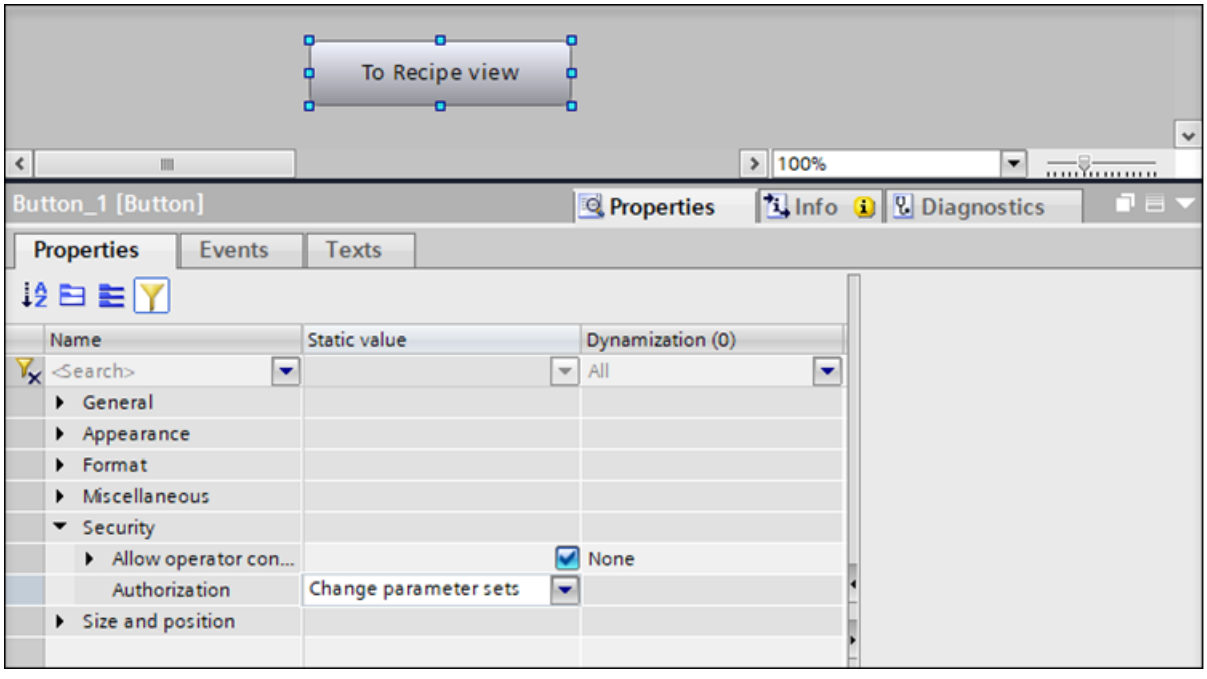
- A "Change parameter sets" function right has been created.
- A "Recipes" screen has been created.

- A "Start" screen has been created and opened.
- A button has been created and marked in the "Start" screen.

Procedure

1. In the Inspector window, click "Properties > Properties > General > Text".
2. Enter "To Recipe view" as the text.
3. Click "Properties > Events > Click left mouse button" in the Inspector window.
4. Click the "Add function" entry in the first line of the "Function list" table.
5. Select the system function "ChangeScreen" from the "Screen" group.
6. Click on the ... button in the "Screen name" row of the "Value" column. A dialog box for selecting the screen opens.
7. Select the "Recipes" screen and use the button to close the dialog box.
8. Click "Properties > Properties > Security" in the Inspector window.
9. Select "Change parameter sets" as function right.

Result



Access to the "To Recipe view" button is protected. If the user "Greenwood" clicks the button in Runtime, for example, the "Recipes" screen opens. Requirement:

- The user "Greenwood" has logged on correctly and has the required function right.
- The "Recipes" screen contains a recipe view and other screen objects.

Note

If the logged-on user does not have the required function right or if no user is logged on, the "Logon dialog box" is displayed. An alarm indicating that no operator authorization is available for this user appears in Runtime.

13.3 Using the user management on the Unified Comfort Panel

13.3.1 Notes on commissioning

Commissioning with central user management

To ensure that the connection to the central user management is set up during initial commissioning of the Panel, we recommend that you do not activate any access protection for the Control Panel on the Panel.

If the access protection is not activated for the Control Panel, configure the connection to the central user management in the Control Panel.

If the access protection for the Control Panel is activated and no connection could be set up during commissioning for the central user management, you have the following options:

- Download the project and the settings for user management from the engineering system.
- Reset the Panel to the factory settings.

Note

Failure of the network connection

If the network connection to the central user management fails, all users who have already logged on to the project once before can still log on for some time. When the connection to the central user management has been restored, other users can log on once again as well.

13.3.2 User management on the Unified Comfort Panel

In the engineering system you specify whether you want to work with local or central users and user groups from the central user management on a Unified Comfort Panel. By default, the use of the local user management is specified in the engineering system.

Note

You can only switch between local and central user management in the engineering system.

To manage users in Runtime, you require the "User management" function right. Configure a user with the required rights in the engineering system and load the user into Runtime.

13.3.3 Protecting the Control Panel from being accessed

In the engineering system you can protect the Control Panel of a Unified Comfort Panel from unauthorized access. You can assign a user the access right for changes on the Control Panel.

Requirement

- A project is open.
- A user has been created in the engineering system.
- A user-defined role has been created.
- A Unified Comfort Panel has been created.

Assign access right to Control Panel to a user

To assign a user the function right "Control Panel access" to access the Control Panel, follow these steps:

1. Open the "Security settings" folder in the project tree.
2. Double-click on "Users and roles".
   The "Users and roles" editor opens in the work area.
3. Open the "Roles" tab.
4. Select a user-defined role.
5. In the lower area "Function rights categories", open the category of the Runtime rights.
6. Click on the category of the Unified Comfort Panels.
7. In the lower area "Function rights", activate the function right "Control Panel access ".
8. Open the "Users" tab.
9. Select a user.
10. In the area "Assigned roles", activate the user-defined role to which you have assigned the function right for access to the Control Panel.

The user receives the access right for the Unified Control Panel and is permitted to change the Panel settings.

Activate access control for Control Panel

In addition, activate the access control in the Control Panel:

1. Start the Panel.
2. Open the Control Panel.
3. Under "Security > Control Panel Access", activate the access control for the Control Panel.

Note

In contrast to the Unified PC Runtime, no login in required. When you open the protected Control Panel, your user rights are checked. If you do not have the necessary rights, a login window is displayed.

See also

System-defined function rights (Page 6914)

Using central user management in the Control Panel (Page 6940)

13.3.4 Managing local users

13.3.4.1 Options for local user management

To manage local users in Runtime, the user requires the "User management" function right on the HMI device.

Managing local users

You have the following options for managing local users:

1. Control Panel of the Unified Comfort Panel. You can find all information in the "SIMATIC HMI devices Unified Comfort Panels (https://support.industry.siemens.com/cs/ww/en/view/109773257)" manual.
2. Via the "Browser" screen object in a project.
3. Using an Internet browser on a PC.

13.3.4.2 Using local user management in the Control Panel

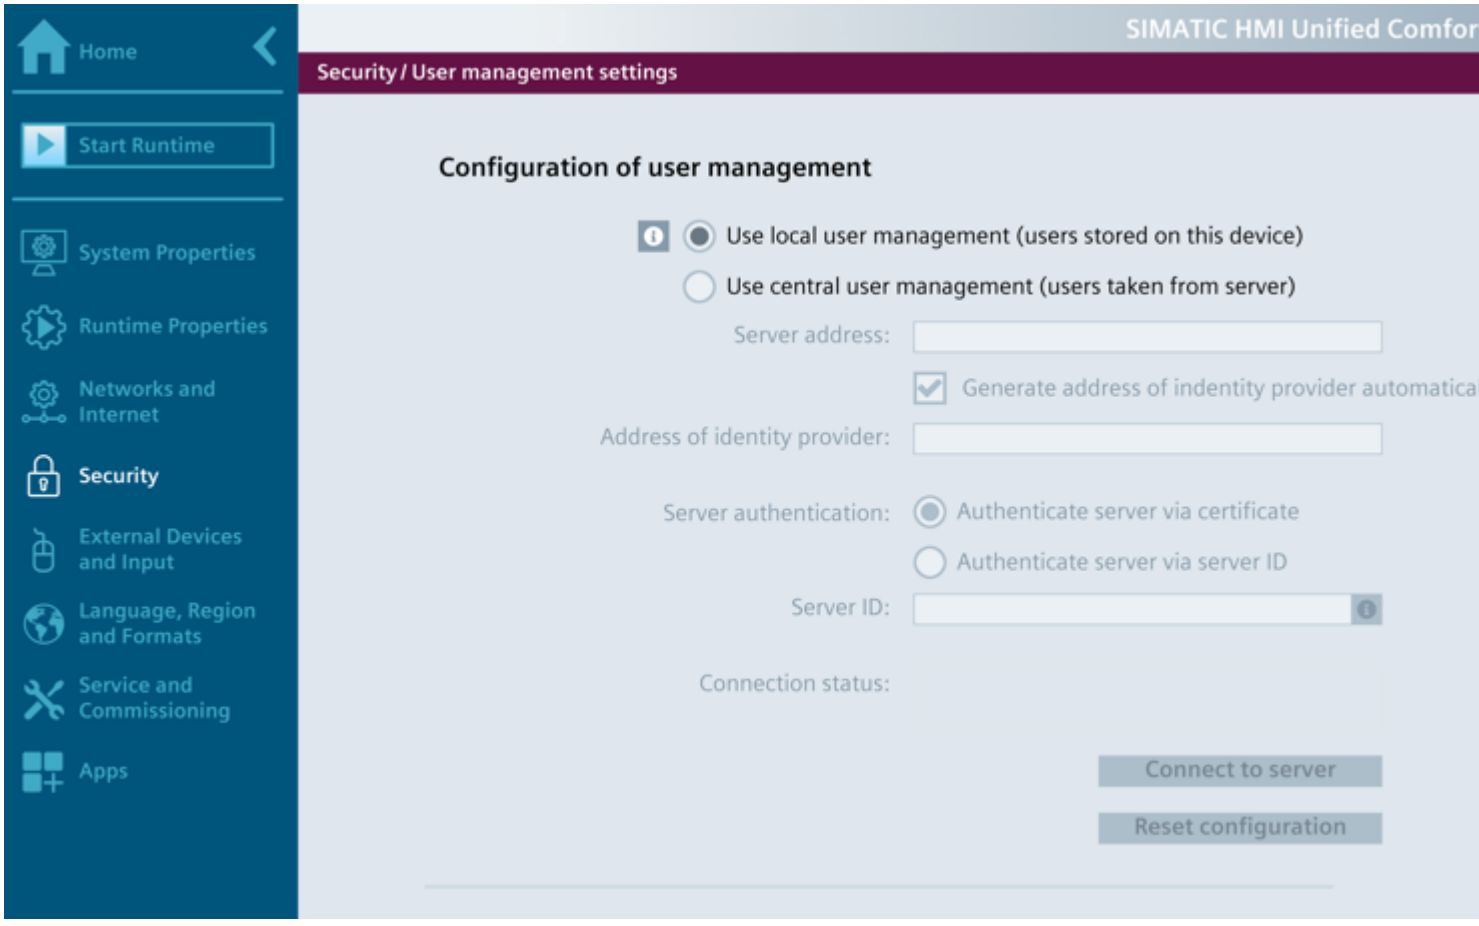
If access protection is configured for the Control Panel in the engineering system, you need the "Control Panel access" function right. If you do not have the necessary rights, a login window is displayed.

You cannot make any changes to the user management in the Control Panel.

Local user management in the Control Panel

If you want to use the user management on the Unified Comfort Panel, follow these steps:

1. Select "Security" in the navigation.
2. Click "User management settings".
3. In the "Configuration of user management" dialog, you can see whether the local or central user management is enabled.



13.3.4.3 Opening local user management in the "Browser" screen object

In Runtime, you access local user management of a Panel by using the "Browser" screen object in a screen.

The detailed description of the individual steps in Runtime can be found in the section "Managing local users in Runtime (Page 6930)".

Note

The specific possible operations depend on the function right.

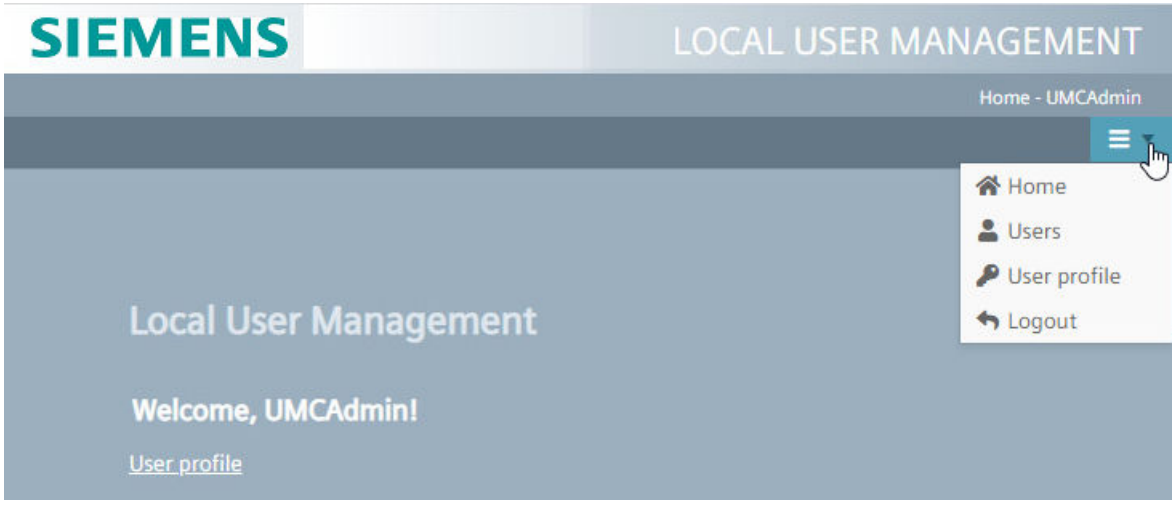
Requirement

- To access the user management, the user must have the "User management" or "Monitor" function right.
- To access the Control Panel, the user must have the "Control Panel access" function right.
- A screen with the "Browser" screen object is displayed in Runtime.

Managing local user in the "Browser" screen object

If you want to manage local users in the "Browser" screen object, follow these steps:

1. Enter the address "https://localhost/umc" in the "Browser" screen object. The "User login" dialog is displayed.
2. Log in to the user management. The home page of the user management opens.



3. Select "Users" in the menu. The user list is displayed.
4. You manage the user information in the user list with the buttons "Add user", "Details", "Edit" and "Delete".

Users without "User management" function right

If you do not have the "User management" function right, you can only select your own "User profile" and change your own password.

13.3.4.4 Opening local user management in the Internet browser

From a PC, you access local user management of a Panel via an Internet browser.

The detailed description of the individual steps in Runtime can be found in the section "Managing local users in Runtime (Page 6930)".

Note

The specific possible operations depend on the function right.

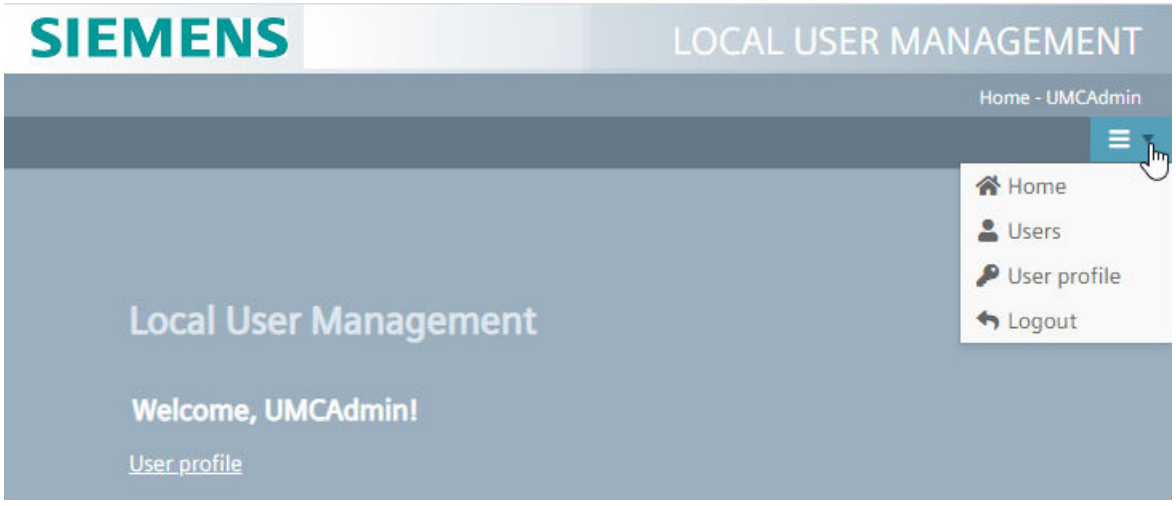
Requirement

- To access the user management, the user must have the "User management" or "Monitor" function right.
- To access the Control Panel, the user must have the "Control Panel access" function right.
- Internet browser is open.

Managing local users in the web browser

If you want to manage local users in the Internet browser, follow these steps:

1. In the address line of the browser, enter the IP address of the Unified Comfort Panel "https://<UCP-IP>/umc". The "User login" dialog is displayed.
2. Log in to the user management. The home page of the user management opens.



3. Select "Users" in the menu. The user list is displayed.
4. You manage the user information in the user list with the buttons "Add user", "Details", "Edit" and "Delete".

Users without "User management" function right

If you do not have the "User management" function right, you can only select your own "User profile" and change your own password.

13.3.4.5 Managing local users in Runtime

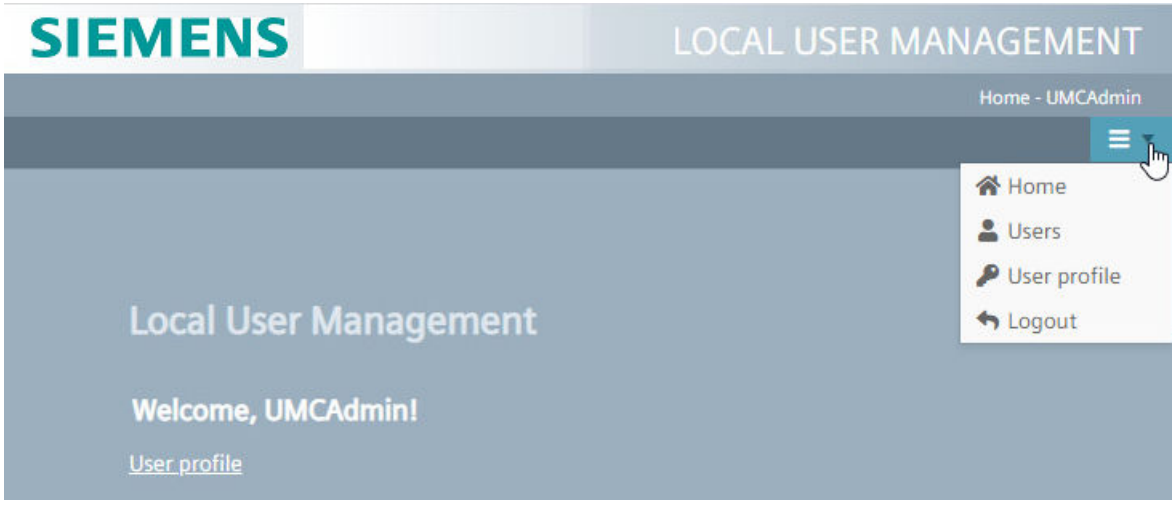
Changing your password

Introduction

You can change your own password in the user management.

Requirement

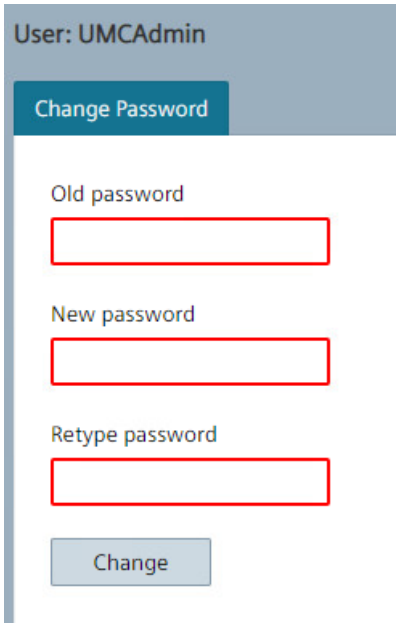
- You have the "User management" function right.
- The home page of the user management is open.



Procedure

To change the password, follow these steps:

1. Select "User profile" directly on the home page or in the menu.
   The "Change Password" dialog is displayed.



2. Change the password and save the change with the "Change" button. The password must meet the password policies.

Changing the password of a different user

Introduction

In the user management you can change the password of a different user. You can also edit the comment.

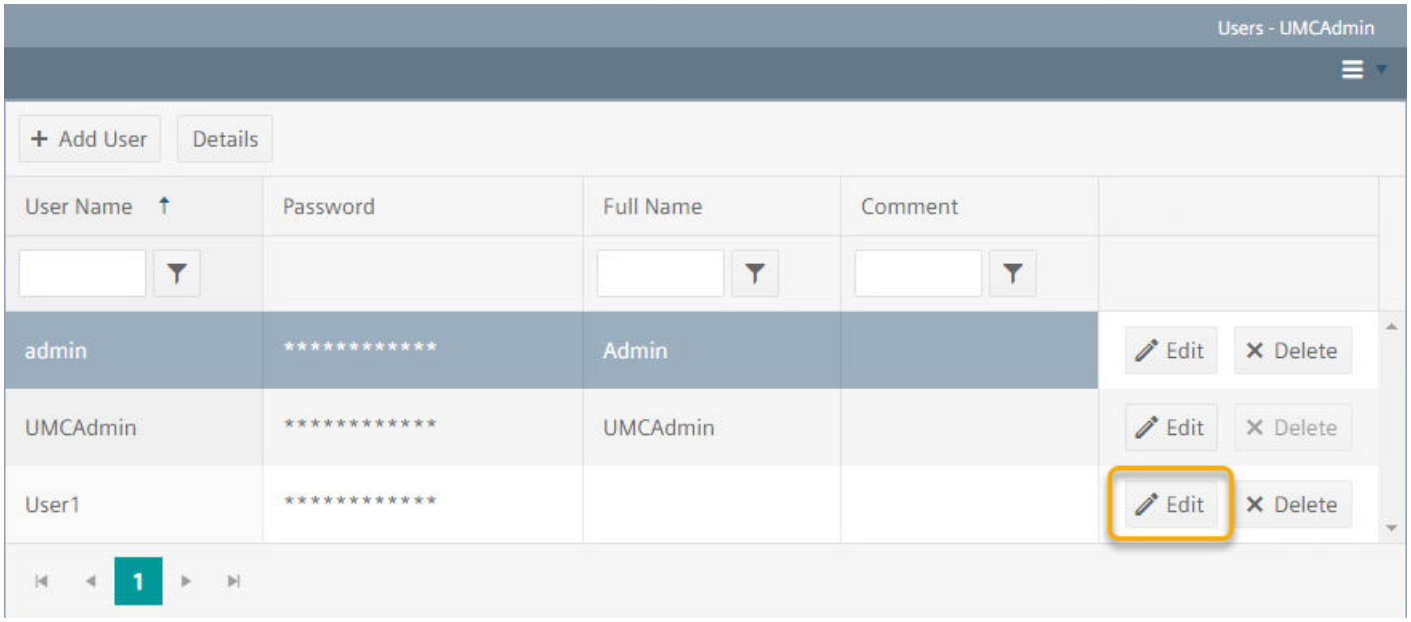
Requirement

- You have the "User management" function right.
- The home page of the user management is open.

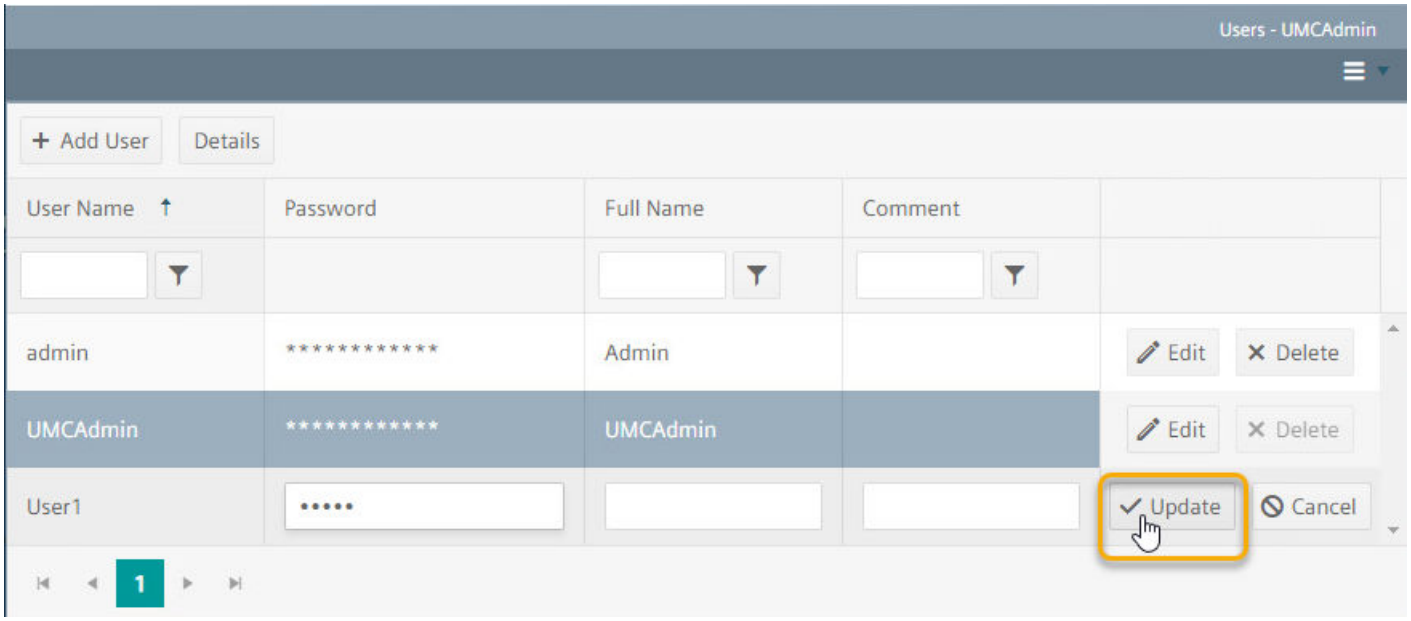
Changing the password and comment

To change the password or comment of a user in the user list, follow these steps:

1. Select "Users" in the menu.
   The user list is displayed.



2. Select a user and click on "Edit" in the respective row.
3. Change the password or the comment and save the change with the "Update" button.



Editing password, status or role

Introduction

In the user list you can edit the password, the status or the role of a user.

Requirement

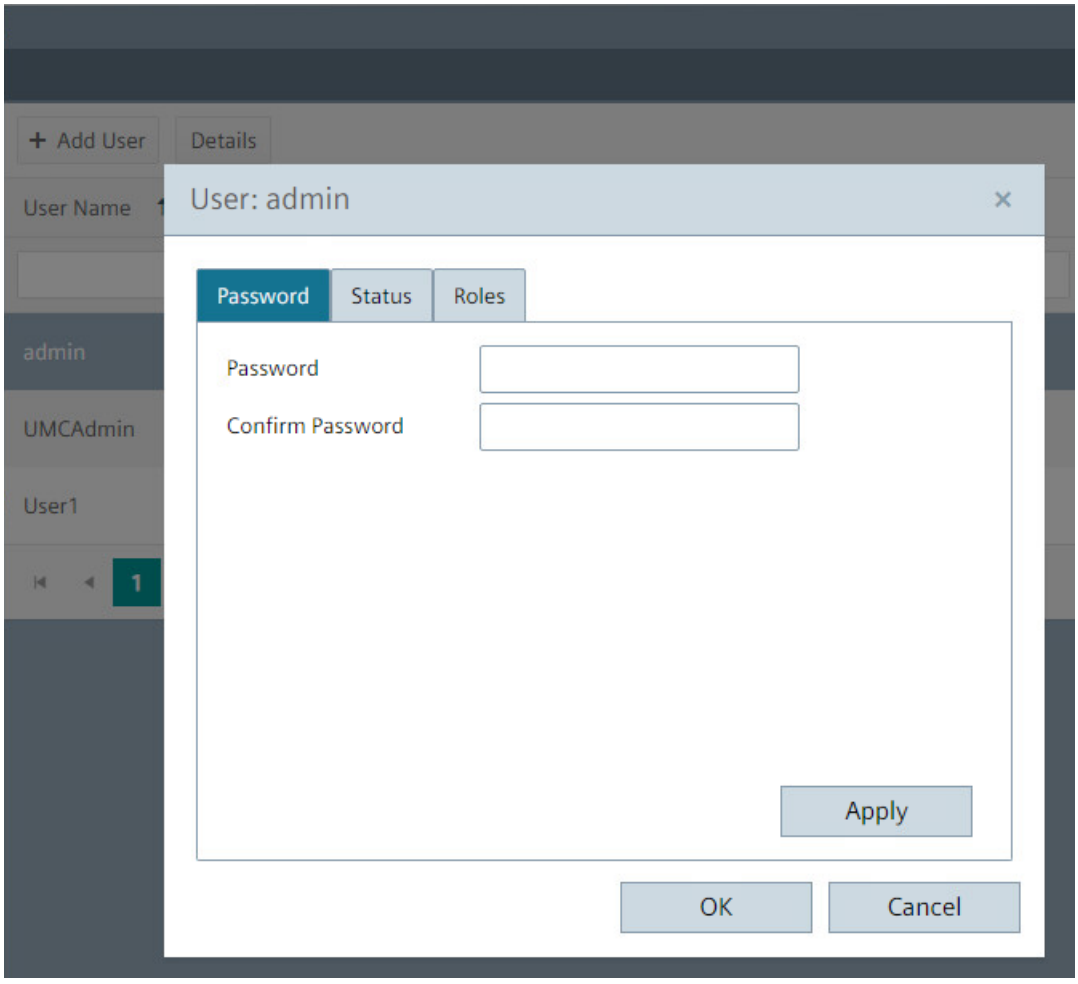
- You have the "User management" function right.
- The home page of the user management is open.

Changing the password

To change the password of a user, follow these steps:

1. Select "Users" in the menu. The user list is displayed.
2. Select a user and click the "Details" button.

3. Enter the new password in the "Password" tab and confirm the password.
4. Confirm your entries with the "Apply" button.
   Save the settings with "OK".

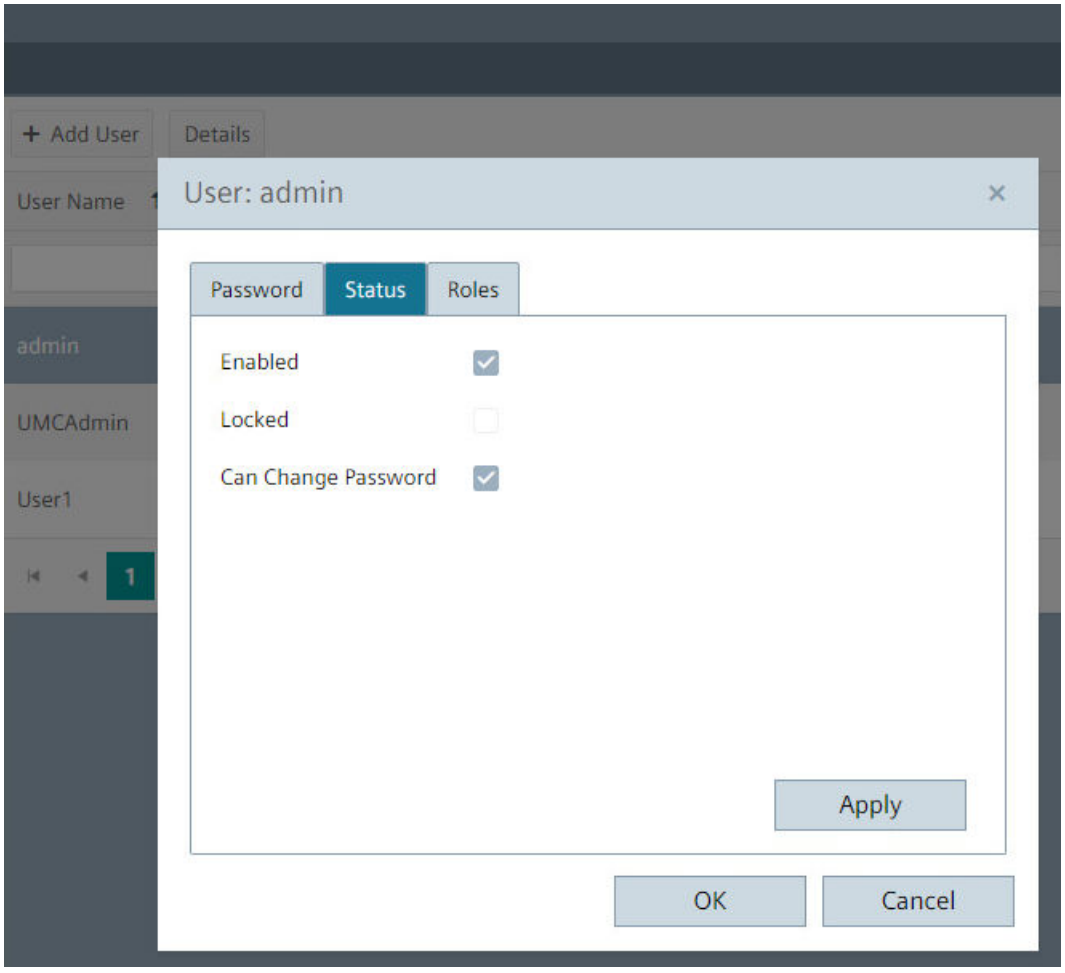


Changing the status

To edit the status of a user, follow these steps:

1. Select "Users" in the menu. The user list is displayed.
2. Select a user and click the "Details" button.

3. In the "Status" tab, you can disable the user or keep this user from changing the password. You cannot change the "Locked" property.
4. Confirm your entries with the "Apply" button.
   Save the settings with "OK".

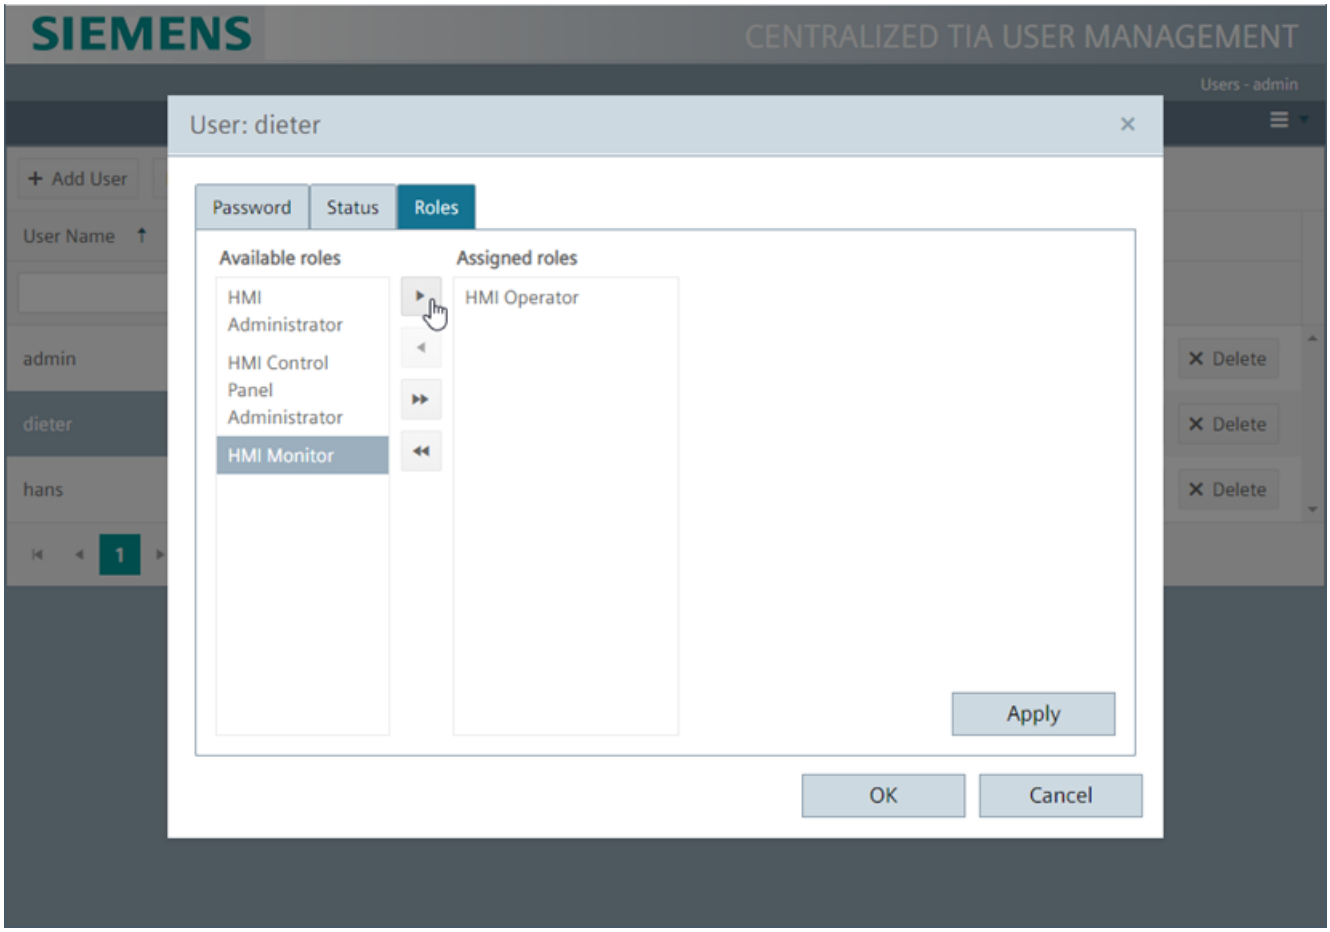


Changing the role

To edit the role of a user, follow these steps:

1. Select "Users" in the menu. The user list is displayed.
2. Select a user and click the "Details" button.
3. In the "Roles" tab, you can change the roles and thus the associated function rights of the user:
   - Select a role from the "Available roles" or "Assigned roles" list.
   - Change the assignment of this role using the buttons between the two lists.
   - Confirm your entries with the "Apply" button.
     Save the settings with "OK".

   The figure below shows you how to assign the "HMI Monitor" role to a user in addition to the "HMI Operator" role.



Note

Note that at least one user in the project has the "HMI Administrator" role and at least one user has access to the Control Panel. If access to the user management or the Control Panel is not possible, a complete download from the TIA Portal is necessary.

Adding users

Introduction

You can add a new user in the user list.

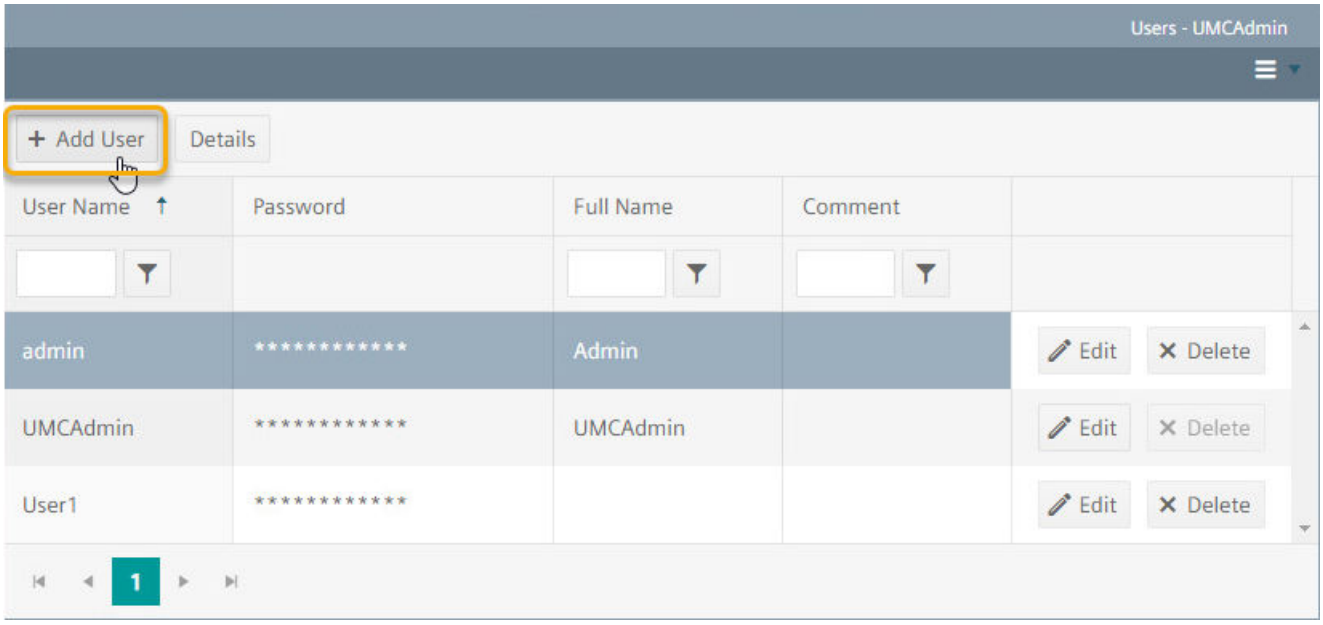
Requirement

- You have the "User management" function right.
- The home page of the user management is open.

Adding a new user

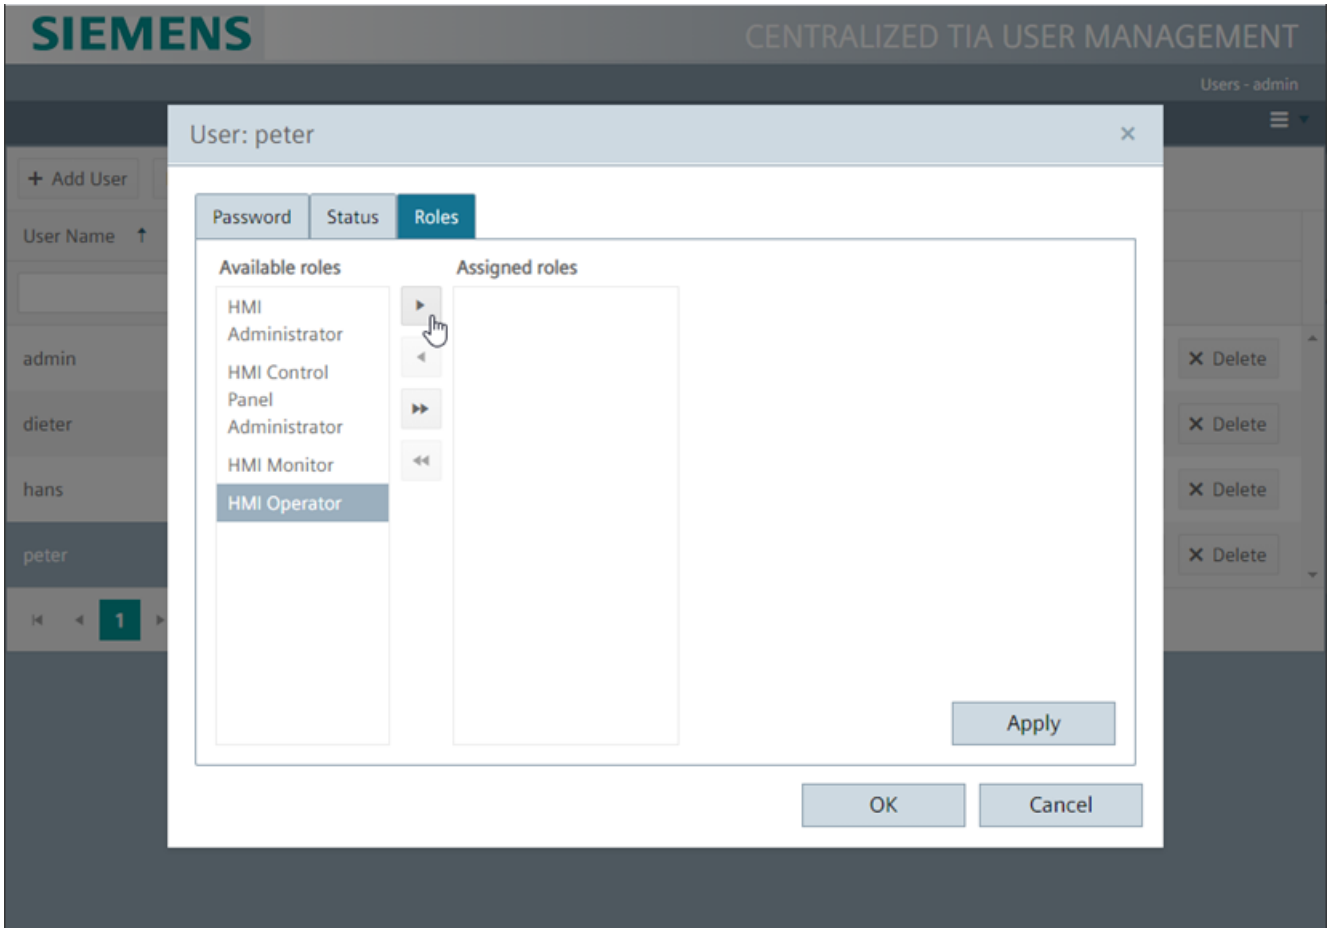
To add a new user, follow these steps:

1. Select "Users" in the menu. The user list is displayed.
2. In the user list, click "Add User".



3. A new row is displayed for the new user in the user list. Enter the information of the new user in the row.

4. Click "Details" in the user list. Assign roles to the new user.



5. Confirm your entries with the "Apply" button.
   Save the settings with "OK".

Deleting users

Introduction

You can delete a user in the user list.

Requirement

- You have the "User management" function right.
- The home page of the user management is open.

Deleting users

To delete a user, follow these steps:

1. Select "Users" in the menu. The user list is displayed.
2. Select the user.
3. Click the "Delete" button in the row. The user is deleted.

Deleting the user from the user list will become effective once the user logs off in Runtime.

13.3.5 Using central user management

13.3.5.1 Using central user management in the Control Panel

In the engineering system you specify whether you want to work with local or central users and user groups from the central user management on a Unified Comfort Panel. By default, the use of the local user management is specified in the engineering system.

Note

You can only switch between local and central user management in the engineering system.

Requirement

- User management has been configured in the engineering system.
- A user with the access right to the Control Panel "Access Control Panel" has been created.
- A Unified Comfort Panel has been started.

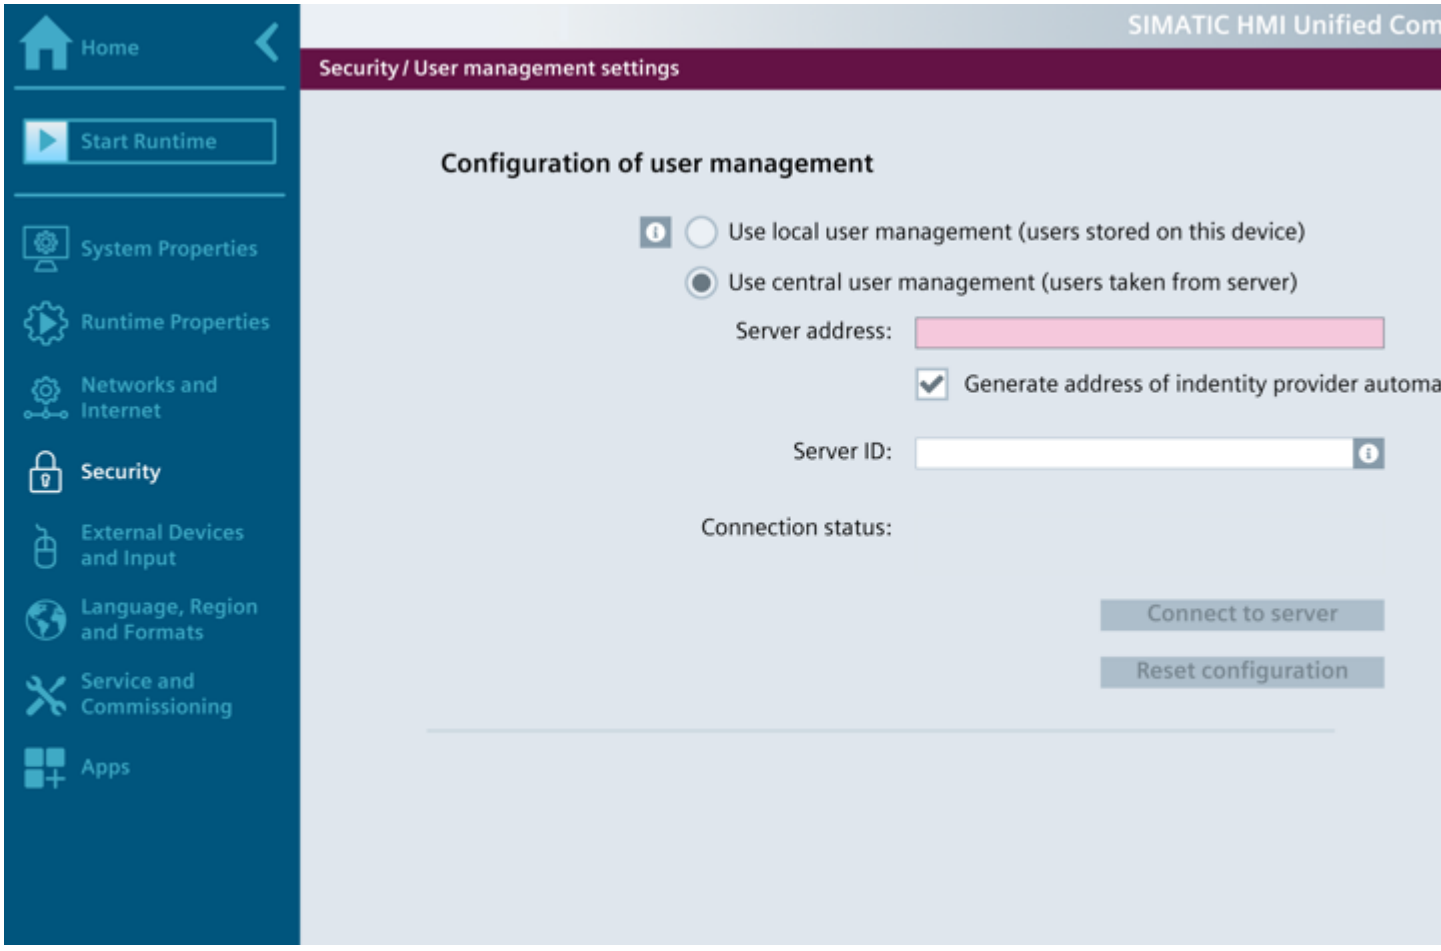
Note

In contrast to the Unified PC Runtime, no login in required. When you open the protected Control Panel, your user rights are checked. If you do not have the necessary rights, a login window is displayed.

Using the user management on the Unified Comfort Panel

If you want to use the user management on the Unified Comfort Panel, follow these steps:

1. Select "Security" in the navigation.
2. Select the "User management settings" tile.
3. In the "Configuration of user management" dialog, you can see whether the local or central user management is enabled. You can only switch between local and central user management in the engineering system.



Establishing a connection to the central user management

If you have not entered any information in the engineering system, follow these steps:

1. Enter the server address.
2. The "Connect to server" button is activated.
3. Enter the server ID manually or click the "Connect to server" button. The server ID is read in from the central user management.
4. In the "Verify user management server" dialog, confirm the displayed server.
   All input fields are filled in and write-protected. Status of the connection is "Connected".
   - The "Connect to server" button is changed to "Check connection".
   - You can check or reset the connection.

Adapting the connection to the central user management

If you have only entered some information in the engineering system, the input field for the missing information is marked in red. Proceed as follows in this case:

1. Enter the missing information.
2. The "Connect to server" button is activated.
3. Click "Connect to server". The server ID is read in from the central user management.
4. In the "Verify user management server" dialog, confirm the displayed server.
   All input fields are filled in and write-protected. Status of the connection is "Connected".
   - The "Connect to server" button is changed to "Check connection".
   - You can check or reset the connection.

If the entered server ID is not the same as the online server ID, you can apply the online server ID.

1. Confirm this in the "Verify user management server" dialog.
   The online server ID is read in. All input fields are filled in and write-protected. Status of the connection is "Connected".
   - The "Connect to server" button is changed to "Check connection".
   - You can check or reset the connection.

Verifying the connection to the central user management

You have entered all information in the engineering system. When the server ID in the engineering system and on the Panel match, the Panel is automatically connected to the central user management.

Status of the connection is not displayed. If you want to verify the central user management on the Unified Comfort Panel, follow these steps:

1. Click "Check connection".
2. The connection to the central user management is established.

When the Panel is not connected to the central user management and no status is displayed, change the server ID.

1. The "Check connection" button is changed to "Connect to server".
2. You can make or reset the connection.

Resetting the connection to the central user management

If you have entered all information in the engineering system, the Panel is connected to the central UMC server. If you want to reset the central user management, follow these steps:

1. Click "Reset configuration".
2. In the "Reset central user management" dialog, confirm the reset.
3. The default is set:
   - The input field for the server address is empty and marked in red.
   - The input field for the server ID is empty.
   - The "Connect to server" button is hidden.
   - The "Reset configuration" button is hidden.

13.3.5.2 Simulating a central user management

You want to simulate a project in which a central user management is configured for a customer. You have two options if you do not have access to the central user management of the customer:

- Configure your own central user management.
- Configure a local user management.

Requirement

- You know which groups and their function rights are contained in the central user management of the customer.

Configuring a central user management

Configure a central user management for the simulation project.

1. Create the users.
2. Create the user groups according to the customer project.
3. Assign the users to the groups.
4. Establish the connection to the central user management.
5. Start the simulation.
6. Log on in runtime.

Changes can be downloaded.

Configuring a local user management

Configure a local user management.

1. Create one or more users.
2. Assign the roles to the users.
3. Start the simulation.

Changes cannot be downloaded.

Simulate Unified Comfort Panel (Page 7205)

13.4 Using user management on the WinCC Unified PC

13.4.1 Notes on commissioning

Commissioning with central user management

To establish the connection to the central user management, configure the connection to the central user management on the PC with SIMATIC Runtime Manager.

Note

Failure of the network connection

If the network connection to the central user management fails, all users who have already logged on to the project once before can still log on for some time. When the connection to the central user management has been restored, other users can log on once again as well.

See also

SIMATIC Runtime Manager users (Page 6947)

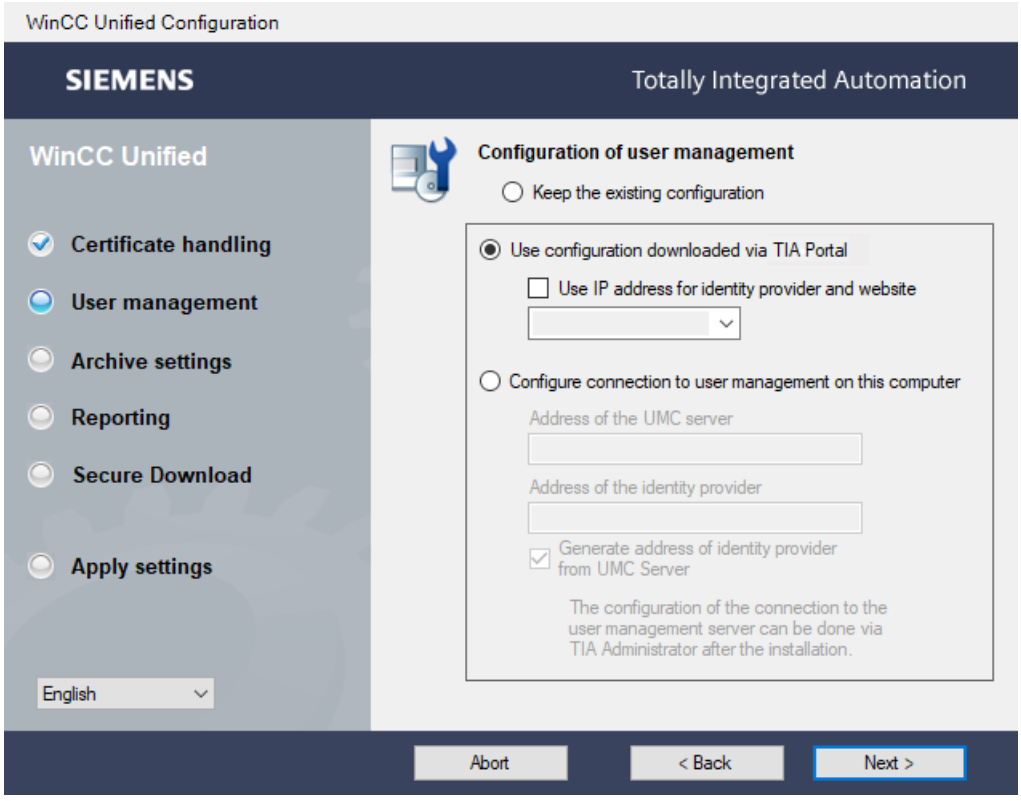
13.4.2 Setting the user management with WinCC Unified Configuration

The "WinCC Unified Configuration" application is installed with the installation of WinCC Unified. A link is automatically created on your desktop for "WinCC Unified Configuration".

You can change the setting made during setup at any time.

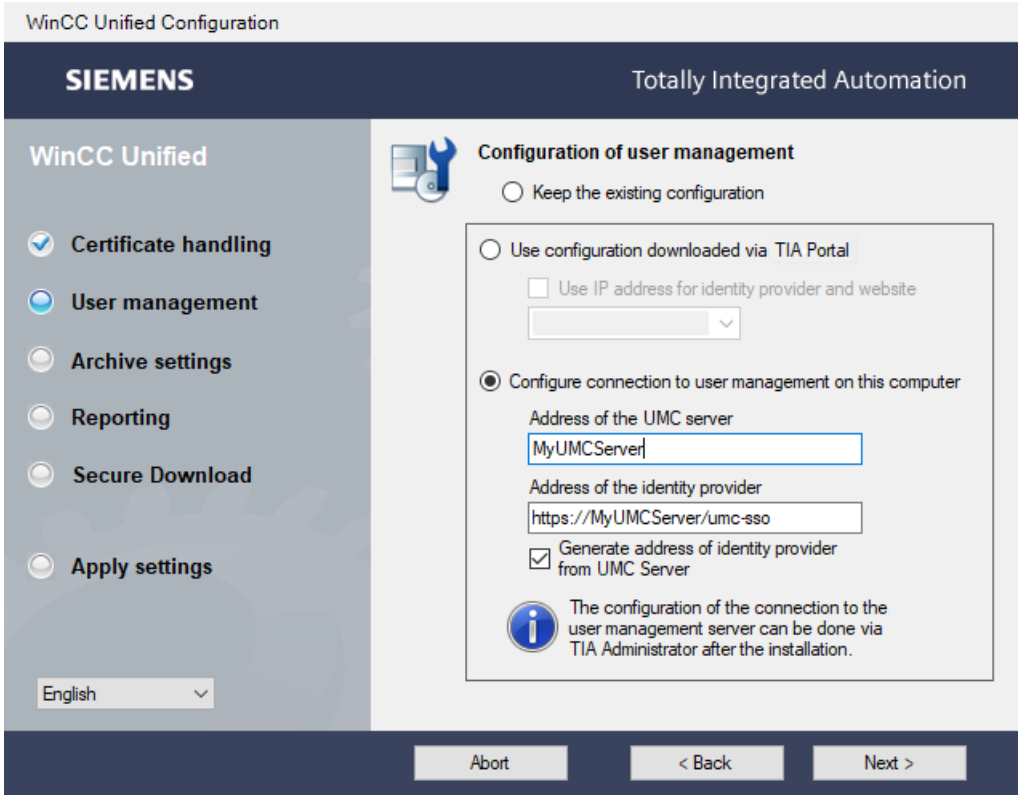
Local user management

If you only edit projects with local user management in the TIA Portal, use the setting "Use configuration downloaded via TIA Portal".



Central user management

If you only edit projects with central user management in the TIA Portal, use the setting "Configure connection to user management on the computer".



Using local and central user management

When you edit projects with local as well as central user management, note the following special features:

Setting "Use configuration downloaded via TIA Portal":

- You cannot simulate projects with central user management.
- Groups and users of the central server cannot be imported into projects with central user management.

Setting "Configure connection to user management on the computer":

- You cannot simulate projects with local user management.

13.4.3 Managing multiple projects in the SIMATIC Runtime Manager

The SIMATIC Runtime Manager is installed with the installation of WinCC Unified Runtime. A link for the SIMATIC Runtime Manager is automatically created on your desktop.

You manage the Runtime projects in the SIMATIC Runtime Manager. Multiple projects can be available on one PC. In SIMATIC Runtime Manager, you enable the matching configuration of the user data for a selected project or you adapt the configuration.

You cannot switch between local and central user management in the Runtime Manager.

See also

Checking local user management in the SIMATIC Runtime Manager (Page 6947)

Setting central user management in the SIMATIC Runtime Manager (Page 6966)

13.4.4 SIMATIC Runtime Manager users

Groups for the user management

Groups are created during the installation of WinCC Unified that enable a user to access specific WinCC Unified functions:

- **umcd_domain_manager**
- **umcd_um**
- **umcd_dsso**

To log in with single sign-on (SSO), the user must be added to the following group:

- **umcd_dsso**

Groups for the Runtime Manager

For a Windows user to be able to change user data in the Runtime Manager, add the user to the following groups:

- **umcd_domain_manager**
- **umcd_um**
- "SIMATIC HMI"

Notes on commissioning (Page 6944)

13.4.5 Managing local users

13.4.5.1 Checking local user management in the SIMATIC Runtime Manager

Multiple projects can be available on one PC. In SIMATIC Runtime Manager, you can activate the matching configuration of the user data for a selected project.

You cannot switch between local and central user management.

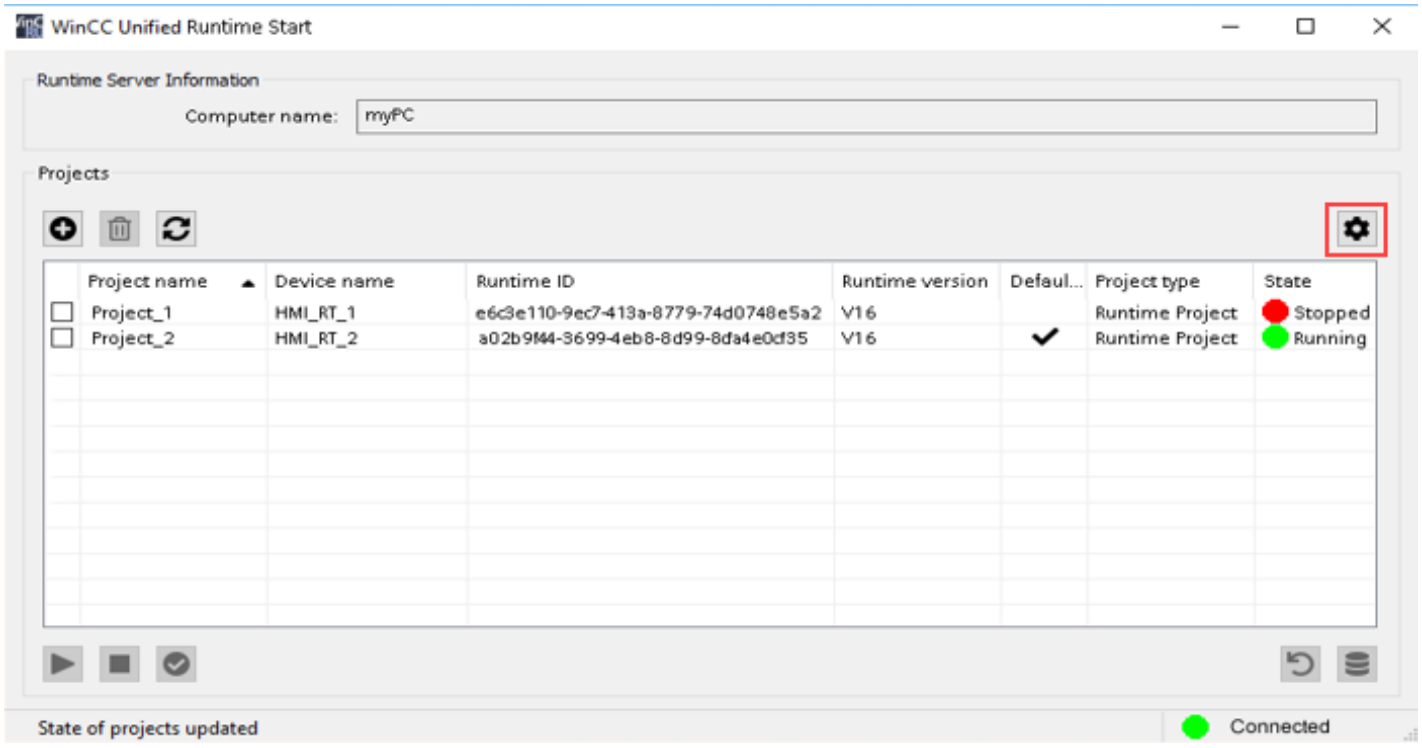
Requirement

- At least one project with user management is loaded on the Runtime PC.
- WinCC Unified Runtime is installed.
- SIMATIC Runtime Manager has been started.

Checking local user management in the SIMATIC Runtime Manager

You cannot configure the local user management in the SIMATIC Runtime Manager.

1. In the SIMATIC Runtime Manager, click "Settings" on the home page.



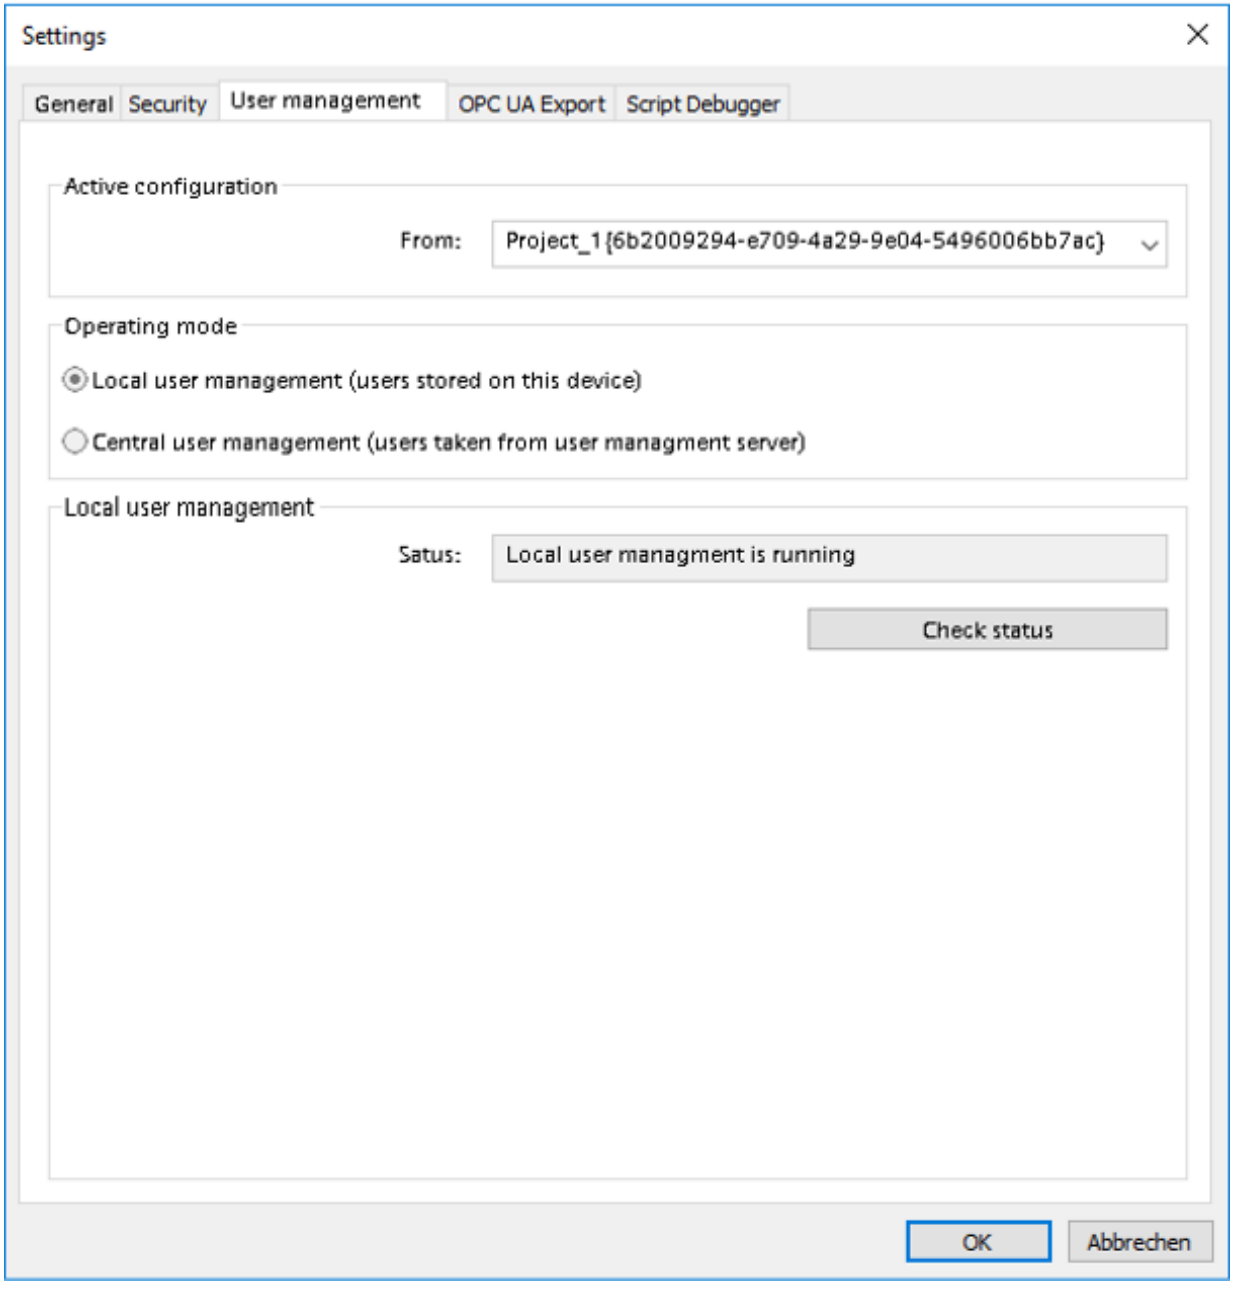
2. Select the "User management" tab.
3. When multiple projects are available on the PC, select the configuration of the user management of a project under "Select configuration".

4. To activate the local user data of the selected project, click "Load user management".

   Note

   When you click "Load user management", the changes of the user management that you have made in runtime are overwritten by the configuration of the last download.

5. The status of the local user management is displayed. You check the status of the local user management with the "Check status" button.



See also

Managing multiple projects in the SIMATIC Runtime Manager (Page 6946)

13.4.5.2 Managing local users in Runtime

User logon

Introduction

From a PC, you access local user management via an Internet browser.

To manage the local users on a Unified PC, you require the "User management" function rights. Configure a user with the required rights in the engineering system and load the user into Runtime.

Note

The specific possible operations depend on the function right.

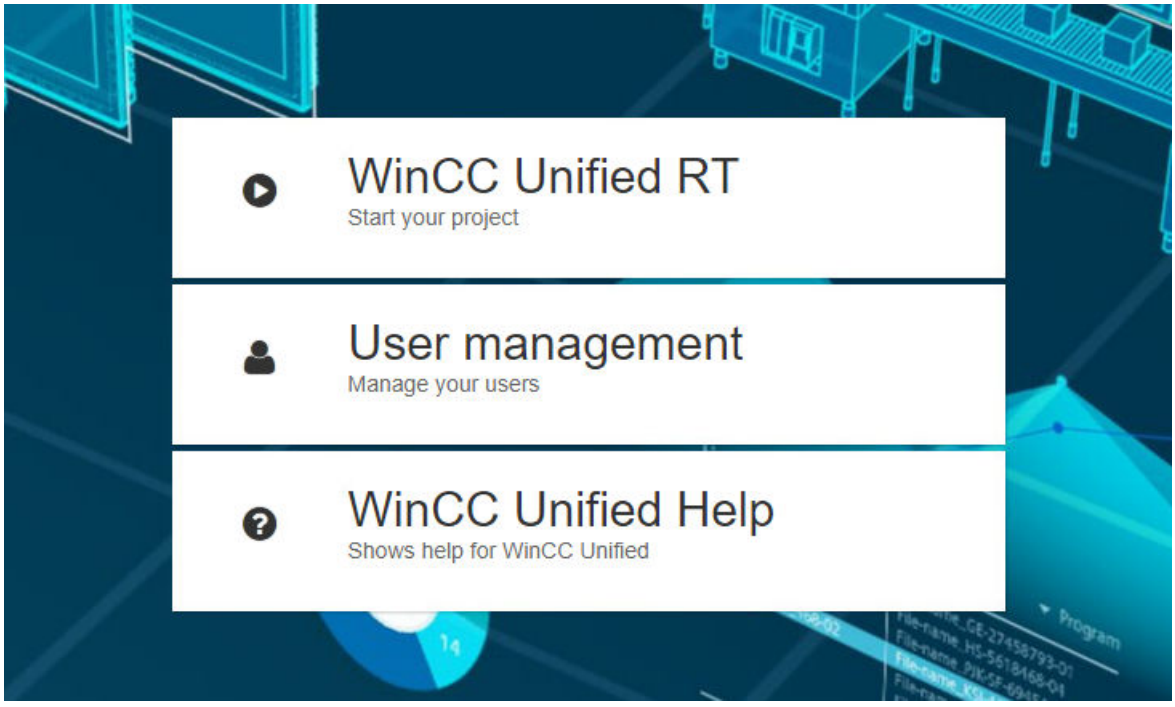
Requirement

- The user has the "User management" function rights.
- Internet browser is open.

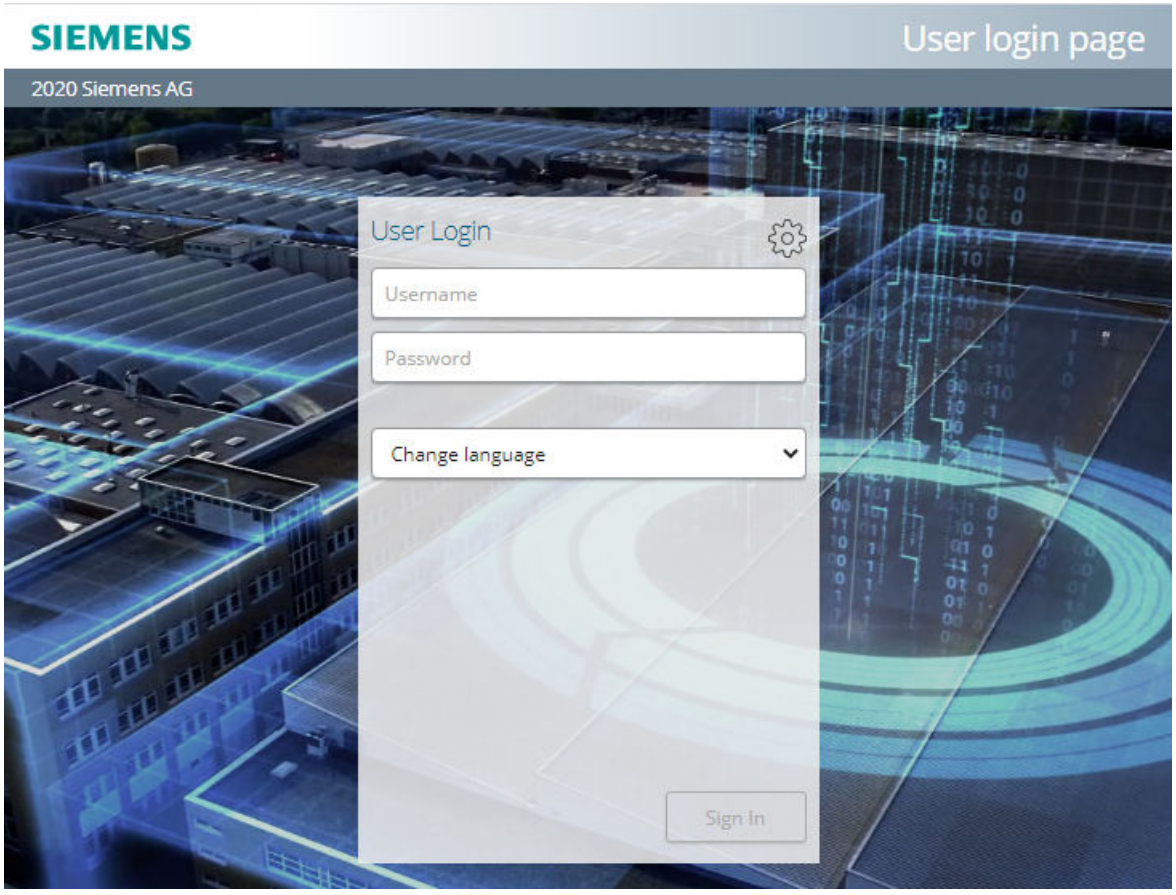
Logging on to the user management

To log on to the user management in Runtime, follow these steps:

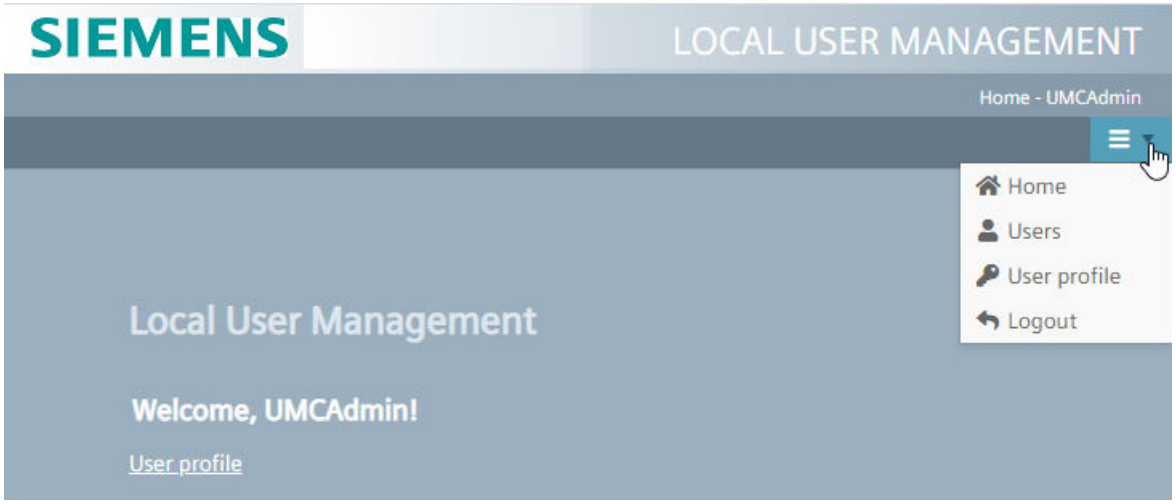
1. In the browser, enter the IP address of the Runtime PC "https://<PC-IP>/umc". If runtime is installed on the same PC as the browser, enter the address "https://localhost/umc". The start page of Runtime is displayed.



2. Click the "User management" button. The "User login" dialog is displayed.



3. Type in the user name and password.
4. If required, use the selection list to change the displayed language.
5. Click "Login".
   The user management start page opens in Runtime.



See also

Managing local users in Runtime (Page 6950)

Structure of the start page

Introduction

In menu on the start page, select whether you want to manage the users, change the password or language, or log out. You can find the menu via the drop-down list in the upper right corner.

Note

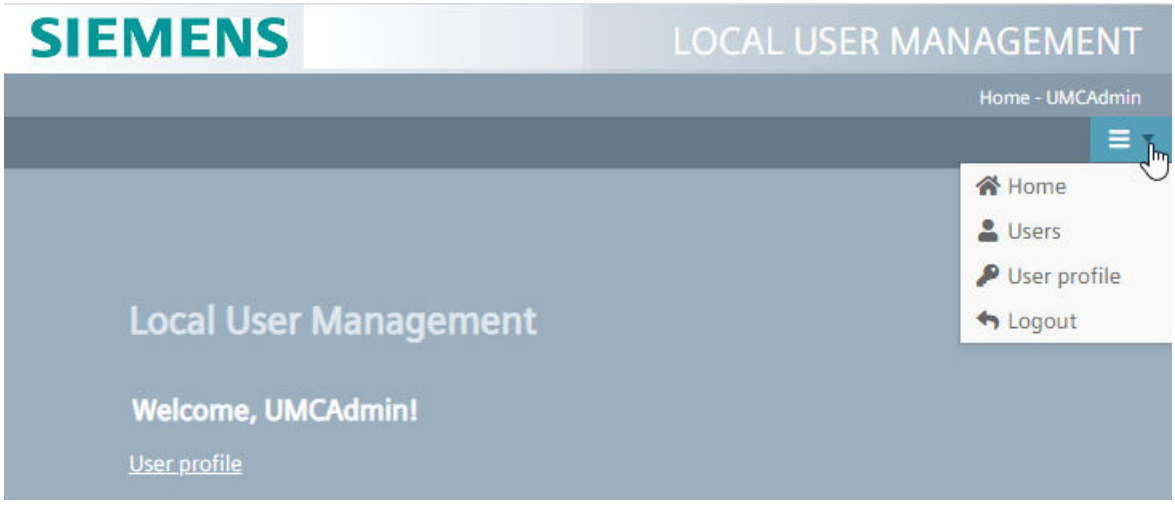
Users with the "User management" function right have access to all functions.

Users without the "User management" function right can change their password under "User profile".

Menu

The following options are available to you under the symbols in the menu:

- "Home"
  This takes you to the start page of the user management.
- "Users"
  You can create new users or manage the existing users.
- "User profile"
  You can change your password and switch the language.
- "Logoff"
  You will be logged out directly and can log in again.



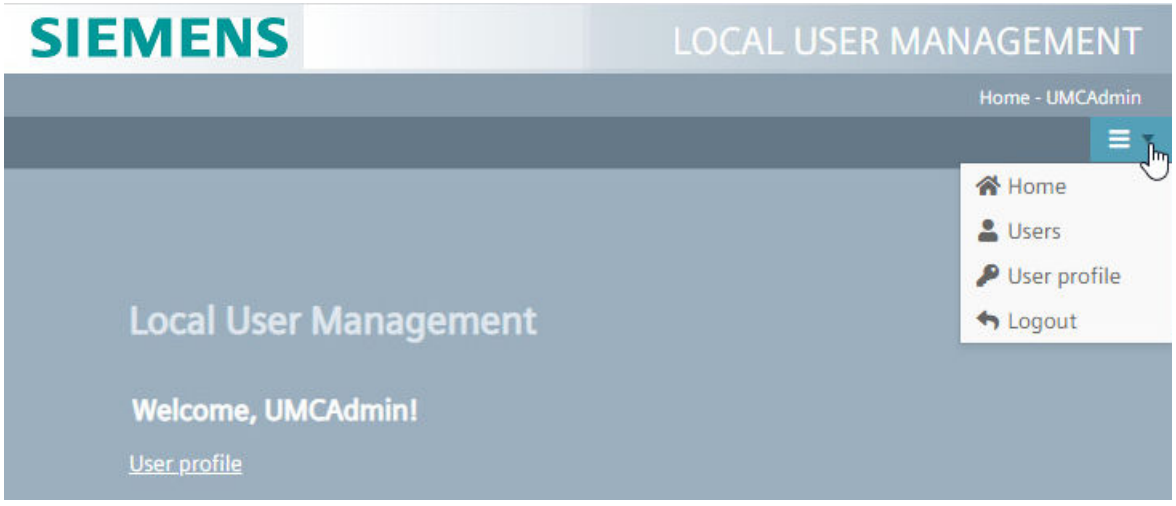
Changing your password

Introduction

You can change your own password in the user management.

Requirement

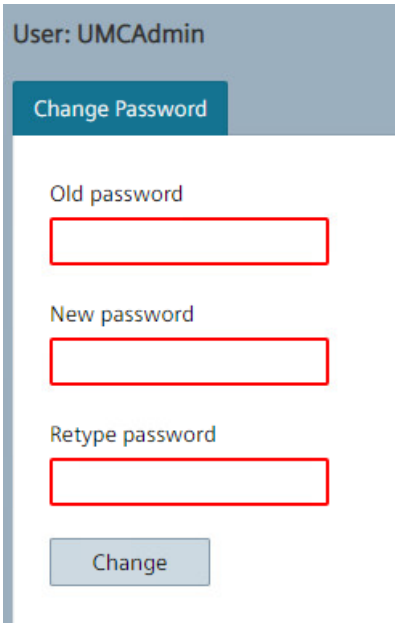
- You have the "User management" function right.
- The home page of the user management is open.



Procedure

To change the password, follow these steps:

1. Select "User profile" directly on the home page or in the menu.
   The "Change Password" dialog is displayed.



2. Change the password and save the change with the "Change" button. The password must meet the password policies.

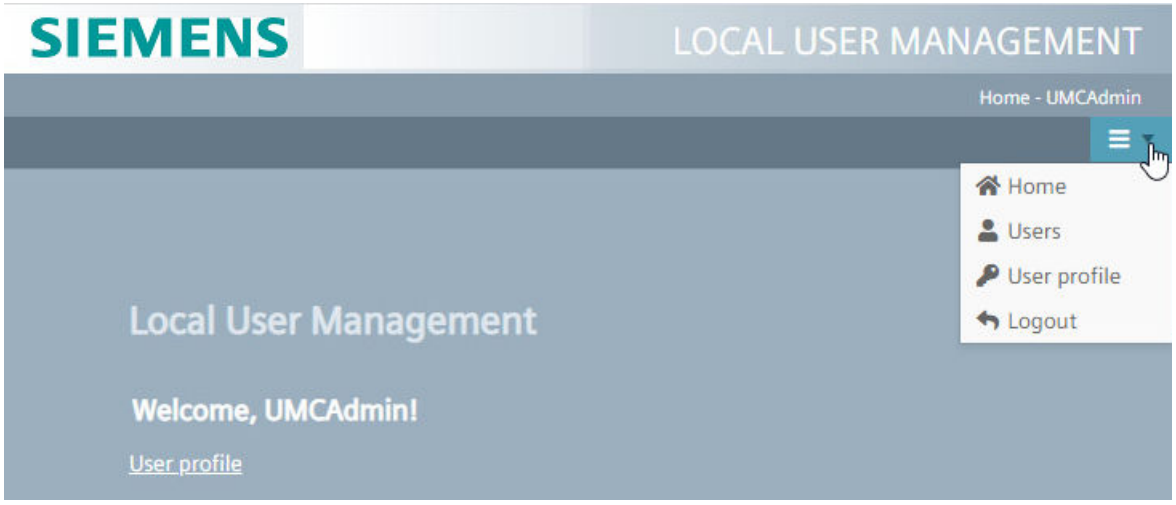
Managing the user list

Introduction

In the user list you can manage the data of the other users.

Requirement

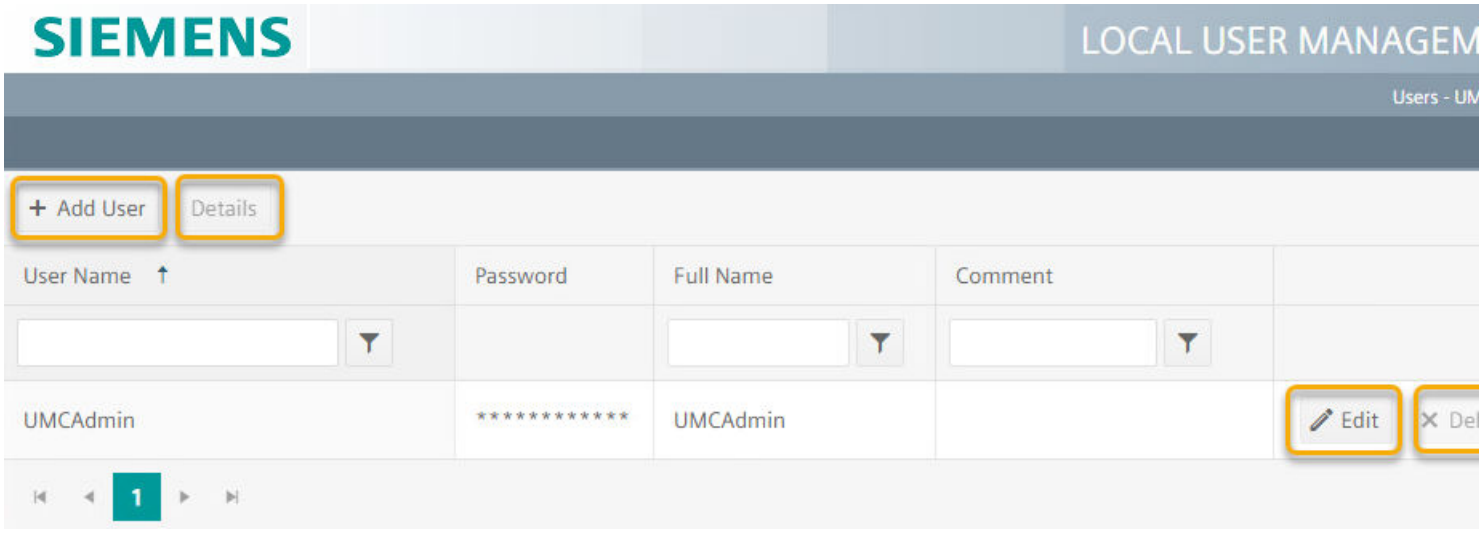
- You have the "User management" function right.
- The home page of the user management is open.



Opening a user list

To display the user list, click "Users" in the menu on the homepage.

The user list is displayed.



Options in the user list

In the user list you can manage the data of the user via the following buttons:

- "Add users"
- "Details"

- "Edit"
- "Clear"

In the user list, you can:

- Sort users by user name or comment.
- Filter users by user name or comment.
- Display 20 users on one page. Additional users are displayed on a new page. You can switch between the pages.

Changing the password of a different user

Introduction

In the user management you can change the password of a different user. You can also edit the comment.

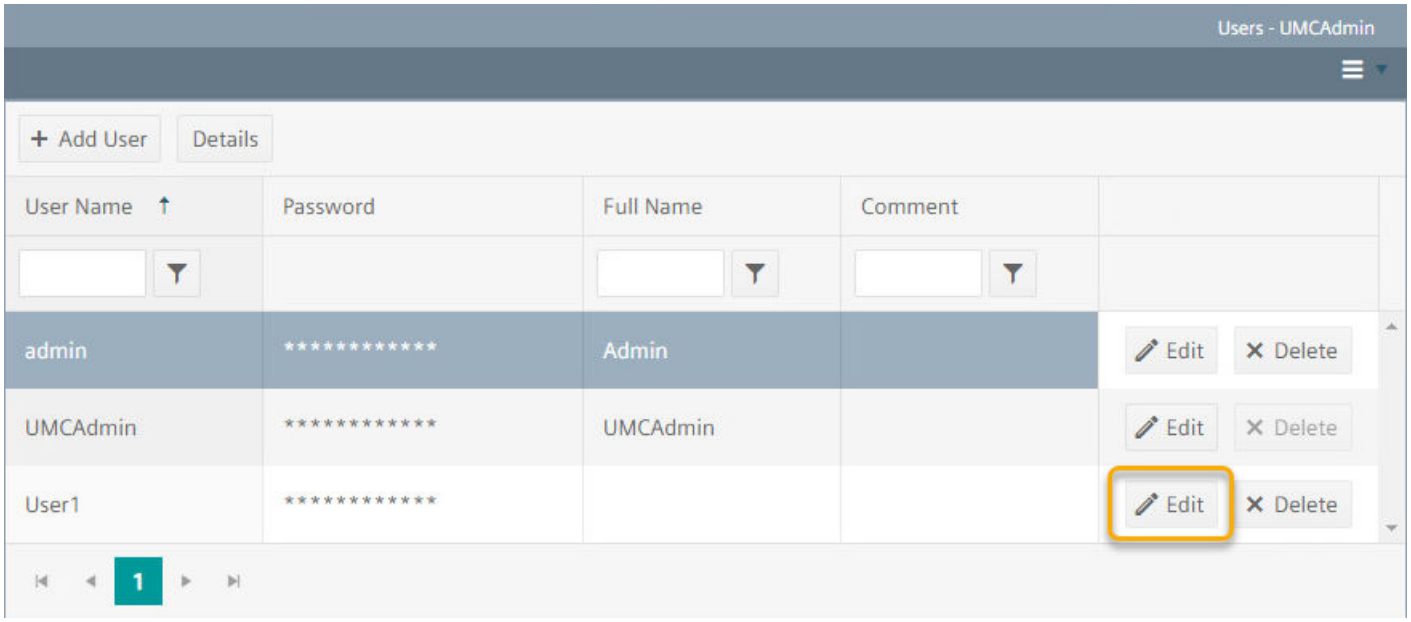
Requirement

- You have the "User management" function right.
- The home page of the user management is open.

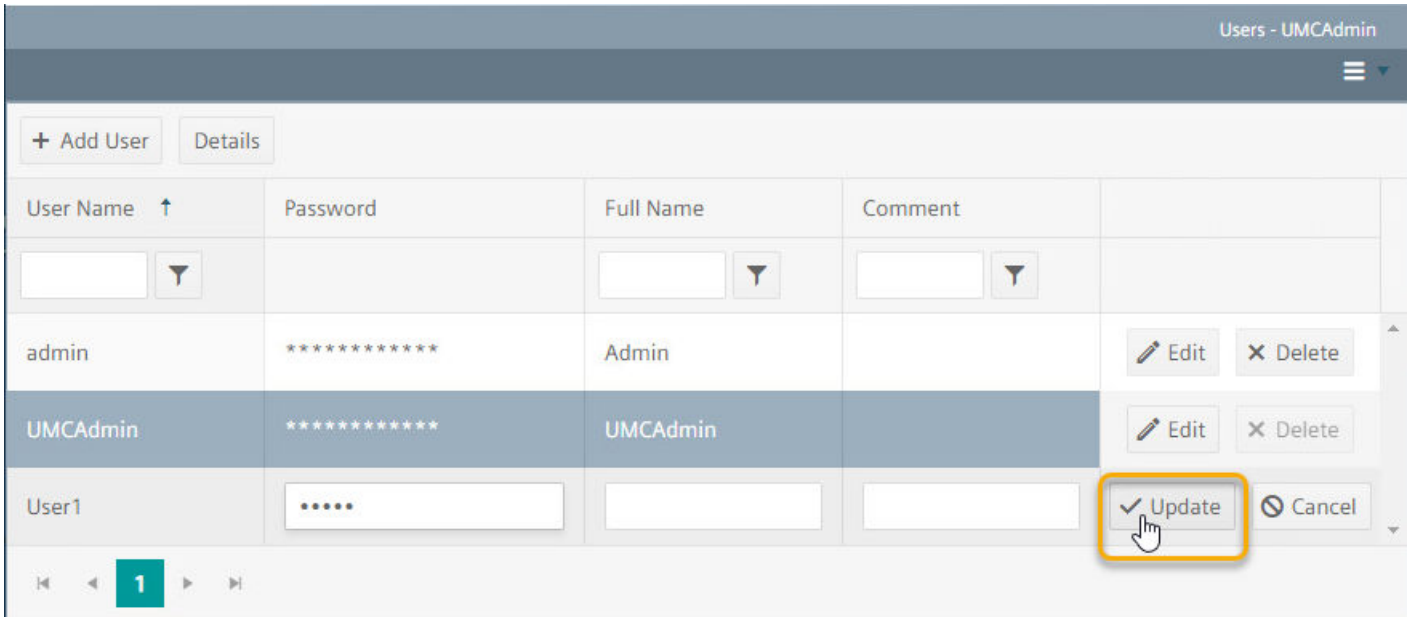
Changing the password and comment

To change the password or comment of a user in the user list, follow these steps:

1. Select "Users" in the menu.
   The user list is displayed.



2. Select a user and click on "Edit" in the respective row.
3. Change the password or the comment and save the change with the "Update" button.



Editing password, status or role

Introduction

In the user list you can edit the password, the status or the role of a user.

Requirement

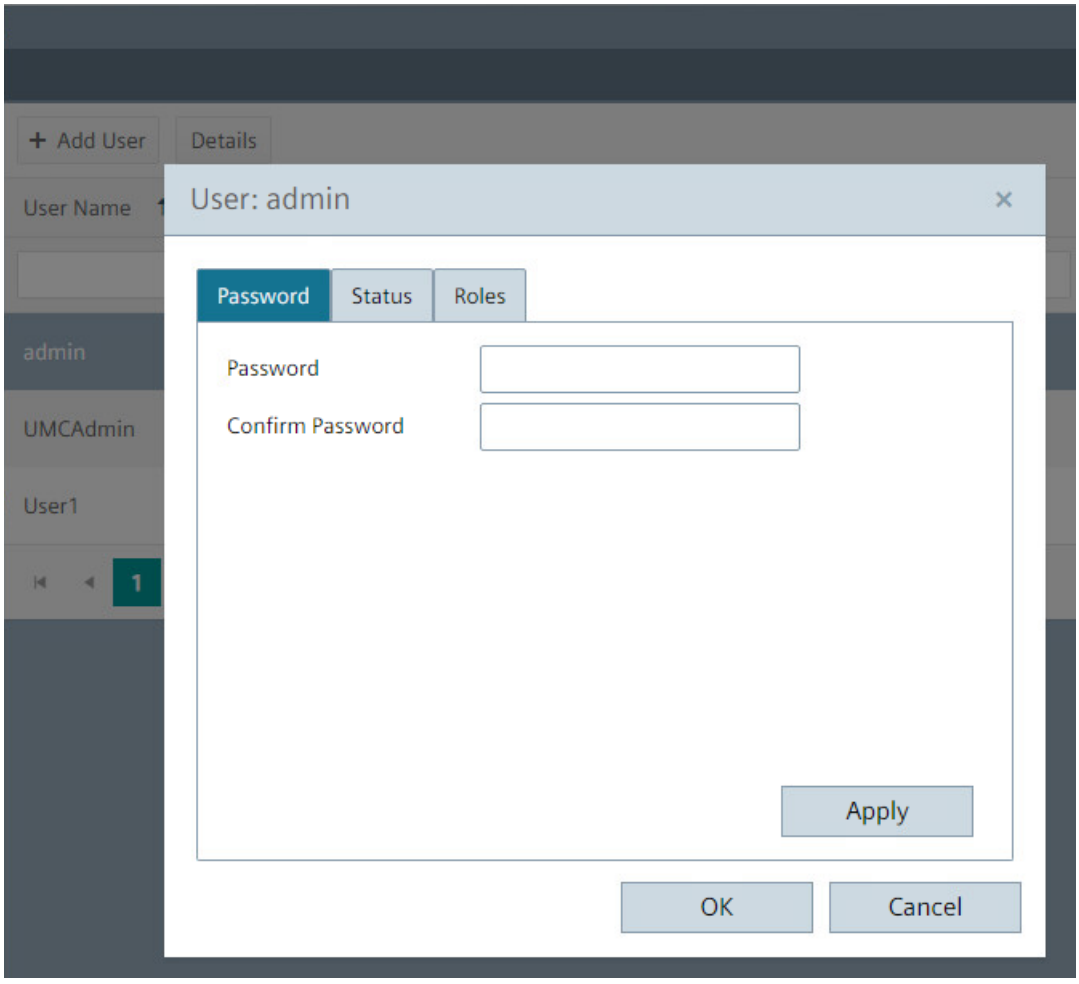
- You have the "User management" function right.
- The home page of the user management is open.

Changing the password

To change the password of a user, follow these steps:

1. Select "Users" in the menu. The user list is displayed.
2. Select a user and click the "Details" button.

3. Enter the new password in the "Password" tab and confirm the password.
4. Confirm your entries with the "Apply" button.
   Save the settings with "OK".

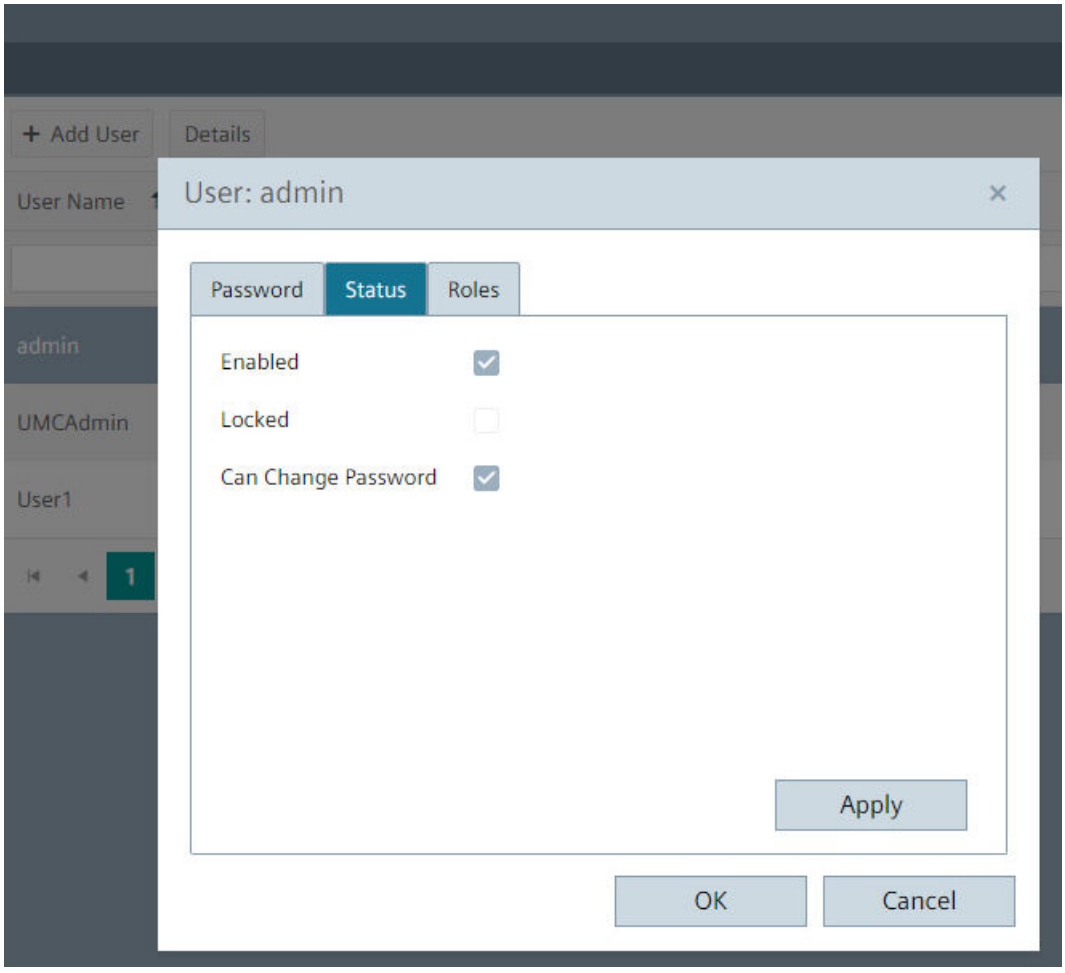


Changing the status

To edit the status of a user, follow these steps:

1. Select "Users" in the menu. The user list is displayed.
2. Select a user and click the "Details" button.

3. In the "Status" tab, you can disable the user or keep this user from changing the password. You cannot change the "Locked" property.
4. Confirm your entries with the "Apply" button.
   Save the settings with "OK".

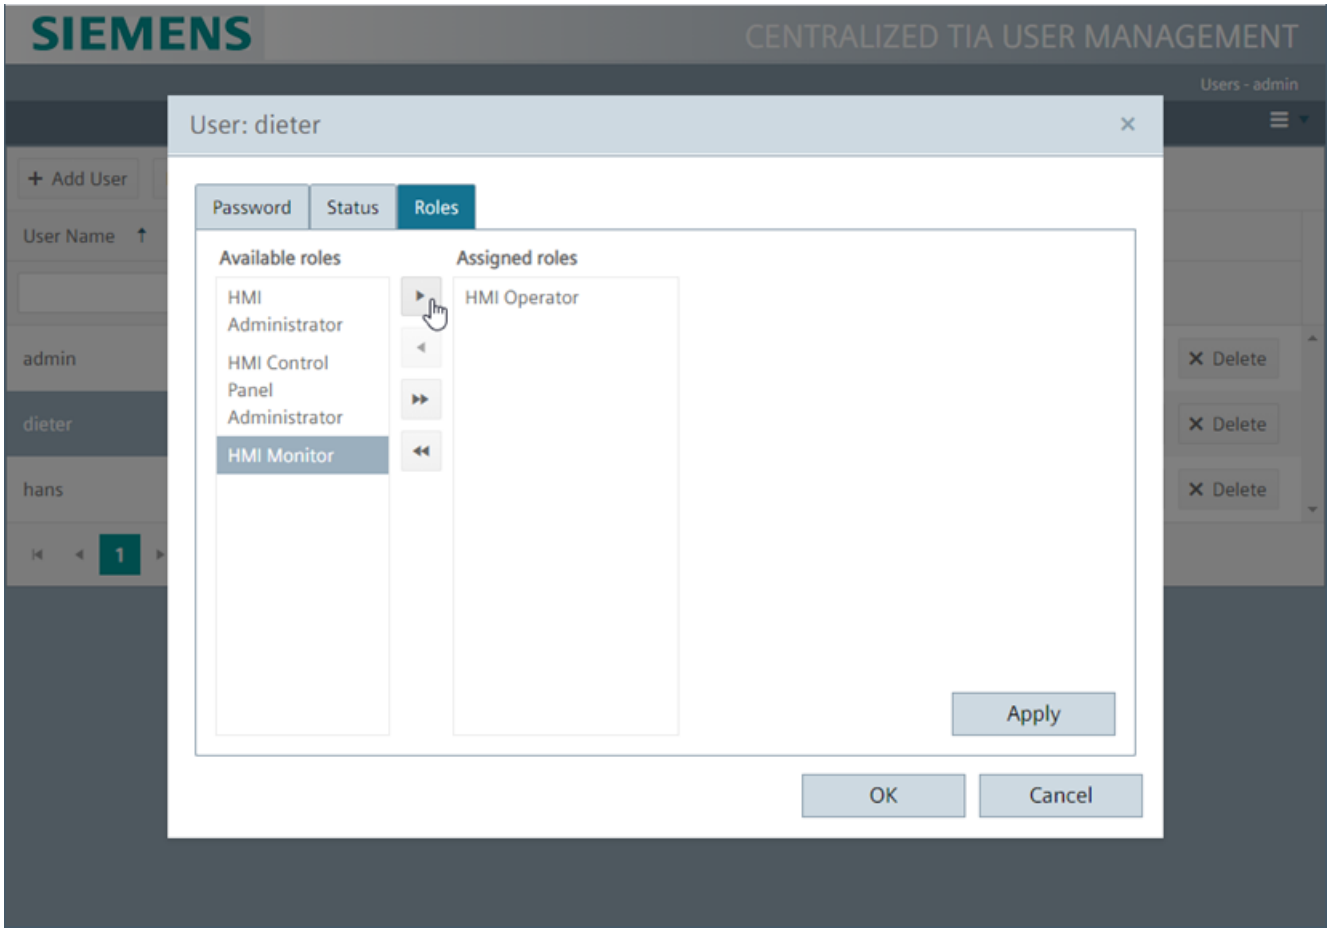


Changing the role

To edit the role of a user, follow these steps:

1. Select "Users" in the menu. The user list is displayed.
2. Select a user and click the "Details" button.
3. In the "Roles" tab, you can change the roles and thus the associated function rights of the user:
   - Select a role from the "Available roles" or "Assigned roles" list.
   - Change the assignment of this role using the buttons between the two lists.
   - Confirm your entries with the "Apply" button.
     Save the settings with "OK".

   The figure below shows you how to assign the "HMI Monitor" role to a user in addition to the "HMI Operator" role.



Note

Note that at least one user in the project has the "HMI Administrator" role and at least one user has access to the Control Panel. If access to the user management or the Control Panel is not possible, a complete download from the TIA Portal is necessary.

Adding users

Introduction

You can add a new user in the user list.

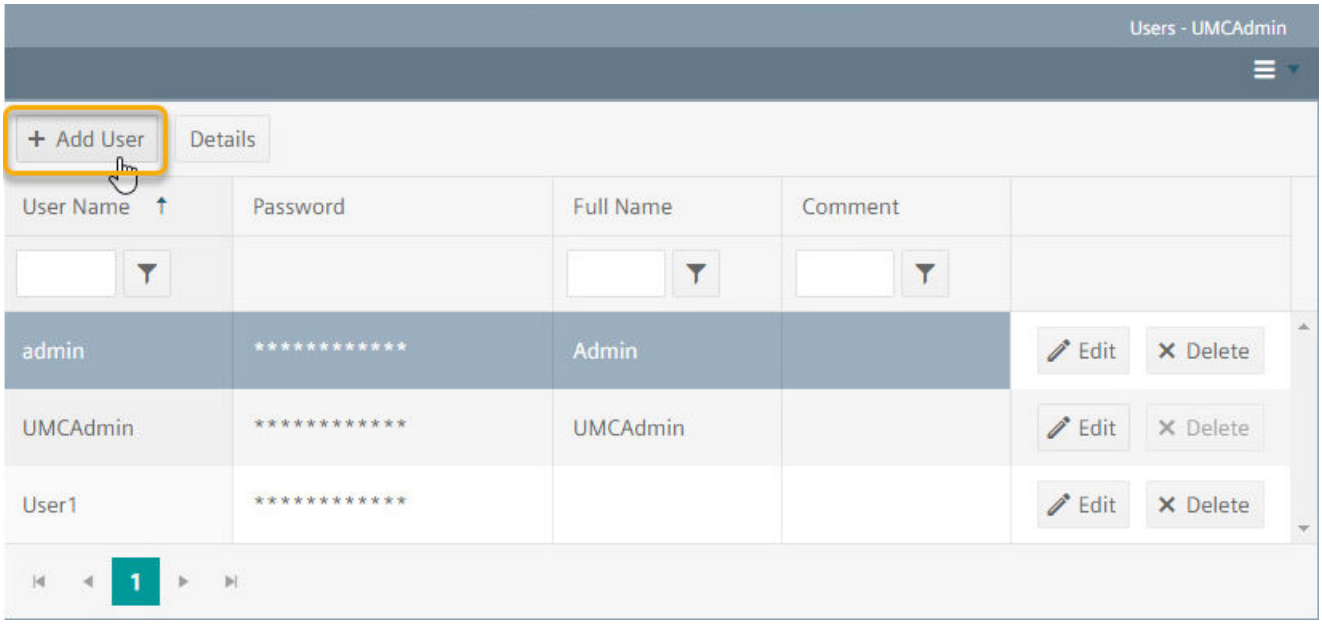
Requirement

- You have the "User management" function right.
- The home page of the user management is open.

Adding a new user

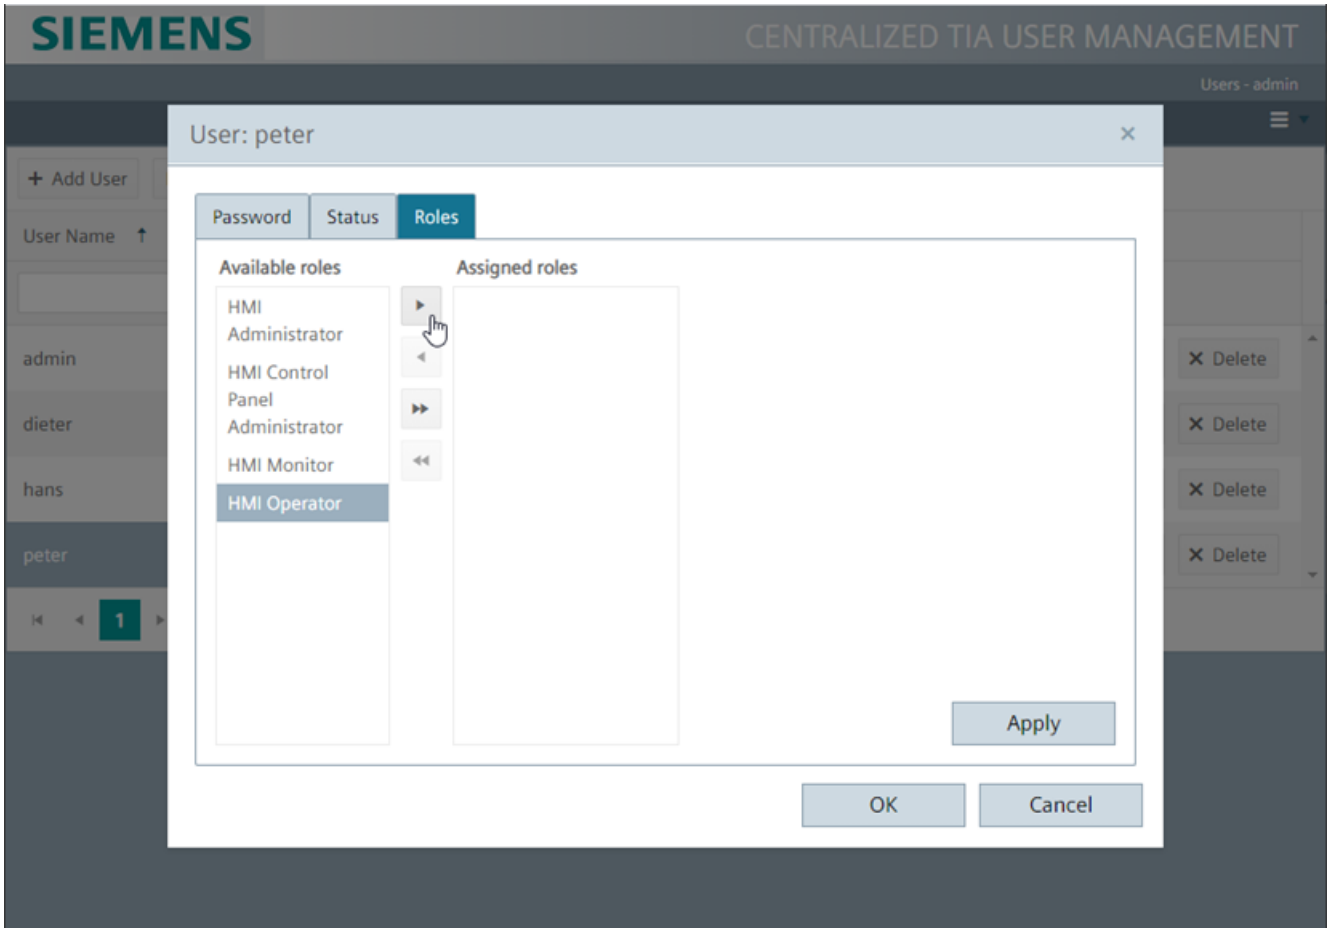
To add a new user, follow these steps:

1. Select "Users" in the menu. The user list is displayed.
2. In the user list, click "Add User".



3. A new row is displayed for the new user in the user list. Enter the information of the new user in the row.

4. Click "Details" in the user list. Assign roles to the new user.



5. Confirm your entries with the "Apply" button.
   Save the settings with "OK".

Deleting users

Introduction

You can delete a user in the user list.

Requirement

- You have the "User management" function right.
- The home page of the user management is open.

Deleting users

To delete a user, follow these steps:

1. Select "Users" in the menu. The user list is displayed.
2. Select the user.
3. Click the "Delete" button in the row. The user is deleted.

Deleting the user from the user list will become effective once the user logs off in Runtime.

Logging a user out

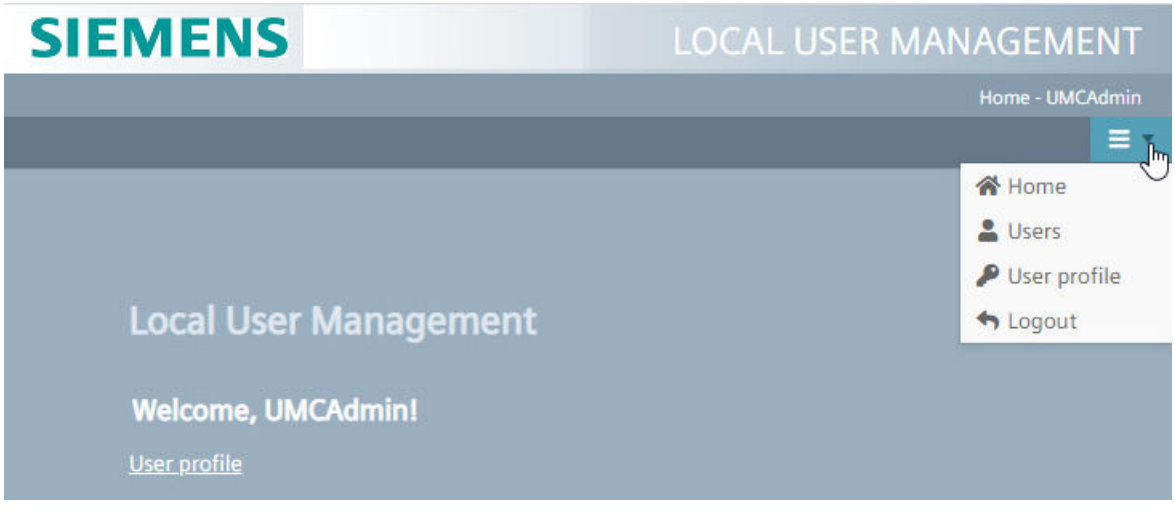
Introduction

You can log out from the user management.

Logging out

To log out, proceed as follows:

1. Close all open pages.
2. Select "Logout" from the menu.



You are logged out from runtime and from the user management.

Newly loaded data from the TIA Portal will not be applied until the next time you log in.

13.4.6 Using central user management

13.4.6.1 Setting central user management in the SIMATIC Runtime Manager

Multiple projects can be available on one PC. In SIMATIC Runtime Manager, you can activate the matching configuration of the user data for a selected project.

You cannot switch between local and central user management.

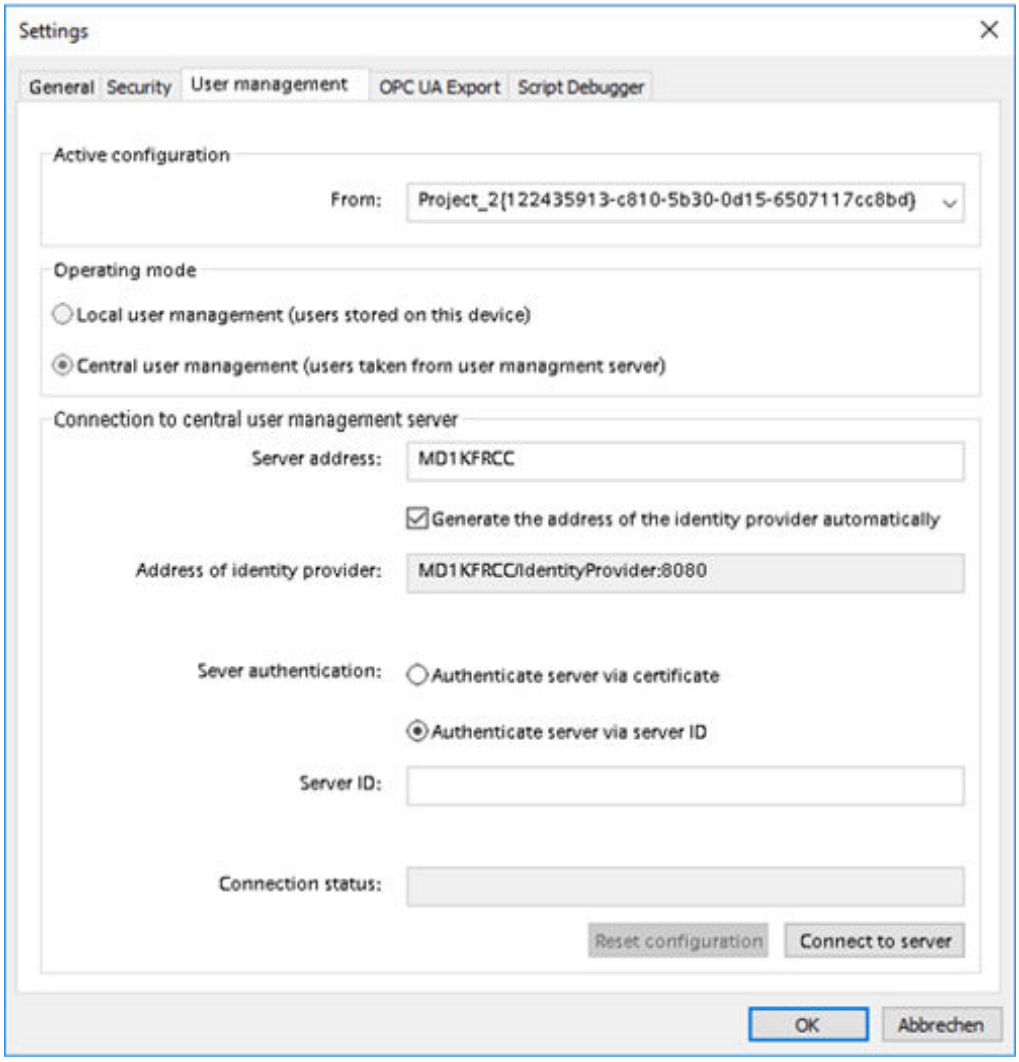
Requirement

- At least one project with user management is loaded on the Runtime PC.
- WinCC Unified Runtime is installed.
- SIMATIC Runtime Manager has been started.

Checking central user management in the SIMATIC Runtime Manager

When you have entered all information in the engineering system and the connection to the central user management can be established, all information is write-protected.

1. In the SIMATIC Runtime Manager, click "Settings" on the home page.
2. Select the "User management" tab.



3. When multiple projects are available on the PC, select the configuration of the user management of a project under "Select configuration".
4. Check the information in the area "Connection to UMC server".
5. Click the "Connect to server" button.
6. If the connection was successfully established, the status of the connection changes to "Connected" and the "Connect to server" button changes to "Check connection". You can reset the connection via "Reset configuration".

Configuring central user management

When the connection to the central user management could not be established, you can complete the information in the SIMATIC Runtime Manager.

1. In WinCC Unified Runtime, click "Settings" on the start page.
2. Select the "User management" tab.
3. When multiple projects are available on the PC, select the configuration of the user management of a project under "Activate configuration".
4. Complete the information. The setting "Authenticate server using server ID" is not changeable.
5. Click the "Connect to server" button.
6. If the connection was successfully established, the status of the connection changes to "Connected" and the "Connect to server" button changes to "Check connection". You can reset the connection via "Reset configuration".

See also

Managing multiple projects in the SIMATIC Runtime Manager (Page 6946)

13.4.6.2 Simulating a central user management

You want to simulate a project in which a central user management is configured for a customer. You have two options if you do not have access to the central user management of the customer:

- Configure your own central user management.
- Configure a local user management.

Requirement

- You know which groups and their function rights are contained in the central user management of the customer.

Configuring a central user management

Configure a central user management for the simulation project.

1. Create the users.
2. Create the user groups according to the customer project.
3. Assign the users to the groups.
4. Establish the connection to the central user management.
5. Start the simulation.
6. Log on in runtime.

Changes can be downloaded.

Configuring a local user management

Configure a local user management.

1. Create one or more users.
2. Assign the roles to the users.
3. Start the simulation.

Changes cannot be downloaded.

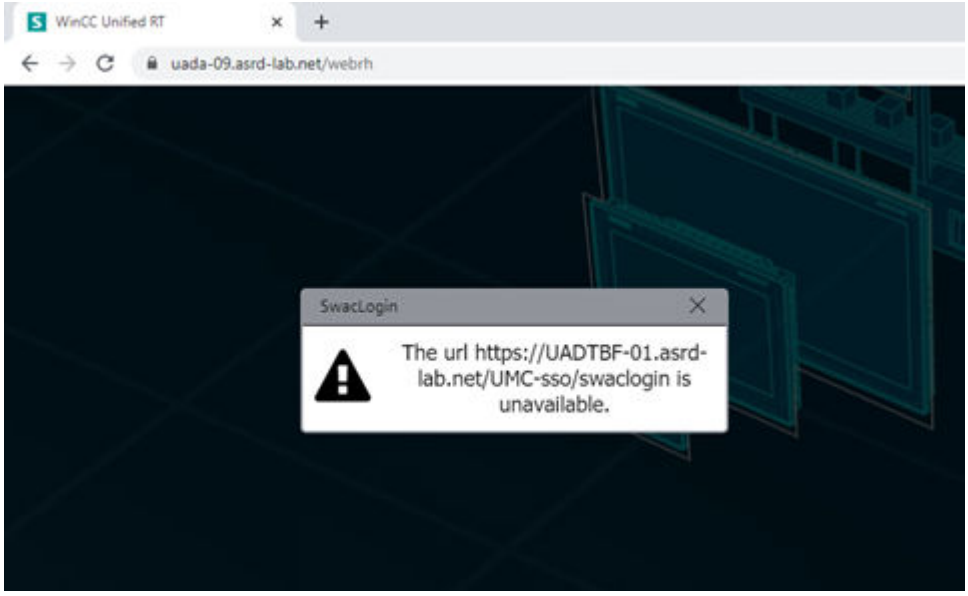
13.4.6.3 SwacLogin: Errors after complete download

After complete download of a project to a Unified PC, an error can occur when you open the WinCC Unified home page. The error can occur regardless of whether you open the home page locally on the PC or from a different device.

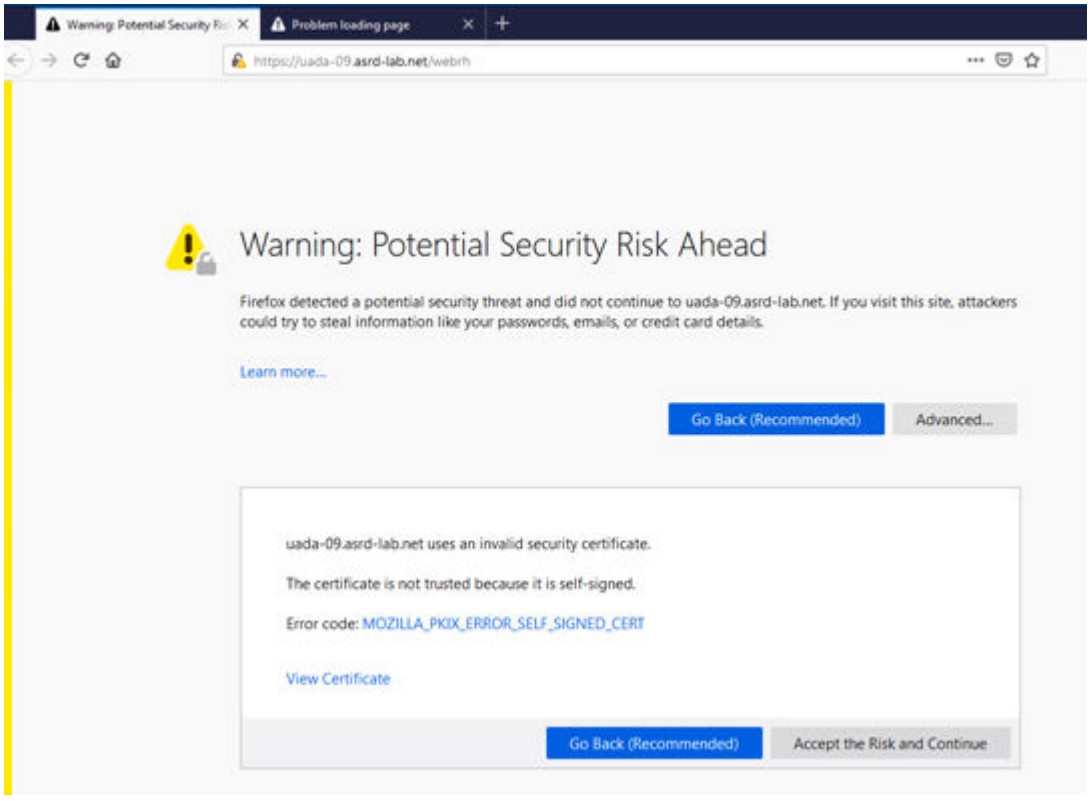
A possible cause of the error is the deletion of the browser cache.

Error description

In "Chrome" and "MS Edge", the error is displayed with the following alarm:



In "Firefox", the error is displayed with the following alarm:



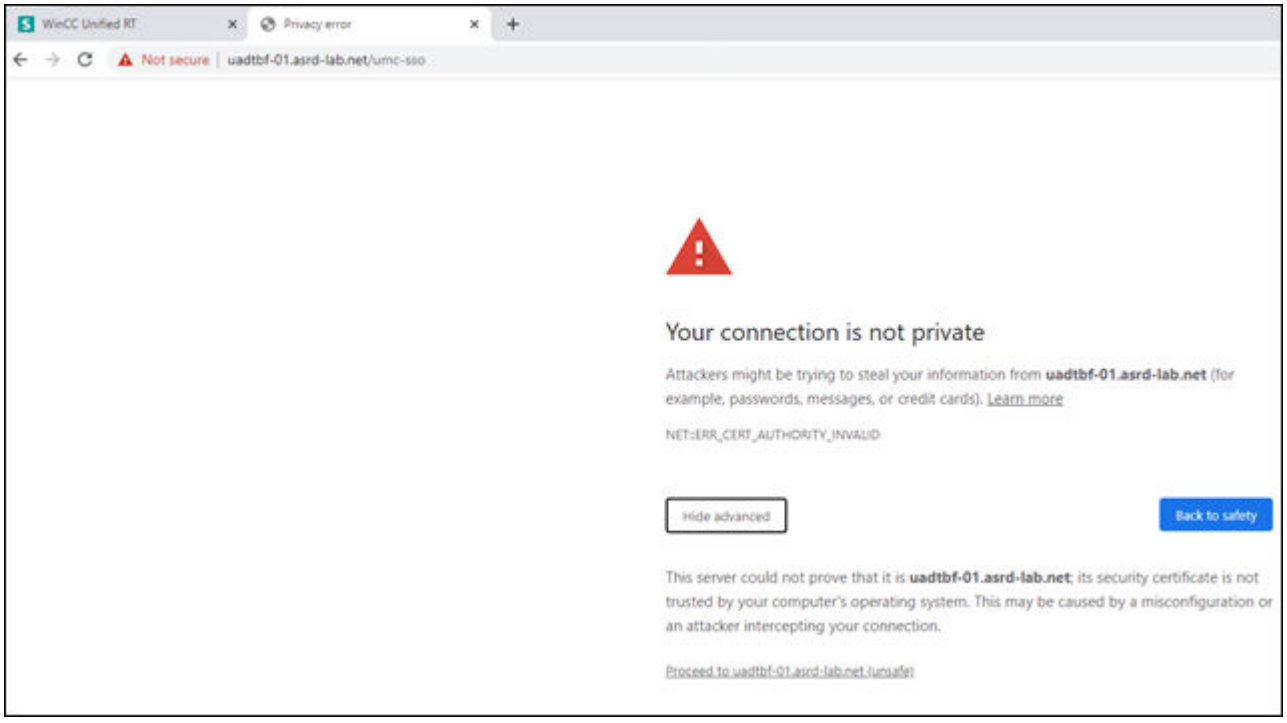
After accepting the warning of a potential security risk, the page remains empty in Firefox. Only the background screen is visible.

Remedy the error in "Chrome" and "MS Edge"

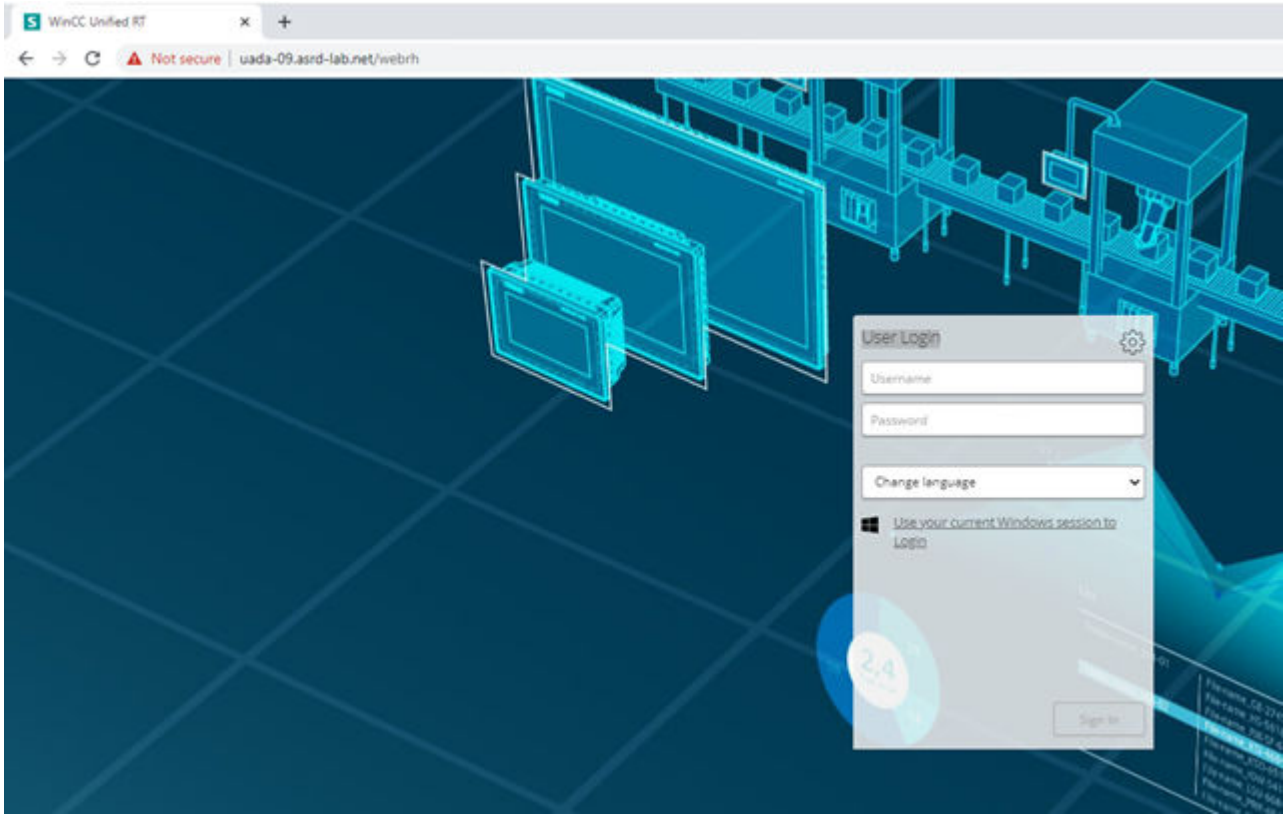
To fix the error in "Chrome" and "MS Edge", proceed as follows:

1. Open a new tab.
2. Enter the URL address of the identity provider of the UMC server in the address line of the browser. The URL is the same as the one in the error message without "/swaclogin", for example, "https://uadtbf-01.asrd-lab.net/umc-sso".

3. The page with a warning regarding the secure connection is displayed.



4. Accept the warning by clicking on "Proceed to uadtbf-01.asrd-lab.net (unsafe)".
5. The home page with the "User login" dialog is displayed.



Remedy the error in "Firefox"

To remedy the error in "Firefox", follow these steps:

1. Open a new tab.
2. Enter the URL address of the identity provider of the UMC server (ring server) in the address line of the browser, for example, "https://uadtbf-01.asrd-lab.net/umc-sso".
3. A blank page opens. Close the page.
4. Refresh the home page with the function key <F5>. The home page with the "User login" dialog is displayed.

Connectivity

14

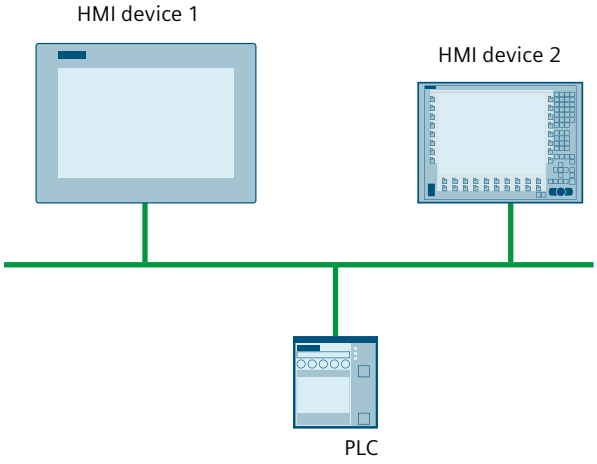
14.1 Basics

14.1.1 Basics of communication

14.1.1.1 Communication between devices

Communication

The data exchange between two devices is known as communication. The devices can be interconnected directly or via a network. The networked devices in communication are referred to as communication partners.



Data transferred between the communication partners is used for various purposes:

- Display processes
- Operate processes
- Output alarms
- Archive process values and alarms
- Document process values and alarms
- Administer process parameters and machine parameters

Communication partners in the automation system

An automation system consists of the following communication partners:

- PLC
  The PLC controls a process by means of a user program.
- HMI device
  The HMI device is used to operate and monitor the process.
  Communication between the communication partners PLC and HMI device is described below.
  Additional information on other forms of communication is available in the online help of the TIA Portal in the section "Editing devices & networks".
  If the following requirements are met, the PLC and HMI device form an automation system:
  - PLC and HMI device are linked to each other
  - Network between PLC and HMI device is configured

Network configuration

The basis for all types of communication is a network configuration.

- Every device in a network has a unique address.
- The devices carry out communication with consistent transmission characteristics.

Data exchange using tags

Process values such as temperatures and levels are transferred by tags in Runtime. Process values are stored in the memory of one of the connected automation systems.

To access the process data with the HMI device, link the external HMI tags to the PLC tags.

For additional information on configuring tags, refer to "Configuring tags (Page 607)".

Communication via a uniform and vendor-neutral interface

With OPC UA (Open Platform Communications Unified Architecture), WinCC has a uniform and manufacturer-independent software interface. This interface enables standardized data exchange between industrial, office, and manufacturing applications.

For more detailed information, refer to the documentation for OPC UA.

See also

Supported PLCs and communication channels (Page 6981)

Configuring communication (Page 6975)

14.1.1.2 Configuring communication

Introduction

To configure an automation system, you configure the connections in the "Devices & networks" editor. Connections of devices that are within the same project and were created with the "Devices & networks" editor are referred to as integrated connections. Connections of devices that were created with the "Connections" editor are referred to as non-integrated connections. The devices do not all have to be within the same project.

You use the graphic and table network view for the configuration.

Requirement

- The network configuration is complete.
- HMI device and PLC are available in the hardware catalog.

Note

Non-integrated configuration

If integrated configuration of the HMI connections is not possible, create non-integrated HMI connections of the HMI device using the "Connections" editor.

Procedure

To set up an automation system, always follow the steps below:

1. **Inserting devices**
   You drag a PLC and an HMI device from the hardware catalog to the network view of the "Devices & networks" editor.
2. **Configuring devices**
   Depending on the HMI device used, you add the required communications modules to your PC station.
3. **Networking devices**
   In the networking step, you configure the physical connection of the devices.
   To connect the devices, you connect the interfaces of the devices with communications capability using drag and drop.
4. **Connecting devices**
   To set up a logical communication connection between the communication partners, you create an HMI connection between the networked devices.
   The tabular network overview supplements the graphical network view.
   In addition, the created HMI connection is also visible in the "Connections" editor of the HMI device where it can be configured.

See also

Supported PLCs and communication channels (Page 6981)

Networking the HMI device and PLCs (Page 6985)

Creating an integrated HMI connection (Page 6988)

Creating a non-integrated HMI connection (Page 6992)

Communication between devices (Page 6973)

14.1.1.3 Secure communication and certificates

Runtime Unified supports secure communication to PLCs of the S7 series, for example, S7-1200 and S7-1500.

Each connection is encrypted by the TLS protocol.

In the TIA Portal you configure secure communication to the PLCs with a PLC certificate.

Note

Encryption with TLS

Always use the most current version of TLS. Disable the older version.

The use of older versions (TLS 1.0 und 1.1) is at your own risk.

Also observe the instructions in SiePortal:

- Making use of Runtime by using certificates (https://support.industry.siemens.com/cs/ww/en/view/109806850)
- Security guidelines for SIMATIC HMI operator devices and SIMATIC WinCC Unified (https://support.industry.siemens.com/cs/ww/en/view/109481300)

Connection establishment

Establishing an unencrypted connection

The connection establishment to PLCs, such as S7-1200 and S7-1500, for example, with older firmware or without PLC certificates is still possible.

Establishing an encrypted connection with secure communication

Current firmware allows for a connection with secure communication via the TLS protocol.

Certificates of a certificate authority, end unit certificates (self-signed or trusted) and certificate revocation lists, if available, are transferred to create an encrypted session.

The session is set up when the certificates match. If the certificates do not match, setup of the session is rejected, and a system alarm is generated.

Creating a connection with secure communication from Runtime Unified to the PLC

The certificates for Runtime Unified are automatically handled by the engineering system and sent to the device.

However, if certificates are modified in the PLC and the HMI device is not reloaded, the following scenarios can be created.

Connection of the Runtime Unified without certificates to a PLC without certificate

- The connection is established during the next connection.

Connection of the Runtime Unified to a PLC with the same certificate

- The connection is established during the next connection.

Connection of the Runtime Unified without certificates to a PLC with certificate

- When the PLC is configured so that HMI connections with and without secure communication are permitted, the connection is established.
- If the PLC only permits connections with secure communication, the connection is denied. The PLC certificate is saved in "%PROGRAMDATA%/Siemens/Automation/device-certificate-store/**untrusted**/certs" . The certificate file contains the IP address of the PLC and a fingerprint of the certificate.
- The HMI device tries every 30 seconds to set up the connection again. The PLC accepts the certificate during the next attempt and the connection is established.

Connection of the Runtime Unified to a PLC with different certificates

- If the HMI connection has a certificate, an attempt is made to set up a connection to this certificate. If the certificate of the HMI connection does not match the one of the PLC, the connection is denied. The PLC certificate is saved in "%PROGRAMDATA%/Siemens/Automation/device-certificate-store/**untrusted**/certs" . The certificate file contains the IP address of the PLC and a fingerprint of the certificate.
- The HMI device tries every 30 seconds to set up the connection again. The PLC accepts the certificate during the next attempt and the connection is established.

Certificate revocation list (CRL)

A certificate revocation list contains certificates that were revoked before they expired and, therefore, are no longer trusted. A certificate revocation list is provided as a CERT file (encoded in PEM or DER format). More than one certificate revocation list can exist.

Certificate revocation lists are saved in the path

"%PROGRAMDATA%/Siemens//Automation//device-certificate-store//trusted//crl/"

.

While the HMI connection to a PLC is being established, the PLC certificate is compared with the certificate revocation list. If the certificate is listed there, the connection is denied. An alarm is output.

14.1.1.4 Networks and connections

SIMATIC communication networks

Communication networks

Overview

Communication networks are a central component of an automation solutions. Industrial networks fulfill special requirements:

- Coupling of automation systems as well as simple sensors, actuators, and PCs
- Error-free transfer of information at the right time
- Robustness against electromagnetic interference, mechanical stresses and soiling
- Flexible adaptation to the production requirements

Industrial networks belong to the LANs (Local Area Networks) and allow communication within a limited area.

Industrial networks fulfill the following communication functions:

- Process and field communication of the automation systems including sensors and actuators
- Data communication between automation systems
- IT communication for integrating information technology

HMI devices in the plant network

You connect an HMI device in the network to SIMATIC S7 modules that have an integrated interface of the corresponding communication channel.

You can connect multiple HMI devices to one SIMATIC S7 PLC and multiple SIMATIC S7 PLCs to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

See also

PROFINET Industrial Ethernet (Page 6978)

PROFINET Industrial Ethernet

PROFINET

PROFINET is an open standard for industrial automation defined by IEEE 61158 and based on Industrial Ethernet. PROFINET makes use of IT standards all the way to the field level and enables plant-wide engineering.

With PROFINET, you realize automation solutions, the high performance and communication in real-time requirements.

Industrial Ethernet

Industrial Ethernet, which is based on IEEE 802.3, enables you to connect your automation system to your office networks. Industrial Ethernet provides IT services that you can use to access production data from the office environment.

See also

Communication networks (Page 6978)

Connections

HMI connection

Definition

An HMI connection is a logical connection between an HMI device and a PLC. The HMI connection enables communication between the communication partners.

Unlike an S7 connection, the HMI connection is assigned to the HMI device.

Layout

The HMI connection defines the following within the plant network:

- Communication partners
  The HMI connection identifies the devices in the plant configuration.
- Communication channel over which these communication partners communicate.
  The HMI connection requires a configured network.
- Communication path
  The HMI connection defines the interface parameters and the network addresses of the communication partners.

HMI connection types

The options for addressing external tags depend on the type of HMI connection between WinCC and the PLC in question. The TIA Portal supports the following types of connection:

- Integrated HMI connection
  In the TIA Portal you configure integrated HMI connections between the devices in the "Devices & Networks" editor. An integrated HMI connection enables an optimized data exchange.
- Non-integrated HMI connection
  In the case of a non-integrated connection, the PLC program can be created outside the WinCC project. You configure the PLC and the WinCC project independently each other. For configuration in WinCC, you only need to know the addresses used in the PLC and their function.
  You use a non-integrated HMI connection, for example, in the following application cases:
  - You configure a WinCC project for external PLCs.
  - You do not have access to the device configuration of a SIMATIC PLC, for example, because you are working without a STEP 7 license.

  You configure a non-integrated HMI connection for the HMI device in the "Connections" editor of the WinCC project.

Additional connection types (Page 6980)

Setting up switch on/switch off of a connection in runtime (Page 6993)

Additional connection types

Overview

The following table provides an overview of the connection types that you can use in addition to the HMI connection for communication to specific device types and areas of application.

Additional information on connection types is available in the online help of the TIA Portal in the section "Editing devices & networks".

Connection type	Description	Application
S7 connections	Connection type can be used in all S7 devices	Data exchange between SIMATIC S7 stations
FDL connection	Fieldbus Data Link Security layer Based on PROFIBUS	Communication with a partner that supports sending and receiving according to the SDA function (Send Data with Acknowledge), e.g. SIMATIC S5 or PC.

Connection type	Description	Application
ISO transport connection	Suitable for large amounts of data Based on ISO transport	Communication with a partner that supports sending and receiving data in accordance with ISO transport, e.g. SIMATIC S5 or PC.
ISO-on-TCP connection	Transmission Control Protocol/Internet Protocol with the extension RFC 1006 Corresponds to the standard TCP/IP	Communication with a partner that supports sending and receiving of data in accordance with ISO-on-TCP, e.g. PC or external system.
TCP connection	Transmission Control Protocol/Internet Protocol Corresponds to the standard TCP/IP	Communication with a partner that supports sending and receiving data in accordance with TCP/IP, e.g. PC or external system.
UDP connection	User Datagram Protocol Subnet: Industrial Ethernet	Unsecured transmission of related data fields between two nodes
Email connection	In the case of an email connection, the mail server via which all emails sent by an IT-CP are delivered is defined.	For example, enables the sending of process data, for example, from data blocks via email using a CP with IT functionality (IT-CP);
P2P connection	Peer-to-Peer Communication between two equal devices	Communication with external devices. e.g. a printer.

HMI connection (Page 6979)

Supported PLCs and communication channels

Overview

Your HMI device can communicate with the following SIMATIC PLC families via integrated HMI connections:

SIMATIC PLC family	Supported communication channels	Comment
SIMATIC S7-1200/1500	Industrial Ethernet	Parallel communication with several PLCs is possible
SIMATIC S7-300/400	Industrial Ethernet	Parallel communication with several PLCs is possible

Communication drivers

In the case of non-integrated connections, the HMI devices, PC systems and PLCs communicate via the following communication drivers:

Communication drivers	Interface/Communication channel	HMI device/ Panel	PC system	Comment
SIMATIC S7-1200/1500	Industrial Ethernet/PROFINET	x		Parallel communication with several PLCs is possible
	Ethernet MPI/DP		x	
SIMATIC S7-300/400	Industrial Ethernet/PROFINET	x		Parallel communication with several PLCs is possible
	Ethernet MPI/DP		x	
SIMATIC HMI HTTP	Ethernet ⇒ http/https		x	
Allen-Bradley Ethernet IP	Industrial Ethernet	x		Parallel communication with several PLCs is possible
Allen Bradley DF1	COM interface		x	
Mitsubishi FX	COM interface		x	Parallel communication with several PLCs is possible
Mitsubishi iQr/iQF	Industrial Ethernet	x		
Mitsubishi MC TCP/IP	Industrial Ethernet	x		Parallel communication with several PLCs is possible
	Ethernet		x	
Modbus RTU	COM interface		x	
Modbus TCP/IP	Industrial Ethernet	x		Parallel communication with several PLCs is possible
	Ethernet		x	
Omron Ethernet/IP	Industrial Ethernet	x		Parallel communication with several PLCs is possible
Omron Host Link	COM interface		x	
OPC UA	OPC	x	x	Parallel communication via OPC UA connections possible
LOGO!	Ethernet		x

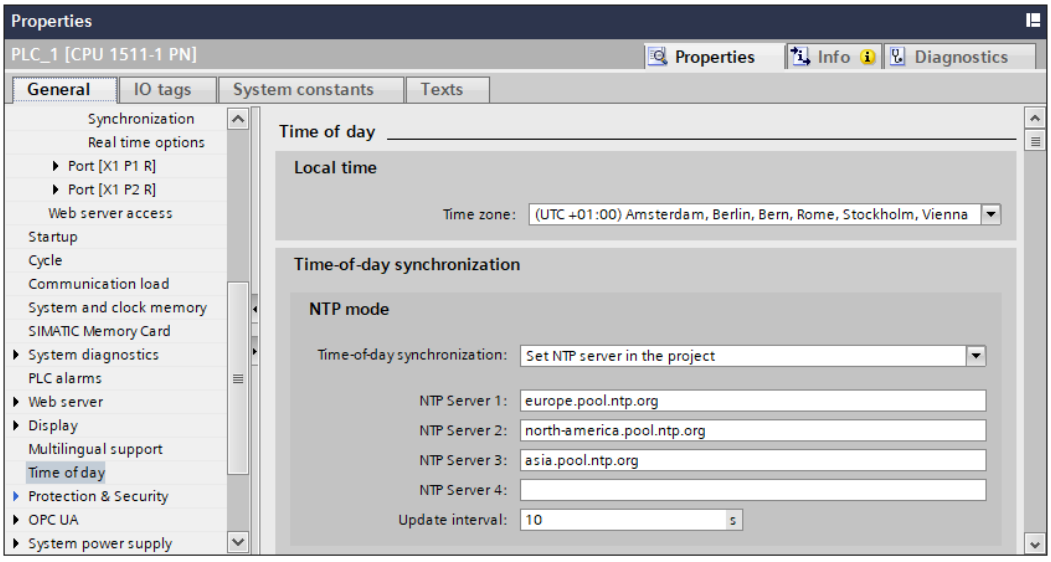
14.1.1.5 Synchronization

Time synchronization on the S7-1200/1500

1. To make settings for the time synchronization, select the "Online & Diagnostics" node of the PLC in the project tree.
2. In the Inspector window, select "Properties > General > Time of day".



Note

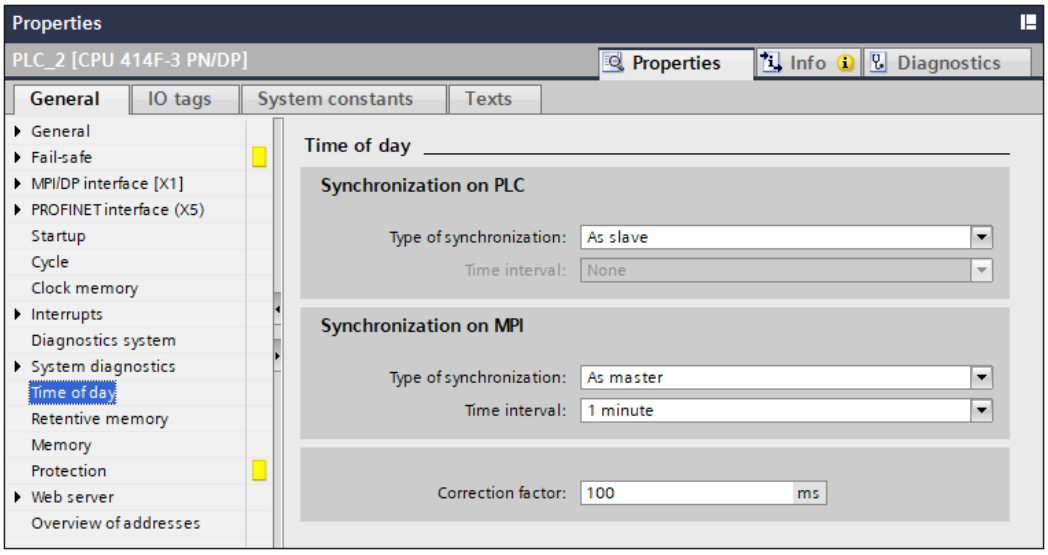
Example of window

Different settings are available depending on the configured PLC.

3. Select the time zone where the device is located.
4. Enable the time synchronization for the device by selecting how the NTP server is accessed under "Time synchronization".
5. Specify at least one NTP server.
6. Complete the settings for
   - Update interval
   - Daylight saving time
   - Start of standard time

Time synchronization on the S7-300/400

1. To make settings for the time synchronization, select the "Online & Diagnostics" node of the PLC in the project tree.
2. In the Inspector window, select "Properties > General > Time of day".



Note

Example of window

Different settings are available depending on the configured PLC.

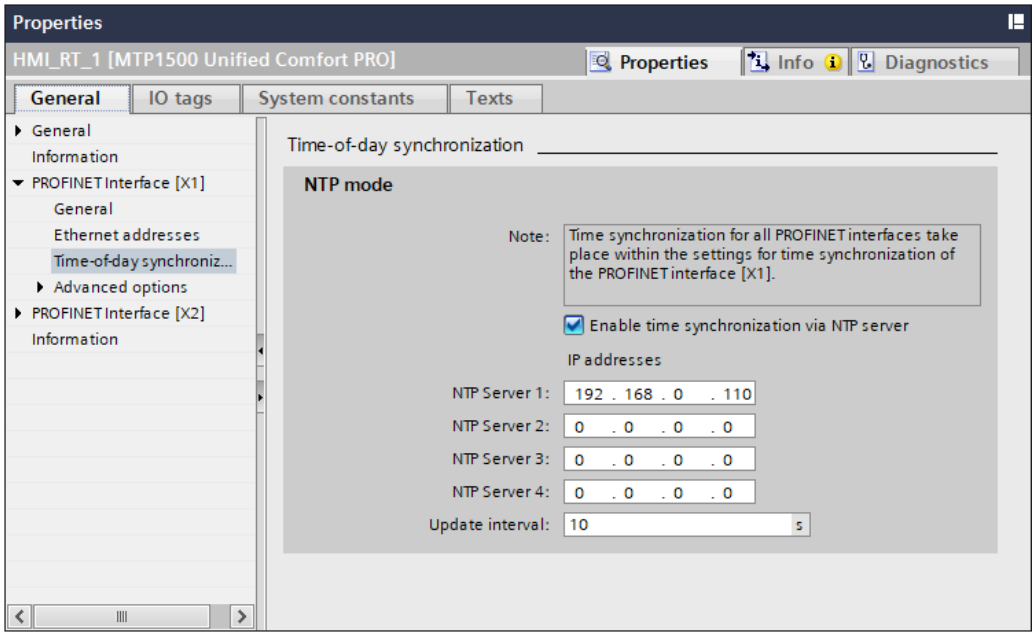
3. Select the synchronization type for the interfaces.
4. Specify a correction factor.

Time synchronization for PROFINET interfaces on Panels

Note

Activating this service reduces security against unauthorized access to functions and data of the PLC from the outside and via the network.

1. To make settings for the time synchronization, select the "Online & Diagnostics" node of the panel in the project tree.
2. Select "Properties > PROFINET interface [x] > Time synchronization" in the Inspector window.



3. Enable the time synchronization.
4. Specify at least one NTP server.

14.1.2 Configuring an HMI connection

14.1.2.1 Configuring an integrated HMI connection

Networking the HMI device and PLCs

Introduction

You can network an HMI device to several PLCs. The networking of devices is depicted by lines that are colored depending on the interface type.

The number of available interfaces and interface types depends on the device. To make additional interfaces available on the device, add a communications module to the device.

Requirement

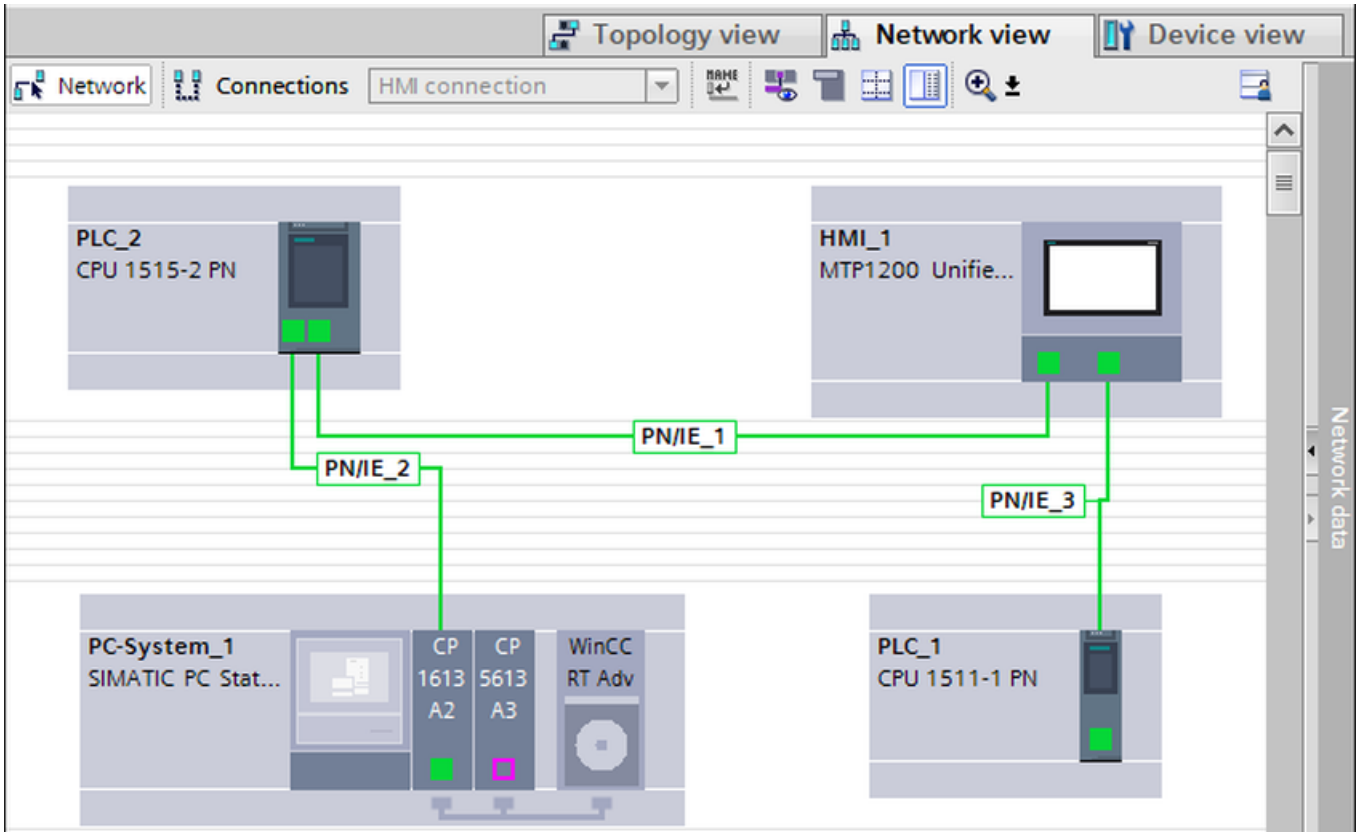
- The "Devices & Networks" editor is open.
- The networks are configured.

- An HMI device is configured in the "Devices & Networks" editor.
- The PLC is configured in the "Devices & Networks" editor.

Procedure

To network an HMI device and a PLC, follow these steps:

1. Open the network view of the "Devices & Networks" editor.
2. Enable the "Networking" mode.
3. Use a drag-and-drop operation to interconnect the interfaces of the desired communication network of the devices.
   A connection is shown as graphic and table in the network view.



The tabular network overview supplements the graphical network view with the following additional functions:

– You obtain detailed information on the structure and parameter settings of the devices.

– Using the "Subnet" column, you can connect communication-capable components to subnets that have been created.

Creating an integrated HMI connection (Page 6988)

SIMATIC communication networks (Page 6978)

Creating an integrated HMI connection

Introduction

An integrated HMI connection connects an HMI device and a SIMATIC S7 PLC within your project.

Connection resources

Each connection requires connection resources for the end point or transition point on the devices involved. The number of connection resources is device-specific.

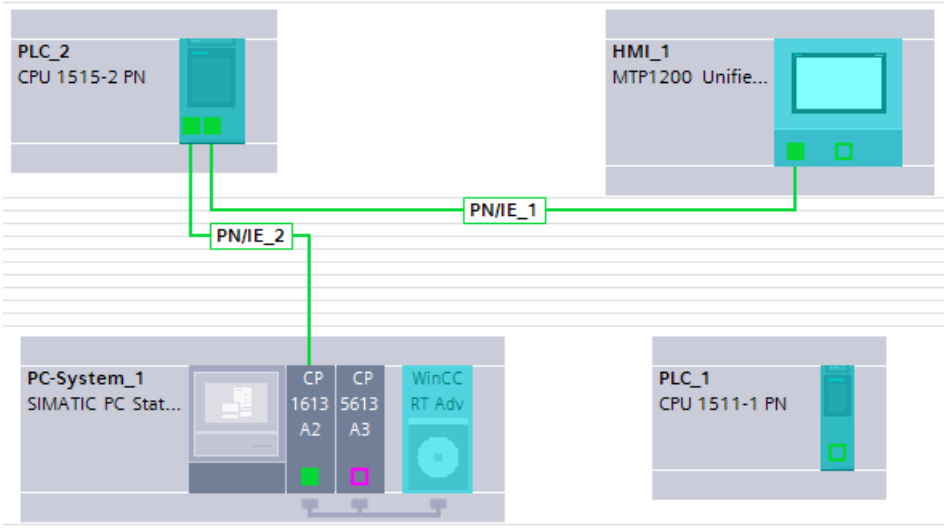
If all connection resources of a communication partner are allocated, no new connection can be configured.

Requirement

- The networks are configured.
- An HMI device and a SIMATIC PLC are configured and networked.
- The network view is open in the "Devices & Networks" editor.

Create an integrated HMI connection

1. Enable the "Connections" mode.
2. Select the "HMI connection" connection type.
   The devices available for connection are highlighted in color.



3. Use a drag-and-drop operation to interconnect the interfaces of the desired communication channel of the HMI device and PLC with each other.
   The HMI connection is shown as graphic and table in the network view.
   In the table area of the editor, the HMI connection is displayed on the "Connections" tab.

Note

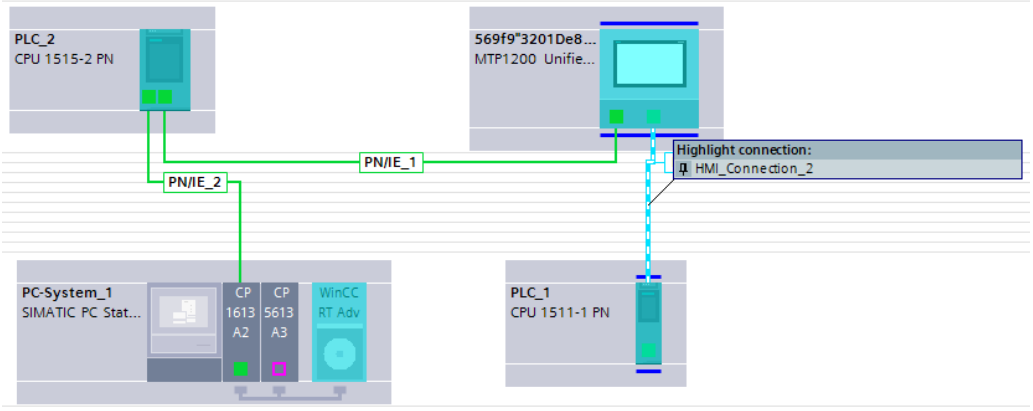
Change local connection names

You can change the local name for the connection only in the tabular area of the editor.

4. Change the connection parameters in the tabular area according to the requirements of your project.

Open the graphic view of the connection partners

1. Select the HMI connection.
2. Click "Highlight HMI connection" and select the HMI connection.



The connection path is shown in the Inspector window under "Properties > General > General".

Change the connection path

1. Open the graphic view display of the connection partners.
2. Select a different interface in the Inspector window under "Properties > General > General > Interface".
   The existing connection parameters are highlighted as invalid.
3. To validate the connection parameters, click on "Find connection path".
   The connection parameters are reassigned and validated.

Create an integrated HMI connection in the "Tags" editor

1. Double-click on "HMI tags" below your HMI device in the project tree.
2. Select a tag table.
   The "HMI tags" editor opens.
3. Create an HMI tag.
4. Connect the HMI tag to an existing PLC tag of the matching data type.
5. The integrated HMI connection to the PLC is established automatically.

14.1.2.2 Configuring a non-integrated HMI connection

Configuring non-integrated connections

Introduction

A non-integrated HMI connection requires a communication driver and a good understanding of the address structure of the communication partner.

Addressing with non-integrated connections

In the case of a project with a non-integrated connection, you always configure a tag connection exclusively with absolute addressing.

Select the valid data type yourself. If the address of a PLC tag changes in a project with a non-integrated connection during the course of the project, you also have to perform the change in WinCC. The tag connection is not checked for validity in Runtime. No alarm is displayed.

Communication drivers

A communication driver is a software component that establishes a connection between a PLC and an HMI device. The communication driver thus enables the assignment of process values to HMI tags.

Depending on the HMI device used and the connected communication partner, you select the interface used as well as the profile and transmission speed.

Basic procedure

The following steps are required to work in your project in a non-integrated connection:

1. Create an HMI connection
2. Select communication drivers and interfaces
3. Address the communication partners
4. Assign the communication network
5. Close the connection

See also

Creating a non-integrated HMI connection (Page 6992)

Supported PLCs and communication channels (Page 6981)

Creating a non-integrated HMI connection

Introduction

A non-integrated connection connects an HMI device to a PLC that is configured outside your project. You create the non-integrated HMI connection in the "Connections" editor of the HMI device.

Requirements

- A project is open.
- An HMI device has been created.

Procedure

To create a non-integrated connection, follow these steps:

1. Double-click "Connections" in the project tree below your HMI device.
   The "Connections" editor opens.
   Existing integrated connections are identified with  .
   Existing non-integrated connections are identified with .
2. Create a new connection with "Add".
3. Select the communication driver. Use the communication driver of the required PLC family.
4. Select the required interface of the HMI device in the graphic area of the editor under "Parameters > [HMI device type] > Interface".
   The number of available interfaces on the HMI device depends on the communication driver.
5. Change the connection parameters according to the requirements of your project.

14.1.2.3 Setting up switch on/switch off of a connection in runtime

Introduction

If an HMI device and a PLC do not have to always be connected, terminate the connection in Runtime and establish it again when necessary. This reduces the load on the communication channel.

Configure a Runtime script for enabling/disabling a connection in runtime.

Note

Alarm system and system diagnostics

After switching off the connection to a PLC, the alarms from this PLC continue to be displayed. The system diagnostics for this PLC is also available.

Requirement

- An HMI connection is configured.
- A button is configured in the HMI device of the HMI connection.
- The "Screens" editor is open.

Procedure

To configure enabling/disabling of a connection in Runtime, follow these steps:

1. Select a button.
2. Select the event that is to trigger enabling/disabling in runtime under "Properties > Events" in the Inspector window.
3. Program a script to the event which enables or disables the connection via the "Set Connection mode" snippet.

Result

Pressing this button triggers enabling/disabling of the connection in Runtime.

See also

Introduction to runtime scripting (Page 969)

HMI connection (Page 6979)

14.1.3 Device configuration

14.1.3.1 HMI devices

Panels and PC systems are used as HMI devices.

Definition

An HMI device visualizes the plant process, shows the process values and enables access to the plant control system via operator inputs.

The HMI device needs a runtime software for process visualization and operation. The device must have the corresponding interfaces and communication drivers to connect the HMI device to the plant network and the PLC.

Structure in the device navigation

Edit further components, to configure a PC system:

- PC station
  The hardware basis of a PC system is an industrial PC.
  The PC provides the operating system, the firmware and the hardware equipment.
- WinCC Runtime software
  The Runtime software visualizes your WinCC Runtime project and enables process operation.
  The runtime software is available in the hardware catalog.
- Communications modules
  If the PC station does not have the required interfaces, install the required communications modules in the PC station.

A Panel is a complete integrated HMI device which does not require further components.

See also

Inserting a HMI device into the project (Page 6994)

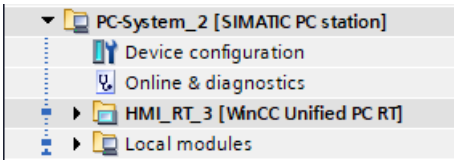
14.1.3.2 Inserting a HMI device into the project

Requirements

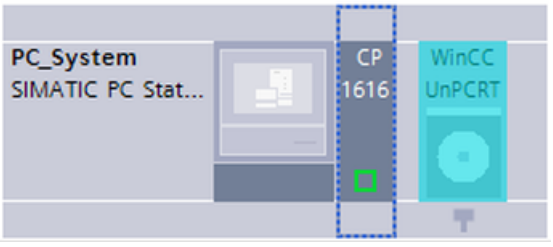
- The networks are configured.
- HMI device and PLC each support the communication channel of the respective network.
- The network view is open in the "Devices & Networks" editor.
- A corresponding interface is required at both ends to connect the HMI device to the PLC.

Configuring a SIMATIC WinCC Unified PC

1. Drag the SIMATIC WinCC Unified PC from the hardware catalog to the work area.
   A SIMATIC PC system with the WinCC Unified PC RT is created.



2. Select a communication module for the required interface type in the hardware catalog.
3. Drag the communication module onto the SIMATIC WinCC Unified PC.
   The communication module is added.



4. Drag a PLC from the hardware catalog to the work area.
   The PLC is created.
5. Network the devices.

Configuring a SIMATIC Unified Comfort Panel

1. Drag a SIMATIC Unified Comfort Panel from the hardware catalog to the work area.
   The SIMATIC Unified Comfort Panel is created.
2. Drag the matching PLC from the hardware catalog to the work area.
   The PLC is created.
3. Network the devices.

Permitted data types for SIMATIC S7-1200/1500 (Page 6996)

Symbolic addressing (Page 6997)

14.2.1.2 Permitted data types for SIMATIC S7-1200/1500

Permitted data types for connections with SIMATIC S7-1500

The table below lists the data types that can be used when configuring tags.

Data type	Length
BOOL	1 bit
BYTE	1 byte
CHAR	1 byte
DATE	2 bytes
DATE_AND_TIME	8 bytes
DINT	4 bytes
DTL	12 bytes
DWORD	4 bytes
INT	2 bytes
LDT	8 bytes The value range of the data type LDT of an S7-1500 stretches from 1970-1-1 00:00:00.000000000 to 2262-04-11 23:47:16.854775807.
LINT	8 bytes
LREAL	8 bytes
LTIME	8 bytes
LTIME_OF_DAY	8 bytes
REAL	4 bytes

Data type	Length
S5TIME	2 bytes
SINT	1 byte
STRING	(2+n) bytes, n = 0 to 254
TIME	4 bytes
TIME_OF_DAY	4 bytes
UDINT	4 bytes
UINT	2 bytes
ULINT	8 bytes
USINT	1 byte
WCHAR	2 bytes
WORD	2 bytes
WSTRING	(2+n) 2 bytes, n = 0 to 254

See also

Communication with S7-1200/1500 (Page 6996)

Symbolic addressing (Page 6997)

14.2.1.3 Symbolic addressing

Introduction

Data are exchanged between the HMI device and the PLC via tags.

Depending on the addressed data blocks, these tags are addressed as absolute or symbolic in the PLC.

- Symbolic addressing
  For symbolic addressing, a validity check of the tag connection is performed in runtime. If an address is changed in the PLC, the change is registered and an error message is issued.
  For symbolic addressing, select the PLC tag via its name and connect it to an external HMI tag. The valid data type for the external HMI tag is automatically selected by the system.
- Absolute addressing
  The linking of tags is not checked in runtime. You select the valid data type of the tags. If the tag address changes in the PLC, compile and load the HMI device again so that the change is registered in Runtime.

Data blocks and symbolic access

Data blocks with optimized access support only symbolic addressing.

During the symbolic addressing of a data block, the address of an element in the data block is dynamically assigned and is automatically adopted in the HMI tag in the event of a change.

Neither the connected data block nor the WinCC project must be compiled.

For symbolic addressing of elements in a data block, you need to recompile and reload the WinCC project only in case of the following changes:

- Name or data type of the connected data block element or of the global PLC tag
- Name or data type of a higher-level structure node of the connected element in the data block element or global PLC tag
- Number of the connected data block

HMI connections and symbolic access

With symbolic addressing of tags, you create an integrated HMI connection:

- Integrated connection
  You address the tags symbolically as well as absolutely over an integrated connection.
- Non-integrated connection
  You address the tags only absolutely over a non-integrated connection.
  A non-integrated connection is available for all supported PLCs.

Disabling symbolic access

In WinCC, symbolic addressing is the default method.

To change the default setting, follow these steps:

1. Select "Options > Settings > Visualization > HMI tags" in the menu.
2. Activate the "Symbolic access" option.

Communication with S7-1200/1500 (Page 6996)

Permitted data types for SIMATIC S7-1200/1500 (Page 6996)

14.2.1.4 Interface and communication parameters

S7-1500 | Integrated HMI connection

PROFINET interface parameters

The following table shows the interface parameters of an integrated HMI connection:

Table 14-1 PROFINET parameters of the HMI device

Parameters	Description
Subnet	Specifies the subnet of the HMI connection via which the HMI device is connected to the network.
MAC address	Specifies the MAC address for the connection type "ISO connection". This option is only available when the "Use ISO protocol" option is selected.
IP address	Specifies the IP address of the communication partner. This property is only available when the "Set IP address in the project" option is selected.
Subnet mask	Specifies the subnet mask. This property is only available when the "Set IP address in the project" option is selected. The subnet mask determines which part of the IP address addresses the network and which part of the IP address addresses the device.
Router address	Specifies the router address. This property is only available when the "Use router" option is selected.

Table 14-2 PROFINET parameters of the PLC

Parameters	Description
Subnet	Specifies the subnet of the HMI connection via which the HMI device is connected to the network.
IP address	Specifies the IP address of the communication partner. This property is only available when the "Set IP address in the project" option is selected.
Subnet mask	Specifies the subnet mask. This property is only available when the "Set IP address in the project" option is selected. The subnet mask determines which part of the IP address addresses the network and which part of the IP address addresses the device.
Router address	Specifies the router address. This property is only available when the "Use router" option is selected.
PROFINET device name	Shows the PROFINET device name or specifies it. This property is only available when the "Generate PROFINET device name automatically" option is deactivated.
Converted name	Shows the name that is automatically generated from the PROFINET device name and satisfies the DNS conventions.
Device number	Shows the device number by which an IO device can be identified.

S7-1500 | Non-integrated HMI connection

PROFINET interface parameters

The following table shows the interface parameters of a non-integrated HMI connection:

Table 14-3 PROFINET parameters of the HMI device

Parameters	Description
Interface	Specifies the communication channel.
Address	Specifies the IP address of the device.
Access point	Defines a logical device name through which the communication partner can be reached.

Table 14-4 PROFINET parameters of the PLC

Parameters	Description
Address	Specifies the IP address of the device.

14.2.1.5 Troubleshooting for SIMATIC S7-1200/1500

Causes of a faulty connection

Causes for a connection not getting established

If communication between the PLC and the HMI device cannot be established, the causes could be the following:

- Integrated connection not configured
- Hardware fault: Cable not plugged in, PLC switched off, network component interrupted
- Connection is not online
- Erroneous network configuration, for example. wrong access point, Invalid IP address of a device
- Failed authentication on the PLC side (wrong or invalid password)
- Wrong or invalid connection certificate
- A connection that has already been established is broken as a result of a system function call.
- Connection resources exhausted

Connection not online

The connection can be set to not 'Online' In the Engineering System. In this case, connection establishment does not take place.

Breaking and switching the connection with a system function

A connection can be broken, established and switched by calling a system function in a script.

- "SetConnectionMode": The specified connection is established or disconnected.
- "ChangeConnection": Changes the connection parameters of an HMI connection.
  Is used to switch between PLCs at runtime.
  When "SwitchConnection" (ChangeConnection) is used, the current connection to the PLC is disconnected and an attempt is made to establish a connection to another PLC. Connection establishment to the other PLC can be rejected or the connection may later be lost.

Procedure if there is no connection

The connection is established at the start of Runtime.

If a connection cannot be established, Runtime issues a system alarm.

Requirement

Configure a screen with a screen object "Alarm view" that is shown on the HMI device in Runtime.

The system alarm for a failed connection establishment is displayed here.

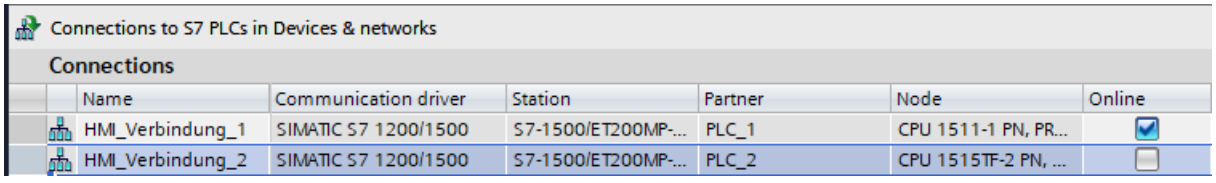
Note

If a connection is configured as not "online" or is not established by calling a system function, a system alarm is not issued. This is not an error; it is configured behavior.

The system alarm provides information on the cause of the faulty connection establishment.

Finding the cause of the error

1. Check the cable and the plug-in connections.
2. Check whether the connection has been configured as "online".



3. Check whether a script has called the system functions "SetConnectionMode" (SetConnectionMode) or "SwitchConnection" (ChangeConnection).
   More information: Setting up switch on/switch off of a connection in runtime (Page 6993)

4. Check the network configuration.
   IP addresses within a subnet must be unique.

   If required, select the function "Find connection path" to assign the optimum connection path to the connection.

5. Check the availability and validity period of the certificate in the TIA Portal.
   The alarm text contains the name of a lapsed certificate.
   More information: Introduction to the WinCC Unified Certificate Manager (Page 7517)
   Connection establishment is not possible with PLCs that do not provide a certificate.

6. The password given for the PLC in "Device configuration > Properties > General > Access protection" must match the password that is specified for the connection.

Error messages SIMATIC S7-1200/1500

The following alarms are output if the connection cannot be established:

ID	Cause
536870948	The connection to the PLC could not be established.
537526273	The connection to an S7-1200/1500 PLC could not be established.
537526274	The S7-1200/1500 PLC is not in RUN mode.
537526275	The runtime settings of the WinCC Unified Device for controller alarms are configured for "Automatic Update", but the PLC S7-1200/1500 PLC does not support full text alarms.
537526276	The S7-1200/1500 PLC communication resources for HMI tags are overloaded.

You can find the configured alarm texts under [HMI device] > "HMI alarms > System events".

More information: Reference to system events (Page 798).

The following alarms can be displayed for certificates.

ID	Cause
536870941	The certificate was not found in the certificate memory.
536870942	Certificate expires soon.
536870943	Certificate has expired.

The alarms specify the relevant device, the name of the certificate and if applicable, the date.

14.2.2 Communicating with SIMATIC S7-300/400

14.2.2.1 Communication with SIMATIC S7-300/400

Introduction

The combined designation for the PLCs S7-300 and S7-400 is SIMATIC S7-300/400.

You can configure the following communication channel for communication between an HMI device and the SIMATIC S7-300/400 PLC:

- PROFINET

See also

Permissible data types for SIMATIC S7-300/400 (Page 7003)

Cyclic operation (Page 7007)

14.2.2.2 Permissible data types for SIMATIC S7-300/400

Permitted data types for connections with SIMATIC S7-300/400

The table lists the data types that can be used when configuring tags.

Data type	Length
BOOL	1 bit
BYTE	1 byte
CHAR	1 byte
DATE	2 bytes
DATE_AND_TIME	8 bytes
DINT	4 bytes
DWORD	4 bytes
INT	2 bytes
REAL	4 bytes

Data type	Length
S5TIME	2 bytes
STRING	(2+n) bytes, n = 0 to 254 • With SIMATIC S7-300: – Read access: 220 characters – Write access: 210 characters • ASCII • Characters from the Windows 1252 code page
TIME	4 bytes
TIME_OF_DAY, TOD	4 bytes
WORD	2 bytes

Communication with SIMATIC S7-300/400 (Page 7003)
Cyclic operation (Page 7007)

14.2.2.3 Interface and communication parameters

S7-300/400 | Integrated HMI connection

PROFINET interface parameters

The following table shows the interface parameters of an integrated HMI connection:

Table 14-5 PROFINET parameters of the HMI device

Parameters	Description
Subnet	Specifies the subnet of the HMI connection via which the HMI device is connected to the network.
MAC address	Specifies the MAC address for the connection type "ISO connection". This option is only available when the "Use ISO protocol" option is selected.
IP address	Specifies the IP address of the communication partner. This property is only available when the "Set IP address in the project" option is selected.
Subnet mask	Specifies the subnet mask. This property is only available when the "Set IP address in the project" option is selected. The subnet mask determines which part of the IP address addresses the network and which part of the IP address addresses the device.
Router address	Specifies the router address. This property is only available when the "Use router" option is selected.

Table 14-6 PROFINET parameters of the PLC

Parameters	Description
Subnet	Specifies the subnet of the HMI connection via which the HMI device is connected to the network.
IP address	Specifies the IP address of the communication partner. This property is only available when the "Set IP address in the project" option is selected.
Subnet mask	Specifies the subnet mask. This property is only available when the "Set IP address in the project" option is selected. The subnet mask determines which part of the IP address addresses the network and which part of the IP address addresses the device.
Router address	Specifies the router address. This property is only available when the "Use router" option is selected.
PROFINET device name	Shows the PROFINET device name or specifies it. This property is only available when the "Generate PROFINET device name automatically" option is deactivated.
Converted name	Shows the name that is automatically generated from the PROFINET device name and satisfies the DNS conventions.
Device number	Shows the device number by which an IO device can be identified.

S7-300/400 | Non-integrated HMI connection

PROFINET interface parameters

The following table shows the interface parameters of a non-integrated HMI connection:

Table 14-7 PROFINET parameters of the HMI device

Parameters	Description
Interface	Specifies the communication channel.
Address	Specifies the IP address of the device.
Access point	Specifies the device name through which the communication partner can be reached.

Table 14-8 PROFINET parameters of the PLC

Parameters	Description
Address	Specifies the IP address of the device.
Expansion slot	Specifies the number of the expansion slot of the PLC to be addressed.
Rack	Specifies the rack number of the PLC to be addressed.
Cyclic operation	Enables/disables cyclic operation.

14.2.2.4 Configuring a connection via "Named connections"

Introduction

For setting up a logical connection, one of the symbolic connection names listed in the "Connection name" field is assigned to a selected application name.

The symbolic connection names and application names are configured in STEP 7.

NAMED CONNECTIONS can only be configured for integrated connections.

Note

With routed HMI connections between WinCC RT Unified and the S7-300/400 PLCs, the use of "Named Connection" is mandatory, independent of the router.

Requirements

A "Named connection" has been created in STEP 7.

The following communication partners are configured in the "Devices & Networks" editor:

- SIMATIC PC with WinCC RT Professional
- SIMATIC S7-300/400

Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed in the network view.
2. Click on the HMI device in the "Network view".
3. Select the entry "S7RTM is installed" in the Inspector window under "Parameters > XDB configuration".

   If you have not installed S7RTM, select "Generate XDB file". Then select the path in which the XDB file will be stored.
4. Click the "Connections" button and select "HMI connection" for the connection type.
5. Click the PROFINET interface of the PLC and drag and drop a connection to the PROFINET interface of the PC.

6. Click the connecting line.
7. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
8. Select the "NAMED CONNECTION" interface in the Inspector window under "Properties > General > Connection path > Interface" of WinCC RT Professional.

Note

The application and connection name can also be entered manually, for e.g. if an XDB file does not exist for the symbolic connection name or if the project is to be transferred to another computer. It is necessary to check the correct writing of the name in STEP 7 because there is no name validation in CS mode.

14.2.2.5 Cyclic operation

Basics of cyclic operation

Operating principle of cyclic operation

When the "Cyclic operation" option is enabled, the HMI device sends a telegram to the PLC at the beginning of communication indicating that certain tags are required on a recurring basis.

The PLC then always transmits the data at the same cyclic interval. This saves the HMI device from having to output new requests for the data.

When cyclic operation is disabled, the HMI device sends a request whenever information is required.

Advantages and properties of cyclic operation

The list below shows the advantages and properties of "Cyclic operation" option:

- Cyclic operation reduces the data transmission load at the HMI device. The PLC resources are used to reduce the load on the HMI device.
- The PLC only supports a certain number of cyclic services. The HMI device handles the operation if the PLC cannot provide any further resources for cyclic services.
- The HMI device generates the cycle if the PLC does not support cyclic operation.
- Screen tags are not integrated into cyclic operation.
- Cyclic operation is only set up at the restart of Runtime.
- The HMI device transfers several jobs to the PLC if cyclic operation is enabled, depending on the PLC.
- The HMI device only transfers one job at a time to the PLC if cyclic operation is disabled.

See also

Configuring cyclic operation (Page 7008)

Configuring cyclic operation

Introduction

You configure cyclic operation for an HMI connection at an HMI connection in the "Connections" editor of the HMI device.

Requirement

- The devices and networks are configured.
- An HMI connection is created in the "Connections" editor.

Procedure

To enable an HMI connection for cyclic operation, follow these steps:

1. Double-click "Connections" in the project tree below your HMI device.
   The "Connections" editor opens.
2. Select the desired HMI connection.
   The parameters of the connection are displayed in the graphic overview.
3. Activate "PLC > Cyclic operation".

Result

The PLC then always transmits the required data at the same cyclic interval.

Basics of cyclic operation (Page 7007)

14.2.2.6 Troubleshooting for SIMATIC S7-300/400

Causes of a faulty connection

Causes for a connection not getting established

If communication between the PLC and the HMI device cannot be established, the causes could be the following:

- Integrated connection not configured
- Hardware fault: Cable not plugged in, PLC switched off, network component interrupted

- Connection is not online
- Fault network configuration, for example, invalid IP address of a device
- Failed authentication on the PLC side (wrong or invalid password)
- A connection that has already been established is broken as a result of a system function call.
- Connection resources exhausted

Connection not online

The connection can be set to not 'Online' In the Engineering System. In this case, connection establishment does not take place.

Breaking and switching the connection with a system function

A connection can be broken, established and switched by calling a system function in a script.

- "SetConnectionMode": The specified connection is established or disconnected.
- "ChangeConnection": Changes the connection parameters of an HMI connection.
  Is used to switch between PLCs at runtime.
  When "SwitchConnection" (ChangeConnection) is used, the current connection to the PLC is disconnected and an attempt is made to establish a connection to another PLC. Connection establishment to the other PLC can be rejected or the connection may later be lost.

Procedure if there is no connection

The connection is established at the start of Runtime.

If a connection cannot be established, Runtime issues a system alarm.

Requirement

Configure a screen with a screen object "Alarm view" that is shown on the HMI device in Runtime.

The system alarm for a failed connection establishment is displayed here.

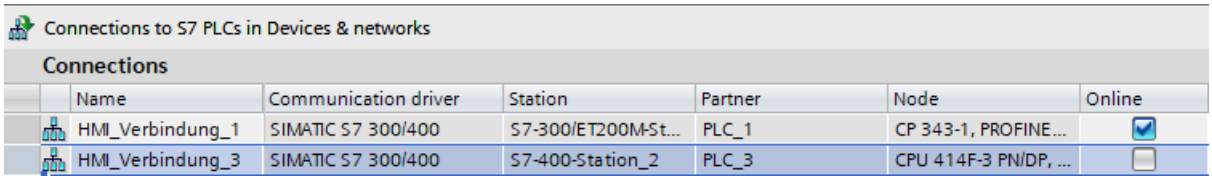
Note

If a connection is configured as not "online" or is not established by calling a system function, a system alarm is not issued. This is not an error; it is configured behavior.

The system alarm provides information on the cause of the faulty connection establishment.

Finding the cause of the error

1. Check the cable and the plug-in connections.
2. Check whether the connection has been configured as "online".



3. Check whether a script has called the system functions "SetConnectionMode" (SetConnectionMode) or "SwitchConnection" (ChangeConnection).
   More information: Setting up switch on/switch off of a connection in runtime (Page 6993)
4. Check the network configuration.
   IP addresses within a subnet must be unique.

   If required, select the function "Find connection path" to assign the optimum connection path to the connection.
5. The password given for the PLC in "Device configuration > Properties > General > Protection" must match the password that is specified for the connection.

SIMATIC S7-300/400 error messages

The following alarms are output if the connection cannot be established:

ID	Cause
536870948	The connection to the PLC could not be established.
537526273	The connection to a S7-300/400 PLC could not be established.

ID	Cause
537526274	The S7-300/400 PLC is not in the RUN mode.
537526275	The runtime settings of the WinCC Unified Device for controller alarms are configured for "Automatic Update" but the PLC S7-300/400 PLC does not support full text alarms.
537526276	The communication resources of the S7-300/400 PLC for HMI tags are overloaded.

You can find the configured alarm texts under [HMI device] > "HMI alarms > System events".

More information: Reference to system events (Page 798).

14.3 Communication with other devices

14.3.1 Communication with WinCC Unified Open Pipe

WinCC Unified Open Pipe is an Openness concept based on pipe technology to connect a customer application to WinCC Unified RT.

The documentation is available on the Online Support: SIMATIC HMI WinCC Unified Open Pipe (https://support.industry.siemens.com/cs/ww/en/view/109803794/143390792203).

14.4 OPC UA - Open Platform Communications

14.4.1 Introduction

14.4.1.1 Principle

OPC is a standardized manufacturer-independent software interface for data exchange in automation engineering.

OPC UA is the technology succeeding OPC. OPC UA is platform-independent and supports different protocols as communication medium.

14.4.1.2 OPC UA specifications and compatibility

Overview

OPC UA specifies interfaces to gain access to the following objects in WinCC Unified:

- Process values (OPC UA 1.04)
- Tag-based alarms (OPC UA 1.04)

For detailed information about the individual OPC specifications, refer to the website of the OPC Foundation (http://www.opcfoundation.org).

Compatibility

Interoperability with OPC products from other manufacturers is guaranteed by participation in "OPC Interoperability Workshops".

14.4.2 Using OPC UA certificates

14.4.2.1 Introduction to OPC UA certificates

Introduction

Communication between an OPC UA server and its OPC UA clients that is protected by certificates requires the following:

- A valid OPC UA server certificate is installed on the server and a valid OPC UA client certificate is installed on the clients.
- The client devices trust the OPC UA server certificate and vice versa.

The type of the certificate used determines how the trust is established between OPC UA server and OPC UA clients:

- When a communication partner uses a certificate issued by a certificate authority (CA) and the other communication partners trust the root certificate of the certificate authority, they automatically trust the OPC UA certificate.

  Note

  Support of external certificate authorities

  The OPC UA certificate of a Unified device cannot be issued by an external certificate authority. The WinCC Unified Certificate Manager tool is required to create the root certificate and the OPC UA certificate.

- When a communication partner uses a self-signed OPC UA certificate, the other communication partners must explicitly trust this certificate.

  Note

  Restriction for self-signed Unified OPC UA server and client certificates

  A self-signed default certificate is generated for the Unified OPC UA server:

  - Unified PC: When installing Runtime on the PC
  - Unified Comfort Panel: When starting Runtime if no OPC UA server certificate is found in the certificate store

  In order not to use a certificate issued by a certification authority for a Unified OPC UA server, use this certificate.

  The use of a self-signed OPC UA client certificate is not possible for Unified OPC UA clients.

How you proceed to create the trust relationship on a Unified device also depends on whether you are using the Unified device as an OPC UA server or client.

If you are using a Unified device as a client, the engineering system also acts as an OPC UA client during configuration of the device.

Provision of the certificates

The following sections describe how to provide the certificates:

	Used as	Section
Unified PC	OPC UA server	Using root certificates (Unified PC as OPC UA server) (Page 7014) Using self-signed certificates (Unified PC as OPC UA server) (Page 7016)
	OPC UA client	Using root certificates (Unified PC as OPC UA client) (Page 7017)
Unified Comfort Panel	OPC UA server	Using root certificates (UCP as OPC UA server) (Page 7019) Using self-signed certificates (UCP as OPC UA server) (Page 7021)
	OPC UA client	Using root certificates (UCP as OPC UA client) (Page 7022) Using self-signed certificates (UCP as OPC UA client) (Page 7024)
Engineering System	OPC UA client	Providing certificates for the engineering systems as OPC UA client (Page 7025)

Unified tools

When you use certificates issued by a certificate authority, the following tools support you in providing the certificates:

Task	Device	Tool
Creating the root certificate of the Unified OPC UA device (if not already done)	Unified PC that is used as certification authority for the Unified OPC UA device	WinCC Unified Certificate Manager
Creating a Unified OPC UA certificate		
Installing the • Unified root certificate (if not yet done) • Unified OPC UA certificate	Unified PC that is used as OPC UA device	WinCC Unified Certificate Manager
	Unified Comfort Panel that is used as OPC UA device	Control Panel > Security > Certificates
Distribute Unified root certificate and its CRL file to the OPC UA communication partners	Unified PC that is used as certificate authority for the Unified OPC UA device[1]	WinCC Unified Certificate Manager
Import the root certificate of the OPC UA communication partner and its CRL file	Unified PC that is used as OPC UA device	SIMATIC Runtime Manager
	Unified Comfort Panel that is used as OPC UA device	Control Panel > Security > Certificates

[1] If the OPC UA device is a Unified PC, you can alternatively distribute the root certificate and CRL file directly on the device using SIMATIC Runtime Manager.

When you use self-signed OPC UA certificates, the following tools support you in providing the certificates:

Task	Device	Tool
Importing or trusting the certificate of the communication partner	OPC UA Unified PC	SIMATIC Runtime Manager
	OPC UA Unified Comfort Panel	Control Panel > Security > Certificates

Note

Operation of the Certificate Manager and Runtime Manager

For more detailed information on operating the Certificate Manager and the Runtime Manager, refer to the Runtime online help.

Certificate store of Unified devices

The OPC UA certificates are stored in the certificate store of the Unified device.

For Unified PC: `C:\ProgrammData\SCADAProjects\certstore`

14.4.2.2 Providing certificates on a Unified PC

Using a Unified PC as OPC UA server

Using root certificates (Unified PC as OPC UA server)

This section describes how you provide the certificates for the following case:

- A Unified PC is used as OPC UA server.

Note

Operating Certificate Manager and Runtime Manager

For more detailed information on operating the Certificate Manager and the Runtime Manager, refer to the Runtime online help.

Requirement

- A root certificate was generated on the Unified PC that serves as certificate authority.

Sequence

The following steps are included in providing the certificates:

1. Generate the OPC UA server certificate and export its certificate configuration.
2. Install the certificate configuration on the Unified OPC UA server.
3. Trust the OPC UA client on the Unified OPC UA server.
4. Trust the Unified OPC UA server on the OPC UA client.

Generating the server certificate and exporting the certificate configuration

1. Open the Certificate Manager on the Unified PC that serves as certificate authority.
2. Generate a OPC UA server certificate for the Unified PC that is used as OPC UA server.
3. Export the certificate configuration to an external data storage medium.
   This step can be omitted when the device that serves as certificate authority is also used as OPC UA server.

Installing the certificate configuration on the Unified OPC UA server

1. Connect the Unified PC that is used as OPC UA server to the external data storage medium.
   This step can be omitted when the device that serves as certificate authority is also used as OPC UA server.
2. Install the certificate configuration on the PC using the Certificate Manager.

The following certificates are installed:

- The root certificate including CRL file
- The OPC UA server certificate

Trusting the OPC UA client on the Unified OPC UA server

1. Save the root certificate of the OPC UA client and its CRL file (Certificate Revocation List) to an external data storage medium.
2. Connect the Unified PC that is used as OPC UA server to the external data storage medium.
3. Open the Runtime Manager on the Unified PC.
4. Import the root certificate of the OPC UA client.
   The root certificate is imported and classified as trusted.
5. Import the associated CRL file.

The Unified OPC UA server trusts the OPC UA client certificate when the next connection attempt is made.

Trusting the Unified OPC UA server on the OPC UA client

1. Ppen the Certificate Manager on the Unified PC that serves as the certification authority of the Unified OPC UA server.
2. In the Certificate Manager, export the root certificate and its CRL file (Certificate Revocation List) to an external data storage medium.

Note

Alternative

On the Unified PC that is used as OPC UA server, use the Runtime Manager to export the root certificate and CRL file.

3. Connect the OPC UA client to the external data storage medium.
4. Copy both files in the certificate store of the OPC UA client into the folder for trusted certificates. To do this, proceed as described in the application help of the client.

The OPC UA client accepts the Unified OPC UA server certificate when the next connection attempt is made.

Using self-signed certificates (Unified PC as OPC UA server)

This section describes how you provide the certificates for the following case:

- A Unified PC is used as OPC UA server.
- The OPC UA certificates of the OPC UA server and the client are self-signed.

Note

Operating the Runtime Manager

For more detailed information on operating the Runtime Manager, refer to the Runtime online help.

Sequence

1. Trust the OPC UA client on the Unified PC.
2. Trust the self-signed default certificate of the Unified OPC UA server on the OPC UA client.

Trusting the OPC UA client on the Unified OPC UA server

After the first connection attempt

If a connection attempt has already been made between the client and server, the self-signed OPC UA client certificate is available on the Unified PC in the certificate store in the "untrusted" folder.

Follow these steps:

1. Open the Runtime Manager on the Unified PC.
2. Trust the OPC UA client certificate in the Runtime Manager.

The certificate is moved to the "trusted" folder in the certificate store of the Unified PC. The Unified PC accepts the OPC UA client certificate when the next connection attempt is made.

Before the first connection attempt

To trust the self-signed certificate before a connection has been established between server and client, follow these steps:

1. Save the certificate of the OPC UA client to an external data storage medium.
2. Connect the Unified PC to the external data storage medium.
3. Open the Runtime Manager on the Unified PC.
4. Import the OPC UA client certificate.

During the import, the certificate is automatically copied to the "trusted" folder of the certificate store. The Unified PC trusts the OPC UA client certificate when the next connection attempt is made.

Trusting the Unified OPC UA server on the OPC UA client

You use the self-signed default certificate of the Unified OPC UA server.

After the first connection attempt

If a connection attempt has already been made between the client and server, the self-signed OPC UA server certificate is available on the client in the certificate store in the rejected certificates.

Copy the certificate to the certificate store for trusted certificates. To do this, proceed as described in the application help of the client.

The OPC UA client accepts the Unified OPC UA server certificate when the next connection attempt is made.

Before the first connection attempt

To trust the self-signed certificate before a connection has been established between server and client, follow these steps:

1. Copy the self-signed OPC UA server certificate on the Unified PC from the following folder to an external data storage medium:
   `<Certificate store>own\certs`
2. Connect the OPC UA client to the external data storage medium.
3. Copy the certificate to the certificate store for trusted certificates. To do this, proceed as described in the application help of the client.

The OPC UA client accepts the OPC UA server certificate when the next connection attempt is made.

Using a Unified PC as OPC UA client

Using root certificates (Unified PC as OPC UA client)

This section describes how you provide the certificates for the following case:

- A Unified PC is used as OPC UA client.
- The OPC UA certificates of the OPC UA server and the client are issued by a certificate authority.

Note

Operating Certificate Manager and Runtime Manager

For more detailed information on operating the Certificate Manager and the Runtime Manager, refer to the Runtime online help.

Requirement

- A root certificate was generated on the Unified PC that serves as certificate authority.

Sequence

The following steps are included in providing the certificates:

1. Generate the OPC UA client certificate and export its certificate configuration.
2. Install the certificate configuration on the OPC UA client.
3. Trust the OPC UA server on the Unified OPC UA client.
4. Trust the Unified OPC UA client on the OPC UA server.

Generating the client certificate and exporting the certificate configuration

1. Open the Certificate Manager on the Unified PC that serves as certificate authority.
2. Generate a OPC UA client certificate for the Unified PC that is used as OPC UA client.
3. Export the certificate configuration to an external data storage medium.
   This step can be omitted when the device that serves as certificate authority is also used as OPC UA client.

Installing the certificate configuration on the Unified OPC UA client

1. Connect the Unified PC that is used as OPC UA client to the external data storage medium.
   This step can be omitted when the device that serves as certificate authority is also used as OPC UA client.
2. Install the certificate configuration on the PC using the Certificate Manager.

The following certificates are installed:

- The root certificate including CRL file
- The OPC UA client certificate.

Trusting the OPC UA server on the Unified OPC UA client

1. Save the root certificate of the OPC UA server and its CRL file (Certificate Revocation List) to an external data storage medium.
2. Connect the Unified PC that is used as OPC UA client to the external data storage medium.
3. Open the Runtime Manager on the Unified PC.
4. Import the root certificate of the OPC UA server.
5. Import the associated CRL file.

The Unified OPC UA client trusts the OPC UA server certificate when the next connection attempt is made.

Trusting the Unified OPC UA client on the OPC UA server

1. Open the Certificate Manager on the Unified PC that serves as the certificate authority of the Unified OPC UA client.
2. In the Certificate Manager, export the root certificate and its CRL file (Certificate Revocation List) to an external data storage medium.

   Note

   Alternative

   On the Unified PC that is used as OPC UA client, use the Runtime Manager to export the root certificate and CRL file.

3. Connect the OPC UA server to the external data storage medium.
4. Copy both files to the certificate store for trusted certificates. To do this, proceed as described in the application help of the server.

The OPC UA server accepts the Unified OPC UA client certificate when the next connection attempt is made.

14.4.2.3 Providing certificates on a Unified Comfort Panel

Use the Unified Comfort Panel as an OPC UA server

Using root certificates (UCP as OPC UA server)

This section describes how you provide the certificates for the following case:

- A Unified Comfort Panel is used as OPC UA server.
- The OPC UA certificates of the OPC UA server and the client are issued by a certificate authority.

Note

Operating the Certificate Manager

For more detailed information on operating the Certificate Manager, refer to the Runtime online help.

Requirement

- A root certificate was generated on the Unified PC that serves as certificate authority.

Sequence

The following steps are included in providing the certificates:

1. Generate the OPC UA server certificate and export its certificate configuration.
2. Install the certificate configuration on the Unified OPC UA server.
3. Trust the OPC UA client on the Unified OPC UA server.
4. Trust the Unified OPC UA server on the OPC UA client.

Generating the server certificate and exporting the certificate configuration

1. Open the Certificate Manager on the Unified PC that serves as certificate authority.
2. Generate an OPC UA server certificate for the Unified Comfort Panel that is used as OPC UA server.
3. Export the certificate configuration to an external data storage medium.
   The root certificate, its CRL file and the OPC UA Server certificate are exported in encrypted format.

Installing the certificate configuration on the Unified OPC UA server

1. If Runtime starts on the Panel that is used as OPC UA server and no OPC UA server certificate is found, a self-signed default certificate is generated.
   Delete the default certificate. Follow these steps:
   - Select "Security > Certificates" in the Control Panel on the Panel.
   - Select the "My Certificates" entry from the "Certificate store" list.
   - Select the OPC UA server default certificate.
   - Click "Delete".
2. Connect the Panel to the external data storage medium onto which you have exported the certificate configuration.
3. Install the root certificate and the OPC UA server certificate.
   For both certificates, follow these steps:
   - Select "Security > Certificates" in the Control Panel on the Panel.
   - Click the "Import" button.
   - In the "Import certifcates" dialog, select the certificate from the external storage medium.
   - Enter the password and the iteration specified during the export in the Certificate Manager.
   - Confirm your entries.

The following certificates are installed:

- The root certificate including CRL file
- The OPC UA server certificate

Trusting the OPC UA client on the Unified OPC UA server

1. Save the root certificate of the OPC UA client and its CRL file (Certificate Revocation List) to an external data storage medium.
2. Connect the Unified Comfort Panel to the external data storage medium.
3. Select "Security > Certificates" in the Control Panel on the Panel.
4. Click the "Import" button.
5. In the "Import certifcates" dialog, select the certificate from the external storage medium.
6. Confirm your entries.

The root certificate and its CRL are imported and classified as trusted.

The Unified OPC UA server trusts the OPC UA client certificate when the next connection attempt is made.

Trusting the Unified OPC UA server on the OPC UA client

1. Open the Certificate Manager on the Unified PC that serves as the certificate authority of the panel.
2. In the Certificate Manager, export the root certificate and its CRL file (Certificate Revocation List) to an external data storage medium.
3. Connect the OPC UA client to the external data storage medium.
4. Copy both files to the certificate store for trusted certificates. To do this, proceed as described in the application help of the client.

The OPC UA client accepts the Unified OPC UA server certificate when the next connection attempt is made.

Using self-signed certificates (UCP as OPC UA server)

This section describes how you provide the certificates for the following case:

- A Unified Comfort Panel is used as OPC UA server.
- The OPC UA certificates of the OPC UA server and the client are self-signed.

Sequence

1. Trust the OPC UA client on the Unified Comfort Panel.
2. Trust the self-signed default certificate of the Unified OPC UA server on the OPC UA client.

Trusting the OPC UA client on the Unified OPC UA server

After the first connection has been established between server and client, the self-signed OPC UA client certificate is available on the Unified Comfort Panel. The Panel does not yet trust the certificate. Follow these steps:

1. Select "Security > Certificates" in the Control Panel on the Panel.
2. Select the "Other Certificates" entry from the "Certificate store" list.

3. Select the OPC UA client certificate.
   The certificate has the status "Untrusted".
4. Click "Trust".

The Unified Comfort Panel accepts the OPC UA client certificate when the next connection attempt is made.

Trusting the Unified OPC UA server on the OPC UA client

You use the self-signed default certificate of the Unified OPC UA server.

After the first connection is established between the server and client, the self-signed certificate of the OPC UA server is available on the OPC UA client. The client does not yet trust the certificate.

Trust the Unified OPC UA server certificate on the OPC UA client.

The client accepts the server certificate the next time it attempts to connect.

Use the Unified Comfort Panel as an OPC UA client

Using root certificates (UCP as OPC UA client)

This section describes how you provide the certificates for the following case:

- A Unified Comfort Panel is used as OPC UA client.
- The OPC UA certificates of the OPC UA server and the client are issued by a certificate authority.

Note

Operating the Certificate Manager

For more detailed information on operating the Certificate Manager, refer to the Runtime online help.

Requirement

- A root certificate was generated on the Unified PC that serves as certificate authority.

Sequence

The following steps are included in providing the certificates:

1. Generate the OPC UA client certificate and export its certificate configuration.
2. Install the certificate configuration on the Unified OPC UA client.
3. Trust the OPC UA server on the Unified OPC UA client.
4. Trust the Unified OPC UA client on the OPC UA server.

Generating the client certificate and exporting the certificate configuration

1. Open the Certificate Manager on the Unified PC that serves as certificate authority.
2. Generate an OPC UA client certificate for the Unified Comfort Panel that is used as OPC UA client.
3. Export the certificate configuration to an external data storage medium.

Installing the certificate configuration on the Unified OPC UA client

1. Connect the Panel to the external data storage medium onto which you have exported the certificate configuration.
2. Install the root certificate and the OPC UA Client certificate.
   For both certificates, follow these steps:
   - Select "Security > Certificates" in the Control Panel on the Panel.
   - Click the "Import" button.
   - In the "Import certifcates" dialog, select the certificate from the external storage medium.
   - Enter the password and the iteration specified during the export in the Certificate Manager.
   - Confirm your entries.

   The following certificates are installed:
   - The root certificate including CRL file
   - The OPC UA client certificate.

Trusting the OPC UA server on the Unified OPC UA client

1. Save the root certificate of the OPC UA server and its CRL file (Certificate Revocation List) to an external data storage medium.
2. Connect the Unified Comfort Panel that is used as Unified OPC UA client to the external data storage medium.
3. Select "Security > Certificates" in the Control Panel on the Panel.
4. Click the "Import" button.
5. In the "Import certificates" dialog, select the certificate from the external storage medium.
6. Confirm your entries.

The root certificate and its CRL are imported and classified as trusted.

The Unified OPC UA client trusts the OPC UA server certificate when the next connection attempt is made.

Trusting the Unified OPC UA client on the OPC UA server

1. Open the Certificate Manager on the Unified PC that serves as the certificate authority of the panel.
2. In the Certificate Manager, export the root certificate and its CRL file (Certificate Revocation List) to an external data storage medium.
3. Connect the OPC UA server to the external data storage medium.
4. Copy both files to the certificate store for trusted certificates. To do this, proceed as described in the application help of the server.

The OPC UA server accepts the Unified OPC UA client certificate when the next connection attempt is made.

Using self-signed certificates (UCP as OPC UA client)

This section describes how you provide the certificates for the following case:

- A Unified Comfort Panel is used as OPC UA client.
- The OPC UA server certificate is self-signed.
- The OPC UA client certificate is issued by a certificate authority.

Note

No use of self-signed Unified OPC UA client certificates

The use of a self-signed OPC UA client certificate is not possible for a Unified OPC UA client.

Sequence

1. Generate your own self-signed OPC UA client certificate for the Unified Comfort Panel.
2. Install the self-signed certificate on the Panel.
3. Trust the OPC UA server on the Unified OPC UA client.
4. Trust the Unified OPC UA client on the OPC UA server.

Trusting the OPC UA server on the Unified OPC UA client

After the first connection has been established between the server and client, the self-signed OPC UA server certificate is available on the Unified Comfort Panel. The Panel does not yet trust the certificate. Follow these steps:

1. Select "Security > Certificates" in the Control Panel on the Panel.
2. Select the "Other Certificates" entry from the "Certificate store" list.
3. Select the OPC UA server certificate.
   The certificate has the status "Untrusted".
4. Click "Trust".

The Unified Comfort Panel accepts the OPC UA server certificate when the next connection attempt is made.

Trusting the Unified OPC UA client on the OPC UA server

1. Open the Certificate Manager on the Unified PC that serves as the certificate authority of the panel.
2. In the Certificate Manager, export the root certificate and its CRL file (Certificate Revocation List) to an external data storage medium.
3. Connect the OPC UA server to the external data storage medium.
4. Copy both files to the certificate store for trusted certificates. To do this, proceed as described in the application help of the server.

The OPC UA server accepts the Unified OPC UA client certificate when the next connection attempt is made.

14.4.2.4 Providing certificates for the engineering systems as OPC UA client

Engineering system as an OPC UA client

If the engineering system acts as an OPC UA client, provide the certificates as follows:

- When the connection is first established, the client certificate is created automatically and transferred to the server.

  Note

  Trust the client certificate

  Move the client certificate on the server from the "untrusted" folder to the "trusted" folder.

- The engineering system automatically receives the server certificate and trusts it without your having to take any action.

14.4.3 WinCC Unified OPC UA server

14.4.3.1 General information about Unified OPC UA servers

Using the WinCC Unified OPC UA server

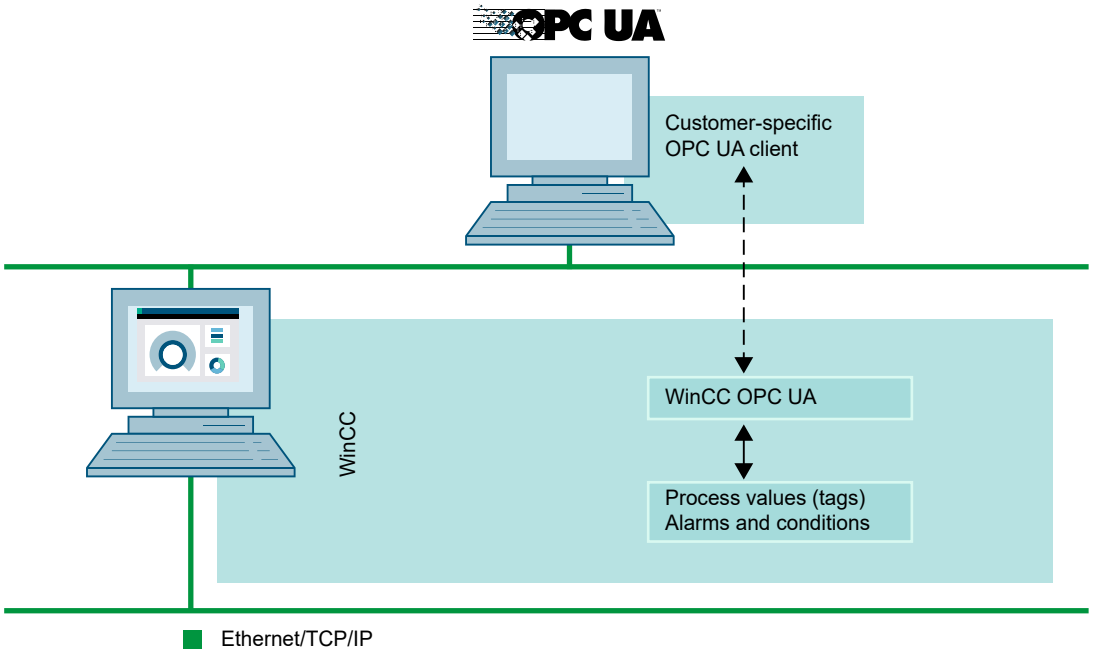
Introduction

Servers are available for the following OPC UA interfaces in WinCC Unified:

- OPC Unified Architecture: Access to the data management of WinCC Unified.

OPC UA communications concept of WinCC Unified

The figure below shows the OPC UA communication concept of WinCC Unified:



Licensing

OPC server	Licensing
WinCC OPC UA Server	A valid Runtime license for WinCC Unified

Requirements for use

Windows firewall settings (Unified PC as OPC UA server)

After installation of WinCC Unified, the Windows firewall settings of the OPC UA servers of WinCC Unified are correctly configured.

If OPC UA clients access OPC UA servers in different subnets, you must adapt the configuration of the permitted network areas to the OPC UA servers.

TIA Portal settings

In order to work with OPC UA in WinCC Unified, the OPC UA server must be enabled in the TIA Portal.

To do to this, select the "Operate as OPC UA server" option in the runtime settings under "OPC UA server > General". As soon as the option is selected, you can make additional settings.

More information is available under Configuring a Unified OPC UA server (Unified PC) (Page 7039) and Using the Unified Comfort Panel as OPC UA server (Page 7042).

Operating principle of the OPC UA server

How it works

The OPC UA server provides the following values:

- Process values
- Tag-based alarms

The OPC UA server supports only the "UA-TCP UA-SC UA Binary" communication profile. The used port number is adjustable.

You can find more information about configuration of the OPC UA server here:

- For Unified PC: In the section "Configuring a Unified OPC UA server (Unified PC) (Page 7039)"
- For Unified Comfort Panel: In the section "Configuring the Unified OPC UA server (UCP) (Page 7042)"

Supported specifications

OPC UA Architecture is a specification for the transmission of process values and alarms. The OPC UA server supports the OPC UA specification 1.04.

For more information about supported OPC UA functions, refer to "OPC UA specifications and compatibility (Page 7011)".

Starting the OPC UA server

The OPC UA server is run automatically when Runtime is started after successful configuration in the TIA Portal.

URL of the OPC UA server

You can reach the OPC UA server via the following URL:

- "opc.tcp://[HostName]:[Port]"

Parameter	Description
HostName	Placeholder for the computer name. Is used automatically.
Port	Specifies the port number. "4890" is set by default. Do not use a port number that is already assigned to another application.

Discovery Server (Unified PC as OPC UA server)

The "Discovery Server" is available by the OPC foundation. The "Discovery Server" is by default installed on the HMI device as Windows service.

The "Discovery Server" makes information available to UA clients about OPC UA servers that are subscribed to the "Discovery Server".

The OPC UA server registers itself at the start of Runtime to no, one or more configured and available "Discovery Servers" depending on its configuration. Registration is then repeated cyclically. When you end Runtime, the OPC UA server is automatically logged off from the "Discovery Server".

You can find information on disabling the OPC UA Local Discovery Server in Siemens Industry Online Support (https://support.industry.siemens.com/cs/document/109749461/how-do-you-disable-the-opcua-local-discovery-server-service-for-wincc-v7-and-wincc-tia-portal-?dti=0&lc=en-WW) (Entry ID 109749461).

Supported languages in the WinCC Unified address area

The OPC UA server supports the WinCC Unified address area in the following languages:

- English

Security concept of OPC UA

Introduction

The OPC UA security concept is based on:

- Authentication and authorization of the participating applications and users
- Ensuring the integrity and confidentiality of messages exchanged between the applications.

Certificates

Certificates represent the authentication mechanism of OPC UA applications. Each application has its own instance certificate and thereby identifies itself within the public key infrastructure.

Instance certificate of the OPC UA server

Each OPC UA server for secure operation requires a separate instance certificate with a private key. The certificate is only valid on the respective computer and may be used only by the OPC UA server installed there.

When you install the server, a self-signed instance certificate of the server is created and stored in the certificate folder of the server.

The private key for this certificate is only stored in the certificate store. Access to the folder with the private key must be restricted to:

- The server itself (account of the local system)
- The system administrator

NOTICE
Restricted access to the private key folder Except for the server and the system administrator, no other users and applications may have access to the private key of the OPC UA server for security reasons. Restricted access to the private key is therefore pre-configured after installing WinCC Unified.

The instance certificate generated during installation and the associated private key can be replaced by the system administrator. In accordance with the respective security concept of the plant, the new instance certificate may be self-signed or created by a certification authority.

The certificate and the private key are stored under this folder:
"C:\ProgramData\SCADAProjects\Certstore\own".

The private key is stored in the subfolder "private".

Validation of the server instance certificate

The instance certificate of the server is validated during the start of the OPC UA server. If the public key or the private key cannot be found or if the certificate is invalid (for example, because it has expired or is corrupt), the server stops and an appropriate entry is made in the trace log.

Trusted client certificates

The OPC UA server supports secure communication to trusted clients only. A client is trusted:

- when the client has a valid self-signed certificate that is located in the certificate store of trusted certificates of the OPC UA server
- or if the valid client certificate was issued by a certification authority. The valid certificate of the certification authority must be located in the certificate store of the trustworthy certification authorities of the OPC UA server. In this case, only the certificate from the certification authority is required. The instance certificate of the client does not need to be in the certificate store of trusted certificates.

Note

Certificates from the memory of the certification authorities are not automatically trusted.

For a certification authority to be trusted, its certificate must be located in the memory for trusted certificates.

Trusted certificates are stored in the directory
"C:\ProgramData\SCADAProjects\Certstore\Trusted\certs".

The certificates from certificate authorities that are required for the verification of a client certificate chain are also stored in the certificate store of the certificate authorities.

Client certificates not accepted

When a OPC UA client accesses the OPC UA server without its trusted certificate, the OPC UA server rejects secure communication and copies the client certificate to the folder for rejected certificates. These certificates are stored in the directory "C:\ProgramData\SCADAProjects\Certstore\Trusted\untrusted".

To enable secure communication with this client, you will have to move the rejected certificate to the certificate memory for trusted certificates.

Supported OPC UA services and profiles

OPC UA services

The following table sets out the functionality supported by OPC UA server 1.04:

OPC UA Service Sets	Services	Comment
Discovery Service Set	FindServers GetEndpoints	-
Secure Channel Service Session Service Set	All	-
View Service Set	Browse BrowseNext	Determination of the WinCC Unified data shown: Process values and archived data
Attribute Service Set	Read Write	only WinCC Unified tags only WinCC Unified tags
Subscription Service Set	CreateSubscription SetPublishingMode Publish RePublish DeleteSubscription	
MonitoredItem Service Set	CreateMonitoredItems SetMonitoringMode DeleteMonitoredItems	only "Value" attribute of the WinCC Unified tags .EventNotifier during access to WinCC Unified alarms

OPC UA profiles and Conformance Units

The OPC UA server supports the following OPC UA 1.03 profiles without restrictions:

- 6.5.5 Base Server Behavior Facet
- 6.5.16 Standard Event Subscription Server Facet
- 6.5.131 UA TCP UA SC UA Binary
- 6.5.148 SecurityPolicy - Basic128Rsa15
- 6.5.149 SecurityPolicy - Basic256
- 6.5.150 SecurityPolicy - Basic256SHA256

The OPC UA server supports the following OPC UA profiles shown in the following table with restrictions:

Profile	"Group"	Not supported "Conformance Unit"
6.5.11 Standard DataChange Subscription Server Facet Subscription Server Facet	Monitored Item Services	ModifyMonitoredItems DeadBand Filter Monitor MinQueueSize_02
6.5.12 Enhanced DataChange Subscription Server Facet	Monitored Item Services	Monitor MinQueueSize_05
6.5.2 Core Server Facet	Attribute Services	Attribute Write Index
6.5.14 Data Access Server Facet	Data Access	Data Access Analog Data Access Multistate Data Access PercentDeadBand Data Access Semantic Changes Data Access Two State
6.5.55 Standard UA Server Profile	Attribute Services	Attribute Write StatusCode & TimeStamp
6.5.55 Standard UA Server Profile	Attribute Services	Attribute Write StatusCode & Timestamp
6.5.16 Standard Event Subscription Server Facet	Event Access	Base Info EventQueueOverflowEventType Base Info Progress Events Base Info SemanticChange Base Info System Status Base Info System Status underlying system Base Info Device Failure
6.5.17 Address Space Notifier Server Facet	Event Access	
6.5.18 A & C Base Condition Server Facet	Alarms and Conditions	
6.5.20 A & C Address Space Instance Server Facet	Alarms and Conditions	
6.5.21 A & C Enable Server Facet	Alarms and Conditions	
6.5.22 A & C Alarm Server Facet	Alarms and Conditions	A & C Comment A & C Discrete A & C OffNormal A & C SystemOffNormal A & C Trip
6.5.23 A & C Acknowledgeable Alarm Server Facet	Alarms and Conditions	

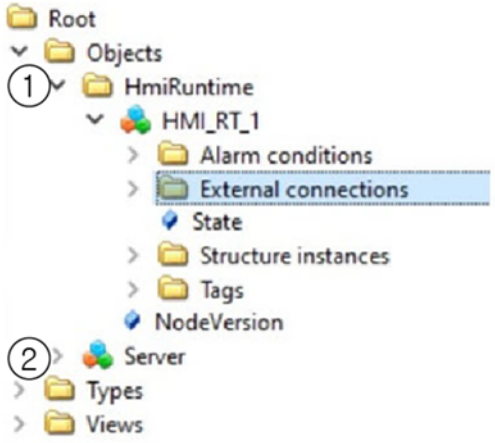
Address space of the OPC UA server

Introduction

A WinCC Unified device that is used as an OPC UA server makes the following runtime data of its system available to its OPC UA clients in its address space:

- Process values (WinCC Unified tags)
- Alarms (tag-based WinCC Unified alarms)

The address space of the OPC UA server is added below "Root > Objects" and has the following hierarchical structure:



① The folder for the Runtime system node
Folders for the alarm conditions and tags of the system are located under the node.
The structure in the tags folder corresponds to the structure of the tags in WinCC Unified.

② The server node

Mapping of the WinCC Unified tag

Connections are displayed by OPC UA objects of the "HMIConnectionType" type.

Internal and external WinCC Unified tags are displayed by OPC UA tags of the "HMISimpleTagType" type.

The following table shows the most important attributes of the OPC UA tags that represent a WinCC Unified tag. You can find the complete list of attributes in the "OPC UA Part 3 - Address Space Model 1.03 Specification" under paragraph "5.6":

Attribute	Description	Comment
NodeId	Unique designation of the WinCC Unified tag	-
BrowseName	Name of the WinCC Unified tag	-
DisplayName	Name of the WinCC Unified tag	-
Value	Tag value and status	-

Attribute	Description	Comment
DataType	OPC UA data type that corresponds to the WinCC Unified tag type, for example: • Int32; signed 32 bit value • UInt32; unsigned 32 bit value	-
AccessLevel	"CurrentRead" / "CurrentWrite"	• Correspondingly to the WinCC Unified tag configuration. • System tags "CurrentRead" only.
ValueRank	Always "Scalar"	-

Mapping of the WinCC Unified alarms

Depending on their state machine, the alarms are mapped to the following OPC UA types:

State machine of the alarm	OPC UA type
RaiseClear RaiseClearRequiresReset	HmiConditionType
RaiseOptionalClearOrAcknowledgment RaiseClearOptionalAcknowledgement RaiseClearOptionalAcknowledgementAndReset RaiseRequiresAcknowledgement RaiseClearRequiresAcknowledgement RaiseClearRequiresAcknowledgementAndReset	HmiAlarmType

Priority

For the configuration of the alarms in WinCC Unified, you select a priority between "0" and "255". The OPC UA specification defines a value range between "1" for the lowest severity and "1000" for the highest severity.

The value of the priority must therefore be selected to match the OPC UA severity. In a standard mapping, the priority "0" is assigned to the OPC UA severity "1", and the priority "255" to the OPC UA severity "1000". All other values are interpolated linearly between "0" and "1000".

Mapping the OPC UA properties

The alarm condition consists of OPC UA event properties and WinCC Unified alarm properties. The properties of the alarm condition may vary depending on the OPC UA event type.

The following table provides the most important properties of the OPC UA events and shows how the WinCC Unified alarm system provides the information.

Note

Optional properties

Optional properties are not disclosed in the server address space.

OPC UA property	Description/Mapping
For all event types:	
EventId	A unique identifier for event notification.
EventType	The NodeId of the HmiConditionType node or HmiAlarmType node
SourceNode	NodeId of the Runtime object
SourceName	Name of the Runtime object
Time	RAISETIME of the WinCC Unified alarm Time stamp when the alarm was triggered at the source.
ReceiveTime	When the server has received the event from the underlying system.
LocalTime	Information about the local time from which the event originated.
Message	EVENTTEXT of the WinCC Unified alarm, multilingual text for messages and alarms.
Severity	PRIORITY of the WinCC Unified alarm that is mapped to the OPC UA severity.
For the HmiConditionType and HmiAlarmType event types:	
ConditionId	NodeId of the condition instance
ConditionClassId	NodeId of the ProcessConditionClassType node
ConditionClassName	ProcessConditionClassType
ConditionName	NAME of the WinCC Unified alarm
BranchId	Not relevant
Retain	RETAIN of the WinCC Unified alarm TRUE for pending alarms
EanbledState/Id	ENABLESTATE of the WinCC Unified alarm TRUE for active alarms
Quality	VALUEQUALITY of the WinCC Unified alarm when the alarm became active
LastServerity	Not relevant
Comment	COMMENTS of the WinCC Unified alarm provided by the operator
ClientUserId	USER that is related to the WinCC Unified alarm
For the HmiAlarmType event type:	
AckedState	Mapped to STATE of the WinCC Unified alarm TRUE for acknowledged alarms
ConfirmedState/Id[1]	Mapped to STATE of the WinCC Unified alarm TRUE for confirmed alarms
ActiveState/Id	Mapped to STATE of the WinCC Unified alarm TRUE for active alarms
InputNode	NodeId of the tag assigned to the alarm
SupressedState/Id	Mapped to SUPPRESSIONSTATE of the WinCC Unified alarm TRUE for suppressed alarm

OPC UA property	Description/Mapping
SupressedOrShelved	Mapped to SUPPRESSIONSTATE of the WinCC Unified alarm TRUE for reset or suppressed alarms
MaxTimeShelved	Not supported

[1] Only for alarms with the state machine RaiseClearRequiresAcknowledgmentAndReset

The following table provides the configurable properties of the WinCC Unified alarms. The properties are mapped one-to-one to OPC UA event properties.

The table applies to all event types:

Optional	Property	Description
-	INSTANCEID	Instance index used to reference an active multi-instance alarm within the (configured) HmiAlarm.
-	ALARM	Pointer to the corresponding HmiAlarm
-	ALARMCLASS	Pointer to the alarm class May differ from the alarm class reference of the associated HmiAlarm.
-	ALARMCLASSSYMBOL	Symbol (abbreviation) of the referenced alarm class
-	TEXTCOLOR	Text color
-	BACKCOLOR	Background color
-	FLASHING	Flashing
-	SUPPRESSIONSTATE	Indicates whether the alarm is reset, suppressed or not suppressed.
✓	ALARMTEXT1 ... ALARMTEXT9	Additional multi-lingual texts (Text 1 to Text 9)
✓	ALARMPARAMETERVALUES1 ... ALARMPARAMETERVALUES16	Parameter value 1 to parameter value 16
-	INVALIDFLAGS	Indicator of invalid property values Bit-by-bit interpretation
✓	ORIGIN	Dynamic alarm-instance-specific name of the alarm-triggering object.
✓	AREA	Dynamic alarm-instance-specific name of the area to which the alarm-triggering object belongs.
✓	LOOPINALARM	Function that is called to navigate from the alarm control, for example, to the screen that shows the source of the alarm or to an application that provides more information.
✓	COMPUTER	Name of the machine that hosts the originator of the alarm.
✓	USERNAME	Name of the user associated with the event (operator alarms only).

Optional	Property	Description
✓	VALUE	Current value at the time when the alarm became active. Updated value at the time the alarm became inactive.
✓	VALUEQUALITY	Current quality at the time when the alarm became active.
✓	VALUELIMIT	Current limit at the time when the alarm became active. For dynamic limits: Updated limit at the time the alarm became inactive.
✓	DEADBAND	Dead zone value of the alarm condition of an analog alarm at the time when the alarm became active.
✓	CONNECTION	Reference to the corresponding HMI connection
✓	SYSTEMSEVERITY	Severity for alarm-based system voting (redundancy)
-	SOURCETYPE	Defines the alarm generation method
-	STATE	The change of the current alarm condition, including history.
-	STATETEXT	Textual representation of the alarm condition
-	CHANGEREASON	Reason for the change time, see Enumeration definition.
-	ACKTIME	Time stamp of the time when the alarm was acknowledged at the source (or the service in case the alarm source does not provide an acknowledgment).
-	CLEARTIME	Time stamp of the time when the alarm at the source became inactive (or the service, in case the alarm source does not provide date and time information).
-	RESETTIME	Time stamp of the alarm reset time (or service, in case the alarm source does not provide date and time information).
✓	LOCALTIME	Information about the local time from which the alarm originated.
-	USERRESPONSE	The type of tag that represents a property of another node.
✓	DURATION	Returns the time interval in nanoseconds between triggering of the alarm and its previous status change.

OPC UA Data Access

Tags

The WinCC Unified tags are displayed by OPC UA tags of the "HMISimpleTagType" type. Other DataAccess tag types such as "AnalogItem" or "DiscreteType" are not supported.

The OPC UA server supports read access to the OPC UA tag attributes such as "DataType" or "AccessLevel". Writing access and subscriptions are only supported for the "Value" attribute.

Inverse browsing on the OPC UA client

The functionality for inverse browsing of tags is not supported in the OPC UA server.

Alarm conditions

Communication between a WinCC Unified device which is used as an OPC UA server and its OPC UA clients includes tag-based alarms.

Availability in the address space

Based on their state machine, the configured alarms of the system running on the WinCC Unified device are mapped to OPC UA types and loaded with their properties into the address space of the OPC UA server. See section Address space of the OPC UA server (Page 7032).

OPC UA clients have read access to the alarms and their properties in the address space.

Monitoring alarms

OPC UA clients can monitor changes to the WinCC Unified alarms by subscribing to the server object or directly to the runtime system for monitoring. A client can subscribe to one object (server or runtime system) or several objects for monitoring.

When a configured alarm becomes active or a property of an active alarm changes, the OPC UA client is automatically notified.

OPC UA clients can perform the following actions for monitored alarms:

Action	Availability	Result
Acknowledge	For alarms of the OPC UA type HmiAlarmType	The alarm state is updated accordingly in the address space in the properties of the alarm. The runtime system reflects this change.
Confirm	For alarms of the OPC UA type HmiAlarmType	
Activate	For alarms of the OPC UA types HmiConditionType and HmiAlarmType	
Disable		
Shelve		
Unshelve alarm	For alarms of the OPC UA type HmiAlarmType	

Managing OPC UA server certificates

If you use a WinCC Unified device as an OPC UA server and the OPC UA communication is protected by certificates, the following applies:

- An OPC UA server certificate must be installed on the Unified device.
- The OPC UA clients must trust the OPC UA server certificate.
- The Unified device must trust the OPC UA client certificates.

Section Introduction to OPC UA certificates (Page 7012) describes how you proceed to provide the certificates required for communication.

14.4.3.2 Using the Unified PC as OPC UA server

Exporting tags

Offline export of tags using the OPC UA server

SIMATIC Runtime Manager allows you to export the tags configured for the active Runtime project to an OPC UA Nodeset using the OPC UA server. The exported data can be imported into another application, e.g. the TIA Portal, without the need for a connection to the OPC UA server.

The export makes it easier to apply an existing configuration to a new Runtime system.

Requirement

- The OPC UA server for WinCC Unified is running.
- A WinCC Unified Runtime project is running on the server.
- The following applies to the user who started the export:
  - The user has the role "SIMATIC HMI".
  - The user has the function right for read and write access to OPC UA.
- The OPC UA server certificate and the WinCC Unified OPC UA exporter certificate trust each other.
  If you have generated and installed the certificates again via the Certificate Manager, this is automatically the case.
  If you want to use the default certificates created during the Runtime installation, move the certificates so that they trust each other:

Source directory	Target directory
`C:\SCADAProjects\certstore\own\certs`	`C:\SCADAProjects\certstore\trusted\certs`

Procedure

Follow these steps to export the tags of the active Runtime using the OPC UA server:

1. Start "SIMATIC Runtime Manager".
2. Click the button  in the toolbar.
3. Configure the export settings in the "OPC UA Export" tab:
   - Select the name and the folder of the output file.
   - Type in the user name and password of the user who started the export.
4. Click "Export".

Result

You can see whether the export was successful in the "Status" field.

If the export is successful, the file is written to the specified folder.

For diagnostic purposes, a trace file is written to the following folder: [ProgramData]/Siemens/Automation/Logfiles

Requirements for use (Page 7026)

Configuring a Unified OPC UA server (Unified PC)

OPC UA server

General

OPC is a standardized manufacturer-independent software interface for data exchange in automation engineering. OPC UA is the technology succeeding OPC. OPC UA is platform-independent and supports different protocols as communication medium.

To work with OPC UA in WinCC Unified, the OPC UA server must be enabled in the TIA Portal in the Runtime settings of the HMI device.

Read/write tags and register tags/alarms

When you enable the "Operate as OPC UA server" option in the HMI device, the protection for unauthorized internal and external access is downgraded.

- Enable the "Operate as OPC UA server" option.
  A security note is displayed.

After enabling the option, all other settings of the OPC UA Server will become available.

Alarms and Conditions

- To display alarm conditions in the address range of the server, select the option "Enable Alarms and Conditions on the OPC UA server".
- To disable or acknowledge alarms on the OPC UA Client, for example, select the option "Allow operation of alarms on the OPC UA Client". To enable this option, the "Enable Alarms and Conditions on the OPC UA server" option must be enabled.

Options

General

Define the following settings:

- Port
  Default value: 4890
  Do not use a port number that is already assigned to another application.
- Maximum session timeout (s)
  Default value: 600000 s
- Maximum number of OPC UA sessions
  Default value: 100

Subscriptions

Define the following settings:

- Minimum publication interval (ms)
  Default value: 100 ms
- Maximum number of monitored items
  Default value: 0

Security

Secure connection

Security policies

⚠ CAUTION
Reduced security When the option "No OPC UA Server Security" is enabled, any OPC UA client can connect to the OPC UA server regardless of the following settings.

The following section contains a list of all security policies available on the server.

- Activate the required security policies.

User authentication

Guest authentication

- To allow access by anonymous users to the OPC UA server, enable the option "Enable guest authentication".
  An authentication by means of user name and password is not required for guests.
  Security is restricted to the degree that you determine by assigning rights to this user.

Authentication by means of user name and password

- To allow access by users with user name and password to the OPC UA server, enable the option "Authentication with user name and password".
  If access to the OPC UA server is to require the user name and password, the user must be assigned the role "HMI Administrator". The "HMI Administrator" role has the system-defined "OPC UA - read and write access" function right. The settings made must then be synchronized with the user management in runtime.

Trace

WinCC Unified provides trace logging for error analysis. The OPC UA traces including SDK can be logged for test purposes and for troubleshooting.

TraceViewer

The log files can be viewed with the TraceViewer. This tool is available in the installation directory of WinCC Unified under "WinCCUnified\bin". Start the file "RTILtraceViewer.exe".

14.4.3.3 Using the Unified Comfort Panel as OPC UA server

Configuring the Unified OPC UA server (UCP)

OPC UA server

General

OPC is a standardized manufacturer-independent software interface for data exchange in automation engineering. OPC UA is the technology succeeding OPC. OPC UA is platform-independent and supports different protocols as communication medium.

To work with OPC UA in WinCC Unified, the OPC UA server must be enabled in the TIA Portal in the Runtime settings of the HMI device.

Read/write tags and register tags/alarms

When you enable the "Operate as OPC UA server" option in the HMI device, the protection for unauthorized internal and external access is downgraded.

- Enable the "Operate as OPC UA server" option.
  A security note is displayed.

After enabling the option, all other settings of the OPC UA Server will become available.

Alarms and Conditions

- To display alarm conditions in the address range of the server, select the option "Enable Alarms and Conditions on the OPC UA server".
- To disable or acknowledge alarms on the OPC UA Client, for example, select the option "Allow operation of alarms on the OPC UA Client". To enable this option, the "Enable Alarms and Conditions on the OPC UA server" option must be enabled.

Options

General

Define the following settings:

- Port
  Default value: 4890
  Do not use a port number that is already assigned to another application.
- Maximum session timeout (s)
  Default value: 600000 s
- Maximum number of OPC UA sessions
  Default value: 100

Subscriptions

Define the following settings:

- Minimum publication interval (ms)
  Default value: 100 ms
- Maximum number of monitored items
  Default value: 0

Security

Secure connection

Security policies

⚠ CAUTION
Reduced security When the option "No OPC UA Server Security" is enabled, any OPC UA client can connect to the OPC UA server regardless of the following settings.

The following section contains a list of all security policies available on the server.

- Activate the required security policies.

User authentication

Guest authentication

- To allow access by anonymous users to the OPC UA server, enable the option "Enable guest authentication".
  An authentication by means of user name and password is not required.
  Security is restricted to the degree that you determine by assigning rights to this user.

Authentication by means of user name and password

- To allow access by users with user name and password to the OPC UA server, enable the option "Authentication with user name and password".
  If access to the OPC UA server is to require the user name and password, the user must be assigned the role "HMI Administrator". The "HMI Administrator" role has the system-defined "OPC UA - read and write access" function right. The settings made must then be synchronized with the user management in runtime.

14.4.4 WinCC Unified OPC UA client

14.4.4.1 Using the WinCC Unified OPC UA client

As OPC UA clients, WinCC Unified devices can integrate the following data from OPC UA servers into their projects:

- Alarm instances received from the OPC UA server
- OPC UA server tags

When configuring this data in the engineering system, the engineering system also becomes the OPC UA client.

14.4.4.2 Defining connection settings to the OPC UA server

Requirement

- In the engineering system, a WinCC project is open that has had a Unified device added to it.
- The "Connections" editor is open.

Procedure

Double-click in the "Add" cell and define the connection settings:

- "Communication driver": OPC UA
- Set the following parameters in the "Parameters" tab under "OPC server":
  - "UA server discovery URL": Enter the OPC UA server IP and port
    Use the following notation: opc.tcp://<IP>:<Port>
    Alternatively, you can also determine the server via "Select OPC server".
  - Select the desired security settings.
    See also Defining the security settings for communication with the OPC UA server (Page 7045).

Result

The Unified OPC UA client uses the settings to establish a connection to the OPC UA server.

14.4.4.3 Defining the security settings for communication with the OPC UA server

Requirement

A connection with the communication driver "OPC UA" is configured in a WinCC project on a Unified device. See also section Defining connection settings to the OPC UA server (Page 7045).

Procedure

Select the security settings that meet the requirements of the OPC UA server:

1. Open the "Connections" editor.
   You make the security settings in the "OPC UA Server" area.
2. To protect the connection with a security policy, follow these steps:
   – Select the security policy.
   The communication with the server is protected by a certificate.

   Note

   Make OPC UA certificates available

   Make sure that the required certificates are available on the OPC UA server and client. See also Introduction to OPC UA certificates (Page 7012).

   Note

   Connection without security policy

   If you do not select a security policy, it is urgently recommended that the OPC UA server and client are installed on the same device.

   – Select whether communication is signed or signed and encrypted.
3. To protect communication with the OPC UA server by a user name and password, follow these steps:
   – Disable the "Anonymous" option.
   – Enter the user name and password of a user account configured on the OPC UA server.
4. For anonymous communication, select the option "Anonymous".

14.4.4.4 Integrating OPC UA server alarm instances into a Unified client

You have the option of integrating alarm instances from an OPC UA server into your Runtime project.

Note

Restrictions

- The OPC UA server is a SINUMERIK device.
- The OPC UA server is based on the OPC UA specification 1.03.

Requirement

- The OPC UA server alarm instances are available in a NodeSet XML file.
- You have access to the XML file on the device on which the engineering system is installed.

Procedure

1. In the engineering system, add a Unified HMI device to a WinCC project.
2. Set the connection settings to an OPC UA server for the HMI device.
   See also section Defining connection settings to the OPC UA server (Page 7045).
3. Import the XML file with the OPC UA server alarm instances into the WinCC project.
   See also section Importing OPC UA server alarm instances (Page 7047).
4. Generate HMI alarms for the OPC UA server alarm instances.
   See also section Generating HMI alarms for OPC UA server alarm instances (Page 7048).
5. Add a screen to the HMI device.
6. Place an alarm display on the screen.
7. Compile the HMI device in a Runtime project, load the Runtime project onto the HMI device and start the project in Runtime.

Note

Loss of the ability to compile and load changes

If you load the OPC UA server alarm instances on the HMI device and then update the alarm instances in the engineering, because the alarm class has been changed for example, you lose the option in the engineering to compile and load only the changes to the project. The project must now be fully compiled and loaded.

Result

In Runtime, the alarm instances received from the OPC UA server are displayed in the alarm display. The following attributes are mapped to each other:

Attributes of an OPC UA server alarm instance	Attribute of an HMI alarm
"Message"	"Alarm text"
"SourceName"	"Origin"

If alarm archiving is activated, the alarms are archived.

Status changes to the alarm instances on the OPC UA server are reflected in Runtime. The Runtime OPC UA client can request status changes on the server. The status change is always done on the server.

Importing OPC UA server alarm instances

Requirement

- In the engineering system, a WinCC project is open that has had a Unified device added to it.
- The OPC UA server alarm instances are available in a NodeSet XML file.
- You have access to the XML file on the device on which the engineering system is installed.

Procedure

To import OPC UA server alarm instances into a WinCC project, follow these steps:

1. Open the "HMI alarms" editor.
2. Select the "OPC UA A&C" tab.
3. Under "Connection" in the right area, select the OPC UA connection.
4. Click "Import" next to "Connection":

   

5. Select the XML file.
6. Click "Import".

Result

The content of the XML file is imported into the "OPC UA browser" area. It contains the hierarchical OPC UA NodeSpace with the OPC UA server alarm instances.

Then generate HMI alarms for the OPC UA server alarm instances.

See also

Generating HMI alarms for OPC UA server alarm instances (Page 7048)

Generating HMI alarms for OPC UA server alarm instances

Requirement

- In the engineering system a WinCC-project is open, to which a HMI device has been added.
- The "HMI alarms" editor of the device is open.
- An XML file with the OPC UA server alarm instances was imported into the editor.

Procedure

1. Select the "OPC UA A&C" tab.
2. Expand the objects in the "OPC UA browser" area up to the node under which the OPC UA server alarm instances are located.
3. Press and hold the left mouse button to drag the node to the "Node ID" cell of the "Add" row of the table in the "OPC UA types" area.
   An entry for an alarm type is added to the table. The table provides detailed information on the properties of the alarm type.

4. Select an alarm class that matches the alarm type of the OPC UA server alarm instances and supports the state machine "Alarm without status active with acknowledgment".
5. In the "OPC UA types" area, click the button to generate and update the alarm instances:

Note

Loss of the ability to compile and load changes

If you load the OPC UA server alarm instances on the HMI device and then update the alarm instances in the engineering, because the alarm class has been changed for example, you lose the option in the engineering to compile and load only the changes to the project. The project must now be fully compiled and loaded.

Result

HMI alarms are generated for the OPC UA server alarm instances.

When loading the project into a Runtime, the mapping between the HMI alarms and the OPC UA server alarm instances are loaded into the target device.

Importing OPC UA server alarm instances (Page 7047)

Configuring plant hierarchies 15

15.1 Basics

15.1.1 Introduction

Object-oriented configuration

The option of object-oriented configuration is available to you with SIMATIC WinCC Unified PC RT. Define reusable plant object types and assign the associated plant object instances in hierarchical plant views.

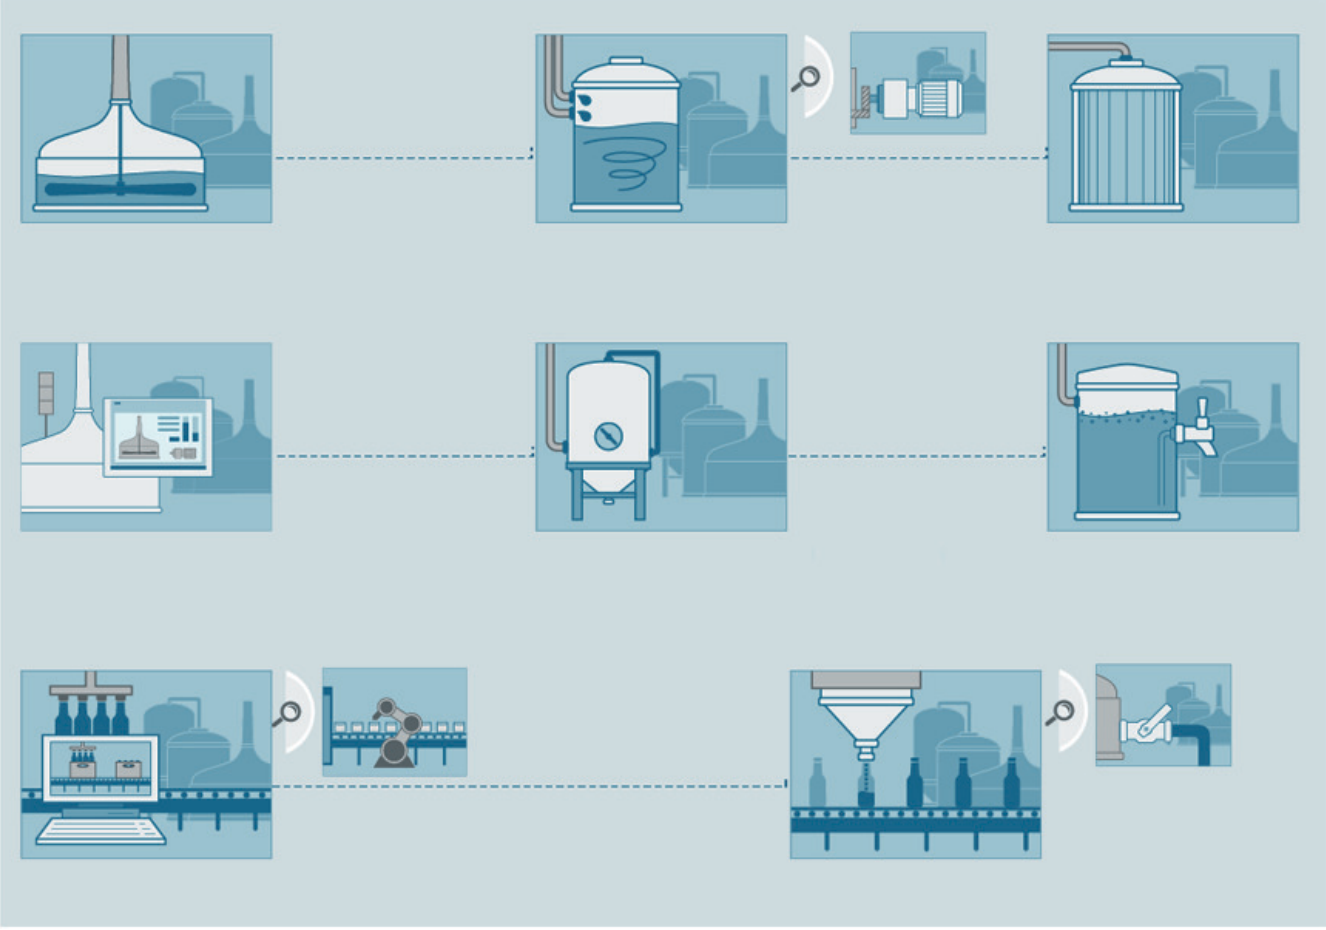
In this way, you can model the plant view of your machine or unit/plant, for example, based on user-defined or standardized technological objects.

The plant structure is created from individual objects, each of which represents a specific component or unit. You configure each object in the context of the operator control and monitoring solution.

In plant object types, you combine all required configuration elements for visualization, such as faceplates, tags, alarms, scripts, etc. Changes to the plant object type automatically affect all instances. This translates into real time savings, especially for plants with a high degree of standardization.

You can start object-oriented plant modeling based on the engineering data, if necessary, and can derive the configuration of the HMI devices and automation systems from this.

Break the machine or unit/plant up into reusable technological units and arrange them hierarchically in a technological plant view according to the plant structure.



The following options are available to you in technology-oriented and object-oriented configuration:

- Creating various hierarchical plant views: technological view, building view, independent of the HMI device that is used.
- Configuration of plant objects and plant object types with data elements for mapping the actual plant configuration
- Access to plant objects (data elements, HMI alarms, logs, screens, etc.)
- Generation of the screen hierarchy
- Expansion of configured plant objects and types using Plant Intelligence options, e.g. WinCC Unified Performance Insight or WinCC Unified Sequence Execution

Software requirements

You acquire the following products to use technology- and object-oriented configuration:

- TIA Portal V16 or higher with WinCC Unified

The "Plant objects" area is visible under Project tree after the installation of WinCC Unified.

Supported devices

The following SIMATIC S7 controllers are supported:

- SIMATIC S7-1500 with the exception of the SIMATIC S7-1500 Software Controller

Applications (Page 7053)

Overview (Page 7065)

Type/instance concept in object-oriented configuration (Page 7055)

15.1.2 Applications

Overview

You use technology-oriented and object-oriented configuration for automation solutions to increase overall effectiveness.

In particular, in plants with high level of standardization, the object-oriented approach increases the configuration efficiency through the reuse of objects, the capability of changing objects centrally, and the integration of manufacturing execution system functionalities such as the calculation of individual key indicators for separate machines.

Technology-oriented and object-oriented configuration supports you in the following operating phases:

- Planning phase: Efficient plant configuration and simple plant expansion through integration of part models from other projects
- Plant maintenance: Transparency through mapping of the exact plant structure
- Quality management: Continuous optimization of your projects

Advantages

- Creation and generation of modular projects based on standardized plant objects
- Reduced engineering workloads and fewer inconsistencies with a shared model in Engineering and Runtime
- Simple plant expansion through integration of part models from other projects
- Creating the screen hierarchy
- Transparent access to all objects and their properties and methods, independent of device assignment
- Targeted corrective measures through transparent relationships of individual plant objects
- Intelligent use of information from the entire manufacturing environment in combination with Plant Intelligence options

Operation in runtime

Depending on your configuration, the following possibilities are available to you in runtime:

- Display hierarchy path of alarm source
- Filter alarm control by plant objects
- Display alarm status of a line and navigation to the alarm source
- Display the most frequently occurring alarms, filtered by plant object or plant object type
- Area-based access protection
- Screen navigation via the plant model
- Determine the energy consumption of a line and compare with another line
- Analysis based on plant objects

The plant hierarchy is also available for scripting in runtime.

Requirements on the configuration engineer

The following prior knowledge is required for using technology-oriented and object-oriented configuration:

- You have experience performing configuration in STEP 7 and WinCC.

See also

Introduction (Page 7051)

Type/instance concept in object-oriented configuration (Page 7055)

Configuration concept (Page 7058)

15.1.3 Type/instance concept in object-oriented configuration

Introduction

The object-oriented approach of WinCC based on the type-instance concept. In types, you create central properties for an object. The instances represent local places of use for the types.

Plant objects are instances of a plant object type.

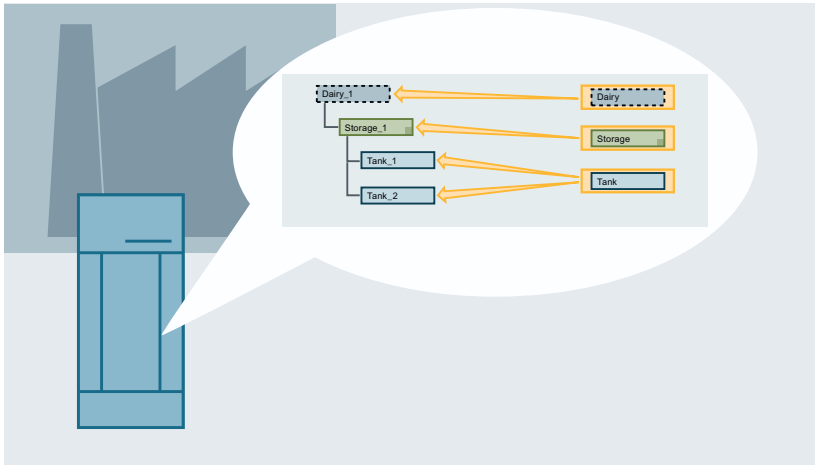
The plant object type is the central, object-oriented definition of a reusable plant component (such as conveyor robot). As instances of the plant object type, the plant objects generally map concrete, physically existing plant components (e.g. conveyor robot_A and conveyor robot_B).

If you change a property of a plant object type, the property is saved centrally and also changed in all instances.

Effect of the type instance concept on object-oriented configuration

The use of a type is called an instance. The common plant model is generated from instances. Each instance inherits all the properties of the type. The Common Plant Model with high level of standardization is characterized by the use of many instances of few types in the model.

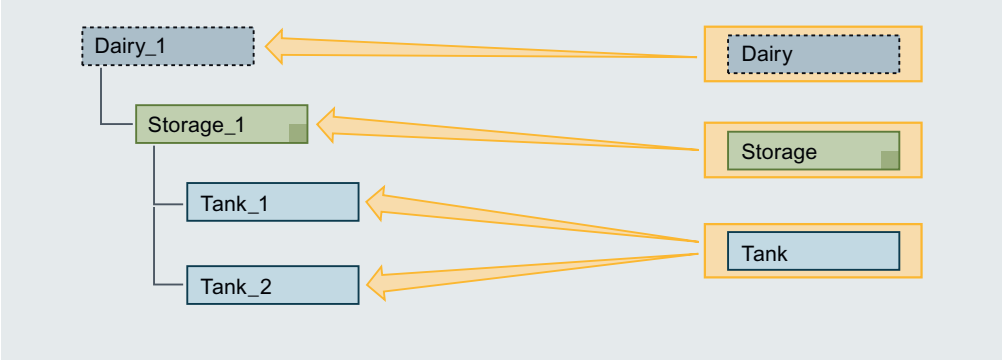
The general types of the plant units are configured and these are reused when required in the configuration and adapted to the specific plant objects. The plant structure hereby specifies the addressing of the plant objects.



In the object-oriented approach of WinCC the following correspondences apply:

- Type = Plant object type
- Instance = Plant object

The following figure shows the basic structure of a plant model:



Plant objects and plant object types

A plant object is a technological unit. In a plant object, the components are stored in a typical form which is required for modeling a plant.

A valid plant object must be created from a plant object type. The plant structure is created from plant objects.

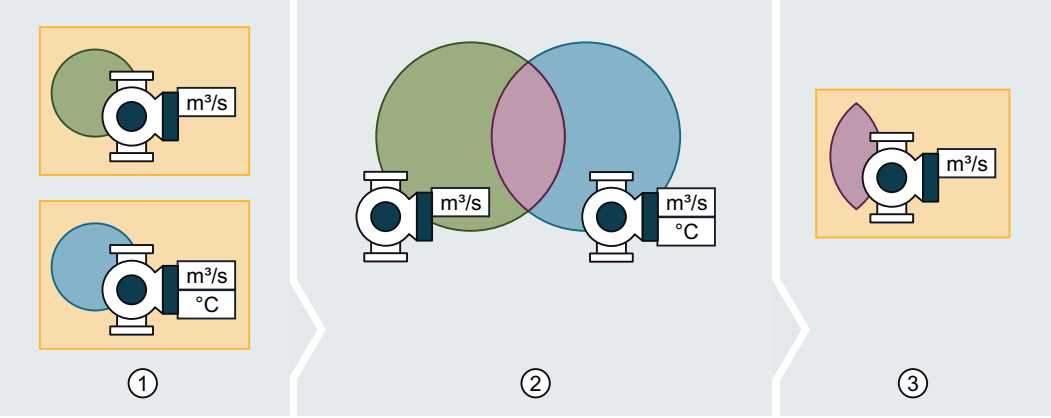
The definition of a plant object type consists of the data structure and context information:

- Alarms
- Logging
- Visualization
- Data member (internal and external)
- Facets (e.g. performance indicators)

Type definition in terms of high reuse

A plant object type is used to describe a plant object independently of its use in the Common Plant Model. Define a plant object type as generally as possible and as specifically as required. Take into account the following aspects:

- Identical data structure in PLC (function block or PLC UDT)
  Example: Pumps that have different performance ranges are installed in a plant. The data structure in the PLC is identical for each pump. Map these pumps with a common plant object type. At each instance you configure the specific value ranges for the respective performance ranges.
  A pump function block (standard FB for a pump) is available on the control side. The customer defines the plant object type "Pump" based on this function block. The data structure of the plant object type is taken over directly from the block. Only the HMI relevant properties from the function block are hereby transferred. They are automatically updated when the block changes. Simply parameterize an instance of the function block as process connection of the plant objects.
- Similarity
  When you have similar plant object types, check if it possible to map these with a common plant object type:



① Example: A pump is installed in a plant in two different variants:
- Variant 1 only measures the flow rate.
- Variant 2 measures the temperature in addition to the flow rate.

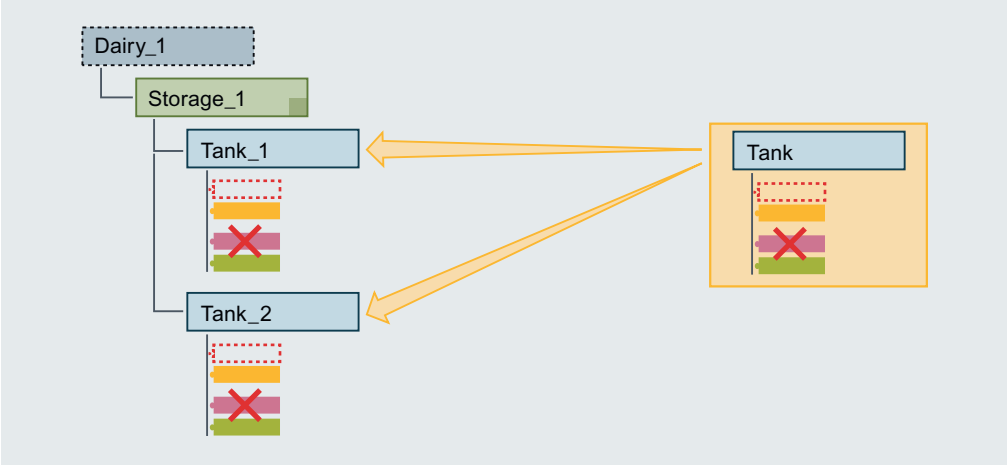
Effects on the definition of the plant object types:
- You map each of the two pumps with a single plant object type. The representation in the Common Plant Model hereby corresponds to reality.
- There is more configuration work.

② The common intersection of the two pumps is measuring the flow.

③ If, for example, you can do without measuring the temperature for operation, define only one plant object type:
- There is less configuration work.
- The two variants of the pumps are not fully represented in the Common Plant Model.

Effects of changes on plant object types

The following figure shows how changes to the plant object type affect its instances, i.e. plant objects:



See also

Overview (Page 7065)

Options for creating plant objects (Page 7068)

Introduction (Page 7051)

Applications (Page 7053)

Configuration concept (Page 7058)

Plant model and target systems (Page 7060)

15.1.4 Configuration concept

Requirements

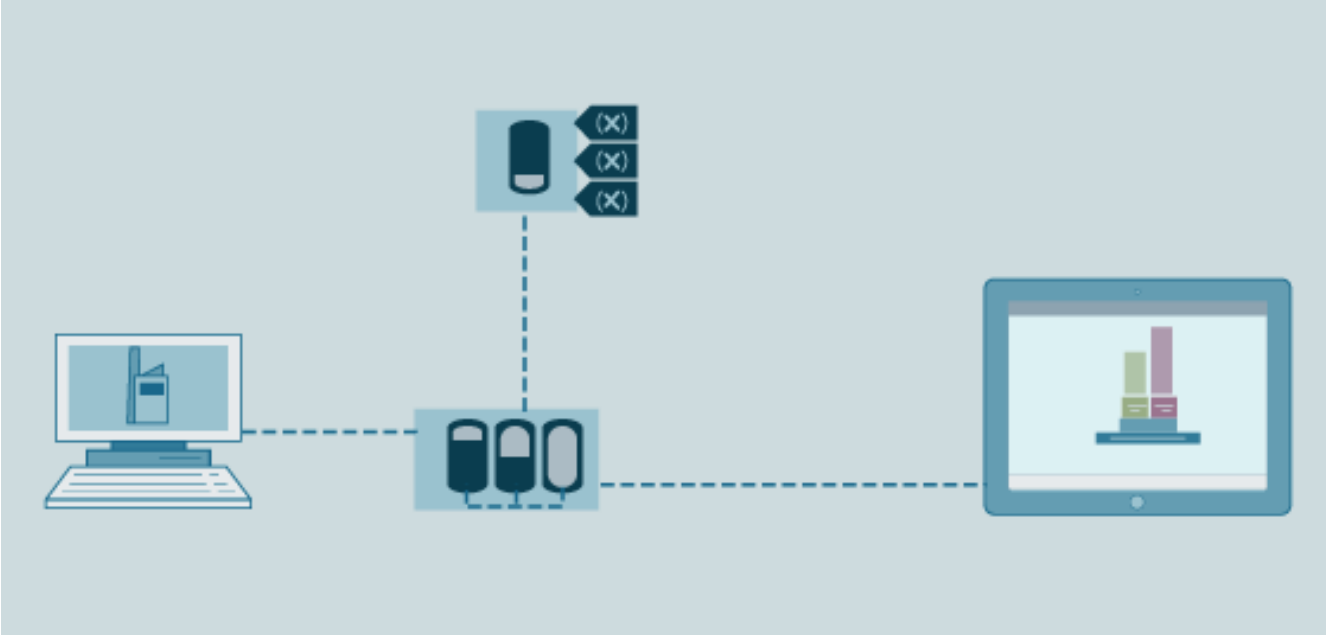
- You have experience in configuring with WinCC and STEP 7.
- The TIA Portal project has been created.
- The WinCC Unified PC RT HMI device has been created.
- A SIMATIC S7-1500 PLC has been created.
- Data blocks are configured in the PLC.

Workflow for configuration

The starting point for the definition of a standardized object-oriented plant model in object oriented configuration is the existing plant structure.

If you want to create a plant structure, use the following sequence of steps as a guide:

- Analyze the plant structure and break it down into units and components (plant objects)
- Identify required plant object types
- Define data of the plant object types based on FBs and PLC UDTs
- Define hierarchical plant view using instances
- Create a target system
- Map the plant structure
- Position plant objects in the plant structure
- Add functional facets to object types, e.g. assign shift calendars for all machines of a line or plant



Tips for an efficient procedure

If you are using pre-planning and automation engineering tools, you can have your plant structure automatically created via TIA Portal Openness. Next, set up the process connection of the plant objects via TIA Portal Openness.

Differences between device-oriented and object-oriented configuration

In technology- and object-oriented configuration, you work with objects with relevant names instead of individual tags or faceplates, for example.

You have access to all objects and their properties, methods, etc. in the hierarchy, independent of HMI device assignment.

The equipment from different products and versions is integrated in the object-oriented configuration.

Using multiuser engineering

If you use multiuser engineering in object oriented configuration, you can save your changes only in the server project view. You cannot check the changes you make in the local session into the server project.

You can find more information on Multiuser Engineering in "Using Multiuser Engineering".

Applications (Page 7053)

15.1.5 Plant model and target systems

Configuration of the plant model

When the configuration of a visualization solution begins, the development of the automation solution often takes place in the final phase. Initially, only the actual plant structure is relevant for mapping the plant model. Whether this involves one or multiple target systems is initially irrelevant.

There are always two views in a WinCC project:

- Device view with configured target systems
- Object-oriented view (common plant model)

You can perform configuration independently in both views.

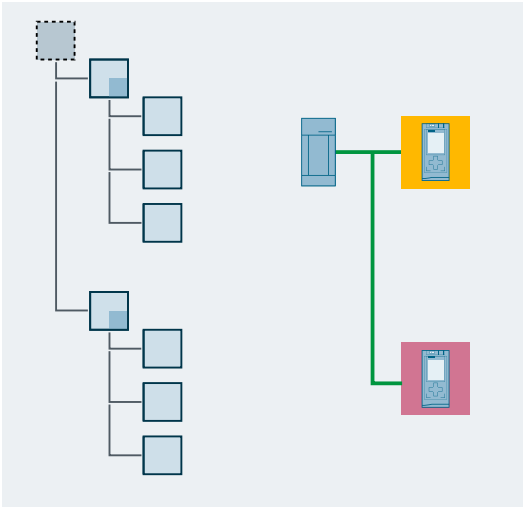
Process connection of the plant model

The target systems are the interface between the common plant model and the process. One or more connections to PLCs are configured on each target system. The plant objects communicate with the PLCs over the target systems.

Your project must meet the following conditions for productive use:

- Each plant view is assigned to a HMI device.
- Each plant object with a process connection is also connected to a PLC.

The following figure shows a schematic representation of the mapping of plant objects to the configured target systems and PLCs:



Plant objects without a process connection as representation of a unit

Plant objects with process connection

Runtime server (target system)

PLC

Type/instance concept in object-oriented configuration (Page 7055)

Configuration concept (Page 7058)

15.1.6 Structure of a plant model

Basic principles

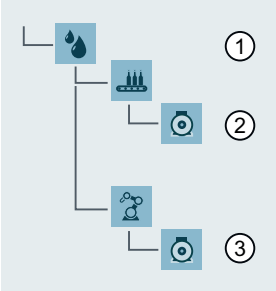
With object oriented configuration, a configured plant object corresponds to a real plant object. Basically, the number of plant objects is determined by the plant hierarchy.

Whether you need to map each plant object with a plant object type is determined by the following factors:

- Relevance of the plant object type for the process visualization
- Depth of the plant hierarchy that is to be mapped
- Degree of reuse

The specific function of a plant object is clear from its position in the plant hierarchy.

For example, the function of a "Drive" plant object is only revealed in the plant hierarchy:

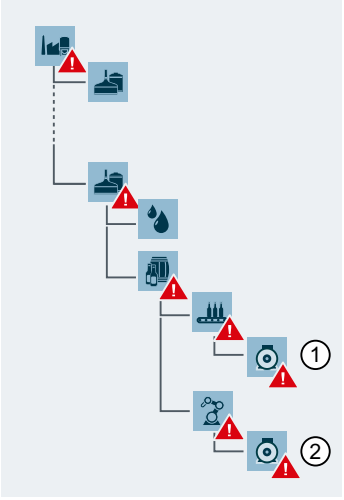


① Process for filling beer into bottles
② Drive for conveyor belt
③ Drive for robot

Depth of the plant hierarchy

Define any depth of the plant hierarchy The depth of the plant hierarchy depends essentially on the number of plant objects. A deep plant hierarchy leads to a precise fault localization. You can then, for example, formulate the concise alarm text.

The context of the plant object is also taken into account in runtime, for example, in the localization of faults. The following figure uses the example of the "Temperature exceeded" alarm to show the advantage a deep hierarchy offers in runtime:



① Representation of the message in an alarm control:
"Brewery.Filling.Paletting.Robots.Drive.Temperature exceeded"
The Common Plant Model with deeper hierarchy leads to a precise fault localization. You can therefore formulate the alarm text concisely.

② Since the drive for the robot is based on the same plant object type, the context of the alarm is automatically correct when a fault occurs:
"Brewery.Filling.Paletting.Robots.Drive.Temperature exceeded"

Configuration data at the plant object type

The following configuration data are created during the definition of a plant object type:

- Properties through which data is exchanged inside and outside of WinCC Unified PC RT.
- HMI visualization: Alarms, logs
- KPIs

See also

Configure plant object types (Page 7073)

Configuration concept (Page 7058)

15.1.7 Contexts

Contexts allow you to view plant units according to a certain viewpoint, e.g. according to a certain customer, product, job or shift.

Principle

Contexts always belong to a plant object. They are indicated as follows:

- User-defined contexts:
  Using a program created with the ODK API
- System-generated contexts:
  For installed Performance Insight and Calendar option packages: Automatically in Runtime
  Example: When a shift starts in Calendar, an archived context value is created with the shift ID

Each time a context (e.g. "Product") is executed, a log entry is generated in the context log. The logged context saves:

- The context value (e.g. "orange lemonade")
- Start time and end time of the execution time
- The quality code

Contexts in the trend control and alarm control

You can filter the content of these controls so that only data that has been generated in a specific plant unit and for the context you have selected is displayed. To do this, select a plant object, a context and one of its logged context values.

Example:

A press house produces juices for various beverage brands. Using contexts, employees can display in Runtime which alarms have occurred:

- During the production of a specific product (e.g. natural apple juice, clear apple juice, pear juice)
- For orders for a specific customer (e.g. Johnson, Smith or Miller).
- During a specific shift (e.g. early shift, late shift, night shift).

Contexts in the "Reports" control

You have the option of linking the generation of reports to the execution of contexts.

If the templates are configured appropriately, the reports available in the control can also contain information about contexts. If a report was generated as an Excel file and reads both contexts and alarms or tag values, you can then use the Excel filter function to filter the alarms and tags by context.

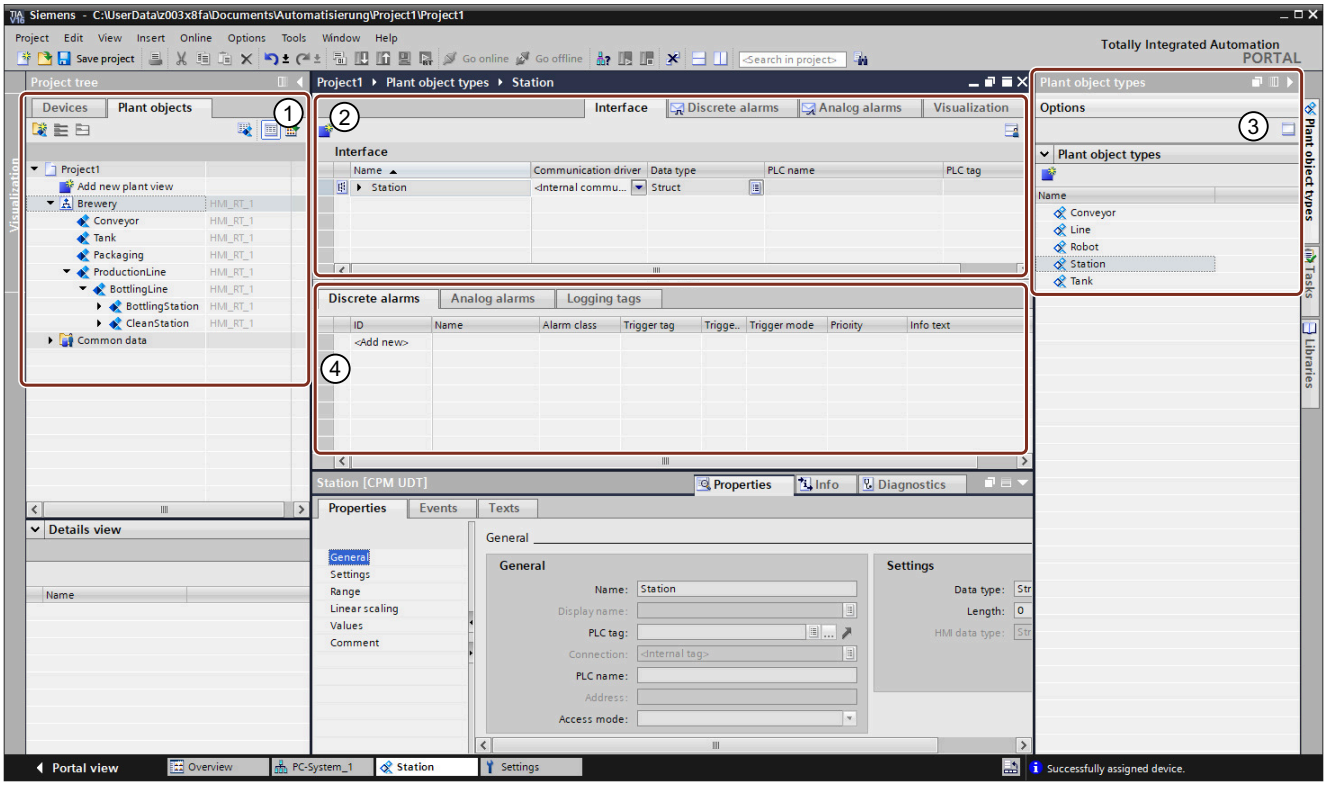
15.2 Elements and basic settings

15.2.1 Overview

"Plant objects" area

To access object-oriented configuration, click on "Plant objects" in "Project tree".



① "Plant objects" area for object-oriented configuration

② Plant object specific tabs, e.g. "Interface", "Visualization", etc.

③ "Plant object types" task card

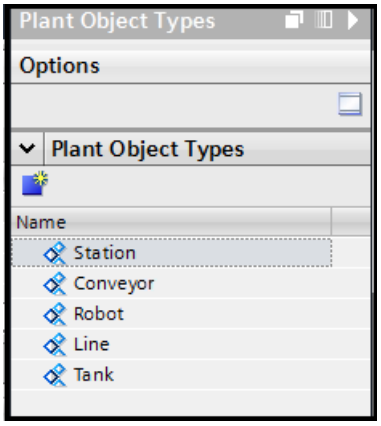
④ Tabs for the configuration of alarms and logs for plant objects

Create the plant view under "Project tree > Plant objects". You can create a plant view in a project. The plant view is filled with plant nodes and thus maps your plant. Plant nodes act as structural elements. Create plant objects based on the plant object types created in the project.

In the "Plant objects" area you assign an HMI device to the plant view.

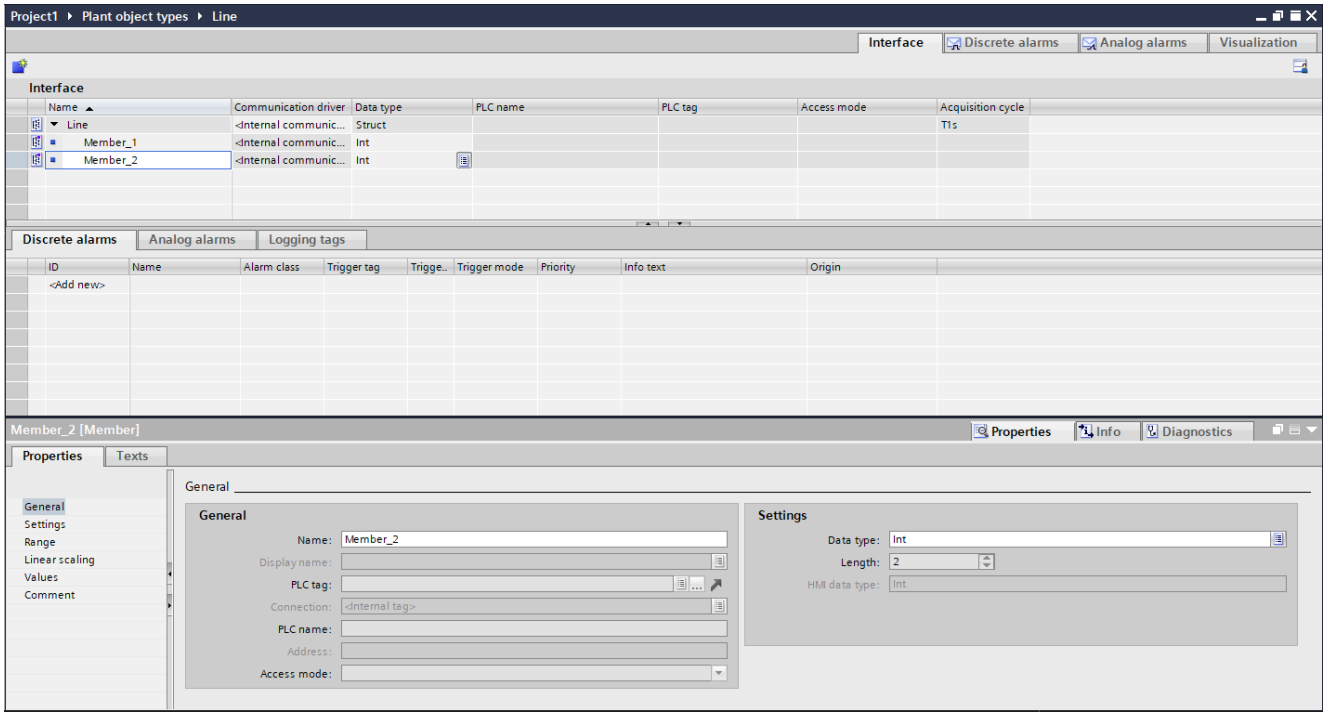
"Plant object types" task card

Under "Plant object types", create the plant object types from which you create plant objects.



"Interface" tab

Plant object types are edited in "Interface" create tags for the communication between a PLC and an HMI device, create members for plant object types, and create alarms and logging tags.



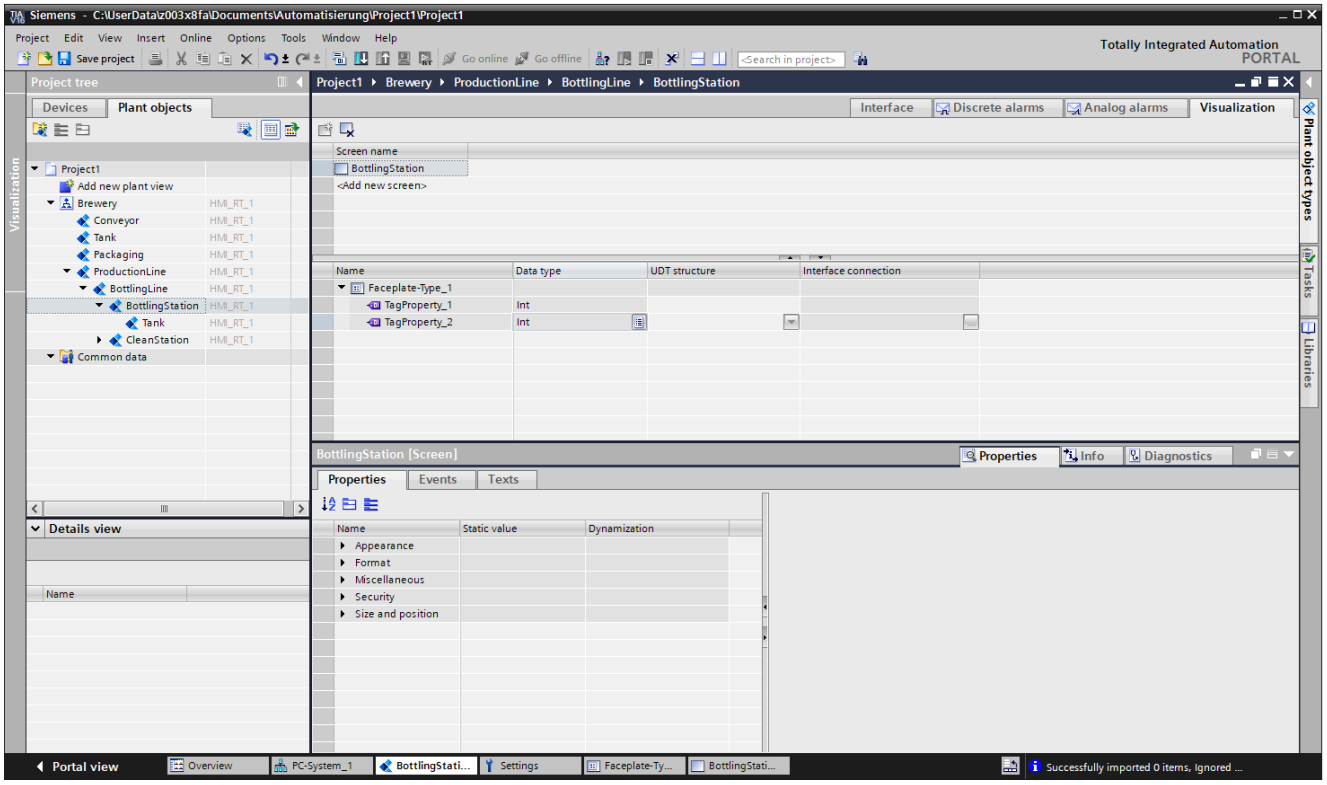
"Visualization" tab of the plant object types

In the "Visualization" tab of a plant object type, you link a faceplate type with the plant object type.

"Visualization" tab of the plant objects

Under "Visualization", you configure a screen for each plant object. In the Inspector window you edit the properties and events of the screen.

The faceplate type associated with the plant type is displayed. The configured tags of the interface are displayed, but cannot be edited.



If you open a screen under "Visualization" by double-clicking, the view is identical to the view on an HMI device. The "Toolbox" and "Layout" task cards are also identical.

Use the "Toolbox" task card to configure in predefined objects in your screens, with which you map your plant, display process sequences and define process values.

Introduction (Page 7051)

Options for creating plant objects (Page 7068)

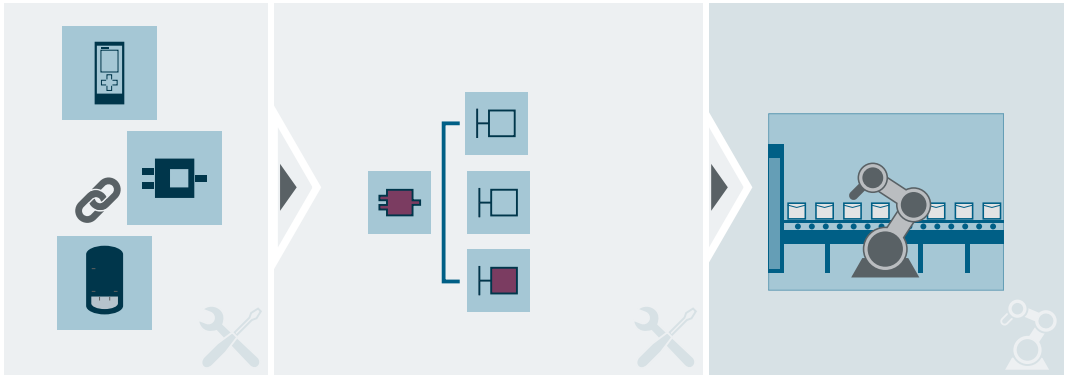
Type/instance concept in object-oriented configuration (Page 7055)

15.2.2 Options for creating plant objects

Basics

You have several options for creating plant objects on the basis of plant object types:

- Creation of plant object types from the function blocks or PLC user data types of an S7-1500 and creation of plant objects from the instance data blocks



- Creation of plant object types within WinCC without an S7-1500

Type/instance concept in object-oriented configuration (Page 7055)

15.3 Object- and technology-oriented configuration

15.3.1 Working with plant views

15.3.1.1 Creating a plant hierarchy

Introduction

Create a plant view to map the structure of your plant. You fill the plant view with plant objects and plant nodes and thus map your plant. Plant nodes act as structural elements.

Assign the plant view to a HMI device.

Requirement

- The TIA Portal project has been created.

Procedure

1. Under "Project tree > Plant objects", click on "Add new plant view".
   An empty plant view is created.

   Note

   A plant view is supported in each project.

2. Rename the plant view accordingly.

   Note

   The following options are not available for the "Plant view" object:
   - Paste
   - Cut
   - Drag-and-drop

Creating plant objects (Page 7072)

Configure plant object types (Page 7073)

Configuration concept (Page 7058)

15.3.1.2 Assigning a plant hierarchy to a HMI device

Introduction

To operate the plant in runtime, always assign a plant view to an HMI device.

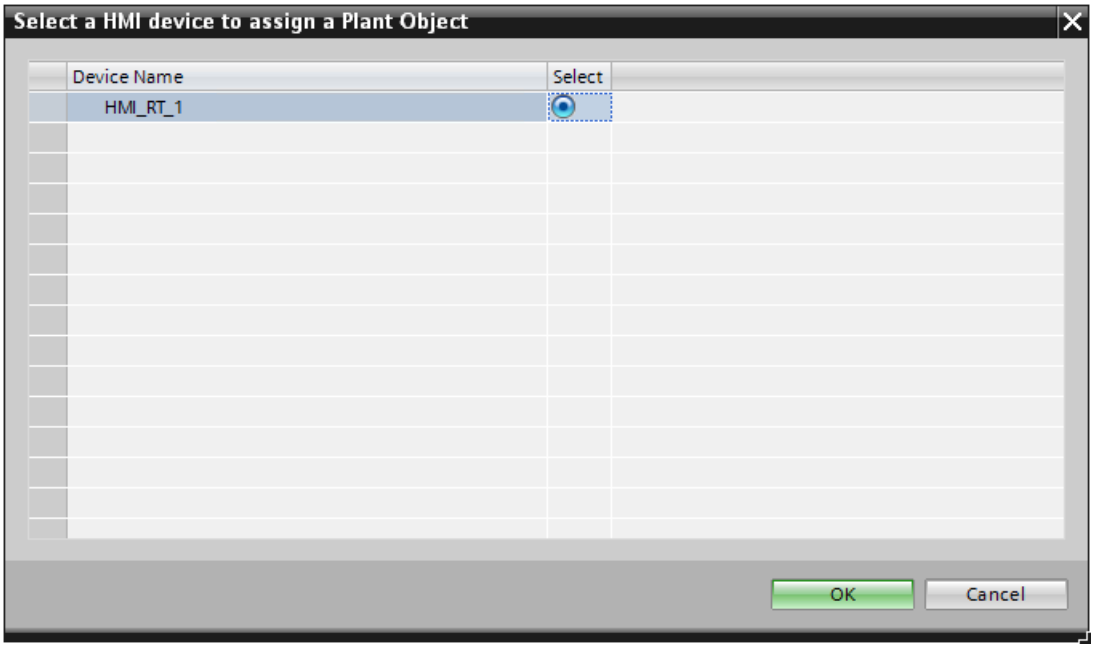
A plant view can only be assigned to a HMI device.

Requirement

- A plant view has been created.
- The WinCC Unified PC RT HMI device has been created.

Procedure

1. Select the "Plant view" node.
2. Select the "Assign HMI device" entry from the shortcut menu.
   A "Select an HMI device for assignment" dialog appears.



3. Select the HMI device.
   The plant view and all lower-level plant objects are assigned to the HMI device.
   If a plant view was assigned to a HMI device, the assignment is visible under "Project tree > Plant objects".

Configure plant object types (Page 7073)

Creating a plant hierarchy (Page 7069)

15.3.1.3 Creating plant nodes

Introduction

Plant nodes help you structure your plant.

Requirement

- The plant view has been created and is displayed.

Procedure

1. Open the shortcut menu in the plant view.
2. Select "Add new node".
   The plant node is created.
3. Rename the plant node.

15.3.2 Working with plant objects and plant object types

15.3.2.1 Creating plant object types

Introduction

You create plant object types.

Then define the "Communications driver" property of the interface:

- "<Internal communication>": Create data members for internal communication.
- "SIMATIC S7 1200/1500": Use either function blocks or the PLC user data types of an S7-1500. You can add further data members to the linked structure.

Requirement

- A project is open.
- A SIMATIC S7-1500 PLC has been created.

Procedure

Create plant object types in the "Plant object types" task card.

1. To display the "Plant object types" task card, click the "Show plant object types" button under "Project tree > Plant objects".
2. To create a plant object type, click "Add new plant object type".
   An empty plant object type is created.
3. Rename the created plant object type accordingly.
4. To edit the plant object type or create lower-level objects and members for the plant object type, double-click the plant object type in the "Plant object types" tab.
   The plant object type appears under "Interface".

Note

The "Communications driver" property is editable for the plant object types. The property "PLC tag" can only be edited with the communications driver "SIMATIC S7 1200/1500".

Configure plant object types (Page 7073)

Example: Determine plant object type (Page 7098)

Assigning a plant hierarchy to a HMI device (Page 7070)

Configuration concept (Page 7058)

15.3.2.2 Creating plant objects

Introduction

You create plant objects from a plant object type using drag-and-drop operation.

Plant objects are specific versions or instances of a plant object type.

Requirement

- A project is open.
- A plant object type has been created.

Procedure

1. Open the "Plant objects" tab in the "Project tree" area.
2. Open the "Plant object types" task card.

3. Drag the plant object type from the task card to the plant view.
   An empty plant object is created.
4. Rename the plant object accordingly.

Note

The name of a plant object must only be assigned once within a project.

Configuration concept (Page 7058)

Configure plant object types (Page 7073)

Assigning a plant hierarchy to a HMI device (Page 7070)

Creating a plant hierarchy (Page 7069)

15.3.2.3 Configure plant object types

Introduction

Configure the plant object types either from the function blocks and PLC user data types of an S7-1500 or create the properties and the external and internal data members for the plant object types.

In both cases you can extend the structure the created plant object types with additional internal or external data members.

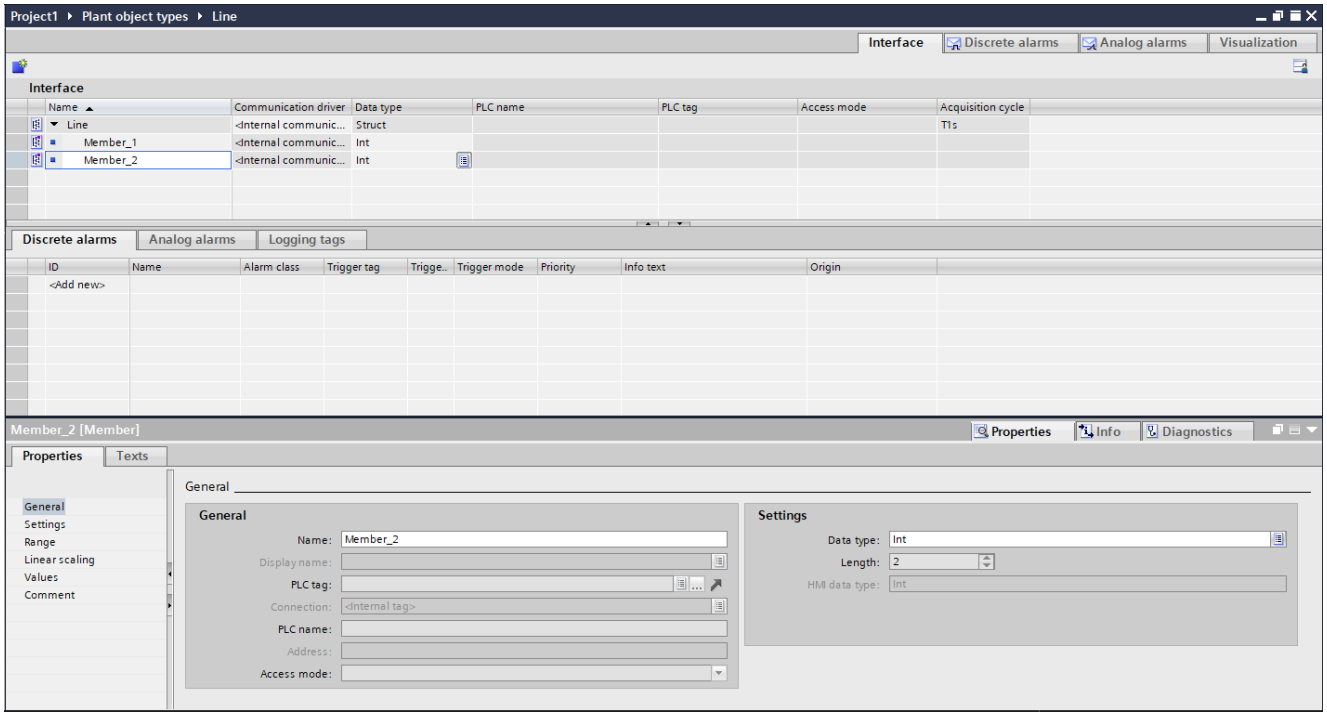
Configuration without using function blocks is described below.

Requirement

- The WinCC Unified PC RT HMI device has been created.
- A plant view has been created and assigned to the HMI device.
- A plant object type has been created.
- A SIMATIC S7-1500 PLC has been created.
- Tags have been configured in the S7-1500.

Procedure

1. Double-click the plant object type in the "Plant object types" editor.
   An empty plant object type with the "Struct" data type appears under "Interface".
2. To add data members to the plant object type, select the plant object type and click "Insert object".



The created data member inherits all properties from the higher level plant object type. "Internal communication" is selected by default in the column "Communications driver" for the newly created data members of the plant object types.

3. If you want to configure an external data member, select "SIMATIC S7-1500" in the "Communication driver" column.
4. Assign a PLC tag to the external data member in the "Tag" column.

Note

If an HMI device is assigned to the plant view, it is possible to view the data members in the "HMI tags" editor in the "Plant object tags" tab. You also have write rights for the "Comment" column.

You can also use the configured data members in screens of an assigned HMI device, e.g., for dynamization instead of tags.

Tips for an efficient procedure

- Differentiate between identically named plant objects and plant object types using the "Insert object" button in the "Interface" tab. If the "Insert object" button is enabled, you have selected a plant object type. If you have selected a plant object, the "Insert object" button is disabled.

15.3.2.4 Configuring plant object types from the data blocks of an S7-1500

Introduction

Configure the plant object types either from the data blocks of an S7-1500 or define the properties and the external and internal data members for the plant object types without connection to a PLC.

In both cases you can extend the structure the created plant object types with additional internal or external data members.

Configuration from the data blocks of an S7-1500 PLC is described below.

Configure plant object types from the configured program blocks of an S7-1500 PLC using drag-and-drop operation.

Requirement

- The WinCC Unified PC RT HMI device has been created.
- A plant view has been created and assigned to the WinCC Unified PC RT.
- A plant object type has been created.
- A SIMATIC S7-1500 PLC has been created.
- A function block is configured in the SIMATIC S7-1500 PLC.

Procedure

1. Open the plant object type in the "Interface" tab.
2. Set the "Communication driver" parameter to the SIMATIC S7-1500 PLC that contains a configured function block.
3. Navigate to the function block in the PLC.
4. Select the function block.

5. Drag the function block to the "PLC tags" field in the "Interface" tab.
   The corresponding structure with data members based on the function block is created in the "Interface" tab.
   When you edit the blocks of the PLC, these changes are automatically transferred to the plant object types.
6. To add additional data members to the plant object type, select the plant object type and click "Insert object".

   Note

   You can create additional data member for each plant object type.

   Function blocks (FBs) or PLC user data types act as basis for the configuration of the plant object types and their data members.

   A member structure can also be connected to a PLC type, for example, function block (FB) or PLC user data type.

   "Raw" data types and arrays are also supported.

   An assignment of the controller blocks to the external data members of the plant object types is only possible if names and data types are identical in the PLC and in the plant object type.
7. If necessary, adjust the data type of the data member.
8. To clear the connection between of a controller and the data members object, delete the block in the "PLC tag" column or select "None".

Tips for an efficient procedure

- Differentiate between identically named plant objects and plant object types using the "Insert object" button in the "Interface" tab. If the "Insert object" button is enabled, you have selected a plant object type. If you have selected a plant object, the "Insert object" button is disabled.

Note

If an HMI device is assigned to the plant view, it is possible to view the data members in the "HMI tags" editor in the "Plant object tags" tab. You also have write rights for the "Comment" column.

You can also use the configured data members in screens of an assigned HMI device, e.g., for dynamization instead of tags.

See also

Configure plant object types (Page 7073)

Assigning process data to plant objects (Page 7076)

15.3.2.5 Assigning process data to plant objects

Introduction

To establish the communication between a S7-1500 controller and a WinCC Unified PC RT device, connect a plant object with a PLC tag or a data block of the PLC.

Requirement

- An S7-1500 PLC and a WinCC Unified PC RT HMI device are configured and connected.
- At least one plant object type in the project contains PLC user data types or function blocks (FBs).

Procedure

1. Drag a plant object type to the plant view.
   The plant object is created based on the plant object type.
2. Double-click the plant object.
3. In the "Interface" tab, in the "Connection" column, select the configured HMI connection for all external data members of the plant object type.
   Select only between the HMI connections that are created for the S7-1500 controllers available in the project.
4. In the "PLC tag" column, select a PLC tag.

Note

In the "Interface" tab, similar to in the "HMI tags" editor, you can view or edit the properties in the following areas:

- "General"
- "Settings"
- "Range"
- "Linear scaling"
- "Values"
- "Comment"

Configure plant object types (Page 7073)

Configuring plant object types from the data blocks of an S7-1500 (Page 7075)

15.3.3 Configuring screens

15.3.3.1 Basic information on configuring screens

Overview

The configuration of screens for operating and monitoring is also available to you in object-oriented configuration. This means that you are working in two areas, under "Project tree> Devices" and "Project tree > Plant objects > Visualization". Here you work with both screens and faceplates that also support the type-instance concept.

In the area "Project tree > Devices", configure screens for HMI devices as usual. In the screens, also configure companion controls that are relevant for the display of screens of the plant objects.

In the "Project tree > Plant objects > Visualization" area, you configure screens for plant objects.

In the "Plant object types > Visualization" area, configure faceplates for plant object types.

In the areas under "Project tree > Devices" and "Project tree > Plant Objects > Visualization", the same predefined screen objects are available in the "Toolbox" task card.

When configuring faceplates, a minimized tool area is available under "Toolbox".

Configuration options

Under "Project tree > Devices", you configure a screen for the created HMI device with the "Plant overview" control and one of the companion controls, such as a screen window. In runtime, navigate the plant structure to the plant objects via the "Plant overview" control. The screen windows in the plant overview display the screens that you have previously configured for the plant object.

The companion controls are connected to one another and supplement one another in displaying the data values.

The following controls can act as companion control for the plant overview:

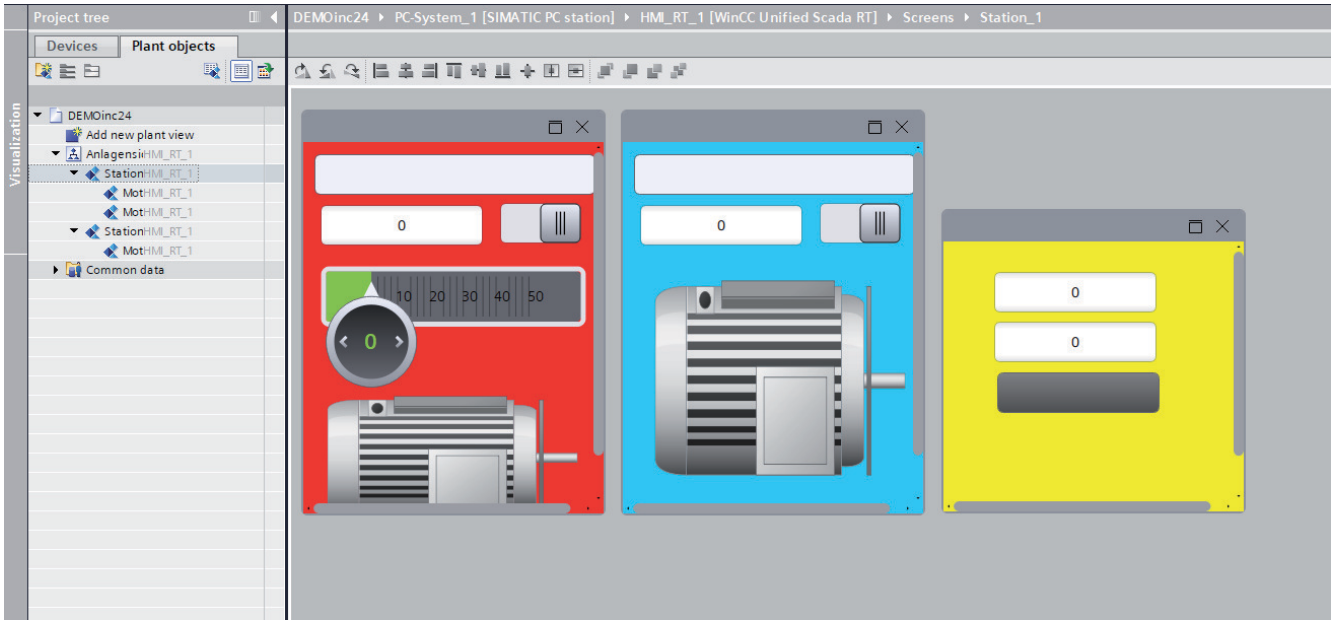
- Alarm control
- Screen window
- Calendar control (when using the WinCC Unified Calendar option)

When required, configure controls as usual, e.g. screen windows, alarm control, or trend control. Select the specific plant object in the plant hierarchy as data source for the alarm control and trend control. Configure the alarm control and trend control for plant objects on the basis of the data members of the plant object types. The procedure for configuring these controls does not differ from the procedure for the device-specific configuration.

The following options are available in runtime:

- Display the hierarchy path of the alarm source
- Display the hierarchy path of the trend values
- Filter the alarm control by plant objects
- Display process values for the selected plant object

Use the "Visualization" tab for the direct visualization of plant objects and plant object types. You can create one screen for each plant object, and you can link one faceplate type for each plant object type. The type-instance concept is used for configuring the screens for plant objects and plant object types. All relevant elements are contained in the faceplate type of a plant object type. Drag a plant object into the screen. A faceplate container is created. For example, several faceplates can be integrated into one visualization of a higher-level plant object.



Configuration steps

In general, proceed in the following order when configuring the screens for your plant:

1. Configure plant object types.
2. Configure faceplates for plant object types.
3. Create plant objects from plant object types.
4. Create screens for plant objects.
5. For the display in runtime, configure the "Plant hierarchy" and "Screen window" controls in a screen of the HMI device.

Displaying plant objects and plant object types

In general, you do not have to create a screen for each plant object. Create an overview for the higher-level plant object. Then create faceplates for the plant object types and drag them to the overview screen of the higher-level plant object using drag-and-drop.

If the screens of the plant objects need to differ from the screens used for the plant object types, you can use the faceplates of the plant object types as a basis and configure additional elements.

In runtime, select a plant object in the "Plant overview" control to display its screen.

See also

Configuring screens for plant objects (Page 7080)

Example: Configuring screens for brewery production lines (Page 7103)

Configuring faceplates (Page 524)

15.3.3.2 Configuring screens for plant objects

Introduction

You configure an overview screen for the higher-level plant object with multiple faceplate containers for lower-level plant objects, for example, for a station that has lower-level objects motor and conveyor belt.

For each plant object you can configure a screen in which all lower-level plant objects are visible. To do this, use the faceplate containers of the plant object types.

If necessary, you also configure basic objects, elements and controls in the screen. For example, you use I/O fields to display process values such as status, temperature and rate.

In the following, you will obtain the data to be processed, such as temperature measurements or speed values from the data blocks of a controller.

You represent lower-level plant objects using faceplates in the overview screen of the higher-level plant hierarchy.

In runtime, the screen window technology assists you in switching between plant objects and representing multiple plant objects in a screen.

You can also use the "Plant overview" control to set up screen navigation via the plant. In runtime, you monitor the plant in this manner and see the overall progress at a glance.

Requirement

- A SIMATIC S7-1500 has been configured in the project.
- WinCC Unified Runtime is configured in the project.
- A plant object type has been created.
- The plant view has been created with the plant objects and assigned to WinCC Unified PC RT.
- The interface tags of the plant object types are linked to the S7-1500.

Procedure

1. Open the plant object editor.
2. In the "Visualization" tab, click "Add new screen".
   A screen is created.
3. If necessary, edit the width and height of the screen under "Properties" in the inspector window.
4. If necessary, configure the required elements and controls for the plant object, such as I/O fields and text fields.

5. Change to the "Libraries" task card.
6. Open the project library.
7. Create a faceplate type.
8. Configure the required screen objects, interface tags and interface properties in the faceplate type and release the version.
9. Open the editor of the plant object type.
10. In the "Visualization" tab, drag the faceplate type from the project library to the "Drop faceplates here" button.
11. Connect the faceplate tags to the interface tags of the plant object type.
12. Create a plant object from the plant object type using a drag-and-drop operation.
13. Open the plant object editor.
14. Assign the plant object a PLC tag under "Interface" in the "PLC tag" column:
15. To display the faceplate container of the plant object type in the screen, drag the plant object from the plant view to the configured screen.

Tips for an efficient procedure

- Adjust the position of the faceplate container in the overview screen using the mouse or the corresponding icons on the toolbar.
- You can zoom in and out of the faceplate container in the overview screen.
- You can at any time delete and reconfigure the overview screen which contains the faceplate container for lower-level plant objects. You can reuse the faceplate types at any time.

Note

If the screen area is not sufficient for all faceplate containers, the faceplate containers are superimposed on each other in runtime.

Note

If additional basic objects, elements and controls are required specifically for a plant object, you can use the faceplates of the plant object types as a basis and configure additional objects.

Note

Note that interface mapping is deleted during updates of faceplate types used in plant objects.

Result

You have created a screen with a faceplate instance for the plant project.

15.3.4 Configuring the controls

15.3.4.1 Configuring "Plant overview" control and companion controls

Introduction

You require the control "Plant overview" when you want to navigate through the plant.

The companion controls are connected to one another and supplement one another in displaying the data values.

You require the companion controls for the following displays:

- Display plant object screens and screen windows using the navigation option throughout the entire plant (plant overview and screen windows)
- Display alarms for plant objects using the navigation option throughout the entire plant (plant overview and alarm view)

The following controls can act as companion control for the plant overview:

- Alarm control
- Screen window
- Calendar view (when using the WinCC Unified Calendaroption)

Requirement

- A screen is open.
- The "Toolbox" task card is open.

Procedure

1. Insert the "Plant overview" control from the "Toolbox > My controls" task card into the screen.

2. Add a companion control.
   Select from the following controls:
   - Alarm control
   - Screen window
   - Calendar control

   Note

   As companion controls, you can only select controls already configured in the screen.

3. Select the "Plant overview" control.
4. Open the Inspector window under "Properties > Properties > Miscellaneous > Interface > Companion control".
   The "Companion control" editor opens on the right-hand side of the Inspector window.
5. Click "Add".
   An element (starting with 0) is created.
6. Create an element for each companion control:
7. Specify the control type for each element:
   - Alarm control
   - Display window (for screen windows)
   - Calendar control (for calendar control)
8. Define the respective companion control as control reference for each element.

9. Specify a filter:
   - No filters: You see all plant objects
   - By plant objects for which alarms are available
   - By plant objects for which screen windows are configured
10. Specify the navigation type:
    - Static: The plant tree is displayed completely in runtime.
    - Dynamic: In runtime, you specify as of which level the plant tree is displayed by double-clicking a plant object.
      The levels below the selected plant object are available and are expanded.
      You can always navigate to the next higher level in runtime.

    The buttons of the toolbar and the filter bar relate to the displayed area.
11. Specify the root node. You have the following options:
    - In the "Static value" column, specify the path of the plant object according to the following schema "HMI_device.hierarchy::Plant view/Plant object", for example, "HMI_RT_1.hierarchy::Brewery/Bottling".
    - Specify the root node dynamically using a tag or a script.

    If a root node is configured, the root node and all objects below the root node are available in the plant overview.
12. Specifies whether the toolbar is shown.
13. Specifies whether the menu bar is shown.

Result

In runtime you see the screen with the "Plant overview" control and the companion controls. When you navigate to the respective plant object in the "Plant overview" control, the content of this plant object is displayed in the companion controls.

If you have configured the screen window as companion control, navigate in runtime in the "Plant overview" control through the plant and display the screens you have configured for the respective plant object.

If you have configured the alarm control as companion control, navigate in runtime in the "Plant overview" control through the plant and have the alarms for the plant objects displayed in the alarm view.

15.3.4.2 Configuring an alarm control for plant objects

Overview

Configure an alarm control, as in the device-specific configuration in a HMI device screen. In order that the alarm control can display the alarms of the plant objects, assign the plant hierarchy to your HMI device.

To directly jump to the alarms of the plant objects in runtime, configure the alarm control is companion control to the "Plant overview" control.

To filter by plant object alarms in the alarm control, configure a filter with the criterion "Area" with one of the following two conditions:

- "Equal" - only shows the alarms of the selected plant object in runtime.
- "Begins with" - shows the alarms of the underlying objects of the selected plant object in runtime.

Configuring a filter for plant objects

To filter by plant object alarms in the alarm control, configure a filter as follows:

1. In the Inspector window under "Properties > Filter", click in the "Static value" column. The "Alarm filter configuration" dialog opens.
2. Select the "Area" criteria.
3. Select the condition "Equal"
4. Click on the selection list in the "Operand" column.
5. Select the plant object whose alarms you want to display in runtime.

Note

You can also create filter criteria directly in runtime and use them as filters.

Result

Alarms for the selected plant object are displayed in runtime.

See also

Configuring screens for plant objects (Page 7080)

Configuring an alarm control (Page 753)

Displaying alarms for plant objects in runtime (Page 7120)

15.3.4.3 Configuring trend control for plant objects

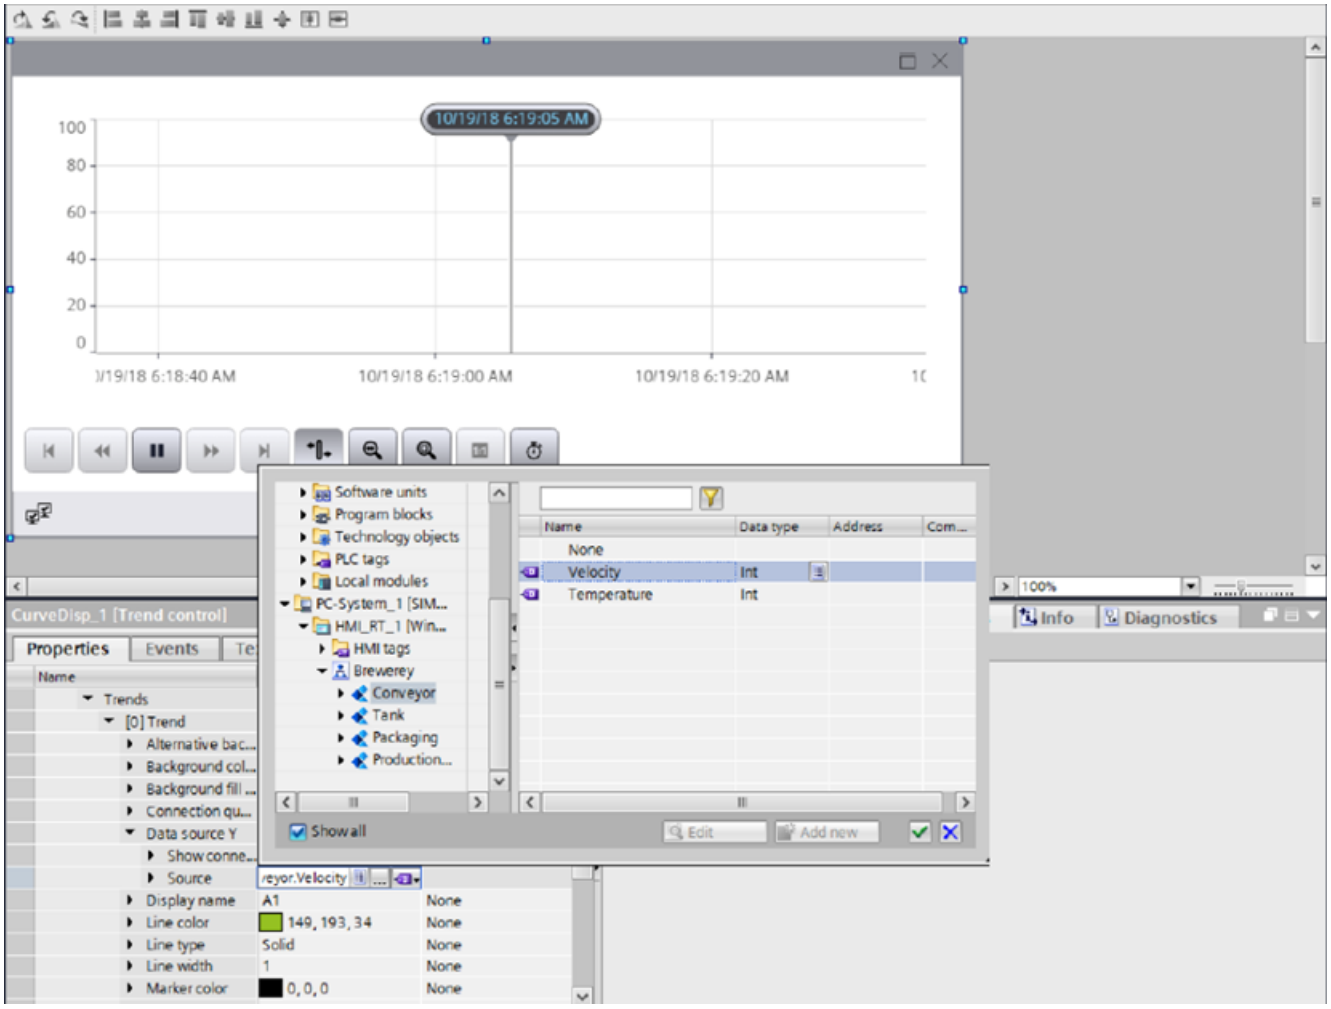
Overview

A trend control, as in the device specific configuration in a HMI device screen. Assign the plant view to your HMI device in order that the trend control can graphically represent the values of the data members of the individual plant objects in runtime.

The trend control allows you to display current and logged values for a specific time window, for example.

As with device-specific configuration, when you configure the trend control for the display of the data values you define the sources from which the values are obtained on the HMI device in runtime. The following sources are available:

- Current process values from data members of the plant object types
- Archived values from logging tags



The path of the plant object is shown in the trend control when displayed in runtime.

See also

Configuring the logging of plant object types (Page 7094)

Configuring a trend control (Page 680)

Display process data of the plant objects in a trend control (Page 7116)

15.3.5 Configuring alarms

15.3.5.1 Basic information on configuring alarms

Overview

In object-oriented configuration, as in device-specific configuration via the alarming, events from the monitoring function in WinCC are displayed in form of alarms. The alarms can be acknowledged by the operator and, if necessary, logged. To do this, configure alarms that are separated into alarm classes.

For plant objects you can configure the following alarms that are used to monitor the plant:

- Discrete alarms: Display status changes
- Analog alarms: Display limit value violations (value changes),

Configure bit or analog alarms for plant object types on the basis of internal or external data members. From these plant object types you create plant objects.

If you have configured an alarm system for plant objects you can display the hierarchy path of the alarm source and the alarm status of a line or a machine in runtime, filter the alarm control by plant objects and navigate to the alarm source.

You can also filter the most frequently occurring alarms by plant object and only permit the alarm of the respective object and all lower-level objects to be displayed.

Configuration steps

In general, proceed in the following order when configuring the alarms for the plant objects:

- Configure plant object types
- Configuring bit or analog alarms for plant object types on the basis of data members.
- Creating plant objects from plant object types
- Configuring alarm control in a screen
- Configuring "Plant view" control as companion control for the alarm control.

Note

An alarm is linked to the respective plant object type. If you delete the plant object type the alarm will also be deleted.

Configuring an alarm view

The alarm view is configured for a screen. Current or logged alarms are displayed in the alarm view in runtime. More than one alarm can be displayed simultaneously, depending on the configured size. Configure the criteria for alarm filtering.

You can also configure multiple alarm views with different contents and in different screens.

See also

Configure discrete alarms for plant objects (Page 7088)

Configuring analog alarms for plant objects (Page 7091)

15.3.5.2 Configure discrete alarms for plant objects

Introduction

If you have configured an alarm system for plant objects you can display the hierarchy path of the alarm source and the alarm status of a line or a machine in runtime, filter the alarm control by plant objects and navigate to the alarm source.

You can also filter the most frequently occurring alarms by plant object and only permit the alarm of the respective object and all lower-level objects to be displayed.

An alarm is linked to the respective plant object type. If you delete the plant object type the alarm will also be deleted.

Requirement

- A plant object type with associated external or internal data members (with elementary data types) has been created.
- The plant structure has been assigned to a device.

Procedure

1. Select the respective data member of the plant object type on the basis of which you want to configure an alarm.
2. To create a new discrete alarm, double-click on "<Add>" under "Discrete alarms" in the table. A new discrete alarm is created.
3. Assign a name for the alarm.

   Note

   The name of a discrete alarm can contain up to 128 characters.

4. To configure the alarm, select "Properties > General" in the Inspector window:
   - Enter the alarm text.
   - Change the name of the alarm as required.
   - Select the alarm class.
   - Configure the priority of the alarm (a value of between "0" and "16").

   Note

   The alarm text must be unique in the context of the plant object type. Hierarchical information is not permitted in the alarm text.

   Note

   You can use the priority to sort or filter the alarms in the alarm control. With sorting by priority, you can ensure that the most important alarm (high priority) is shown in the display area in a single-line alarm control.

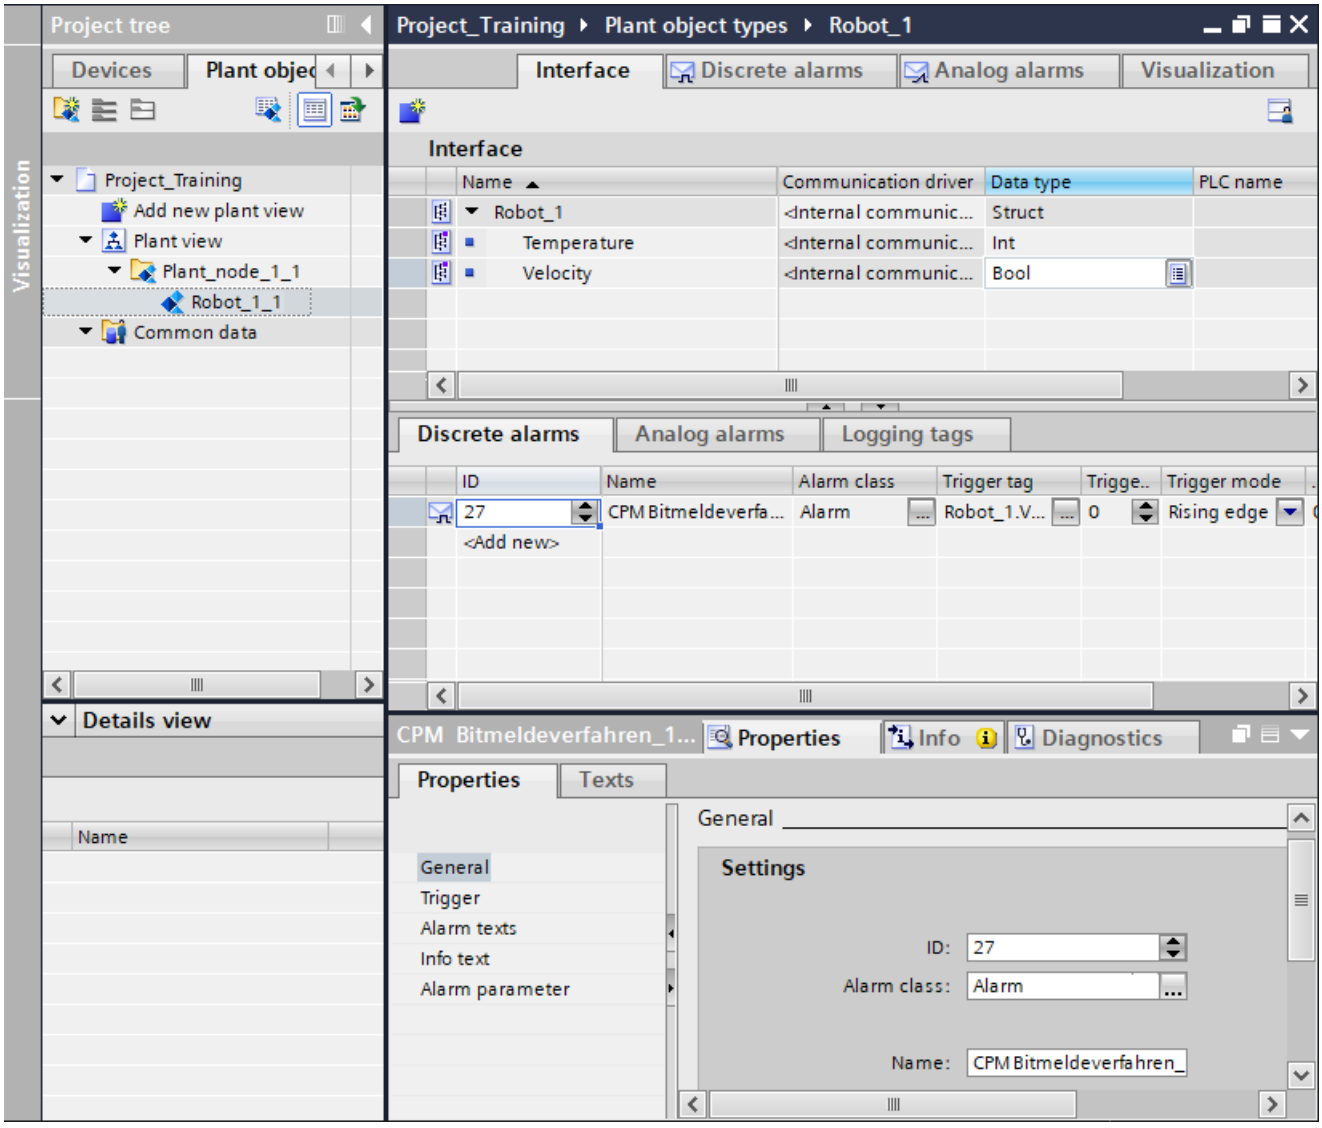
   If you filter the alarm control by priority "16", only the alarms with priority "16" will appear.

5. Select "Properties > Trigger" in the Inspector window to select the tag and the bit that triggers the alarm.

   Note

   Only the data member of the plant object type is permitted as trigger tag.

6. Select "Trigger mode" to specify whether to trigger the alarm at a rising or falling edge.
7. To configure the alarm text, select "Properties > General > Alarm text".
   – Enter the text for the alarm under "Alarm text".



See also

Configuring analog alarms for plant objects (Page 7091)

Basic information on configuring alarms (Page 7087)

Displaying alarms for plant objects in runtime (Page 7120)

15.3.5.3 Configuring analog alarms for plant objects

Introduction

If you have configured an alarm system for plant objects you can display the hierarchy path of the alarm source and the alarm status of a line or a machine in runtime, filter the alarm control by plant objects and navigate to the alarm source.

You can also filter the most frequently occurring alarms by plant object and only permit the alarm of the respective object and all lower-level objects to be displayed.

An alarm is linked to the respective plant object type. If you delete the plant object type the alarm will also be deleted.

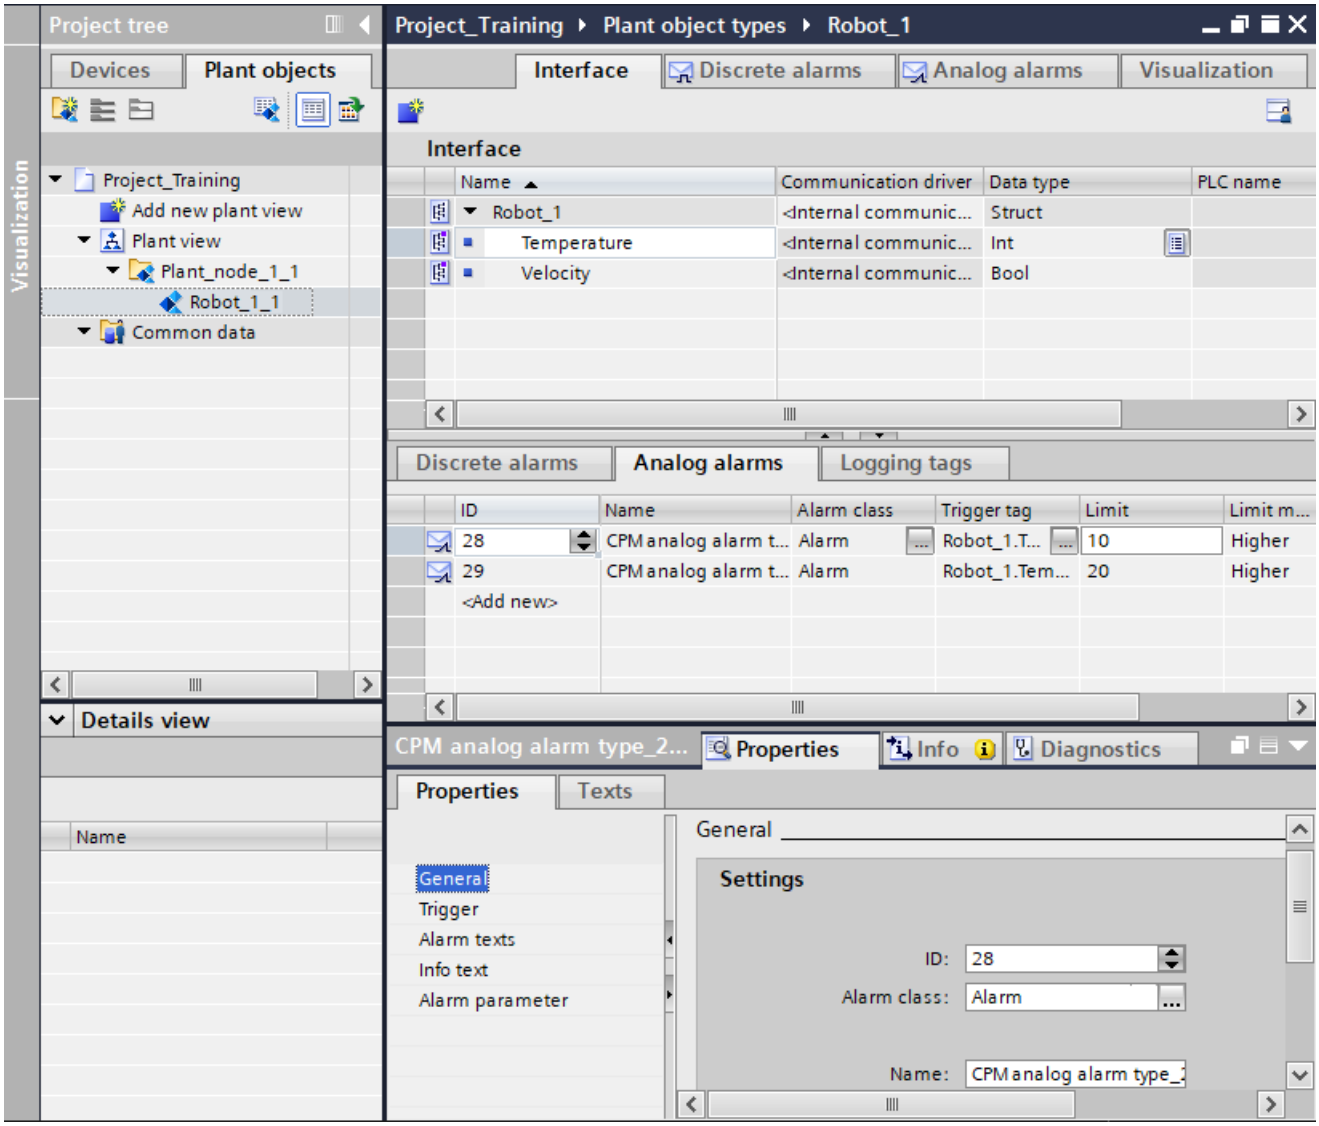
Requirement

- A plant object type with associated external or internal data members (with elementary data types) has been created.
- The plant structure has been assigned to a device.

Procedure

1. Select the respective data member of the plant object type on the basis of which you want to configure an alarm.
2. Enter the alarm text under "Properties > General".
3. To create a new analog alarm, double-click in the table on "<Add>" under "Analog alarms" in the table.
   A new alarm is displayed.

4. To configure the alarm, select "Properties > General" in the Inspector window:
   - Enter the alarm text.
   - Change the name of the alarm as required.
   - Select the alarm class.
   - Configure the priority of the alarm (a value of between "0" and "16").



Note

The alarm text must be unique in the context of the plant object type. Hierarchical information is not permitted in the alarm text.

Note

You can use the priority to sort or filter the alarms in the alarm control. With sorting by priority, you can ensure that the most important alarm (high priority) is shown in the display area in a single-line alarm control.

If you filter the alarm control by priority "16", only the alarms with priority "16" will appear.

5. In the Inspector window, select the tag that triggers the alarm, e.g. a data member, under "Properties > Trigger".

Note

Only the data member of the plant object type is permitted as trigger tag.

6. In the Inspector window under "Properties > Trigger", enter a limit in the "Value" field in the "Limits" area.
7. Select the trigger mode in the "Mode" field:
   - "Lower": The alarm is triggered if the limit is undershot.
   - "Upper": The alarm is triggered if the limit is exceeded.
   - "Equal": The alarm is triggered when the limit is reached.
   - "Not equal": The alarm is triggered if the limit is not reached.
   - "Lower or equal": The alarm is triggered if the limit is undershot or reached.
   - "Greater or equal": The alarm is triggered if the limit is exceeded or reached.
8. You can create additional limits for the alarm, if necessary. Note the following:
   - A tag is monitored using only one alarm type. You should therefore create either analog alarms **or** discrete alarms for a tag.
   - If the object included in the selection does not yet exist, create it in the object list and change its properties later.
9. Select the analog alarm to which you want to assign the limits.

See also

Configure discrete alarms for plant objects (Page 7088)

Example: Configuring analog alarms for temperature monitoring (Page 7106)

Basic information on configuring alarms (Page 7087)

Displaying alarms for plant objects in runtime (Page 7120)

15.3.6 Configuring the logging of plant object types

Introduction

Save the values of the data members of the plant object types in logs for later evaluation. Alarm logging can be used to analyze error states, to optimize maintenance cycles, and to document the process.

Create a logging tag for each data member of the plant object type. These logging tags are saved in the data log of the assigned device.

You can analyze the logged tag values directly in your project, such as in a trend view, or in another user program, such as Excel.

The logging tags are created for the plant object types. This means that the plant objects are automatically supplied with the logging tags of the plant object types.

Requirement

- The plant hierarchy has been created and assigned to a device.
- A plant object type with associated external or internal data members (with elementary data types) has been created.

Procedure

1. Under "Interface", jump to the "Logging tags" tab in the middle part of the work area.
2. Under "Interface", select a data member of a plant object type that you want to log.
3. Click "Add" under "Logging tags".
   A logging tag is created.
   The logging tag is linked to the tag. The data type of the logging tag corresponds to the data type of the connected tag.

   Note

   A logging tag is automatically assigned to a data log. This assignment cannot be changed.

   The assignment is only possible if the plant hierarchy is assigned to a HMI device.

4. Specify the logging mode.

   Note

   Depending on the configuration, the database can grow very quickly. This can occur, for example, when you select a short cycle without smoothing and without compression.

5. When the "Cyclic" logging mode is set, define the logging mode and the factor under "Properties > Properties > Cycle".
6. Define the tag trigger depending on the logging mode.

7. Define the limit values.

   Note

   Process values that are outside the set limit range will not be logged.

8. Define the smoothing.
9. If you have selected the "Cyclic" logging mode, define the compression.

Logging tags and logging is available under "Visualizing processes with Runtime Unified".

Configuring trend control for plant objects (Page 7085)

15.3.7 Good Manufacturing Practice

Traceability and therefore the documentation of production data is becoming increasingly important in many sectors such as the pharmaceutical industry, the food and beverage industry, and the related mechanical engineering industry.

Therefore, sector-specific and cross-industry standards have been developed for the electronic documentation of production data.

The most important set of regulations is the FDA guideline 21 CFR Part 11 for electronic data records and electronic signatures issued by the FDA, the US Food and Drug Administration. In addition, different EU regulations apply, such as EU 178/2002, depending on the industry.

Requirements for production systems in these industries have been developed on the basis of 21 CFR Part 11 and the corresponding layout to comply with GMP (Good Manufacturing Practice). They are also required for other industries.

The following main requirements are derived from these directives and regulations:

- Creation of an Audit Trail or operating trace in runtime
  Based on this document, it is possible to trace the user who carried out the operator action on the machine at what time.
- Important process steps must also be assigned to a clear responsibility, for example, via an electronic signature.

GMP (Good Manufacturing Practice)

If necessary, activate the GMP-compliant configuration in the Runtime settings.

GMP is also displayed in the properties of a tag of a PLC user data type used in an HMI device even if it is not enabled in the specific device but the tag is used in an additional device that uses GMP. The menu command "GMP" is grayed out in this case and cannot be edited.

15.3.8 Example

15.3.8.1 Example: Scenario

The production lines "Bottling" and "Packaging" exist alongside other lines in a brewery and are connected to one another in the production chain. The production lines consist of multiple units.

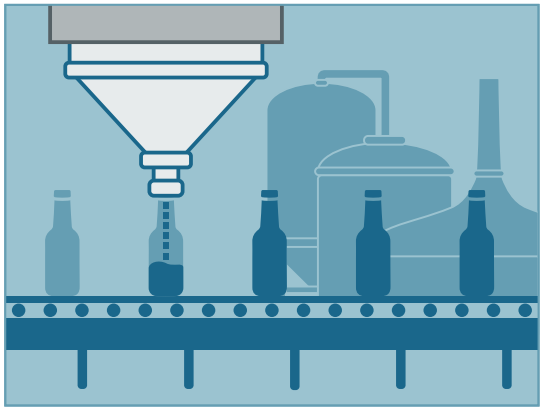
You configure plant objects in the plant view from the plant object types based on the data blocks.

Screens must be configured for all plant objects relevant for the monitoring. In addition, a screen navigation should be set up so that the user can navigate from one plant object screen to another in runtime using the "Plant overview" control. The production value should also be monitored, for example the temperature in the filling tank or the weight of the product after the filling. Make sure to notify the operator in case of deviations.

The relevant production values must be logged for quality assurance purposes and for Food Authority audits.

The "Bottling" production line consists of the following units:

- Conveyor belt 1 ("Conveyor_1")
- Robot 1 ("Robot_1"): Places the bottles on the conveyor.
- Filling tank ("Filling Tank"): Fills the bottles, the temperature in the filling tank is monitored.
- Robot 2 ("Robot_2"): Closes the bottles.
- Robot 3 ("Robot_3"): Performs quality checks (weight and light barrier)

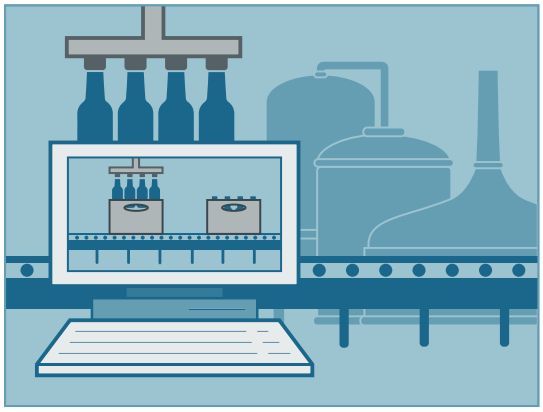


The bottles are sorted from the conveyor belt into beverage crates on the "Packaging" production line.

The "Packaging" production line consists of the following units:

- Conveyor belt 2 ("Conveyor_2"): Makes the filled bottles available.
- Conveyor belt 3 ("Conveyor_3"): Conveys filled crates.
- Robot 4 ("Robot_4"): Places the crates on the conveyor belt.
- Robot 5 ("Robot_5"): Places the bottles in the crates.

- Robot 6 ("Robot_6"): Places the crates on the pallet.
- Robot 7 ("Robot_7"): Performs quality checks (weight and light barrier)



15.3.8.2 Example: Implementation concept

Creating a plant view

They map the plants, units and production lines of the brewery in the plant view. To do this, you first create the plant object types that you can reuse for plant objects. Based on the plant object types, you then create the "Brewery" plant view from the plant objects. The two production lines "Bottling" and "Packaging" contain the units according to the following concept:

- Bottling
  - Robot_1
  - Robot_2
  - Robot_3
  - Conveyor_1
  - Filling Tank_1
- Packaging
  - Robot_4
  - Robot_5
  - Robot_6
  - Robot_7
  - Conveyor_2
  - Conveyor_3

Visualization

You create faceplate types for the "Conveyor", "Robot" and "Filling Tank" plant object types.

The faceplate types of the plant object types are instantiated in the screens of the plant objects.

According to the structure of the production line, the "Robot" faceplate type is reused three times in the "Bottling" production line and four times in the "Packaging" production line.

You also configure an overview screen called "Overview" with the "Plant overview" control. The plant overview gives you direct access to the unit data in runtime.

Temperature monitoring

You want to monitor the temperature in the filling container and to notify the operator if changes occur.

To monitor the temperature, configure a trend control and an alarm control for the filling tank as companion controls for the plant overview.

Because a specific temperature must not be exceeded during the bottling of beverages, configure analog alarms for the filling tank that can be output via the alarm view.

The trend view provides you with an overview of the temperature trend of the filling tank.

Logging

The production values are logged for the Food Authority inspections. It must be verified that the temperature was complied with and that quality checks were regularly performed. To this end, configure logging tags for the relevant plant objects.

15.3.8.3 Example: Determine plant object type

Scenario

For a new brewery location, two employees of an engineering office configure the process visualization and plant-specific parameters. The employees develop a configuration concept for this.

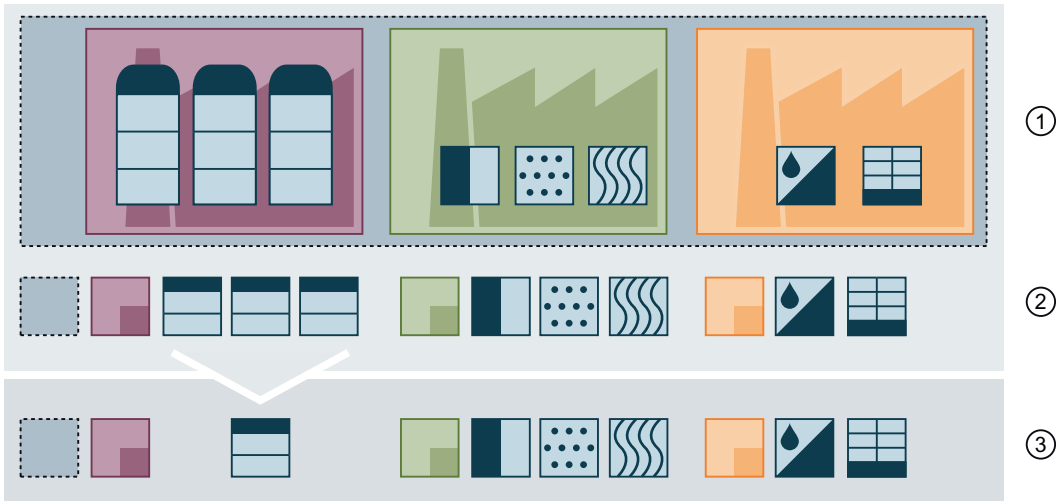
The following examples shows how process visualization and object-oriented configured mesh with each other.

Determining plant object types

How you determine plant object types by analyzing the plant structure depends on the context:

- In the WinCC Runtime Unified context, you view the plant "from the bottom" in the process view. Functional units are in the background compared to plant objects of the field and process levels. The functional units are still necessary for a complete mapping of the plant.
- In the context of plant-specific KPIs, look at the plant "from the top" in the plant view. Plant objects of the field and process levels may no longer be relevant.

The following figure is a schematic representation of the analysis sequence of the plant structure for defining the plant object types:



① Analyze the plant structure: The brewery consists of the three plant units, "Delivery/Storage", "Processing" and "Bottling". Various processes run in the plant sections.

② Determining relevant plant objects for monitoring process and productivity: These plant objects are the basis for mapping the plant hierarchy.

③ Defining plant object types: Plant objects used multiple times are mapped using a common plant object type. The data structure and context information is configured for each plant object type.

Brewery

- Plant-specific parameters: Cumulative characteristics of productivity

Unit for delivery and storage of ingredients

- Plant-specific parameters: Characteristics for duration of delivery

Tank for storage of ingredients

- Process visualization: Monitoring temperature and fill level

Unit for processing

- Plant-specific parameters: Characteristics of productivity

"Mashing"

- "Batches taken out of mash" Process visualization: Monitoring temperature and pressure
- "Pump back batches taken out of mash", check: "Iodine test": Process visualization: Monitoring temperature and pressure

"Purifying" Process visualization: Monitoring temperature and pressure

"Wort boiling" Process visualization: Monitoring temperature and pressure

- Whirlpooling
- Addition of yeast and fermenting
- Storage

Unit for bottling and packaging

- Plant-specific parameters: Characteristics for period of change in production, unplanned downtime and produced quantities

Bottling process

- Process visualization: Monitoring temperature / control of filling

Process for packaging the beer bottles on pallets

- Process visualization: Monitoring packaging

Note

The data structure of a plant object type is often reflected in the function blocks of the user program. In such a case you can create plant object types automatically. Consultation with the programmer is recommended especially for plant object types with strong links to the PLC.

See also

Creating plant object types (Page 7071)

15.3.8.4 Example: Creating a plant view

Task

You map the brewery plant with its units and production lines with the plant view and make the unit data available for the entire project.

You create the "Brewery" plant view and assign it to the HMI device.

Requirement

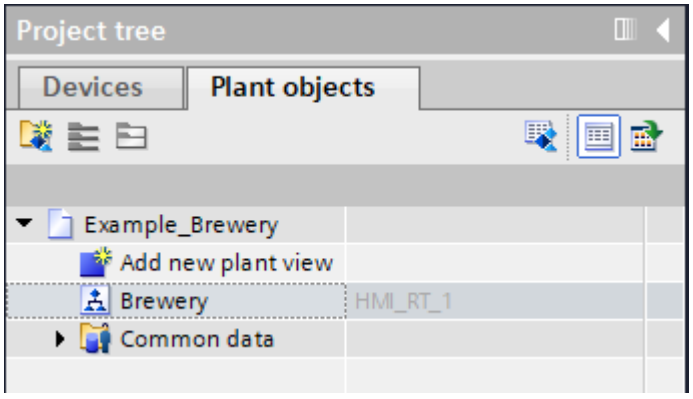
- A project has been created.
- An HMI device has been created.

Introduction

1. Under "Project tree > Plant objects", click "Add new plant view".
   An empty plant view is created.
2. According to our example, call the plant view "Brewery".
3. Assign the plant view to the HMI device.

Result

You have created the "Brewery" plant view and assigned it to the HMI device:



15.3.8.5 Example: Creating plant objects and plant object types

Task

You create plant object types from which you will create plant objects in the plant view in the next step. The plant objects represent the units and production lines of the brewery. These are the following elements in our example:

- Filling tank (unit)
- Conveyor (unit)
- Robot (unit)
- Bottling (production line)
- Packaging (production line)

Next, you define the "Communication driver" property of the interfaces.

Requirement

- The project is open.
- A SIMATIC S7-1500 PLC has been created.
- At least one program block is configured in the PLC.
- The "Brewery" plant view is created, assigned to an HMI device and open.

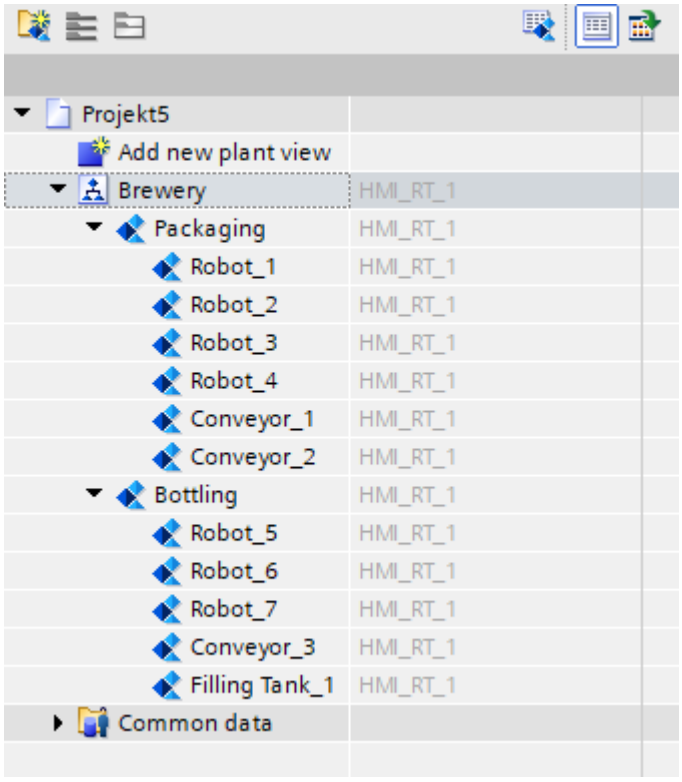
Procedure

1. To display the "Plant object types" task card, click the "Show plant object types" button under "Project tree > Plant objects".
2. Create a plant object type for each unit and assign the following names:
   - Conveyor
   - Robot
   - Filling Tank
   - Bottling
   - Packaging
3. Specify "SIMATIC S7 1200/1500" as communication driver for each plant object type.
4. As PLC tag, specify the function block that contains tags which match the unit.
5. Now create the following plant objects from the plant object types by dragging the respective plant object type to the plant view and adapting the name:
   - Packaging
   - Bottling
6. In the "Bottling" plant object, create the following lower-level plant objects by dragging the respective plant object type to the "Bottling" plant object:
   - Robot_1
   - Robot_2
   - Robot_3
   - Conveyor_1
   - Tank_1
7. In the "Packaging" plant object, create the following lower-level plant objects by dragging the respective plant object type to the "Packaging" plant object:
   - Robot_4
   - Robot_5
   - Robot_6
   - Robot_7
   - Conveyor_2
   - Conveyor_3
8. Under "Connection", assign each plant object the HMI connection and an instance data block as PLC tag.

Result

You have created plant object types for the units and production lines of the brewery. From the plant object types, you have created plant objects in the plant view.

The plant view should have the following structure:



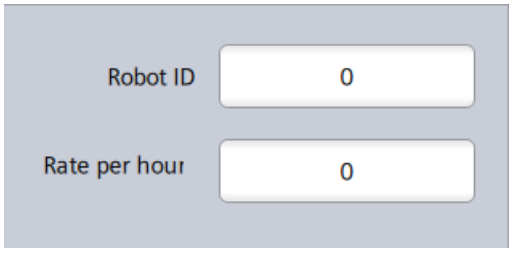
15.3.8.6 Example: Configuring screens for brewery production lines

Task

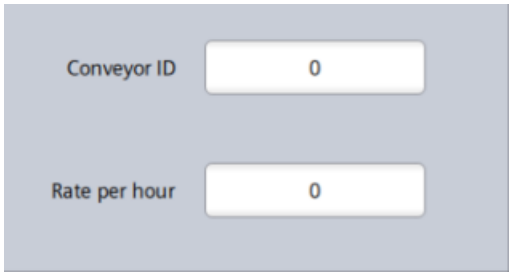
To visualize the plant objects, configure faceplate types for each plant object type.

Procedure

1. Under "Project tree > Plant objects", configure the screens for the "Bottling" and "Packaging" production lines.
   - Open the "Bottling" plant object and switch to the "Visualization" tab.
   - You press the "Add new screen" button to create a new screen.
   - Repeat the procedure for the "Packaging" plant object.
2. In the project library, you create a faceplate type for the plant object type "Robot" and release it.
   The faceplate could look as follows according to the example scenario:

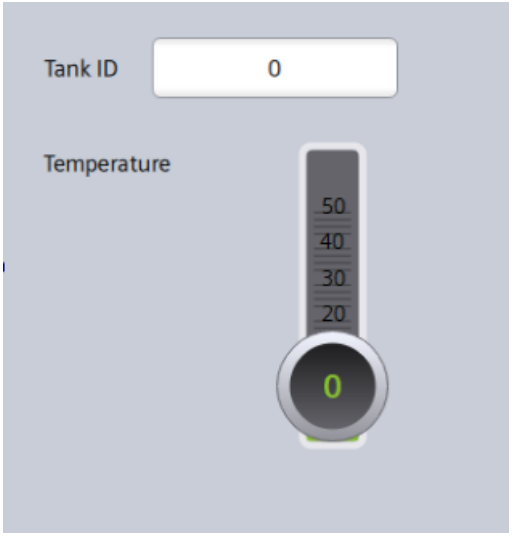


3. Under "Project tree > Plant objects", open the plant object type "Robot" and drag the created faceplate type to the "Save faceplates here" button in the "Visualization" tab.
4. Create faceplate instances for all the robots you need for the two production lines:
   - Open the "Bottling" screen.
   - Then drag all lower-level plant objects that are based on the "Robot" plant object type one after the other to the screen.
   - Repeat the procedure for the "Packaging" screen.
5. In the project library, you create a faceplate type for the plant object type "Conveyor" and release it.
   The faceplate could look as follows according to the example scenario:



6. Create faceplate instances for all the conveyors you need for the two production lines:
   - Open the "Bottling" screen.
   - Then drag all lower-level plant objects that are based on the "Conveyor" plant object type one after the other to the screen.
   - Repeat the procedure for the "Packaging" overview screen.

7. In the project library, you create a faceplate for the plant object type "Filling tank" and release it.
   The faceplate could look as follows according to the example scenario:



8. Under "Project tree > Plant objects", open the plant object type "Filling tank" and drag the created faceplate type to the "Drop faceplates here" button in the "Visualization" tab.
9. From the "Filling tank" plant object, create a faceplate instance for the filling container:
   - Open the "Bottling" overview screen.
   - Then drag the plant object that is based on the "Tank" type to the screen.

Result

You have successfully configured screens and faceplates for the plant objects of the brewery and can display the plant objects in the runtime.

See also

Configuring screens for plant objects (Page 7080)

Basic information on configuring screens (Page 7077)

15.3.8.7 Example: Configuring plant overview and companion controls

Task

To access the unit data directly from the "Overview" screen in runtime, configure a plant overview control in the overview screen.

To directly jump to the alarms of the "Filling Tank" plant object in runtime, create the alarm control as companion control to the "Plant overview" control. The alarm control is configured in the next step.

Procedure

1. Change to the project tree.
2. Under "Project tree > Devices", create an "Overview" screen.
3. Configure the "Plant overview" control in the "Overview" screen.
4. Also add the "Alarm control" and "Screen window" controls as companion controls to the "Overview" screen.

Result

You have configured an overview screen and added a screen window and an alarm control. Next, configure the alarm control.

15.3.8.8 Example: Configuring analog alarms for temperature monitoring

Task

The temperature of the beer brewing ingredients in the brewery must be strictly maintained. One of your tasks is to configure the temperature monitoring of the filling tank.

The following requirements apply to temperature monitoring of the filling tank:

- The setpoint for the temperature is 5 °C.
- When the temperature rises above 5 °C, the operator of the plant is notified.
- If the temperature reaches 7 °C, the operator is notified immediately. The operator has to confirm the notification.

Temperature deviations of the filling tank should be output on the HMI device.

You plan several escalation levels for the alarms to be output according to the requirements:

- Temperature is at 5 °C.
- Temperature is above 5 °C: An alarm that does not require acknowledgment is output.
- Temperature exceeds the critical temperature of 7 °C: An alarm that requires acknowledgment is output.

The temperature sensor of the filling tank returns analog values. Use these values to specify the triggers. The triggers determine when an alarm is triggered.

Requirement

- A trigger tag is configured for temperature monitoring, for example, "temperature".
- The "Filling Tank" plant object type is open.
- The "Analog alarms" editor is open.

Procedure for creating an alarm for exiting the setpoint range

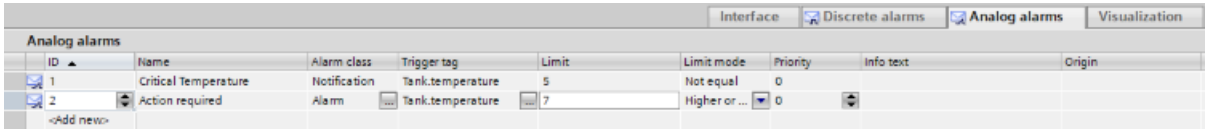
1. Create a new alarm and call it "Critical Temperature", for example.
2. Select the alarm class "Notification".
   Alarms of this alarm class do not require acknowledgment.
3. Select the trigger tag.
4. Define the trigger with a limit "5".
   This corresponds to the setpoint of 5 °C. Limits are always without units. The physical unit depends on the plant component which delivers the values.
5. Configure "Not equal" as the mode limit.
   When the value of the trigger tag is not equal to 5, an alarm is output.

Procedure for creating an alarm for exceeding the critical temperature

1. Create the "Action required" alarm.
2. Select "Alarm" as the alarm class.
   Alarms of this alarm class are displayed flashing in red on the HMI device and require acknowledgment.
3. Define the trigger with limit "7".
   This corresponds to a critical temperature of 7 °C.
4. Configure "Higher" as the mode limit.
   When the value of the trigger tag is higher than 7, an acknowledgeable alarm is output.

Result

You have configured alarms for the temperature monitoring:



See also

Configuring analog alarms for plant objects (Page 7091)

15.3.8.9 Example: Configuring the alarm control for fill level monitoring

Task

The configured alarms for temperature monitoring are to be output in an alarm control in runtime.

To filter by plant object alarms in the alarm control, configure a filter with the criterion "Area" with one of the following two conditions:

- "Equal" - only shows the alarms of the selected plant object in runtime.
- "Begins with" - shows the alarms of the underlying objects of the selected plant object in runtime.

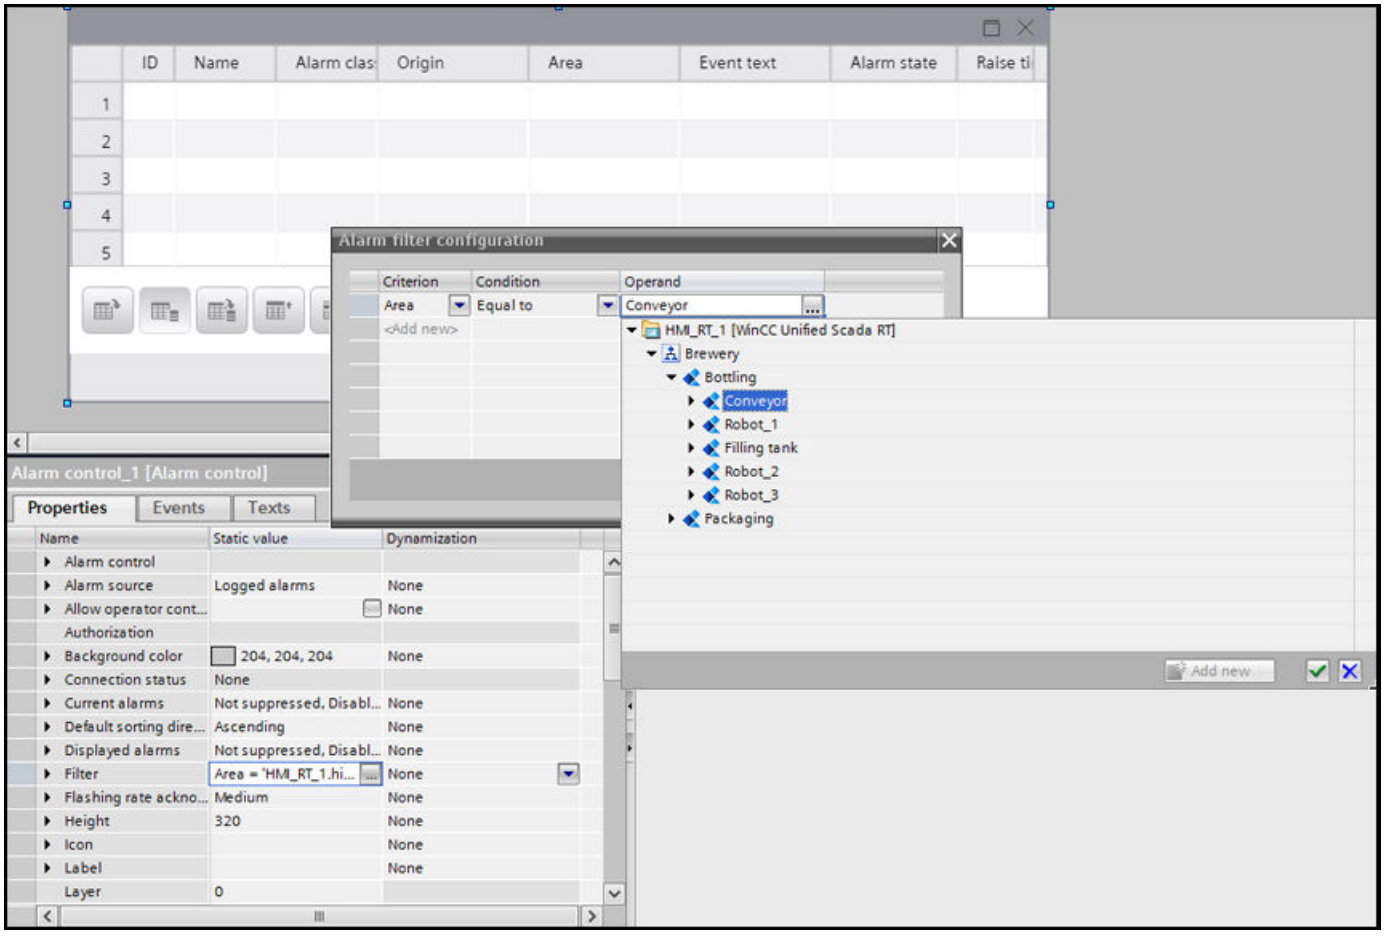
Requirement

- The "Overview" screen is created and open for editing.
- Configure a "Plant overview" control in the "Overview" screen.
- The "Alarm control" control is created as companion control of the plant overview.

Configuring a filter for the "Filling Tank" plant object

To filter by alarms of the "Filling Tank" plant object in the alarm control, configure a filter as follows:

1. In the Inspector window under "Properties > Filter", click in the "Static value" column. The "Alarm filter configuration" dialog box opens.
2. Select the "Area" criterion.
3. Select the condition "Equal".
4. Click on the selection list in the "Operand" column.
5. Select the "Filling Tank" plant object whose alarms are to be displayed in runtime.



Result

You have configured an alarm control for alarms of the "Filling Tank" plant object. The alarms of the plant object can be displayed in runtime.

15.3.8.10 Example: Configuring a trend view for temperature monitoring

Introduction

To visualize the tag values of the temperature monitoring in runtime, you have added a trend view in the "Overview" screen. You can display the current temperature of the "Filling Tank" plant object with the trend view.

Requirement

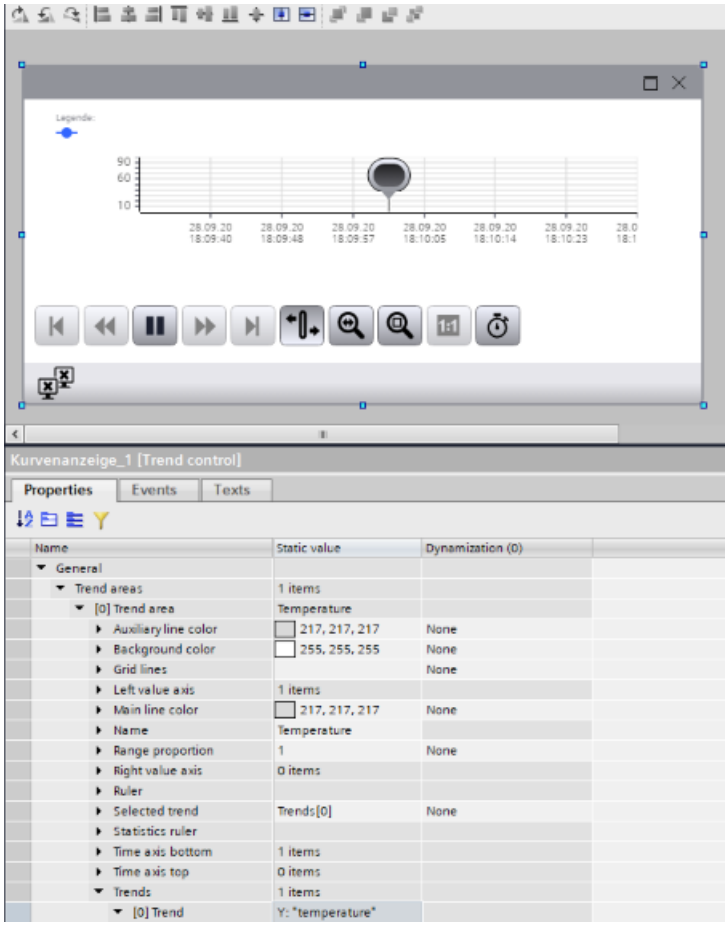
- The HMI tag for temperature measurement has been configured, for example "temperature".
- The "Overview" screen is open for editing.

Configuring the trend area and axes

1. Create a trend view in the "Overview" screen by dragging the control from the "Tools" task card to the screen.
2. Go to "Properties" and set the required height, width and position of the trend view.
3. Open the "Trend areas" group under "Properties".
   The index numbers of the trend area are displayed.
4. Expand the index number of the trend area.
   The properties of the trend area are displayed.
5. Define the colors for displaying the trend area and the reference lines.
6. Configure the time axis and value axis settings under "Bottom time axis" and "Left value axis".

Configuring trends

1. Go to "Properties > Properties > General > Trend areas > [0] trend areas > Trends" and click on the selection button in the "Static value" column.
   A dialog opens.
2. Click "Add" in the "Index" column.
   This adds another trend. Close the dialog.
3. Expand the index number of the trend [0]. The trend settings are displayed.
4. Specify the name of the trend under "Display name", for example "Temperature".
5. Under "Data source Y > Source", select the "temperature" tag in the "Static value" column.
6. Configure the line color for the trend, for example, blue.



Result

The trend control is now configured. In runtime, you monitor the temperature changes over time based on the trend.

Configure an additional value display if you want to evaluate the data of the trend control in runtime. You can also configure the value display as a "Ruler".

15.3.8.11 Example: Configuring the logging of production values

Task

You want to log the temperature values of the "Filling Tank" plant object to be able to use them later for controls, for example.

To this end, you create a logging tag for the data member you want to log. This logging tag is saved in the data log of the assigned device.

You can analyze the logged tag values directly in your project, such as in a trend view, or in another user program, such as Excel.

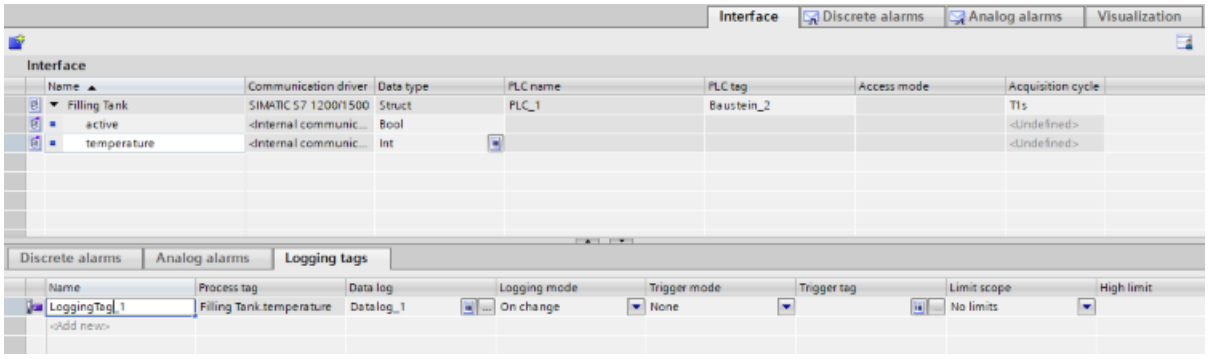
Logging tags are created for the plant object types. This means that the plant objects are automatically supplied with the logging tags of the plant object types.

Requirement

- The "Brewery" plant view has been created and assigned to a device.
- The "Filling Tank" plant object type is created, and the "temperature" member has been configured.

Procedure

1. Open the "Conveyor" plant object type.
2. Under "Interface", jump to the "Logging tags" tab in the middle part of the work area.
3. Under "Interface" select the "Rate" data member, for example, to log it.
4. Click "Add" under "Logging tags".



A logging tag is created.
The logging tag is linked to the tag. The data type of the logging tag corresponds to the data type of the connected tag.

5. Specify the logging mode, for example, "Upon change".
6. Define the tag trigger depending on the logging mode.
7. Define the limit values.
8. Define the smoothing.

Additional information on logging tags and logging is available under "Visualizing processes with Runtime Unified".

Result

You have created a logging tag that logs tag values for the defined period and within the parameters you have specified.

15.4 Visualizing plant objects in runtime

15.4.1 Displaying plant objects in runtime

Overview

Depending on your configuration, the following possibilities are available to you in runtime:

- Screen navigation via the plant model
- Analysis based on plant objects
- Filter alarm control by plant objects
- Display alarm status of a line and navigation to the alarm source
- Display the most frequently occurring alarms, filtered by plant object or plant object type
- Area-based access protection
- Determine the energy consumption of a line and compare with another line

You can display the configured plant hierarchy in runtime using the "Plant overview" control. If a screen window was configured as companion control for the "Plant overview", you can navigate between the screens of the plant objects and show them alternately in the screen window.

Display process data of the plant objects in a trend control. Switch between the following display modes directly in runtime:

- Device view and plant hierarchy
- Online values and log values

You can view alarms on plant objects in an alarm control.

Display process data of the plant objects in a trend control (Page 7116)

Displaying alarms for plant objects in runtime (Page 7120)

15.4.2 Operating "Plant overview" in runtime

Introduction

Display the configured plant view in runtime using the "Plant overview" controls.

You use it to navigate to the plant objects within the plant structure and get an overview of your plant at one glance.

If you have configured screens or alarms for the lower-level plant objects and have linked them to the "Plant overview" control, display these screens and alarms in runtime.

If you have configured events for the "Plant overview" control and linked these to scripts, the scripts are called when the events occur.

An event can, for example, be linked to the operation of the buttons in the control.

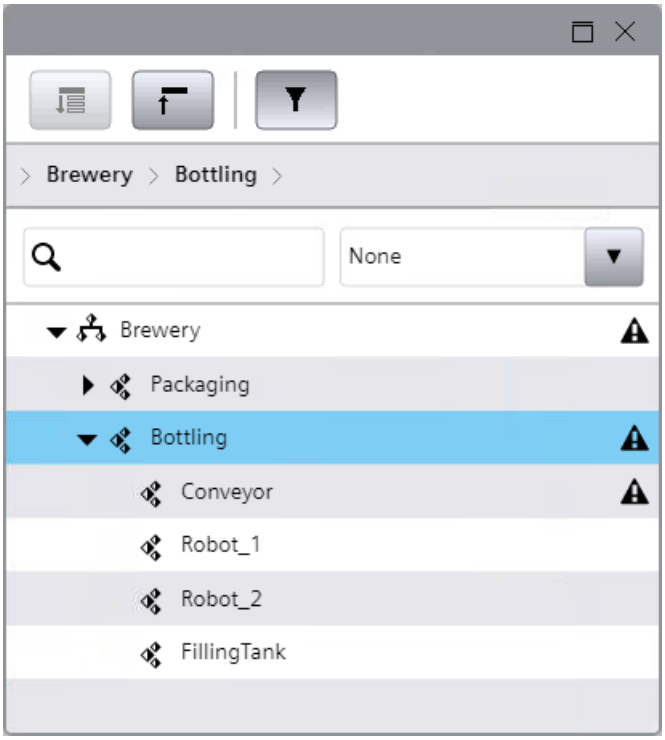
Requirement

- The plant view has been created and assigned to a device.
- The "Plant overview" control and the corresponding companion controls are configured in the screen of the assigned device.
- Runtime is active.

Procedure

The plant view is displayed in the "Plant overview" control.

1. To display all lower-level plant objects, click [[ICON]] "Expand all".
2. To display the configured screen or screen window for a selected plant object, click on the respective plant object in the "Plant overview" control.
3. In case of an alarm, the plant path of the alarm source is displayed in the "Range" column of the connected alarm view.
   The alarm icon only appears an alarm has actually occurred at the respective plant object. The alarm icon disappears again when the alarm is no longer present.



See also

Configuring screens for plant objects (Page 7080)

Displaying alarms for plant objects in runtime (Page 7120)

Display process data of the plant objects in a trend control (Page 7116)

Displaying plant objects in runtime (Page 7113)

15.4.3 Display process data of the plant objects in a trend control

Introduction

The process data or the logging data of the plant objects are displayed graphically in a trend control in runtime.

You switch between the following display modes in runtime:

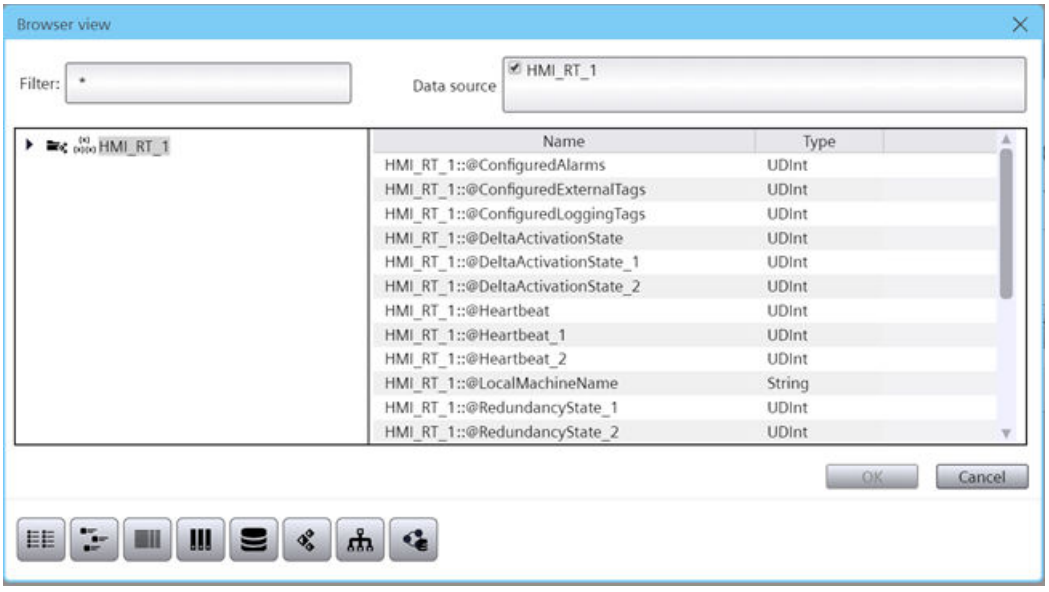
- Device view and plant hierarchy
- Online values and log values

Requirement

- The plant hierarchy has been created and assigned to a device.
- A trend control is configured in the screen by the assigned device.
- The "Select data connection" button is displayed in the control.
- The "Select context" button is displayed in the control.
- Runtime is active.

Display process data of the plant objects

1. Click "Select data connection" in the trend control.
   A "Selection of logs/tags" dialog opens.
2. To open the list of available tags, click "Tag".
   The "Browser view" dialog opens.



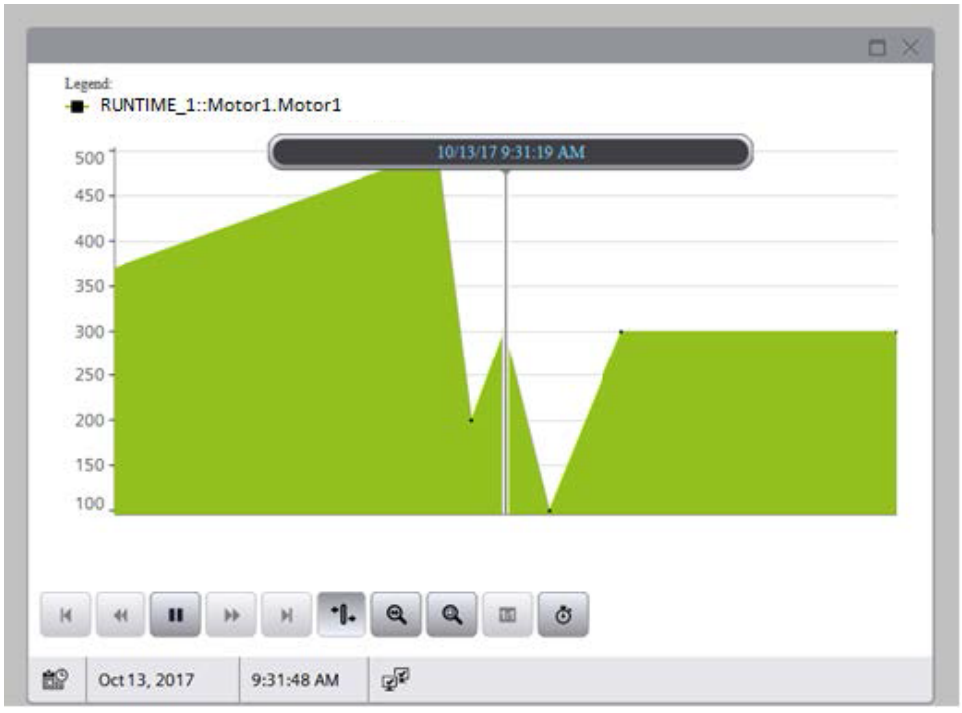
3. To jump to the plant view dialog, click on the "CPM" icon in the toolbar.
   The plant objects and the available data members for the plant objects are displayed.

Note

If you have assigned a descriptive display name for the trend when you configured the trend control, only the display name is shown in runtime. All plant objects are visible at a glance in the selection list.

4. Select the respective plant object whose process data you want to display in the trend control.

5. Select the data members that you want to display as trend in the trend control.
6. Confirm with "OK".
   The process values for the selected plant object are displayed in the trend control.



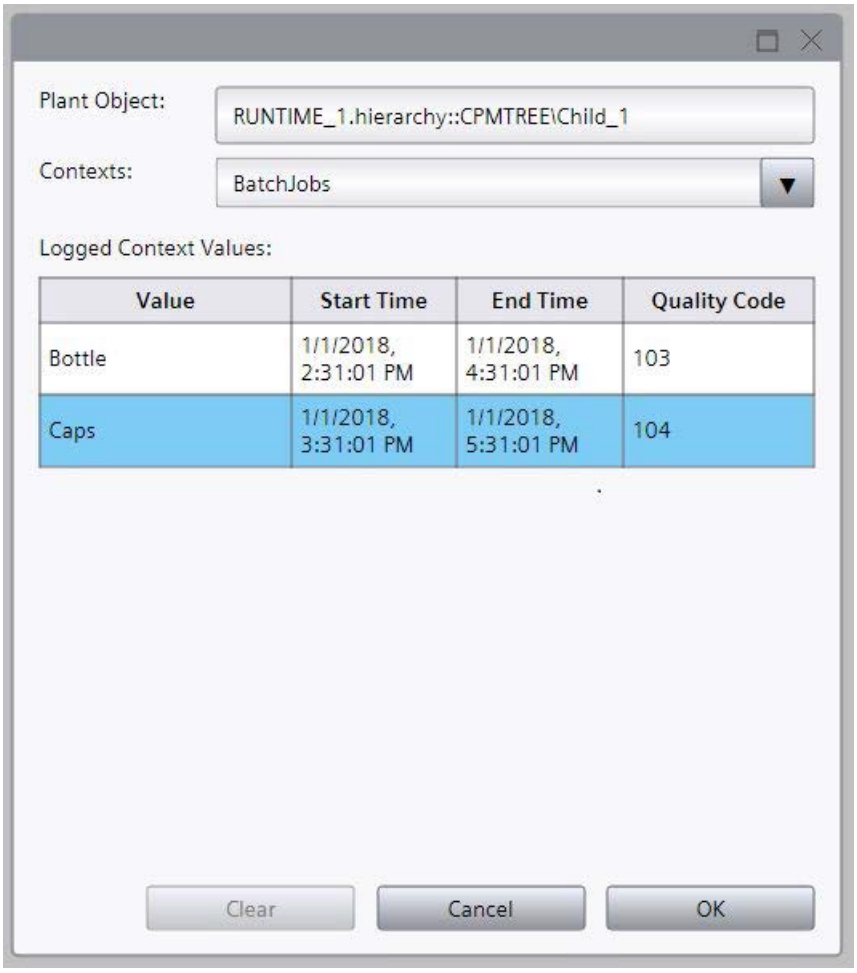
Display context data of the plant objects in a trend control

For analysis purposes, display the value range of the resulting data using the context data.

The evaluation is relevant, for example, in connection with WinCC Unified Performance Insight to analyze the effectiveness or the fault rate of the plant.

1. In the trend control, click "Select context".
   The "Trend context" dialog opens.
2. In the "Plant objects" selection list, select the respective plant object whose data you want to display in the trend control.
3. In the "Context" selection list, select the data assigned to the plant object.
   The list of the data appears under "Logged context values".

4. Select the value that you want to display.
5. Confirm with "OK".



The trend control displays the trends for the selected data.

Contexts (Page 7063)

15.4.4 Displaying alarms for plant objects in runtime

Introduction

The "Alarm control" object displays alarms that occur during the production process in a plant.

Depending on your configuration, the following possibilities are available to you in runtime:

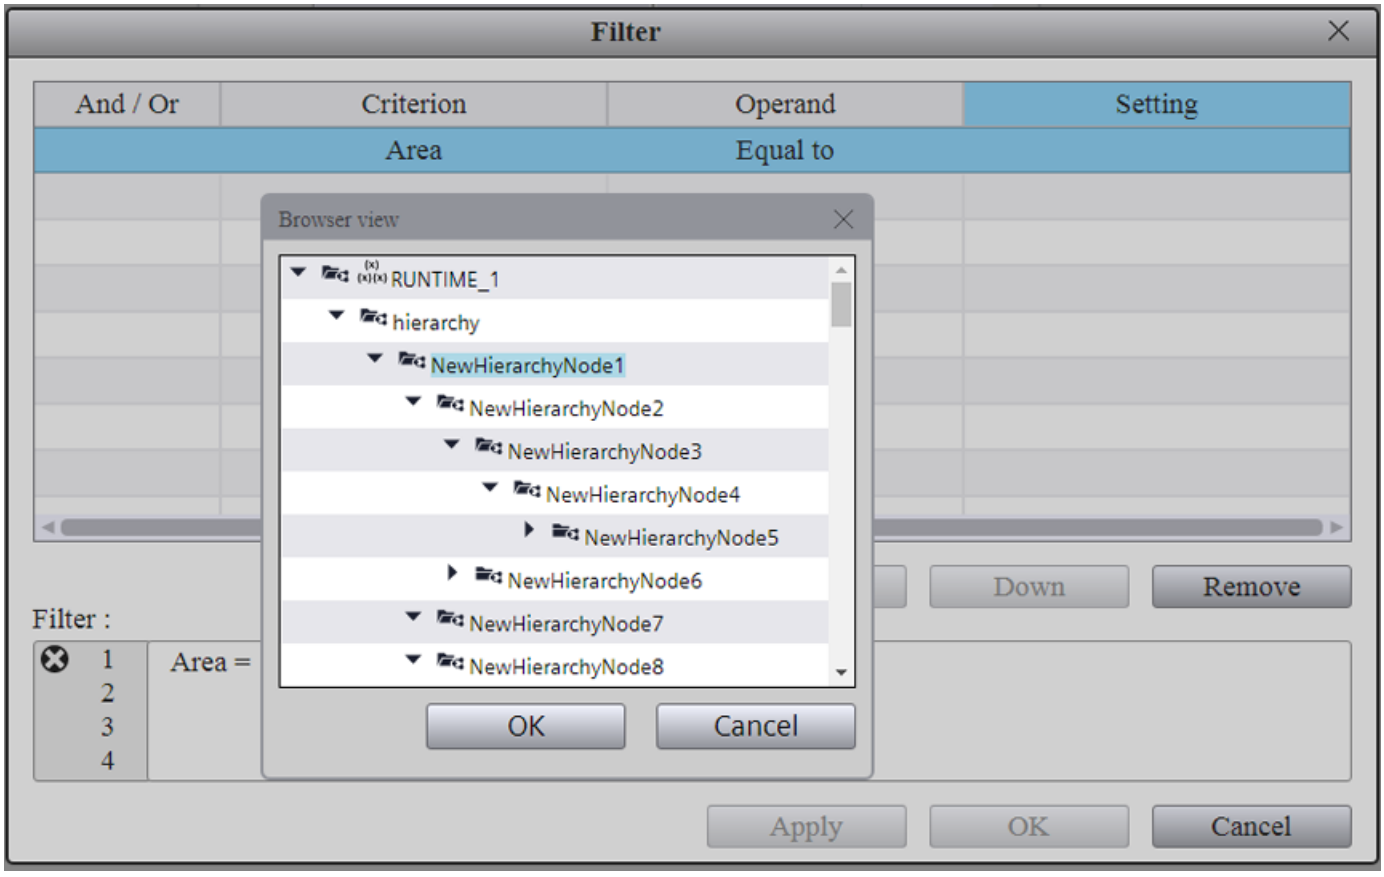
- Display hierarchy path of the alarm source
- Filter alarm control by plant objects
- Display alarm status of a line
- Navigate to the alarm source
- Display the most frequently occurring alarms, filtered by plant object or plant object type

Requirement

- The plant hierarchy has been created and assigned to a device.
- An alarm control with the filter "Range" is configured in the screen by the assigned device.
- Runtime is active.
- The alarm view has been configured.
- Runtime is active.

Filter alarms by plant objects

1. If you want to filter alarms by plant objects, click "Selection display" in runtime.
   The "Selection" dialog opens.
2. Under "Criterion", select the criterion "Range".
   All plant objects of the plant hierarchy are displayed.
3. Select the respective plant object to which you want to display the alarms.



Only alarms for the selected plant object are displayed in the alarm control.

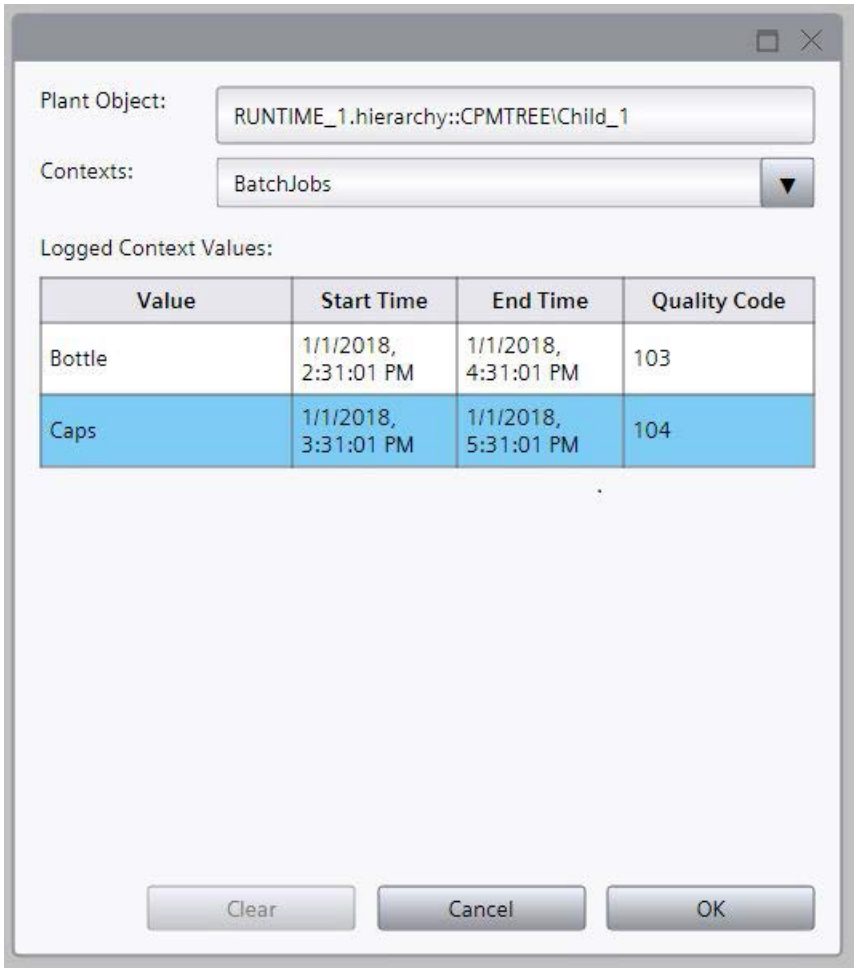
Display alarm context of the plant objects

For analysis purposes, display the value range of the resulting data using the context data.

The evaluation is relevant, for example, in connection with the WinCC Unified Performance Insight to analyze the effectiveness or the fault rate of the plant.

1. In the alarm control, click "Select context".
   The "Alarm context" dialog box opens.
2. In the "Plant objects" selection list, select the respective plant object whose data you want to display in the alarm control.
3. In the "Context" selection list, select the data assigned to the plant object.
   The list of the logging data appears under "Logged context values".

4. Select the value that you want to display.



5. Confirm with "OK".
   The alarm control displays the alarms that match your selection.

Note

Make sure that the filter settings match the setting of the alarm context.

If no alarms appear in the alarm control, check your settings by clicking "Selection display".

15.5 Options

15.5.1 Plant Intelligence Options

Overview

The Plant Intelligence options offer optional enhancements to the WinCC Unified Basic System. These can be combined freely in line with your requirements.

The options allow you to plan production processes and analyze and optimize the overall effectiveness of your plant. In addition, you can design flexible production processes and coordinate complex and interlinked production processes.

Plant Intelligence options

- WinCC Unified Performance Insight
  Define, calculate and analyze plant-specific key performance indicators (KPIs) for individual aggregates, machines or entire production lines in machine-oriented or line-oriented manufacturing plants.
- WinCC Unified Calendar
  Plan, configure and manage events and actions together in a shared calendar in WinCC and combine these with WinCC tags or scripts.
- WinCC Unified Sequence
  Control step-based and sequence-based processes, define the production steps of the production units and adapt the production processes flexibly in runtime.
- WinCC Unified Line Coordination
  Coordinate and supervise processes in the production line in your plant. Control and manage recipes, processes and jobs for the production of various end products.

Note

The Plant Intelligence options are successively released as add-on packages. To use the Plant Intelligence options, you require the relevant software packages and licenses.

You can find information on the licenses in the TIA Portal installation instructions in the section "Licensing of Plant Intelligence options".

Requirements

Please note the following requirements for using the options:

- SIMATIC WinCC Runtime Unified is installed.
- STEP7 Professional is installed.
- Plant Intelligence option, including license, is installed.
- The plant hierarchy is configured.
- License for the respective option is available.
- The configuration engineer has WinCC experience.

Compiling and loading 16

16.1 Basics

16.1.1 Overview

Introduction

To generate an executable runtime project from the configuration data of an HMI device, you must compile the project. You can then transfer the runtime project to the HMI device. This section explains the terms used in this context.

Project

In the context of compiling and downloading, the term "project" is used as follows:

- WinCC project: Contains the configuration data of one or more HMI devices in the engineering system
- Runtime project: Contains the compiled configuration data of an HMI device.

Runtime

In runtime, you execute the project in process mode.

A distinction is made depending on the HMI device:

- Runtime on a panel
  The runtime software for process visualization runs on the HMI device.
  Before you run a runtime project on a panel, you have to transfer the runtime project to the panel.
- Runtime on a PC
  WinCC Unified PC RT is the runtime software for process visualization.
  If Runtime has been installed on the configuration PC, you can execute the runtime project directly on the configuration PC.
  If you want to execute the runtime project on a different PC, you have to transfer the runtime project to the PC.

Compiling and loading

To compile a project means generating a runtime project from the WinCC project.

Downloading a project means transferring the runtime project from WinCC to an HMI device.

Simulation

With a simulation, you test the configuration, for example, configured internal tags or a screen change. You simulate the project on the configuration PC.

See also

Using WinCC version compatibility (Page 187)

16.1.2 Power Tags

Tags that have a connection to the PLC are called Power Tags.

Information on the Power Tags used is helpful to

- Know when the limits of the system are reached
- Be able to estimate the performance
- Be able to estimate the system load through communication

Information on Power Tags used

The number of Power Tags used is displayed in the Inspector window during the following operations:

- A device is compiled.
- Only changes for a device are compiled.
- A device is loaded.
- Only changes for a device are loaded.

16.1.3 Workflow

Introduction

This section provides an overview of the work steps from creating the WinCC project to displaying runtime on the HMI device.

They work with various applications:

- WinCC Engineering System in the TIA Portal
- WinCC Runtime system on a Unified PC or Unified Comfort Panel

- If the HMI device is Unified PC:
  - SIMATIC Runtime Manager
    You manage the Runtime projects in Runtime Manager.
    You can find additional information in the runtime help in the "SIMATIC Runtime Manager" manual.
  - WinCC Unified - Configuration
    In WinCC Unified - Configuration, you check and manage the settings for secure communication in Runtime.
- If the HMI device is a Unified Comfort Panel:
  - Control Panel
    In the Control Panel, you can start and stop the Runtime project or define a time interval after which the Runtime project starts automatically. You manage the transfer settings in the Control Panel.

Configuration in the engineering system

You start the configuration in the engineering system.

1. Create a project.
2. Add one of the following HMI devices:
   - PC General with the HMI application WinCC Unified PC
   - Industrial PC with the HMI application WinCC Unified PC
   - SIMATIC Unified Comfort Panel
3. Configure the required contents of the HMI device.
4. Check the runtime settings of the HMI device, especially the settings for secure communication.

Compiling and loading

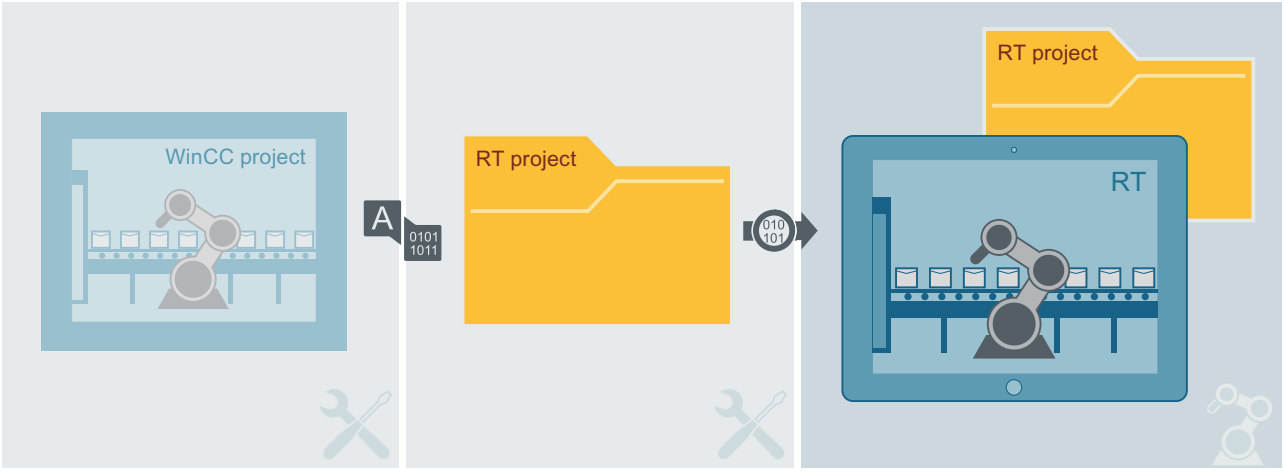
Then compile your WinCC project into a runtime project and download it to the target HMI device. Before you start the download, check to ensure that the settings for secure communication in the Engineering System and runtime are compatible.

1. Compile the WinCC project.
2. Download the runtime project directly to the HMI device:
   - When you first download the project, set up the connection to the HMI device before you start downloading.
   - When you download the project again, you can either download it completely or changes only.

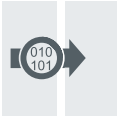
   For Unified PC, you can also copy the project onto an external storage medium and transfer it to the HMI device via the storage medium. You can download the complete project or download only changes.

Note

Not all changes can be loaded in Runtime with the option "Download to device > Software (only changes)". A list of changes and actions that require complete compiling and complete download can be found under "Restrictions in compiling and loading changes (Page 7132)".



The configuration data are compiled.



The runtime project is loaded.

Starting the runtime project

Before you start downloading the project, you specify in the "Load preview" dialog whether the project is started in runtime after the download.

Depending on the HMI device, you have the following options to start the project at a later time:

- Unified PC: To start the runtime of the project later, use the SIMATIC Runtime Manager.
- Unified Comfort Panel: Depending on the configuration, the project starts automatically after the delay time specified in the Control Panel.
  If the project does not start automatically, click "Start Runtime" in the Control Panel.

Displaying screens in runtime

Depending on the HMI device, runtime is displayed as follows:

- Unified PC: You can see Runtime in the browser. The user must be logged on in runtime.
- Unified Comfort Panel: Runtime is displayed on the HMI device after the start.

See also

Loading project encrypted (Page 7130)

Loading project unencrypted (Page 7131)

16.1.4 Secure communication

Introduction

You download your Runtime projects encrypted and password protected using secure communication.

The following components are involved:

- Engineering System on the configuration PC: You manage the "Encrypted transfer" option under "Runtime settings" of the created HMI devices.
- Runtime on the HMI device
  - Unified PC: You manage the "Secure download" option during the installation of the runtime software or in the "WinCC Unified - Configuration" application.
  - Unified Comfort Panel: You set the password for encrypted transfer to the HMI device in the Control Panel under "Service and Commissioning > Transfer".
- SIMATIC Runtime Manager (only for Unified PC): The password is specified in the settings of the Runtime Manager under "General > Secure connection".
  If the "Secure download" option is enabled in Runtime, data exchange is only possible if the identical password is stored in the Runtime Manager.
  You can find more information in the runtime help in the "SIMATIC Runtime Manager" manual.

  Note

  If the passwords in the Runtime Manager and Runtime do not match, the project cannot be managed in the Runtime Manager.

Runtime is encrypted and password-protected when the "Secure download" option is selected. The data exchange with Runtime is only possible in the engineering system if authentication was successful. The password must be available in the runtime settings of the HMI device and it must match the password in runtime.

Password

The password must meet the following criteria:

- A length of 8 to 120 characters
- At least one special character
- At least one number
- At least one lowercase letter
- At least one uppercase letter

Settings for encrypted transfer in the Engineering System

By default, the encrypted transfer is enabled in the runtime settings of the HMI device.

In the runtime settings of the HMI device under "General > Encrypted transfer", make the following settings:

- Entering a password in the engineering system
- Allow transfer of initial password via unencrypted loading
- Deactivate encrypted transfer

Multiple runtime projects in one runtime

When you download multiple runtime projects to one runtime with WinCC Unified PC, assign the same password in the runtime settings of the created HMI devices in the engineering system. This password must match the password stored in runtime.

See also

Loading project encrypted (Page 7130)

Loading project unencrypted (Page 7131)

16.1.5 Loading project encrypted

Introduction

If you want to use secure communication, the encrypted transfer must be enabled in the runtime settings of the HMI device. The password must be entered once and confirmed.

Depending on the configuration of runtime, we distinguish between two cases:

- "Secure download" is configured in runtime.
- "Secure download" is not configured in runtime.

"Secure download" is configured in runtime

If the password was configured in WinCC Unified Configuration or during the installation of the runtime software, the option "Allow transfer of initial password via unencrypted loading" is not needed.

If the password in the engineering system matches the password configured in runtime, the project is loaded encrypted.

Note

Deviating passwords

If the passwords in the runtime settings of the HMI device and in runtime are different, you will have the opportunity to enter the password stored in runtime in the "Load preview" dialog before you download the project. If the input was successful, the password in runtime is replaced by the password in the runtime settings of the HMI device.

The project is loaded encrypted.

To use the Runtime Manager, update the password in the settings of the Runtime Manager.

"Secure download" is not configured in runtime

If the option "Secure download" is not configured in runtime, you can activate the option "Allow transfer of initial password via unencrypted loading":

- The runtime project is initially loaded unencrypted.
- Secure download is activated.
  The password entered in the runtime settings of the HMI device is written to the runtime configuration.
  The change can be verified in WinCC Unified Configuration.
- The runtime project is loaded encrypted for all subsequent download operations. The option "Allow transfer of initial password via unencrypted loading" is no longer taken into account.
- To use the Runtime Manager, update the password in the settings of the Runtime Manager.

If the option "Allow transfer of initial password via unencrypted loading" is not enabled, the runtime project is not loaded. An error message is displayed in the "Load preview" dialog.

See also

Secure communication (Page 7129)

Loading project unencrypted (Page 7131)

16.1.6 Loading project unencrypted

If encrypted transfer is disabled in the runtime settings of the HMI device, a distinction is made between two cases, depending on the configuration:

- "Secure download" is configured in runtime.
  The project is not loaded.
  An error message is displayed in the "Load preview" dialog.
  The encrypted transfer must be enabled in the runtime settings of the HMI device.
- "Secure download" is not configured in runtime.
  The project is loaded unencrypted.

See also

Secure communication (Page 7129)
Loading project encrypted (Page 7130)

16.1.7 Restrictions in compiling and loading changes

Compiling and loading changes

Many changes to the configuration can be compiled and loaded in Runtime with the options "Compile > Software (only changes)" or "Download to device > Software (only changes)". After some changes or actions, however, the project must be completely compiled or completely loaded.

NOTICE
Option to compile and load changes is lost Please note the following instructions for compiling and loading changes: • A dialog is often displayed when the option to compile only changes is about to be lost. The change can be confirmed or rejected. When you reject the change, the option to compile and load changes is retained. • When you use the "Undo" button to undo a change that requires complete compiling or loading, the project must still be completely compiled or loaded. • For the relevant changes and actions, an alarm is displayed in the Inspector window when the option to load changes is already lost. The project must be downloaded completely.

Complete compilation or loading may be necessary under the following circumstances:

- Creating, changing or deleting configuration data
- Actions that directly affect the compiling and loading (e.g. starting a simulation)
- System-dependent conformity errors (for example, through the installation of an update that must update the resultant compilation data or owing to the compilation crashing)

Note

Complete compilation always requires complete loading.

The following changes or actions require complete compilation or complete loading:

Area of the change or action	Complete compilation required	Complete download required
Tags	• All changes to the configuration of complex tags of the Array or Struct data type	• Renaming simple tags • Changing the data type for simple tags
Styles	• Creating styles • Changing styles • Deleting styles	-
Connections	• Creating connections • Changing connections • Deleting connections	-
Cycles	• Creating cycles • Changing cycles • Deleting cycles	-
Plant objects and plant views	• Creating plant objects and the plant view • Changing plant objects or the plant view • Deleting plant objects or the plant view	-
Logging	• Creating the first data log by creating system tags • Changing a data log • Deleting a data log • Creating an alarm log • Changing an alarm log • Deleting an alarm log	• Changing a log name • Changing the path when using the backup • Changing the data type of the tag to which the logging tag is linked. • Changing the logging mode • Changing the compression mode • Changing the source for using compression
Audit	• Changing the Audit Trail	• Activating the GMP-compliant configuration • Deactivating the GMP-compliant configuration • Changing the Audit Trail name • Changing the Audit Trail storage medium • Changing the Audit Trail storage directory
Unified Collaboration	• All changes in the Runtime settings under "Collaboration"	-
Language & font	• All changes in the runtime settings under "Language & Font"	-
Identification	• Renaming the WinCC Unified PC RT: Renaming changes the Runtime ID. The Runtime ID can be viewed in the Runtime settings under "General".	-

Area of the change or action	Complete compilation required	Complete download required
UMC (User Management Component)		• Creating a local user • Changing a local user • Deleting a local user • Creating a role • Changing a role • Deleting a role • Switching between local and central user management
Alarms	-	• All changes to alarm classes • Changing the alarm class for discrete alarms or analog alarms • Changing the name, alarm class or the range for alarms from OPC UA A&C
Resource lists	-	• Renaming text lists • Renaming Graphic lists
Simulation	-	• When you load the project in runtime mode and then load the same project in simulation mode, the simulation must be loaded completely. • When you load the project in simulation mode and then load the same project in runtime mode, the project must be loaded completely.
Reporting		• Changing the Runtime settings for reporting
Dynamic SVG types		• Manual assignment of a version number to a type

Compiling a project (Page 7145)

16.2 Unified Comfort Panel

16.2.1 Specifying runtime settings

16.2.1.1 Introduction

Before you compile and download a project, update the runtime settings of the HMI device. You specify the Runtime languages, for example, or activate collaboration.

To edit the runtime settings for an HMI device, open "Runtime settings" in the project tree below the HMI device.

16.2.1.2 General

Identification

The runtime ID is the unique identification of a runtime project. Based on the runtime ID, you can determine whether a project has already been downloaded to the HMI device.

Encrypted transfer

To download the project encrypted, the same password must be stored in the runtime settings and in runtime. Alternatively, transfer the password unencrypted during the initial download.

Screen

Under "Screen", you specify the start screen and the style of the HMI device.

The start screen is displayed after runtime start.

Select the screen resolution. The setting of the HMI device is used by default.

Note

Display of a changed start screen

You have defined a start screen in the project and started runtime. When you define another start screen and download only changes to the device, the last active screen is displayed in runtime.

After reloading the project, refresh the screen in Runtime.

See also

Secure communication (Page 7129)

16.2.1.3 Alarms

Controller alarms and diagnostics

Note

WinCC only supports controller alarms of a SIMATIC S7-1500. WinCC only supports controller alarms that are automatically updated by the central alarm management in the PLC.

One or several HMI connections to a PLC are shown in "Controller alarms".

You can manage the following options:

- "Display classes":
  You filter the controller alarms via display classes. You specify for each connection which display classes are displayed on the HMI device.
- "Automatic update":
  Controller alarms are automatically updated on the HMI device.
  Requirement: The option "Central alarm management in the PLC" must be enabled.
- "System diagnostics":
  System diagnostic alarms can be displayed in runtime.
  Requirement: The "Automatic update" option must be enabled.
- "Security events":
  Security events can be displayed in runtime.
  Requirement: The "Automatic update" option must be enabled.

State texts

You specify the state texts of alarms in the runtime settings. The state texts are displayed in runtime in the alarm control.

Specify the state texts in other languages under "Languages & Resources > Project texts".

See also

Configuring the display of security events (Page 795)

Configuring state texts of alarms (Page 733)

Configuring the display of system diagnostic alarms (Page 767)

Filtering controller alarms via display classes (Page 748)

16.2.1.4 Services

SMTP communication

SMTP communication enables automatic sending of e-mails when events occur.

Specify the port for SMTP communication.

16.2.1.5 Language & font

Runtime language and font selection

You configure project languages that are available as runtime languages for the respective device. You also define the order in which the languages are switched.

At Runtime start, the language that has the lowest number in the "Order" column under "Runtime settings > Language & font" in the TIA Portal is used. You change the order with  .

The fixed font 1 is always provided for the respective HMI device.

When you enable the option "Enable for logging" for a language, alarm texts are logged in the respective language. To keep the size of the log relatively small, log only alarm texts in the required languages.

See also

Editing log contents with scripts and system functions (Page 850)

Enabling the runtime language (Page 246)

16.2.1.6 Remote access

Collaboration

General settings

- Select the "Enable collaboration" check box.

Identification

The following information must be unique for all devices participating in a collaboration:

- System ID:
  The system ID must be unique for each device participating in Unified Collaboration, as this ID is used for communication between the devices.
- Collaboration name:
  Assign a collaboration name or select "Generate collaboration name automatically".
- IP address / Host name

Connect actively to

A list of all HMI devices available for collaboration with system ID and IP address / host name is displayed. You select the HMI devices to which the current HMI device provides collaboration.

Note

Collaboration is enabled in both directions

The HMI device that you selected under "Connect actively to" can display screens of the current HMI device and vice versa. Collaboration is always enabled in both directions, even if you only have the connection activated for one collaboration device.

See also

Defining collaboration settings (Page 7572)

Web Client

Web client configuration

When you activate access via web client, you can access the runtime of the Unified Comfort Panel from any browser.

Smart Server

Smart Server configuration (only available for Unified Comfort Panel)

When you activate the Smart Server, you enable remote access to the Unified Comfort Panel via the Smart Client application.

Users

You set passwords for up to two users and enable the users for remote access to the control panel of the Unified Comfort Panel.

Communication

- You enable or disable the use of self-signed certificates by selecting or clearing the check mark.
- Port configuration
  You enable or disable the automatic port configuration by selecting or clearing the check mark.
  If you want to specify a manual port for access from desktop applications, enter the port number.

See also

WinCC Smart Server (Page 7606)

16.2.1.7 Storage system

Introduction

You specify the storage locations of the following databases:

- Database for tag persistency
- Database for data logging
- Database for alarm logging

NOTICE
Different storage locations cannot be used for Unified Comfort Panel When you specify a different storage location for a log in the "Logs" editor other than the main database storage location defined in the runtime settings of the HMI device, the log cannot be used.

You have the option of saving parameter set types on external storage media. If the databases for data logs or alarm logs and the parameter set types are stored on the same storage medium and the storage medium is changed while runtime is running, the parameter set types can be affected.

Note

Use different storage media for parameter set types and logging.

Database type

Unified Comfort Panel supports the "SQLite" database type.

Database storage location for tag persistency

You can specify tag persistency for internal tags. The last values of the persistent tags are used after Runtime has been started.

A separate database is used for tag persistency. The values of the tags are available again after restarting runtime or restarting or switching off the HMI device.

Specify the storage location of the database:

- Off
- SD-X51
- USB-X61
- USB-X62

If no storage medium is connected to the respective interface, an alarm is displayed in the alarm control.

If the log databases and the database for tag persistency are stored on the same storage medium and the storage medium is changed while runtime is running, tag persistency can be affected.

Note

Use different storage media for tag persistency and logging.

Location of the main database for data logging

Specify the storage location of the databases for data logging:

- Off
- SD-X51
- USB-X61
- USB-X62

You have the option of specifying a path on the storage medium.

If no storage medium is connected to the respective interface, an alarm is displayed in the alarm control.

Location of the main database for alarm logging

Specify the storage location of the databases for alarm logging:

- Off
- SD-X51
- USB-X61
- USB-X62

You have the option of specifying a path on the storage medium.

If no storage medium is connected to the respective interface, an alarm is displayed in the alarm control.

See also

Specify tag persistency (Page 636)

Storage locations of logs (Page 843)

16.2.1.8 Settings for tags

You have the option of synchronizing HMI tags with the connected PLC tags. The position of a data value in the structure of a data block is thus mapped in the HMI tag name. If necessary, the PLC name is set as a prefix. You synchronize the tags in the "HMI tags" editor.

You specify before the synchronization whether and under which conditions the names are synchronized.

Synchronization of the name of the PLC tag in the engineering station

To avoid conflicts within complex tag types, configure how the delimiters of the path specification from STEP 7 are replaced in WinCC during name synchronization:

- Replace delimiters
  Depending on your selection, the delimiters of all hierarchy levels are replaced during synchronization.
- Replace invalid characters
- PLC prefix
  The PLC name is set as a prefix to the HMI tag name. You set the option for each HMI connection.

Note

Duplicate tag names

If the generated tag name is already in use, a number is added in parentheses, e.g. Datablock_1_Static_2{1}(1).

Example

The "PLC1" controller contains the structured data block "DB1". The "Db1.a[1].b.c[3]" data block element is used in a picture. Depending on your settings, the HMI tag name is generated as follows:

Selected option	HMI tag name
PLC prefix	Plc1.Db1.a[1].b.c[3]
Replace dot and parenthesis with ; ( )	Db1;a(1);b;c(3)
Replace dot and parenthesis with _ { } PLC prefix	Plc1_Db1_a{10}_b_c{3}

See also

Synchronizing tags (Page 640)

16.2.1.9 Good Manufacturing Practice

Traceability and therefore the documentation of production data is becoming increasingly important in many sectors such as the pharmaceutical industry, the food and beverage industry, and the related mechanical engineering industry.

Therefore, sector-specific and cross-industry standards have been developed for the electronic documentation of production data.

The most important set of regulations is the FDA guideline 21 CFR Part 11 for electronic data records and electronic signatures issued by the FDA, the US Food and Drug Administration. In addition, different EU regulations apply, such as EU 178/2002, depending on the industry.

Requirements for production systems in these industries have been developed on the basis of 21 CFR Part 11 and the corresponding layout to comply with GMP (Good Manufacturing Practice). They are also required for other industries.

The following main requirements are derived from these directives and regulations:

- Creation of an Audit Trail or operating trace in runtime
  Based on this document, it is possible to trace the user who carried out the operator action on the machine at what time.
- Important process steps must also be assigned to a clear responsibility, for example, via an electronic signature.

GMP (Good Manufacturing Practice)

1. Enable GMP-compliant configuration.
2. If necessary, select a text list entry that contains the reason for the GMP-relevant tags.

16.2.1.10 User management

You specify whether you are using a local or a central user management. By default, the use of the local user management is specified in the engineering system.

Local users are only valid for this project.

You manage central users in the TIA User Management Component (UMC).

User administration configuration

- When you activate the local user management, you use the users and user roles that you have created under "Security settings > Users and roles" for management.
- When you activate the central user management, the users, user roles and their rights are applied from the TIA User Management Component (UMC). To access the UMC, you must specify the server address and the server ID.

See also

Local and central user management (Page 6889)

16.2.1.11 OPC UA server

General

OPC is a standardized manufacturer-independent software interface for data exchange in automation engineering. OPC UA is the technology succeeding OPC. OPC UA is platform-independent and supports different protocols as communication medium.

To work with OPC UA in WinCC Unified, the OPC UA server must be enabled in the TIA Portal in the Runtime settings of the HMI device.

Read/write tags and register tags/alarms

When you enable the "Operate as OPC UA server" option in the HMI device, the protection for unauthorized internal and external access is downgraded.

- Enable the "Operate as OPC UA server" option.
  A security note is displayed.

After enabling the option, all other settings of the OPC UA Server will become available.

Alarms and Conditions

- To display alarm conditions in the address range of the server, select the option "Enable Alarms and Conditions on the OPC UA server".
- To disable or acknowledge alarms on the OPC UA Client, for example, select the option "Allow operation of alarms on the OPC UA Client". To enable this option, the "Enable Alarms and Conditions on the OPC UA server" option must be enabled.

Options

General

Define the following settings:

- Port
  Default value: 4890
  Do not use a port number that is already assigned to another application.
- Maximum session timeout (s)
  Default value: 600000 s
- Maximum number of OPC UA sessions
  Default value: 100

Subscriptions

Define the following settings:

- Minimum publication interval (ms)
  Default value: 100 ms
- Maximum number of monitored items
  Default value: 0

Security

Secure connection

Security policies

CAUTION
Reduced security When the option "No OPC UA Server Security" is enabled, any OPC UA client can connect to the OPC UA server regardless of the following settings.

The following section contains a list of all security policies available on the server.

- Activate the required security policies.

User authentication

Guest authentication

- To allow access by anonymous users to the OPC UA server, enable the option "Enable guest authentication".
  An authentication by means of user name and password is not required.
  Security is restricted to the degree that you determine by assigning rights to this user.

Authentication by means of user name and password

- To allow access by users with user name and password to the OPC UA server, enable the option "Authentication with user name and password".
  If access to the OPC UA server is to require the user name and password, the user must be assigned the role "HMI Administrator". The "HMI Administrator" role has the system-defined "OPC UA - read and write access" function right. The settings made must then be synchronized with the user management in runtime.

16.2.1.12 Layers

Default names of the layers

Adjust the default names of the layers.

16.2.1.13 Reporting

Report system

For Unified Comfort Panels with device version V18, you make the settings for Reporting here.

"Enable Reporting"	You can create report templates based on this project or project report jobs and generate reports in Runtime only if reporting is enabled.	
"Storage location for the Reporting database"	The Reporting database stores the actions and settings made in Runtime in the "Reports" control.	
	"Storage location"	Select a storage medium.
	"Folder"	Enter the path to a folder of the storage medium. Use an existing folder. Use the Linux notation. The Reporting database is stored in the folder. Default folder: The project folder
"Storage location for reports"	Select the local main storage location for the generated reports.	
	"Storage location"	Select a storage medium.
	"Folder"	Enter the path to a folder of the storage medium. Use an existing folder. Use the Linux notation. The reports are stored in the folder. Default folder: "`media/simatic/<storage medium>/Reports`"

Note

Devices with a device version lower than V18

Unified Comfort Panels with a device version of lower than V18 always have the same settings:

- Reporting is enabled.
- The storage locations are predefined:
  Storage location for reports: `media/simatic/X51/Reports` folder on the SD card inserted in the panel.
  Storage location of the reporting database: The respective project folder under `media/simatic/X51` on the SD card plugged into the panel.

You cannot change the settings.

16.2.2 Compiling a project

Basics

Compilation results in a runtime project that is executable on the respective HMI device.

A project can be compiled explicitly or implicitly:

- Explicit: The compilation is started manually. Compile the entire project or only changes. Explicit compiling is described in the following section.
- Implicit: The project is downloaded without previous manual compilation.
  The project is compiled in the background even as you are configuring it in WinCC.
  This reduces the compilation times before downloading the project.

Note

Changes to S7 blocks are not automatically compiled in the background. If you are using HMI tags in the project that are connected to PLC tags, you should also compile all changed S7 blocks before you compile the HMI device.

Requirement

- A project is open.

Compiling changes of a project

1. Select an HMI device in the "Project tree".
2. There are two ways to start compiling the changes:
   - Press the "Compile" button in the toolbar.
   - Select "Compile > Software (only changes)" from the shortcut menu.

Compiling a project completely

1. Select an HMI device in the "Project tree" area.
2. Select "Compile > Software (rebuild all)" from the shortcut menu.

Note

When a project was compiled completely, the project must also be downloaded completely afterward.

Compiling projects of multiple HMI devices simultaneously

1. Select the HMI devices using multiple selection in the project tree.
2. To compile the changes to the projects, select the "Compile" button in the toolbar. Alternatively, select "Download to device > Software (only changes)" from the shortcut menu.
3. To compile the projects completely, select "Download to device" > "Software (rebuild all)" from the shortcut menu.

Result

The configuration data of the selected HMI devices is being compiled. If errors occur during compilation, the errors are shown in the Inspector window under "Info > Compile". Correct the errors and recompile the project.

Load the compiled project.

See also

Restrictions in compiling and loading changes (Page 7132)

Simulate Unified Comfort Panel (Page 7205)

Downloading projects (Page 7147)

16.2.3 Downloading projects

16.2.3.1 Basics for downloading projects

Introduction

During downloading, the compiled project is transferred to an HMI device. Only one project can be in runtime on an HMI device at a time.

Before the download, use the "Load preview" dialog to determine whether existing data is retained and whether logs are reset. The following data can be retained or overwritten:

- Runtime values:
  Tag values, active alarms and user data
- Logs:
  Data logs, alarm logs, Audit Trails and context logs

The HMI device name entered in the project tree is used for PROFINET communication. The use of the name corresponds to the default setting of the PROFINET interface of the HMI device. For devices with more than one PROFINET interface, the name of the IE CP is automatically added to the device name with a separating period. The name is written to the HMI device during download. If a device name for PROFINET communication has already been entered in the HMI device, it will be overwritten.

You can find additional information about these settings in the information system in the "Assigning a device name and IP address" section.

When TIA Portal detects incompatible Runtime versions during online loading, you have the option in the "Load Preview" dialog to install an image with a compatible, installed Runtime version to the Panel before the download.

NOTICE
Changing the installed Runtime version deletes all data from the HMI device. Data is deleted on the target system when you change the installed Runtime version. When the operating system is updated, the project, parameter sets and user administration on the HMI device are deleted. Before updating the operating system, save the data on the HMI device, if required. When the operating system is updated with a reset to factory settings, all data on the HMI device is deleted and all settings in the control panel are reset to the factory settings.

The compilation of the project is checked before downloading and missing content is compiled. This ensures that the latest version of the project is always downloaded.

When you download a project again, you can decide whether you want to download only changes or the complete project. If you want to download only changes, a compilation of changes must be possible beforehand.

Note

No data loss when loading is interrupted

Existing data on the HMI device is only deleted when the transfer is complete.

Runtime ID

At the start of the configuration, each project receives a runtime ID which is transferred to the HMI device during downloading. If you have already downloaded a project, the download process recognizes the project using the Runtime ID. If the HMI device name is changed in the configuration, the Runtime ID also changes.

Note

Existing runtime projects on the HMI device

If a runtime project with the same Runtime ID is already available on the HMI device, the project is overwritten. In this case, the options "Software (only changes)" and "Software (all)" are available for loading.

If a runtime project with a new runtime ID is downloaded to the HMI device, the existing runtime project is replaced by the new project. In this case, only the option "Software (all)" is available for the download.

In both cases, existing project data on the HMI device is overwritten.

Controlling the transfer behavior on the HMI device

You enable the transfer on the HMI device in the Control Panel under "Transfer". When the transfer is activated, the project can be downloaded.

Note

Disable transfer after commissioning

Disable the transfer after the commissioning phase so that no project can be loaded inadvertently.

An inadvertent transfer mode can trigger unwanted responses in the plant.

In order to restrict access to the transfer settings and thus avoid unauthorized changes, enter a password in the Control Panel.

For more information on the transfer settings, refer to the documentation of the HMI device.

Transferring Runtime add-ons in WinCC

Projects may contain Runtime add-ons in the form of controls or CSP (Communication Support Packages). These Runtime add-ons are automatically transferred with the project.

Basics on version compatibility (Page 187)

16.2.3.2 Initial download of a project

Introduction

The first download of a project is different from any subsequent download processes:

- The connection to the HMI device must be set up before the download.
- The project is always downloaded completely during the first download.

Note

Runtime is stopped during a complete download

The project running in runtime is stopped when a project is executed in runtime while you are completely downloading the project.

Requirement

- The project has been compiled without errors.
- A user is configured.
- The HMI device is connected to the configuration PC.
- The Control Panel is started on the HMI device.
- The protocol by which the project is loaded is set on the HMI device in the Control Panel under "Settings".
- The transfer is activated on the HMI device.

Editing connection parameters before download

1. Select the HMI device in the project tree.
2. Select "Online > Extended download to device" in the menu.
   The "Extended download" dialog opens.
3. Configure the interface.
4. Click "Connect" and load the project.
   The Runtime project is downloaded with changed connection parameters.

Options when initially loading a project

Runtime values: Tag values, active alarms and user data

Select whether you want to keep the current values or reset the values to the start values.

Select "Reset to start values" at the time of initial loading.

Reset logs: Data logs, alarm logs, Audit Trails and context logs

Select whether you want to reset all logs or no log in Runtime.

Initial loading of a project

1. Select the HMI device in the project tree.
2. In the toolbar, select the "Download to device" button or select "Download to device" > "Software (all)" from the shortcut menu.

   Note

   When you select "Download to device" > "Software (only changes)" from the shortcut menu, the project is still downloaded completely during the initial download.

   The "Extended download" dialog opens.
3. Configure the interface. Make sure that the settings match the transfer settings in the HMI device:
   - Select the protocol used, for example, Ethernet.
   - Configure the relevant interface parameters on the configuration PC.
   - Make any interface-specific or protocol-specific settings required on the HMI device.
4. Click "Connect".
   The connection is established and a dialog is displayed.
5. Select "Load".
   The compilation of the project is checked and missing content is compiled.
   The compilation result is displayed in the Inspector window under "Info > Compile".
   The "Load Preview" dialog is displayed.
6. Check the displayed default settings and change the settings as necessary:
   - Specify whether runtime should start on the target system after the download.
   - Select "Reset to start values".
   - Specify whether all logs are reset in runtime.
     The setting is only accepted when you have selected "Start runtime".
7. Click "Download".

Result

The project is downloaded to the selected HMI device with the runtime extensions it contains.

If errors or warnings occur during the download, corresponding alarms are output under "Info > General" in the Inspector window.

On completion of the successful download of the project, you can execute it on the HMI device.

Note

No data loss when loading is interrupted

Existing data on the HMI device is only deleted when the transfer is complete.

See also

Loading projects of multiple HMI devices simultaneously (Page 7155)

Specify tag persistency (Page 636)

Basics for downloading projects (Page 7147)

Secure communication (Page 7129)

Compiling a project (Page 7145)

16.2.3.3 Complete reloading of a project

Options when reloading a project

Runtime values: Tag values, active alarms and user data

Select whether you want to keep the current values or reset the values to the start values.

With the "Keep selected" option, you can specify which values you want to keep.

- Current values of tags and pending alarms
- Current user management data

Reset logs: Data logs, alarm logs, Audit Trails and context logs

Select whether you want to reset all logs or no log in Runtime.

Requirement

- The project has been compiled without errors.
- The project has been downloaded at least once before.

Reloading a project

1. Select the HMI device in the project tree.
2. Select "Download to device > Software (all)" from the shortcut menu.
   The compilation of the project is checked and content that has not been compiled is compiled.
   The compilation result is displayed in the Inspector window under "Info > Compile".
   The "Load Preview" dialog is displayed.

Note

Runtime is stopped during a complete download

The project running in runtime is stopped when a project is executed in runtime while you are completely downloading the project.

3. Check the displayed default settings and change the settings as necessary:
   - Specify whether runtime should start on the target system after the download.
   - Specify whether tag values, active alarms, and user data are retained.
     The setting is only accepted when you have selected "Start runtime".
     To retain internal tags, the persistency must be enabled in the settings of the respective tag.
   - Specify whether all logs are reset in runtime.
     The setting is only accepted when you have selected "Start runtime".
   - Specify whether the IDs of objects in the Engineering System and their relevant Runtime data should be synchronized.
4. Click "Download".

Note

To prevent the users created in the user management from being overwritten in runtime by the complete download of the project, activate the "Keep current user administration data in runtime" option.

When this option is selected, role assignments and function rights from the user management of the engineering system are loaded to Runtime, but not user data such as user name and password.

Result

The project with the Runtime add-ons it contains is downloaded to the selected HMI devices.

If errors or warnings occur during the download, corresponding alarms are output under "Info > General" in the Inspector window.

On completion of the successful download of the project, you can execute it on the HMI device.

Note

No data loss when loading is interrupted

Existing data on the HMI device is only deleted when the transfer is complete.

See also

Updating the operating system of the HMI device (Page 7167)

Error messages during loading of projects (Page 7159)

Basics for downloading projects (Page 7147)

16.2.3.4 Download changes only

Introduction

When you only download changes to a project, the relevant project must be executed in runtime. Runtime is not closed when loading.

Requirement

- The project has been compiled without errors.
- The project has been downloaded at least once before.
- A compilation of changes must be possible or have been executed.
- The project that contains the changes is being executed in runtime.

Procedure

1. Select the HMI device in the project tree.
2. Select "Download to device" in the toolbar.
   Alternatively, select "Download to device > Software (only changes)" from the shortcut menu.
   The compilation of the project is checked and content that has not been compiled is compiled.
   The compilation result is displayed in the Inspector window under "Info > Compile".
   The "Load Preview" dialog is displayed.
3. Click "Download".

Result

The project with the Runtime add-ons it contains is downloaded to the selected HMI devices.

If errors or warnings occur during the download, corresponding alarms are output under "Info > General" in the Inspector window.

Runtime continues to be executed.

Note

No data loss when loading is interrupted

Existing data on the HMI device is only deleted when the transfer is complete.

See also

Basics for downloading projects (Page 7147)

Restrictions in compiling and loading changes (Page 7132)

16.2.3.5 Loading projects of multiple HMI devices simultaneously

Requirement

- Multiple HMI devices are configured.
- The individual projects have been compiled without errors.
- A user is configured.
- The HMI devices are connected to the configuration PC.
- The Control Panel has started on the Unified Comfort Panels.
- The protocol by which the project is loaded is set on the Unified Comfort Panel in the Control Panel under "Settings".
- "Automatic" or "Manual" is set as the transfer mode on the Unified Comfort Panels.

Connecting HMI devices to the configuration PC

1. Select an HMI device in the project tree.
2. Select "Online > Extended download to device".
   The "Extended download" dialog opens.
3. Configure the interface. Make sure that the settings match the transfer settings in the HMI device:
   - Select the protocol used, for example, Ethernet.
   - Configure the relevant interface parameters on the configuration PC.
   - Make any interface-specific or protocol-specific settings required on the HMI device.
4. Click "Connect".
   The connection is established and a dialog is displayed.
5. To connect additional HMI devices and load several projects at the same time, select "Cancel".
6. Repeat steps 1 to 5 for additional HMI devices.

Loading projects

1. Select the HMI devices using multiple selection in the project tree.
2. To download the changes to the projects, select the "Load" button in the toolbar.
   Alternatively, select "Download to device > Software (only changes)" from the shortcut menu.

3. To download the projects completely, select "Download to device" > "Software (all)" from the shortcut menu.
   The compilation of the projects is checked and content that has not been compiled is compiled.
   The result of the compilations is displayed in the Inspector window under "Info > Compile".
   The "Load Preview" dialog is displayed. All selected projects are listed in the dialog.

   Note

   Runtime is stopped during a complete download

   The project running in runtime is stopped when a project is executed in runtime while you are completely downloading the project.

4. Check the displayed default settings and adjust the settings for each device:
   - Specify whether runtime should start on the target system after the download.
   - Specify whether tag values, active alarms, and user data are retained.
     Only available if you have selected "Start runtime".
   - Specify whether all logs are reset in runtime.
     Only available if you have selected "Start runtime".
5. Click "Download".

See also

Initial download of a project (Page 7150)

Basics for downloading projects (Page 7147)

16.2.3.6 Using external storage medium

Introduction

If you cannot establish a direct connection from the configuration PC to the HMI device, load the compiled runtime project onto an external storage medium. For example, use a USB flash drive or SD card.

As soon as you have connected the external storage medium to your HMI device, transfer the project to the HMI device.

Requirement

- An HMI device has been created.
- The project has been compiled without errors.

Loading project to external storage medium

1. Jump to the "Devices" tab in the project tree.
2. Double-click on

3. "Add user-defined card reader" in the "Card reader/USB storage" folder.
   A selection dialog opens.
4. Select a target directory to save the project.
5. Drag and drop the folder of the HMI device (e.g. "HMI_1 [<Device type>]") to the added folder.
   Alternatively, use copy and paste.
   The project is checked. If the project has contents that have not yet been compiled, a compile is performed.
   The "Load Preview" dialog opens.
6. Select the options for loading.
7. Click "Load" to confirm.

Result

Your project is stored as a compressed ZIP folder in the directory "[<Target directory>]\Simatic.HMI\RT_Projects". The file name is made up of the name of the HMI device, the project name and the time stamp, for example "HMI_RT_1[Project1] - Full 2020-04-03 - 14.51.41.zip".

If errors or warnings occur during the download, corresponding alarms are output under "Info > General" in the Inspector window.

You can find information about loading the project from the external storage medium to the Unified Comfort Panel in the operating instructions for the Unified Comfort Panel.

16.2.4 Compiling and loading with team engineering

16.2.4.1 Compiling and loading with team engineering (overview)

Introduction

You can compile and download to an HMI device in the server project view, in the exclusive session and the local session.

Note

Unified objects cannot be selected in a local session

To edit an object using Multiuser Engineering, it must first be "selected". Only objects marked for check-in can be transferred into the server project after editing.

Unified objects cannot be marked in a local session. Changes to these objects are not applied to the server project during check-in.

You can edit unmarked objects in the server project view.

Basics

The options for compiling and downloading in the server project view, in the exclusive session or the local session are no different from the options in a single-user project. The most recent project is always compiled or loaded from the currently active view.

In principle, you can execute all commands for compiling and downloading in multiuser engineering and exclusive engineering:

- "Software (rebuild all)"
- "Compile > Software (only changes)"
- "Software (all)"
- "Download to device > Software (only changes)"

Rules

The following rules apply to compiling and downloading in multiuser engineering and exclusive engineering:

- The project that was changed in a local session always remains local and is not uploaded to the multiuser server.

  Note

  A Unified project that was created or changed in a local session cannot be saved in the multiuser server project.

  Use the local session to test your configuration. When you update your local session, all changes to Unified objects are overwritten by the server project.

- Only projects that were created or changed in the server project view or in the exclusive session can be saved in the multiuser server project.

See also

Compiling in the server project view (Page 7158)

Downloading projects (Page 7147)

16.2.4.2 Compiling in the server project view

Basics

Compiling and downloading of projects in the server project view and the exclusive session is no different from compiling and downloading in a single-user project.

While you are compiling a project in the server project view or the exclusive session, the server project is blocked. Other users cannot edit the server project in the meantime. The compiled runtime project is saved with the WinCC project on the central server. Blocking

the server project ensures that the configuration data and the runtime project remain synchronized.

Note

When you compile and save in the server project view or in the exclusive session, other users then obtain the Runtime project you have updated along with the WinCC project when they "refresh" their local session. Other users do not have to recompile the changes you have made after an update.

See also

Compiling and loading with team engineering (overview) (Page 7157)

16.2.5 Error messages during loading of projects

Possible problems during the download

When a project is being downloaded to the HMI device, status messages regarding the download progress are displayed in the output window.

Problems arising during the download of the project to the HMI device are usually caused by one of the following errors:

- Wrong version of operating system on the HMI device
- Incorrect settings for downloading to the HMI device
- Incorrect HMI device type in the project
- The HMI device is not connected to the configuration PC.

Download failures and possible causes and remedies are listed below.

The download is canceled due to a compatibility conflict

Possible cause	Remedy
Conflict between versions of the configuration software used and the operating system of the HMI device	• Synchronize the operating system of the HMI device with the version of the configuration software. • To update the operating system of the HMI device, select the command "Update operating system" in WinCC in the menu "Online > HMI device maintenance" or in the "Load preview" dialog. You can also use ProSave. For additional information, refer to the operating instructions for the HMI device.
The configuration PC is connected to a wrong device, e.g. a PLC.	• Check the cabling. • Correct the communication parameters.

Project download fails

Possible cause	Remedy
Connection to the HMI device cannot be established (alarm in the output window)	• Check the physical connection between the configuration PC and the HMI device. • Check that the HMI device is in transfer mode. Exception: Remote control

The configuration is too complex

Possible cause	Remedy
The configuration contains too many different objects or options for the HMI device selected.	• Reduce the project size.

See also

Reducing the project size (Page 7162)

16.2.6 Starting runtime

Introduction

You can start the project in runtime as soon as you have downloaded the project to the HMI device. By default, the project is started automatically on the HMI device.

The project settings defined in the "Runtime settings" of the HMI device are activated when the project is started in runtime.

Note

Response of runtime when the HMI device is restarted

When the HMI device is restarted, the project is automatically restarted even if the project was stopped before the restart.

Note

Closing Runtime automatically

If the transfer is activated on the HMI device and a transfer is started on the configuration PC, the running project is automatically terminated.

The HMI device then automatically switches to "Transfer" mode.

After the commissioning phase, disable the transfer so that the HMI device does not inadvertently switch to the "Transfer" mode.

"Transfer" mode can trigger unwanted reactions in the plant.

To restrict access to the transfer settings and thus avoid unauthorized changes, enter a password for access to the Control Panel.

Requirement

- The project has been downloaded to the HMI device.
- The Control Panel has been started.

Starting runtime on an HMI device

The Control Panel is displayed when the HMI device is switched on. Depending on the configuration, the loaded project starts automatically after the defined delay time.

If the project does not start automatically, click "Start" in the Control Panel.

Refer to the documentation for the HMI device for additional information on startup of projects.

Result

Runtime is started on the HMI device.

16.2.7 Reducing the project size

Introduction

When loading a large project to an HMI device, the HMI device may not have enough memory for the project.

Options for reducing the project size

There are several ways to reduce the size of the project and save space:

- Reduce the number of available runtime languages
  Check if all selected runtime languages are needed.
  If necessary, you can disable the languages that you do not need under "Runtime settings > Language & Font > Runtime language and font selection".
- "Software (rebuild all)"
  In order to optimize the project data and to clean up obsolete changes, compile the entire project using the "Compile > Software (rebuild all)" command from the shortcut menu of the HMI device.
- Reduce the number of fonts loaded
  Check if the number of user-defined downloaded fonts can be minimized.
  To save memory space, use fewer font groups for the configuration.
- Reduce the size of the graphics
  High-resolution graphic objects require a lot of memory and cause long loading times. They also reduce performance in Runtime.
  Check the size of the graphics that you use in the project. If necessary, reduce the size of the graphics by reducing the resolution or choose a higher compression format without noticeable loss of quality for the project graphics. Note the display resolution of the target device and the size in which the graphic object is displayed on the display of the target device.
  Select appropriate graphic formats for your screens: Use PNG images for drawings that are not vector graphics and JPEG images for photos.

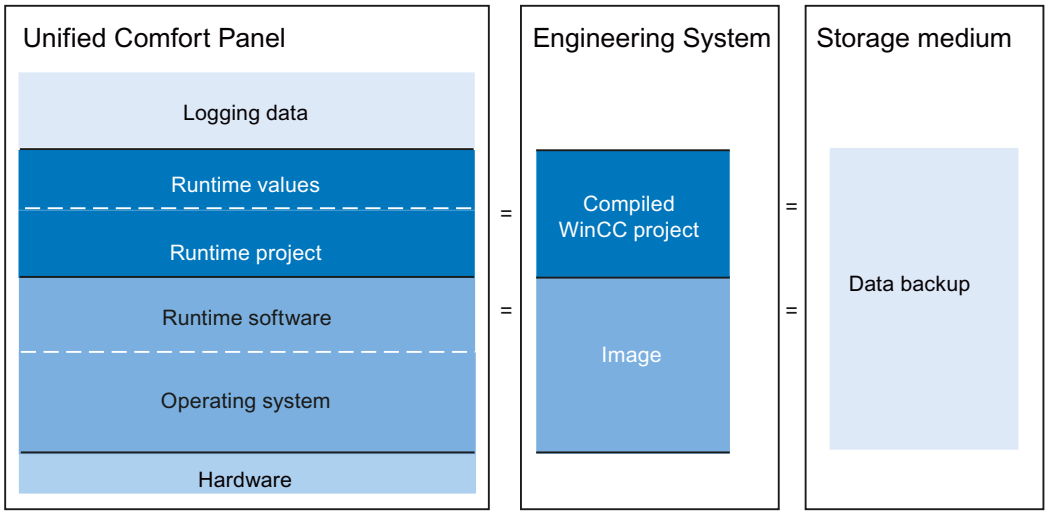
Complete reloading of a project (Page 7152)

16.2.8 Maintenance of the HMI device

16.2.8.1 Overview of the service for Unified Comfort Panels

Structure

The following figure shows the software components of an HMI device and their relation to the engineering system.



Logging data

Tags and alarms can be saved to logs. The log databases are stored on an external storage medium.

Runtime values

The runtime data is created during operation of the plant and stored on the HMI device. This data includes, for example, parameter sets and data for the user administration.

Runtime project

The runtime project contains the compiled configuration data for an HMI device.

Operating system and runtime software

The operating system of the HMI device is provided together with the runtime software in the form of an HMI device image. Suitable HMI device images are supplied with each WinCC version. Depending on the configuration, download the appropriate image along with the runtime project to the HMI device as required.

Firmware and hardware

The HMI device is delivered with preconfigured firmware and hardware.

16.2.8.2 ProSave

Introduction

The "ProSave" service tool is included in the WinCC installation. The ProSave functions are accessed in WinCC with the menu "Online > HMI Device maintenance".

Functional scope

ProSave offers numerous functions for data transfer between the configuration PC and HMI device:

- Backing up and restoring data of the HMI device
- Updating the operating system of the HMI device
- Communication settings (transferred from WinCC)

16.2.8.3 Data backup of the HMI device

Introduction

Data backup is used to create a backup of the data on the HMI device, e.g. before the update of the operating system. You can restore the backed-up data at a later time.

If an HMI device is connected to the configuration PC, you can back up and restore the data of the HMI device from the configuration PC using WinCC.

Alternatively, you can back up the data to an external storage medium supported by the HMI device. If the HMI device is networked, you can also back up the data to a server.

Scope of data backup

You have the option of performing a complete backup.

The following components are saved with this:

- Runtime
- Firmware
- Operating system
- Configuration
- Parameter sets
- User management
- Options

A backup includes several files. The master file has the extension ".brf". The number of additional files is variable, these files have the file name of the master file and a consecutive number (".0", ".1", ".2", ...) as extension.

Note

Scope of data backup

The selected content of the flash memory is saved during data backup. Alarm logs and data logs are stored on the external storage medium and are therefore not saved using the "Save" function. If necessary, back up the contents of the memory card separately.

Note the following for a complete backup and restore of the dataset:

- A full backup includes all options installed. All data of the option that are still present after "Power off" are saved.
- If the data is completely restored, all data previously on the device, including the operating system, will be irrevocably deleted.
- If the recovery process cannot be completed due to a power failure or an interrupted data connection, for example, the HMI device starts in maintenance mode and must be reset to factory settings.

Use an interface with high bandwidth, such as Ethernet, to back up and restore data via WinCC.

See also

Backing up and restoring data of the HMI device (Page 7165)

16.2.8.4 Backing up and restoring data of the HMI device

Note

Use the restore function for project data only on HMI devices which were configured using the same configuration software.

Requirement

- The HMI device is connected to the configuration PC.
- The HMI device is selected in the project tree.
- If a server is used for data backup: The configuration PC has access to the server.

Backing up data of the HMI device

To back up the HMI device data, follow these steps:

1. Select "Online > HMI device maintenance > Save" in the menu.
   The "Create backup" dialog box opens.
2. Select the type of the PG/PC interface and the target device, and click "Create".
   The "SIMATIC ProSave" dialog box opens.
3. Under "Data type", select the data to backup for the HMI device.
4. Enter the name of the backup file under "Save as".
5. Click "Start Backup".

This starts the data backup. The backup operation takes some time, depending on the connection selected.

Restoring data of the HMI device

To restore the data of the HMI device, follow these steps:

1. Select "Online > HMI device maintenance > Restore" in the menu.
   The "Restore backup" dialog box opens.
2. Select the type of the PG/PC interface and the target device, and click "Load".
   The "SIMATIC ProSave" dialog box opens.
3. Enter the name of the backup file under "Open...".
   Information about the selected backup file is displayed under "File information".
4. Click "Start Restore".

This starts the restoration. This operation takes some time, depending on the connection selected.

Backup/restore from the "Backup/Restore" dialog in the Control Panel of the HMI device

The "Backup / Restore" function is enabled for SD memory cards and USB memory media.

For more information, refer to the operating instructions of the HMI device.

See also

Data backup of the HMI device (Page 7164)

16.2.8.5 Updating the operating system

Introduction

If the image of an HMI device has a version status that does not match the configuration, update the image of the HMI device. The version of the image matches the installed Runtime version.

Update the operating system and the runtime software of the HMI device using the installed Runtime version. Depending on the protocol used, you may be prompted to run an automatic update of the installed Runtime version while loading the project.

Loading will then continue.

Update of the installed Runtime version

To update the installed Runtime version, connect the HMI device to the configuration PC. If possible, use the interface providing the highest bandwidth for this connection, e.g. Ethernet.

See also

Updating the operating system of the HMI device (Page 7167)

16.2.8.6 Updating the operating system of the HMI device

If possible, use the interface providing the highest bandwidth for this connection, e.g. Ethernet. When you update the operating system, the runtime software on the HMI device is also updated and the installed Runtime version is changed.

NOTICE
Updating the operating system deletes all data on the HMI device When you update the operating system you delete data on the target system. For this reason, you should back up the following data beforehand: • User management • Parameter sets • Project data

Requirement

- The HMI device is connected to the configuration PC.
- The HMI device is selected in the project tree.

Updating the operating system

Proceed as follows to update the operating system:

1. Select "Online > HMI device maintenance > Update operating system" in the menu.
   The "Update operating system" dialog box opens.
2. Select the type of the PG/PC interface and the target device, and click "Update".
   The "SIMATIC ProSave [OS-Update]" dialog opens. The path to the image is preset.
3. If required, you can select a different path for the image that you want to transfer to the HMI device.
4. Click "Update OS".

This starts the update. The update operation can take time, depending on the connection selected.

Resetting the HMI device to factory settings

To reset the HMI device to factory settings, follow these steps:

1. Switch off the power supply for the HMI device.
2. Connect the HMI device to the configuration PC.
3. Select the "Update operating system" command from the menu under "Online > HMI Device maintenance" on the configuration PC in WinCC.
   The "Update operating system" dialog box opens.
4. Select the type of the PG/PC interface and the target device, and click "Update".
   The "SIMATIC ProSave [OS-Update]" dialog opens. The path to the image is preset.
5. If required, you can select a different path with a different image that you want to transfer to the HMI device.
6. Activate "Reset to factory settings".
7. Click "Update OS".
8. To reset to factory settings, switch on the power supply to the HMI device again.
   This operation can take time.

Result

The operating system of the HMI device is operational and up to date.

See also

Updating the operating system (Page 7166)

Backing up and restoring data of the HMI device (Page 7165)

Basics for downloading projects (Page 7147)

16.2.8.7 Updating the operating system of the HMI device from a data storage medium

Introduction

You can update the operating system using a data storage medium. You can find the HMI device image files, for example, in the installation directory of WinCC under: "\Siemens\Automation\Portal V1x\Data\Hmi\Transfer\<HMI device image version>\Images".

NOTICE
Data loss All data on the HMI device, including the project and HMI device password, is deleted during a restore operation. Back up data before the restore operation.

Requirement

- The HMI device image file is located in the "SIMATIC.HMI\Firmware\" directory on your data storage medium, e.g. a SIMATIC HMI Memory card or an industry-grade USB stick.
- The data storage medium with the relevant HMI devices image file including operating system is inserted in the HMI device.

Procedure

1. Open the Control Panel on the HMI device.
2. Select "Service & Commissioning > Update OS".
3. Select a storage medium under "Select storage media for OS update".

   Note

   If there is no storage medium or a defective storage medium in the HMI device, the "0 devices found" alarm is displayed. Insert the storage medium or replace the storage medium.

4. Select the required HMI device image file under "Firmware files on external storage".
5. Press "Update OS".
   The "Update OS Image" dialog opens.
6. To start restoring the operating system, press "Yes".
   The "Transfer" dialog opens. A progress bar shows the course of the restore. The HMI device then restarts.

Note

After the restore, it may be necessary to recalibrate the touch screen.

See also

Updating the operating system of the HMI device (Page 7167)

16.3 WinCC Unified PC

16.3.1 Specifying runtime settings

16.3.1.1 Introduction

Before you compile and download a project, update the runtime settings of the HMI device. You specify the Runtime languages, for example, or activate "Collaboration".

To edit the runtime settings for an HMI device, select "Runtime settings" in the project tree below the HMI device.

16.3.1.2 General

Identification

The runtime ID is the unique identification of a runtime project. The runtime ID is also stored in the SIMATIC Runtime Manager. Based on the runtime ID, you can determine whether a project has already been downloaded to the HMI device.

Note

When you rename the WinCC Runtime of the Unified PC in the Engineering System, the Runtime ID changes. The project must be downloaded completely during the next download.

Encrypted transfer

To download the project encrypted, the same password must be stored in the runtime settings and in runtime. Alternatively, transfer the password unencrypted during the initial download.

When you manage an encrypted project in the Runtime Manager, the password must be stored in the Runtime Manager.

Screen

Under "Screen", you specify the start screen and the style of the HMI device.

The start screen is displayed after runtime start.

Select the screen resolution. The setting of the HMI device is used by default.

Note

Display of a changed start screen

You have defined a start screen in the project and started runtime. When you define another start screen and download only changes to the device, the last active screen is displayed in runtime.

After reloading, refresh runtime in the browser with the <F5> key or the "Update" button.

See also

Secure communication (Page 7129)

16.3.1.3 Alarms

Controller alarms and diagnostics

Note

WinCC only supports controller alarms of a SIMATIC S7-1500. In addition, WinCC only supports controller alarms that are automatically updated by the central alarm management in the PLC.

One or more HMI connections to a PLC are shown in "Controller alarms and diagnostics".

You can manage the following options:

- "Display classes": You filter the controller alarms via display classes. You specify for each connection which display classes are displayed on the HMI device.
- "Automatic update": Controller alarms are automatically updated on the HMI device.
  Requirement: The "Central message management in the PLC" option is enabled.
- "System diagnostics": System diagnostic alarms can be displayed in runtime.
  Requirement: The "Automatic update" option is enabled.
- "Security events": Security events can be displayed in runtime.
  Requirement: The "Automatic update" option is enabled.

State texts

You specify the state texts of alarms in the runtime settings. The state texts are displayed in runtime in the alarm control.

Specify the state texts in other languages under "Languages & Resources > Project texts".

See also

Configuring state texts of alarms (Page 733)

Configuring the display of system diagnostic alarms (Page 767)

Configuring the display of security events (Page 795)

Filtering controller alarms via display classes (Page 748)

16.3.1.4 Process diagnostics

General

Indicates whether the device participates in process diagnosis.

16.3.1.5 Services

SMTP communication

SMTP communication enables automatic sending of e-mails when events occur.

Specify the port for SMTP communication.

16.3.1.6 Language & font

Runtime language and font selection

You configure project languages that are available as runtime languages for the respective device. You also define the order in which the languages are switched.

When using central user management, runtime is displayed in the language that a user selected in the "User login" dialog during login. If this language is not configured in the runtime settings of the HMI device or if the language setting in the central user management was not set, runtime is displayed in the language that has the lowest number in the "Order" column in the runtime settings. You change the order with  .

If users do not select a language in the "User login" dialog, runtime is displayed in the language that is set for the browser.

The fixed font 1 is always provided for the respective HMI device.

When you enable the option "Enable for logging" for a language, alarm texts are logged in the respective language. To keep the size of the log relatively small, log only alarm texts in the required languages.

See also

Enabling the runtime language (Page 246)

Editing log contents with scripts and system functions (Page 850)

16.3.1.7 Collaboration

General settings

- Select the "Enable collaboration" check box.

Identification

The following information must be unique for all devices participating in a collaboration:

- System ID:
  The *system ID* must be unique for each device participating in Unified Collaboration, as this ID is used for communication between the devices.
- Collaboration name:
  Assign a collaboration name or select "Generate collaboration name automatically".
- IP address / Host name

Connect actively to

A list of all HMI devices available for collaboration with system ID and IP address / host name is displayed. You select the HMI devices to which the current HMI device provides collaboration.

Note

Collaboration is enabled in both directions

The HMI device that you select under "Connect actively to" can display screens of the current HMI device and vice versa. Collaboration is always enabled in both directions, even if you only have the connection activated for one collaboration device.

See also

Defining collaboration settings (Page 7572)

16.3.1.8 Storage system

You specify the storage locations of the following databases:

- Database for tag persistency
- Database for data logging
- Database for alarm logging

Note

Logging on network drives

Do not save databases directly on a network drive. Power supply can be interrupted at any time. Reliable operation is therefore not guaranteed.

For example, save the logs on your local hard drive or a USB stick.

If you have defined a storage location in the runtime settings of the HMI device, you can specify the database storage location for individual logs in the "Logs" editor under "Storage medium". You have the following options:

- Default:
  The database is saved according to the runtime settings of the HMI device.
- Local:
  Specify a path.

Database type

Specify the database type. WinCC Unified PC supports the following database types:

- SQLite
- Microsoft SQL
  A separate installation is required for using Microsoft SQL. After installing Microsoft SQL, SQLite logging is no longer possible.

Database storage location for tag persistency

You can specify tag persistency for internal tags. The last values of the persistent tags are used after Runtime has been started.

A separate database is used for tag persistency. The values of the tags are available again after restarting runtime or restarting or switching off the HMI device.

Specify the storage location of the database:

- Off:
  Tag persistency is not used.
- Local:
  Specify a path.
- Project folder:
  The database is stored in a subfolder of the runtime project folder.

Note

Use different storage media for tag persistency and logging.

The tag persistency can be affected if the log databases and the database for tag persistency are stored on the same storage medium and the storage medium is changed while runtime is running.

Location of the main database for data logging

Specify the storage location of the databases for data logging:

- Off:
  Tags are not logged.
- Local:
  Specify a path.
- Project folder:
  The logs are stored in the "TLGDB" subfolder of the runtime project folder.
- Default:
  In WinCC Unified Configuration you store the path at which the logs are saved under "Log settings".

Location of the main database for alarm logging

Specify the storage location of the databases for alarm logging:

- Off:
  Alarms are not logged.
- Local:
  Specify a path.
- Project folder:
  The logs are stored in the "ALGDB" subfolder of the runtime project folder.
- Default:
  In WinCC Unified Configuration you store the path at which the logs are saved under "Log settings".

See also

Specify tag persistency (Page 636)

Storage locations of logs (Page 843)

16.3.1.9 Settings for tags

You have the option of synchronizing HMI tags with the connected PLC tags. The position of a data value in the structure of a data block is thus mapped in the HMI tag name. If necessary, the PLC name is set as a prefix. You synchronize the tags in the "HMI tags" editor.

You specify before the synchronization whether the names are matched and under which conditions.

Synchronization of the name of the PLC tag in the engineering station

To avoid conflicts within complex tag types, configure how the delimiters of the path statement from STEP 7 are replaced in WinCC similar to name matching:

- Replace delimiters
  Depending on your selection, the delimiters of all hierarchy levels are replaced during synchronization.
- Replace invalid characters
- PLC prefix
  The PLC name is set as a prefix to the HMI tag name. You set the option for each HMI connection.

Note

Duplicate tag names

If the generated tag name is already in use, a number is added in parentheses, e.g. Datablock_1_Static_2{1}(1).

Example

The "PLC1" controller contains the structured data block "DB1". The "Db1.a[1].b.c[3]" data block element is used in a picture. Depending on your settings, the HMI tag name is generated as follows:

Selected option	HMI tag name
PLC prefix	Plc1.Db1.a[1].b.c[3]
Replace dot and parenthesis with ; ( )	Db1;a(1);b;c(3)
Replace dot and parenthesis with _ { } PLC prefix	Plc1_Db1_a{10}_b_c{3}

See also

Synchronizing tags (Page 640)

16.3.1.10 Good Manufacturing Practice

Traceability and therefore the documentation of production data is becoming increasingly important in many sectors such as the pharmaceutical industry, the food and beverage industry, and the related mechanical engineering industry.

Therefore, sector-specific and cross-industry standards have been developed for the electronic documentation of production data.

The most important set of regulations is the FDA guideline 21 CFR Part 11 for electronic data records and electronic signatures issued by the FDA, the US Food and Drug Administration. In addition, different EU regulations apply, such as EU 178/2002, depending on the industry.

Requirements for production systems in these industries have been developed on the basis of 21 CFR Part 11 and the corresponding layout to comply with GMP (Good Manufacturing Practice). They are also required for other industries.

The following main requirements are derived from these directives and regulations:

- Creation of an Audit Trail or operating trace in runtime
  Based on this document, it is possible to trace the user who carried out the operator action on the machine at what time.
- Important process steps must also be assigned to a clear responsibility, for example, via an electronic signature.

GMP (Good Manufacturing Practice)

1. Enable GMP-compliant configuration.
2. If necessary, select a text list entry that contains the reason for the GMP-relevant tags.

16.3.1.11 User management

You specify whether you are using a local or a central user management. By default, the use of the local user management is specified in the engineering system.

Local users are only valid for this project.

You manage central users in the TIA User Management Component (UMC).

Configuration of user management

- When you activate the local user management, you use the users and user roles that you have created under "Security settings > Users and roles" for management.
- When you activate the central user management, the users, user roles and their rights are applied from the TIA User Management Component (UMC). To access the UMC, you must specify the server address and the server ID.

See also

Local and central user management (Page 6889)

16.3.1.12 OPC UA server

General

OPC is a standardized manufacturer-independent software interface for data exchange in automation engineering. OPC UA is the technology succeeding OPC. OPC UA is platform-independent and supports different protocols as communication medium.

To work with OPC UA in WinCC Unified, the OPC UA server must be enabled in the TIA Portal in the Runtime settings of the HMI device.

Read/write tags and register tags/alarms

When you enable the "Operate as OPC UA server" option in the HMI device, the protection for unauthorized internal and external access is downgraded.

- Enable the "Operate as OPC UA server" option.
  A security note is displayed.

After enabling the option, all other settings of the OPC UA Server will become available.

Alarms and Conditions

- To display alarm conditions in the address range of the server, select the option "Enable Alarms and Conditions on the OPC UA server".
- To disable or acknowledge alarms on the OPC UA Client, for example, select the option "Allow operation of alarms on the OPC UA Client". To enable this option, the "Enable Alarms and Conditions on the OPC UA server" option must be enabled.

Options

General

Define the following settings:

- Port
  Default value: 4890
  Do not use a port number that is already assigned to another application.
- Maximum session timeout (s)
  Default value: 600000 s
- Maximum number of OPC UA sessions
  Default value: 100

Subscriptions

Define the following settings:

- Minimum publication interval (ms)
  Default value: 100 ms
- Maximum number of monitored items
  Default value: 0

Security

Secure connection

Security policies

CAUTION

Reduced security

When the option "No OPC UA Server Security" is enabled, any OPC UA client can connect to the OPC UA server regardless of the following settings.

The following section contains a list of all security policies available on the server.

- Activate the required security policies.

User authentication

Guest authentication

- To allow access by anonymous users to the OPC UA server, enable the option "Enable guest authentication".
  An authentication by means of user name and password is not required for guests.
  Security is restricted to the degree that you determine by assigning rights to this user.

Authentication by means of user name and password

- To allow access by users with user name and password to the OPC UA server, enable the option "Authentication with user name and password".
  If access to the OPC UA server is to require the user name and password, the user must be assigned the role "HMI Administrator". The "HMI Administrator" role has the system-defined "OPC UA - read and write access" function right. The settings made must then be synchronized with the user management in runtime.

16.3.1.13 Layers

Default names of the layers

Adjust the default names of the layers.

16.3.1.14 Reporting

Report system

For Unified PCs with device version V18, you make the settings for Reporting here.

"Enable Reporting"	Enables Reporting. You can create report templates based on this project or project report jobs and generate reports in Runtime only if reporting is enabled.	
"Storage location for the Reporting database"	Configure the storage location of the Reporting database. The Reporting database stores the actions and settings made in Runtime in the "Reports" control.	
	"Storage location"	"Default" The database is in the folder that is selected during installation or later in the "Reporting" step in WinCC Unified Configuration.
		"Project folder" The database is in the project folder of the Runtime project.
		"Local" The database is in the device folder you entered under "Folder".
	"Folder"	If you have selected the value "Local" under "Storage location", enter the path to the local folder here.
"Storage location for reports"	Configure the local main storage location for the generated reports. In Runtime, the local main storage location is one of the possible storage locations for reports with the "File system" target type.	
	"Storage location"	"Default" The folder defined during installation or later in WinCC Unified Configuration in "Reporting" step is used as the main local storage location.
		"Project folder" The project folder of the Runtime project is used as the main local storage location.
		"Local" The device folder you entered under "Folder" is used as the main local storage location.
	"Folder"	If you have selected the value "Local" under "Storage location", enter the path to the local folder here.

Note

Devices with a device version lower than V18

Unified PCs with a device version of lower than V18 always have the same settings:

- Reporting is always enabled.
- The folder configured during the installation of Unified Runtime or later with WinCC Unified Configuration is always used as local main storage location for reports.
- The Reporting database is always in the project folder.

16.3.2 Compiling a project

Basics

Compilation results in a runtime project that is executable on the respective HMI device.

A project can be compiled explicitly or implicitly:

- Explicit: The compilation is started manually. Compile the entire project or only changes. Explicit compiling is described in the following section.
- Implicit: The project is downloaded without previous manual compilation.
  The project is compiled in the background even as you are configuring it in WinCC.
  This reduces the compilation times before downloading the project.

Note

Changes to S7 blocks are not automatically compiled in the background. If you are using HMI tags in the project that are connected to PLC tags, you should also compile all changed S7 blocks before you compile the HMI device.

Requirement

- A project is open.

Compiling changes of a project

1. Select an HMI device in the project tree.
2. There are two ways to start compiling the changes:
   – Press the "Compile" button in the toolbar.
   – Select "Compile > Software (only changes)" from the shortcut menu.

Compiling a project completely

1. Select an HMI device in the "Project tree" area.
2. Select "Compile > Software (rebuild all)" from the shortcut menu.

Note

When a project was compiled completely, the project must also be downloaded completely afterward.

Compiling projects of multiple HMI devices simultaneously

1. Select the HMI devices using multiple selection in the project tree.
2. To compile the changes to the projects, select the "Compile" button in the toolbar. Alternatively, select "Download to device > Software (only changes)" from the shortcut menu.
3. To compile the projects completely, select "Download to device" > "Software (rebuild all)" from the shortcut menu.

Result

The configuration data of the selected HMI devices is being compiled.

If errors occur during compilation, the errors are shown in the Inspector window under "Info > Compile".

1. Correct the errors and recompile the projects.
2. Load the compiled projects.

Overview (Page 7125)

Basics of downloading projects (Page 7182)

Complete reloading of a project (Page 7187)

Restrictions in compiling and loading changes (Page 7132)

16.3.3 Downloading projects

16.3.3.1 Basics of downloading projects

Introduction

During downloading, the compiled project is transferred to an HMI device. The project can be downloaded either locally to the Unified Runtime of the configuration PC or a connected HMI device. If there is no connection, an external storage medium can be used for the transfer.

Before the download, use the "Load preview" dialog to determine whether existing data is retained and whether logs are reset. The following data can be retained or overwritten:

- Runtime values: Tag values, active alarms and user data
- Logs: Data logs, alarm logs, Audit Trails and context logs

The compilation of the project is checked before downloading and missing content is compiled. This ensures that the latest version of the project is always downloaded.

When you download a project again, you can decide whether you want to download only changes or the complete project. If you want to download only changes, a compilation of changes must be possible beforehand.

Ethernet connection

You download the project to the HMI device via an Ethernet connection. The connection uses Ethernet port 20008.

Note

Ethernet port 20008

If an application already occupies Ethernet port 20008, loading is not possible.

If no connection to the target can be established, check the port assignments. If another application is using Ethernet port 20008, close this application.

Runtime ID

At the start of the configuration, each project receives a runtime ID which is transferred to the HMI device during downloading. If you have already downloaded a project, the download process recognizes the project using the Runtime ID. When you rename the WinCC Runtime of the Unified PC, the Runtime ID changes as well.

Note

Existing runtime projects on the target HMI device

If a runtime project with the same Runtime ID is already available on the HMI device, the project is overwritten.

Synchronization of IDs:

In runtime, objects and their relevant Runtime data are identified by IDs. If the Engineering data and Runtime data are not synchronized, conflicts may arise, which may lead to undesired reactions at runtime. This is the case, if, for example:

- the Engineering process is not linear, i.e. an earlier project version is enhanced with new objects and loaded to the device that is already running with a newer project version, for example, when using a backup or if the project was not saved after loading.
- the process of compiling and loading a project gets aborted unexpectedly.
- the Runtime data are reset.

To detect and rectify such application cases, the dialog "Load Preview" contains setting options for synchronizing IDs.

Note

Synchronization is not necessary when downloading changes since the linearity has already been selected.

Downloading various runtime projects onto one HMI device

If the runtime software "WinCC Unified PC RT" is installed on the PC, you can download multiple projects directly to the configuration PC. But you are only executing one runtime project in runtime. You can use the SIMATIC Runtime Manager to start and stop projects.

Example: The "Mixing" project is loaded to the configuration PC and is being executed in runtime. When you change the "Mixing" project, download the changes using "Download to device > Software (only changes)". Runtime continues running.

When you then download the "Bottling" project completely, the "Mixing" project Runtime is stopped. If you have selected the "Start runtime" option, the "Bottling" project is started.

Downloading a runtime project to multiple HMI devices

You can download a runtime project to several connected HMI devices one after the other and start runtime at the same time. Changes can only be downloaded for the first device.

16.3.3.2 Initial download of a project

Introduction

The first download of a project is different from any subsequent download processes:

- The connection to the HMI device must be set up before the download.
- The project is always downloaded completely during the first download.

Note

Runtime is stopped during a complete download

The project running in runtime is stopped when a project is executed in runtime while you are completely downloading the project.

Requirement

- The project has been compiled without errors.
- A user is configured.
- The HMI device is connected to the configuration PC or the configuration PC is the HMI device.
- The Runtime version of the target device corresponds to the configured Runtime version.
- Ethernet port 20008 in the network configuration is not allocated.

Editing connection parameters before download

1. Select the HMI device in the project tree.
2. Select "Online > Extended download to device".
   The "Extended download" dialog opens.
3. Enter the IP address or device name of the new target device.
4. Click "Connect" and load the project.
   The Runtime project is downloaded with changed connection parameters.

Options when initially loading a project

Runtime values: Tag values, active alarms and user data

Select whether you want to keep the current values or reset the values to the start values.

Select "Reset to start values" at the time of initial loading.

Reset logs: Data logs, alarm logs, Audit Trails and context logs

Select whether you want to reset all logs or no log in Runtime.

Synchronizing IDs

Select whether the IDs of objects in the Engineering System and their relevant Runtime data should be synchronized.

Note

At the time of initial loading, the IDs of objects in the Engineering System and their relevant Runtime data are not synchronized, regardless of the selected option.

- Synchronize: The synchronization of IDs is verified before loading. If inconsistencies are reported during the verification of the IDs, the IDs are synchronized. Then the project is completely loaded.
- Verifying the synchronization: The synchronization of IDs is verified before loading. If inconsistencies are reported during the verification of the IDs, loading is cancelled. The IDs are then not synchronized.
- Do not Sync: Synchronization of the IDs is not verified. The system cannot guarantee that the data loaded from the Engineering System match the data present in Runtime.

  Note

  Restart Runtime

  To prevent data inconsistencies, restart Runtime when you select "Do not Sync".

Initial loading of a project

1. Select the HMI device in the project tree.
2. In the toolbar, select the "Download to device" button or select "Download to device" > "Software (all)" from the shortcut menu.

   Note

   When you select "Download to device" > "Software (only changes)" from the shortcut menu, the project is still downloaded completely during the initial download.

   The "Extended download" dialog opens.
3. Enter the address or the name of the target device. You have the following options:
   – "Configured IP address"
   – "Use other IP address"
   – "Use device name (DNS)"

   If you use your configuration PC as an HMI device, enter the IP address 127.0.0.1 or the device name "localhost".
4. Click "Connect".
   The connection is established and a dialog is displayed.
5. Select "Load".
   The compilation of the project is checked and missing content is compiled.
   The compilation result is displayed in the Inspector window under "Info > Compile".
   The "Load Preview" dialog is displayed.

6. Check the displayed default settings and change the settings as necessary:
   - Select the "Full download" option under "Load Runtime".
   - Under "Runtime start", specify whether Runtime should start on the target system after the download.
   - Under "Runtime values", select "Reset to start values" in the Options menu.
   - Under "Reset logs", specify whether all logs are reset in Runtime.
     The setting is only accepted when you have selected "Start runtime".
7. Click "Download".

Result

The project is downloaded onto the selected HMI device under the file path "C:\ProgramData\SCADAProjects".

If errors or warnings occur during the download, corresponding alarms are output under "Info > General" in the Inspector window.

On completion of the successful download of the project, you can execute it on the HMI device. If you have activated the start of runtime on the target system in the "Load Preview" dialog, the project is started in runtime after loading.

16.3.3.3 Complete reloading of a project

Options when reloading a project

Make the following settings in the "Load preview" dialog during reloading:

- Load Runtime: Full download
  You cannot download if you keep the "No action" option.
- Runtime start: Specify whether Runtime should start on the target system after the download.

- Runtime values: Select whether you want to keep the current values for tags, active alarms and user administration data or if you want to reset the values to the start values.
  With the "Keep selected" option, you can specify the values you want to keep.
  - Current values of tags and pending alarms
  - Current user administration data: Disable "Keep current user administration data in runtime" during initial download.
- Reset logs: Select whether you want to reset data logs, alarm logs, Audit Trails and context logs or no log in Runtime.
- Synchronize IDs: Specifies the process to be followed for synchronizing the IDs of objects in the Engineering System and their relevant Runtime data.
  The following options are available:
  - Synchronize: The synchronization of IDs is verified before loading. If inconsistencies are reported during the verification of the IDs, the IDs are synchronized. Then the project is completely loaded.
  - Verifying the synchronization: The synchronization of IDs is verified before loading. If inconsistencies are reported during the verification of the IDs, loading is cancelled. The IDs are then not synchronized.
  - Do not Sync: Synchronization of the IDs is not verified. The system cannot guarantee that the data loaded from the Engineering System match the data present in Runtime.

  Note

  Restart Runtime

  To prevent data inconsistencies, restart Runtime when you select "Do not Sync".

Requirement

- The project has been compiled without errors.
- The project has been downloaded at least once before.

Procedure

1. Select the HMI device in the project tree.
2. Select "Download to device > Software (all)" from the shortcut menu.
   The compilation of the project is checked and content that has not been compiled is compiled.
   The compilation result is displayed in the Inspector window under "Info > Compile".
   The "Load Preview" dialog is displayed.

   Note

   Runtime is stopped during a complete download

   The project running in runtime is stopped when a project is executed in runtime while you are completely downloading the project.

3. Check the displayed default settings and change the settings as necessary:
   - Select the "Full download" option under "Load Runtime".
   - Specify whether Runtime should start on the target system after the download.
   - Specify whether tag values, active alarms, and user data are retained.
     The setting is only accepted when you have selected "Start runtime".
     To retain internal tags, the persistency must be enabled in the settings of the respective tag.

     Note

     To prevent the users created in the user administration from being overwritten in runtime by the complete download of the project, activate the "Keep current user administration data in runtime" option.

     When this option is selected, role assignments and function rights from the user administration of the Engineering System are loaded to Runtime, but not user data such as user name and password.

   - Specify whether all logs are reset in runtime.
     The setting is only accepted when you have selected "Start runtime".
   - Select the desired option under "Synchronize IDs" in the selection menu.
4. Click "Download".

Result

The project is downloaded onto the selected HMI device under the file path "C:\ProgramData\SCADAProjects".

If errors or warnings occur during the download, corresponding alarms are output under "Info > General" in the Inspector window.

After the successful download of the runtime project, you can execute it. If you have activated the start of runtime on the target system in the "Load Preview" dialog, the project is started in runtime after loading.

Specify tag persistency (Page 636)

Secure communication (Page 7129)

16.3.3.4 Download changes only

Introduction

When you only download changes to a project, the relevant project must be executed in runtime. Runtime is not closed when loading.

Requirement

- The project has been compiled without errors.
- The project has been downloaded at least once before.
- A compilation of changes must be possible or have been executed.
- The project that contains the changes is being executed in runtime.

Procedure

1. Select the HMI device in the project tree.
2. Press the "Download to device" button in the toolbar.
   Alternatively, select "Download to device > Software (only changes)" from the shortcut menu.
   The compilation of the project is checked and content that has not been compiled is compiled.
   The compilation result is displayed in the Inspector window under "Info > Compile".
   The "Load Preview" dialog is displayed.
3. Click "Download".

Result

The changes are downloaded onto the selected HMI device under the file path "C:\ProgramData\SCADAProjects".

If errors or warnings occur during the download, corresponding alarms are output under "Info > General" in the Inspector window.

Runtime continues to be executed.

Update Runtime in the browser with the <F5> key or by pressing the "Update" button to see the changes in runtime.

See also

Basics of downloading projects (Page 7182)

Restrictions in compiling and loading changes (Page 7132)

16.3.3.5 Loading projects of multiple HMI devices simultaneously

Requirement

- Several WinCC Unified PCs are configured.
- The individual projects have been compiled without errors.
- A user is configured.
- Ethernet port 20008 in the network configuration is not allocated.

Connecting WinCC Unified PCs to the configuration PC

1. Select a WinCC Unified PC in the project tree.
2. Select "Online > Extended download to device".
   The "Extended download" dialog opens.
3. Enter the address or the name of the target device. You have the following options:
   - "Configured IP address"
   - "Use other IP address"
   - "Use device name (DNS)"
4. Click "Connect".
   The connection is established and a dialog is displayed.
5. To connect additional HMI devices and load several projects at the same time, select "Cancel".
6. Repeat steps 1 to 5 for additional WinCC Unified PCs.

Loading projects

1. Select the WinCC Unified PCs using multiple selection in the project tree.
2. To download the changes to the projects, select the "Load" button in the toolbar.
   Alternatively, select "Download to device > Software (only changes)" from the shortcut menu.
3. To download the projects completely, select "Download to device" > "Software (all)" from the shortcut menu.
   The compilation of the projects is checked and content that has not been compiled is compiled.
   The result of the compilations is displayed in the Inspector window under "Info > Compile".
   The "Load Preview" dialog is displayed. All selected projects are listed in the dialog.

   Note

   Runtime is stopped during a complete download

   The project running in runtime is stopped when a project is executed in runtime while you are completely downloading the project.

4. Check the displayed default settings and adjust the settings for each device:
   - Specify whether runtime should start on the target system after the download.
   - Specify whether tag values, active alarms, and user data are retained.
     The setting is only accepted when you have selected "Start runtime".
   - Specify whether all logs are reset in runtime.
     The setting is only accepted when you have selected "Start runtime".
5. Click "Download".

See also

Initial download of a project (Page 7185)

16.3.3.6 Using external storage medium

Loading project to external storage medium

Introduction

If you cannot establish a direct connection from the configuration PC to the HMI device, load the compiled runtime project onto an external storage medium. For example, use a USB flash drive or SD card.

You load either the complete runtime project or only changes of a runtime project.

As soon as you have connected the external storage medium to your HMI device, transfer the project to the HMI device.

Requirement

- An HMI device has been created.
- The project has been compiled without errors.
- A user is configured.

Procedure

1. Jump to the "Devices" tab in the project tree.
2. Double-click "Add user-defined card reader" in the "Card reader/USB storage" folder.
   A selection dialog opens.
3. Select a target directory to save the project.

4. Drag and drop the HMI device (e.g. "HMI_1 [<Device type>]") to the added folder.
   Alternatively, use copy and paste.
   The project is checked. If the project has contents that have not yet been compiled, a compile is performed.
   The "Load Preview" dialog opens.
5. In the selection menu you specify which project contents are downloaded:
   - "Full download": The project is downloaded completely.
   - "Delta download": Only changes of the project are downloaded.
6. Click "Load" to confirm.

Result

Your project is stored as a compressed ZIP folder in the directory "[<Target directory>]\Simatic.HMI\RT_Projects". The file name is made up of the name of the HMI device, the project name and the time stamp:

- Projects that were created with the option "Full download" receive as file name e.g. "HMI_RT_1[Project1] - Full 2020-04-03 - 14.51.41.zip".
- Projects that were created with the option "Delta download" receive as file name e.g. "HMI_RT_1[Project1] - Delta 2020-04-03 - 14.53.45.zip".

If errors or warnings occur during the download, corresponding alarms are output under "Info > General" in the Inspector window.

Adding a project (Page 7497)

16.3.4 Compiling and loading with team engineering

16.3.4.1 Basics on compiling and loading with team engineering

Introduction

You can compile and download to an HMI device in the server project view, in the exclusive session and the local session.

Note

Unified objects cannot be selected in a local session

To edit an object using Multiuser Engineering, it must first be "selected". Only objects marked for check-in can be transferred into the server project after editing.

Unified objects cannot be marked in a local session. Changes to these objects are not applied to the server project during check-in.

You can edit unmarked objects in the server project view.

Basics

The options for compiling and downloading in the server project view, in the exclusive session or the local session are no different from the options in a single-user project. The most recent project is always compiled or loaded from the currently active view.

You can execute all commands for compiling and downloading in multiuser engineering and exclusive engineering:

- "Software (rebuild all)"
- "Compile > Software (only changes)"
- "Software (all)"
- "Download to device > Software (only changes)"

Rules

The following rules apply to compiling and downloading in multiuser engineering and exclusive engineering:

- The project that was changed in a local session always remains local and is not uploaded to the multiuser server.

  Note

  A Unified project that was created or changed in a local session cannot be saved in the multiuser server project.

  Use the local session to test your configuration. When you update your local session, all changes to Unified objects are overwritten by the server project.

- Only projects that were created or changed in the server project view or in the exclusive session can be saved in the multiuser server project.

See also

Compiling in the server project view and in the exclusive session (Page 7195)

Downloading projects (Page 7182)

YouTube (https://www.youtube.com/watch?v=n4oTZ2Gzg6U)

16.3.4.2 Compiling in the server project view and in the exclusive session

Basics

Compiling and downloading of projects in the server project view and the exclusive session is no different from compiling and downloading in a single-user project.

While you are compiling a project in the server project view or the exclusive session, the server project is blocked. Other users cannot edit the server project in the meantime. The compiled runtime project is saved with the WinCC project on the central server. Blocking the server project ensures that the configuration data and the runtime project remain synchronized.

Note

When you compile and save in the server project view or in the exclusive session, other users then obtain the Runtime project you have updated along with the WinCC project when they "refresh" their local session. Other users do not have to recompile the changes you have made after an update.

See also

Basics on compiling and loading with team engineering (Page 7194)

16.3.5 Error messages during loading of projects

Possible problems during the download

When a project is being downloaded to the HMI device, status messages regarding the download progress are displayed in the output window.

Problems arising during the download of the project to the HMI device are usually caused by one of the following errors:

- Wrong version of operating system on the HMI device
- Incorrect settings for downloading to the HMI device
- Incorrect HMI device type in the project
- The HMI device is not connected to the configuration PC.

The most common download failures and possible causes and remedies are listed below.

The download is canceled due to a compatibility conflict

Possible cause	Remedy
The configuration PC is connected to a wrong device, e.g. a PLC.	Check the cabling. Correct the communication parameters.
The database of the configured HMI device in the engineering system differs from the database type in runtime.	Runtime of the Unified PC uses Microsoft SQL. Change the database type in the runtime settings of the HMI device under "Storage System" to "Microsoft SQL".

Project download fails

Possible cause	Remedy
The connection to the HMI device cannot be established.	Check the physical connection between the configuration PC and the HMI device.

Downloading projects (Page 7182)

16.3.6 Starting and stopping runtime

Introduction

You have two options for starting a project Runtime:

- Select the "Start runtime" option in the "Load preview" dialog before you download a runtime project.
  Runtime is started automatically after downloading the Runtime project.
- Use the "SIMATIC Runtime Manager".

Requirements

- The runtime project is downloaded to the HMI device.

Starting runtime

To start the Runtime of the downloaded Runtime project with the SIMATIC Runtime Manager, follow these steps:

1. Start the "SIMATIC Runtime Manager" tool.
2. Click on the project in the project list.
3. Click the "Start" button.
4. Define whether project data is reset on startup.
   - To start the project in a state that existed when the project was first started, activate the options "Reset login data" or "Reset Runtime data".
   - Disable these options to start the project in a state that existed before the last project stop.
5. Select "Start".

Stop runtime

You have two options for stopping a project Runtime:

- Select the "Online > Stop runtime/simulation" button in the Engineering System.
- Select the "Stop" button in the "SIMATIC Runtime Manager".

See also

Downloading projects (Page 7182)

16.3.7 Managing users in Runtime

Requirement

- An administrator has been created.
- The IP address or the fully qualified name (name and domain) of the PC on which Runtime is installed is entered in the browser.
  If Runtime is installed on the same PC as the browser, the "localhost" designation can also be used.

Procedure

1. Select "User management".
2. Log on as an administrator.
3. Expand the selection menu at the top right.

4. Select "Users".
5. You have the following options:
   - Create new users.
   - Change the properties of the users.

Changing your password

1. Expand the selection menu at the top right.
2. Select "User profile".
3. Enter your current password.
4. Assign a new password.
5. Enter the new password again.
6. Select "Change". The password is changed.

16.4 Simulating control with PLCSIM

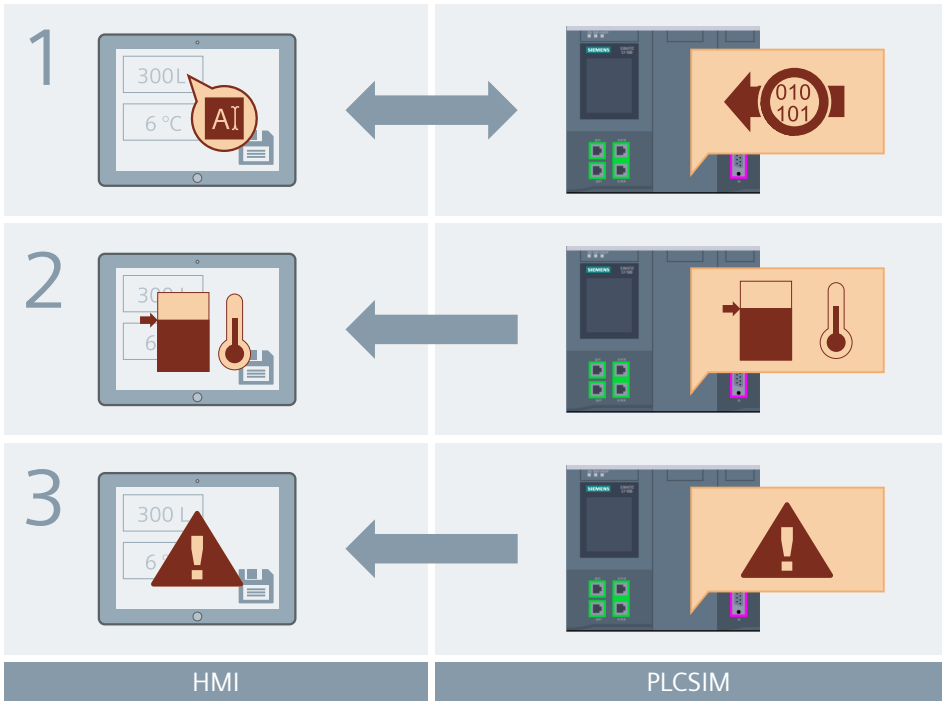
16.4.1 Using PLCSIM

Introduction

With PLCSIM you can test the configuration of your HMI device without the PLC required for it. PLCSIM simulates a PLC to which you connect the HMI device. Process parameters can be changed, or specific hardware behavior can be triggered to test the reaction of the HMI device.

With PLCSIM, you can test the following functions of your HMI device:

1. Communication between HMI device and PLC
   - Read
   - Write
2. Process behavior
   - Changing PLC parameters
   - Sequential change of recorded changes to PLC parameters
3. Hardware behavior
   - Hardware alarm
   - Diagnostic error alarm
   - Pulling or plugging modules
   - Rack/station failure



Requirements for using PLCSIM

Requirements in the software

PLCSIM is installed during the installation of WinCC. This requires you to select the corresponding check box during installation.

Requirements in the project

No special preparations are necessary to use PLCSIM. You complete their configuration in the usual way. When you start the simulation, the communication runs with PLCSIM instead of a real CPU.

16.4.2 Starting simulation and simulating behavior

Requirement

The configuration is completed.

Procedure

To test the configuration in runtime, follow these steps:

1. Select the PLC in the project tree and select "Online > Start simulation" in the menu.
   PLCSIM starts and the "Extended download to device" dialog is displayed.
2. Start the search with "Start search".
   The simulated PLC is displayed as target device.
3. Select the simulated PLC and select the "Download" command.
   PLCSIM is now ready for operation.
4. Select the HMI device in the project tree and select "Online > Start simulation" in the menu.
   The "Load Preview" dialog is displayed.
5. Select the desired settings and load the project into the HMI device.
6. Start runtime.
7. Use the editors of the project view of PLCSIM to test the behavior of the HMI.

16.4.3 Preparing simulation with PLCSIM

Requirement

- The engineering project is open.
- PLCSIM has started.

Procedure

To prepare a project with PLCSIM, follow these steps:

1. Switch from the compact view to the project view of PLCSIM by clicking on the button in the upper right-hand corner.
2. Open the "New" command via the "Project" menu and create a new project via the dialog.
3. Load and organize the PLC tags from the project in the SIM tables.
   You can load all PLC tags from an active project using the "Load project tags" button.
4. If desired, create sequences by recording the parameter changes in the SIM tables or create events in the event table.
5. Save the project.

Result

The PLCSIM project is prepared and can be used.

16.4.4 Working with PLCSIM

User interface of PLCSIM

With PLCSIM, you can choose between two different user interfaces: Compact view and project view. The view you select depends on how you want to use PLCSIM in combination with TIA Portal.

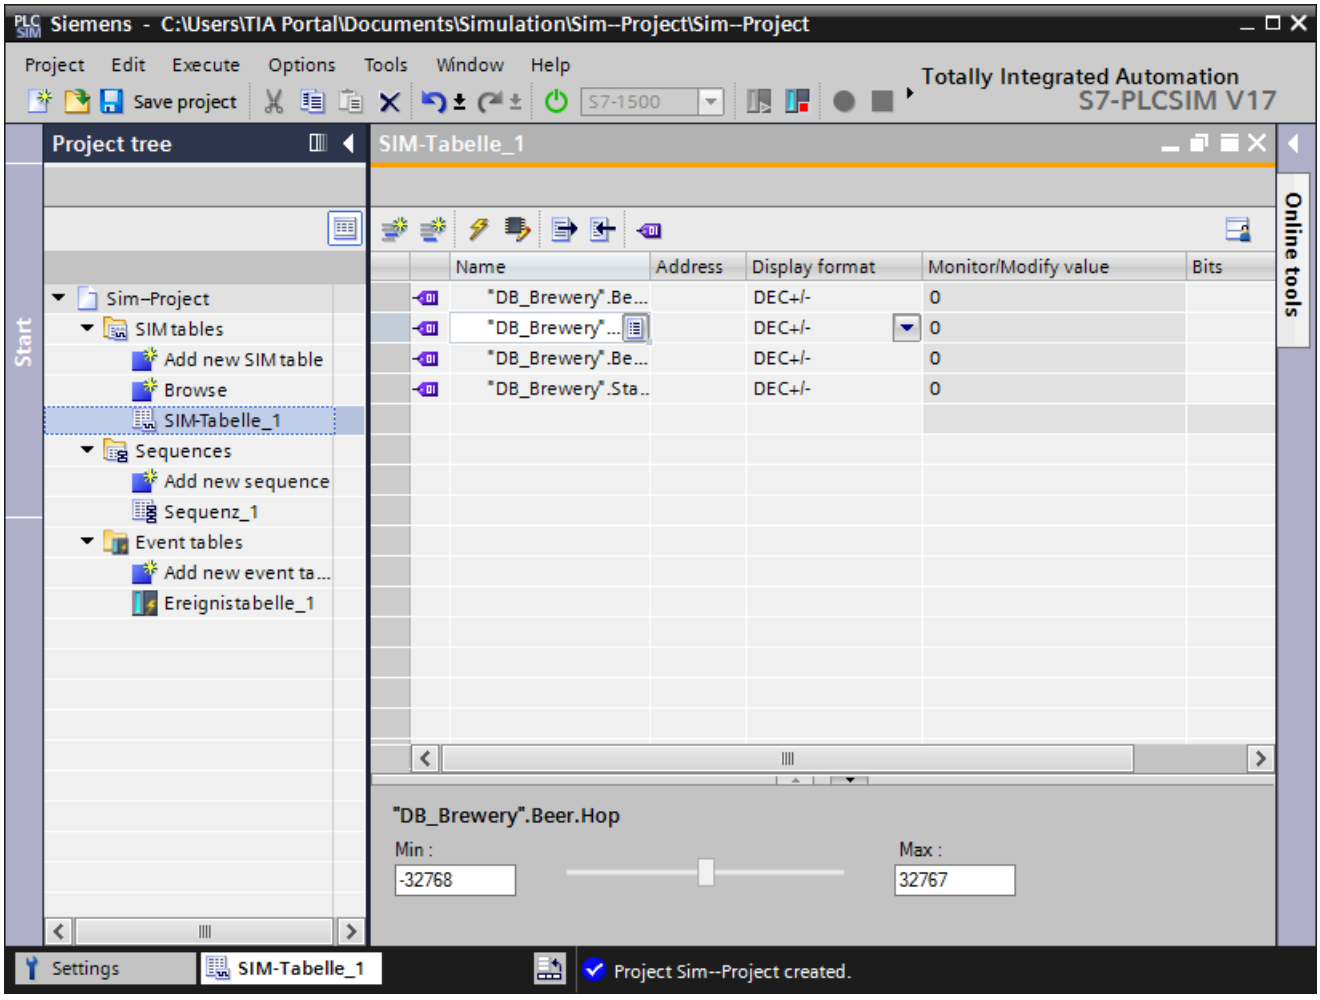
Compact view - Operate PLC

You operate the CPU exclusively in the compact view. The basic operating functions of a CPU are available with the operator controls of the compact view: "RUN", "STOP", "PAUSE" and "MRES". The status displays inform you about the state of the CPU.

Project view - Simulate process behavior and hardware behavior

The project view offers the same functions as the compact view. Additionally, simulation projects are created and stored in the project view. In the simulation project, you define the CPU behavior that you want to simulate. Several editors are available for this:

- You import PLC parameters from the automation project in Sim tables. The parameters can be written and read there.
- You simulate the behavior of external processes in sequences. To do this, you start a recording and record parameter changes that you make in the SIM table. You can edit the recorded sequence afterwards and test your process with it.
- In result tables, you select from a list of hardware actions that you want to simulate. Triggerable events are alarms, pulling and plugging of modules as well as the failure of modules or stations.



Further information

You can find more information on this topic in the PLCSIM user documentation.

Runtime and simulation 17

17.1 Simulate runtime

17.1.1 Simulate Unified Comfort Panel

17.1.1.1 Basics of simulation

Introduction

You can use the simulator to test the performance of your runtime project on the configuration PC. This allows you to quickly locate any logical configuration errors before productive operation.

The simulation is compiled like a real project and loaded into the Runtime installed on the configuration PC. To shorten the process, you can hide the "Load preview" dialog for a simulation.

The project is downloaded as follows:

- The project is fully downloaded if the simulation of the project is not executed in runtime.
- If the simulation of the project is executed in runtime and changes can be compiled and downloaded, only changes are downloaded.

You recognize a simulation in the SIMATIC Runtime Manager by the "Simulation" type. A runtime project can be downloaded to the PC as a real project and as a simulation at the same time.

With an installed Runtime as of version V17, backward compatibility is also supported for simulations.

You can simulate runtime projects with a configured Runtime version of V16 or V17.

Field of application

You can use the simulator to test the following functions, for example:

- Screen change and screen navigation
- Internal tags
- Screen display
- Configured alarms which are not triggered by a PLC

Using PLCSIM (Page 7199)

17.1.1.2 Skip "Load preview" dialog

Skip "Load preview" dialog

To permanently skip the "Load preview" dialog when simulating projects, follow these steps:

1. Open the settings under "Options > Settings".
2. Select "Simulation".
3. In the "HMI Simulation" area, clear the check box "Show 'Load preview' dialog during download to simulation".

Note

Settings of the "Load preview" dialog

The following settings are applied from the previous loading process with displayed "Load preview" dialog:

- Settings for keeping tag values, active alarms and user data (default value: enabled).
- Settings for resetting logs (default value: "No reset")

If the "Load preview" dialog was hidden before the first loading of the project, the default values are used.

If other settings are required, the "Load preview" dialog can be opened via the "Online > Download to device" command.

Result

- The "Load preview" dialog is no longer displayed.
- The simulation is downloaded directly.
- The simulation is opened automatically in the standard browser.

Download messages that occur are displayed in the Inspector window in the "Info > Load" tab.

See also

Simulating a project (Page 7207)

17.1.1.3 Simulating a project

Introduction

You simulate a project on the configuration PC and download the simulation via an Ethernet connection. The connection uses Ethernet port 20008.

Note

Ethernet port 20008

If an application already occupies Ethernet port 20008, loading is not possible.

If no connection to the target can be established, check the port assignments. If another application is using Ethernet port 20008, close this application.

Requirement

- The "SIMATIC WinCC Unified Runtime" component is installed on the configuration PC.
- The project is open in the configuration PC.
- The PLC and the HMI device have been compiled successfully.
- A user is configured.

Procedure

To start the simulation with enabled "Load preview" dialog, follow these steps:

1. Select one of the following buttons:
   - From the shortcut menu of the HMI device: "Start simulation"
   - In the "Start simulation" toolbar
   - In the "Online > Simulation > Start" menu
   - In the portal view "Visualization > Simulate device".

   The compilation result is displayed in the Inspector window under "Info > Compile".
   The "Load Preview" dialog is displayed.

NOTICE
Running runtime is stopped during complete download of a simulation The project running in runtime is stopped when a project is executed in runtime on the configuration PC and a simulation is downloaded completely.

2. When the simulation is downloaded completely, check the displayed default settings and change the settings as necessary:
   - Specify whether runtime should start after the download.
   - Specify whether tag values, active alarms, and user data are retained.
     Only available if you have selected "Start runtime".
     To retain internal tags, the persistency must be enabled in the settings of the respective tag.
   - Specify whether all logs are reset in runtime.
     Only available if you have selected "Start runtime".
3. Click "Download".
   If you have selected the "Start runtime" option, Runtime is started after the download.
4. Open the browser.
5. Call the URL "https://localhost" in the browser.
   Instead of the name "localhost", you can use the PC name.
6. Select "WinCC Unified RT".
7. Enter the user name and password.
   The configured screen is displayed as start screen in the browser.
8. Test, for example:
   - Screen change and screen navigation
   - Layout
   - Internal tags
9. To stop the simulation, you have these options:
   - Select "Online > Stop runtime/simulation" in the menu bar.
   - Select "Stop runtime/simulation" in the shortcut menu of the HMI device.

   While the simulation is running, the project is always loaded in simulation mode.

Note

Simulation and license

If no license is found for Runtime, an alarm appears and the simulation runs in demo mode. After 1 hour, you will be reminded that no license was found.

Managing users in Runtime (Page 7198)

17.1.1.4 Simulating a central user management

You want to simulate a project in which a central user management is configured for a customer. You have two options if you do not have access to the central user management of the customer:

- Configure your own central user management.
- Configure a local user management.

Requirement

- You know which groups and their function rights are contained in the central user management of the customer.

Configuring a central user management

Configure a central user management for the simulation project.

1. Create the users.
2. Create the user groups according to the customer project.
3. Assign the users to the groups.
4. Establish the connection to the central user management.
5. Start the simulation.
6. Log on in runtime.

Changes can be downloaded.

Configuring a local user management

Configure a local user management.

1. Create one or more users.
2. Assign the roles to the users.
3. Start the simulation.

Changes cannot be downloaded.

17.1.2 Simulating Unified PC

17.1.2.1 Basics of simulation

Introduction

You can use the simulator to test the performance of your runtime project on the configuration PC. This allows you to quickly locate any logical configuration errors before productive operation.

The simulation is compiled and downloaded just like a real project. To shorten the process, you can hide the "Load preview" dialog for a simulation.

The project is downloaded as follows:

- The project is fully downloaded if the simulation of the project is not executed in runtime.
- If the simulation of the project is executed in runtime and changes can be compiled and downloaded, only changes are downloaded.

You recognize a simulation in the SIMATIC Runtime Manager by the "Simulation" type. A runtime project can be downloaded to the PC as a real project and as a simulation at the same time. You cannot run the real project and the simulation at the same time in runtime.

With an installed Runtime as of version V17, backward compatibility is also supported for simulations.

You can simulate runtime projects with a configured Runtime version of V16 or V17.

Field of application

You can use the simulator to test the following functions, for example:

- Screen change and screen navigation
- Internal tags
- Layout
- Configured alarms which are not triggered by a PLC

17.1.2.2 Skip "Load preview" dialog

Skip "Load preview" dialog

To permanently skip the "Load preview" dialog when simulating projects, follow these steps:

1. Open the settings under "Options > Settings".
2. Select "Simulation".
3. In the "HMI Simulation" area, clear the check box "Show 'Load preview' dialog during download to simulation".

Note

Settings of the "Load preview" dialog

The following settings are applied from the previous loading process with displayed "Load preview" dialog:

- Settings for keeping tag values, active alarms and user data (default value: enabled).
- Settings for resetting logs (default value: "No reset")

If the "Load preview" dialog was hidden before the first loading of the project, the default values are used.

If other settings are required, the "Load preview" dialog can be opened via the "Online > Download to device" command.

Result

- The "Load preview" dialog is no longer displayed.
- The simulation is downloaded directly.
- The simulation is opened automatically in the standard browser.

The Inspector window displays any download messages that occur in the "Info > Load" tab.

Simulating a project (Page 7211)

17.1.2.3 Simulating a project

Requirement

- The "SIMATIC WinCC Unified Runtime" component is installed on the configuration PC.
- The project is open in the configuration PC.
- The PLC and the HMI device have been compiled successfully.
- A user is configured.

Always start the simulation in WinCC and then S7-PLCSIM.

If you have not installed the TIA Portal or S7-PLCSIM yourself, you must be a member in the following Windows user groups:

- PlcSimUsers
- RTIL Tracing Users
- Siemens TIA Engineer
- SIMATIC HMI
- SIMATIC HMI VIEWER

Procedure

To start the simulation with enabled "Load preview" dialog, follow these steps:

1. Select one of the following buttons:
   - From the shortcut menu of the HMI device: "Start simulation"
   - In the toolbar: "Start simulation"
   - Menu command "Online > Simulation > Start"
   - Under "Visualization > Simulate device" in the portal view.

   The compilation result is displayed in the Inspector window under "Info > Compile".
   The "Load Preview" dialog is displayed.

NOTICE
Running runtime is stopped during complete download of a simulation A project running in runtime is stopped when a simulation is completely loaded.

2. When the simulation is downloaded completely, check the displayed default settings and change the settings as necessary:
   - Specify whether runtime should start after the download.
   - Specify whether tag values, active alarms, and user data are retained.
     The setting is only accepted when you have selected "Start runtime".
     To retain internal tags, the persistency must be enabled in the settings of the respective tag.
   - Specify whether all logs are reset in runtime.
     The setting is only accepted when you have selected "Start runtime".
3. Click "Download".
   If you have selected the "Start runtime" option, Runtime is started after the download.
4. Open the browser.
5. Call the URL "https://localhost" in the browser.
   Instead of the name "localhost", you can use the PC name.
6. Select "WinCC Unified RT".
7. Enter the user name and password.
   The configured screen is displayed as start screen in the browser.

8. Test, for example:
   - Screen change and screen navigation
   - Layout
   - Internal tags
9. You have several options for stopping the simulation:
   - Select "Online > Stop runtime/simulation" in the menu bar.
   - Select "Stop runtime/simulation" in the shortcut menu of the HMI device.

   As long as the simulation is running, the project is always loaded in simulation mode.

Note

Simulation and license

If no license is found for Runtime, an alarm appears and the simulation runs in demo mode. After 1 hour, you will be reminded that no license was found.

Skip "Load preview" dialog (Page 7211)

Specify tag persistency (Page 636)

17.1.2.4 Simulating a central user management

You want to simulate a project in which a central user management is configured for a customer. You have two options if you do not have access to the central user management of the customer:

- Configure your own central user management.
- Configure a local user management.

Requirement

- You know which groups and their function rights are contained in the central user management of the customer.

Configuring a central user management

Configure a central user management for the simulation project.

1. Create the users.
2. Create the user groups according to the customer project.
3. Assign the users to the groups.
4. Establish the connection to the central user management.

5. Start the simulation.
6. Log on in runtime.

Changes can be downloaded.

Configuring a local user management

Configure a local user management.

1. Create one or more users.
2. Assign the roles to the users.
3. Start the simulation.

Changes cannot be downloaded.

Specifying local or central user management (Page 6894)

Managing local users (Page 6900)

17.2 Operating Unified Panel

17.2.1 Users in runtime

Introduction

To protect your project, create users and assign roles to them. You can create local users or central users in the UMC (User Management Component). To access the runtime of a project, a user must be configured before loading. You configure the user administration in the engineering system.

Local user administration

To transfer the local user administration from the engineering system to the HMI device, the HMI device "Keep current user administration data in the runtime" must be disabled in the "Load preview" dialog before loading.

Runtime starts after loading the local user administration settings.

Central user administration in the UMC

The connection to the central UMC server is established after loading the settings of the central user administration. Runtime starts and you log on in Runtime.

Using central user management in the Control Panel (Page 6940)

Protecting the Control Panel from being accessed (Page 6926)

17.2.2 Viewing memory card data

17.2.2.1 Basics

WinCC provides you with the possibility of viewing data stored on your memory card. The function supports the use of memory cards of the HMI device and of the PLC.

You have the following options:

- Viewing a backup (Page 7215)
- Renaming and deleting backups (Page 7217)

See also

Viewing a backup (Page 7215)

Renaming and deleting backups (Page 7217)

17.2.2.2 Working with backups

Viewing a backup

Introduction

If you have stored the backup of an HMI device on a memory card, this backup can also be viewed in the TIA Portal.

Requirements

- WinCC is installed.
- A memory card with a backup is available.
- The card reader is connected to the configuration PC.
- The project view is open.

Backup on the memory card in the card reader

1. Insert the memory card into the card reader.
2. Open "Card Reader/USB storage" in the project tree.

3. Select the card reader drive.
   The "Online card data" folder is displayed.
4. Open the "Online card data" folder.
5. Click the backup to open the shortcut menu.
6. Select "Properties".

Backup on the memory card of the PLC

Proceed as follows if the backup is stored on the memory card of the PLC:

1. Connect the PLC with the configuration PC.
2. Click on the PLC in the project navigation.
3. Select "Connect online" from the shortcut menu.
   A connection to the PLC is established.
   Once the PLC is connected, the "Online card data" folder is displayed.
4. Open the "Online card data" folder.

   Note

   Accessing a password-protected PLC

   When you attempt to access a PLC that is protected by a password, you will be prompted to enter the password.

   You need at least read access rights in order to view the data that is stored on the memory card.

5. Click the backup to open the shortcut menu.
6. Select "Properties".

Result

The backup properties are displayed in a separate dialog:

- General properties
  - Date and time when the backup was created
  - Software version with which the backup was created.
- Supported HMI devices with which the backup is compatible

See also

Renaming and deleting backups (Page 7217)

Renaming and deleting backups

Introduction

You can rename and delete backups from a memory card in the project navigation of the TIA Portal.

Requirements

- WinCC is installed.
- The card reader is connected to the configuration PC.
  Or The PLC is connected online with the configuration PC.
- A memory card with a backup is available.
- The project view is open.
- The backup is displayed in the project navigation.

Note

Accessing a password-protected PLC

When you attempt to access a PLC that is protected by a password, you will be prompted to enter the password.

You need write access rights to rename or delete memory card data.

Procedure

1. Click on the backup in the project navigation.
2. Open the shortcut menu.
3. Select "Rename" to rename the file.
4. Enter a new name.
5. Select "Delete" to delete the file.

Result

The backup file is now renamed or deleted.

See also

Viewing a backup (Page 7215)

17.2.3 Operation in Unified Runtime

17.2.3.1 Overview

Operating options for an HMI device

The following operating options are available:

- Operation via touch screen
  The HMI device has a touch-sensitive touch screen. Use your finger or a suitable touch pen to operate the touch screen.
- Operation via mouse and keyboard
  You can use the mouse and keyboard to operate the device like a PC.

Adhere to the instructions for operating the device in the relevant operating instructions.

Individually configured operation

The configuration engineer has various options available for setting up operation.

Examples of actions whose execution is always determined on a project-specific basis:

- Screen change
- Reporting
- Changing runtime language

There are no specific operating elements to execute certain functions. The configuration engineer specifies the project-specific execution. The screen change can be triggered, for example, via a button.

Information on project-specific operations can be found in the system documentation.

17.2.3.2 Operation with the touch screen

Overview of operation with the touch screen

You use the touchscreen to operate the HMI device or the project running on your HMI device.

Special features when operating using the touch screen

Operation with the touch screen is characterized by the following special features:

- Enable
  To enable the operator control, use your finger or a suitable touch pen to operate the touch screen. To generate a double-click, touch the operator control twice in rapid succession.
- Value input
  You enter numbers and letters on the touch screen with a screen keyboard.

Input using the screen keyboard

The screen keyboard is displayed when you select a screen item that requires input. The screen keyboard is hidden again when input is complete.

Further information on the screen keyboard can be found in the operating instructions of the HMI device.

Placing the focus on objects

You have the following options:

- Click or tap on the object.

  Note

  Giving focus to objects with a transparent background

  If an object has a transparent background, click on a visible area of the object.

- Press <Tab> until the object has the focus.

Operating objects with transparent fill

The objects displayed on a screen can have transparent ranges.

Example: Sliders, bars and pointer instruments are enclosed by a transparent rectangle.

Requirement

An event which is triggered by operating actions such as typing or clicking has been configured for the object in the engineering.

Trigger event

To trigger the event, proceed as follows:

- If the object does not have the focus, click a visible part of the object, e.g. its border.
- If the object already has the focus, the event is also triggered by clicking in the transparent area.

Using multi-touch functions

Supported gestures

Definition

Various touch gestures are available for the runtime operation. Some touch gestures have different effects in the process pictures than in the controls.

Note

No operation with three or more fingers.

Only use one or two fingers when operating with touch gestures.

If you use more than two fingers with touch gestures, this can cause incorrect operation.

In the case of multitouch operation with several fingers, you only operate the respectively configured objects.

Supported touch gestures in process pictures

Icon	Gesture	Function
	Tap	To select an object, tip on the corresponding position in the process screen.
	Drag with one finger	To move objects with a window, drag the object by its title bar in the desired direction.
	Scale	To zoom in or zoom out, drag simultaneously with two fingers.
	Wiping	To switch between two process screens, swipe horizontally or vertically with one finger. A touch area must be configured for this function.
	Keep pressed	The function corresponds to a right-click. To trigger the event configured for the right-click, press for longer than a second on the object or the link.

Supported touch gestures in controls

Icon	Gesture	Behavior	Supported WinCC controls
	Tap	• To select a row, tap the row. • With corresponding configuration of the control: To select a cell. • To sort a column, click on the column header. • In trend controls: Zooms in on the trend area along the X/Y axis. Requirement: The "Zoom +/-", "Zoom time axis +/-" or "Zoom value axis +/-" button is pressed.	• Alarm control • Process control • Trend control • Function trend control • Ruler window • System diagnostics control • Parameter set control
	Tap with two fingers	Zooms out of the trend control. Requirement: The "Zoom +/-", "Zoom time axis +/-" or "Zoom value axis +/-" button is pressed.	• Trend control • Function trend control
	Drag with two fingers	To move window contents, such as zoomed-in tables or trends, drag with two fingers in the operating element window.	• Trend control • Process control • Ruler window • Browser
	Drag with one finger	• Moves the ruler. • Moves the X axis or Y axis. Requirement: The "Move trend area" or "Move axes area" button is pressed or the control is zoomed in.	• Trend control • Function trend control
		To select multiple rows, tap a row and drag your finger up or down. With corresponding configuration of the control: To select multiple cells.	• Alarm control • Process control • Ruler window • System diagnostics control • Parameter set control
		To adapt the column width, tap a column grid line and drag your finger to the right or left.	
		To change the order of the columns, tap a column header and drag your finger to another column header.	
		To move zoomed-in window contents, drag with one finger.	Browser

Icon	Gesture	Behavior	Supported WinCC controls
	Double tap	To edit a cell value, double-tap the cell. Requirement: • Process control: The "Edit" button is pressed. • Parameter set control: A parameter set is selected.	• Process control • Parameter set control
	Scale	To zoom in or out in an operating element, drag with two fingers in the operating element window.	Trend control, browser
	Two-hand operation Hold the release button with one finger, and operate an object with the second finger	An operating element can be configured for two-hand operation, that is, the object can only be operated when a release button is being pressed at the same time. For two-hand operation in WinCC you configure: • A button that is defined as a release button in the security settings of a plant screen. • The security property "Require explicit unlock" at all operating elements that can only be operated when the release button is pressed.	

See also

Special features for multi-touch operation (Page 7222)

Special features for multi-touch operation

Scrolling in lists and controls

You can scroll through lists and controls by dragging.

Special features of the trend view

You enlarge or reduce the view in "Trend view" and "f(x) trend view" objects by pinch-to-zoom with two fingers.

Double tap to switch from the magnified trend view back to the normal view.

The zooming function is limited to the time axis in the "Trend view" object.

If you have enabled the option "Range > Auto-size" during configuration of the value axes in f(x) trend view, the axes are constantly calculated during zooming.

Horizontal scrolling is not supported in the "Trend view" object.

Note

Current view is not persistent

The changes of zoom factor and position changed by scrolling are not saved.

The trend view is reset to the default setting during a screen change.

See also

Supported gestures (Page 7220)

Two-hand operation of operator controls

Two-hand operation of operator controls

Introduction

WinCC supports two-hand operation of operator controls for Unified Comfort Panel. It ensures safe operation of operator controls which are used to change critical system settings, for example, control tags with machine limits.

Locked and unlocked operator controls

You define specific operator controls as "locked operator controls" for two-hand operation of operator controls. Locked operator controls usually cannot be operated in runtime. Operators can only operate the locked operator controls when they press a release button at the same time.

In runtime, locked operator controls can only be accessed with the tab sequence when a release button is pressed at the same time.

Locked operator controls and release buttons

You can configure all operator controls as locked.

You must configure at least one button in the screens as release button. This can be any unlocked button. The unlocking of locked operator controls by pressing the release button has an effect on all open screens.

Display in runtime

The locked operator controls are displayed as dimmed in runtime. The locked operator controls are completely visible when they are unlocked by means of the release button.

Simulation of projects with multi-touch functions

WinCC supports the simulation of configured multi-touch functions. Requirement is that your monitor supports multi-touch operation.

Locking and unlocking operator controls

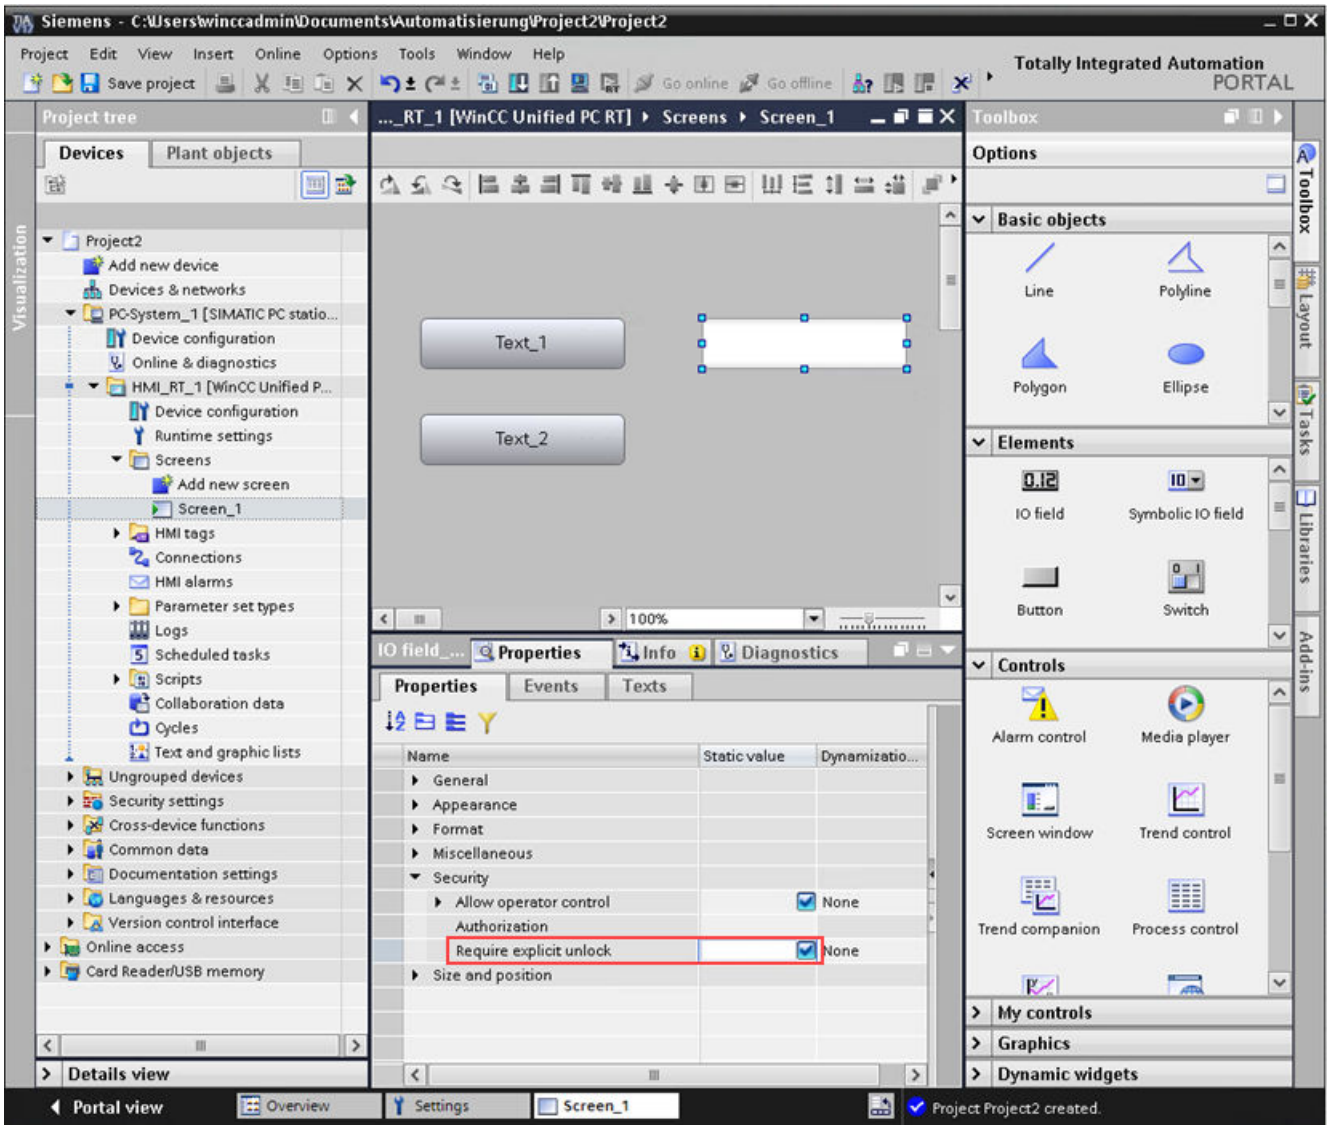
You can lock and unlock operator controls in projects for multi-touch devices. Locked operator controls can only be operated in runtime when the operator presses a release button at the same time.

You can lock and unlock individual operator controls or several operator controls simultaneously.

Procedure

1. Configure operator controls of the type I/O field, button or slider.
2. Select the required operator control(s).

3. To lock the operator controls, enable the "Require explicit unlock" option under "Properties > Properties > Security".



4. To unlock the operator controls, disable the "Require explicit unlock" option under "Properties > Properties > Security".

In runtime, locked operator controls can only be operated when a release button is pressed at the same time.

Note

Locking of operator controls is an add-on to the existing security settings of the operator control. This means that in case of locked operator controls - in addition to pressing the release button - the general operability ("Allow operator control" option) and the required operator control ("Authorization" property) must be present so that the operator control can be operated in runtime.

Defining the release button

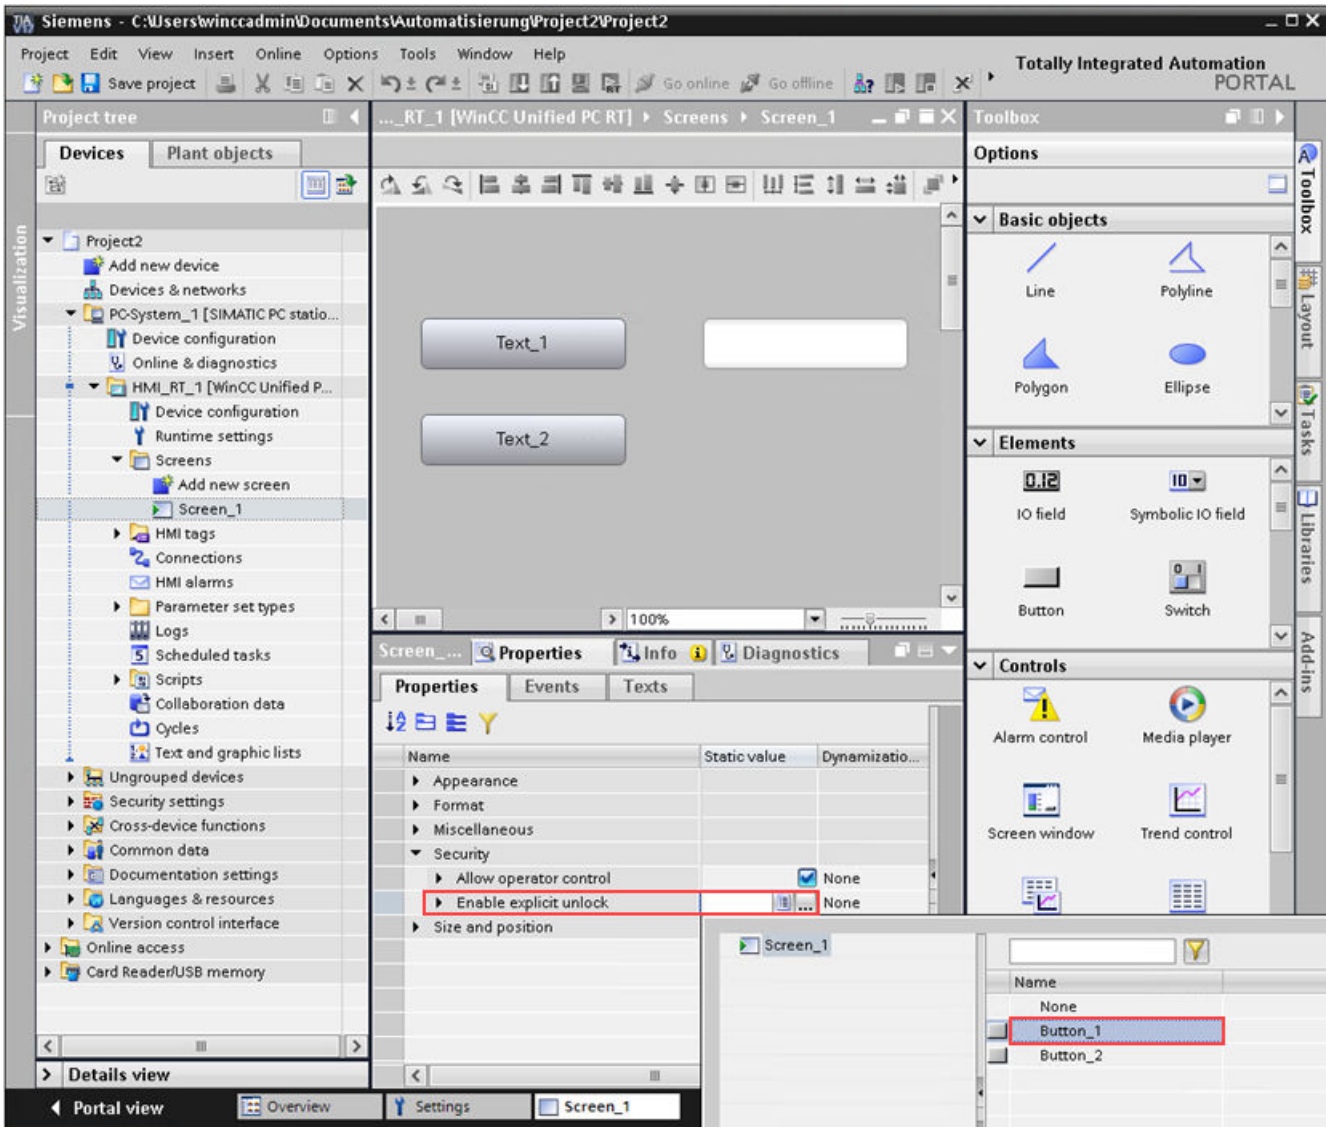
To use the locked operator controls, you must configure at least one release button in one of the displayed screens.

Configuring the release button in the screen

So that you can operate locked operator controls on multi-touch devices, configure a release button.

Procedure

1. Select the screen.
2. Select the desired button of the screen under "Properties > Security" under "Enable explicit unlock".



3. To turn a release button back into a normal button, select a different button or "None" under "Properties > Security" under "Enable explicit unlock".

17.2.3.3 Triggering an action

Introduction

Triggering an action at an operator control can mean the following:

- A command is executed.
  Example: Touch a button to trigger a script or perform a predefined function.
- An object is enabled.
  Example: Touch a table cell to enter a value in a list.

Requirement

- You have navigated to the operator control on which you want to trigger the action.
- The operator control has the focus.

Procedure

- Touch the operator control on the touch screen once or twice in rapid succession.

Result

The following results are possible:

- The requested command is executed.
- The screen keyboard is opened and/or the cursor blinks in the input area of the operator control.
- The element is selected and can be moved.

17.2.3.4 Entering a value

Introduction

Depending on the input format, you enter numeric or alphanumeric values in an input field using the screen keyboard.

Requirement

- The object is an input field or table field.
- The operator control is enabled.

Entering a value

1. Enter the desired value.
2. To confirm the value and exit the field, press the <Enter> key.
3. To discard the value and exit the field, press the <Esc> key.

Result

A value is entered or discarded. You navigate as needed to the next operator control.

For more detailed information, refer to the operating instructions for your HMI device.

17.2.3.5 Moving operator controls

Introduction

You operate movable operator controls of a screen item in Runtime via the touchscreen, such as a slider.

Requirement

- A movable operator control is selected.

Procedure

1. Use a corresponding gesture to move the operator control, e.g. "drag" for a slider.
2. To finish the movement, navigate to another screen object or operator control.

Result

The position of the movable operator control and the display in the screen object have changed.

17.2.3.6 Changing Runtime language

Introduction

The project on the HMI device can be multilingual. A corresponding operating element which lets you change the language setting on the HMI device has been configured in runtime.

The project always starts with the language set in the previous session.

Requirement

- The desired language for the project is available on the HMI device.
- The language switching function is linked to an operating element, for example, to a button.

Selecting a language

You can change project languages at any time. The language-specific objects are displayed in the selected language when the language switching function is called.

You can switch the language in Runtime in one of the following ways:

- Use a configured operating element to switch from one language to the next in a list.
- Use a configured operating element to directly set the required language.

17.2.3.7 Web browser of WebKit engine

Introduction

If the "Browser" object is configured for an HMI device, then the "Browser" operating object is displayed in the corresponding runtime screen. Only the web browser of the WebKit engine is available on HMI devices. This web browser offers many HTML5 features, but no Active X support.

HTML5 functions

The following HTML5 standard functions are fully or partly supported by the Web browser of the WebKit engine:

- Parsing rules
- Elements
- Forms and fields
- Output
- Communication
- User interactions
- Performance
- Security
- History and Navigation
- 2D graphics
- Memory
- Animations
- Web applications
- Files and file systems

Note

Functions not supported in the WebKit engine web browser

- Microdata
- Enter
- Peer to peer
- Position and orientation
- Video, audio
- Responsive images
- 3D graphics
- Streams
- Web components

The following tables show the availability of the HTML5 functions in the web browser of the WebKit engine in detail:

Parsing rules	**Available**
<!DOCTYPE html> triggers the standard mode	Yes
HTML5 tokenizer	Yes
HTML 5 tree building	Yes
Parsing Inline SVG	Yes
Parsing Inline MathML	Yes

Elements	**Available**
Embedded invisible data	Yes
New or modified elements	
Section elements	Yes
Grouping content elements that belong together	Partly
Semantic elements of the text level	Partly
Interactive elements	Partly
Global attributes and methods	
Hidden attributes	Yes
Inserting dynamic markups	Yes

Forms and fields	**Available**
Field types	
type = text	Yes
type = search	Yes
type = tel	Yes
type = URL	Yes
type = email	Yes
type = date	No

Forms and fields	**Available**
type = month	No
type = week	No
type = time	No
type = datetime	No
type = datetime-local	No
type = number	Yes
type = range	Yes
type = color	Yes
type = checkbox	Yes
type = image	Yes
type = file	Yes
textarea	Yes
select	Yes
fieldset	Yes
datalist	Yes
keygen	Yes
output	Yes
progress	Yes
meter	Yes
Fields	
Field validation	Yes
Assignment of forms and controls	Yes
Other attributes	Yes
CSS sectors	Yes
Events	Yes
Forms	
Form validation	Yes

Output	**Available**
Full-screen support	No
Web notifications	Yes

Communication	**Available**
Server-sent events	Yes
Web beacons	No
XML HttpRequest Level 2	
File upload	Yes
Response type	Yes
WebSocket	
Basic Socket Communication	Yes
ArrayBuffer and Blob	Yes

User interactions	**Available**
Drag-and-drop	
Attributes	Yes
Events	Yes
Editing HTML	
Editing elements	Yes
Editing documents	Yes
CSS sectors	No
APIs	Yes
Clipboard	
Clipboard for API and events	No
Spell check	
Spelling attributes	Yes

Performance	**Available**
Native binary data	Yes
Workers	
Web workers	Yes
Shared workers	Yes

Security	**Available**
Web Cryptography API	No
Content Security Policy 1.0	Yes
Content Security Policy 1.1	No
Cross-Origin Resource Sharing	Yes
Cross-Document Messaging	Yes
iFrames	
Sandboxes iFrame	Yes
Seamless iFrame	Yes
iFrame with inline contents	Yes

History and Navigation	**Available**
Session history	Yes

2D graphics	**Available**
Canvas 2D graphics	Yes
2D primitives	
Text input in graphics	Yes
Path input in graphics	No
Drawing an ellipse in graphics	No

2D graphics	**Available**
Drawing a dashed line in graphics	Yes
System focus ring	No
Functions	
Hit testing	No
Aperture mode	No
Formats for image export	
PNG	Yes
JPEG	Yes
JPEG-XR	No
WebP	No

Animation	**Available**
window.requestAnimationFrame	Yes

Web applications	**Available**
Offline resources	
Application cache	Yes
Service workers	No
Content and scheme handlers	No

Memory	**Available**
Key value storage	
Session memory	Yes
Local storage	No
Database storage	
IndexedDB	No
Blob object store	No
ArrayBuffer object store	No
Web SQL database	Yes

Files and file systems	**Available**
Reading files	
Basic support for reading files	Yes
Creating a blob from a file	Yes
Creating a data URL from a blob	Yes
Creating an ArrayBuffer from a blob	Yes
Creating a blob URL from a blob	Yes
Accessing a file system	

Files and file systems	Available
API file system	No
File API: Folders and system	No

Additional functions	Available
Styles	
Style items	No
Scripts	
Asynchronous script execution	Yes
Signaling script errors in Runtime	Yes
Events for script execution	No
Base 64 encoding and decoding	Yes
JSON coding and decoding	Yes
URL API	Yes
MutationObserver	"Yes" (pre-selected)
Promises	No
Page visibility	"Yes" (pre-selected)
Text selection	Yes
Scrolling (Scroll into view)	Yes

17.2.4 Entering barcodes via handheld readers

Introduction

Optical handheld readers enable you to optically identify components, machines and other objects and to transfer the read-out data on your HMI device directly to certain operating objects.

Optical handheld readers capture codes such as two-dimensional data matrix codes, one-dimensional barcodes and postal barcodes.

Supported optical handheld readers can be found at the following entry on the Internet:

FAQ 19188460 (https://support.industry.siemens.com/cs/ww/en/view/19188460)

You can find templates for the settings and instructions on configuration in the manual for your optical handheld reader.

Procedure

You use the connected optical reader to read a code into the object that has the focus.

After the read-in, confirm the value with the Enter key or with the "Suffix - Enter" that you have previously configured in the settings of your optical reader.

Objects for input with optical handheld reader

The following objects support input via an optical handheld reader:

Object	Preconditions for input
IO field Clock	The corresponding data type is selected. The object and the tag length are configured accordingly. The operating object has the cursor focus.
Parameter set control	The parameter set has the cursor focus.
Browser	The operating object has the cursor focus.
Runtime dialogs which support keyboard entry	The dialog is open and the corresponding input field has the cursor focus.
File browser	The field "File path" has the cursor focus.

Result

The code is read and entered into the corresponding input field.

17.3 Operating Unified PC

17.3.1 Basics

17.3.1.1 Process screens

Behavior of process screens

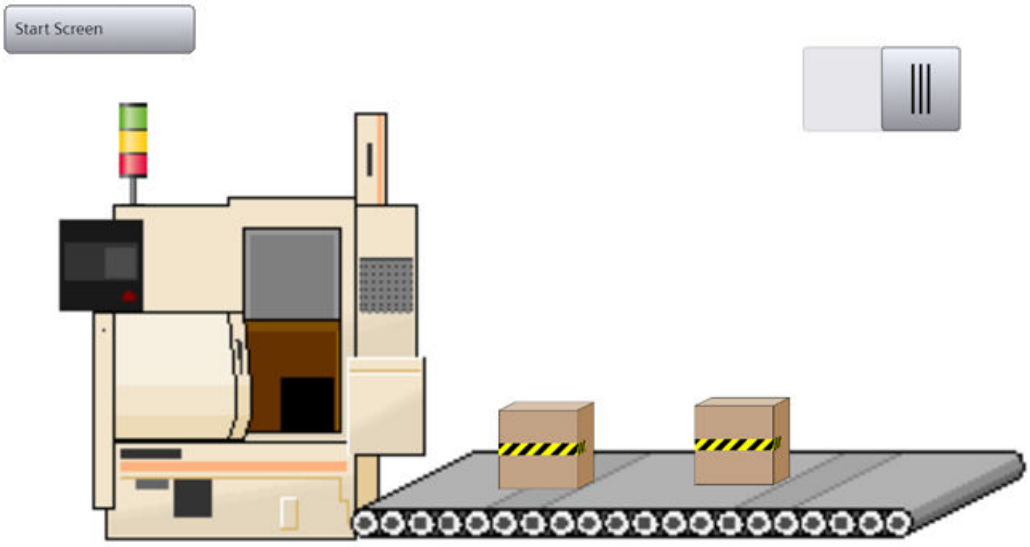
Process screens are static and dynamic representations of the plant, plant units or processes. You use the process screens to operate and monitor the plant or areas within it.

A project on an HMI device consists of multiple process screens. When you start Runtime, the process screen that was defined as the start screen is displayed. You navigate between process screens according to a sequence, navigation or link that was defined by the configuration engineer.

The process screen contains static and dynamic screen objects. Screen objects visualize the current process values from the controller memory and record operator inputs that influence the process. Dynamization is realized through the connection of tags to the screen object during configuration.

Process values and operator inputs are exchanged between the controller and the HMI device by means of tags.

A process screen can be opened and operated by several operating stations simultaneously in Runtime.



Note

Displaying a start screen changed by reloading

A start screen was defined for a project, and the project was started in Runtime. If another start screen is then defined in engineering and the project is loaded into the device again, the last active screen is displayed in Runtime after the connection is established again.

After reloading the project, refresh the screen in Runtime. If your HMI device is a computer, use the F5 key or the browser "Refresh" button to do this.

Screen navigation

Process visualization is generally split between multiple process screens, for example on the basis of functional or technological aspects. Changing between process screens is referred to as screen navigation.

Popup window

With corresponding configuration in the engineering system, clicking on a screen area opens a popup window containing additional information on the screen area.

Example: A screen represents a pump with its valves. When you click on a valve, a popup window opens with detailed information on the valve as well as input fields. You can check the state of the valve in the pop-up window and edit using the input fields.

Predefined styles

The following predefined styles are available for the process screens of the HMI devices:

- Light style
- Dark style
- Expanded style

Note

Compact mode in light and dark style

If the following elements in light or dark style fall below specific dimensions, they are automatically displayed in compact mode:

- Bar
- Slider
- Gauge
- Clock

17.3.1.2 Tags

Behavior of tags

Tags correspond to defined memory areas to which values are written and/or from which values are read. In runtime, tags are output in trends or tables, for example.

External tags correspond to the process values from the memory of an automation system. They are connected to the tags of a connected PLC.

Internal tags transport values within the HMI device. The internal tag values are only available as long as runtime is running.

Value changes to external tags

Value changes to external tags are triggered as follows in runtime:

- By a PLC
  The PLC changes the value of the connected PLC tags.
  During the next update of the external tags, the new value is written to the HMI process image.
- By operator actions or by a script running on the HMI device
  The value change requested in runtime is not directly applied from the HMI process image. Runtime transfers the value to the PLC. The PLC writes the value to the linked PLC tag after successful verification.
  During the next update of the external tags, the new tag value is written to the HMI process picture.

Acquisition mode and acquisition cycle for updating the tags are specified during configuration.

Executing the script of a trigger tag

The script defined for a trigger tag in engineering is executed in Runtime in the following cases:

- During start of Runtime
  The start value of the trigger tag is reported to Runtime.
- When the condition defined for the trigger tag occurs
  For example if the trigger tag changes its state or exceeds a limit value.

Floating point numbers in the web client

Since the web client is implemented via JavaScript, tag values for floating point numbers can only be displayed with a mantissa of up to 54 bits. This leads to rounding of values with a mantissa greater than 54 bit in Runtime.

Note

Values with a mantissa of up to 64 bits are correctly displayed by I/O fields.

Restricted scope of validity "local session"

By default, internal tags apply "system-wide".

As an option, the scope of validity of an internal tag can be limited to "local session". Data related to a session in a multi-user environment is processed independently in each local session.

The use of local session tags is supported in Unified Collaboration and in the web client.

Local session tags permit, for example:

- Individual navigation in screen windows or in different menu structures
- Session-related disabling/enabling of the user
- Session-related position, alignment and rotation of objects in a screen

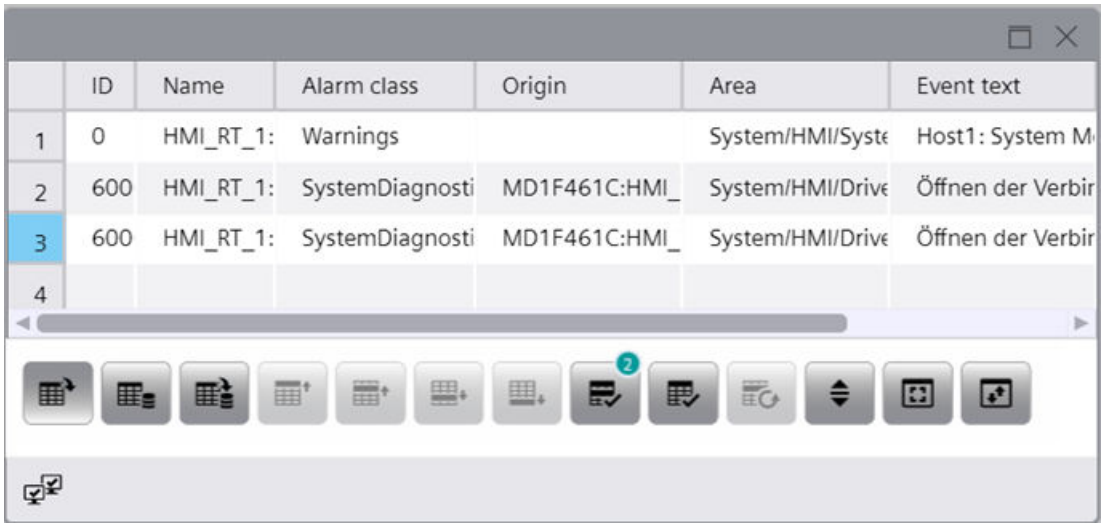
The values of a local session tag are not saved and will be lost at the end of a session.

17.3.1.3 Alarms

Behavior of alarms in Runtime

Depending on the configuration, PLC alarms and HMI alarms from various areas of the plant are displayed in Runtime.

Depending on the configuration, the alarms are labeled according to importance or type and are represented and displayed differently. For example, a pending alarm can be displayed as follows:



17.3.1.4 Logs

Data log

In Runtime, the data logging functions on the server as a log server. On the clients, the data logging functions as a log client. Only the log server accesses the database and compiles and logs the process data. The clients receive log data from the log server.

The log data is visualized in tabular or graphic format on all clients running tag logging in Runtime. The data to be displayed always comes from the log server. All operations on the client are transmitted to the server and the result of the processing is transferred back to the client.

Alarm log

Alarms in the project indicate fault states and operating states of a process. They are generally triggered by the controller. Alarms are displayed on the HMI device in screens. All the data associated with an alarm and configuration data are saved in an alarm log, for example, alarm class, time stamp and alarm text. Each alarm class can be logged separately. Alarms are logged either automatically or by operator intervention.

17.3.1.5 Contexts

Contexts allow you to view plant units according to a certain viewpoint, e.g. according to a certain customer, product, job or shift.

Principle

Contexts always belong to a plant object. They are indicated as follows:

- User-defined contexts:
  Using a program created with the ODK-API
- System-generated contexts:
  For installed Performance Insight and Calendar option packages: Automatically in Runtime
  Example: When a shift starts in Calendar, an archived context value is created with the shift ID

A log entry is generated each time a context (e.g. "Product") is executed. The logged context saves:

- The context value (e.g. "orange lemonade")
- Start time and end time of the execution time
- The quality code

Contexts in the trend control and alarm control

You can filter the content of these controls so that only data that has been generated in a specific plant unit and for the context you have selected is displayed. To do this, select a plant object, a context and one of its logged context values.

Example

A press house produces juices for various beverage brands. Using contexts, employees can display in runtime which alarms have occurred:

- During the production of a specific product (cloudy apple juice, clear apple juice, pear juice etc.).
- For orders for a specific customer (Schmitt, Schulze, Meier).
- During a specific shift (early shift, late shift, night shift).

Contexts in the "Reports" control.

You have the option of linking the generation of reports to the execution of contexts.

If the templates are configured appropriately, the reports available in the control can also contain information about contexts. When a report was generated as an Excel file and reads both contexts and alarms or tag values, you can then use the Excel filter function to filter the alarms and tags by context.

Display context data of the plant objects in a trend control (Page 7329)

Adding contexts (Page 7421)

17.3.2 Starting and displaying runtime

17.3.2.1 Internet browsers for WinCC Unified PC

Ensure you have the latest operating system and browser version if you want to access Runtime Unified with this device.

WinCC Unified displays the runtime elements in HTML5. The browser used also has to support this standard. Since the browsers interpret HTML5 differently, it is possible that objects are displayed differently depending on the browser and the browser version used. For example, browsers sometimes display fonts differently.

Compatibility tests were performed for the following browsers. The focus of the compatibility tests was on the browsers marked with *:

Operating system	Browser
Microsoft Windows	• Google Chrome* • Microsoft Edge • Mozilla Firefox, Mozilla Firefox ESR
Android	• Google Chrome* • Firefox • Edge
iOS, Mac	• Safari* • Google Chrome • Firefox • Edge

Browser recommendation

In view of the performance and support of the Runtime standard elements, Google Chrome has proven to be the preferred browser. Its memory requirements are slightly higher than those of the other browsers.

Note

Operating system and browser version

For Runtime operation via Android or iOS, always use the latest operating system.

Use the latest browser version.

Note

Performance differences in different versions of individual browsers

The browser versions can differ from each other, which can result in different behavior regarding the memory requirements and speed.

Note

Suitability for continuous operation

MS Edge and Mozilla Firefox have proven to be problematic in continuous operation.

Known browser problems

The following restrictions apply to the following browsers:

Internet browser	Limitation
MS Edge	• High memory capacity utilization in continuous operation
Mozilla Firefox	• High memory capacity utilization in continuous operation
Mozilla Firefox ESR	• Support of touch gestures for touch panels as of Firefox ESR V59
Google Chrome	• High memory capacity utilization in uninterrupted duty depending on the version. • On Android: Grid lines with a line width ≤1 are not displayed correctly. This is due to the browser's own line thickness representation. As a solution, it is helpful to use a line width ≥1. • No correct representation of elements that use an SVG graphic as background graphic scaled in the Engineering System.

Restrictions to the various functions can also occur, such as the availability of the before and after buttons in the controls.

Current information on browser problems

You can find up-to-date information on display problems in browsers at the Siemens Online Support under the entry ID 109757952.

17.3.2.2 Displaying runtime

Introduction

Use a web browser (web client) to display and operate the Runtime project running on the HMI device. The following options are available to access and display Runtime:

- From the same device (local web client)
  The web browser is installed on the same device as Runtime.
- Remote access from the same network
  The device on which the web browser is installed belongs to the same network as the HMI device.
- Remote access from a foreign network
  The device on which the web browser is installed does not belong to the same network as the HMI device.

Requirement

- The Runtime project is loaded on the HMI device.
- The project runs in runtime.
- The user management configuration of the project is active.
- When using the central user management:
  - At least one user is created in the UMC system.
  - The user created in the UMC system has been imported into the TIA Portal project before the loading.
  - The user has function rights via his/her roles to monitor or monitor and operate the Runtime project.
- When using the local user management:
  - Before the loading, at least one user has been created in TIA Portal.
  - The user has been assigned at least one role. The user has function rights via his/her roles to monitor or monitor and operate the Runtime project.
  - At least one user has the "HMI Administrator" role.

Procedure

1. To view the Unified start page, enter the Unified URL in the browser address bar:
"`https://<IP address of the HMI device or its FQDN or device name>`"
To display the Unified Runtime page directly, append the following string to the URL: "`/WebRH`"
Step 5 is omitted.
Example: "`https://141.73.65.245/WebRH`"

   Note

   Whether you enter the IP address, the FQDN (fully qualified domain name) or the device name in the URL depends on how the web server certificate has been bound to the HMI device. This is defined during Runtime installation or later in the "Website settings" step of WinCC Unified Configuration.

   If needed, ask your administrator.

   The following restrictions apply to entering the URL:

   - FQDN: Only if the HM device belongs to a domain
   - IP address: Not when using dynamic IP addresses
   - Device name: Only when accessing from the same network

   Note

   When using a local web client, you can also enter the "`localhost`" command.

   Example: "`https://localhost/WebRH`"

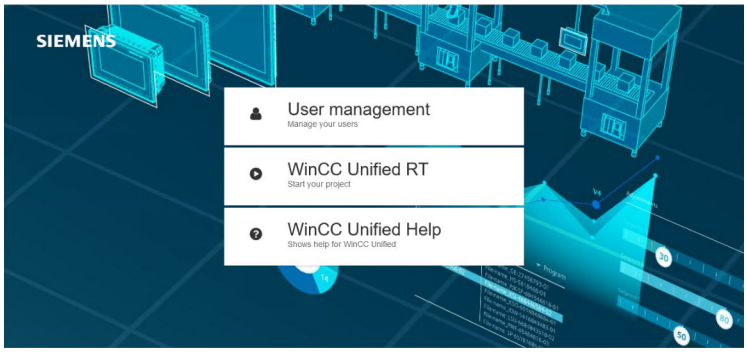
   Regardless of whether the web server certificate is already installed in the browser, you will first see a security warning. Bypass this warning by clicking "Advanced" and "Continue to <link> (unsecure)".

2. Press Enter.
3. If you are accessing the Runtime of the HMI device from this device for the first time and there is no corresponding certificate, install the certificate in the browser. Then reload the page.

4. The start page of Runtime is displayed.

Note

If you experience display problems in the web client, completely delete the browser data (history, form entries, etc.).



If WinCC Unified Online Engineering is installed on the device, the "WinCC Unified Configuration" button also appears.

5. Select "WinCC Unified RT".
The login page of WinCC Unified Runtime is displayed.

Note

After a complete download of a project, an error (SwacLogin) may occur when opening the WinCC Unified Runtime page.

You can find more information at SwacLogin: Errors after complete download (Page 7253).

6. Specify the user name and password of a runtime user.
7. (Optional) Select the language in which runtime is displayed.
8. Confirm your entry.
The Runtime project that is running is displayed in the web browser.

Note

Displayed runtime language

When using central user management, runtime is displayed in the language you have selected in the "User login" dialog during login.

If this language is not available for the current project or if the language setting was not set in the central user management, the following language is displayed:

- Engineering with TIA Portal: The language for which the lowest number was configured in the runtime settings.
- Engineering with Online Engineering: The language set as default language in the "Languages" tab in the "Languages and Resources" editor.

If you do not select a language in the "User login" dialog, runtime is displayed in the language that is set for the browser.

Changing users in runtime (Page 7257)

Starting and stopping a project (Page 7259)

Installing a certificate when accessing via web client (Unified PC) (Page 7247)

Activating user management (Page 7508)

17.3.2.3 Installing a certificate when accessing via web client (Unified PC)

Using root certificates

To enable web browsers to establish a secure connection to WinCC Unified, the root certificate with which the web server certificate of WinCC Runtime was issued must be known in the web browser as a trusted certification authority.

By installing the web server certificate on the PC device, the public root certificate is made available as a download for installation in web browsers on the WinCC Unified home page.

The procedure for installing the root certificate differs depending on your web browser.

Use of self-signed certificates

As an alternative to the root certificate, you can use a self-signed certificate.

NOTICE
Security risk from self-signed certificate A self-signed certificate is not issued by a trusted certification authority. If you use a self-signed certificate from an untrustworthy source, the data transfer is not protected from attacks. Before using self-signed certificates, check the source. Depending on the firewall and network settings, the use of self-signed certificates may be prohibited.

The installation of self-signed certificates is not supported by all web browsers. Depending on the web browser, it is possible to define exceptions.

For more detailed information, refer to the operating instructions of the web browser.

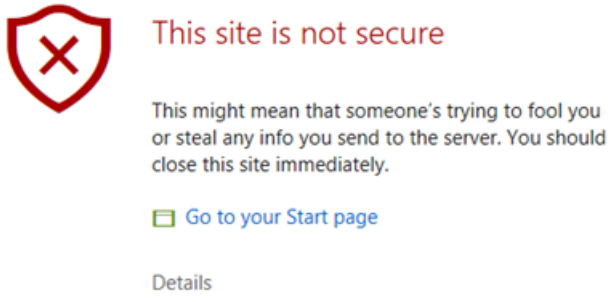
Installing the root certificate for Chrome and Microsoft Edge

Chrome and Microsoft Edge use the Windows system certificate store.

- On devices **with WinCC Unified installation** that have been configured with the Certificate Manager, these web browsers can immediately establish a secure connection to the WinCC Unified web pages because the root certificate has already been installed in the system certificate store.
- On devices **without WinCC Unified Installation** the root certificate must be installed manually.

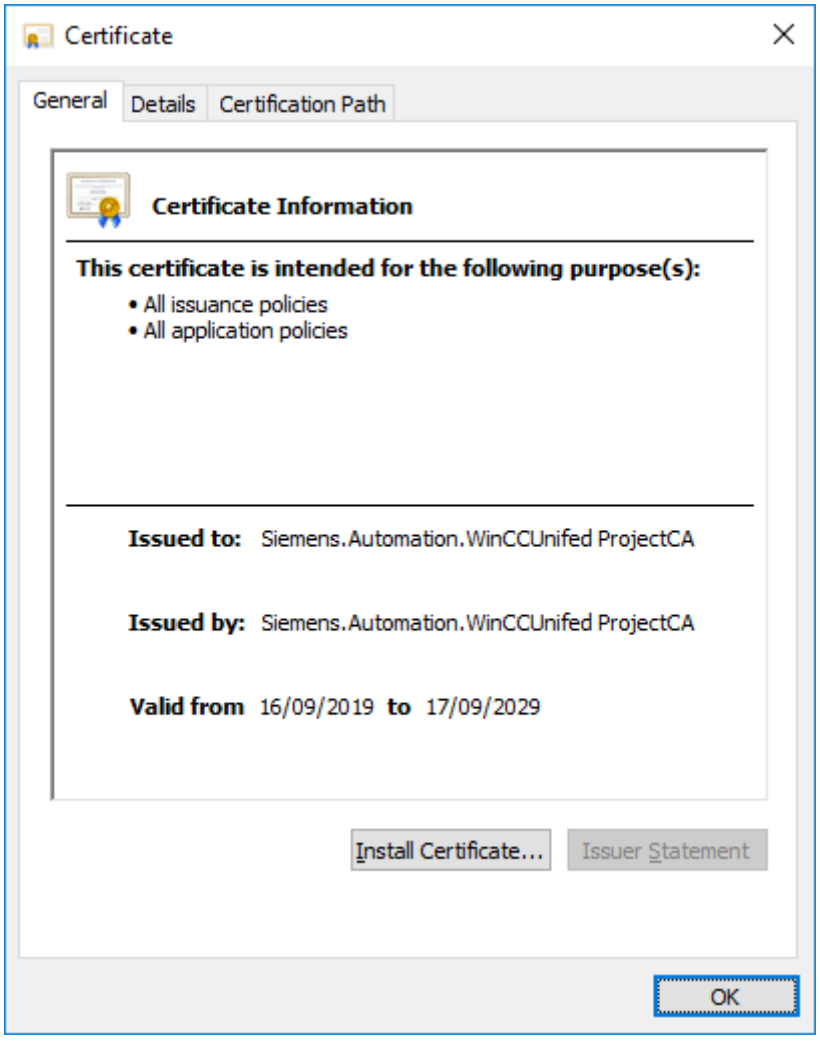
To install manually, follow these steps (for example, Microsoft Edge):

1. Open the WinCC Unified home page via the URL https://<host name>
   At first, an error message appears:



2. Open the field with the error details and confirm that you want to open the web page.
3. On the WinCC Unified home page, select the field "Certificate Authority" and confirm "Open file" in the download dialog.
   The root certificate is downloaded to the default download directory.

4. Open the downloaded file.
   The root certificate is opened with the Windows standard form.



5. To import the root certificate into Windows, select "Install Certificate".
6. In the certificate import wizard, select "Local Machine" as the storage location, "Trusted Root Certification Authority" as the certificate store and start the import process.

Installing the root certificate for Firefox

Firefox uses its own certificate store and must therefore be configured manually on each device once:

1. Open the WinCC Unified home page via the URL https://<host name>
   At first, an error message appears.
2. Open the field "Advanced" and confirm the field "Accept the Risk and Continue".
   An exception is entered for this page in the Firefox certificate management.
3. On the WinCC Unified home page, select the field "Certificate Authority".

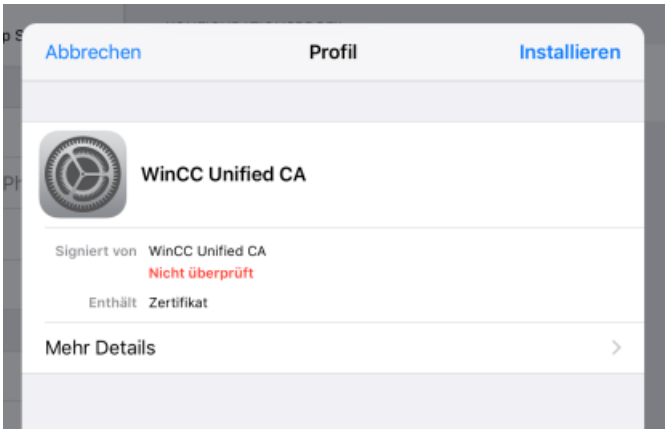
4. Save the root certificate. To do this, click "Save file" in the Firefox dialog that follows.
5. Store the certificate in the Firefox certificate store. Proceed as follows:
   - Open the "Settings" page of Firefox.
   - Select "Privacy & Security". There you will find the "Certificates" area further down. Open "Show certificates...".
   - In the "Certificate Management" window, select the "Certification authorities" tab:

   - Click "Import" and select the root certificate you saved in step 3.
   - In the window that opens, select the option "This certificate can identify websites" and confirm your selection.
     The connection to Runtime is now secure. In the Firefox address bar it is still displayed as unsecure.
   - To show the connection as secure in the address bar, click "Server" and remove the exception created by step 2.

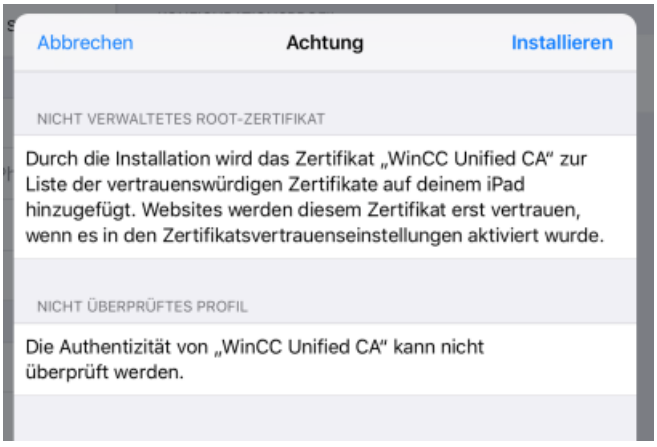
Installing the root certificate on iOS devices

iOS uses its own certificate store and must therefore be configured manually on each device once. An error message also appears when the WinCC Unified home page is opened.

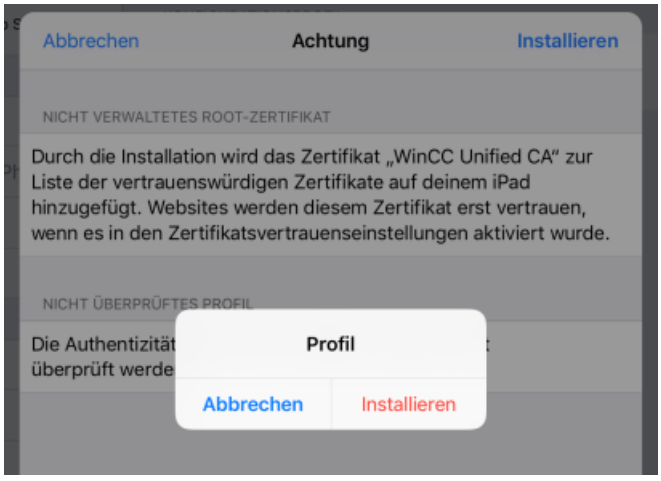
1. Open the field "Advanced" and confirm the field "Accept the Risk and Continue".
2. On the WinCC Unified home page, select the field "Certificate Authority".



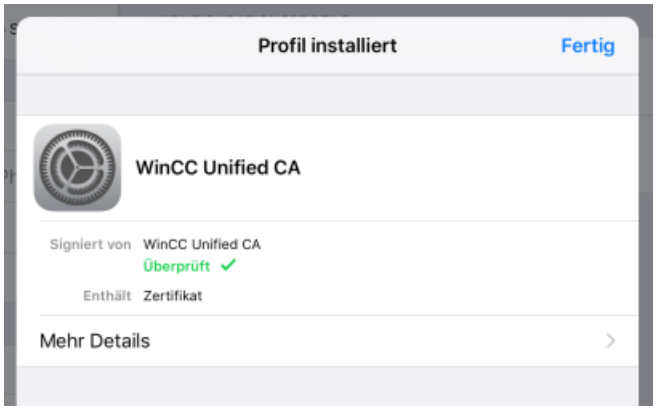
3. Select "Install".



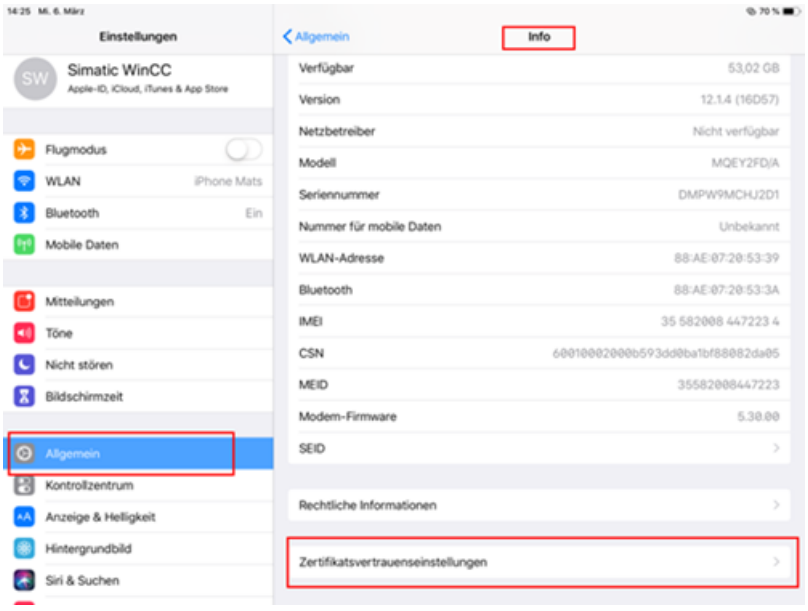
4. Select "Install" again.



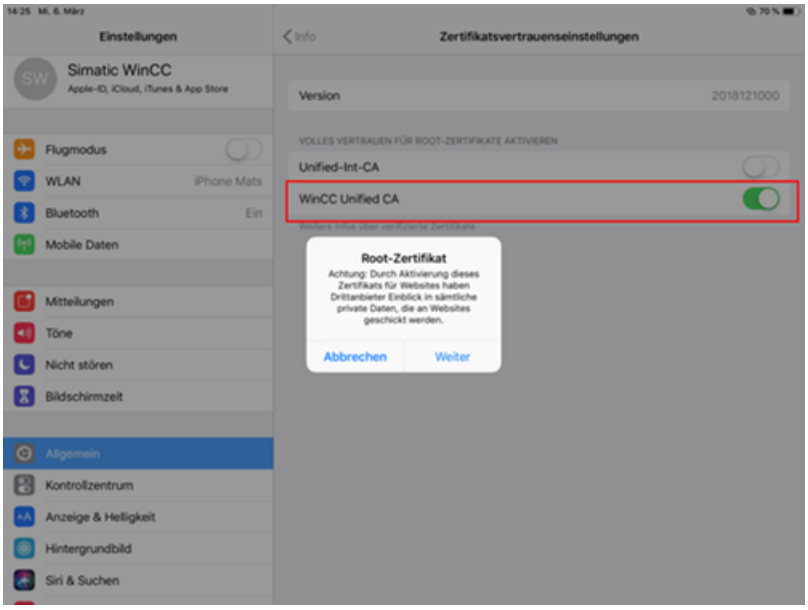
You see the entry "Trusted".



5. Select "General > Info > Certificate Trust Settings".



6. Enable "WinCC Unified CA" and select "Next".



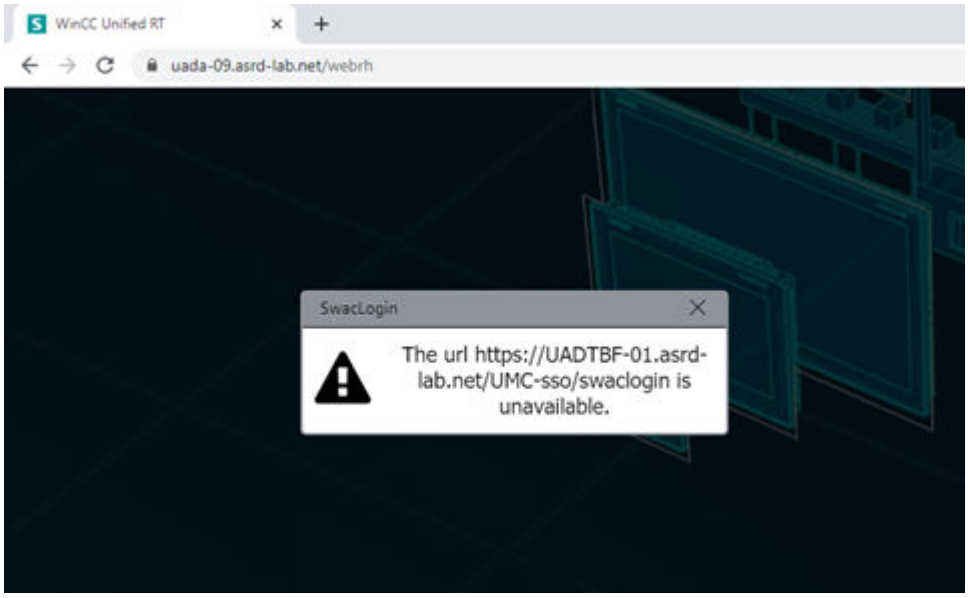
17.3.2.4 SwacLogin: Errors after complete download

After complete download of a project to a Unified PC, an error can occur when you open the WinCC Unified home page. The error can occur regardless of whether you open the home page locally on the PC or from a different device.

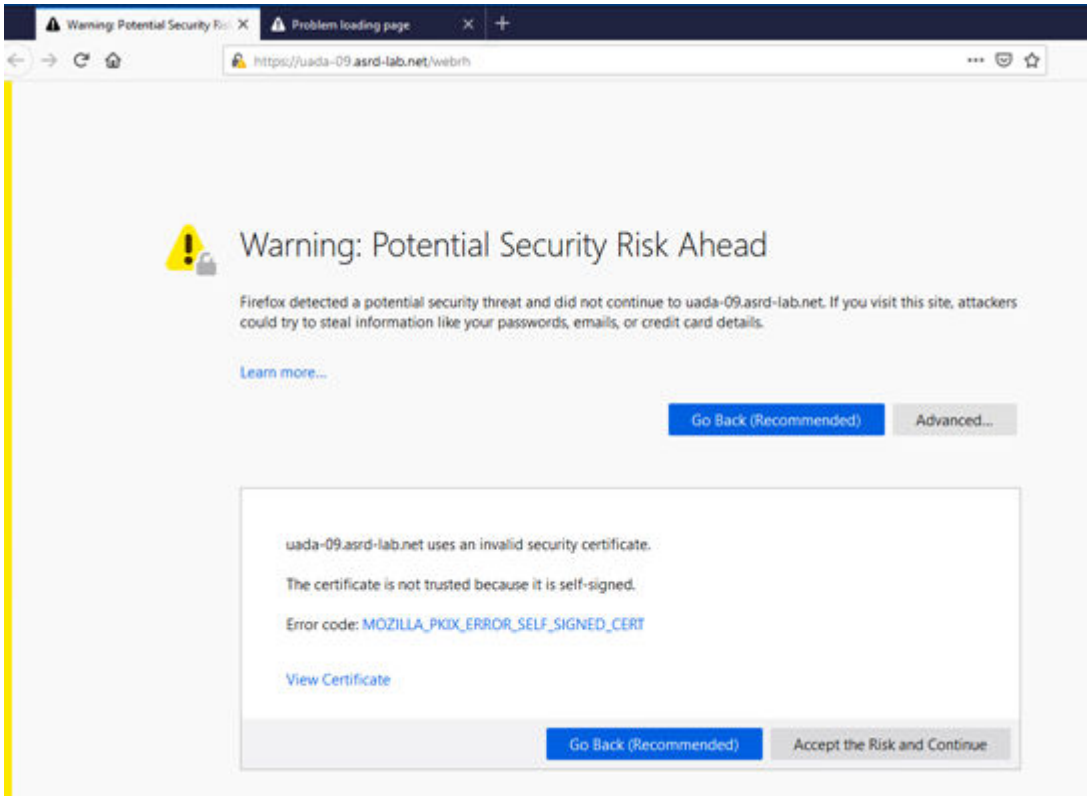
A possible cause of the error is the deletion of the browser cache.

Error description

In "Chrome" and "MS Edge", the error is displayed with the following alarm:



In "Firefox", the error is displayed with the following alarm:

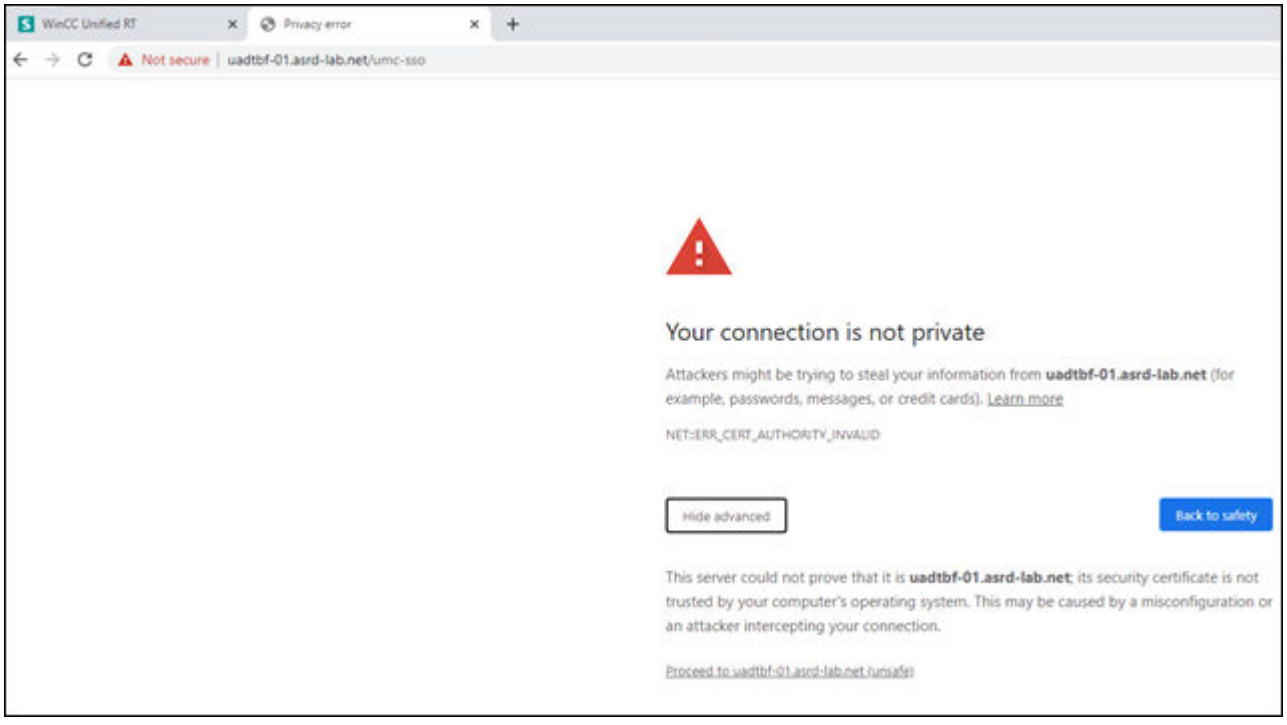


After accepting the warning of a potential security risk, the page remains empty in Firefox. Only the background screen is visible.

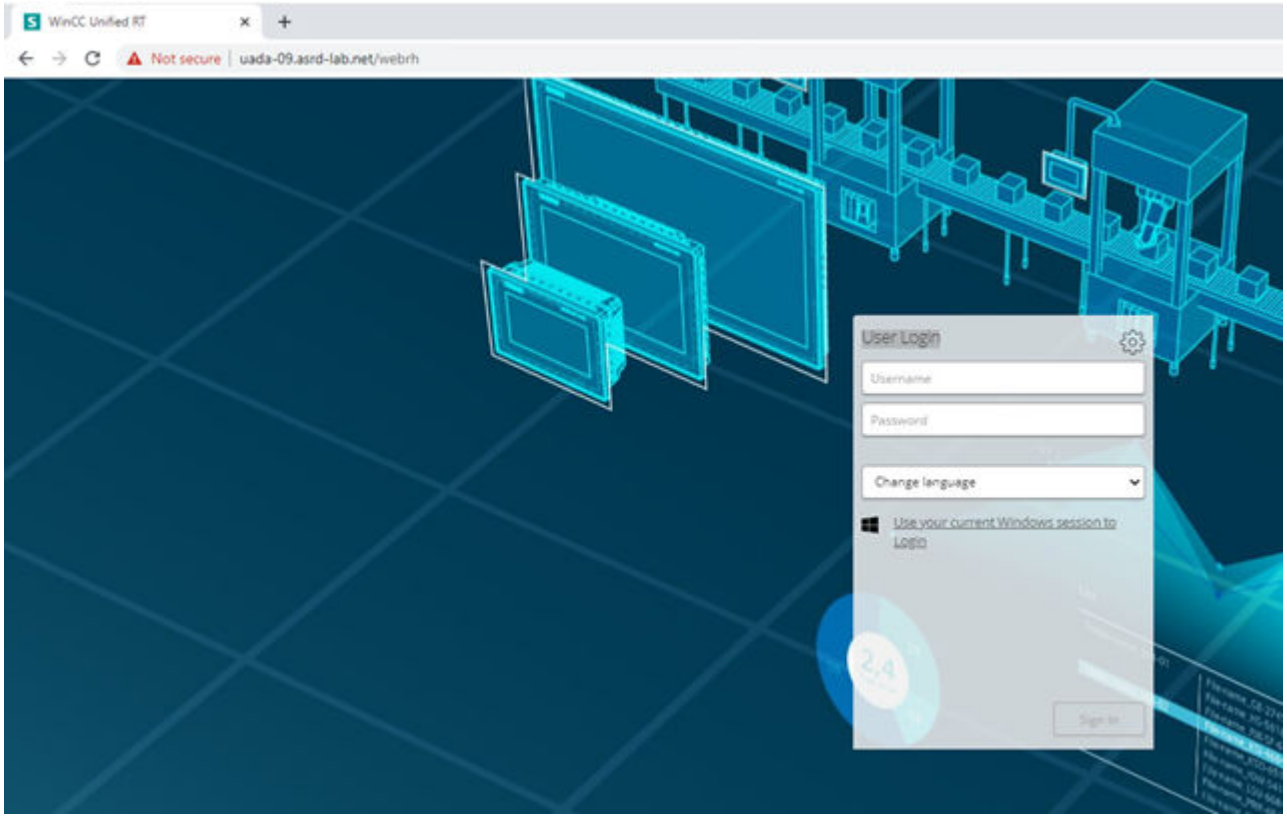
Remedy the error in "Chrome" and "MS Edge"

To fix the error in "Chrome" and "MS Edge", proceed as follows:

1. Open a new tab.
2. Enter the URL address of the identity provider of the UMC server in the address line of the browser. The URL is the same as the one in the error message without "/swaclogin", for example, "https://uadtbf-01.asrd-lab.net/umc-sso".
3. The page with a warning regarding the secure connection is displayed.



4. Accept the warning by clicking on "Proceed to uadtbf-01.asrd-lab.net (unsafe)".
5. The home page with the "User login" dialog is displayed.



Remedy the error in "Firefox"

To remedy the error in "Firefox", follow these steps:

1. Open a new tab.
2. Enter the URL address of the identity provider of the UMC server (ring server) in the address line of the browser, for example, "https://uadtbf-01.asrd-lab.net/umc-sso".
3. A blank page opens. Close the page.
4. Refresh the home page with the function key <F5>. The home page with the "User login" dialog is displayed.

See also

Displaying runtime (Page 7243)

17.3.2.5 Logging out user

If you want to end your Runtime session, you have the following options to log out completely:

- Use the "Logout" system function.
- Log out in the user management.
- Close all instances, i.e. open windows, of the browser in use.

Requirement

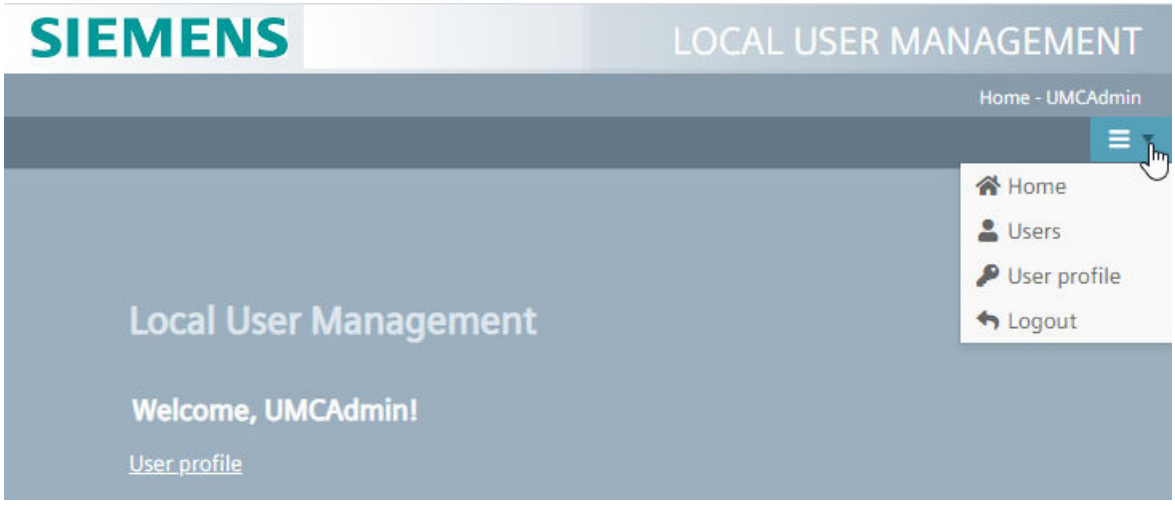
- You are logged in to Runtime.
- When you want to log out in the Runtime project, the system function "Logout" is configured, for example, to the event "Click left mouse button".

Logging out in the Runtime project with the system function "Logout"

- Select the button at which the system function "Logout" is configured.

Logging out in the user management

- Select "Logout" from the menu.
  Your session is ended.



New data downloaded from the TIA Portal is applied during the next login.

17.3.2.6 Changing users in runtime

Introduction

In Runtime, the users that are created in the engineering system can log on.

Requirement

- The IP address or the fully qualified name (name and domain) of the PC on which Runtime is installed is entered in the browser.
  If Runtime is installed on the same PC as the browser, the "localhost" designation can also be used.
- A user is logged into runtime.
  You log in by selecting "WinCC Runtime RT" or "User management".

Procedure

To log off a user and then log on a different user, proceed as follows:

1. Select "User management" on the start page of Runtime.
2. Expand the menu at the top right.
3. Select "Logout".
4. Log in with a different user.

Change logged-on user via RFID card

For local Web clients, WinCC Unified Runtime supports login with RFID and PM-LOGON.

Requirement

- Runtime uses local user management.
- Logon via RFID is active for the HMI device.
  This setting is made during installation of Runtime or later in WinCC Unified Configuration in the "User management" step.
- PM-LOGON is installed on the HMI device.
- The teach-in of the used RFID card with PM-LOGON is completed.
- An RFID reader supported by PM-LOGON is connected to the HMI device.
- The local web client is opened and connected to Runtime.
- A user is logged into runtime.

Procedure

1. Hold the RFID card in front of the reader or insert the card into the reader.
2. If the entry of a PIN was set in PM-LOGON during the teach-in of the card, enter the PIN.

Result

After successful validation of the credentials stored on the card, the user logged-on in Runtime is changed.

If the card requires PIN entry and an incorrect PIN is entered, the previously logged-on user remains logged on.

Note

There is no system feedback about the user change. If required, process screens can be configured in engineering to display the logged-on user.

Note

Additional information on PM-LOGON

See the PM-LOGON user help for information:

- For licensing and installation of PM-LOGON
- To the card readers supported by PM-LOGON
- To the teach-in of the RFID cards.

You can find the PM-LOGON user help at https://support.industry.siemens.com/cs/document/109810587/pm-logon-manual?dti=0&lc=en-DE (https://support.industry.siemens.com/cs/document/109810587/pm-logon-manual?dti=0&lc=en-DE).

17.3.2.7 Starting and stopping a project

A project must be running on the HMI device for Runtime to be displayed.

If no project is running, follow these steps:

1. Start the SIMATIC Runtime Manager tool on the HMI device.
2. Use the tool to get an overview of which projects are loaded on the HMI device.
3. Start the desired project.

You can find more information about the functions of the SIMATIC Runtime Manager and its operation, in the "SIMATIC Runtime Manager" user help.

See also

Exporting tags (Page 7038)

Functions in the SIMATIC Runtime Manager (Page 7491)

17.3.2.8 Switching the Runtime language

Introduction

The project running on the HMI device can be configured in multiple languages. If a corresponding operating element has been configured, you have the option of switching the language set on the HMI device during ongoing operation.

The project always starts with the language set in the previous session.

Requirement

- The desired language for the project is available on the HMI device.
- An operating element is configured, for example, a button that is linked to the language switching function.

Procedure

You can switch between the languages at any time in runtime. Language-specific objects are immediately displayed on the screen in the new language when you switch languages.

Depending on the configuration, you have the following options:

- Use a configured operating element to switch from one language to the next in a list.
- Use a configured operating element to directly set the required language.

17.3.3 Runtime operation

17.3.3.1 Overview

Operating variants

The following operating options for Runtime are available:

- Operation with the touch screen
  The device of the web client has a touch-sensitive touchscreen. Use your finger or a suitable touch pen to operate the touch screen.
- Mouse and keyboard operation
  The device of the web client has a mouse and keyboard.

Adhere to the instructions for operating the device in the operating instructions.

Individually configured operation

The configuration engineer has various options available for setting up operation.

Examples of actions whose execution is always determined on a project-specific basis:

- Screen change
- Reporting
- Change the Runtime language

There are no specific operating elements to execute certain functions. The configuration engineer specifies the project-specific execution. The screen change can be triggered, for example, via a button.

Information on project-specific operations can be found in the system documentation.

17.3.3.2 Operation with the touch screen

Overview of operation with the touch screen

Special features when operating using the touch screen

Operation with the touch screen is characterized by the following special features:

- Enable
  To enable the operating element, use your finger or a suitable touch pen to operate the touch screen. To generate a double-click, touch the operating element twice in rapid succession.
- Value input
  You enter numbers and letters on the touch screen with a screen keyboard.

Input using the screen keyboard

The screen keyboard is displayed when you select a screen object that requires input. The screen keyboard is hidden again when input is complete.

Further information on the screen keyboard can be found in the operating instructions of the HMI device.

Supported gestures

Definition

Various touch gestures are available for Runtime operation on mobile devices. Some touch gestures have different effects in the process pictures than in the controls.

Note

No operation with three or more fingers.

Only use one or two fingers when operating with touch gestures.

If you use more than two fingers with touch gestures, this can cause incorrect operation.

In the case of multi-touch operation with several fingers, you only operate the respectively configured objects.

Supported touch gestures in process pictures

Icon	Gesture	Function
	Tap	To select an object, tap on the corresponding position in the process picture.
	Zoom	To zoom in or out, drag two fingers simultaneously in an area where there are no operating elements. (Zooming) The fingers form the zoom center. With the exception of pop-up windows opened in the process screen, the entire content of the process screen is zoomed.
	Drag with one finger	After zooming in a screen, you can move the screen section. To do this, drag a finger in the desired direction in an area where there are no operating elements. Pop-up windows open in the process screen are not moved with it.
	Keep pressed	To call the shortcut menu, press for longer than a second on the object or the link. The function corresponds to a right-click.

Supported touch gestures in screen windows

The following gestures in the screen window only affect the screen window, not the screen:

Icon	Gesture	Function
	Drag with one finger	After zooming into a screen window, you can move the screen window section. To do this, drag a finger in the desired direction in an area where there are no operating elements.
	Drag with two fingers	With corresponding configuration in engineering, you can also move the screen window section with two fingers.
	Zoom	With corresponding configuration in the engineering, you can enlarge or reduce the screen window section independent of the zoom factor of the screen. Drag simultaneously with two fingers (zooming). If the screen window section is smaller than the content configured for the screen window due to zooming, the fingers serve as zoom center, otherwise the upper left corner of the screen window.

The following gestures work analogously to the gestures supported in the screen:

- Tap
- Keep pressed

Supported touch gestures in controls

Icon	Gesture	Behavior	Supported WinCC controls
	Tap	• To select a row, tap the row. • With corresponding configuration of the control: To select a cell. • To sort a column, click on the column header. • In trend controls: Zooms into the trend area along the X/Y axis. Requirement: The "Zoom +/-", "Zoom time axis +/-" or "Zoom value axis +/-" button is pressed.	• Alarm control • Process control • Trend control • f(x) trend control • Ruler window • System diagnostics view • Parameter set control
	Tap with two fingers	Zooms out in the trend control. Requirement: The "Zoom +/-", "Zoom time axis +/-" or "Zoom value axis +/-" button is pressed.	• Trend control • f(x) trend control
	Drag with two fingers	To scroll vertically or horizontally in the table of the control, drag in the control window with two fingers in the desired direction.	• Alarm control • Process control • Ruler window • System diagnostics view • Parameter set control
	Drag with one finger	• Moves the ruler. • Moves the x-axis or y-axis. Requirement: The "Move trend area" or "Move axis area" button is pressed or the control is zoomed in.	• Trend control • f(x) trend control
		To select multiple rows, tap a row and drag your finger up or down. With corresponding configuration of the control: To select multiple cells.	• Alarm control • Process control • Ruler window • System diagnostics view • Parameter set control
		To adapt the column width, tap a column grid line and drag your finger to the right or left.	
		To change the order of the columns, tap a column header and drag your finger to another column header.	
	Double tap	To edit a cell value, tap the cell twice. Requirement: • Table view: The "Edit" button is pressed. • Parameter set control: A parameter set is selected.	• Process control • Parameter set control

Icon	Gesture	Behavior	Supported WinCC controls
	Zoom	To zoom in or out in the trend control, drag with two fingers in the control window. Requirement: Trend control is paused and no zoom button is active. Or "Move trend area" is active.	Trend control
	Swiping (horizontally and vertically)	To quickly scroll left or right or up or down within the table of the control, swipe in the corresponding direction.	• Alarm control • Process control • Ruler window • System diagnostics view • Parameter set control

Special features of touch operation

Multi-touch operation of process pictures

WinCC Unified supports multi-touch operation in screens.

Simulation of projects with multi-touch functions

WinCC Unified supports the simulation of configured multi-touch functions. Requirement is that your monitor supports multi-touch operation.

Restrictions for touch gestures

Do not start moving on the following objects with one-finger as well as two-finger gestures:

- Release buttons
- Buttons with configured "Release" or "Press" event.
- "Browser" controls
- Custom web controls
- Touch area
- Elements and controls that manage touch gestures themselves (e.g. sliders and trend control)

Releasing locked operator controls by two-hand operation

Unified supports safe operation of controls that can be used to change critical system settings, such as control variables with machine limits. Such operator controls can be configured as locked.

Locked operator controls are displayed dimmed in runtime. To operate them, simultaneously press the release button provided for this purpose.

Releasing the locked operator controls by pressing the release button has a cross-screen effect on all open screens.

In Runtime, locked operator controls can only be accessed with the tab sequence if a release button is pressed at the same time.

Scrolling in lists and controls

You can scroll through lists and controls by dragging.

Special features of the trend control

You enlarge or reduce the view in "Trend control" and "function trend control" objects by pinch-to-zoom with two fingers.

Double tap to switch from the magnified trend control back to the normal view.

The zooming function is limited to the time axis in the "Trend control" object.

If you have enabled the option "Range > Auto-size" during configuration of the value axes in function trend control, the axes are constantly calculated during zooming.

Horizontal scrolling is not supported in the "Trend control" object.

Note

Current view is not persistent

The changes of zoom factor and position changed by scrolling are not saved.

The trend control is reset to the default setting during a screen change.

17.3.3.3 Triggering an action

Introduction

Triggering an action at an operating element can mean the following:

- A command is executed.
  Example: Click a button to trigger a script or to execute a pre-defined function.
- An object is enabled.
  Example: To enter a value in a list, click in a table cell.

Requirement

- You have navigated to the operating element on which you want to trigger the action.
- The operating element has the focus.

Procedure

- Tap the operating element on the touchscreen once or twice in quick succession.

Result

The following results are possible:

- The requested command is executed.
- The cursor flashes in the input area of the operating element.
  When accessing via touch devices: The screen keyboard opens.
- The element is selected and can be moved.

17.3.3.4 Entering a value

Introduction

Depending on the input format, you enter numerical or alphanumerical values in an input box.

Requirement

- The object is an input field or table field.
- The operating element is enabled.

Entering a value

1. Enter the desired value.
2. To confirm the value, press the <Enter> key or click on a blank area of the screen.
3. To discard the value, press the <Esc> key.

Result

The input is accepted or discarded.

The input box still has the focus.

17.3.3.5 Moving operator controls

Introduction

There are screen objects with movable operator controls, e.g. a slider.

Requirement

- A movable operating element is selected.

Procedure

1. To move the operating element, move it while holding down the mouse button or use a corresponding touch gesture, e.g. "Drag" for a slider.

Result

The position of the movable operating element and the display in the screen object have changed.

17.3.3.6 Placing the focus on objects

You have the following options:

- Click on the object.

  Note

  Giving focus to objects with a transparent background

  If an object has a transparent background, click on a visible area of the object.

- Press <Tab> until the object has the focus.

See also

Operating objects with transparent fill (Page 7267)

17.3.3.7 Operating objects with transparent fill

The objects displayed on a screen can have transparent ranges.
Example: Sliders, bars and pointer instruments are enclosed by a transparent rectangle.

Requirement

An event which is triggered by operating actions such as typing or clicking has been configured for the object in the engineering.

Trigger event

To trigger the event, proceed as follows:

- If the object does not have the focus, click a visible part of the object, e.g. its border.
- If the object already has the focus, the event is also triggered by clicking in the transparent area.

17.3.3.8 Flashing

Flashing in Runtime

You can display the objects flashing in Runtime. Scripts can be used to switch flashing on and off and influence the properties of the flashing.

Configure the flashing behavior of an object property in the engineering system for each color setting of an object that supports flashing.

Note

The flashing in Runtime does not change the color value of the property.

17.3.4 Controls

17.3.4.1 Overview of controls

Runtime has operable controls in process pictures.

The following controls are available depending on the configured access rights:

Icon	Control	Brief description
	Screen window	Displays other screens of the object.
	Trend control	Displays graphical representations of tag values from the current process or from a log in the form of trends with values over time from the controller or a log.
	f(x) trend control	Represents the values of a tag as a function of another tag.
	Browser	Displays HTML pages.
	Media Player	Enables video and audio files to be played.
	Alarm control	Shows currently pending alarms or alarm events from the alarm buffer or alarm log.
	Process control	Represents current or logged process data in a table.
	Trend companion	Displays evaluated data and statistics in a table.
	Parameter set control	Shows the parameter sets with which the PLC is set up for production.
	System diagnostics view	Shows the diagnostic status of multiple PLCs via traffic light SVGs.

Icon	Control	Brief description
	GRAPH overview	Provides an overview of the current status of the configured monitoring.
	PLC code view	Displays the current program status of user programs.

17.3.4.2 Operating alarms

Basics of alarms

Alarm system

Introduction

Alarms show events, operating modes or faults that occur in runtime in the plant.

You can use alarms for diagnostic purposes, for example, when troubleshooting. They will help you to immediately locate the cause of the fault. You can adjust your processes through targeted intervention so that compliant products continue to be produced despite the fault, or the process is stabilized, and the fault only causes a minimal loss of production.

The acquired alarms are displayed on the HMI device in screens. The alarm system logs the alarms from the ongoing process. Targeted access to the alarms combined with supplementary information about individual alarms ensures that faults are localized and cleared quickly. This reduces stoppages or even prevents them altogether.

The alarm system in WinCC Unified Scada

The alarm system distinguishes between the following alarms:

User-defined alarms	Analog alarms	Display limit value violations (value changes) They are used to monitor the plant.
	Discrete alarms	Display status changes They are used to monitor the plant.
	User-defined PLC alarms	Displays the status values of the PLC. They are used to monitor the plant and are configured in STEP 7.
System-defined alarms	System alarms	Are included in the HMI device. They are used to monitor the HMI device.
	System-defined PLC alarms	They consist of system diagnostic alarms and system errors. They are used to monitor the PLC. The types of system-defined PLC alarms depend on the PLC used.

Analog alarms (Page 7271)

Discrete alarms (Page 7271)

User-defined PLC alarms (Page 7271)

System alarms (Page 7272)

System-defined PLC alarms (Page 7272)

Alarm control overview (Page 7280)

Alarms

User-defined alarms

Analog alarms

Description

Analog alarms display limit violations. An analog alarm is triggered when the value of the trigger tag meets the trigger condition defined on the analog alarm.

Depending on the selected trigger condition, the alarm is triggered, for example, when the condition value is higher than, lower than, or the same as the defined value.

Example

When the motor speed reaches a critical range as defined in the engineering, an alarm with matching alarm text is displayed. The alarm text can provide the operator with specific instructions on how to check and remedy the situation.

Discrete alarms

Description

A discrete alarm is triggered when the value of a specific bit of a tag changes. The discrete alarms indicate status changes in a plant and are triggered by a controller.

Example

Imagine that the state of a valve is to be monitored during operation. The state of the valve is "open" or "closed".

A discrete alarm is configured for each state of the valve. If the status of the valve changes, a discrete alarm is output, containing for example the following alarm text: "Valve closed".

User-defined PLC alarms

Example of an alarm

"The temperature in Tank 2 is too high."

Description

A user-defined PLC alarm maps the status values of a PLC, for example, time stamp and process values. It is created by a PLC project engineer in STEP 7.

The PLC alarms configured in STEP 7, are applied into the integrated WinCC operation as soon as a connection is established to the PLC.

Note

Automatic update of new or modified PLC alarms on the HMI device

If PLC alarms are configured in STEP 7 and an HMI connection to a SIMATIC S7-1500 controller (firmware version 2.0 or higher) is established, and the PLC and HMI device are configured accordingly in the engineering, the PLC alarms are sent to the HMI device and updated automatically. You can find more information in the TIA Portal help for WinCC Unified.

Note

WinCC only supports PLC alarms of a SIMATIC S7-1500 controller. In addition, WinCC only supports PLC alarms that are automatically updated by the central alarm management in the PLC.

System-defined alarms

System alarms

Description

A system alarm indicates the status of the system and communication errors between the HMI device and the system. System alarms are output in runtime in the configured alarm control. System alarms are output in the language currently set on your HMI device.

The time format (AM/PM or 24-hour format) is based on the selected language. If no translation of the alarm texts exists in this language, English is used as replacement and the corresponding time format is displayed.

Example of an alarm

"Memory is full!"

System-defined PLC alarms

Note

Device dependency

System-defined PLC alarms are not available for all HMI devices.

Description

System-defined PLC alarms are installed with STEP 7 and are only available if WinCC is operated in the STEP 7 environment.

System-defined PLC alarms are used to monitor states and events of a PLC. System-defined PLC alarms consist of system diagnostic alarms and system errors (RSE)

Note

Automatic update of system diagnostic alarms on the HMI device

When an HMI connection to a SIMATIC S7-1500 controller (firmware version 2.0 or higher) is established, and the PLC and the HMI device were configured accordingly in the engineering, the system diagnostic alarms are sent to the HMI device and updated automatically. You can find more information in the TIA Portal help for WinCC Unified.

Note

Note the following restrictions:

- WinCC only supports system diagnostic alarms of a SIMATIC S7-1500 controller.
- WinCC only supports system diagnostic alarms that are automatically updated by the central alarm management in the PLC.

Example of an alarm

"CPU maintenance required"

Alarm blocks

Overview

In Engineering you configure which columns you can see in runtime and which alarm blocks the columns are evaluating. The following section provides an overview of some important alarm blocks.

Example of alarm blocks output in runtime:

Alarm class	Alarm number	Time of occurrence	State machine	Alarm text	Information	Value	Limit value
Warning	1	08/27/2017 11:09:14 AM	Alarm with single-mode acknowledgment	Maximum speed reached	This alarm is...	50	27

Alarm class

The alarm class controls, for example, the display and the acknowledgment concept of the alarm.

Alarm number

You identify an alarm by its number (ID).

Change the alarm number, if necessary; for example, with a consecutive alarm number to mark alarms that belong together in your project.

Note

The alarm number of a system alarm has a higher priority than the number of a user-defined alarm. Do not use numbers that are used by system alarms for user-defined alarms.

Alarm blocks with time and date

These alarm blocks show the time at which the alarm was active, acknowledged or became inactive, etc.

Note

Time zones

By default, the time stamp in the alarm display is converted into the time zone used by the HMI device.

If the alarm display is configured accordingly, the time stamp can be converted to another time zone in Runtime via the "Time base configuration" button.

State machine

An alarm has the state machine or the acknowledgment concept of the alarm class.

The state machine is the way an alarm is displayed in various states and processed by the system.

See section Acknowledgment model (Page 7276).

Alarm state

An alarm always has a specific alarm state in runtime, for example, active or active/ acknowledged. Based on the alarm state, you can understand the process that the alarm went through.

Alarm text

The alarm text (event text) describes the cause of the alarm.

The alarm text can contain output fields for current values. The value is retained at the time at which the alarm status changes.

Priority

Displays the priority of individual alarms.

Note

A priority configured on the alarm has precedence in runtime over the priority configured on the alarm class.

Limit value

Analog alarms display limit violations. Depending on the configuration, WinCC outputs the analog alarm as soon as the trigger tag exceeds or undershoots the configured limit value.

Computer

Operator input alarms have the "Computer" column in the alarm summary. The computer name is displayed for local alarms and the IP address for alarms from the web client.

Users

When an empty user name is passed to an alarm, it will display its formatting string instead of the user name, for example, "@S2%s@".

Duration

Returns the time interval in nanoseconds between triggering of the alarm and its previous status change.

See also

Alarm classes (Page 7275)

Alarm classes

Introduction

Many alarms occur in a plant; these are all of different importance. To make it clear to you, which alarms are most important, alarms are assigned to alarm classes.

Assignment of the alarms to alarm classes and configuration of the alarm classes takes place in the engineering system.

Purpose

The alarm class of an alarm defines the following:

- State machine/acknowledgment model
- Appearance in alarm control (e.g. color)
- Priority

  Note

  The priority configured on the alarm has precedence in runtime over the priority configured on the alarm class.

- Logging

Examples of how to use alarm classes

- The alarm class of the alarm "Fan 1 speed in upper tolerance range" is "Warning". The alarm is displayed with a yellow background. The alarm does not require acknowledgment.
- The alarm "Speed of fan 2 has exceeded upper warning range" is assigned to the "Alarm" alarm class. The alarm is displayed with a red background and flashes at high frequency in runtime. The alarm is displayed until you have acknowledged it.

User-defined and predefined alarm classes

The alarms use user-defined or predefined alarm classes:

- Number and configuration of user-defined alarm classes depend on the configuration of the runtime project in the engineering.
- The number and configuration of predefined alarm classes are provided by the system. You can find more information on predefine alarm classes in the TIA Portal help for WinCC Unified as well as in the user help for WinCC Unified Online Engineering.

See also

Acknowledgment model (Page 7276)

Logging basics (Page 7298)

Acknowledgment model

Introduction

The state machine of an alarm class regulates which statuses the alarms of this alarm class can have. From this it is derived which events can occur for them and whether and how they are acknowledged.

State machines

The following state machines are available for HMI alarm classes:

State machine	Description	Use in predefined alarm classes
Active	Alarm without inactive state without acknowledgment This alarm is displayed until the event that triggered the alarm is no longer pending. The alarm will then no longer be displayed in the alarm control.	Information OperatorInputInformation SystemInformation
Active and inactive	Alarm without acknowledgment This alarm becomes active and inactive without having to be acknowledged.	Notification SystemNotification
Active, requires acknowledgment	Alarm without inactive state with acknowledgment This alarm must be acknowledged as soon as the event that triggers the alarm occurs. The alarm is pending until it is acknowledged.	AlarmWithoutClearEvent SystemAlarmWithoutClearEvent SystemWarningWithoutClearEvent
Active and inactive, requires acknowledgment	Alarm with a single acknowledgment This alarm must be acknowledged as soon as the event that triggers the alarm occurs. The alarm is pending until it is acknowledged and inactive.	Alarm Critical OperatorInputRequest SystemAlarm SystemWarning Warning
Active and inactive, requires acknowledgment and reset	Alarm with acknowledgment and confirmation The alarm requires acknowledgment once the event that triggers, the alarm has occurred, or the alarm has been reset. In addition, the alarm requires confirmation when the event that triggers the alarm is no longer pending. The alarm is pending until it is acknowledged and confirmed.	AlarmWithReset CriticalWithReset WarningWithReset

The following state machines are available for HMI alarm classes that are associated with common alarm classes:

- Alarm with a single acknowledgment
- Alarm without acknowledgment

Alarms requiring acknowledgment

Alarms that indicate critical or hazardous states in the process must be acknowledgeable. Every change in the status of an alarm that requires acknowledgment is logged.

By acknowledging an alarm, you confirm the processing of the state that triggered the alarm. You acknowledge the alarm using the buttons in the alarm control.

Acknowledgment and confirmation of alarms

- Group acknowledgment of alarms in the alarm control
  With the "Group acknowledgement" button you acknowledge all alarms pending in the alarm control that are visible and require acknowledgment.
- Single acknowledgment of alarms in the alarm control
  With the "Single acknowledgment" button you acknowledge a single alarm that is selected in the alarm control.
- Single acknowledgment of alarms with acknowledgment and confirmation in the alarm control
  With the "Single acknowledgment" button you acknowledge a single alarm with the state machine "Alarm with acknowledgment and confirmation" after it was previously acknowledged via group acknowledgment or single acknowledgment and was inactive.

Note

If the "Show recent" button is active, the most recent alarm is always displayed first and is selected.

Group acknowledgment is only carried out for the visible alarms.

See also

Alarm states (Page 7278)

Alarm states

Description

Each alarm has an alarm state. Alarm states are made up from the following events:

- **Active**
  The condition for triggering an alarm is fulfilled. The alarm is displayed, such as "Boiler pressure too high".
- **Inactive**
  The condition for triggering an alarm is no longer fulfilled. The alarm is no longer displayed as the boiler was vented.
- **Acknowledged**
  The operator has acknowledged the alarm.

The alarm state of an alarm at any given time depends on the following factors:

- Which state machine has its alarm class.
  The state machine of an alarm class regulates which events can occur for alarms of this alarm class. From this it is derived which states the alarms can have and whether and how they are acknowledged.
  For an overview of the available state machines, see Acknowledgment model (Page 7276).
- Which events occurred for the alarm.

Note

The display texts of the alarm states are different depending on the language and configuration. The texts displayed in runtime can deviate from the texts shown here.

Alarms without acknowledgment

The following table shows the alarm states for alarms without acknowledgment:

Icon	Alarm state	Description
	Active	The condition of an alarm is fulfilled. The alarm does not need to be acknowledged.
	Inactive	The condition of an alarm is no longer fulfilled. The alarm is no longer pending.

Alarms with acknowledgment

The following table shows the alarm states for alarms with acknowledgment:

Icon	Alarm state	Description
	Active	The condition of an alarm is fulfilled.
	Active/inactive	The condition of an alarm is no longer fulfilled. The operator has not acknowledged the alarm.
	Active/inactive/acknowledged	The condition of an alarm is no longer fulfilled. The operator has acknowledged the alarm after this time.
	Active/acknowledged	The condition of an alarm is fulfilled. The operator has acknowledged the alarm.
	Active/acknowledged/inactive	The condition of an alarm is no longer fulfilled. The operator acknowledged the alarm while the condition was still fulfilled.

Disabled alarms

Operators disable an alarm to, for example, prevent a nuisance alarm from impairing the effectiveness of the system.

- Disabled: The alarm has been deactivated (locked). The alarm transitions to its final state without any further state transitions.
- Not disabled: The alarm is activated (enabled). The alarm is visible again in its last state.

Shelved alarms

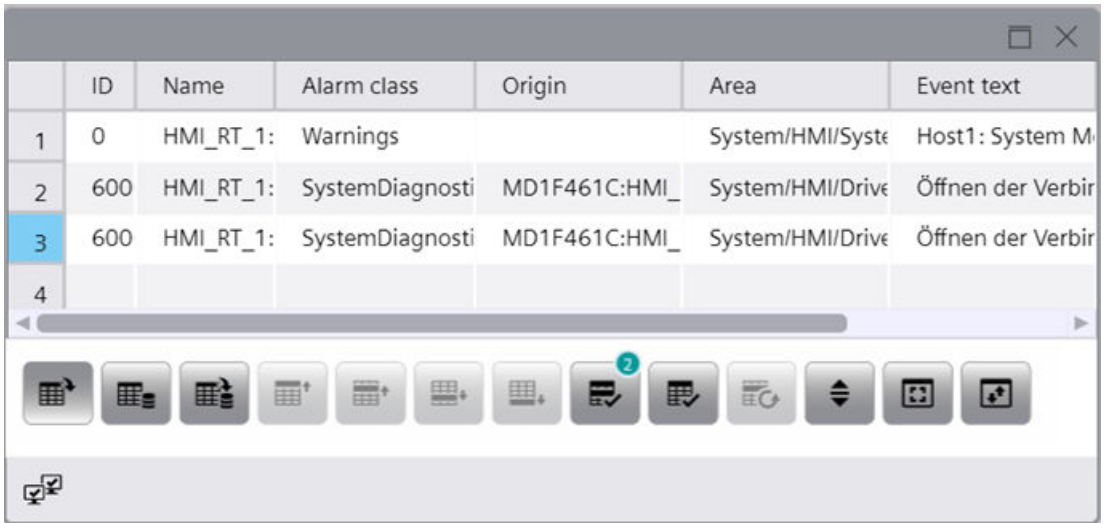
The display of specific alarms is shelved (suppressed) in order, for example, not to overload the operator with information. Manually reset: The alarm was manually reset by the operator. Shelved due to design: The alarm was automatically shelved due to a condition and is automatically hidden in runtime.

Alarm control overview

Introduction

The alarm control displays PLC alarms and HMI alarms that occur during the process in a plant. The alarm control helps prevent faults in the plant or localize and remedy the causes of a fault.

User interface



① Columns for the output alarm blocks
② Alarm summary
Each alarm is displayed in a separate line.
The alarms that are displayed depend on the view or list selected and whether filters are applied.
③ Toolbar for operating the alarm control
④ Information bar

Note

Selection of alarm blocks, column titles and localization depend on the configuration in engineering.

Note

An alarm appears in the alarm control with the date and time stamp crossed out in the following situations:

- A disabled alarm is enabled again.
- An alarm is reloaded after a power failure. This applies only to chronological alarming.
- The automation system is restarted. This applies only to chronological alarming.

Views and lists

Depending on the configuration of the alarms and the situation in the system, a large number of alarms can occur in runtime.

The alarm control offers various views and alarm lists that filter the alarm summary and thus provide a better overview:

View	Description		
Alarm view	Shows the alarms of the currently selected alarm list. Available alarm lists:		
		Display active alarms	Shows the pending alarms. If the toolbar is configured accordingly, you use the "Display options setup" button to set the alarms that are displayed in this list. Default setting: Displays all alarms that are not suppressed.
		Show logged alarms	Shows the logged alarms. The display is not updated immediately when new incoming alarms occur.
		Show and update logged alarms	Updates the logged alarms and shows them. The display is updated immediately when new incoming alarms occur.
		Display defined alarms	Displays the defined alarms. If the toolbar is configured accordingly, you use the "Display options setup" button to set the alarms that are displayed in this list.
Alarm statistics		Displays statistical calculations of logged alarms.	

You enable a view or list using the corresponding button in the toolbar.

Information bar

The information bar shows the different states related to the alarm servers. The information bar contains the following icons:

Icon	Meaning
	Shows the status to the alarm servers: No faulty connections
	Shows the status to the alarm servers: Faulty connections
	Shows the status to the alarm servers: All connections are faulty

With the corresponding configuration in engineering, the information bar shows the number of alarms that are not acknowledged in runtime. The counter includes all connected servers, but no filters.

When a context is selected, the information bar shows the values of the selected context.

Icons for the alarm state

The column for the alarm state can contain the following icons:

Icon	Meaning
In "Show and update logged alarms" list:	
	Alarm is active
	Alarm is inactive
	Alarm acknowledged
In the other lists:	
	Alarm is active
	Alarm is active/inactive
	Alarm is active/acknowledged

Performance data for SIMATIC Unified PC

Number of controller alarms	160000
Number of OPC UA A&C alarms	20000
Number of alarms per second (continuous load)	20
Number of pending alarm events	Unlimited
Number of alarms per 10 seconds (alarm burst)	8000

The maximum number of alarms that can be displayed in Runtime depends on the selected view:

View	Maximum number of alarms that can be displayed.
Display active alarms	No limit
Display defined alarms	
Alarm statistics	
Show logged alarms	1000
Show and update logged alarms	100

See also

Buttons of the alarm control (Page 7283)

Buttons of the alarm control

You operate the alarm control using the buttons on the toolbar. The buttons that are available depend on the configuration:

Button		Description
	Display active alarms	Displays the currently pending alarms. With the ""Active alarms" setup" button, you set which alarms belong to the active alarms.
	Show logged alarms	Shows the logged alarms. The display is not updated immediately when new incoming alarms occur.
	Show and update logged alarms	Updates the logged alarms and shows them. The display is updated immediately when new active alarms occur.
	Alarm statistics	Visualizes statistical information of logged alarms, such as frequency and display duration.
	Alarm statistics setup	Setting options for calculating the alarm statistics.
	Display defined alarms	Shows the alarms configured in the system.
	Alarm signaling equipment	Shows all alarms for which the alarm signaling equipment was configured. The alarm signaling equipment is a visual or acoustic signal, such as a horn or warning light, that is displayed in addition to the alarm control in the system.
	First line	Selects the first of the displayed alarms. The visible area of the alarm control is moved, if required. This button is only operable if the "Show recent" function is disabled.
	Previous line	Selects the previous alarm, starting from the currently selected alarm. The visible area of the alarm control is moved, if required. This button is only operable if the "Show recent" function is disabled.

Button		Description
	Next line	Selects the next alarm, starting from the currently selected alarm. The visible area of the alarm control is moved, if required. This button is only operable if the "Show recent" function is disabled.
	Last line	Selects the last of the displayed alarms. The visible area of the alarm control is moved, if required. This button is only operable if the "Show recent" function is disabled.
	Skip to the next alarm that requires acknowledgment	Selects the next alarm that requires acknowledgment, starting from the currently selected alarm. The visible area of the alarm control is moved, if required. This button is only operable if the "Show recent" function is disabled.
	Previous page	Navigates to the previous page.
	Next page	Navigates to the next page.
	Single acknowledgment	Acknowledges the selected alarm. If using the multiple selection, the selected alarms which require single acknowledgment are not acknowledged. A counter shows how many alarms are not acknowledged. The counter includes all connected servers, but no filters.
	Group acknowledgment	Acknowledges all pending, visible and acknowledgeable alarms in the alarm control if they are not individually acknowledgeable.
	Single confirm	Resets the alarm. Relevant for alarms with the state machine "Alarm with acknowledgment and confirmation", which were already acknowledged and inactive.
	Show recent	Defines whether it is always the latest alarm that is selected in the alarm control. Button not pressed: The "Show recent" function is active. • The most recent alarms are always shown first in the alarm control. Alarms that have been filtered out of the alarm control are not displayed. • The visible area of the alarm control moves automatically, if necessary. • You cannot select the alarms individually or sort them by column. Button pressed: The "Show recent" function is paused.
	Info text setup	Opens a dialog that shows a help text configured for the selected alarm.
	Comments setup	Opens a dialog for adding a comment.
	Disable alarm	Disables an alarm.
	Enable alarm	Enables a disabled alarm.
	Shelve alarm	Resets an alarm, for example, to prevent a nuisance alarm from impairing the effectiveness of your system.

Button		Description
	Unshelve alarm	Cancels the reset of the respective alarm.
	Copy lines	Copies the selected alarms.
	Time base setup	Opens a dialog for setting the time zone for the time information shown in alarms.
	Selection display	Opens a dialog for filtering alarms. Define your own filter criteria or change or remove filters defined in the engineering system.
	Sorting setup	Opens a dialog for setting custom sorting criteria for displayed alarms.
	Display options setup	Opens a dialog in which you set which alarms the currently displayed alarm list displays.
	Configuration of the disabled alarms	Opens a dialog for configuring the display options of the disabled alarms.
	Export	Starts exporting the alarms to a CSV file.
	Select context	For context-based filtering of alarms. The alarm control only shows alarms that fall within the time period of the selected context entry.

Operate alarm control

Note

Displayed alarms

The alarms that you see in the alarm control depend on which alarm view or alarm list you have selected in the toolbar.

Operation using the mouse

Selecting and operating alarms

- Click on an alarm.
- Click a button in the toolbar.

The function of the button is applied to the alarm.

Rearranging columns

You can change the column arrangement configured in the engineering here. See section Rearranging columns at runtime (Page 7451).

Sorting alarms by column

You can sort the alarms by column. See section Sorting alarms (Page 7292).

Operation using the keyboard

Press <Shift + Enter> until the focus is on the alarm control. Then select the alarm to be edited and operate it using the toolbar.

Use the following buttons for this:

Buttons	Description
<PgUp>	Selects the previous alarm.
<PgDn>	Selects the next alarm.
<Ctrl + Up> or <Home>	If multiple rows were selected, the first row of the selection is selected.
<Ctrl + Down> or <End>	If multiple rows were selected, the last row of the selection is selected.
<Ctrl + Left>	If multiple columns were selected, the first column of the selection is selected.
<Ctrl + Right>	If multiple columns were selected, the last column of the selection is selected.
<Tab>	Selects the next button in the toolbar.
<Shift + Tab>	Selects the previous button in the toolbar.
<Enter>	Executes the currently selected button.
<Shift + Page Up>	Scrolls to the left column-by-column.
<Shift + Page Down>	Scrolls to the right column-by-column.

Alternative operation

- Depending on the configuration, you can also operate the alarm control via the function keys.
- If the alarm control is configured accordingly, all information about the alarm is displayed in a pop-up for a selected alarm. To do this, the function "Show recent" (Autoscroll) must be switched off.

Supported gestures (Page 7261)

Filtering alarms

Introduction

You can use filters to control which alarms you see in the alarm view in runtime. To do so, define filter conditions.

The following settings are available in the "Alarm filter" dialog:

Setting	Description
"AND/OR" column	Adds additional criteria to the existing criteria with the Boolean operations AND or OR.
"Criterion" column	Selection list with the available criteria. Criteria correspond to the alarm blocks in the alarm control.
"Operator" column	Selection list with the available relational operators.
"Setup" column	Free text field
"Remove" button	Removes the selected filter criterion.
"Up/down" button	Moves the selected filter criterion.
"Filter" area	Free text area for direct input and editing of filter criteria.

Requirement

The "Selection display" button is configured in the alarm control.

Procedure

The following example describes how to define a filter. In the example, a filter is defined that filters for alarms that contain the alarm text "Motor on" and have a priority less than or equal to 5:

1. Click the "Selection display" button.

   

   The "Alarm filter" dialog opens.
2. Click in the "Criterion" column and select the "Alarm text" entry.
3. Click in the "Operator" column and select the "Equal to" entry.
4. In the free text field of the "Setup" column, enter the value "Motor on".
5. In the next row in the "And / Or" column, click "Add" and select the AND logic operation.
6. Click in the "Criterion" column and select the "Priority" entry.
7. Click in the "Operator" column and select the entry "Less than or equal to".
8. Enter the value "5" in the free text field of the "Setting" column.

9. Confirm your entries.
10. Close the dialog.

With some alarm blocks, for example, you can define the start and end times or search texts for "Date" and "Time". Your input must be in the format required in the dialog.

Note

In multi-user systems, make sure that contents displayed in the "Alarm filter" dialog on a client have the same names on all servers.

When filtering by time, the start and stop values are not adjusted automatically when the time base of the alarm control is changed.

Example: At the PC location with the time zone "UTC + 1h", the alarm control has the "Local time zone" time base. You should filter by the time 10:00 to 11:00. Change the time base from "Local time zone" to "UTC". If you want to display the same alarms, change the filter to 9:00 to 10:00 hrs.

Result

The filter is applied to all alarm lists in the alarm view.

Time-based filtering

Define the filter period

During time-based filtering of the alarm control, always define two filter conditions linked via "And". For these conditions, use the operators "Greater than", "Greater than or equal to" and "Less than or equal to".

Do not use the "Equal to" operator. When filtering, you specify the filter period down to the millisecond. Internally, the time stamp of alarms is stored precisely down to the nanosecond and the missing information for nanoseconds is supplemented by 0. A search with "Equal to" will therefore only find alarms whose time stamp has the nanosecond value 0.

Examples:

You can use the following filter conditions to filter for alarms that were triggered between 12:00 and 12:01:

- Filter condition 1: "Raise time", "Greater than or equal to", 12:00:00.000
- Filter condition 2: "And", "Raise time", "Less than or equal to", 12:01:00.001

You can use the following filter conditions to filter for alarms that were triggered at 12:00:00.000 hrs:

- Filter condition 1: "Raise time", "Greater than or equal to", 12:00:00.000
- Filter condition 2: "And", "Raise time", "Less than or equal to", 12:00:00.000

Change time base

If the time base of the alarm control is changed, the start value and stop value are not automatically adjusted when you filter by time.
Example: At the location of the PC with the time zone "UTC + 1h", the time base "Local time

zone" was selected for the alarm control. If you filter for the time 10:00 to 11:00 and then change the time base to "UTC", you need to change the start value and stop value of the filter to 9:00 and 10:00 to display the same alarms as before.

Display alarms for plant objects (Page 7289)

Display alarms for plant objects

Introduction

In the case of the corresponding configuration, the alarm control shows the alarms of the plant objects that are configured in the plant hierarchy:

- Automatic display
  When the HMI device is assigned to a plant hierarchy or a plant object, and a plant overview and an alarm control are configured for the screen, the alarm control automatically shows the alarms of the plant object selected in the plant overview.
- Manual display through filters
  If no plant overview is configured in the screen, filter the alarm control to display alarms of a plant object.

The alarm control offers the following options for plant object alarms:

- Display the hierarchy path of the alarm source
- Filter the alarm control by plant objects
- Display alarm log of a plant object
- Context-dependent display of plant object alarms

General requirements

- The plant hierarchy has been created and a device assigned in the engineering system.
- An alarm control with the column "Area" has been configured in the screen of the assigned device.
- Runtime is active.

Filter alarm control by plant objects

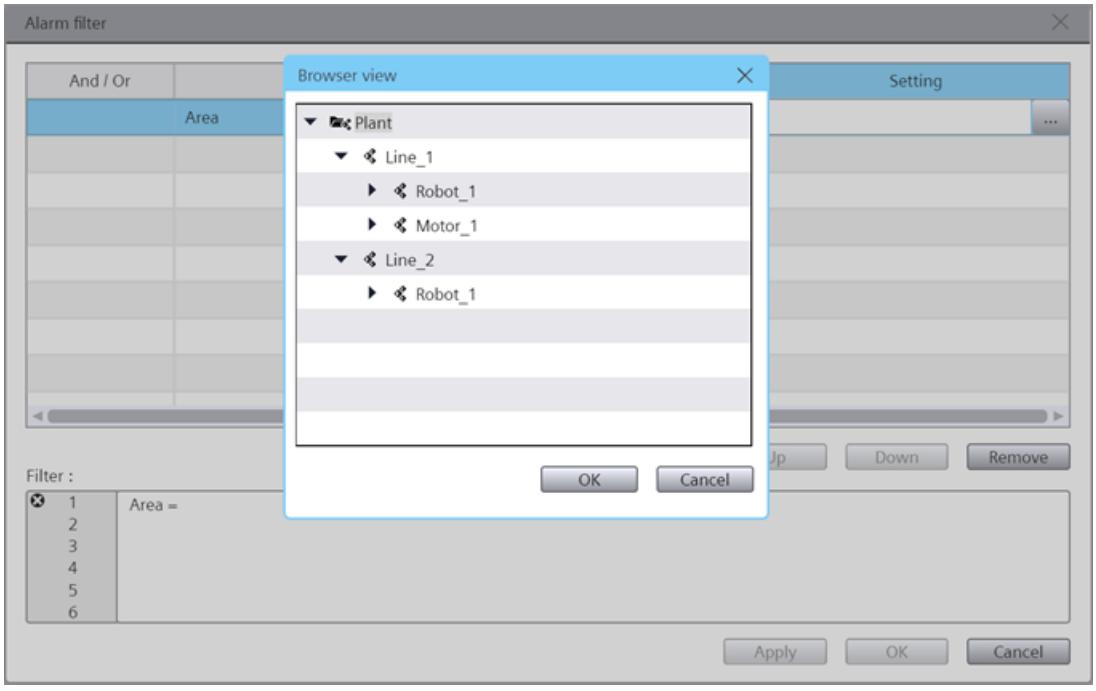
Additional requirements

- Alarms are available for a plant object from the plant hierarchy.

Procedure

1. In Runtime, click the "Selection display" button in the alarm control.
2. Select "Area" as the criterion in the "Alarm filter" dialog.
3. Click the cell of the "Setting" column

4. Click "...".
   A tree of the plant hierarchy is displayed.
5. Select a plant object and confirm your selection.



6. Under "Operand", select one of the following operators:
   - To display the alarms of the selected plant object, select "Same as".
   - To output the alarms of the lower-level plant objects, select "Begins with".

The alarm control shows its setting according to the alarms of the selected plant object or its lower-level plant objects. The "Area" column shows the complete path of the plant object.

Note

Display of the filter string for filters configured in engineering

The plant view is based on a type/instance architecture. When a filter has been configured in engineering that filters the alarm view by plant objects, you will first see a filter string with information from the type level in the "Filter" field of the "Alarm filter" dialog.

If you select an operand under "Operand" or a plant object under "Setting", the filter string changes to the instance level and adopts the device ID.

Display alarm log for a plant object

Additional requirements

- The alarm log contains entries for a plant object from the plant hierarchy.

Procedure

1. In runtime, click on the "Display logged alarms" button.

The alarm control shows the logged alarms of the plant object.

See also

Filtering alarms (Page 7287)

Plant overview (Page 7342)

Display context-dependent alarms of a plant object

This section describes how to show alarms that occurred on a plant object that you selected for a context that you selected.

Requirement

- An HMI device has been configured.
- An alarm control is configured in the device screen.
- The plant hierarchy has been created and assigned to the HMI device.
- There are alarms for the plant object.
- Contexts and context entries are available for the plant object.
- The "Select context" button is configured in the alarm control.

Procedure

1. In the alarm control, click the "Select context" button.
   The "Alarm context" dialog opens.
2. Click "..." and select the plant object whose data you want to display in the alarm control.
3. Select one of the contexts assigned to the plant object in the "Context" drop-down list.
   A list of the entries logged for the context appears under "Logged context values".
4. Select an entry.
5. Click "OK".

The alarm control shows the alarms of the plant object that fall within the time period of the selected entry. The information bar shows the values of the selected context.

Note

"AND" link with other filters

When a filter is defined for the alarm control, the filter condition and the context conditions are linked via "AND".

When no alarms appear in the alarm control, check your filter settings by clicking "Selection display".

See also

Contexts (Page 7240)

Sorting alarms

Introduction

You can control the columns according to which the alarm control sorts the alarms in runtime.

Examples for sorting alarms:

- In descending order by date, time, and alarm number. The latest alarm appears at the top.
- By priority
  You must have defined the priority of the alarms in the "HMI alarms" editor and configured the "Priority" alarm block in the alarm control. As a result, in a single-line alarm control, only the top-priority alarm appears in the alarm window. A lower-priority alarm is not displayed, even if it is more recent. The alarms are displayed in chronological order.
- The "Alarm state" alarm block is sorted by the type of state and not by the configured status texts. For an ascending sort order, the following order is used:
  - Active
  - Inactive
  - Acknowledged
  - Disabled
  - Activated
  - Automatic acknowledgment
  - Emergency acknowledgment
  - Active/Inactive

When sorting the alarm control by columns, define the sort order over up to four columns. An arrow and a number are shown on the right in the column header. The arrow indicates the sort order (ascending or descending). The number beside the arrow indicates the sort order of the column headers.

Requirement

- "Allow sorting" is enabled for the respective columns in the configuration of the alarm control.
- The "Show recent" function is paused in the alarm control.

Procedure

To filter alarms in the alarm control by column, follow these steps:

1. Click the column header by which you want to sort the alarms first.
   The number "1" is displayed with an arrow pointing upwards for ascending sort order or an arrow pointing downwards for descending sort order.
2. Optional:
   - To reverse the sort order for this column, click the column header again.
   - To cancel the sorting for this column, click the column header a third time.
3. If you want to sort by several columns, click the column header in the required order.

Alternatively, click the "Sorting setup" button and configure the sorting in the "Sorting" dialog.

Disabling individual alarms

Note

No locking and unlocking of PLC alarms

Locking and unlocking of PLC alarms for an S7-1500 PLC is not supported.

Introduction

If you disable an alarm, the alarm is not checked to determine whether the alarm condition applies. The alarm is not logged.

Note

Disabled alarm

Disabled alarms are no longer disabled after a restart of Runtime. Only alarms that are disabled directly in the automation system via data blocks remain disabled (disabled at source).

Requirement

- The "Visibility" and "Allow operator control" settings have been enabled for the following buttons in the engineering:
  - "Disable alarm"
  - "Enable alarm"
- The user is authorized to disable and enable alarms.

  Note

  The "Disable alarms" and "Enable alarms" authorizations must be configured directly one below the other. This is necessary because the authorization level used automatically for the "Enable alarms" authorization is directly below the "Disable alarms" authorization.

- An alarm is displayed on the HMI device.

Disable alarm

1. Select one of the following alarm lists in the alarm control:
   - "Show logged alarms"
   - "Show and update logged alarms"
   - "Show defined alarms"
2. Select the alarm.
3. Click "Disable alarm".

Result

The alarm is removed from the "Show active alarms" alarm list. Its alarm condition is no longer checked.

The alarm is visible in the alarm lists for logged alarms and defined alarms and has the status "Removed".

Enable alarm

To enable a disabled alarm, follow these steps:

1. In the alarm control, select an alarm list for logged alarms or defined alarms.
2. Select the alarm in the alarm list.
3. Click "Enable alarm".

The alarm condition of the alarm is checked again.

Shelving alarms

Introduction

You shelve an alarm for a specific period of time, for example, to prevent that a conformity error alarm affects the efficiency of your system.

Shelving can be canceled at any time. To do so, you use the buttons "Shelve alarm" and "Unshelve alarm" in the alarm control in runtime.

Requirement

- The "Visibility" and "Allow operation" settings have been activated for the following buttons in the engineering system:
  - "Shelve alarm"
  - "Unshelve alarm"
  - "Show active alarms"
  - "Display options setup"
- To unshelve: An alarm is displayed on the HMI device.

Procedure

To shelve an alarm, follow these steps:

1. Select one of the following alarm lists in the alarm control:
   - "Show active alarms"
   - "Show logged alarms"
   - "Update and display logged alarms"
   - "Show defined alarms"
2. Select the alarm.
3. Click the "Shelve alarm" button.

Result

The alarm is shelved. Its status remains unchanged.

The shelving creates a log entry. Shelved alarms are still available and logged in the system.

Note

Display of shelved alarms in the alarm list "Show active alarms"

Whether shelved alarms are visible in the alarm list for active alarms depends on the settings in the alarm list.

By default, the alarm list for active alarms does not display any shelved alarms.

Display shelved alarms

To display the currently shelved alarms, follow these steps:

1. In the alarm control, select the "Show active alarms" alarm list.
2. Click the "Display options setup" button.
3. Activate the option for shelved alarms.

Unshelve an alarm

To unshelve an alarm, follow these steps:

1. Display the shelved alarms.
2. Select the alarm in the "Show active alarms" alarm list.
3. Click the "Unshelve alarm" button.
4. If required, hide the shelved alarms from the "Show active alarms" alarm list.

Unshelving is canceled. Canceling the unshelving creates a log entry.

Acknowledging

Acknowledging alarms

The number of alarms to be acknowledged is indicated by a counter at the "Single acknowledgment" button or, if the alarm control was configured accordingly in engineering, by the information bar.

Introduction

You can acknowledge alarms in runtime according to your project configuration settings. You acknowledge alarms as follows:

- In the alarm control with the buttons "Single acknowledgment" and "Group acknowledgment", and for alarms with dual-mode acknowledgment also with the button "Single confirm".
- With customized buttons

When an operator authorization is configured for the buttons, the alarms can only be acknowledged by authorized users.

Acknowledgment variants

You acknowledge individual alarms or multiple alarms together in Runtime. The following options are possible:

- Single acknowledgment
  Acknowledgment of an alarm using the "Single acknowledgment" button of the alarm control.
- Group acknowledgment
  Acknowledgment of all pending, visible alarms that require acknowledgment in the alarm control using the "Group acknowledgment" button in the alarm control.
- Dual-mode acknowledgment
  When an alarm requires dual-mode acknowledgment, you must acknowledge both the enabling and disabling of the alarm. Or you acknowledge the alarm and reset it with the "Single confirm" button in the alarm control. The alarm status changes from "Active/ Acknowledged" to "Inactive".

Requirement

- The "Visibility" and "Allow operator control" settings have been enabled in the engineering for the following buttons of the alarm control:

	Single acknowledgment
	Group acknowledgment
	Single confirm
	Show recent

- For the single acknowledgment: An alarm that requires acknowledgment is pending.
- For the group acknowledgment: Several alarms that require acknowledgment are pending. The alarms do not require single acknowledgment.

Acknowledge alarms individually

To acknowledge an alarm, follow these steps:

- Read the alarm texts of the pending alarm and perform corrective measures, if necessary.
- Pause "Show recent".
- Select the alarm.
- Click "Single acknowledgment" in the alarm control.

Result

The alarm status is set to "Acknowledged". When the trigger condition for an alarm no longer applies, the alarm status is set to "Inactive" and no longer displayed on the HMI device.

Acknowledging alarms collectively

For group acknowledgment of alarms, follow these steps:

1. Read the alarm texts of the pending alarms and perform corrective actions, if necessary.
2. In the alarm control, click "Group acknowledgment".

Result

All pending alarms with the following properties are acknowledged:

- Requires acknowledgment
- Does not require single acknowledgment
- Visible

When the trigger condition for an alarm no longer applies, the alarm status is set to "Inactive" and no longer displayed on the HMI device.

Logging alarms

Logging basics

Introduction

An alarm log documents the alarms that occurred in the monitored process. You can use alarm logging to analyze error states and to document the process. When you analyze the logged alarms, you can extract important business and technical information regarding the operating mode of the plant.

With the appropriate configuration in engineering, logging alarms are created in runtime. If an error or limit violation occurs, for example, an alarm is output in runtime.

The alarm events are saved in a log database and/or printed out. The alarms logged in the database can be output in runtime if required, for example, in an alarm control.

The logged alarms are stored in a circular log that consists of multiple single segments.

With the appropriate configuration of the HMI device and a PLC connected to it, the alarms of the connected PLC are logged as well and made available in all configured languages.

Operating principle

An alarm is only logged if logging has been configured for its alarm class. The alarm logs are automatically created by the system in runtime.

Each alarm event of an alarm that has occurred is logged, for example, the status change from "Active" to "Active, acknowledged".

Note

Alarm classes for pure logging

Alarms of the alarm classes "Information", "OperatorInputInformation" and "SystemInformation" are only used for logging. In runtime, they are only displayed in the alarm lists "Show logged alarms" and "Show and update logged alarms".

Content of the alarm log

The alarm logs are used to store all alarm data, including configuration data. You can read all properties of an alarm from the logs, for example, alarm class, time stamp and alarm texts.

A new log segment with the new configuration data is generated whenever you edit configuration data of an alarm. This function prevents any change from influencing alarms logged previously.

The possible number of logged alarms depends on the database used.

Note

The time stamp of a logged alarm is always specified in standard UTC format (Universal Time Coordinated).

Because the alarm configuration is language-specific, the logs contain a configuration data table for each language configured.

Storage location and storage media

Log data are stored in a database. You can further process the saved data in other programs for analysis purposes, for example.

Backup for log segments

Take backups of your log segments to ensure complete documentation of your process.

Note

Backups can only be created if the Microsoft SQL Server is used.

Note

Segments from logs for which a backup was created can be restored in runtime. To do so, open SIMATIC Runtime Manager on the HMI device. See also section Restoring and deleting log segments (Page 7499).

Display of logged data

You can view the logged data on the HMI device with the buttons "Show logged alarms" and "Show and update logged alarms".

No logging due to overload

When an alarm cannot be written to the log after the configured number of attempts and within the defined time interval, the alarm is lost. The memory state is set to "StorageSystemWriteDataLost" internally. This documents that the number of alarms in the queue exceeds the configured high limit. No more alarms can be written to the log.

The alarm "SystemOverloadAlarm" of the alarm class "ALCL@%SystemInformation" is triggered. It is displayed in the alarm control but not logged.

Possible reasons for the overload:

- There are more alarms in the queue than can be processed.
- The alarms in the queue cannot be processed due to additional error conditions or memory states, for example, because the storage space is used up (memory state "StorageSpaceExceeded").

See also

Alarm classes (Page 7275)

Connecting and disconnecting the alarm log backup

Introduction

When you want to access the data of an archived alarm log, connect the log backup to the project. You can configure an automatic connection or connect the alarm log to the project via a script. The logged alarms are displayed in the alarm control.

If you no longer want to access the backup of a log segment, disconnect the log backup from the project.

Requirement

The relevant backup files in "*. ldf" and "*.mdf" format are stored locally.

Display Time Range

Alarms are only displayed if you have configured the time range in the alarm control accordingly.

Example

You have configured the time range so that only the alarms of the past 24 hours are displayed. When you connect to a log backup containing alarms that are older than 24 hours, these alarms are not included in the alarm control.

Automatically connecting to an alarm log

To automatically connect to the alarm log backup, follow these steps:

1. Insert the log backup files in the "RuntimeProjectPath\ProjectName\CommonArchiving" folder.
2. In runtime, the alarm log is automatically connected to the project.

If signing is enabled, signed log backup files that are changed will not be connected automatically. A WinCC system alarm is generated and an entry is added to the Windows event log in the "Application" section.

Connecting to the alarm log using a script

Using the "AlarmLogs" VBS object, you can link the log backup files to the project using a script. The log segments are then copied with the "Restore" VBS method to the "Common Archiving" folder of the Runtime project.

Automatically disconnecting the alarm log

To automatically disconnect the alarm log backup from the project, follow these steps:

1. Go to the folder "RuntimeProjectPath\ProjectName\CommonArchiving".
2. Remove the log backup files from the folder.

Disconnecting from the alarm log using a script

Using the "AlarmLogs" VBS object, you can disconnect the log backup files from the project using a script. The log segments are then removed with the "Remove" VBS method from the "Common Archiving" folder of the Runtime project. For additional information, see the description of the "AlarmLogs" VBS object and the "Remove" VBS method.

Display logged alarms

Introduction

You can display the logged alarms with the buttons "Show logged alarms" and "Show and update logged alarms".

Requirements

- An alarm log is configured.
- All logged data that is to be displayed must be stored locally on the logging server. The SQL server does not allow access to backup files held elsewhere, such as another computer on the network.
- The buttons "Show logged alarms" and "Show and update logged alarms" are configured in the alarm control.

Procedure

1. To display only logged alarms, click the "Show logged alarms" button in the alarm control:

   The alarm control shows the logged alarms. The display is not updated immediately when new incoming alarms occur.
   Each page shows a maximum of 1000 alarms. Use the "Previous page" and "Next page" buttons to change pages.

2. Click the "Show and update logged alarms" button in the alarm control to display logged and current alarms:

   The alarm control shows the logged alarms. The display is updated immediately when new active alarms occur.
   The alarm control shows a maximum of 100 alarms.

Restriction for the alarm list "Show logged alarms"

For log alarms with identical time stamp, it is possible in rare cases that log alarms are skipped when paging forwards and backwards.

To display the skipped alarms, page again, this time in the opposite direction.

Note

In the case of more than 1000 log alarms with identical time stamp, not all skipped alarms can be displayed by scrolling in the opposite direction.

Example

- The alarm log contains several 1000 log alarms. Ten alarms of the log have an identical time stamp. The first five are shown at the end of the current page.
  The alarm control is sorted by time stamp in ascending order.
- Click "Next page".
  You see the next 1000 alarms whose time stamp is higher than the time stamp of the last alarm shown on the previous page.
  The remaining five alarms with identical time stamp are skipped on the page change.
- Click "Previous page".
  You will see all ten alarms with identical time stamp as well as the next 990 alarms with lower time stamp.

Displaying alarm statistics

Introduction

The alarm statistics represent statistical calculations of logged alarms.

You can use a button in the alarm control to export the alarm statistics to an Excel file.

Note

Filter

A filter set in the alarm control is not effective in the alarm statistics.

Note

Display options

Display options selected via the "Configuration of the defined alarms" button in the alarm control are not effective in the alarm statistics.

Requirement

- Alarms are logged.
- For the following button of the alarm control, the "Visibility" and "Allow operator control" are enabled in the engineering system:

	Alarm statistics

Procedure

To display the alarm statistics in Runtime, proceed as follows:

1. Click the "Alarm statistics" button in the alarm control.

Result

The alarms to be displayed in the alarm statistics are specified in the engineering system. Depending on the engineering system, the following columns are displayed:

Column	Description
Number	Configured number of the alarm.
Frequency	Frequency of an alarm. The system counts the number of occurrences of an alarm with "active" status in the log. If the alarm number is not found, this alarm number is not included in the statistics.
Sum active active	Total display time of an alarm in seconds. The time period between the alarm states "active" and "active" is calculated.
Sum active inactive	Total display time of an alarm in seconds. The time period between the alarm states "active" and "inactive" is calculated.
Sum active acknowledged	Total display time of an alarm in seconds. The time period between the alarm states "active" and "acknowledged" is calculated.
Average active active	Average display time of an alarm in seconds. The time period between the alarm states "active" and "active" is calculated.
Average active inactive	Average display time of an alarm in seconds. The time period between the alarm states "active" and "inactive" is calculated.
Average active acknowledged	Average display time of an alarm in seconds. The time period between the alarm states "active" and "acknowledged" is calculated.

The calculation of the time of acknowledgment includes the "acknowledged" alarm state. This "acknowledged" alarm state includes the acknowledgment by the controller.

Note

For the calculation, alarms with the status "acknowledged" and "inactive" are only used if a suitable alarm with the status "active" is found in the result set beforehand.

If an alarm from the controller is pending and runtime is disabled and enabled several times, the alarm is entered into the log several times with the state "active". The alarm is also included multiple times in the calculation.

Operating alarm statistics

Introduction

Using the statistics setup, you can change the settings for calculating the alarm statistics. The following settings are available:

Setting	Description
Time range start	• Now The current time is displayed as the start time of the calculation. • Fixed The start time of the calculation can be changed as required.
Start time	Start time for the calculation. If the "Now" option is selected under "Time range start", the start time cannot be changed.

Setting	Description
Time range base	Unit of time for the calculation. The following settings are available: • Undefined The default time unit "Minute" is used with this setting. • Millisecond • Second • Minute • Hour • Day • Month • Year
Time range factor	The time range factor depends on the "Time range base" setting. For example, if the number 4 is set for the time range factor and "Minutes" is set for the time range base, all alarms that are logged within this period will be evaluated.

Requirement

- Alarms are located in the alarm log.
- For the following button of the alarm control, the "Visibility" and "Allow operator control" are enabled in the engineering:

	Statistics setup

- The alarm statistics are selected in the alarm control.

Procedure

To display the statistics setup in Runtime, follow these steps:

1. Click the "Statistics setup" button in the alarm control.
   Setup opens.
2. Change the settings as required.
3. Click the "OK" button.

Result

The calculation of the alarm statistics is displayed according to the changed settings.

17.3.4.3 Displaying tags in Runtime

Outputting the tag values

Overview

With WinCC you can output tag values in the HMI screen with different screen objects and change them.

- The I/O field is used for the input and output of process values.
- Bars are used for graphic display of the process values in form of a scale.
- Sliders are used for the input and output of process values within a defined range.
- The gauge is used to display the process values in form of an analog gauge.

In runtime you can also output tag values as table or as trend. You can use either process values or logged values as source for the tag values.

- Use a trend for the graphic display of tag values. Trends allows you to display the change in motor temperature, for example.
- Use a table to compare tag values. In the table you can, for example, compare fill levels of supply tanks.

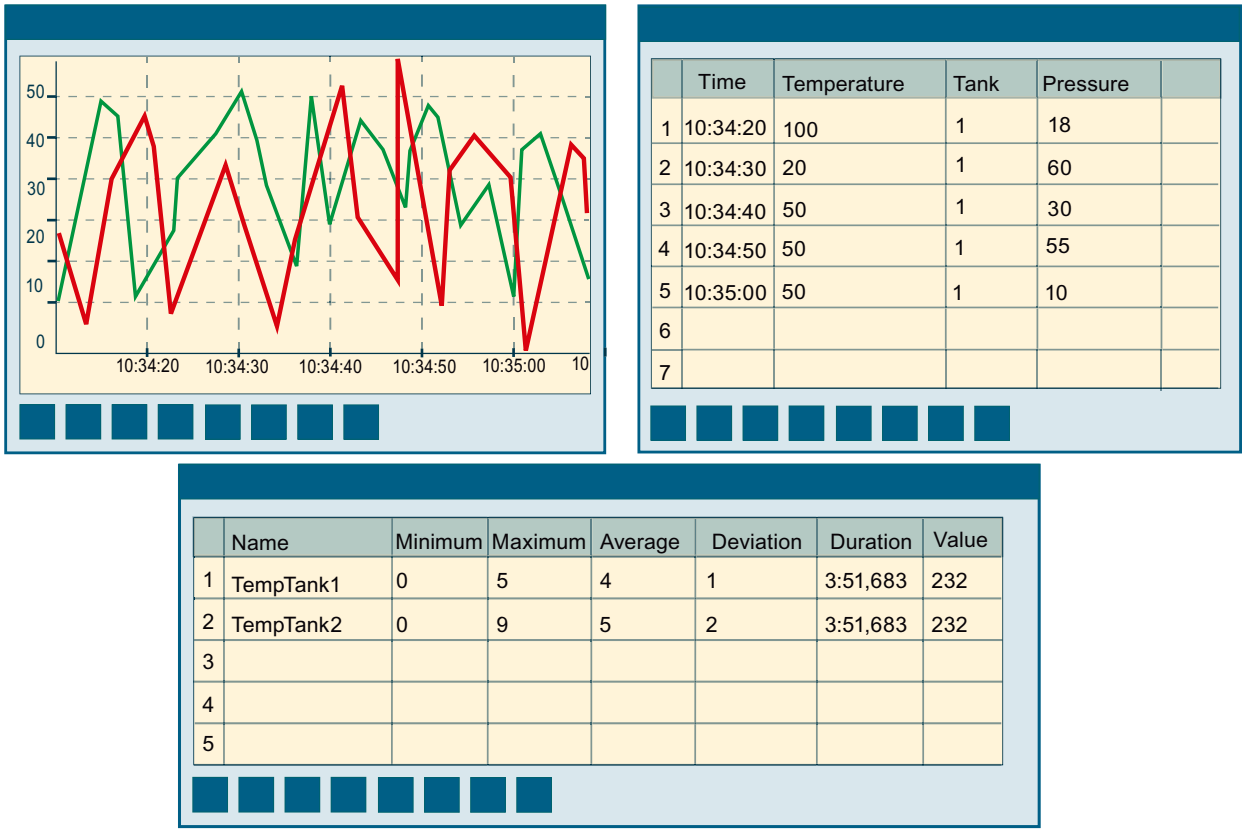
Controls for displaying tag values

To display tag values as a trend, use the trend control. The versions of trend views are available:

- "Trend control": You display a tag value over time, for example, the change in temperature. You can compare the current values and logged values or monitor the change in current values on the HMI device.
- "Function trend control": You display a tag value against a second tag value, for example, the engine speed against the heat produced.

You can use the "Trend companion" to create statistics, for example, from the displayed values. Furthermore, you can use the trend companion as reading assistance for the trend control.

To display tag values in a table, use the process control.



Displayed values

When configuring the trend control, specify which tag values are to be displayed.

- "Online": The trend is continued with current individual values from the PLC.
- "Log": In runtime, the trend control displays the values of a tag from a data log. The trend shows the logged values in a particular window in time. The operator can move the time window in runtime to view the desired information from the log.

Operating controls

Starting and Stopping Update

Introduction

You can continue the update of the data contained in the control with the "Start/Stop" buttons.

Some buttons stop the update automatically, e.g. "Define statistics area"

The appearance of the button indicates whether the update is stopped or not:

 The update has been stopped. To continue the update, click on the button.

 The update has been started. To stop the update, click on the button

Creating statistics for Runtime data

Introduction

You can generate an analysis of the process data for the Runtime data in the trend or process control. You can display the evaluated data in the trend companion.

Overview

Use the following buttons to create statistics of runtime data:

 "Start/stop"

 "Select time range"

 "Statistics area"

Requirement

- A trend control or process control is configured.
- A trend companion is configured and connected to the trend or process control.
- Runtime is enabled.

Displaying data in a statistics area window

Requirement:

The "Statistics area window" display mode is enabled in the trend companion.

To display data in the statistics area window of the trend companion, proceed as follows:

1. In the trend control or process control, click "Stop".
   The updated display is stopped, the process data continues being logged.
2. If you wish to evaluate data outside the displayed time range:
   - Click "Select time range".
     The "Time - Selection" dialog opens.
   - Enter the required time range.
     The data for the defined time range is displayed.

3. If you are using a trend control:
   - Click on the "Statistics area".
     In the trend control, two vertical lines are displayed on the right and left margin.
   - To define the statistics area, move the two lines to the desired position.
4. If you are using a process control:
   - Use the mouse to select the rows for the desired time range in the table.
     For different time columns with different time frames, you can select different time ranges for the calculation of statistics.
   - Click on "Statistic area" in the toolbar.

The evaluated data is displayed in the columns that you have configured in the statistics area window.

To continue with the display of Runtime data, click "Start".

Note

For additional statistical analysis of process data and logging of results, you can write the scripts yourself.

Displaying logged values

Introduction

Scroll through the displayed data of a log using the buttons in the toolbar of a trend or process control. If key combinations are configured, you can also use these for scrolling.

The buttons for browsing in logs are available only if data is supplied through logging tags.

The logged values of a tag are displayed within a time range in the trend or process control.

Overview

Use the following buttons to display logged values:

"First data record"

"Previous data record"

"Next data record"

"Last record"

Requirement

- Time range is configured.

Buttons for Archived Values

To scroll in archived values, proceed as follows:

1. To display the first data record of the time range, click on  .
2. To display the previous data record of the time range, click on  .
3. To display the next data record of the time range, click on  .
4. To display the last data record of the time range, click on  .

Elements of the information line

Elements of the information bar

The information bar of the trend control or process control can contain the following elements:

Icon	Name	Description
	Connection status[1]	No faulty data connections.
		Faulty data connections exist.
		All data connections are faulty.
"Line 1"[2]	Selected line	Shows the number of the selected line.
"Column 2"[2]	Selected column	Shows the number of the selected column.
"23.02.2010"	Date	Shows the system date.
"23:59:59"	Time	Shows the system time.
	Time base	Shows the time base used in the display of times.
[1]: If you double-click on the "Connection status" icon, the "Status of the data connections" window opens. The following properties of each data connection are listed in the window: • Name • Status • Tag name		
[2]: Only in the process control		

Basics of time range

The time range is the range from which the values at the HMI device are shown. The time range is determined by the start time and the end time. The time range is always in the past. If the end time is later than the current system time, the current system time is used as a temporary end time.

A distinction is made between the following time ranges:

- Static time range
- Dynamic time range

Static time range

The static time range is determined by fixed start and end times. The values are displayed within this time range.

Dynamic time range

The dynamic time range is determined by a period of time beginning with a fixed start time. The end time thus corresponds to the conclusion of the time period.

You set the time period as follows:

- Duration, e.g. 30 minutes
- The number of measurement points multiplied by the update cycle also produces a duration.

Configuring time range

Configure the time range for all controls. Configure the time range in the time column or in the time axis for the process control and the f(t) trend control. For the function trend control, configure the time range directly at the trend.

Exporting values

Requirement

- The "Export" button is configured in the control.

Procedure

1. Optional: For the export of a trend control, check the time format for the time axis configured in the control.
   The time axis of the export file takes on the time format configured in the control.
2. Click "Export" in the control.
3. Enter the name of the target file.

4. For the trend companion and process control: Choose whether all values are exported or just the values selected in the control.
5. Optional: Using "Select format", determine which separator and which character set the target file uses.

Note

Displaying Asian languages correctly in MS Excel

If Runtime is running in an Asian language, select the character set "UTF-8".

Trend companion

Trend companion basics

Function

The trend companion displays values or statistics from a control. The content of the trend companion is specified during its configuration.

Overview of the trend companion

The trend companion is connected to one of the following controls:

- Trend control
- Function trend control

In the trend companion, a "display mode" is specified during configuration. The display mode determines which data are shown in the trend companion.

Display mode

Three different display modes are available in the trend companion.

- Ruler window
  The ruler window shows the coordinate values of the trends on a ruler or values of a selected line in the table.
- Statistics area window
  The statistics area window shows the values of the low limit and high limit of the trends between two rulers or the selected area in the table. You can only connect the statistics area view to the trend control or the process control.
- Statistics window
  The statistics window displays the statistical evaluation of the trends. Among other things, the statistics include:
  - Minimum
  - Maximum
  - Average
  - Standard deviation
  - Integral

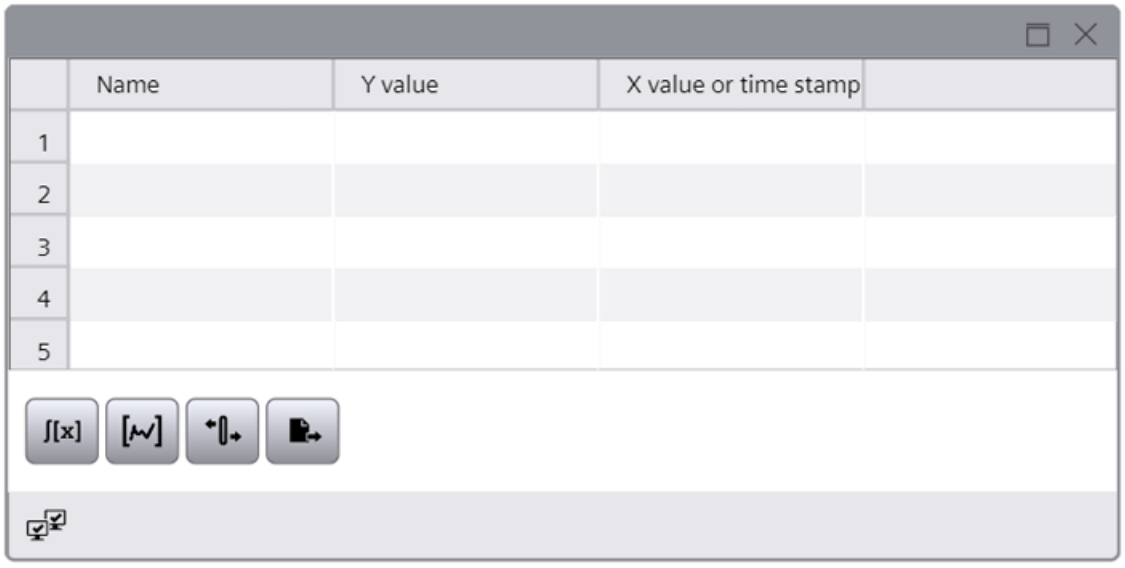
All windows can also display additional information on the connected trends or columns, such as time stamps.

Overview of trend companion

Note

With version V16, the "Trend companion" control is supported only for Unified PC. If you use the control under Unified Comfort Panel, an error message of the compiler is returned. Existing projects under Unified Comfort Panel in which the control is configured must delete the control before compilation to version V16.

With the "Trend companion", you display evaluated data and statistics of a control in a table.



Buttons of the trend companion

The toolbar contains buttons for executing specific functions. Depending on the configuration, the following buttons are available for operator input:

Icon	Name	Function
	Statistical analysis	Displays the statistical values from a defined "statistics range" of the trend or process controls in the statistics window of the trend companion. Only available with a configured trend companion.
	Statistics area	Specifies the period for calculation of statistics.
	Ruler window	Displays a ruler that shows the coordinates of the intersection point with a trend in the trend companion. Requirement: The trend companion is configured with "Ruler window" display mode.
	Print	Reserved for future versions.
	Export	Exports all or selected data to a *.CSV file. Depending on the configuration and authorizations, the following options may be available: • Display export settings and start export • Select file name and directory

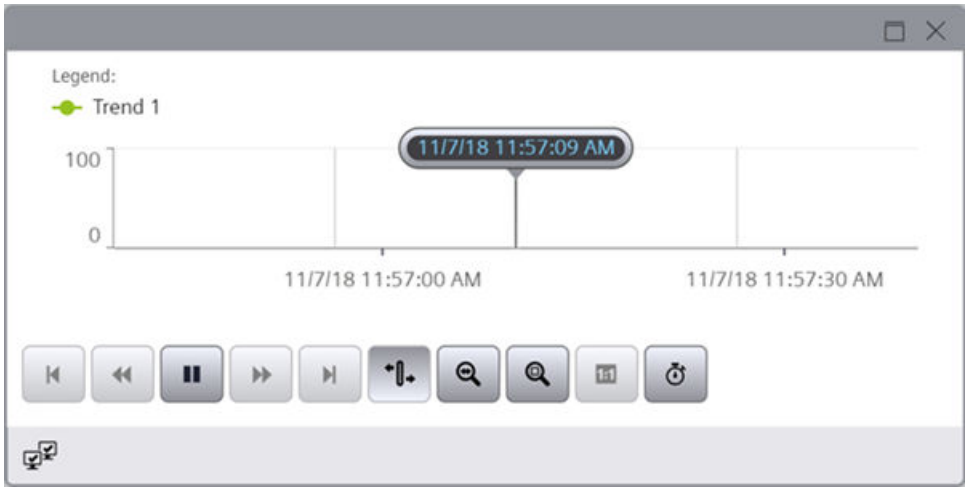
Rearranging columns

You can change the column arrangement configured in the engineering here. See section Rearranging columns at runtime (Page 7451).

Trend control

Overview of trend control

With the trend control, you show the currently pending process values or logged values as a trend over time. You design the trend display according to your wishes.



Note

Trend display in future time range

The trend area located in the future continues the last drawn value.

Buttons of the trend controls

The toolbar contains buttons for executing specific functions. Depending on the configuration, the following buttons are available for operator input:

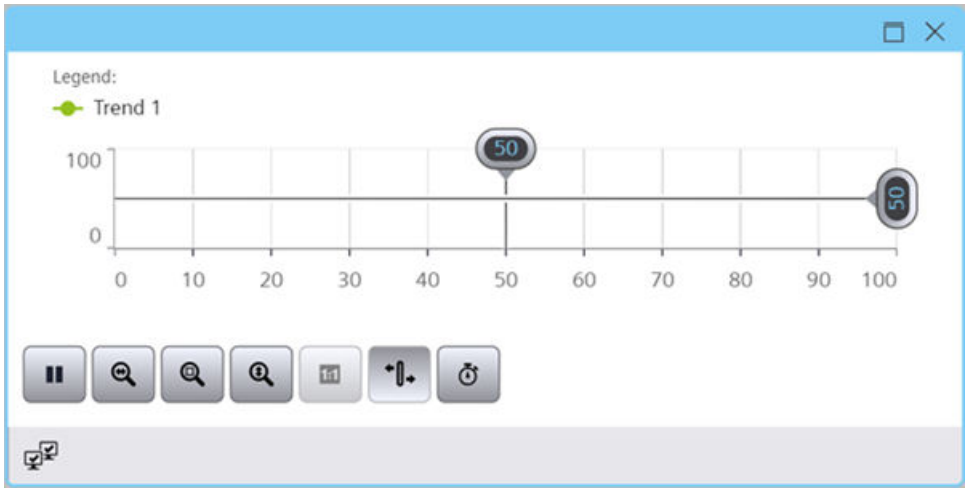
Icon	Name	Function
	First record	Shows the trend direction starting with the first logged value. Requirement: The values come from a process value log.
	Previous record	Shows the trend direction of the previous time range.
	Start/stop	Stops and starts the trend update. Started: The trend is continuously updated. It always shows the latest values. Stopped: New values are buffered and updated as soon as you start the trend update again.
	Next record	Shows the trend direction of the next time range.

Icon	Name	Function
	Last record	Shows the trend direction up to the last logged value. Requirement: The values come from a process value log.
	Previous trend	Displays the previous trend in the foreground.
	Next trend	Displays the next trend in the foreground.
	Ruler	Displays a movable ruler that shows the coordinates of the intersection point with a trend in the trend companion. With stopped trend update, the trend values are also displayed in tooltips. Requirement: The trend companion is configured with "Ruler window" display mode.
	Zoom time axis +/-	Zooms into or out of the time axis in the trend control. Left-click: Zoom in
	Zoom value axis +/-	Zooms in or out of the value axis in the trend control.
	Zoom area	Zooms in on the section of the trend control. You define the section by dragging with the mouse. Use the "Original view" button to return to the original view.
	Zoom +/-	Enlarges or reduces the view in the trend window.
	Move trend area	Moves the display in the trend area.
	Move axes area	Moves the display in the axes area.
	Original view	Returns to the original view from the zoomed display.
	Select time range	Opens a dialog in which you configure the time range.
	Select trends	Opens a dialog in which you set the visibility and sorting of trends.
	Select data connection	Opens a dialog in which you select the data source: • Process value log • Tag • Recipe (only function trend control)
	Statistics area	Enables you to define a time range for which statistical values are determined. Vertical lines which you use to set the time range are displayed in the trend window.

Icon	Name	Function
	Statistical analysis	Opens a statistics window to display the minimum, maximum, average, and standard deviation for the selected time range and the selected trend.
	Print	Starts printing the trends shown in the trend window.
	Export	Opens the dialog for saving the trend data in CSV format. The time axis in the export file takes on the time format configured in the control. If necessary, change the configuration of the time format in the control before the export.
	Select context	Shows the value range of the resulting data for analysis purposes

Overview of function trend control

With the function trend control, you display active or logged process values as a function of another tag in a trend. You design the trend display according to your wishes.



Note

Trend display in future time range

The trend area located in the future continues the last drawn value.

Button of the function trend control

The toolbar contains buttons for executing specific functions. Depending on the configuration, the following buttons are available for operator input:

Icon	Name	Function
	Start/Stop	Stops and starts the trend update. Started: The trend is continuously updated. It always shows the latest values. Stopped: New values are buffered and updated as soon as you start the trend update again.
	Zoom X axis +/-	Zooms into or out of the time axis in the trend control. Left-click: Zoom in <Shift + Left-click>: Zoom out Use the "Original view" button to return to the original view.
	Zoom area	Zooms in on the section of the trend control. You define the section by dragging with the mouse. Use the "Original view" button to return to the original view.
	Zoom X axis plus minus	Zooms into or out of the time axis in the trend control. Left-click: Zoom in <Shift + Left-click>: Zoom out Use the "Original view" button to return to the original view.
	Zoom Y axis plus minus	Zooms in or out of the value axis in the trend control. Left-click: Zoom in <Shift + Left-click>: Zoom out Use the "Original view" button to return to the original view.
	Original view	Returns to the original view from the zoomed display.
	Previous trend	Displays the previous trend in the foreground.
	Next trend	Displays the next trend in the foreground.
	Ruler	Displays a ruler that shows the coordinates of the intersection point with a trend in the trend companion. Requirement: The trend companion is configured with "Ruler window" display mode.
	Move trend area	You can move the trends in the trend window along the X axis and the Y axis using the button. Values from the future trend area apply the last displayed value.
	Move axes area	You can move the trends in the trend window along the value axis using the button.
	Select time range	Opens a dialog in which you configure the time range.

Icon	Name	Function
	Select trends	Opens a dialog for setting the visibility of trends.
	Select data connection	Opens a dialog in which you select the data source: • Process value log • Tag • Recipe
	Print	Click this button to print the trend shown in the trend window. The print job used during printing is defined in the configuration dialog in the "General" tab.
	Export data	This button is used for exporting all or the selected runtime data to a csv file.

Value aggregation

Introduction

If the number of process values or archive values to be displayed for the selected time range in a trend control is larger than the number of pixels available for the trend, they will be aggregated.

Which values are aggregated to a trend value depends on the loading time of the trend control. For this reason, screen changes can result in a change of the trend line.

Avoid aggregation

To avoid that values are aggregated, select a shorter time range or enlarge the width of the trend control.

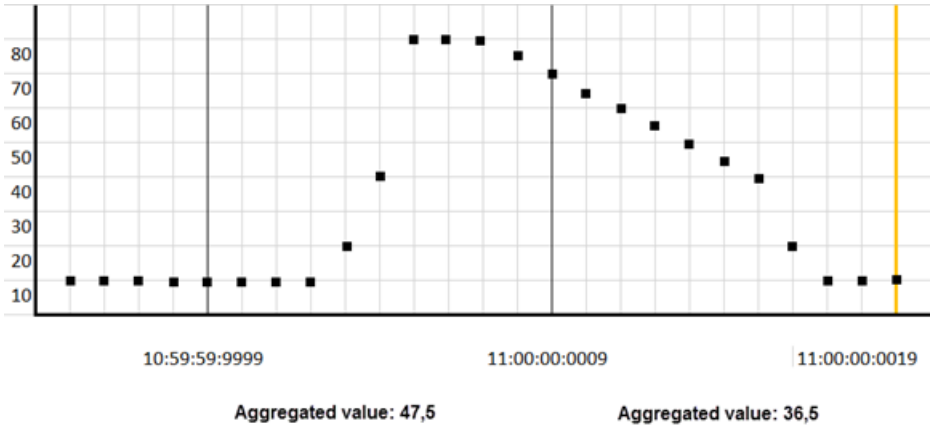
Example

- Pixels available for the trend: 600
- Measuring interval of the tag set as the data source: 10 times per s
- Time range: 10 minutes,

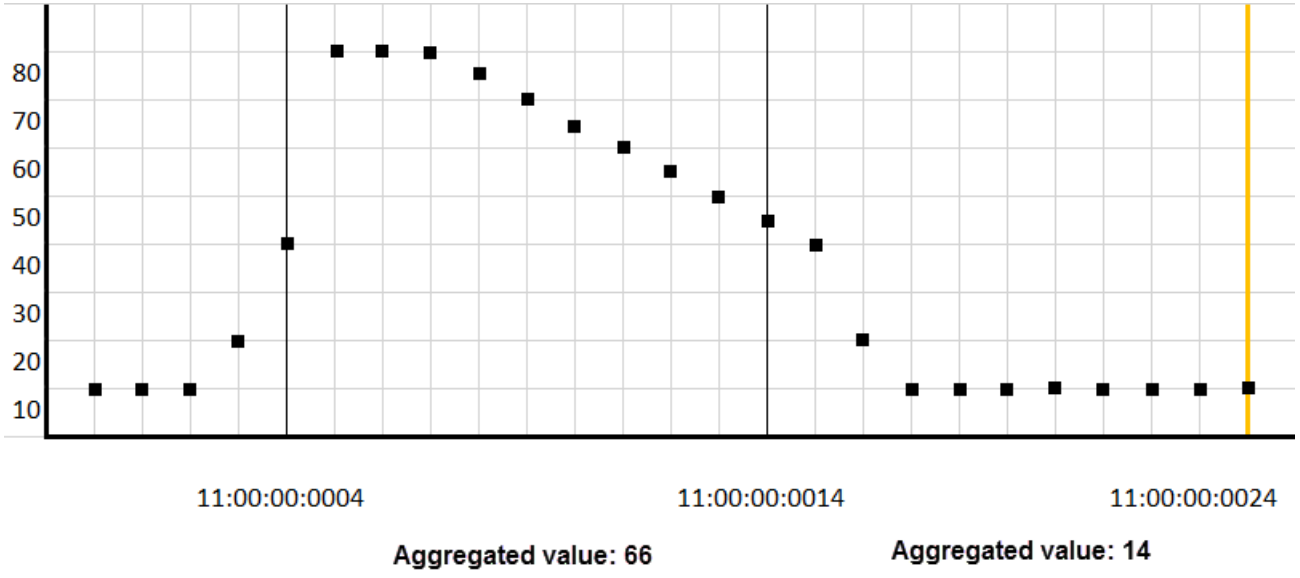
i.e. in the selected time range, 6000 values are measured or logged. When drawing the trend, 10 values are aggregated to each trend value.

The trend displays different values depending on the loading time. The following graphics illustrate how the last two aggregated trend values change when the loading time is 11:00:0019 instead of 11:00:0024.

- Loading time 11:00:0019:



- Loading time 11:00:0024:



Using the trend control

Online configuration of the trend control

Introduction

In Runtime, you configure online and thus change the appearance of the trend control.

During the configuration of the trend control, it is specified whether online configurations are retained or discarded during a screen change or after Runtime is ended.

Overview

Use the following buttons to configure the trend control in Runtime:

	"Select data connection"	Opens a dialog in which you can set the source from which a configured trend is supplied. Possible sources are the tags or logging tags of an HMI device or plant object and UDTs.
	"Select trends"	Opens a dialog in which you set the visibility and sorting of trends.
	"Select time range"	Opens a dialog in which you configure the time range.

See also

Select data connection of a trend (Page 7325)

Using the zoom functions in trend windows

Note

Scrolling in a zoomed in trend control

When the trend control is zoomed in, you can scroll using the mouse wheel:

- Move the mouse wheel to scroll up or down.
- Press <Shift> and move the mouse wheel to scroll to the left or right.

Introduction

Key functions can be used for zooming in on, zooming out of and returning to the original view for trends, axes and various zoom areas of the trend window.

Overview

The following zoom functions are available in the trend window:

	Zoom time axis +/-	Zooming in or out of time axis
	Zoom value axis +/-	Zooming in or out of value axis
	Zoom area	Zooming in on a trend control area
	Zoom +/-	Zooming in or out on trend
	Original view	Returning to the original view

Requirement

- The trend control is open
- Buttons with zoom functions are configured
- Runtime is enabled

Zooming in on a trend control area

Via the toolbar

1. Click "Zoom area" in the toolbar.
   The updated display is stopped.
2. Drag with the mouse to draw a box around the area to be zoomed.
   If there are at least two measured values within this area, the area of the trend is zoomed.
3. To return to the original view of the trend, click "Original view".
4. To restart the update, click "Start/Stop".

The default values are used for the axis.

Using the mouse wheel

Requirement: No zoom button was clicked in the toolbar.

1. Pause the update of the trend control.
2. Press <Ctrl> and move the mouse wheel.

Zooming in or out on trends

If you zoom in or out on a trend, the 50% value of the trend is always in the middle of the value axes.

Proceed as follows to zoom in or out on a trend:

1. Click "Zoom +/-".
   The updated display is stopped.
2. To zoom in on a trend, click on the trend with the left mouse button.
3. To zoom out on a trend, hold down the <Shift> key and click on the trend with the left mouse button.
4. To return to the original view of the trend, click "Original view".
5. To restart the update, click "Start/Stop".

The default values are used for the axis.

Note

If you change the value area of a value axis on the "Value Axis" tab in the configuration dialog while zooming, the visible zoom area is set to the new value area.

Zooming in on the time axis or value axis

While zooming with time or value axes, the 50% value of the trend is always in the middle of the axes.

Proceed as follows to zoom the time axis or value axis:

1. To zoom in or out on the time axis, click on "Zoom time axis +/-".
   The updated display is stopped.
2. To zoom in or out on the value axis, click on "Zoom value axis +/-".
   The updated display is stopped.
3. To zoom in on an axis, click on the trend control with the left mouse button.
4. To zoom out on an axis, hold down the <Shift> key and click on the trend control with the left mouse button.
5. To return to the original view of the trend, click "Original view".
6. To restart the update, click "Start/Stop".

The default values are used for the axis.

Zooming using touch gestures

Refer to the section Supported gestures (Page 7261).

Sorting trends

If a trend area contains multiple trends, you can select the order of the trends.

You have the following options:

- Specify the top trend
- Specify the order of all trends

Specify the trend order

Requirement

The "Select trend" button is configured in the toolbar.

Procedure

1. Click "Select trend" in the toolbar.
2. Click on a trend.
3. Move the trend to the selected position using the buttons.
4. Repeat these steps for the other trends.

Note

The trend at the top position is displayed in the trend area as the top trend.

Specify the top trend

In the drop-down list of the trend area, select the trend that you want to display as top trend.

Alternatively, use the "Select trend" button in the toolbar and move the desired trend to the top position.

Hiding and showing trends

Requirement

The "Select trend" button is configured in the toolbar.

Procedure

1. Click "Select trend" in the toolbar.
2. Disable the trend option to hide a trend.
3. Enable the trend option to show a trend.

Determining the coordinates of a point

Introduction

The "Ruler" button is used to determine the coordinates of a point on the trend by means of a ruler. You can zoom in on an area of the trend to make coordinate finding easier. If you display the ruler in the trend control, you can move the ruler at any time.

If you click on the trend with the mouse, several trend parameters are shown in the tooltip for the trend control.

Requirement

- A trend control is configured
- A trend companion is configured and connected with the trend control
- The "Ruler window" display mode is activated in the trend companion
- Runtime is activated

Procedure

Proceed as follows to determine the coordinates of a point:

1. Click "Ruler" in the trend control.
   The ruler is shown.
2. Move the ruler to the desired position with the mouse.
3. If you want to zoom in on an area, click on "Zoom area".
   - Move the ruler to the desired position with the mouse.
   - To return to the original view, click "Original view".

Result

In the ruler window of the trend companion, besides the X value/time stamp and the Y value, the data that you have configured in the trend companion is shown in the columns.

In the trend companion, the indices "i" and "u" can be displayed in addition to the values:

- "i.": The displayed value is an interpolated value.
- "u.": The displayed value has an uncertain status:
  - The start value after Runtime activation is unknown
  - A substitute value is used

  Note

  You can also display the "uncertain" status of a value in the displayed trend curve. You must activate the "Value with uncertain status" option on the "Trends" tab under "Limits".

Alternative procedure

Alternatively, you can also connect the trend companion to the process control. In the "ruler window" display mode, the values of the selected row are displayed in the trend companion.

Select data connection of a trend

You have the option to set in Runtime the source from which a trend is supplied.

Possible sources:

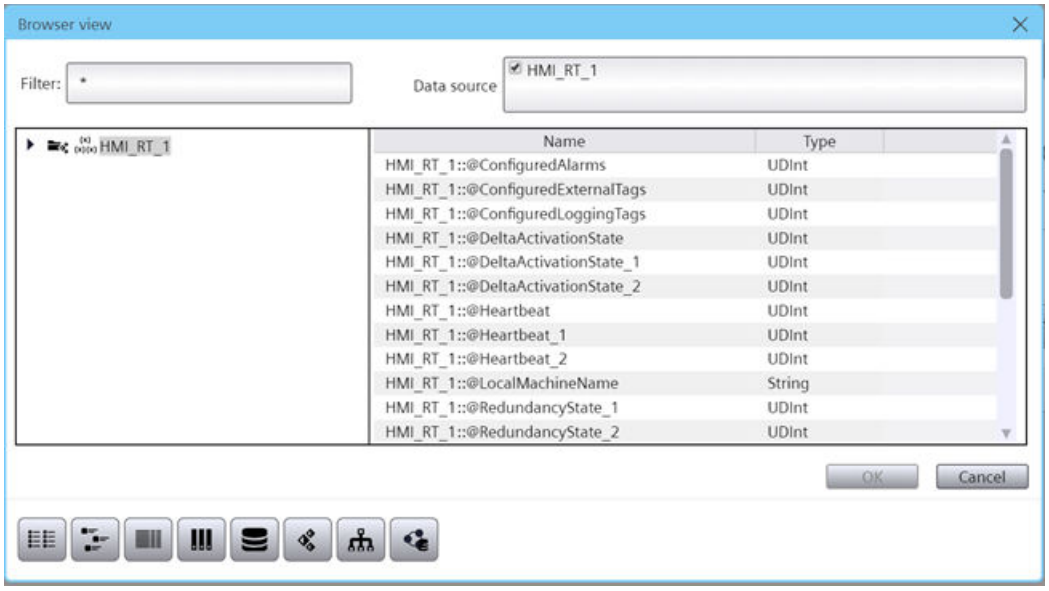
- Tags and logging tags of an HMI device, plant object or PLC
- UDTs

Requirement

- An HMI device has been configured.
- A trend control is configured in the screen of the device.
- To display logging tags: A data log has been configured.
- To display the tags of a plant object: The plant hierarchy has been created and assigned to the HMI device.
- Runtime is active.

Procedure

1. Click on "Select data connection" in the toolbar of the trend control.
   The "Selection of logs/tags" dialog opens.
2. Click "Trend:" and select a trend.
3. Click "Tag".
   The "Browser view" dialog opens in which you specify how the selected trend is supplied with data.



4. (Optional) Define in a filter.
5. Use the toolbar to configure the display in the dialog:

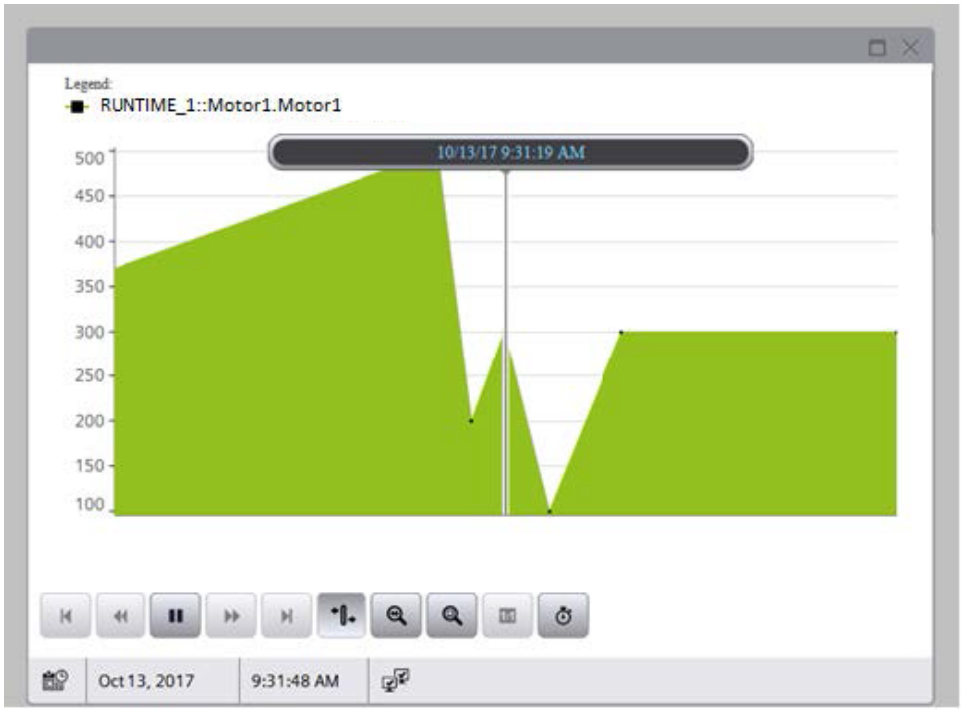
	"Small icons"
	"List"
	"Details"

6. Use the toolbar to configure the contents of the dialog:

	"Online tags"	Shows the device and its tags.
	"Logging tags"	Shows the device and its logging tags.
	"CPM"	Shows the plant hierarchy and the plant object tags.
	"UDT"	Shows the device and its UDTs.
	"CPM logging tags "	Shows the plant hierarchy and the logging tags of the plant objects.

7. In the tree, select the object whose data you want to display in the trend control.
8. Select a tag as the data source.
9. Confirm your entries.

The values of the tags are displayed in the trend control. If the path belongs to a plant object, the path of the plant object is also shown in the trend control.



Changing the time range of a trend

Procedure

To configure the time range, follow these steps:

1. Click "Select time range" in the toolbar of the trend control.
   The "Time selection" dialog opens.
2. Under "Time axes", select the time axis with the time range you want to adjust.
   Under "Trend area", you can see to which trend area the selected time axis belongs.
   If the trends in a trend control are to be displayed with a common time axis, the specified time range applies to all trends.
3. Configure the time range as described below.

Note

The format of date and time depends on the Runtime language used.

Configure time range

1. Select the "Time interval" entry in "Setting".
2. Select date and time of the start time.
3. Set the duration of the time range. To do this, enter a factor and select the time unit.
   Example: "90" as the factor and "Seconds" as the time unit for a duration of one and a half minutes.
4. Confirm your entries.

The time range of the time axis is adjusted:

- If the preset start time has been changed:
  - The trend update is paused.
  - The time axis starts with the selected start time.
- If the preset start time has been retained: The trend update continues. The preset start time is not included in the time axis.
- The duration of the time axis results from the factor and time unit.

Configure start time and end time

1. Select the "Start time and end time" entry in "Setting".
2. Select the date and time of the start time and end time.
3. Confirm your entries.

The time range of the time axis is adjusted:

- If the preset start time and/or end time has been changed:
  - The trend update is paused.
  - The time axis starts with the start time.
- If the preset start time and end time have been retained: The trend update continues. The preset start time and end time are not included in the time axis.
- The duration of the time axis results from the start time and end time.

Configure number of measuring points

1. Select the "Measuring points" entry in "Setting".
2. Select date and time of the start time.
3. Enter the number of desired measuring points under "Measuring points".
4. Confirm your entries.

The time range of the time axis is adjusted:

- If the preset start time has been changed:
  - The trend update is paused.
  - The time axis starts with the start time.
- If the preset start time has been retained: The trend update continues. The preset start time is not included in the time axis.
- The duration of the time axis results from the number of measuring points multiplied by the update cycle.

Basics of time range (Page 7310)

Display context data of the plant objects in a trend control

This section describes how to show context-dependent data of a plant object in the trend control.

The evaluation is relevant, for example, in connection with the WinCC Performance Insight in order to analyze the effectiveness or the fault rate of the plant.

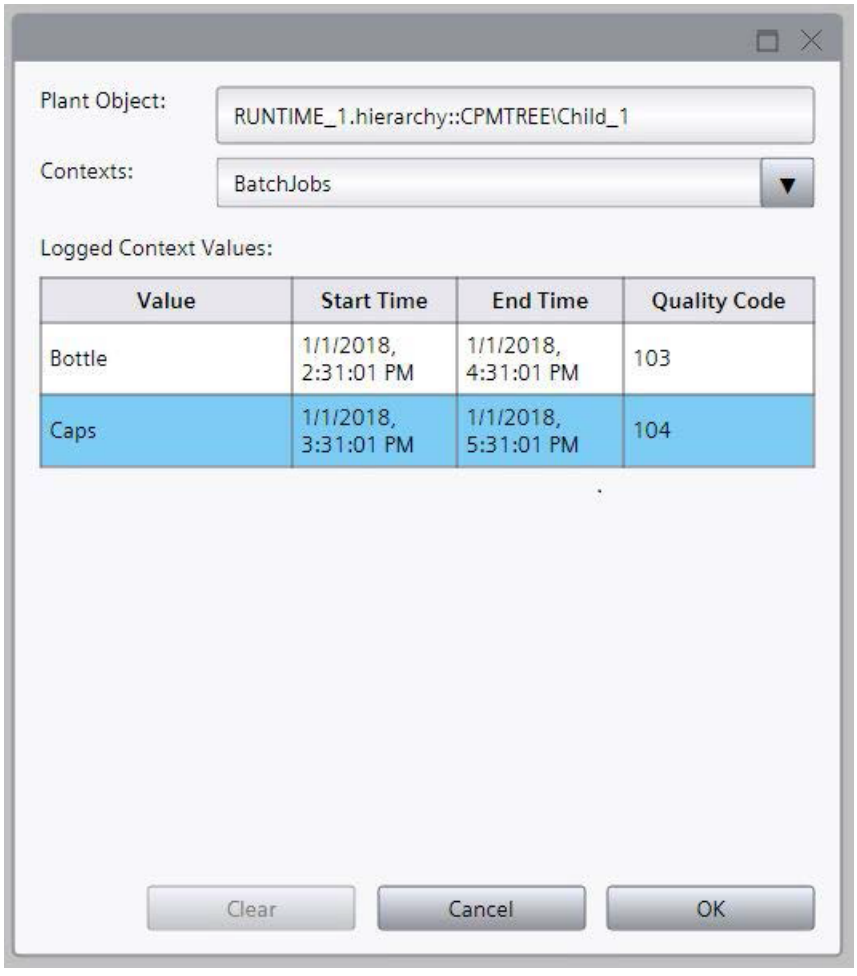
Requirement

- A trend control is configured in the screen of an HMI device.
- The plant hierarchy has been created and assigned to the HMI device.
- The data source of one of the trends in the trend control is a plant object.
- To display the logging tags of the plant object: A data log has been configured.

- Contexts are available for the plant object.
- The "Select context" button is configured for the trend control.

Procedure

1. In the trend control, click "Select context".
2. Select the plant object set as data source.
3. Select one of the contexts assigned to the plant object in the "Context" drop-down list.
   A list of the entries logged for the context appears under "Logged context values".
4. Select an entry.
5. Click "OK".



Result

The time period of the selected entry is applied to the time axis of the trend area. The trend represents the data that falls within the time period of the selected entry.

Note

Effect on other trend areas

If the plant object selected as data source has multiple interface tags and trends from other trend areas of the trend control display these tags, their time axes are also updated accordingly.

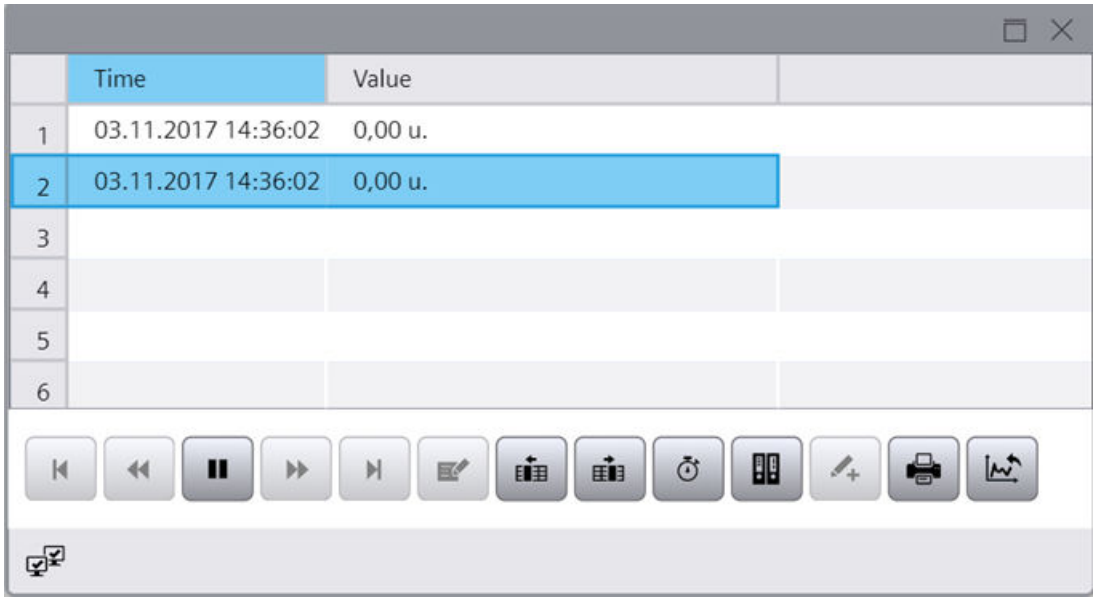
Contexts (Page 7240)

Process control

Overview of process control

With the process control, you display active or logged process values in a table. You design the display of the table as you wish.

You create statistics from selected data. You also export the data for further use.



Buttons of the process control

The following table shows the buttons that are available in the process control:

Icon	Name	Function	ID
	"First data record"	Displays the history of a tag within a specified time range starting with the first logged value. Requirement: Values come from a process value log.	0
	"Previous data record"	Displays the history of a tag within the previous time interval, based on the currently displayed time interval. Requirement: Values come from a process value log.	1
	"Start/stop"	Stops and starts the column update. The values are buffered and updated as soon as you start the column update again.	2
	"Next data record"	Displays the history of a tag within the next time interval, based on the currently displayed time interval. Requirement: Values come from a process value log.	3
	"Last record"	Displays the history of a tag within a specified time range ending with the last logged value. Requirement: Values come from a process value log.	4
	"Edit"	Activates editing of table entries. To edit a value, double-click in the desired table cell. Requirement: Updated display is stopped.	5
	"Previous column"	Moves the value column in front of the previous value column. The function refers to the value columns that are assigned to a time axis.	6
	"Next column"	Moves the value column to behind the next value column. The function refers to the value columns that are assigned to a time axis.	7
	"Select time range"	Opens a dialog in which you configure the time range.	8
	"Select data connection"	Opens the dialog for selecting the logs and tags of an HMI device, plant object or PLC that serve as data source for this table view.	9
	"Create archive value"	Creates a table entry for a log value. Enter the log value manually. Its time stamp corresponds to the time at which you added the table entry.	10
	"Delete archive value"	Deletes a logged value.	11
	"Export"	Exports all or selected data to a *.CSV file. Depending on the configuration and authorizations, the following options may be available: • Display export settings and start export • Select file name and directory	12

Using the process control

Online configuration of the process control

Introduction

In Runtime, you configure online and thus change the layout of the process control. The process control configuration specifies whether online configurations are retained or discarded on a screen change or after Runtime is ended.

Overview

The following buttons make online configuration possible in process control:

"Select data connection"

"Select time range"

Changing the data connection

The following table shows the configuration options for data connection:

Field	Description
Value column	Choose the configured value column for which you want to change the data connection.
Data Source	Define whether the selected value column is supplied with a logging tag or online tag.
Tag name	Select the tag name for the data connection.

Proceed as follows to change the data connection:

1. Click "Select data connection" in the toolbar.
   The "Log/tag selection" dialog is opened.
2. Choose the "Value column" for which you want to change the data connection.
3. Select the "Data supply" and the "Tag name".

Changing a time range

The following table shows the configuration options for the time range:

Field	Description
Time column	Select the configured time column for which you want to define a time range.
Time range	Set the time range: • If you want to define a fixed time interval, select the setting "Start to end time". Enter the date and time for each. • If you want to define a time period, select the setting "Time range". Define the date and time for the start time. The length of the time interval to be displayed is determined by multiplying the "Factor" by the "Unit of time". • If you want to display a certain number of values, select the setting "Number of measuring points". Define the date and time for the start time. Enter the desired number of measuring points in the input field.

To configure the time range, follow these steps:

1. Click "Select time range" in the toolbar of the process control.
   The "Time - Selection" dialog opens.
2. Choose the "Time column" for which you want to adapt the time range.
   If the columns of a process control are to be displayed with a common time axis, the specified time range applies to all columns.
3. Configure the time range.
   The entry format of the date and time depends on the Runtime language used.

Editing a table field

Introduction

You change the values displayed in the process control manually using the "Edit" button.

Overview

The following buttons allow you to edit the table fields:

"Start/stop"

"Edit"

Requirement

- The process control is configured
- The "Edit" button is configured
- Runtime is activated

Procedure

Proceed as follows to edit a table field in Runtime:

1. Click "Stop" in a process control.
   The updated display is stopped, the process data continues being logged.
2. Click "Edit".
3. Double click on the desired table field of a value column.
4. Enter the new value.
   The changed value is logged.
5. To continue with the display of Runtime data in the process control, click on "Start".

Moving value columns

You can rearrange the value columns assigned to a time axis.

Via the toolbar

1. Click on a column.
2. To move a column to the left, select "Previous column" in the toolbar
   The column is shifted one position to the left.
   If you have selected the first column, it is moved to the end of the value columns.
3. To move a column to the right, select "Next column" in the toolbar.
   The column is shifted one position to the right.
   If you selected the last column, it is moved to the beginning of the value columns.

With the mouse

See section Rearranging columns at runtime (Page 7451).

17.3.4.4 Screen window

Use

The "Screen window" object is used to display other screens of the project in the current screen. To continuously update the content of a screen window, for example, the object must be dynamized. Custom menus and toolbars can add specific buttons to the screen window.

You can also use independent screen windows independently of the screen in question. With appropriate hardware equipment and support by the operating system, you can also control multiple monitors and map processes in a more comprehensive and differentiated manner.

Layout

The settings for the position, geometry, style and color of the object are made during configuration.

In particular, the following properties are changed:

- Zoom factor: Defines the size of the embedded screen.
- Screen section: Defines the section of the embedded screen that is displayed in the screen window. If the embedded screen is larger than the screen window, you configure scroll bars for the screen window.
- Independent screen windows: Specified that the screen windows are displayed independently from the screen in which they were configured.

Note

Cascading screen windows

Screen windows can also display screens which, in turn, contain screen windows. Up to 14 cascaded screen windows can be displayed.

17.3.4.5 Web control

Introduction

The "Browser" control is designed for the visualization of simple HTML pages. It allows creation of centrally stored machine-specific descriptions, which are displayed from different HMI devices.

You have access to the data of the local user management in Runtime via a browser.

Note

Switching the functionality of the web control as a file explorer, in the following ways, for example, is not enabled in WinCC:

- Entry of a folder or drive, e.g. "\" or "C:", or
- Connection to an FTP server, for example, "ftp://"

One reason this function is not implemented is to prevent inadvertent changes to files, their deletion or execution.

When configuring, ensure that the operator can only enter valid Internet addresses, for example, by using symbolic I/O fields. Configure a password-protected input for service purposes.

Note

Page navigation in the web control

Whether you can navigate back and forth between the pages that you have viewed in the web control depends on the browser and browser versions in which Runtime is running. If the browser or browser versions do not support page navigation, the buttons in the web control are disabled.

Displayed content

Remember the following notes when using the control:

- The "Browser" control only shows contents that are supported by the browser in which Runtime is open.
- The control is implemented as IFrame. Pages with X-Frame option settings that prevent the display in an IFrame are not displayed in the control.
- As compared to a standard browser, the "Browser" control has limited functionality:
  - Navigation from the "Browser" control is not supported (top-level navigation).
  - Calls of queries and dialogs (pop-ups and modal dialogs) are only supported if they were activated in the file <Path for the WinCC Unified installation directory>WinCCUnified\WebRH\public\content\custom\CustomSettings.json:
    ```
    {"CustomSettings": {"HmiWebControl" : {"AllowPopups" :
    true,"AllowModals" : true}}}
    ```

    Note

    Pop-ups and modal dialogs stop the update.

  - Links to embedded files, for example, *.pdf or *.xls, are not supported.
  - Queries and dialogs that are conducted during the access of, for example, protected pages are not supported.

17.3.4.6 Media player

Use

In Runtime, the media player is used to play multimedia files via an https connection.

Layout

The settings for the position, style and color of the object are made during configuration.

In particular, the following properties are changed:

- Display operator controls: Specifies the buttons in runtime.
- Show tracker: establishes, whether a slider is available for the operation.

Supported file formats

The media player supports all formats that support the HTML5 video tag.

Restrictions

Note

Play restrictions

- The web control security settings do not allow local files to be played.
- Playing multimedia files in the Runtime control system depends on factors such as the installed operating system, the browser used and video and audio codecs installed on the machine.
  Examples:
  - Internet Explorer does not play any video file with an embedded .wav audio file.
  - Most browsers do not support .avi files.
- The browser determines which video formats are supported.
  You can find an overview of the video formats supported by popular browsers here (https://www.w3schools.com/html/html5_video.asp).
  You can find a detailed overview of the browser version used or between browsers here (https://html5test.com/compare/browser/index.html).
- iOS guidelines for the <video autoplay> element are available here (https://webkit.org/blog/6784/new-video-policies-for-ios/).

Note

Requirements for video files

To play video files in the Windows Server 2008 R2 SP1 and 2012 R2, install the Microsoft feature "Desktop Experience". You will find more detailed information on this topic on the Internet in the Microsoft documentation.

Note

Data loss when copying the project

If you copy the project to another PC, keep the following in mind:

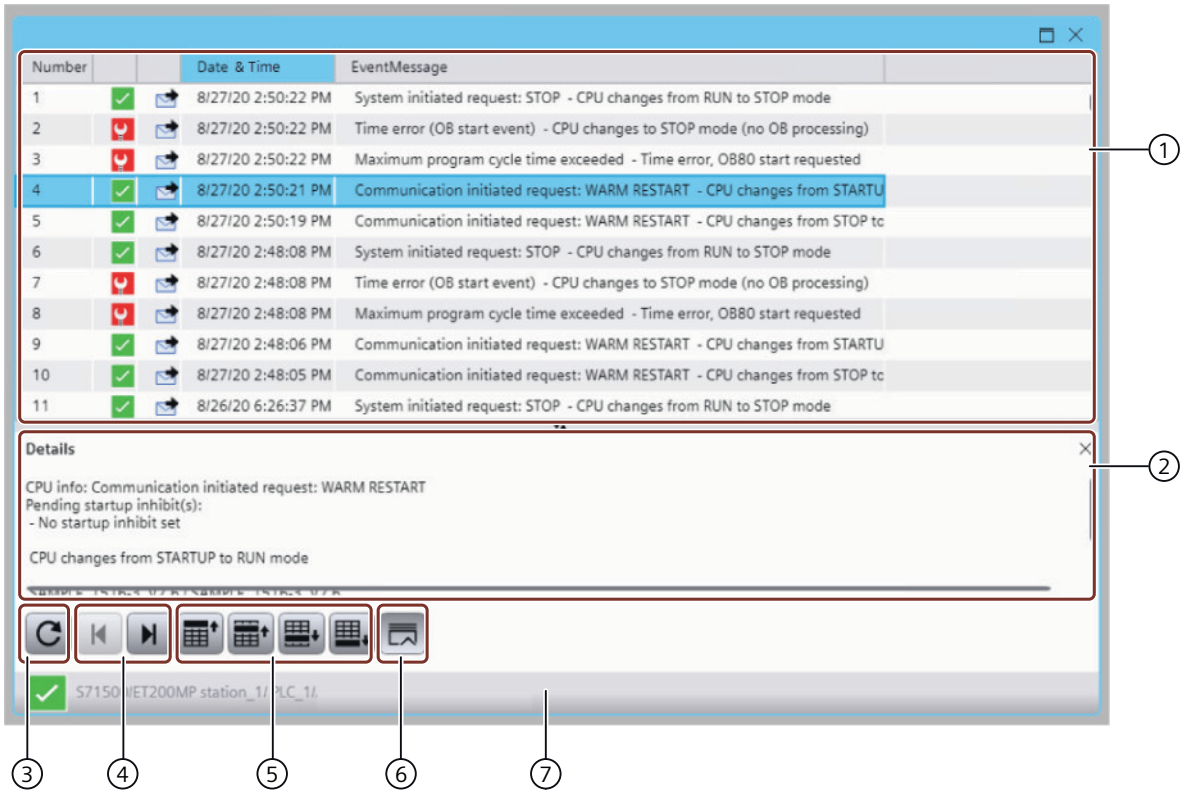
Files indicated in the WinCC Media Control are not copied along with the other files if they are dynamically linked and no UNC path is specified. You have to load the files into the project again.

17.3.4.7 System diagnostics view

The "System diagnostics control" object shows the diagnostic status of several PLCs via traffic light SVGs. The diagnostic status contains the overall status of all relevant PLCs. Navigation buttons can be used to navigate to the next PLC. The merged state is always the worst state of all PLCs.

Layout

In Runtime, the diagnostic messages of the selected PLC are displayed in the "System diagnostics control". The selected PLC can be changed using the buttons ④. Once Runtime has started, the events of the PLC with the most serious error are displayed.



① Grid view
② Detail view
③ Update the view of the diagnostics event
④ Switch to the next or previous PLC
⑤ Navigation buttons for the grid view:
jump to the first line
jump to the previous line
jump to the next line
jump to the last line
⑥ Enable/disable detail view
⑦ Information bar

The diagnostic buffer displays the diagnostics events of a PLC in a grid view ①. The grid view shows the last 200 diagnostics events of the PLC.

The first column shows the number of the entry.

The symbols in the second column indicate the event type of the PLC:

	Device in operation
	Maintenance required
	Maintenance necessary
	Error in the device

You can see the symbols of the incoming or outgoing status in the third column:

	Incoming event
	Outgoing event
	Incoming event for which there is no independent outgoing event
	User-defined diagnostics event

The fourth column shows the date and time of the event. You can see the event message in the last column.

Below the grid view, the detail view ② of the selected row from the grid view is displayed. You can enable or disable the detail view with the button ⑥.

When the screen is loaded, the "System diagnostics control" shows the PLC with the most severe error. If several PLCs are configured for system diagnostics, you can use the toolbar buttons ④ to switch to the next or previous PLC.

To update the "System diagnostics control", select the toolbar button ③. For performance reasons, no automatic update is performed.

At the bottom of the window, an information bar ⑦ is displayed with the diagnostic status and the name of the station/PLC.

Note

Rearranging columns

You can change the preconfigured column arrangement.

Languages in runtime

The alarms are displayed in the RT language selected by the user in the screen logon dialog. The Runtime language and the PLC language should be identical.

The PLC supports only three languages, which can be configured by the user in the engineering. If the PLC language and the Runtime language are different, the event text is displayed as follows according to the fallback mechanism:

- English US
- English UK
- the standard text "## text is missing ##"

Rearranging columns at runtime (Page 7451)

17.3.4.8 Plant overview

Introduction

Note

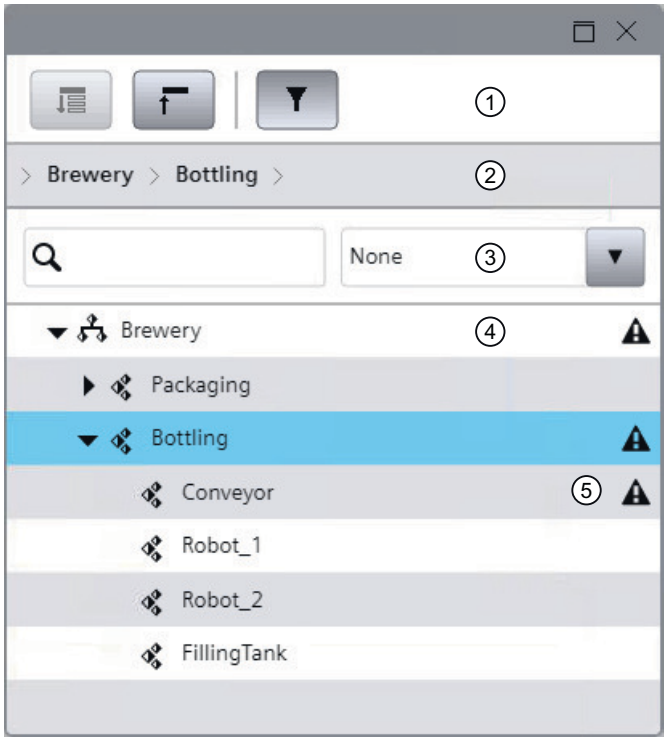
With version V17, the "Plant overview" control is supported only for Unified PC. If you use the control under Unified Comfort Panel, an error message of the compiler is returned. If the control is configured for the Unified Comfort Panels, it must be deleted before the compile.

The "Plant overview" object shows you the configured plant hierarchy in Runtime. In the plant overview, you can navigate through the system to the plant objects and see the plant at a glance.

With the corresponding configuration of the lower-level plant objects and the assigned HMI device during the engineering, the plant overview also offers you the following options:

- Obtaining an overview of the plant objects for which alarms are available
- Displaying the alarms of a plant object
- Display of configured screens of a plant object.

Overview of the Plant overview



1 Toolbar
2 Menu bar
3 Filter bar
4 Plant tree
5 Alarm icon
Alarms are available for the plant object or one of its lower-level plant objects.

The following buttons are available in the toolbar and in the filter bar:

Icon	Name	Function
	Expand all	Expands all lower-level plant objects of the plant object selected in the control.
	Collapse all	Recursively collapses all lower-level plant objects of the selected plant object.
	Expand or collapse the filter bar	Opens or closes the filter bar.
		Filters the plant overview: • No filter: You see all plant objects • For plant objects for which alarms are available • According to plant objects for which screen windows are configured
	Search field	Filters according to the entered text.

When configuring in the engineering system, you can hide the toolbar and menu bar.

Requirement

- The plant view has been created and assigned to an HMI device.
- The "Plant overview" object is configured in the screen of the assigned HMI device.
- Optional:
  - The "Dynamic" navigation type is configured in the engineering system for the plant overview.
  - A root node is configured in the engineering system for the plant overview.
- Runtime is active.

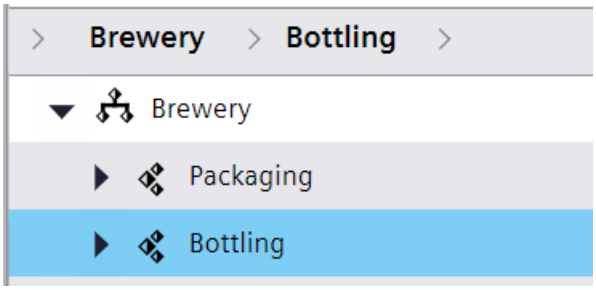
Operation

Expand and collapse plant tree

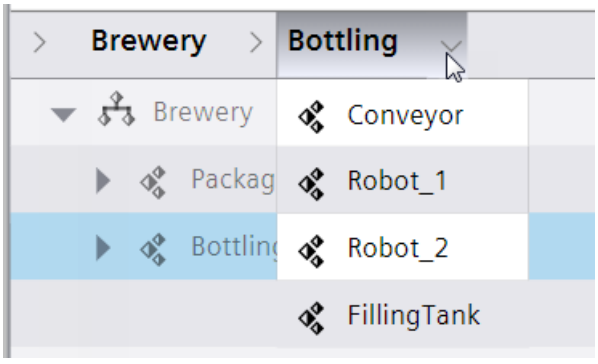
- To show all lower-level plant objects of a plant object, click the "Expand all" button.
  To collapse the plant tree, click "Collapse all".
- To expand only the lower-level objects of the next level, click the button with the triangle next to the plant object.
  To collapse the level again, click again on the button with the triangle.
  Alternatively, you can double-click the plant object to expand or collapse lower-level objects.

Select plant objects

- To select a plant object, click on the plant object in the plant tree.
  The path to the selected plant object appears in the menu bar of the "Plant overview" object:



- To see which lower-level objects a plant object displayed in the menu bar has at the next level, click the arrow in the menu bar next to the plant object.



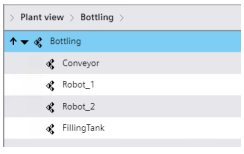
- To go from the menu bar to the overview, click on one of the plant objects shown in the menu bar.

Dynamic navigation

If dynamic navigation is enabled in the engineering system, specify the level from which the plant tree is displayed.

The buttons of the toolbar and the filter bar relate to the displayed area.

- To select a plant object, click on the object in the menu bar or double-click on the object in the plant tree.
  The levels below the selected plant object are available.
- To navigate up one level, click on the up arrow next to the plant object.



Root node

You have the option of defining a root node in the engineering system.

If a root node is configured, the root node and all objects below the root node are available in the plant overview.

See also

Display alarms for plant objects (Page 7289)

17.3.4.9 Plant overview with companion controls

Requirement

- The plant view has been created and assigned to a device.
- The "Plant overview" object is configured in the screen of the assigned device.
- The objects "Alarm control" and "Screen window" are configured in the screen of the assigned device and configured as companion controls of the plant overview.
- Screens are configured at the plant objects.
- Runtime is active.

Display alarms

To display the alarms of a plant object, click on the alarm icon.

The alarm control shows the alarms of the plant object.

Note

The alarm icon only appears when an alarm has occurred at the respective plant object or one of its lower-level objects. The alarm icon disappears again when the alarm is no longer present.

Show a screen of a plant object

To show the screen of a plant object, click on the plant object.

The screen window shows the screen of the assigned HMI device.

If you have not configured any screen window, a screen of the plant object with text box "$POName$" appears.

Note

"$POName$" is an expression with which the name of the plant object is resolved.

17.3.4.10 Parameter set control

Overview of parameter set control

Introduction

Note

With version V16, the "Parameter set control" is supported only for Unified PC. If you use the control under Unified Comfort Panel, an error message of the compiler is returned. Existing projects under Unified Comfort Panel in which the control is configured must delete the control before compilation to version V16.

Set up the machine for production in Runtime using parameter sets. The elements in a parameter set are defined in engineering by defining its parameter set type.

In Runtime, the parameter sets are displayed in the parameter set control. In the control, you manage the parameter sets and load a parameter set into the PLC to set up a machine for production.

Example

A bakery generates the following parameter set types in the engineering system:

- Bread
- Bread rolls
- Cake

The elements of the parameter set types define the ingredients of these products. For example, the parameter set type "Bread" has the following elements:

- Flour
- Salt
- Syrup
- Yeast
- Water

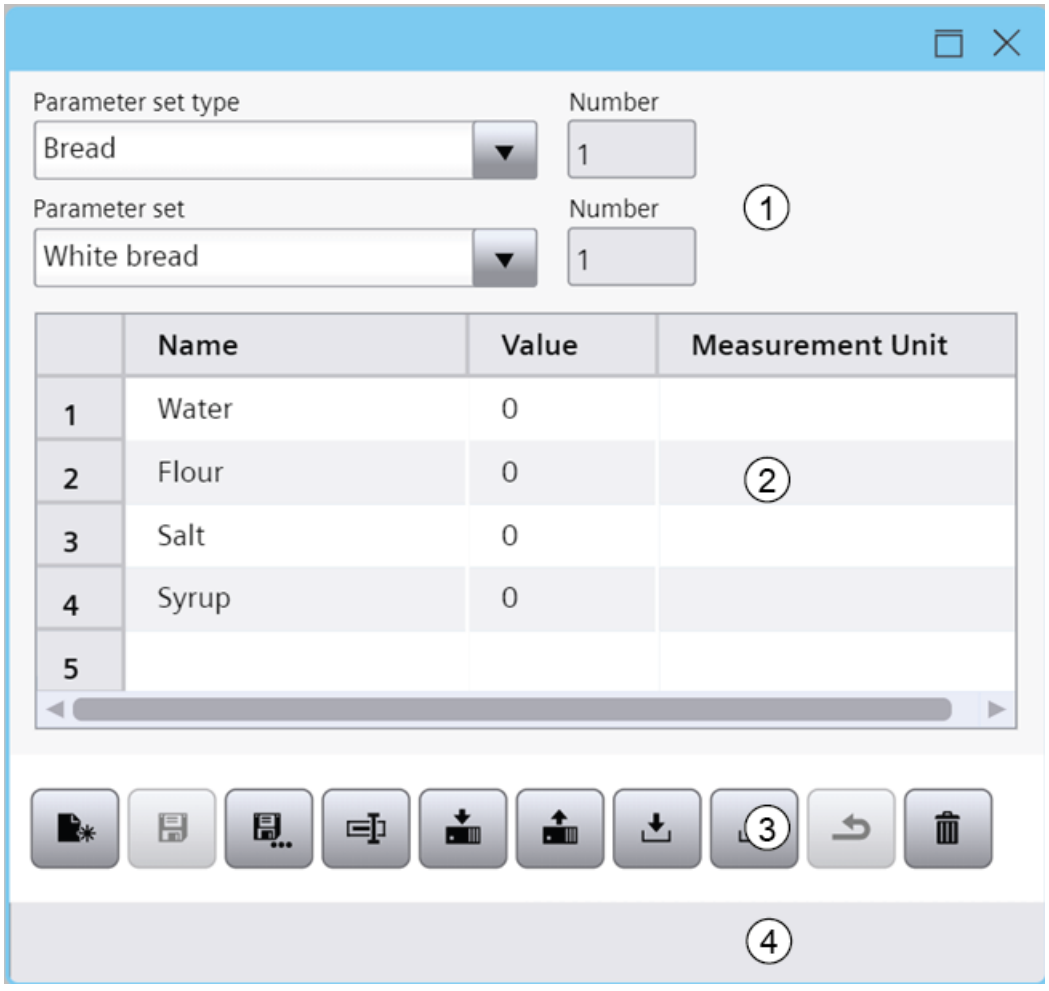
In Runtime, the bakery creates parameter sets for the "bread" parameter set type for the bread types to be produced:

- White bread
- Wholewheat bread
- French bread

The quantities required for this type of bread are entered in the elements.

During production, an operator selects the parameter set to be produced next and writes it to the PLC.

User interface



① Area for selecting the parameter set types and parameter sets

② Parameter table

Displays the values of the selected parameter set or parameter set type. The columns in the table depend on the configuration in engineering.

③ Toolbar

④ Information bar

The elements in the information bar depend on the configuration in engineering.

Note

Fixed parameter set type

The parameter set control in the engineering system can be configured so that you are only offered the parameter sets of a certain parameter set type and cannot select any other parameter set types.

Parameter set control buttons

The toolbar contains buttons for executing specific functions. Depending on the configuration, the following buttons are available for operator input:

	Button	Function
	Create	Creates a new parameter set.
	Save	Saves a parameter set.
	Save as	Opens the selection dialog for the storage path of the selected parameter set.
	Rename	Renames the selected parameter set. The new name must be unique.
	Write to PLC	Save the parameter set and writes it to the PLC.
	Read from PLC	Reads a Parameter set type or parameter set from the PLC.
	Import	Imports parameter sets to a CSV file.
	Export	Exports parameter sets to a CSV file.
	Cancel	Cancels the process.
	Delete	Deletes the selected parameter set. The table shows the default values at the parameter set type.

Rearranging columns

You can change the column arrangement configured in the engineering here. See section Rearranging columns at runtime (Page 7451).

Operate parameter set control

Create parameter sets

Requirements

- Parameter set types were configured in the engineering system.
- The parameter set control is configured in the screen of the device that is active in Runtime.

Create a new parameter set

To create a new parameter set, follow these steps:

1. Select a parameter set type in the parameter set control in "Parameter set type".
   The parameter table loads the columns and default values predefined at the parameter set type.
2. Click the "Create" button.

   Note

   Cancel creation

   Another parameter set parameters set type cannot be selected until you have saved the new parameter set or clicked on "Cancel".

3. Optional: Enter the name of the new parameter set in "Parameter set name".
   The name must be unique for the parameter set type.
4. Optional: Enter the ID of the parameters set in "Number".
   The number must be unique for the parameter set type.
5. The find the values of the parameters set by clicking in a table cell and modifying the value predefined by the parameter set type.
6. Confirm.

The parameter set is created and saved.

Create a version of the existing parameter set

To create a new parameter set based on an existing parameter set, follow these steps:

1. Select a parameter set type in the parameter set control in "Parameter set type".
2. Select a parameter set in "Parameter set".
   The parameter set table loads the columns and values defined for the parameter set.
3. Click the "Save as" button.
   The "Save parameter set as" dialog opens.
4. Optional:
   - Overwrite the automatically generated name in "Parameter set name".
     The name must be unique.
   - Overwrite the ID in "Number".

5. Confirm.
   The new parameter set is created.
6. To change the values taken over from the original parameter set, click in a table cell and enter a new value.
7. Click the "Save" button.

The parameter set is created and saved.

Edit parameter sets

Requirements

- Parameter set types were configured in the engineering system.
- The parameter set control is configured in the screen of the device that is active in Runtime.
- A parameter set was created in Runtime.

Procedure

1. In the parameter set control, select a parameter set type under "Parameter set type".
2. Select a parameter set in "Parameter set".
   The parameter set table loads the columns and values defined for the parameter set.
3. The new parameter set is created.
4. Click in a table cell and enter a new value.
5. Click the "Save" button.

Exchanging data with the PLC

Requirements

- Parameter set types are configured in the engineering system.
- The parameter set control is configured in the screen of the device that is active in Runtime.
- Write to the PLC: Parameter sets are available in Runtime.

Write parameter sets to the PLC

1. Select a parameter set and a parameter set type in the parameter set control.
2. Click "Write to PLC".

Result

- Unsaved data of the parameter set is saved.
- The parameter set is written to the PLC of the parameter set type.

Reading parameter sets or parameter set types from PLC

Reading a parameter set

1. To read a parameter set from a PLC, select the parameters set type of the parameter set and the parameter set.
2. Click "Read from PLC".
3. Select one of the following options:
   - Overwrite parameter set
   - Create new parameter set
     Define the name and the number.

Reading a parameter set type

1. To read a parameter set type from a PLC, select the parameter set type.
2. Click "Read from PLC".
3. A parameter set is created for the parameter set type during import. Define the name and the number of the parameter set.

Result

- The parameter set or the parameter set type and a parameter set are read in.
- The parameter table is updated.
- The parameter set that is created for the imported parameter set type has the default values defined in the type.

Note

A parameter set cannot be read from the PLC if minimum and/or maximum values are defined for a parameter set type element and the value in the parameter set to be transferred is outside this range. A message is output.

Importing and exporting parameter sets

Requirements

- Parameter set types are configured in the engineering system.
- The "Parameter set control" control is configured in the screen of the device that is active in Runtime.
- For the export: Parameter sets are available in Runtime.

Import

1. Click "Import" in the parameter set control.
2. In the dialog "Import - Parameter set", select a TSV file with parameter sets.

3. To overwrite parameter sets in the parameter set control that have the same IDs as the imported parameter sets, activate the "Overwrite" option.

   Note

   If you deactivate overwriting and if a parameter set with the same ID or the same parameter set name exists in the parameter set control, the import of parameter sets is not possible.

   Any added parameter sets whose IDs and parameter set names deviate from the existing parameter sets are imported regardless of the "Overwrite" option.

4. Select "Check checksum" when importing a parameter data record that was exported with the "Generate checksum" option.
5. Click "OK".

Result

- The parameter sets from the file is stored in the database.
- In selecting your parameter set type, you will be prompted to select under "Parameter set".
- If the currently loaded parameter set was part of the import, it will be updated accordingly in the parameter set control.

Export

1. Select a parameter set type in the parameter set control.
2. Click the "Export" button.
3. In the "Export - Parameter set" dialog, select a storage location for the file with parameter sets.
4. Set the formatting settings:
   - Select the file format.
   - Select the list separator.
   - Select the decimal character.
   - Select "Generate checksum" to export the parameter data record with a checksum. Parameter data records with a checksum cannot be imported if they have been manipulated in the meantime.
5. Click "OK".

Result

All parameters of the parameter set type are exported.

Updating the UDTs

Parameter set types are linked to UDTs. If the UDT of a parameter set type is replaced or edited in the engineering system, the derived parameter sets are updated accordingly in Runtime after the next compilation and loading:

- Replacement of the UDT
  The parameter sets created in Runtime are retained. You adopt the elements and default values of the new UDT.
- Assignment of another UDT version
  The parameter sets created in Runtime are retained. New elements are assigned default values, deleted elements are removed.

17.3.4.11 Reports

Basics

Reporting in Runtime

Note

Restriction for Unified Comfort Panel

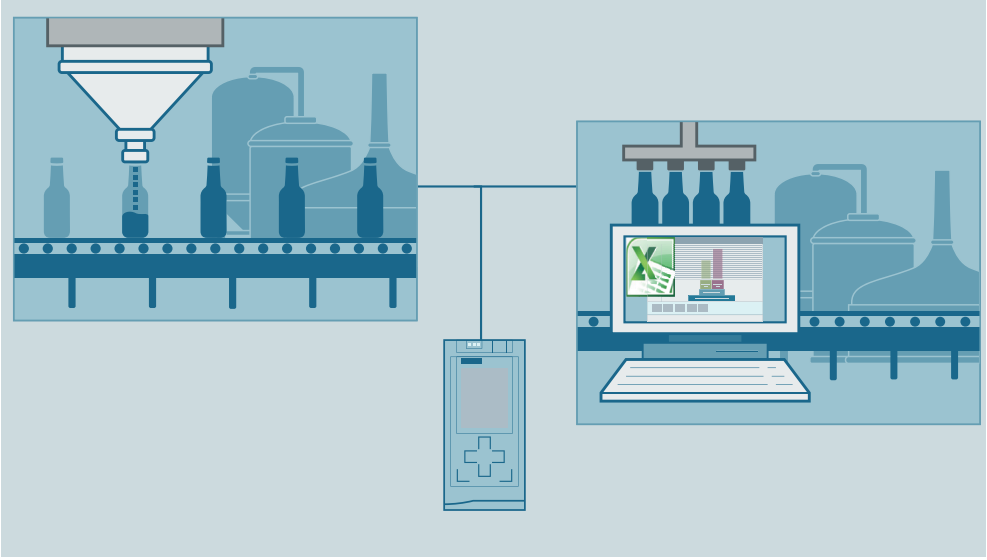
Contexts are not supported in V17 for Unified Comfort Panel. This option is not available in a report template with a Unified Comfort Panel as data source. When you generate a report on a Unified Comfort Panel whose report template uses this option, error entries are generated in the "ErrorLog" worksheet of the report.

Introduction

With WinCC Unified Reporting, you can generate tabular production reports (reports) in Runtime for the following project data:

- Logging tags and tags
- Log alarms
- Contexts:
  - User-defined contexts:
    These contexts are created and executed by a program created with the ODK API.
  - System-generated contexts
    When the Performance Insight and Calendar option packages are installed, these contexts are executed by the system during Runtime.
- Audit Trail of the Runtime device
- If Plant Intelligence options are installed, you can use the WinCC Unified Local Reporting option to generate production logs for additional project data.
  You can find more information in the Help for the respective Plant Intelligence option.

The production reports can be generated as XLSX file or PDF file and sent automatically as an email to a specified group of recipients. For example, you can generate an XLSX report that outputs all alarms occurring in a production line. You then distribute or archive the report for analysis purposes.



Functional scope

In the "Reports" control in Runtime, you configure report jobs that use the report templates defined in the Excel add-in. To do so, Reporting offers the following functions in Runtime:

- Maintenance of the global email settings (contact data and SMTP server configuration)
- Maintenance of job parameters, especially import and export of report templates
- Creating new report jobs and managing existing report jobs
- Overview of the generated reports
- Download or deletion of the reports

Basics of Reporting

Report templates

A *report template* is an Excel file (.xslx) that was created with the WinCC Unified Excel add-in. The report template has access to the data of the data source with which the add-in is connected.

For each report template, you define which segments are contained in the reports using the template and which data source items are evaluated by the segments.

After you have imported report templates into the "Reports" control in Runtime, you can select them for configuring report jobs.

Data sources

The *data source* is the source from which you select data source items when you configure the report template.

The following connection modes and data sources are available:

- Connection mode: Online
  The data source is the project that is running on the Runtime server to which the add-in is connected.
- Connection mode: Offline
  Data source is a configuration file. You generate the configuration file by exporting the data source items of the project to a file in the "Reports" control in Runtime. You can use this file to create additional report templates without connecting to a runtime server.

Options and data source items

Options control the types of data source items to which the report template has access.

Data source items are the specific objects whose data is read from the Runtime project during report generation.

The following options and types of data source items are available in Reporting, depending on the installed software:

Software	Option	Types of data source items
WinCC Unified basic installation	Alarms	Logging alarms Alarm statistics for logging alarms
WinCC Unified basic installation	Logging tag	Logging tags
WinCC Unified basic installation	Tag	Tags
WinCC Unified basic installation	User-defined column	User-defined texts or Excel formulas
WinCC Unified basic installation	Context	User-defined contexts Not available for Unified Comfort Panel
WinCC Unified basic installation	Audit	Audit
Performance Insight option package	Performance Insight	Local KPIs and operands of the PI option Performance Insight: • KPIs • Logged KPIs • Operands (counters and numerical operands) • Machine states • System-generated contexts
Line Coordination option package	Line Coordination	Jobs
Calendar option package	Context	System-generated contexts

Report jobs and job parameters

A *report job* is a job for generating reports in Runtime. A new report is generated each time the report job is performed.

The *job parameters* of the report order determine the details of its execution, such as which trigger it has, which report template it uses and the format of the report.

Report jobs are executed automatically when their trigger event occurs or manually by the user.

Reports

A *report* (production report) is an XLSX file or PDF file that is generated when a report job is executed in Runtime. The data source items from the Runtime project defined in the report template are read during generation, and their data are imported into a table in the report.

Using general Excel functions

In addition to the specific add-in functions, you also have access to the standard Excel functions in a report template. These include:

- Layout functions
- Functions for graphical preparation or analysis of the data imported from Runtime, such as charts, pivot tables and formulas

See also Tips on design and layout (Page 7449).

General requirements and restrictions

Installing the Excel add-in

The installation of the Reporting add-in on a computer requires that the operating system and the local MS Excel installation are regularly updated.

If there are problems with the installation, check the version of the local MS Excel installation. Lengthy maintenance intervals between the operating system and Excel can cause problems during installation of the add-in.

Update the operating system and the Excel version if necessary.

To install the add-in with a local Excel installation, MS Excel with build 16.0.6769 or higher is required.

Note

Note the Microsoft upgrade restrictions

If you have an Excel installation that cannot be upgraded to Build 16.0.6769 or higher (for example, because Excel was installed using a single Office license), purchase a current Office version or use Online Office.

IIS settings for standalone installation of the Excel Add-In

To install the Excel Add-In on a PC without Unified Runtime, the same IIS (Internet Information Services) settings must be active in Windows that are required to install WinCC Unified Runtime on a PC.

You can find additional information in the "SIMATIC Unified PC Installation" user help section on the software and hardware requirements.

Unified Comfort Panel

The following restrictions apply to generating reports on Unified Comfort Panels:

Contexts	Contexts are not supported in V17 for Unified Comfort Panel. This option is not available in a report template with a Unified Comfort Panel as data source. When you generate a report on a Unified Comfort Panel whose report template uses this option, error entries are generated in the "ErrorLog" worksheet of the report.
Storage location of the Reporting database	The following folder on the SD card plugged into the panel is preconfigured as the storage location of the reporting database: • Device version V18: `media/simatic/X51/Reports` You can configure and load another storage location in TIA Portal in the Runtime settings of the Panel. • Device version <V18: `media/simatic/X51`
Storage location for reports	The "Reports" folder on the SD card inserted in the Panel is permanently pre-configured as the local main storage location for reports: `media/simatic/X51/Reports` For Panels with device version V18, you can configure and load a different local main storage location in the Runtime settings of the Panel in TIA Portal.

Enable Reporting

The use of Reporting requires that the Reporting functionality was enabled:

- For configuring report templates:
  Reporting must be enabled for the Runtime project that serves as the data source.
- For configuring report jobs and generating reports in Runtime as well as in a simulation:
  Reporting must be enabled for the Runtime project that is running on the HMI device or is being simulated.

The reporting functionality of a Runtime project is enabled in TIA Portal in the Runtime settings of its HMI device with the option "Enable reporting".

Note

Devices with a device version lower than V18

Reporting is always enabled for HMI devices with a device version lower than V18.

Version compatibility (Page 7359)

Version compatibility

Introduction

When loading a Runtime project for which the "Reports" control has been configured, the general rules for version compatibility of WinCC Unified apply.

The rules described here also apply for the interaction between add-in, data source, report template and runtime version of the project in which reports are generated.

Compatibility between add-in and data source

The add-in can use the following data sources:

Add-in	Online data source	Offline data source
V16	Runtime project V16	Configuration file generated with a Runtime project V16
V17	Runtime project V16 or V17	Configuration file generated with a Runtime project V16 or V17

Compatibility between add-in and report template

The following report templates can be opened and edited in the add-in:

Add-in	Report template
V16	Created with a V16 add-in
V17	• Created with a V17 add-in • Created with a V16 add-in If the add-in is connected to a V17 data source when you open the report template, you will be prompted to migrate the report template to V17. If the add-in is connected to a V16 data source when the report template is opened, no migration is necessary.

Note

Migration of report templates

The migration of the report template is not reversible. A report template migrated from V16 to V17 can no longer be opened in a V16 add-in.

If migration is not desired, connect the add-in to a V16 data source before opening the report template.

Note

Scope of functions of report templates

The functions available in the configuration of the report template in the add-in depend on the version of the data source used by the add-in.

Compatibility between report template and runtime project

In a runtime project, reports can be generated using the following report templates:

Report template	Version of the runtime project
V16	V16 and V17
V17	V17

Workflow for working with reports in Runtime

Introduction

The following workflow describes which works are required in the "Reports" control so that production reports are generated in Runtime.

The reports can be stored as file in the file system and sent as an attachment to an e-mail. Alternatively, an e-mail without attachment can also be sent about the generation of the report. In this way, employees from management and production can be informed about the production situation promptly, regardless of their location.

You can send the e-mail using a secure SMTP server (authentication with user name and password or via certificate) or an unsecured SMTP server, for example, an internal company mail server.

Requirement

- Requirements in TIA Portal:
  - The necessary project data were configured for the HMI device for which reports are to be created.
  - The "Reports" control was placed on an HMI screen of the device.
  - The "Enable Reporting" option was enabled in the Runtime settings of the device.
  - (Optional) The storage locations for reports and the Reporting database were configured in the Runtime settings of the device.
- The HMI device has been compiled, uploaded to the Runtime server and its project is running.
- When using contexts: Contexts have been defined and executed in Runtime for the project.
- The Runtime server has access to report templates.
- For cross-project and cross-Runtime use of report templates: The data sources used in the report template can also be found on the HMI device. Make sure that the names and plant hierarchy are consistent.

Procedure

1. To send reports by e-mail, configure the global e-mail settings:
   - When one of the servers requires a certificate for sending e-mails, upload the certificate.
   - Create contacts for the e-mail receivers and e-mail senders.
   - Create the required SMTP server configurations.
2. Configure job parameters for report templates, triggers and targets.
   These job parameters will then be available to you for selection when configuring the report jobs.
3. Configure report jobs.
   Reports are generated in Runtime when the report jobs are executed.
4. (Optional) Perform report orders manually.
5. In the control, get an overview of which reports have been generated.
6. Download the reports, if necessary.
7. (Optional) To reuse the configuration of the "Reports" control, such as on a device in another network, transfer the existing configuration from the control from one device to the control of the other device.

Configuring job parameters

First, you configure which job parameters are available for selection during the configuration of the report jobs. You configure the following job parameters:

- The available report templates
  The report template defines which data the report outputs. Import and/or delete templates, if required.
- The available triggers
  The trigger defines when a report job is executed. Add triggers, edit triggers or delete them.
- The available targets
  Targets define whether reports are made available to users in the file system or via e-mails. Add targets, edit triggers, or delete them.

You set further job parameters while configuring a report job in the "Report jobs" tab.

Configuring a report job

You configure the following for each report job:

- Name of the report job
- Used report template

- Name of the reports generated by this template

  Note
  Texts through dynamic placeholders

  Placeholders are available to you when defining the report name. The placeholders are evaluated and replaced by text during execution of the report.

  See also Dynamic placeholder (Page 7386).

- Targets of the generated report
  To send e-mails, select a target of the type "E-mail".
- Per target: The target format of the generated report
  Possible formats: .XLSX and .PDF
- Trigger
- Comment
- Activate

Transferring the control configuration (Page 7384)

Configuring report templates in the add-in (Page 7389)

The user interface of the "Reports" control

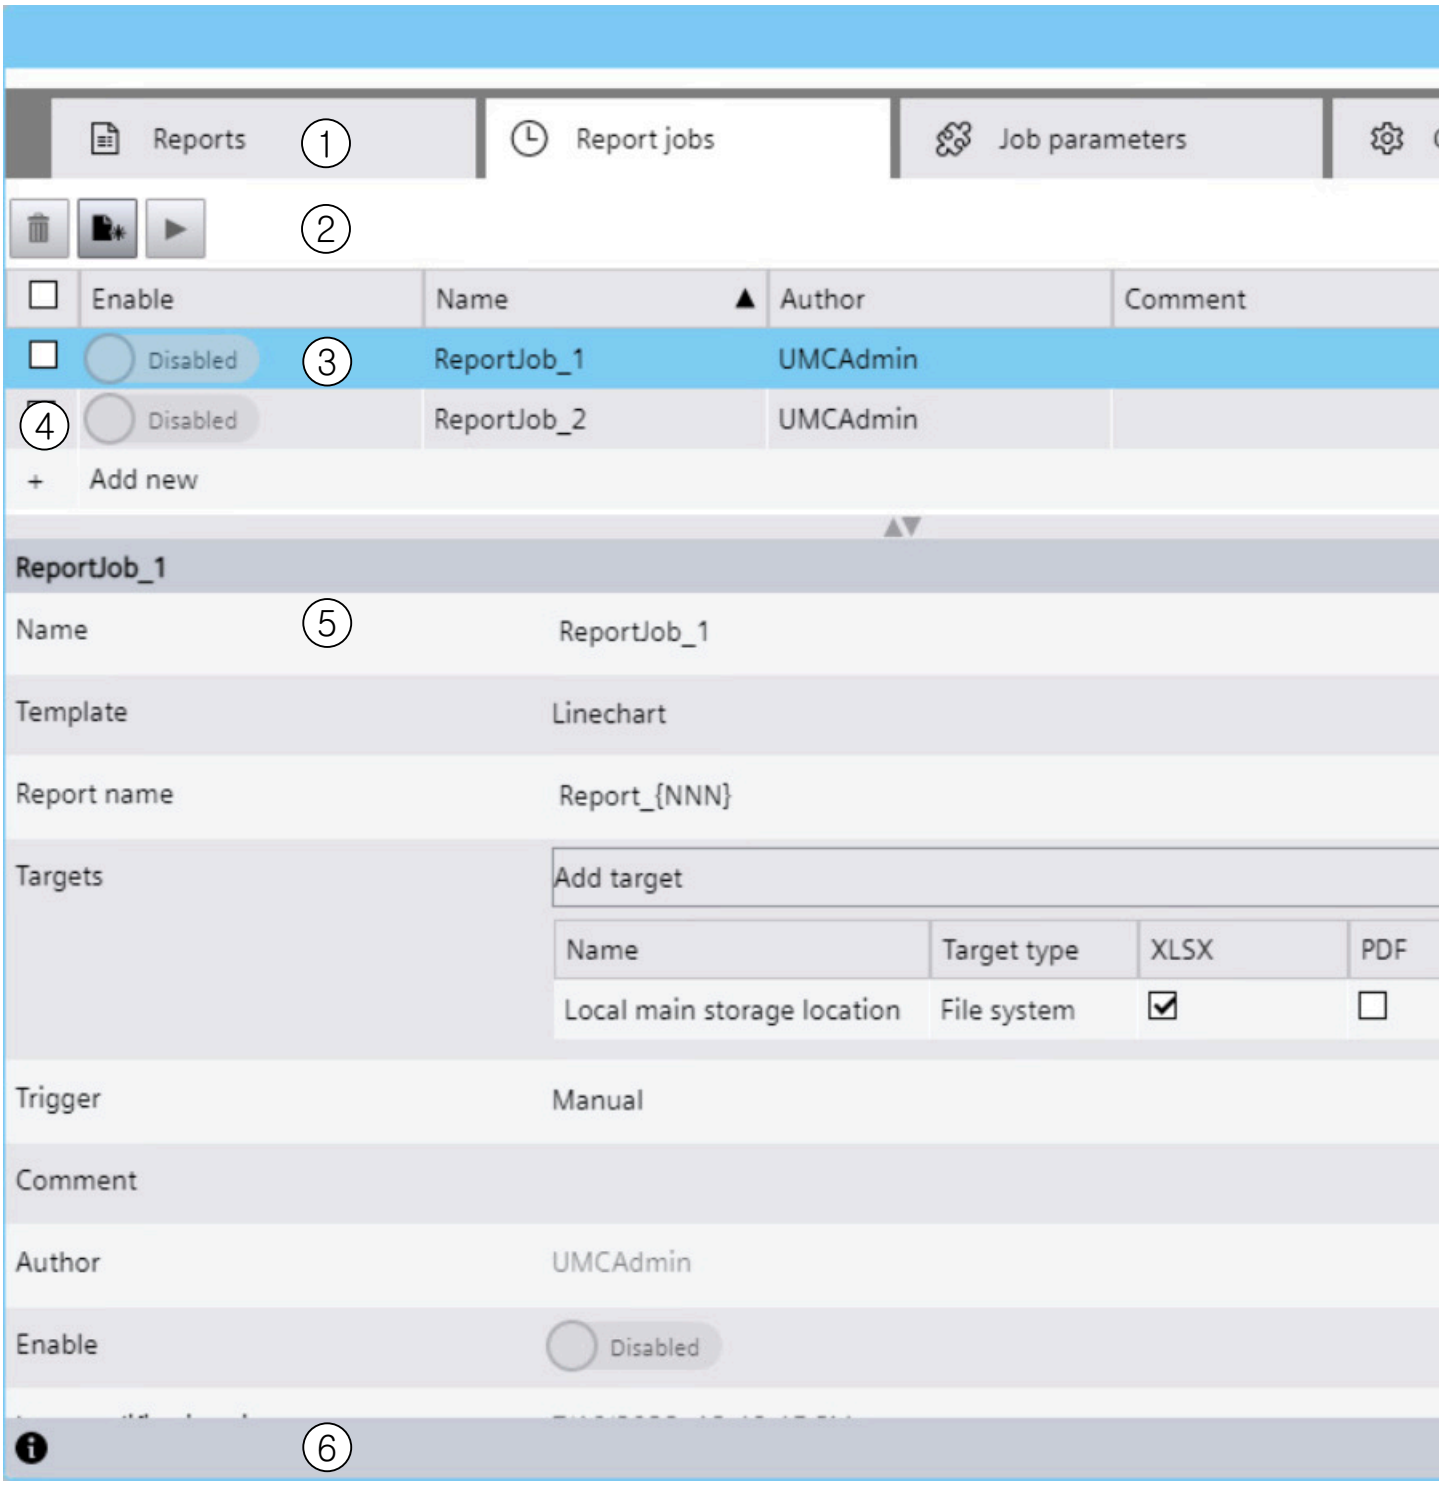
Note
Automatic data transfer

Changes in the "Reports" control are saved automatically.

Layout

You create and manage report jobs in the "Reports" control. You also have access to the reports generated by the report jobs.

The control has the following structure:



1 Tab for the configuration and management of reports, report jobs, job parameters and global settings

2 Toolbar
The buttons you see depend on the tab.

3 Work area
On the "Reports", "Report jobs" and "Job parameters" tabs: List of elements available on the tab
On the "Global settings" tab: The settings

4 Options for selecting the elements
You can select elements individually or all at once.

5 Detail area
Shows the properties of the selected element.

6 Information bar

Tab

"Reports" tab

Here you can see which reports have been generated. You can download or delete reports via the toolbar.

The "Status" column shows Information:

- On the status of the generated report files (XLSX and PDF)
- On the status of the targets (File system and E-mail)

Overview of the status icons:

Status	Description
	Execution has been successfully completed.
	An error occurred during execution.
	Execution is in progress.

A click on an icon opens a detailed status message.

"Report jobs" tab

Here you create new report jobs, manage existing report jobs or start a report job manually.

"Job parameters" tab

Here you manage the parameters with which you configure the report jobs in the "Report jobs" tab.

"Global settings" tab

Here you make the following settings:

- For sending e-mails
- For transfer of the control configuration
- For creating an offline configuration file
- For configuring paging

Toolbar

The following buttons are available in the toolbars of the tab:

Icon	Button	
	Delete	Deletes the elements whose option is enabled in the work area.
	• Add new • Import	• Creates a new element. • "Job parameters > Templates" tab: To import a report template into Runtime
	Run	In the "Report jobs" tab. Manually creates a report for the report job whose option is enabled in the work area.
	Export	• In the "Job parameters > Templates" tab: To export report templates • In the "Reports" tab: To download reports to the client

Information bar

The button in the information bar displays general information sent by the reporting service, for example, on whether a report job has been executed.

Setting global email settings

If configured accordingly, an e-mail is sent automatically after a report job is executed. The e-mail can include the report as an attachment.

Maintenance of the basic settings for sending e-mails is carried out in the "Global settings" tab:

- If necessary: The certificates that the e-mail sender uses to authenticate itself at the SMTP servers.
- The contact information of the e-mail senders and e-mail receivers.
- The configuration of the SMTP server via which the e-mails are sent.

Upload certificates

Store the certificates of the SMTP servers that require authentication via certificate.

Requirement

- You have access to the storage location of a valid certificate file.

Procedure

1. In the "Reports" control, click on the "Global settings > Certificates" tab.
2. Click "Add new" in the toolbar.
   Alternative: In the work area, click "Add new".
3. In the dialog that opens, select the certificate file.
4. Confirm your input.
5. Optional: Select the uploaded certificate in the work area and enter a comment on the certificate in the detail area.

Result

The certificates uploaded here are available in the "Contacts" tab.

Maintaining contacts

Store the data of the e-mail senders and email recipients.

Procedure

To create a new contact, follow these steps:

1. In the "Reports" control, click on the "Global settings > Contacts" tab.
2. Click "Add new".
3. Enter the name of the contact.
4. Enter the e-mail address of the contact.
5. To use the contact as a sender for an SMTP server that requires authentication with a certificate, select the appropriate certificate under "Certificate".
6. To use the contact as a sender for an SMTP server that requires authentication with a user name and password, enter the password.
   The e-mail address is used as the user name.
7. (Optional) Enter a comment relating to the contact.

Result

The contacts configured here are available:

- As the e-mail sender in the SMTP server configuration.
- As an e-mail recipient when configuring "target" job parameters with the target type e-mail

Maintenance of the SMTP server configuration

Store the data of the SMTP servers via which the e-mails are sent.

Requirement

Contacts that are suitable as senders have been entered in the "Global Settings > Contacts" tab.

Procedure

To create a new SMTP server configuration, follow these steps:

1. In the "Reports" control, click on the "Global settings > SMTP" tab.
2. Click "Add new".
3. Specify the following:

Field	Description
"Name"	Enter the name of the SMTP server configuration.
"Address"	Enter the URL of the SMTP server. Servers without authentication (e.g. company-internal mail servers) and with authentication are permitted. Example: URL of a company mail server: `mail.<Company name>.com`
"Port"	Enter the port number of the SMTP server. Default setting: 25
"Sender"	In the list, select the contact that is used as the sender for this SMTP server configuration. All contacts maintained under "Contacts" are offered to you for selection. Select a sender that meets the respective requirements of the server.
"Comment"	(Optional) Enter a comment relating to the SMTP server configuration.

Result

The servers configured here are available when configuring the "Target" job parameters with the target type email.

Configuring job parameters

Job parameters define the details of a report job.

You configure the following parameters on the "Job parameters" tab:

- Templates
- Trigger
  Define trigger when a report job is executed.
- Targets
  Targets define how a report is made available to users. The following target types are available:
  - "E-mail"
    An e-mail is sent after a report job is executed. The report generated by the report job can be included with the e-mail as an attachment.
  - "File system"
    The reports generated by the report job are stored in the file system.

The parameters configured here are available to you for selection when configuring the report jobs in the "Report jobs" tab.

You define the remaining job parameters while configuring a report job in the "Report jobs" tab.

Importing and exporting report templates (Page 7368)

Deleting templates (Page 7369)

Configure trigger (Page 7369)

Add target with target type "E-mail" (Page 7372)

Importing and exporting report templates

Requirement

- The "Reports" control is placed on a screen of the project.
- The "Job parameters > Templates" tab is visible in the control.
- Import: You have access to the storage location of the report template.
- Export: Report templates have been imported into the control.

Importing report template

1. Click "Add new" in the toolbar.
   Alternative: In the work area, click "Add new".
2. In the dialog that opens, select the file of a report template.

3. Confirm your input.

Note

No validation

The template is not validated during import.

4. Optional: In the work area, select the imported report template in the work area and enter a comment describing the template in the detail area.

Exporting report templates

1. In the work area, select the options next to the report templates you want to export.
2. Click "Export" in the toolbar.

The report templates are downloaded to the download folder or a user-defined directory according to the device settings.

Deleting templates

Requirement

- The "Reports" control is placed on a screen of the project.
- The "Job parameters > Templates" tab is visible in the control.
- Templates have been imported into the control.

Procedure

1. In the work area, select the options next to the templates you want to delete.
2. Click "Delete" in the toolbar.

Deleting used templates

The "In use" column shows whether the template is used by a report job.

If you delete a template that is used by a report job, the report job is marked as inconsistent and no longer executed.

Configure trigger

Introduction

In the "Job Parameters > Triggers" tab you configure which automatic triggers are available for selection when configuring report jobs.

Report jobs with automatic triggers are executed if the report jobs on the "Report jobs" tab are set to active and their trigger event occurs. Users can also start the execution manually.

Requirement

- The "Reports" control is placed on a screen of the project.
- The "Job parameters > Trigger" tab is visible in the control.
- To use the trigger type "Context trigger": Contexts are available in the project.

Add trigger

1. In the work area of the tab, click "Add new".
   A new trigger is created and displayed in the detail area.
2. Assign a unique name to the trigger.
3. Select the trigger mode:

Trigger type	Triggering the trigger
"Tag trigger"	Automatically when the configured value condition occurs at the tag defined in the trigger.
"Serial trigger"	Automatically within the user-defined interval when the time defined by the series has been reached.
"Context trigger"	Automatically when the selected context is started or stopped. Optional: By using a condition, you can also limit the triggering of the trigger to specific context values.

4. Depending on the selected trigger type, set the settings for the new trigger as described below.
5. Optional: Enter a comment for the trigger.

Settings for tag trigger

1. Click "Select tag".
2. Click "Load".
3. Select the required tag and click "OK".
4. Set the condition and the condition value.
   Example:

Set tag	<tag name>
Condition	>
Condition value	100

The trigger will be initiated when the tag receives a value greater than 100.

Settings for serial triggers

1. Select the serial pattern.
   The series pattern defines the occurrence and time at which the trigger is initiated.
   Example: Weekly > Every 2 weeks > Fridays
2. Select the series area.
   The series range defines the period in which the trigger is initiated.

"Start"	Specify the start date
"Time"	Specify the time at which the trigger is initiated.
"End on"	Specify the end date. The trigger will be executed for the last time on this day.
"End after"	Determine the number of dates after which the series ends.
"No end date"	The series runs indefinitely.

Settings for context triggers

1. Click "Select context".
2. In the "Context selection" dialog, click "Select plant object".
3. In the "Browser view" dialog, select a plant object and confirm your input.
   In the "Context selection" dialog you can see all contexts that have been defined for the selected plant object.
4. Select a context and confirm your input.
5. Under "Context status", select when the trigger will be triggered:

"Started"	When starting the context.
"Stopped"	When stopping the context.

6. Optional: To bind the execution of the report order to certain context values, you define a condition:

"Condition"	Select an operator.
"Value"	Select a context value.

Example:

Plant object	"MyPlant.hierarchy::PlantView/Bottling"
Context	"Product"
Context state	"Started"
Condition	=
Value	"Orange lemonade"

Report jobs with this trigger are always executed when the context "Product" defined on the plant object "Bottling" is started with the value "Orange lemonade".

Delete trigger

Select the option of the desired trigger in the work area of the "Job Parameters > Triggers" tab and click "Delete" in the toolbar.

Edit trigger

1. Enable the option of the desired trigger in the work area of the tab.
2. In the detail area, edit the settings of the trigger.

Note
No change of the trigger type

The trigger type can only be set when adding the trigger.

Add target with target type "E-mail"

Requirement

- The "Reports" control is placed on a screen of the project.
- The receivers of the e-mails are maintained as contacts in the "Global settings > Contacts" tab.
- An SMTP server, with which the e-mail is to be sent, has been configured in the "Global settings > SMTP" tab.

Procedure

1. In the "Reports" control, click on the "Job parameters > Targets" tab.
2. In the work area of the tab, click "Add new".
3. Select "E-mail" as target type.
   A new target is created and displayed in the detail area.
4. Assign a unique name to the target.
5. Select an SMTP server configuration.
6. Add the desired receivers and CC receivers:
   – To do so, select a contact from the list "Add receiver" or "Add CC receiver".
   – Add the contact by clicking "+".
7. Enter the e-mail subject.
   To integrate the report name into the subject line, use the placeholder {ReportName}.
8. Enter the e-mail text.
   To integrate the report name into the email text, use the placeholder {ReportName}.
9. (Optional) Enter a comment.

Result

The target is available for selection when configuring report jobs.

An e-mail is sent after a report job is executed with this target. The e-mail can include the report as attachment.

See also

Dynamic placeholder (Page 7386)

Add a target with "File system" target type

Introduction

A reporting job with a target of the "File system" target type saves reports to a file system.

When configuring the report jobs, you can choose from pre-configured and user-defined targets of this target type.

Preconfigured targets

The following targets with "File system" target type are pre-configured:

Local project storage location	The reports are stored in the following folder: `<Project folder of the Runtime project>\Reports`
Local main storage location	The reports are stored in the local main storage location for reports. The local main storage location is configured in TIA Portal in the Runtime settings of the HMI device. If this setting has not been set in TIA Portal, the reports are stored as follows: • Unified PC: In the folder configured during installation of Runtime or later in the "WinCC Unified Configuration" tool • Unified Comfort Panel: In the "Reports" folder on the SD card inserted in the Panel: `media/simatic/X51/Reports`

You can select these targets in the "Report jobs" tab. You cannot edit or delete these targets in the "Job parameters > Targets" tab.

User-defined targets

In the "Reports" control, you can create user-defined targets of the "File system" target type. These user-defined targets are always subfolders of the local main storage location.

Requirement

- The "Reports" control is placed on a screen of the project.
- Unified Comfort Panel: The panel contains the storage media configured in the TIA Portal Runtime settings as storage locations for reports and for the reporting database.

Procedure

To add user-defined targets of the "File system" target type, follow these steps:

1. In the "Reports" control, click on the "Job parameters > Targets" tab.
2. In the work area of the tab, click "Add new".

3. Select "File system" as target type.
   A new target is created and displayed in the detail area.
   Under "Destination path", you can see the path to the local main storage location for reports.
4. Assign a unique name to the target.
5. Under "Subfolder", enter the path to the subfolder in which the report is to be saved.
   Use the following notation: <folder name> or <folder name>\<folder name>\...

   Note
   Relative path information

   The path specification is relative to the local main storage location for reports.

6. (Optional) Enter a comment.

Result

The target is available for selection when configuring report jobs.

When a report job with this target is being executed, the generated report is stored in the subfolder of the local main storage location defined as the target. If the folder entered under "Target path" does not exist, it is created by the system.

Note
Change of the local main storage location for reports

When the local main storage location for reports changes, the targets are automatically adapted. New reports are stored relative to the new local main storage location. The old folders are not deleted.

Configuring report jobs

Creating a report job

Introduction

A *report job* is a job for generating reports in Runtime. The configuration of a report job controls the details of the generation.

Requirement

- The "Reports" control is configured on a screen of the project.
- The following job parameters were configured in the control:
  - At least one template has been imported.
  - To automatically execute a report job: Triggers are configured in the "Job parameters > Trigger" tab.

- For sending an email after execution of the report job:
  - Email contacts were configured in the global settings.
  - An SMTP server was configured in the global settings.
  - A target of the target type "E-mail" was configured in the "Job parameters > Targets" tab.
- For a report job with the target format PDF:
  - Microsoft Office Excel or LibreOffice is installed on the runtime server.
  - Depending on whether Excel or LibreOffice is installed, the information required for PDF creation was provided during the Runtime installation or in the "WinCC Unified Configuration" tool.

Procedure

1. Select the "Report jobs" tab in the "Reports" control.
2. Select "Add new" in the work area or click "Add new" in the toolbar.
3. In the detail area, enter a name for the report job.
4. Select a report template.
5. Configure the report name. See section Configuring report names (Page 7377).
   The configuration is applied to all reports generated by the report job.

6. Under "Targets", you determine how the reports are to be made available to users. Follow these steps:
   - Click "Add target".
     You see the targets configured in the tab "Job parameters > Targets".
   - Select a target.
   - Add the target by clicking "+".
     The target is added to the table to define the target formats.

   - Determine the formats in which the reports generated by the report job are provided for the target. In the table, activate the options of the desired formats for each target.

     Note

     Sending emails without a report

     If you deactivate both options for targets with "E-mail" target type, an email without attachment is sent after the report job has been executed.

     Note

     PDF as target type

     Generating PDFs with Excel is significantly slower than with LibreOffice. To generate large PDF reports, it is therefore recommended that you install LibreOffice.

     A PDF report created by LibreOffice can deviate in content or layout from a PDF report generated with Excel, for example, if the report template uses common Excel features that LibreOffice does not support, such as special fonts or chart types.

   - To remove a target from the report job, click the "Remove" button in the table.
7. Under "Trigger", select which event triggers the execution of the report job:
   - If the report job is only to be executed manually, select "Manual".
   - If the report job is to be executed automatically, select one of the other triggers configured under "Trigger".

     Note

     You can also execute the report job manually.

8. (Optional) Enter a comment for the report job.
9. Specify whether the automatic execution of the report job is active or paused. To do this, set the slider "Enabled" or "Disabled".

   Note

   You can still execute disabled report jobs manually.

Result

The report job is saved automatically.

When its trigger occurs, the report job is executed. A report is generated and made available as configured under "Targets".

Tips on design and layout (Page 7449)

Managing report jobs

Requirement

- The "Reports" control is configured on a screen of the project.
- Report jobs have been configured in the control.

Procedure

1. Select the "Report jobs" tab in the "Reports" control.
2. To edit a report job, proceed as follows:
   - Select the report job in the work area.
   - In the detail area, edit the settings of the report job.
     You have the same options as when creating a report job.
3. To delete report jobs, proceed as follows:
   - In the work area, enable the options next to the report job.
   - Click "Delete" in the toolbar.

Configuring report names

Note

Make sure that the generated report name does not violate the policy of the operating system regarding the maximum length of file names.

Introduction

The default name of reports is `Report_{NNN}`.

To use different report names, enter one or more placeholders at the report job. The placeholders are combined to form the report name during execution of the report.

Placeholder types

Placeholders have one of the following types:

Placeholder type	Description	
Text	For user-defined fixed texts	
Counter	On automatic numbering	Dynamic placeholders The placeholders are broken down into values during execution of the report.
Date format	For outputting the generation time	
Tag	To output the process value of an online tag	

Unique report names

If the report name uses counter or date format placeholders, the report job generates unique report names.

Requirement

- The "Reports" control contains a screen of the runtime project that is running.

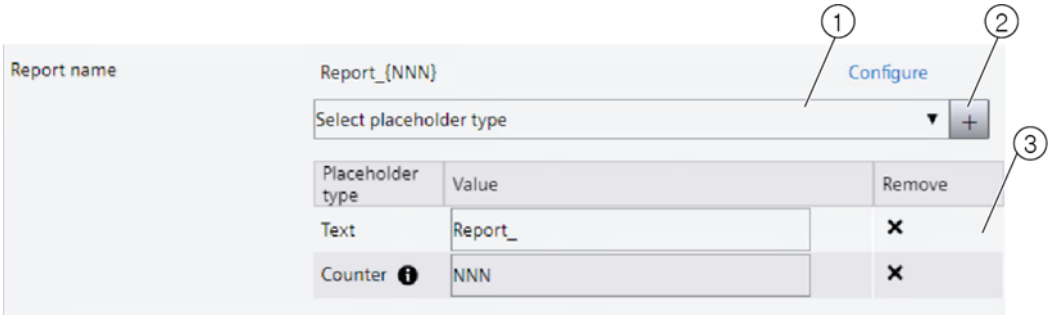
Procedure

You can enter the placeholders manually in the "Report name" field or you can have the software help you configure the report name.

To have the software help configure the report name, follow these steps:

1. Select the "Report jobs" tab in the "Reports" control.
2. Select a report job in the work area.
   You can see the settings for the report job in the detail area.

3. Next to "Report name", click "Configure".
   You see the following operator controls:



① List for selection of the placeholder type
② Button for adding a placeholder of the selected type
③ Table for configuring or removing the placeholder

Note

For the default report name, the "Report name" has the value `Report_{NNN}` and the table shows the placeholders "`Report_`" and "`NNN`".

To swap the order of placeholders or to add a placeholder in the center, delete the placeholders and then add them in the desired order.

4. Optional: To delete the default placeholders, click "x" in the placeholder table.
5. Select the desired type under "Select placeholder type".

Note

A report name can contain only one counter.

6. Click "+".
   An empty placeholder of the corresponding type is added at the end of the table.
7. Enter the placeholder under "Value" in the placeholder table.

Placeholder type	Description	Example
"Text"	Enter the text.	`Report_`
"Date format"	Enter a date placeholder.	A list of permitted placeholders and examples can be found in section Dynamic placeholder (Page 7386).
"Counter"	Enter a counter placeholder.	
"Tag"	Enter the full name of an online tag.	`RT1_Brewery::BatchNo`

Note

Enter the dynamic placeholders without any markup characters.

Alternatively, you can select an online tag via the user interface. Follow these steps:

– Click the "..." button on the tag placeholder.

– In the "Tag selection" dialog, click the "Search" button.
  You can see all the tags of the Runtime project that is running.

  Note

  Scrolling and filtering

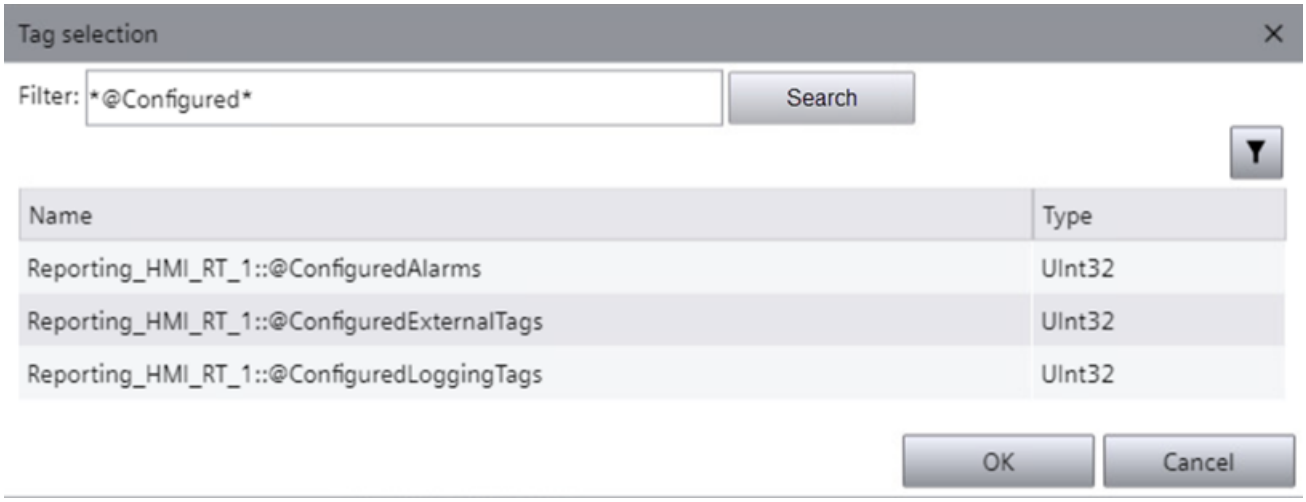
  Use the page navigation buttons to scroll forward or backward.

  To filter the displayed tags, enter a filter string in "Filter" and click "Search".

  You use the wildcard "*" to filter by partial strings.

  For example:
  - *T* returns all tags with a "T" in their name.
  - *T returns all tags that end in "T".
  - T* returns all tags that start with "T".

  When filtering for structures, the separators must be part of the filter string.



– Click the desired tag.

– Confirm with "OK".

In the "Report name" field, the placeholder you added is appended to the end of the report name.

Alternative procedure

To enter the placeholders manually, proceed as follows:

1. Select the "Report jobs" tab in the "Reports" control.
2. Select a report job in the work area.
   You can see the settings for the report job in the detail area.
3. Enter the desired combination of fixed texts and dynamic placeholders manually in the "Report name" field.
   Use markup characters for the dynamic placeholders. See section Dynamic placeholder (Page 7386).

Example:

"Report name" value	Generated report name
`Report_{yyyymmdd}_{HHMMss}_{@PC1_Brewery::BatchNo}`	`Report_20190101_170001_BatchNo_87002314`

Result

When generating a report, the dynamic placeholders are resolved and all placeholders are merged to form the report name.

If a process value contains a character that is not permitted in file names, it is replaced by an underscore.

If there is an error resolving the name, e.g. because the tag is not found in runtime, the tag placeholder in the name is replaced by `ERR`. The process is logged in the generation status of the report.

Execution of report jobs

Automatic and manual execution

Automatic execution

Report jobs that have a tag trigger, serial trigger or context trigger and are set to active on the "Report jobs" tab are automatically executed when their trigger occurs.

Manual execution

Report jobs with a trigger of the "Manual" type must always be executed manually.

In addition, you can at any time manually execute report jobs that have a tag trigger, serial trigger or context trigger.

System response to errors

- Error adding the report job to the queue
  The execution of the report job is discarded. A system alarm documents the error.
- Error executing the job
  In the "Reports" control, "Reports" tab, the status icon indicates the error. A click on the icon opens a detailed status message.
  A system alarm documents the error.

See also

Running a report job manually (Page 7382)

Configure trigger (Page 7369)

Running a report job manually

You can execute report jobs manually at any time, regardless of their trigger type. This also applies to report jobs that were disabled in the "Report Jobs" tab and whose automatic execution is therefore paused.

Requirement

Report jobs have been configured in the "Reports" control.

Procedure

1. Select the "Report jobs" tab in the "Reports" control.
2. In the work area, enable the option next to the report job that you want to execute manually.
3. Click "Execute" in the toolbar.

Result

The report is generated. You can download it in the "Reports" tab.

Downloading reports

You can download the reports stored by the report job in the file system to your device.

Depending on which file formats have been set in the report job, you can download the report as an XLSX file and as a PDF file.

Requirement

- Report jobs with the target type "File system" have been configured and executed in the "Reports" control.

Procedure

1. Select the "Reports" tab in the "Reports" control.
2. In the work area, select the option in the left column for each report that you want to download.
3. Enable the desired target formats in the "Files" column.

   Note

   Generation status

   You are only offered successfully generated formats.

   In the "Status" column you can check whether the generation for a format has failed. For a detailed status message click on the icon of a target format.

4. Click "Export" in the toolbar.

Result

The reports are downloaded into the download directory of the browser.

You can edit, distribute, or log the reports.

See also

Installation of the Reporting add-in (Page 7391)

Exporting an offline configuration file

An offline configuration file is required to configure reporting templates in the Reporting Excel add-in without an online connection to the Runtime server.

Requirement

- The "Reports" control is placed on a screen of the project.
- The Runtime project has data that can serve as data source elements in the reporting template, such as alarms and logging tags.

Procedure

1. In the "Reports" control, click on the "Global settings > Configuration" tab.
2. Enter the name of the offline configuration file under "Offline-configuration".
3. Click "Export offline configuration".

Result

A JSON file with the data source elements of the Runtime project is created. The file is downloaded to the download folder or a user-defined directory according to the device settings.

You can select the configuration file in the Reporting Excel add-in as data source for an offline connection.

Transferring the control configuration

You have the option of reusing the settings in the "Reports" control, for example, on a device in another network. To do this, export the existing configuration on the one device from the control to a ZIP file. Then import the file into a "Reports" control on the other device.

Scope

The transfer covers the following data:

- Global settings, without passwords and certificates
- Job parameters, including the report templates available in the control
- Report jobs

Reports are not transferred.

Requirement

- The "Reports" control is placed on a screen in the project running in Runtime.
- Export: Settings have been made, e.g. contacts maintained, report templates imported, and report jobs created in the "Reports" control.
- Import: You have access to the ZIP file generated by the export on the device on which Runtime is installed.

Export configuration

1. In the "Reports" control, select the "Global settings > Configuration" tab.
2. Enter the name of the export file under "Export/import configuration > Export".
3. Click "Export configuration".

The configuration is exported to a ZIP file and downloaded to the default download directory of the device.

Import configuration

1. In the "Reports" control, select the "Global settings > Configuration" tab.
2. Click "Select import file" under "Export/import configuration".
3. Select the ZIP file in File Explorer and confirm your selection.
4. Runtime checks whether the control already contains configurations:
   - No: The configuration is imported.
   - Yes:
     Select "OK" to import the configuration. The existing configuration is overwritten.
     Select "Cancel" to cancel the import.

Configuring enable paging

To set how many entries the lists in the work area of the "Reports" control display per page, follow these steps:

1. In the "Reports" control, click on the "Global settings > Configuration" tab.
2. Under "List Settings", select the number of entries.

If a list has more entries, these are split over several pages. Use the buttons below the list to switch pages.

Note

The setting is lost through a screen change.

Inconsistencies and error diagnostics

Note

Inconsistent report jobs are not executed.

The templates available in the "Reports" control are not validated.

Display of inconsistencies and errors

Errors and inconsistencies are displayed as follows:

In the control	If job parameters are affected. Examples: • No template is set for a report job. • A tag that triggers a report job is deleted in the engineering system. The project is reloaded into the device.
In the "Error log" worksheet of the report	Errors or inconsistencies affecting the content of the report. Example: The report evaluates data from a tag that is no longer available in runtime.
As system alarm	For errors and inconsistencies that do not affect job parameters or the contents of the report. Example: The ExecuteReport system function transfers a report job that does not exist.

Job parameters

The following values lead to errors and inconsistencies:

Parameter	Invalid values	Default setting
"Name"	Zero, empty or already assigned name	"New report job"
"Template"	Zero, empty or "None". Name of a template that is not imported	"None"
"Target name"	Zero or empty	"NewReportJob[NN]"

Dynamic placeholder

Introduction

Dynamic placeholders are evaluated when the report job is executed and replaced with text in runtime.

The following job parameters can contain placeholders:

- Report name
- Targets with the target type "E-mail": Subject and text of the email

Dynamic placeholders for report names

Use dynamic placeholders for counters and/or dates to generate unique report names:

Counter placeholder	Description	Example		Area
		Configuration	Result	
{N}	Automatic numbering	Rep_{N}	Rep_1	0...9
{NN}		Rep_{NN}	Rep_01	00...99
{NNN}		Rep_{NNN}	Rep_001	000...999

Date placeholder	Description	Example		Area
		Configuration	Result	
{yy}	Current year	Rep_{yy}	Rep_18	Valid year with 2 digits
{yyyy}		Rep_{yyyy}	Rep_2018	Valid year with 4 digits
{m}	Current month	Rep_{m}	Rep_1	Valid month, no prefixed 0 for months in single-digit range
{mm}		Rep_{mm}	Rep_01	Valid month, prefixed 0 for months in single-digit range
{mmm}		Rep_{mm}	Rep_Jan	Month abbreviation with 3 characters
{mmmm}		Rep_{mmmm}	Rep_January	Month with full name

Date placeholder	Description	Example		Area
		Configuration	Result	
{d}	Current day of the month	Rep_{d}	Rep_1	Valid day, no prefixed 0 for days in single-digit range
{dd}		Rep_{dd}	Rep_01	Valid day, prefixed 0 for days in single-digit range
{ddd}		Rep_{ddd}	Rep_Mon	Day abbreviation with 3 characters
{dddd}		Rep_{dddd}	Rep_Monday	Day with full name
{h}	Current hour	Rep_{h}	Rep_1	Current hour (12-hour clock), no prefixed 0 for single-digit values
{hh}		Rep_{hh}	Rep_01	Current hour (12-hour clock), prefixed by 0 for single-digit values
{H}		Rep_{H}	Rep_13	Current hour (24-hour clock), no prefixed 0 for single-digit values
{HH}		Rep_{HH}	Rep_13	Current hour (24-hour clock), prefixed by 0 for single-digit values
{M}	Current minute	Rep_{M}	Rep_6	Valid minute, no prefixed 0 for single-digit values
{MM}		Rep_{MM}	Rep_06	Valid minute, prefixed by 0 for single-digit values
{s}	Current second	Rep_{s}	Rep_41	Valid second, no prefixed 0 for single-digit values
{ss}		Rep_{ss}	Rep_41	Valid second, prefixed by 0 for single-digit values

Use a dynamic placeholder for tags to integrate process values in the report name:

Tag placeholder	Description	Example		Area
		Configuration	Result	
{@<Full Tag name>}	Process value of an online tag	Rep_{@PC1_LineA::MyTag1}	Rep_On	Process value of the online tags If the value contains a character that is not permitted in file names, it is replaced by an underscore. If there is an error resolving the name, e.g. because the tag is not found in runtime, the tag placeholder in the name is replaced by `ERR`. The process is logged in the generation status of the report.

Examples:

Definition with placeholder	Generated report name
LineA_{yyyymmdd}_{HHMMss}	LineA_20190101_170001
LineA_{yymmmd}_{hhMMss}	LineA_19Jan1_050001
LineA_{NNN}	LineA_014
LineA_{yyyymmdd}_{HHMMss}_BatchNo_{@PC1_Brewery::BatchNo}	LineA_20190101_170001_BatchNo_87002314

Placeholder for email subject and email text

To integrate the report name into the subject line or the email text, use the following dynamic placeholder {ReportName}.

Markup

Use the following markup characters for dynamic placeholders:

- Placeholders for counter and date: `{ }`
- Placeholders for tags: `{@}`

Note

There is no markup in the placeholder table for defining the report name. See also section Configuring report names (Page 7377).

Reporting system events

Reporting system events

The most important system events are listed below.

ID	Alarm text	Effect/causes	Solution
538640385	Initialization of the reporting service failed	Initialization of the reporting service fails.	Contact Siemens customer service.
538640386	Report Data Provider cannot be started	The data provider for reports could not be started.	Contact Siemens customer service.
538640387	The report cannot be started for the job [name].	The Report Creator for report jobs cannot be started.	Check the report job settings. If you use the "ExecuteReport" system function, check the name of the report job and the parameters passed when calling the function.
538640388	An error occurred during communication with the database server	The reporting database cannot be found or access is not possible for other reasons.	Check whether the reporting database is available at the storage location configured in the Runtime settings in engineering. Example for panel: • Is the SD card plugged in? • Does the folder specified as storage location in the Runtime settings exist? • Has the folder been specified in the correct notation?
538640389	The creation of the report job [name] failed	The Report Creator is missing information about the report job. A possible reason for this are problems with processing the report template.	Check the report job settings and the report template.
538640390	Report failed	Report Creator reports an error while generating the report.	Check the detailed error message for the report: Control "Reports" > "Reports" tab > "Status" column.

Configuring report templates in the add-in

Requirements

General requirements and restrictions

Installing the Excel add-in

The installation of the Reporting add-in on a computer requires that the operating system and the local MS Excel installation are regularly updated.

If there are problems with the installation, check the version of the local MS Excel installation. Lengthy maintenance intervals between the operating system and Excel can cause problems during installation of the add-in.

Update the operating system and the Excel version if necessary.

To install the add-in with a local Excel installation, MS Excel with build 16.0.6769 or higher is required.

Note

Note the Microsoft upgrade restrictions

If you have an Excel installation that cannot be upgraded to Build 16.0.6769 or higher (for example, because Excel was installed using a single Office license), purchase a current Office version or use Online Office.

IIS settings for standalone installation of the Excel Add-In

To install the Excel Add-In on a PC without Unified Runtime, the same IIS (Internet Information Services) settings must be active in Windows that are required to install WinCC Unified Runtime on a PC.

You can find additional information in the "SIMATIC Unified PC Installation" user help section on the software and hardware requirements.

Unified Comfort Panel

The following restrictions apply to generating reports on Unified Comfort Panels:

Contexts	Contexts are not supported in V17 for Unified Comfort Panel. This option is not available in a report template with a Unified Comfort Panel as data source. When you generate a report on a Unified Comfort Panel whose report template uses this option, error entries are generated in the "ErrorLog" worksheet of the report.
Storage location of the Reporting database	The following folder on the SD card plugged into the panel is preconfigured as the storage location of the reporting database: • Device version V18: `media/simatic/X51/Reports` You can configure and load another storage location in TIA Portal in the Runtime settings of the Panel. • Device version <V18: `media/simatic/X51`
Storage location for reports	The "Reports" folder on the SD card inserted in the Panel is permanently pre-configured as the local main storage location for reports: `media/simatic/X51/Reports` For Panels with device version V18, you can configure and load a different local main storage location in the Runtime settings of the Panel in TIA Portal.

Enable Reporting

The use of Reporting requires that the Reporting functionality was enabled:

- For configuring report templates:
  Reporting must be enabled for the Runtime project that serves as the data source.
- For configuring report jobs and generating reports in Runtime as well as in a simulation:
  Reporting must be enabled for the Runtime project that is running on the HMI device or is being simulated.

The reporting functionality of a Runtime project is enabled in TIA Portal in the Runtime settings of its HMI device with the option "Enable reporting".

Note

Devices with a device version lower than V18

Reporting is always enabled for HMI devices with a device version lower than V18.

Version compatibility (Page 7359)

Installation of the Reporting add-in

Note

Regular updates of operating system and MS Excel

The installation of the Reporting add-in on a computer requires that the operating system and the local MS Excel installation are regularly updated.

If there are problems with the installation, check the version of the local MS Excel installation. Lengthy maintenance intervals between the operating system and Excel can cause problems during installation of the add-in.

Update the operating system and the Excel version if necessary.

To install the add-in with a local Excel installation, MS Excel with build 16.0.6769 or higher is required.

Note

Note the Microsoft upgrade restrictions

If you have an Excel installation that cannot be upgraded to Build 16.0.6769 or higher (for example, because Excel was installed using a single Office license), purchase a current Office version or use Online Office.

Procedure

1. Install the Excel manifest on the computer.
2. Set up read access to the installation path of the Excel manifest.
3. Add the add-in to Excel.

See also

Installing the Excel manifest (Page 7392)

Setting up read access to the Excel manifest (Page 7392)

Adding the Reporting add-in in Excel (Page 7393)

Installing the Excel manifest

Procedure

1. In the installation package of WinCC Unified on "DVD_2", double-click the file "Support\Reporting\SIMATIC_WinCC_Unified_Reporting_<Version number>.exe".
2. Select the target directory to which the underlying ZIP file is extracted and confirm your input. The ZIP file is extracted and setup starts automatically.

   Note

   Start setup manually

   To start the setup manually after the file was extracted, select the option "Extract the setup files without being installed".

   Start the setup later by running the "Setup.exe" file as administrator in the target directory.
3. Follow the setup instructions.
4. In the "Configuration" step, select the option for the Excel add-in.
5. Click "Next" and follow the setup instructions.

See also

Installation of the Reporting add-in (Page 7391)

Setting up read access to the Excel manifest

Requirement

The Excel manifest is installed.

Procedure

Give the users that create templates with the Excel add-in read access to the installation path of the Excel manifest: <target directory>\WinCCUnifiedReporting\Excelmanifest

Note

This step is also necessary if the user belongs to a group in the user management with general read permission.

See also

Installing the Excel manifest (Page 7392)

Installation of the Reporting add-in (Page 7391)

Adding the Reporting add-in in Excel

Requirement

- The Excel manifest is installed on the PC.
- Read access to the installation path of the Excel manifest is set up.
- The following software is available on the computer:
  - Local Excel
    MS Excel (Build 16.0.6769 or higher)

    Note

    Regular updates of operating system and MS Excel

    The installation of the Reporting add-in on a computer requires that the operating system and the local MS Excel installation are regularly updated.

    If there are problems with the installation, check the version of the local MS Excel installation. Lengthy maintenance intervals between the operating system and Excel can cause problems during installation of the add-in.

    Update the operating system and the Excel version if necessary.

    Note

    Note the Microsoft upgrade restrictions

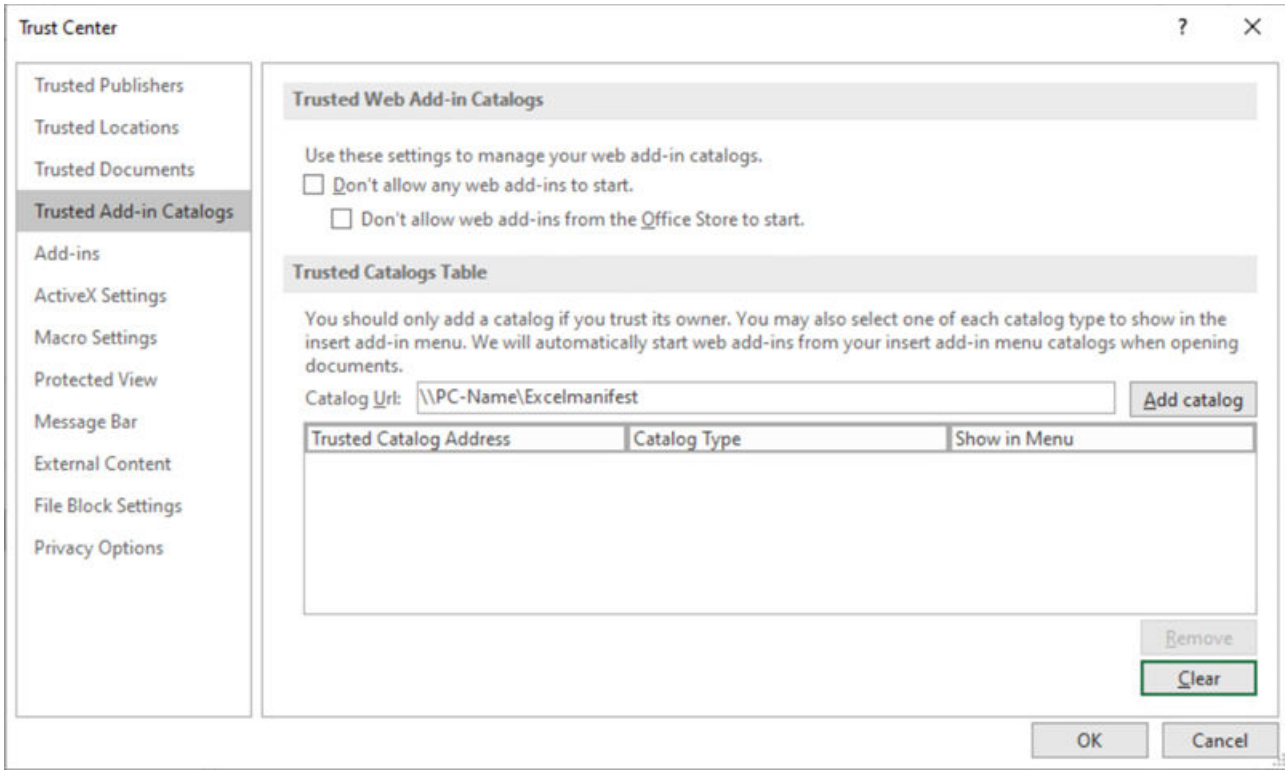
    If you have an Excel installation that cannot be upgraded to Build 16.0.6769 or higher (for example, because Excel was installed using a single Office license), purchase a current Office version or use Online Office.

  - Or Office online

Procedure

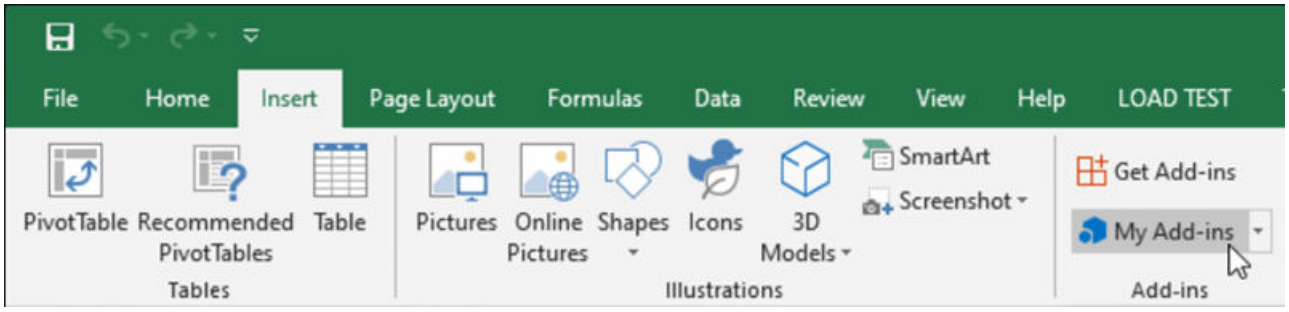
1. Open Microsoft Excel.
2. Open the "Trust Center" under "File" > "Options".
3. Click "Trust Center Settings".
4. Click "Catalogs of trusted add-ins".

5. Add the catalog using the URL "\\<Computer name>\Excelmanifest".



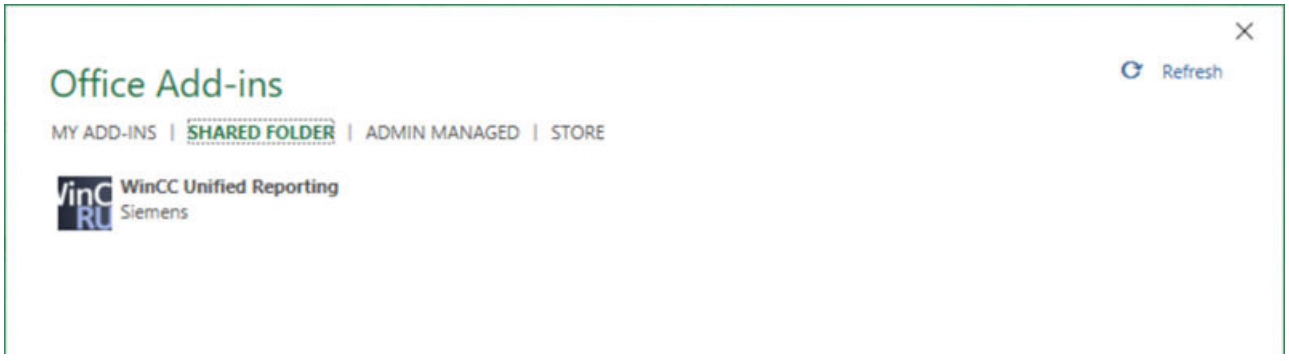
6. Make sure that the check mark in the "Show in Menu" column is set.
7. End and restart Excel.

8. In the "Insert" menu, click "My Add-ins".



In the "Office Add-ins" dialog box, the Siemens add-in is displayed under "Shared folders".

9. Select the add-in and click "Add".



See also

Installing the Excel manifest (Page 7392)

Setting up read access to the Excel manifest (Page 7392)

Installation of the Reporting add-in (Page 7391)

Configuring Internet Explorer and Edge

The Reporting Excel add-in uses the certificate that was selected during installation of WinCC Unified Runtime or later in "WinCC Unified Configuration".

Some browsers do not recognize self-signed certificates as trusted. If you use a self-signed certificate for WinCC Unified Runtime, you must add the certificate to the list of trusted certificates in Internet Explorer or Edge on the device on which the Excel add-in is installed.

You can find detailed information on handling certificates here.

Trusting self-signed certificates

The following section describes the procedure for adding a self-signed certificate to the list of trusted certificates, using Internet Explorer as an example:

1. Start Internet Explorer.
2. In the address line, enter the host name entered when creating the certificate.
   You will receive a security warning.
3. Click "Continue to this website (not recommended)".
4. Click "View Certificates".
5. Click "Install Certificate".
6. Click "Place all certificates in the following store" and "Browse".
7. Click "Trusted Root Certification Authorities" followed by "OK".

   Note

   Do not use the preset options for automatic selection of the certificate store.

8. Exit the dialog.
9. If you receive a security warning as to whether you want to trust the certificate, confirm it with "Yes".
10. Load the page again.

Login

A login dialog opens in the Excel add-in in the following cases:

- After start of Excel and the add-in
- When using an online connection: When the connection to the Runtime server must be re-established.
  Examples:
  - Runtime has been reloaded.
  - The security token has expired due to a timeout.

Requirement

- The add-in is installed.
- When using an online connection:
  - A Runtime server is accessible.
  - A Runtime project is running on the server.

Procedure

In order to use an online connection, log onto a Runtime server:

1. Under "Server", enter the name of the server on which the project that is to serve as data source for the report template is running.
   Use the same spelling as when the Runtime server certificate was created.

   Note

   If Runtime is installed on the same computer as the add-in, use of the name "localhost" is not permitted.

2. Enter the user name and password of a user that is registered on the server in the Runtime user management.
3. Click "Login".

In order to use an offline connection, click "Go offline".

Result

Online connection

The add-in is connected to the Runtime server and the options available there are loaded.

You can now create report templates.

Offline connection

Before you create report templates, set up the offline connection.

See also

Installation of the Reporting add-in (Page 7391)

Setting up an offline connection (Page 7400)

Setting up a data source

Using an online connection

When an online connection is present, the add-in establishes a connection to a Runtime server. The project running on the server serves as data source for the add-in.

The connection settings allow you to:

- Change the connected Runtime server to another Runtime server
- When a report template that was created with a different Runtime server than the currently connected server is reused: check the options available on the server and delete the options that were not loaded

Setting up an online connection

Requirements

- A Runtime server is accessible.
- A Runtime project is running on the server.

Procedure

1. In the "Data sources" group on the "WinCC Unified" tab, click on "Connections".
2. Click "Online" under "Connections" in the add-in.
3. Under "Server", enter the server name.
   Use the same spelling as when the Runtime server certificate was created.

   Note

   If Runtime is installed on the same computer as the add-in, use of the name "localhost" is not permitted.

4. Click "Load".

Result

- A server node is created.
- The add-in is connected to the Runtime server and its options are loaded.
  Data source items of these options can be added to report templates. Their data can be read in from Runtime to Excel.

  Note

  To check which options were loaded, click on the server node.

  Options that are being used in the currently open report template but are not available on the connected server have a red icon. You can remove the option:

- If no connection can be established or an incorrect server name has been entered, the add-in will display a corresponding error message.

See also

Removing options (Page 7398)

Removing options

Introduction

If you reuse report templates across servers, e.g. in order to adapt an existing template for another project, it may be necessary to remove unavailable options from the connection settings.

The procedure for this is presented using the Performance Insight option as an example.

Requirement

- The add-in was connected to a server on which the Performance Insight (PI) option is installed.
- A report template that uses KPIs was created with the add-in.
- The add-in was then connected to a server without the Performance Insight option installed for the purpose of adapting the template to the project running there.

Removing an option

1. In the "Data sources" group on the "WinCC Unified" tab, click on "Connections".
2. Under "Connections", click on "Online".
3. Select the server node.
   You see the loaded options under the server node:

	Available options The following applies to data source items of these options: • They can be added to the report template. • Their data can be read in from Runtime to Excel in the add-in.
	Unavailable options In the example: Performance Insight The following applies to data source items of these options: • They cannot be added to the report template. • If the report template already has a data source element of this option, its data cannot be read in from Runtime to Excel.

4. Select the "Performance Insight" option under the server node.
5. Click the "Delete" button next to the option.
6. Confirm your input.

Result

The option is removed from the connection settings.

Next, remove all data source items of this option from the report template.

Reloading an option

When the add-in is connected to a Runtime server, all options available on the server are loaded.

To reload an option that was deleted in the connection settings but is available on the server, select the server node and click "Load".

Using an offline connection

With the offline connection, the add-in uses a configuration file as data source.

The connection settings allow you to:

- Change the configuration file used
- When reusing a report template with a configuration based on a Runtime server different to that of the currently selected configuration file: Check the available options and delete the options that were not loaded.

Setting up an offline connection

Requirement

An offline configuration file was created in the "Reports" control in Runtime. The configuration file is available on the device.

Procedure

1. In the "Data sources" group on the "WinCC Unified" tab, click on "Connections".
2. Under "Connections", click on "Offline".
3. Click "Open offline configuration".
4. Select the desired file in the window that opens and confirm your entries.
5. Click "Load".
6. Select the desired options.
7. Confirm your entries.

Result

- A server node is created. The node bears the name of the server on which the configuration file is based.
- The configuration file, together with its options, is loaded into the add-in. The data of the configuration file is available for configuring the report template.

Note

To check which options were loaded, click on the server node.

Options that are being used in the currently open report template but are not available in the configuration file have a red icon. You can remove the option:

See also

Removing options (Page 7401)

Exporting an offline configuration file (Page 7383)

Removing options

Introduction

If you reuse report templates across servers, e.g. in order to adapt an existing template for another project, it may be necessary to remove unavailable options from the connection settings.

The procedure for this is presented using the Performance Insight option as an example.

Requirement

- The add-in was changed over to an offline connection whose configuration file does not include Performance Insight.
- A report template was opened in the add-in whose configuration is based on a connection to a Runtime server on which Performance Insight is installed.

Removing an option

1. In the "Data sources" group on the "WinCC Unified" tab, click on "Connections".
2. Under "Connections", click on "Offline".
3. Select the server node.
   You see the loaded options under the server node:

	Available options The following applies to data source items of these options: • They can be added to report templates. • Their data can be read in from the configuration file to Excel.
	Unavailable options In the example: Performance Insight The following applies to data source items of these options: • They cannot be added to the report template. • If the report template already has a data source element of this option, its data cannot be read in from the configuration file to Excel.

4. Select the "Performance Insight" option under the server node.
5. Click the "Delete" button next to the option.
6. Confirm your input.

Result

The option is removed from the connection settings.

Next, remove all data source items of this option from the report template.

Reloading an option

When a configuration file is loaded, all options available in the file are loaded.

To reload an option that was deleted in the connection settings but is available in the configuration file, select the server node and click "Load".

Configuring report templates

Requirement

An online connection or offline connection has been established.

Procedure

To create a new report template, proceed as follows:

1. Open a new Excel file.
2. Add a segment.
   You can choose between time series segments and single value segments.
3. Add data source items to the segment.
   The exact procedure depends on the type of the data source item.
4. Optional: If you do not want a data source item to use the default configuration, determine its configuration.
   You have the following options:
   - Select an existing configuration.
   - Create a new configuration and select it.
   - Define a local configuration.
5. Optional: To define additional segments, repeat steps 2 to 4.
6. Optional: When using an online connection, test the template by reading the runtime data of selected segments or all segments.

See also

Setting up a data source (Page 7397)

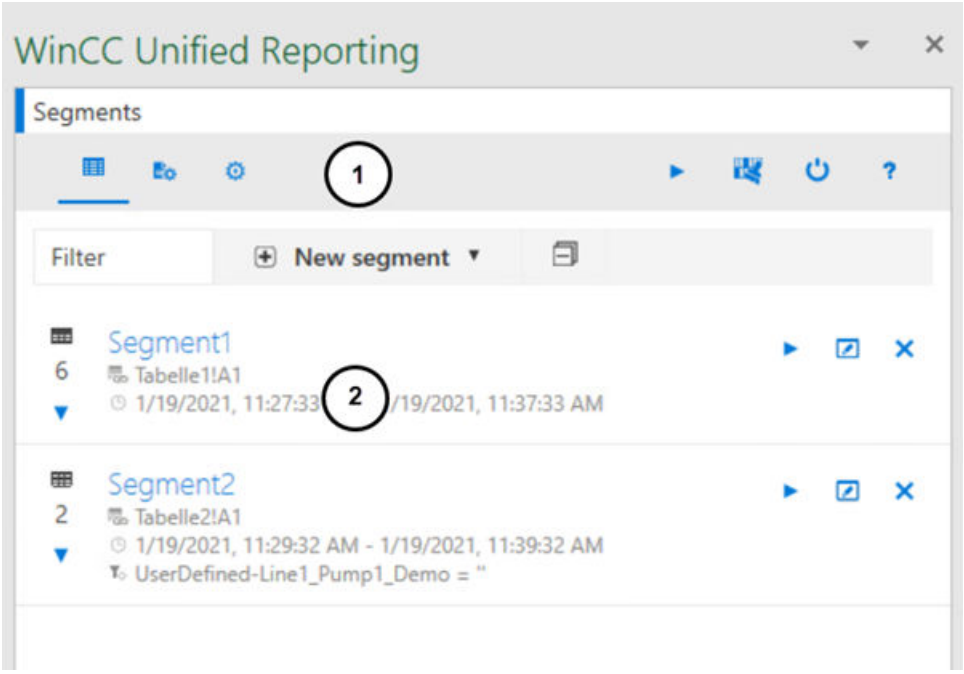
User interface of the add-in

Requirement

- The "WinCC Unified" tab is visible in Excel.

Structure

If you click on "Segments" in the "Configuration" group, you see the following interface:



① Toolbar
② Work area

Toolbar buttons:

Button	Tooltip	Description
	"Segment configuration"	Loads the interface to add and edit segments in the work area.
	"Data source item configuration"	Loads the interface for adding and editing the configuration of a data source item in the work area.
	"Basic settings"	Loads the interface for setting the language settings in the work area.
	"Update all"	Reads the Runtime data of the connected data source into the data tables of the segments.
	"Delete Runtime data"	Removes all Runtime data from the report template.
	Logoff	Logs out the user currently logged in to the add-in.
	Help	Opens the user help for the add-in.

See also

The segment user interface (Page 7408)

Working with segments

Basic information on segments

Definition

A report template consists of any number of segments. Each *segment* is a container to which you can add any number of data source items. The segment reads the data from its data source items.

There are time series segments and single value segments.

Note

Hierarchical segments of PI options

Hierarchical segments are also available with PI Options installed. For more information on this, refer to the PI Options help.

Time series segments

A *time series segment* documents the data of its data source items in a defined time period.

It has a legend table and a data table.

Data source items

Time series segments can have the following data source items:

- Logging alarms
- Alarm statistics
- Logging tags
- User-defined columns
- Contexts
- Audit

Note

Data source items of the PI options

If PI options are installed, additional data source items can be added. For more information on this, refer to the PI Options help.

Legend table

The table header row provides general information about the segment and its data source items.

You decide which type of information is provided when you create or edit the segment.

Data table

The data table outputs the data of the data source items. It documents how the data source items have changed in the defined time period.

The data table of a time series segment has the following columns:

Columns		Description
Time stamp column		Always output Always output as the first column
Per data source item	Standard column	The standard column provides the standard property of the data source item. This property depends on the type of data source item. For a data source item of the Tag type, e.g. the tag value
	Optional columns	Provide more information about the data source item. What information this is depends on the type of the data source item. For a data source item of the Tag type, e.g. the quality code of the tag value You change the default settings for visibility, column title and order of these columns in the configuration of the data source item.

In the default setting, the data source items in the data table have the order in which they were added to the segment.

Note

When the standard columns and optional columns provide numerical values, you can have the actual values replaced with texts or graphics from a text list or graphic list when importing the Runtime data.

Single value segments

A *single value segment* documents exactly one value for its data source items.

Data source items

Single value segments can have the following data source items:

- Logging tags
- Tags

Note

Data source items of the PI options

If PI options are installed, additional data source items can be added. For more information on this, refer to the PI Options help.

Data table

The data table of a single value segment has the following columns per data source item:

Columns	Description
Standard column	The standard column provides the standard property of the data source item. For tags and logging tags: the tag value
Optional columns	Provide more information about the data source item. For tags and logging tags: • Time stamp • Data source item • Quality code of the tag value You change the default settings for the visibility of these columns in the configuration of the data source item.

The data table of a single value segment shows the data source items in the order in which they were added to the segment.

Note

When the standard columns and optional columns provide numerical values, you can have the actual values replaced with texts or graphics from a text list or graphic list when importing the Runtime data.

Single row segments do not have a table header row. However, in the configurations of their data source items, you can determine whether a caption is inserted for the displayed columns and the position at which this occurs.

See also

Standard column (Page 7406)

Standard column

Introduction

For each data source item of a segment, a standard column is added in the data table of the segment.

Content of the standard column

The standard column provides the standard property of the data source item and depends on the type of the data source item:

Data source item type	Default column title	Value
Logging alarm	"Alarm ID"	Alarm IDs of the displayed alarms
Alarm statistics	"Alarm statistics [ID]"	Alarm IDs of the alarms displayed in the alarm statistics

Data source item type	Default column title	Value
Tag or logging tag	"<Name of the tags or logging tags>"	Value of the tag or logging tag
Context	"<Name of the context object>"	Context name
Audit	"Audit [<object name>]"	The name of the object monitored by the Audit Trail
User-defined column	Name entered when creating the data source item	As set in the configuration of the data source item: • A fixed string. Or • A dynamically calculated string

Changing the column title

You can replace the default column title with a localizable display name. See Setting a display name for standard column (Page 7443).

Replacing numerical values

If the standard column provides numeric values, you have the option to have the actual values replaced with texts or graphics from a text list or graphic list when the Runtime data is read in. See Assigning text lists and graphic lists (Page 7440).

User-defined columns are excluded from this.

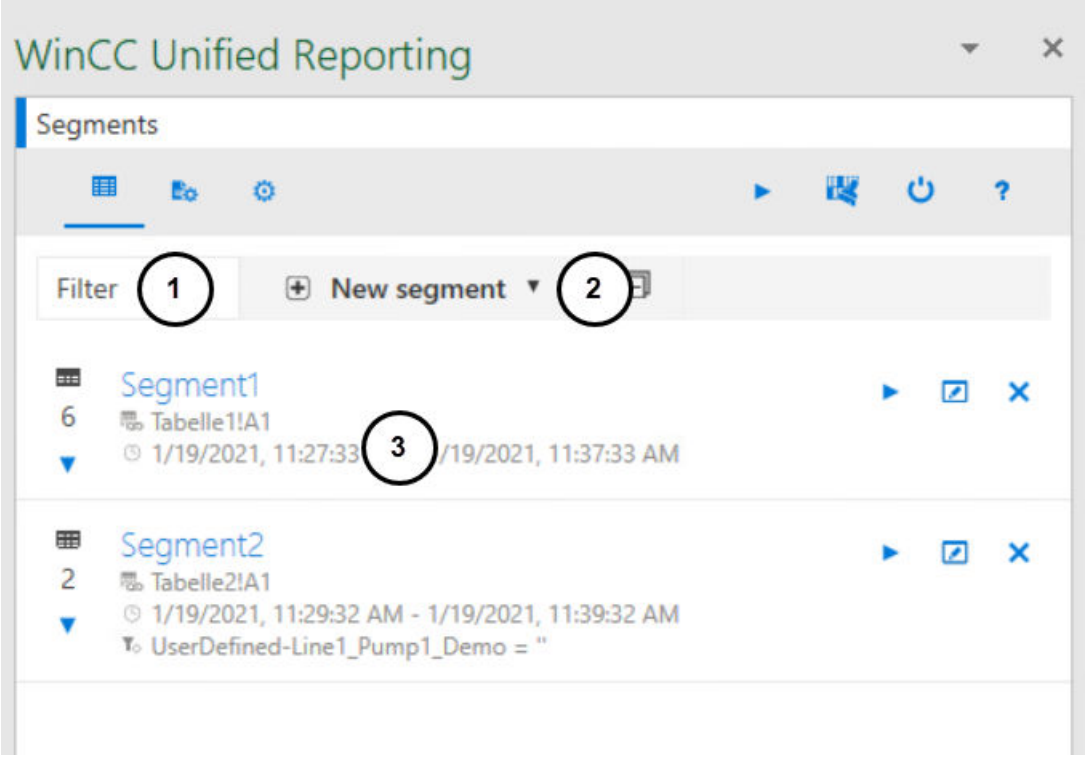
Basic information on segments (Page 7404)

The segment user interface

Structure

The interface for creating and editing segments has the following structure:



① Filter
Filters the list of segments by name.

② Button for creating a segment

③ List of segments
Each segment has buttons for reading in, editing and deleting the segment.
The following configuration is displayed for each segment:

- Segment name
- Number of data source items
- Insertion location of the segment in the Excel file
- Time span
- If context filters have been configured: The filter string

A click on the segment opens the area with the data source items.

Create segments

Requirement

- The "WinCC Unified" tab is visible in Excel.
- The data source is set up.
- To filter the time interval of the time series segment depending on the context: There are contexts in the project that run on the connected Runtime server or are the basis of the configuration file.

Procedure

1. Click on "Segments" in the "Configuration" group.
2. Click "New segment".
3. Select "New time series segment" or "New single value segment".
4. Enter a segment name.

Note

Note the Excel restrictions for naming tables (for example, do not use blanks).

Change the segment name only via the add-in, not via the Excel property "Table name".

Do not change the name of the worksheet after creating the segment. The add-in addresses the segment by the segment name and the worksheet name.

5. For a time series segment, make the following settings in addition:
   - Under "File location" you determine where the segment will be inserted in the file. Enter the name of the worksheet and the cell.
     Alternatively, click "Select a cell" and use the cell currently selected in the Excel file:

     
   - Under "Start" and "End", you determine the time period for which values are read into the segment.

	"Absolute date/ time"	Select a date and a time. The information is absolute to the current date.
	"Relative date/ time"	Select a reference time and a time interval. The information is relative to the current date. See also Formats for relative time information (Page 7413).
	"Date/Time of the cell"	Applies the value of the cell currently highlighted in the Excel file. Make sure that the cell supplies a valid time.
	"Date/Time of the tag"	Applies the value of the set tag. Make sure that the tag supplies a valid time. Possible data types: • DateTime • String • Integer

– (Optional) Under "Properties of the legend table", you configure the contents to be displayed in the table header row of the segment:

"Name" "Start" "End" "State"	General information on the segment
"Context filter"	If the segment time was limited by a context filter: The filter string is output. See step 6.
"Audit status"	If the segment has an audit data source item, the field shows the overall status of the audit data: • Green field: No manipulations of the Audit Trail were found in the queried time range. • Red field: Manipulations of the Audit Trail were found in the queried time range. Single or multiple entries have been deleted, added or changed.
"Header"	The table header row includes a list of the segment's data source items showing general information about these data source items. The information displayed for the data source items depends on their type. Example of contexts: Display name of the context, context provider, hierarchy path, short name of the context, full name of the context, option

Use the check boxes to remove information from or add information to the legend table. To change the sorting in the table header row, move the mouse pointer to a row and shift it using the arrow buttons or drag-and-drop.

6. (Optional) You can filter the time interval of the time series segment depending on the context. You can define up to two filter conditions.
   Proceed as follows:
   - Under "Context filter", click "+" or "Add new condition row".
     The condition line is added.
   - Click on "+" in the condition line.
   - Under "Select context", select the root of the common plant model.
     In the next row, you see the top level of the common plant model.
   - Navigate through the common plant model to plant objects with contexts.
     Plant objects and contexts can be recognized by the following icons:

	Plant object
	Context

   - Select a context.
   - Select an operator.
   - Enter a value.
   - (Optional) Use "+" or "Add new condition row" to create a second condition and select whether the two conditions are to be linked with a logical AND or OR.
7. (Optional) Under "Autofit", configure whether the column width and row height of the data table is automatically adapted to the text read from Runtime.
8. Confirm your entries with "OK".

Result

The segment is created and added to the list of segments:

Next, add data source items to the segment. Your procedure depends on the type of the new data source item.

See also

Tips on design and layout (Page 7449)

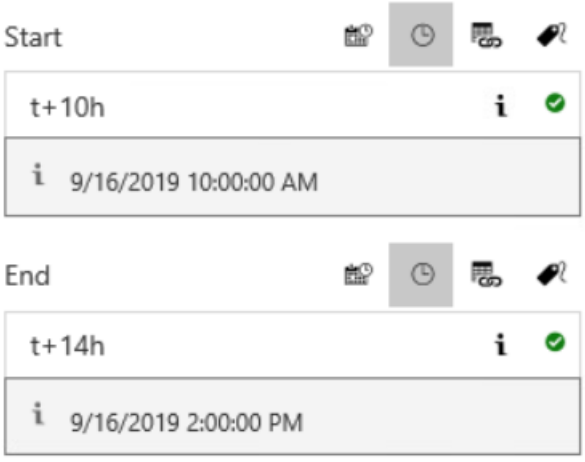
Adding data source items (Page 7415)

Working with configurations (Page 7427)

Formats for relative time information

Definition of a relative time information

The relative times are entered using a reference time and a time interval.



Reference time

Use one of the following characters for the reference time:

- "*" - Now
- "t" (today) - Today at midnight
- "y" (yesterday) - Yesterday at midnight
- "1-31" - Specific day of the current month

Time interval

- "y" (year): +1y = plus 1 year
- "mo" (month): +1mo = plus 1 month
- "w" (week): +1w = plus 1 week
- "d" (day): +1d = plus 1 day
- "h" (hour): +1h = plus 1 hour
- "m" (minute): +1m = plus 1 minute
- "s" (second): +1s = plus 1 second
- "ms" (milliseconds): +250ms = plus 250 milliseconds

Examples

- *-1y: One year ago today
- t+8h: Today at 8:00 am
- y+8h: Yesterday at 8:00 am
- 1+8h: The first day of the current month at 8:00 am
- *-1d: One day ago
- *-2h-30m-30s: 2 hours, 30 minutes and 30 seconds ago

See also

Create segments (Page 7409)

Edit segments

Requirement

- The "WinCC Unified" tab is visible in Excel.
- A segment is available.

Procedure

1. Click on "Segments" in the "Configuration" group.
2. Click "Edit" next to a segment in the list of segments.
3. Edit the segment.
   You can make the same settings as when creating the segment.

Delete segments

Requirement

- The "WinCC Unified" tab is visible in Excel.
- A segment is available.

Procedure

1. Click on "Segments" in the "Configuration" group.
2. Click "Delete" next to a segment in the list of segments.
3. Confirm your entries with "OK".

Adding data source items

Adding log alarms

Requirement

- There are logging alarms in the project that runs on the connected Runtime server or is the basis of the configuration file.
- The "Alarm" option is enabled in the connection settings.
- The "WinCC Unified" tab is visible in Excel.
- A time series segment is available.

Adding logging alarms

1. Click on "Segments" in the "Configuration" group.
   The list with the segments already created is loaded into the add-in.
2. Select a segment.
   The segment is extended by the area for the data source items.
3. Click "+".
4. Select the "Alarms" option.
5. Select the "Alarm" entry under "Select alarms".
6. Under "Select alarms", select the entry "Alarm [ID]".

   Note

   Change selection criteria

   After you have added alarms, you can change the selection criteria and add more data source items to the segment.

   For example: Output tags and alarms in the same segment.

7. To cancel your selection, select the entry "Alarm [ID]" under "Selected data source items" and click "Delete".
8. Confirm with "OK".

Result

- The data source item for logging alarms is added to the add-in below the segment.
- The configuration of the data source item controls which data is added when importing the runtime data into the data table.

  Note

  With the default setting, the data source item uses the default configuration. It shows all logging alarms of the project.

To display data that deviates from the default configuration, select one of the following options:

- Select a different matching configuration.
- Create your own configuration.
- Edit a configuration.
- Overwrite a configuration locally.

See also

Creating or editing configurations for log alarms (Page 7427)

Select configuration (Page 7438)

Working with configurations (Page 7427)

Adding alarm statistics

Introduction

To output statistical calculations for logging alarms in a report, add alarm statistics to a report template. The following calculations are available:

- Frequency of an alarm
- Average display time per state machine
- Total display time per state machine
- Maximum display time per state machine
- Minimum display time per state machine

The alarm statistics add columns with statistical calculations and columns with general alarm properties of the recorded alarms to the reports.

You can find more information about calculations in alarm statistics in the help for the alarm control.

Requirement

- The "Alarm" option is enabled in the connection settings.
- The "WinCC Unified" tab is visible in Excel.
- A time series segment is available.

Procedure

1. Click on "Segments" in the "Configuration" group.
   The list with the segments already created is loaded.
2. Select a time series segment.
   The segment is extended by the area for the data source items.

3. Click "+".
4. Select the "Alarm" option.
5. Under "Select alarms", select the entry "Alarm statistic [ID]".
6. Under "Select alarm statistic" select the entry "Alarm statistic [ID]".

   Note

   Change selection criteria

   After adding the alarm statistics, you can change the selection criteria and add more data source items.

7. (Optional) To cancel your selection, select the entry "Alarm statistic [ID]" under "Selected data source items" and click "Delete".
8. Confirm with "OK".

Result

The added data source item for alarm statistics is displayed below the segment and inserted into the data table.

First, the data table shows the contents configured in the default configuration for alarm statistics. To output other contents, select or create a configuration.

Add logging tags

Requirement

- The project on which the connected Runtime server runs or the basis of the configuration file has logging tags.
- The "Logging tag" option was selected while setting up of the connection.
- The "WinCC Unified" tab is visible in Excel.
- A single value segment or time series segment is available.

Procedure

1. Click on "Segments" in the "Configuration" group.
   The list of segments is loaded.
2. Select a segment.
   The segment is extended by the area for the data source items.
3. Click "+".
4. Select the "Logging tag" option.

5. Optional: To reduce the load time, filter which tags are loaded to the selection under "Add filter".
   The preset filters "*" return all logging tags of the project.
   - "Tag name": Enter the name of the tag whose logging tags you want to add.
   - "Logging tag name": Enter the name of the logging tags you want to add.

   Note that the entry is case-sensitive.

   Note

   Filter by partial string

   You use the wildcard "*" to filter by partial strings.

   For example:
   - *T* returns all tags with a "T" in their name.
   - *T returns all tags that end in "T".
   - T* returns all tags that start with "T".

   When filtering for structures, the separators must be part of the filter string.

   For example: The following filters return the logging tags for all tags of the device "HMI_RT_1":
   - Filter for tag: "HMI_RT_1::*"
   - Filter for logging tag: "*"

6. Click "Load".
   The logging tags of the project are filtered and provided under "Select tags".
7. Optional: Further reduce the number of tags that are offered for selection by clicking next to "Select logging tags" and entering another filter string.
   The list of tags you are being offered is filtered while you type.
8. Select one or more tags under "Select logging tags".
   The tags are added to the "Selected data source items" list.

   Note

   Change selection criteria

   After you have added a tag, you can select a different option or a different filter and add additional data source items.

   For example: Output KPIs and logging tags in the same segment.

9. To remove one or more data source items from "Selected data source items", select them and click "Delete".
10. Confirm with "OK".
    The added logging tags are shown below the segment and added to the Excel table.
11. If you have added the logging tag to a single value segment:
    - In the Excel worksheet, select the cell in which the logging tag is to be inserted.
    - Click the "Select a cell" button on the data source item of the logging tag.
      Alternatively, enter the name of the worksheet and the cell.

See also

Create or edit configurations for logging tags (Page 7429)

Working with configurations (Page 7427)

Adding tags

Requirement

- The project on which the connected Runtime server runs or the basis of the configuration file has tags.
- The "Tag" option was enabled when the connection was set up.
- The "WinCC Unified" tab is visible in Excel.
- A single value segment is available.

Procedure

1. Click on "Segments" in the "Configuration" group.
   The list of segments is loaded.
2. Select the single value segment.
   The segment is extended by the area for the data source items.
3. Click "+".
4. Select the "Tag" option.
5. Optional: To reduce the load time, filter which tags are loaded to the selection under "Add filter".
   Under "Tag name", enter a filter, e.g. the name of the tag. Note that the entry is case-sensitive. The default filter "*" returns all tags of the project.

   Note

   Filter by partial string

   You use the wildcard "*" to filter by partial strings.

   For example:
   - *T* returns all tags with a "T" in their name.
   - *T returns all tags that end in "T".
   - T* returns all tags that start with "T".

   When filtering for structures, the separators must be part of the filter string.

   For example: The filter "HMI_RT_1::*" returns all tags of the device "HMI_RT_1".

6. Click "Load".
   The tags of the project are filtered and provided under "Select tags".
   You can recognize structs and arrays in the list by the following items:

① Button to display the members of the struct or array
② "Select all included data source items"
Button that adds all members with a simple data type to the list of selected data source items

7. Optional: Further reduce the number of tags that are offered for selection by clicking next to "Select tags" and entering another filter string.

   The list of tags you are being offered is filtered while you type.

8. Select which tags will be added to the segment. You have the following options:

Target	Procedure	Result
Show the members of a struct or array.	Click the button with the arrow next to the struct or array.	A second "Select tags" list is added, in which you can see all the members of the struct or array. You can add to the segment any members that have a simple data type, e.g. bool, float or string.
Add all members of a struct or array.	Next to the struct or array, click "Select all included data source items".	All members with a simple data type are added to the "Selected data source items" list and marked as selected under "Select tags":
Select tags with simple data type.	Under "Select tag", click the required tags.	The tags are added to the "Selected data source items" list and marked as selected under "Select tags": 

Note

Automatic filtering when displaying the members or selection of all members

If you click the button to display the members of a struct or array or activate the option to select their members, the struct or array is set as a filter:

- The list under "Select tags" only shows the struct or array.
- A second "Select tags" list is added below this, in which you can see all members of the struct or array.

To see all available tags again, delete the filters.

Note

Change selection criteria

After you have added a tag, you can select a different option or a different filter and add additional data source items.

9. To remove tags from the segment, click on the tags in "Selected data source items" and click "Delete".
10. Confirm with "OK".

The added tags are added to the segment.

When the report template is updated in the add-in and when the report is generated in runtime, the tag values are inserted into the data table.

See also

Creating or editing configurations for tags: (Page 7432)

Working with configurations (Page 7427)

Adding contexts

Introduction

To display in a report which contexts are to run during a certain time period, add only contexts to a segment in the report template.

To display which process data has been accumulated during the runtimes of a context, add the context and other data source items, such as logging tags or logging alarms, to the segment.

Requirement

- There are contexts in the project that run on the connected Runtime server or are the basis of the configuration file.
- The "Context" option is enabled in the connection settings.
- The "WinCC Unified" tab is visible in Excel.
- A time series segment is available.

Adding a context to a segment

1. Click on "Segments" in the "Configuration" group.
   The list with the segments already created is loaded.
2. Select a segment.
   The segment is extended by the area for the data source items.
3. Click "+".
4. Select the "Context" option.

5. Select a context:
   - Under "Select a context definition", select the root of the plant model.
     In the next row, you see the top level of the common plant model.
   - Navigate through the common plant model to plant objects with contexts.
     Plant objects and contexts can be recognized by the following icons:

	Plant object
	Context

   - Select the desired contexts.
     All selected contexts are included in the "Selected data source items" list

Note

Change selection criteria

After you have added a context, you can select a different option and add additional data source items.

For example: Context and logging tags in the same segment.

6. To remove one or more data source items from "Selected data source items", select them and click "Delete".
7. Confirm with "OK".

Result

The selected contexts are displayed below the segment and inserted into the data table.

If you do not want a context to use the default configuration, select its configuration next.

Content of the data table after executing the segment

In segments to which only contexts or contexts and user-defined columns have been added:

- A line is inserted for each context whose runtime falls within the time period of the segment.
- "Time stamp" column: The time at which the context was started

In segments that combine contexts with logging tags or logging alarms:

- All logged values with the same time stamp are displayed per row.
- "Time stamp" column: The logging event
- "Start time" column: The time at which the context was started
- "Context " <Context name>"" column: The value passed to the context at start
- If no context was started at the time of logging, the context cells remain empty.

Example

The following data source items were added to a segment:

- The "Product" context
  Runtime of the context: 15:00:00 to 19:59:59 hours
  The context was started with the "Orange lemonade" value.
- The "Logged_Rotation" logging tag
  Logging cycle: 2s
- The "Logged_Temperature" logging tag
  Logging cycle: 5s
- The user-defined "Unit" column
  It contains the unit for "Logged temperatures".

Content of the data table after execution of the segment:

	A	B	C	D	E	F	G
1	Time stamp	Context "Product"	.../Line1-Product:StartTime	.../Line1-Product:EndTime	Logged_Rotation	Logged_Temperature	Unit
2	Mo, 24 Feb 2020 15:00:00,100	Orange lemonade	Mo, 24 Feb 2020 15:00:00,00	Mo, 24.02.2020 19:59:59,99	10	20	°C
3	Mo, 24 Feb 2020 15:00:02,100	Orange lemonade	Mo, 24 Feb 2020 15:00:00,00	Mo, 24.02.2020 19:59:59,99	100		°C
4	Mo, 24 Feb 2020 15:00:04,100	Orange lemonade	Mo, 24 Feb 2020 15:00:00,00	Mo, 24.02.2020 19:59:59,99	500		
5	Mo, 24 Feb 2020 15:00:05,100	Orange lemonade	Mo, 24 Feb 2020 15:00:00,00	Mo, 24.02.2020 19:59:59,99		40	°C
6	Mo, 24 Feb 2020 15:00:06,100	Orange lemonade	Mo, 24 Feb 2020 15:00:00,00	Mo, 24.02.2020 19:59:59,99	750		°C
7	...	...	...	...	...	...	...
8	Mo, 24 Feb 2020 20:00:00,100				650		°C

Lines 2 to 6	Values were logged for "Logged_Rotation" and "Logged_Temperature", while the "Product" context ran with the "Orange lemonade" value.
Line 8	A value was logged for "Logged_Rotation" while no context was running.

Contexts (Page 7240)

Adding user-defined columns

Introduction

User-defined columns supplement the data of the other data source items of a time series segment with additional information:

- With a fixed string
  The string appears in each cell of the column.
  Example: Display measurement unit of the tag values in report
- With a formula
  The formula is calculated during generation for each cell in the dynamic column.
  Example: The sum of the tag values output in the report.

The configuration of the user-defined column controls which string or formula it uses.

Requirement

- The "User-defined column" option was enabled when the connection was set up.
- The "WinCC Unified" tab is visible in Excel.
- A time series segment is available.

Procedure

1. Click on "Segments" in the "Configuration" group.
   The list of segments is loaded.
2. Select a segment.
   The segment is extended by the area for the data source items.
3. Click "+".
4. Select the option "User-defined column".
5. Enter the name of the column under "name".
6. Click "Select" or press <ENTER>.
   The column is included in the list "Selected data source items".

   Note

   Change selection criteria

   After you have added a column, you can select a different option or a different filter and add additional data source items.

7. Select a configuration for the user-defined column.
8. To remove one or more data source items from "Selected data source items", select them and click "Delete".
9. Confirm with "OK".

The added columns are displayed below the segment and inserted into the data table.

Select configuration (Page 7438)

Working with configurations (Page 7427)

Add Audit

Introduction

To output the Runtime device Audit Trail in a report, add an Audit data source item to a report template.

You can find more information about the Audit option in WinCC Unified in the TIA Portal help.

Requirement

- The Audit option was activated in the engineering for the Runtime device.
- The "Audit" option is activated in the connection settings of the Excel add-in.
- The "WinCC Unified" tab is visible in Excel.
- A time series segment is available.

Procedure

1. Click on "Segments" in the "Configuration" group.
   The list with the segments already created is loaded.
2. Select a time series segment.
   The segment is extended by the area for the data source items.
3. Click "+".
4. Select the "Audit" option.
5. Select the Audit Trail.
6. (Optional) To undo your selection, select the Audit Trail under "Selected data source items" and click "Delete".
7. Confirm with "OK".

Result

The Audit data source item is displayed below the segment.

If an Audit Trail is configured for the data source, the Audit data is inserted into the report when the Runtime data is read into Excel and when it is generated in Runtime:

- In the legend table: Identifier of the overall status of the Audit Trail for the queried time range in the "Audit Status" field

Value	Description
Green	No manipulations of the Audit Trail were found in the queried time range.
Red	Manipulations of the Audit Trail were found in the queried time range. Single or multiple entries have been deleted, added or changed.

Requirement: The "Audit status" option is activated on the segment under "Header properties".

Note

Overall status for check mode "None"

If the check mode "None" is set in the configuration of the audit data sources item, the "Audit status" field is always green.

- In the data table of the segment: Identifier of manipulations

Type of manipulation	Identifier in the data table
Value of entries changed	Directly at the entries
Entries added	
Entries deleted	The manipulated time range receives a start and end entry.

First, the data table shows the contents configured in the standard configuration for Audit. To output other contents, select or create a configuration.

Delete data source elements

Requirement

- The "WinCC Unified" tab is visible in Excel.
- A segment with a data source element is available.

Procedure

1. Click on "Segments" in the "Configuration" group.
2. Expand a segment by clicking on it.
   The area for adding and editing data source elements appears.
3. Move the mouse pointer over a data source element and click "Delete".

Working with configurations

Basics of configuration

The *configuration* of a data source item defines the values of a data source element that are displayed in a segment or how they are calculated and displayed.

There are specific configuration settings for each data-source-item type.

Data source items used in time series segments use a different configuration than data source items used in single-value segments.

You have the following options:

- Use standard configuration.
  There is a standard configuration for all types of data source items. Once added, data source items use the default configuration of their type.
  You can edit the standard configurations.
- Use user-defined configuration.
  You can create any number of user-defined configurations for all types of data source items.
  You can select one of the user-defined configurations on the data source item.
- Overwrite a configuration locally.
  You can overwrite the configuration selected at the data source item locally.

Creating or editing configurations for log alarms

Requirement

- The "WinCC Unified" tab is visible in Excel.

Creating a configuration

1. Click on "Segments" in the "Configuration" group.
2. Click "Data source item configuration":

   

3. Click "New Configuration > Logging alarm configuration".
4. Enter the name of the configuration under "Configuration name".
5. (Optional) Enter texts or graphics from a text list or graphic list in the standard column instead of the alarm IDs.
   See Assigning text lists and graphic lists (Page 7440).
6. (Optional) Change the default settings of the optional columns. The optional columns are used to display the alarm properties.
   See Configuring optional columns (Page 7439).

7. (Optional) Filter the logging alarms to be displayed. You define a filter query for this purpose. The filter query can consist of up to two conditions.
   Proceed as follows:
   - Under "Filter", click "+" or "Add new condition row".
   - Select an alarm property, an operator, and enter a value.
   - Optional: Use "+" or "Add new condition row" to create additional conditions. Select whether the conditions are to be linked with a logical AND or OR.
8. Enable the option "Use system colors" so that the alarms are highlighted with the same colors as in the alarm control.
9. Confirm your entries with "OK".

Note

To not use the default column title for the standard column, set a display name in the local configuration of the data source item. See Setting a display name for standard column (Page 7443).

Editing a configuration

1. Click on "Segments" in the "Configuration" group.
2. Click "Data source item configuration":

   

3. Click a configuration for logging alarms.
4. Edit the configuration settings. You have the same options as when creating the configuration.
5. Confirm your entries with "OK".

The changes are applied the next time you read in the Runtime data.

Creating or editing configurations for an alarm statistics

Requirement

- The "WinCC Unified" tab is visible in Excel.

Procedure

1. Click on "Segments" in the "Configuration" group.
2. Click "Data source item configuration":

   

3. Click "New Configuration > Alarm statistics configuration".

4. Enter the name of the configuration under "Configuration name".
5. (Optional) Enter texts or graphics from a text list or graphic list in the standard column instead of the alarm IDs.
   See Assigning text lists and graphic lists (Page 7440).
6. (Optional) Change the default settings of the optional columns. The optional columns are used to display the statistical calculations and alarm properties.
   See Configuring optional columns (Page 7439).
7. (Optional) Filter the contents to displayed in the alarm statistics. You define a filter query for this purpose. The filter query can consist of up to two conditions.
   Proceed as follows:
   - Under "Filter", click "+" or "Add new condition row".
   - Select an alarm property, an operator, and enter a value.
   - Optional: Use "+" or "Add new condition row" to create additional conditions. Select whether the conditions are to be linked with a logical AND or OR.
8. Enable the option "Use system colors" so that the alarms are highlighted with the same colors as in the alarm control.
9. Confirm your entries with "OK".

Note

To not use the default column title for the standard column, set a display name in the local configuration of the data source item.

See Setting a display name for standard column (Page 7443).

Editing a configuration

1. Click on "Segments" in the "Configuration" group.
2. Click "Data source item configuration":

   

3. Click a configuration for alarm statistics.
4. Edit the configuration settings. You have the same options as when creating the configuration.
5. Confirm your entries with "OK".
