ControlBarButton.ForeColor
```

See also

ControlBarButton (Page 1720)

ControlBarButton.Graphic

Description

The "Graphic" property specifies the graphic of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Graphic
```

See also

ControlBarButton (Page 1720)

ControlBarButton.Height

Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Height
```

See also

ControlBarButton (Page 1720)

ControlBarButton.HotKey

Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
ControlBarButton.HotKey
```

See also

ControlBarButton (Page 1720)

ControlBarButton.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog

- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled

- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarButton.Mapping
```

See also

ControlBarButton (Page 1720)

ControlBarButton.Margin

Description

The "Margin" property specifies the surrounded outer distance of the button.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarButton.Margin
```

See also

ControlBarButton (Page 1720)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarButton.Margin (Page 1735)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarButton.Margin (Page 1735)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarButton.Margin (Page 1735)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarButton.Margin (Page 1735)

ControlBarButton.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumHeight
```

See also

ControlBarButton (Page 1720)

ControlBarButton.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumWidth
```

See also

ControlBarButton (Page 1720)

ControlBarButton.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumHeight
```

See also

ControlBarButton (Page 1720)

ControlBarButton.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumWidth
```

See also

ControlBarButton (Page 1720)

ControlBarButton.Operability

Description

The "Operability" property returns whether the button is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarButton.Operability
```

See also

ControlBarButton (Page 1720)

ControlBarButton.Padding

Description

The "Padding" property specifies the distance of the content from the border of the button.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarButton.Padding
```

See also

ControlBarButton (Page 1720)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarButton.Padding (Page 1741)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarButton.Padding (Page 1741)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarButton.Padding (Page 1741)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarButton.Padding (Page 1741)

ControlBarButton.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarButton.RequireExplicitUnlock
```

See also

ControlBarButton (Page 1720)

ControlBarButton.Text

Description

The "Text" property specifies the label of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Text
```

See also

ControlBarButton (Page 1720)

ControlBarButton.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.ToolTipText
```

See also

ControlBarButton (Page 1720)

ControlBarButton.Visible

Description

The "Visible" property specifies whether the button is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Visible
```

See also

ControlBarButton (Page 1720)

ControlBarButton.Width

Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Width
```

See also

ControlBarButton (Page 1720)

ControlBarDisplay

Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarDisplayPart

Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the display area is enabled in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the display area.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.

- **Operability**
  Returns whether the display area is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the display area is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarDisplay.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarDislay.Authorization
```

See also

ControlBarDisplay (Page 1746)

ControlBarButton.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarDislay.Content
```

See also

ControlBarDisplay (Page 1746)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarButton.Content (Page 1748)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarButton.Content (Page 1748)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarButton.Content (Page 1748)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarButton.Content (Page 1748)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarButton.Content (Page 1748)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarButton.Content (Page 1748)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarButton.Content (Page 1748)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarButton.Content (Page 1748)

ControlBarDisplay.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarDislay.CustomID
```

See also

ControlBarDisplay (Page 1746)

ControlBarDisplay.Enabled

Description

The "Enabled" property specifies whether the display is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Enabled
```

See also

ControlBarDisplay (Page 1746)

ControlBarDisplay.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.ForeColor
```

See also

ControlBarDisplay (Page 1746)

ControlBarDisplay.Graphic

Description

The "Graphic" property specifies the graphic of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Graphic
```

See also

ControlBarDisplay (Page 1746)

ControlBarDisplay.Height

Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Height
```

See also

ControlBarDisplay (Page 1746)

ControlBarDisplay.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarDislay.Mapping
```

See also

ControlBarDisplay (Page 1746)

ControlBarButton.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the display.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarDislay.Margin
```

See also

ControlBarDisplay (Page 1746)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarButton.Margin (Page 1758)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarButton.Margin (Page 1758)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarButton.Margin (Page 1758)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarButton.Margin (Page 1758)

ControlBarDisplay.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumHeight
```

See also

ControlBarDisplay (Page 1746)

ControlBarDisplay.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumWidth
```

See also

ControlBarDisplay (Page 1746)

ControlBarDisplay.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumHeight
```

See also

ControlBarDisplay (Page 1746)

ControlBarDisplay.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumWidth
```

See also

ControlBarDisplay (Page 1746)

ControlBarDisplay.Operability

Description

The "Operability" property returns whether the display is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarDislay.Operability
```

See also

ControlBarDisplay (Page 1746)

ControlBarButton.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the display.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarDislay.Padding
```

See also

ControlBarDisplay (Page 1746)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarButton.Padding (Page 1763)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarButton.Padding (Page 1763)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarButton.Padding (Page 1763)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarButton.Padding (Page 1763)

ControlBarDisplay.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarDislay.RequireExplicitUnlock
```

See also

ControlBarDisplay (Page 1746)

ControlBarDisplay.Text

Description

The "Text" property specifies the label of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Text
```

See also

ControlBarDisplay (Page 1746)

ControlBarDisplay.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.ToolTipText
```

See also

ControlBarDisplay (Page 1746)

ControlBarDisplay.Visible

Description

The "Visible" property specifies whether the display is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Visible
```

See also

ControlBarDisplay (Page 1746)

ControlBarDisplay.Width

Description

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Width
```

See also

ControlBarDisplay (Page 1746)

ControlBarLabel

Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar.

You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarLabelPart

Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the identifier can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the identifier.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.

- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the identifier is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the identifier is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarLabel.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarLabel.Authorization
```

See also

ControlBarLabel (Page 1768)

ControlBarLabel.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarLabel.CustomID
```

See also

ControlBarLabel (Page 1768)

ControlBarLabel.Enabled

Description

The "Enabled" property specifies whether the identifier is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Enabled
```

See also

ControlBarLabel (Page 1768)

ControlBarLabel.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.ForeColor
```

See also

ControlBarLabel (Page 1768)

ControlBarLabel.Height

Description

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Height
```

See also

ControlBarLabel (Page 1768)

ControlBarLabel.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

See also

ControlBarLabel (Page 1768)

ControlBarLabel.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarLabel.Mapping
```

See also

ControlBarLabel (Page 1768)

ControlBarLabel.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarLabel.Margin
```

See also

ControlBarLabel (Page 1768)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarLabel.Margin (Page 1775)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarLabel.Margin (Page 1775)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarLabel.Margin (Page 1775)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarLabel.Margin (Page 1775)

ControlBarLabel.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumHeight
```

See also

ControlBarLabel (Page 1768)

ControlBarLabel.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumWidth
```

See also

ControlBarLabel (Page 1768)

ControlBarLabel.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumHeight
```

See also

ControlBarLabel (Page 1768)

ControlBarLabel.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumWidth
```

See also

ControlBarLabel (Page 1768)

ControlBarLabel.Operability

Description

The "Operability" property returns whether the identifier is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarLabel.Operability
```

See also

ControlBarLabel (Page 1768)

ControlBarLabel.Padding

Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarLabel.Padding
```

See also

ControlBarLabel (Page 1768)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarLabel.Padding (Page 1780)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarLabel.Padding (Page 1780)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarLabel.Padding (Page 1780)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarLabel.Padding (Page 1780)

ControlBarLabel.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarLabel.RequireExplicitUnlock
```

See also

ControlBarLabel (Page 1768)

ControlBarLabel.Text

Description

The "Text" property specifies the label of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.Text
```

See also

ControlBarLabel (Page 1768)

ControlBarLabel.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.ToolTipText
```

See also

ControlBarLabel (Page 1768)

ControlBarLabel.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.VerticalTextAlignment
```

See also

ControlBarLabel (Page 1768)

ControlBarLabel.Visible

Description

The "Visible" property specifies whether the identifier is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Visible
```

See also

ControlBarLabel (Page 1768)

ControlBarLabel.Width

Description

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Width
```

See also

ControlBarLabel (Page 1768)

ControlBarSeparator

Description

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarSeparatorPart

Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the disconnector can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the separator.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the separator is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the disconnector is only operable while the associated button is being pressed.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the disconnector is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarSeparator.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarSeparator.Authorization
```

See also

ControlBarSeparator (Page 1785)

ControlBarSeparator.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarSeparator.CustomID
```

See also

ControlBarSeparator (Page 1785)

ControlBarSeparator.Enabled

Description

The "Enabled" property specifies whether the separator is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Enabled
```

See also

ControlBarSeparator (Page 1785)

ControlBarSeparator.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.ForeColor
```

See also

ControlBarSeparator (Page 1785)

ControlBarSeparator.Height

Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Height
```

See also

ControlBarSeparator (Page 1785)

ControlBarSeparator.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarSeparator.Mapping
```

See also

ControlBarSeparator (Page 1785)

ControlBarSeparator.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the separator.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarSeparator.Margin
```

See also

ControlBarSeparator (Page 1785)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarSeparator.Margin (Page 1791)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarSeparator.Margin (Page 1791)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarSeparator.Margin (Page 1791)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarSeparator.Margin (Page 1791)

ControlBarSeparator.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumHeight
```

See also

ControlBarSeparator (Page 1785)

ControlBarSeparator.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumWidth
```

See also

ControlBarSeparator (Page 1785)

ControlBarSeparator.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumHeight
```

See also

ControlBarSeparator (Page 1785)

ControlBarSeparator.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumWidth
```

See also

ControlBarSeparator (Page 1785)

ControlBarSeparator.Operability

Description

The "Operability" property returns whether the separator is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarSeparator.Operability
```

See also

ControlBarSeparator (Page 1785)

ControlBarSeparator.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the separator.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarSeparator.Padding
```

See also

ControlBarSeparator (Page 1785)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarSeparator.Padding (Page 1796)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarSeparator.Padding (Page 1796)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarSeparator.Padding (Page 1796)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarSeparator.Padding (Page 1796)

ControlBarSeparator.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the disconnector can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarSeparator.RequireExplicitUnlock
```

See also

ControlBarSeparator (Page 1785)

ControlBarSeparator.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

Type

String

Access

Read-write

Syntax

```
ControlBarSeparator.ToolTipText
```

See also

ControlBarSeparator (Page 1785)

ControlBarSeparator.Visible

Description

The "Visible" property specifies whether the separator is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Visible
```

See also

ControlBarSeparator (Page 1785)

ControlBarSeparator.Width

Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Width
```

See also

ControlBarSeparator (Page 1785)

ControlBarTextBox

Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarTextBoxPart

Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the text box can be operated in runtime.
- **ForeColor**
  Specifies the font color.

- **Height**
  Specifies the height.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Mapping**
  Returns the function of the text box.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the text box is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **Readonly**
  Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**
  Returns whether the text box is only operable while the associated button is being pressed.
- **Text**
  Specifies the labeling.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the text box is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarTextBox.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.AlternateBorderColor
```

See also

ControlBarTextBox (Page 1801)

ControlBarTextBox.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarTextBox.Authorization
```

See also

ControlBarTextBox (Page 1801)

ControlBarTextBox.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BackColor
```

See also

ControlBarTextBox (Page 1801)

ControlBarTextBox.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BorderColor
```

See also

ControlBarTextBox (Page 1801)

ControlBarTextBox.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarTextBox.BorderWidth
```

See also

ControlBarTextBox (Page 1801)

ControlBarTextBox.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarTextBox.CustomID
```

See also

ControlBarTextBox (Page 1801)

ControlBarTextBox.Enabled

Description

The "Enabled" property specifies whether the text box can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Enabled
```

See also

ControlBarTextBox (Page 1801)

ControlBarTextBox.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.ForeColor
```

See also

ControlBarTextBox (Page 1801)

ControlBarTextBox.Height

Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Height
```

See also

ControlBarTextBox (Page 1801)

ControlBarTextBox.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

See also

ControlBarTextBox (Page 1801)

ControlBarTextBox.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarTextBox.Mapping
```

See also

ControlBarTextBox (Page 1801)

ControlBarTextBox.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the text box.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarTextBox.Margin
```

See also

ControlBarTextBox (Page 1801)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarTextBox.Margin (Page 1810)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarTextBox.Margin (Page 1810)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarTextBox.Margin (Page 1810)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarTextBox.Margin (Page 1810)

ControlBarTextBox.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumHeight
```

See also

ControlBarTextBox (Page 1801)

ControlBarTextBox.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumWidth
```

See also

ControlBarTextBox (Page 1801)

ControlBarTextBox.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumHeight
```

See also

ControlBarTextBox (Page 1801)

ControlBarTextBox.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumWidth
```

See also

ControlBarTextBox (Page 1801)

ControlBarTextBox.Operability

Description

The "Operability" property returns whether the text box is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarTextBox.Operability
```

See also

ControlBarTextBox (Page 1801)

ControlBarTextBox.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the text box.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarTextBox.Padding
```

See also

ControlBarTextBox (Page 1801)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarTextBox.Padding (Page 1815)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarTextBox.Padding (Page 1815)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarTextBox.Padding (Page 1815)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarTextBox.Padding (Page 1815)

ControlBarTextBox.ReadOnly

Description

The "ReadOnly" property specifies whether the text box is read-only.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.ReadOnly
```

See also

ControlBarTextBox (Page 1801)

ControlBarTextBox.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

See also

ControlBarTextBox (Page 1801)

ControlBarTextBox.Text

Description

The "Text" property specifies the label of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.Text
```

See also

ControlBarTextBox (Page 1801)

ControlBarTextBox.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.ToolTipText
```

See also

ControlBarTextBox (Page 1801)

ControlBarTextBox.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

See also

ControlBarTextBox (Page 1801)

ControlBarTextBox.Visible

Description

The "Visible" property specifies whether the text box is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Visible
```

See also

ControlBarTextBox (Page 1801)

ControlBarTextBox.Width

Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Width
```

See also

ControlBarTextBox (Page 1801)

ControlBarToggleSwitch

Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar.

You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarToggleSwitchPart

Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".

- **AlternateGraphic**
  Specifies the graphic for the "pressed" state.
- **AlternateText**
  Specifies the text for the "pressed" state.
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the identifier of the switch.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the switch can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the switch.
- **IsAlternateState**
  Specifies the current state of the switch.
- **Mapping**
  Returns the function of the switch.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.

- **Operability**
  Returns whether the switch is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the switch is only operable while the associated button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the switch is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarToggleSwitch.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.AlternateGraphic

Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateGraphic
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.AlternateText

Description

The "AlternateText" property specifies the text of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateText
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Authorization
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BackColor
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.Badge

Description

The "Badge" property specifies the identifier of the switch.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Badge
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderColor
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderWidth
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Content
```

See also

ControlBarToggleSwitch (Page 1821)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarToggleSwitch.Content (Page 1828)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarToggleSwitch.Content (Page 1828)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 1828)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarToggleSwitch.Content (Page 1828)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarToggleSwitch.Content (Page 1828)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarToggleSwitch.Content (Page 1828)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarToggleSwitch.Content (Page 1828)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 1828)

ControlBarToggleSwitch.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarToggleSwitch.CustomID
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.Enabled

Description

The "Enabled" property specifies whether the switch can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Enabled
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ForeColor
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.Graphic

Description

The "Graphic" property specifies the graphic of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Graphic
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.Height

Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Height
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.HotKey

Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
Button.HotKey
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.IsAlternateState

Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Mapping
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the switch.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Margin
```

See also

ControlBarToggleSwitch (Page 1821)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarToggleSwitch.Margin (Page 1839)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarToggleSwitch.Margin (Page 1839)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarToggleSwitch.Margin (Page 1839)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarToggleSwitch.Margin (Page 1839)

ControlBarToggleSwitch.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumHeight
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumWidth
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumHeight
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumWidth
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.Operability

Description

The property "Operability" returns whether the switch is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Operability
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the switch.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Padding
```

See also

ControlBarToggleSwitch (Page 1821)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarToggleSwitch.Padding (Page 1844)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarToggleSwitch.Padding (Page 1844)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarToggleSwitch.Padding (Page 1844)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarToggleSwitch.Padding (Page 1844)

ControlBarToggleSwitch.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.Text

Description

The "Text" property specifies the label of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Text
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ToolTipText
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.Visible

Description

The "Visible" property specifies whether the switch is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Visible
```

See also

ControlBarToggleSwitch (Page 1821)

ControlBarToggleSwitch.Width

Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Width
```

See also

ControlBarToggleSwitch (Page 1821)

ToolBar.Enabled

Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Enabled
```

See also

AlarmControl.ToolBar (Page 1716)

ToolBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ToolBar.Font
```

See also

AlarmControl.ToolBar (Page 1716)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ToolBar.Font (Page 1850)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ToolBar.Font (Page 1850)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ToolBar.Font (Page 1850)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ToolBar.Font (Page 1850)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ToolBar.Font (Page 1850)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ToolBar.Font (Page 1850)

ToolBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the toolbar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ToolBar.Margin
```

See also

AlarmControl.ToolBar (Page 1716)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ToolBar.Margin (Page 1853)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ToolBar.Margin (Page 1853)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ToolBar.Margin (Page 1853)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ToolBar.Margin (Page 1853)

ToolBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ToolBar.Padding
```

See also

AlarmControl.ToolBar (Page 1716)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ToolBar.Padding (Page 1856)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ToolBar.Padding (Page 1856)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ToolBar.Padding (Page 1856)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ToolBar.Padding (Page 1856)

ToolBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.ShowToolTips
```

See also

AlarmControl.ToolBar (Page 1716)

ToolBar.UseHotKeys

Description

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.UseHotKeys
```

See also

AlarmControl.ToolBar (Page 1716)

ToolBar.Visible

Description

The "Visible" property specifies whether the toolbar is visible.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Visible
```

See also

AlarmControl.ToolBar (Page 1716)

AlarmControl.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
AlarmControl.Top
```

See also

AlarmControl (Page 1571)

AlarmControl.UseAlarmColors

Description

The "UseAlarmColors" property specifies whether the configured alarm colors are used.

Type

Bool

Access

Read-write

Syntax

```
AlarmControl.UseAlarmColors
```

See also

AlarmControl (Page 1571)

AlarmControl.Visible

Description

The "Visible" property specifies whether the alarm control is visible.

Type

Bool

Access

Read-write

Syntax

```
AlarmControl.Visible
```

See also

AlarmControl (Page 1571)

AlarmControl.Width

Description

The "Width" property specifies the width of the alarm control in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
AlarmControl.Width
```

See also

AlarmControl (Page 1571)

AlarmControl.WindowFlags

Description

The "WindowFlags" property specifies the window configuration of the alarm control.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

Enable multiple properties by adding the integer values or bit operators.

Access

Read-write

Syntax

```
AlarmControl.WindowFlags
```

Example

Adapt the "windowFlags" tag depending on the window configuration:

Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose){
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

See also

AlarmControl (Page 1571)

AlarmControl.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the alarm control.

Syntax

```
AlarmControl.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

AlarmControl (Page 1571)

AlarmControl.FireCommand()

Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the alarm control.

Syntax

```
AlarmControl.FireCommand(commandId, custom)
```

Parameters

commandId

Type: Int32

ID of the element of the toolbar or information bar

custom

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

Return value

--

See also

AlarmControl (Page 1571)

AlarmControl.GetSelectedAlarmData()

Description

The "GetSelectedAlarmData" method returns the visible data of the selected alarm of the alarm control.

Syntax

```
AlarmControl.GetSelectedAlarmData()
```

Parameters

--

Return value

--

See also

AlarmControl (Page 1571)

AlarmControl.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
AlarmControl.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

AlarmControl (Page 1571)

AlarmControl_OnActivated()

Description

The "OnActivated" event occurs when an alarm control receives focus:

- An alarm control is selected via the configured tab sequence.
- An alarm control that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and receives focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
AlarmControl_OnActivated(item)
```

Context

`item`

Type: Object

Alarm control at which the event occurs.

See also

AlarmControl (Page 1571)

AlarmControl_OnDeactivated() (Page 1867)

AlarmControl_OnDeactivated()

Description

The "OnDeactivated" event occurs when an alarm control loses focus when the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

Syntax

```
AlarmControl_OnDeactivated(item)
```

Context

item

Type: Object

Alarm control at which the event occurs.

See also

AlarmControl (Page 1571)

AlarmControl_OnActivated() (Page 1866)

AlarmControl_OnInitialized()

Description

The "OnInitialized" event occurs when an alarm control has been successfully initialized and the data connection to the PLC has been established.

Syntax

```
AlarmControl_OnInitialized(item)
```

Context

item

Type: Object

Alarm control at which the event occurs.

See also

AlarmControl (Page 1571)

AlarmControl_OnCommandFired()

Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the alarm control.

Syntax

```
AlarmControl_OnCommandFired(item, commandId, custom)
```

Context

item

Type: Object

Alarm control at which the event occurs.

commandId

Type: DInt

ID of the element of the toolbar or information bar that was operated.

custom

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

See also

AlarmControl (Page 1571)

Control Bar Elements (Page 1720)

AlarmControl_OnSelectionChanged()

Description

The "OnSelectionChanged" event occurs when the selection in the alarm control changes.

Syntax

```
AlarmControl_OnSelectionChanged(item, SelectedRowData)
```

Context

item

Type: Object

Alarm control at which the event occurs.

SelectedRowData

Type: Variant

Visible properties of the selected alarm row of the alarm control.

See also

AlarmControl (Page 1571)

Bar

Description

The "Bar" object represents a bar for the display of process values in runtime.

Object type

HmiBar

Properties

The "Bar" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.

- **BackColor**
  Specifies the background color.
- **BarMode**
  Specifies the color of the bar.
- **BorderColor**
  Specifies the border color.
- **BorderWidth**
  Specifies the border thickness.
- **ComputedMaxPeakValue**
  Returns the highest process value that occurred.
- **ComputedMinPeakValue**
  Returns the lowest process value that occurred.
- **ComputedValueTendency**
  Returns the change of the process value.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the bar.
- **Enabled**
  Specifies whether the bar can be operated in runtime.
- **Font**
  Specifies the font of the text.
- **Height**
  Specifies the height.
- **Label**
  Specifies the labeling below the bar.
- **Layer**
  Returns the layer of the screen in which the bar is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the bar.
- **NormalRangeColor**
  Specifies the color of the normal range.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the bar is operable.
- **OriginValue**
  Specifies the output value of the normal range that is visualized.
- **OutputFormat**
  Specifies the format for displaying the process values.

- **Parent**
  Returns the higher-level screen object.
- **PeakIndicators**
  Specifies whether the highest and lowest process value up to this time are displayed.
- **ProcessValue**
  Specifies the process value.
- **ProcessValueIndicatorBackColor**
  Specifies the background color for the process value.
- **ProcessValueIndicatorForeColor**
  Specifies the foreground color for the process value.
- **ProcessValueIndicatorMode**
  Specifies the type of display of the current process value.
- **RelativeToOrigin**
  Specifies whether the output value is an absolute or a percentage value between the minimum and maximum value.
- **RenderingTemplate**
  Returns the name of the template from which the bar was created.
- **RequireExplicitUnlock**
  Returns whether the bar is only operable while the associated button is being pressed.
- **RotationAngle**
  Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the bar rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ScaleBackColor**
  Specifies the background color of the scale.
- **ScaleForeColor**
  Specifies the foreground color of the scale.
- **ShowFocusVisual**
  Specifies whether the bar is highlighted when in focus.
- **ShowTrendIndicator**
  Specifies whether the tendency (rising or falling) of the process value to be monitored is indicated by means of a small arrow.
- **StraightScale**
  Specifies the scale of the bar.
- **StyleItemClass**
  Returns the style which is applied to the bar.
- **TabIndex**
  Returns the position of the bar in the tab sequence.

- **ThresholdIndicators**
  Specifies how parameterized limit values are visualized.
- **Thresholds**
  Returns the list of all limit values of the bar.
- **Title**
  Specifies the caption which appears as the title.
- **ToolTipText**
  Specifies the tooltip text.
- **Top**
  Specifies the value of the Y coordinate.
- **TrendIndicatorColor**
  Specifies the color of the trend indicator.
- **Visible**
  Specifies whether the bar is visible.
- **VisualizeQuality**
  Specifies whether the connection quality of the process value is displayed.
- **Width**
  Specifies the width.

Methods

The "Bar" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the bar.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "Bar" object has the following events:

- **OnActivated()**
  Occurs when a bar receives focus.
- **OnContextTapped()**
  Occurs when a bar is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when a bar loses focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the bar is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the bar is in focus.
- **OnTapped()**
  Occurs when a bar is left-clicked or short-touched.

Bar.AlternateBackColor

Description

The "AlternateBackColor" specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
Bar.AlternateBackColor
```

See also

Bar (Page 1869)

Bar.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
Bar.AlternateBorderColor
```

See also

Bar (Page 1869)

Bar.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
Bar.Authorization
```

See also

Bar (Page 1869)

Bar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
Bar.BackColor
```

See also

Bar (Page 1869)

Bar.BarMode

Description

The "BarMode" property specifies the color of the bar.

Type

Int32, HmiBarMode

Specifies the bar mode:

- Segmented (0): Bar changes color according to the bar segments.
- Unicolor (1): Entire bar has same color.
- SegmentedStatic (2): Bar segments in the background, process value indicator in front of the bar segments.
- UnicolorStatic (3): Background color changes according to the process value and the limit colors, process value indicator runs in front of the bar segments.

Access

Read-write

Syntax

```
Bar.BarMode
```

See also

Bar (Page 1869)

Bar.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
Bar.BorderColor
```

See also

Bar (Page 1869)

Bar.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
Bar.BorderWidth
```

See also

Bar (Page 1869)

Bar.ComputedMaxPeakValue

Description

The "ComputedMaxPeakValue" property returns the highest process value that occurred.

Type

Variant

Access

Read-only

Syntax

```
Bar.ComputedMaxPeakValue
```

See also

Bar (Page 1869)

Bar.ComputedMinPeakValue (Page 1877)

Bar.ComputedMinPeakValue

Description

The "ComputedMinPeakValue" property returns the lowest process value which occurred.

Type

Variant

Access

Read-only

Syntax

```
Bar.ComputedMinPeakValue
```

See also

Bar (Page 1869)

Bar.ComputedMaxPeakValue (Page 1876)

Bar.ComputedValueTendency

Description

The "ComputedValueTendency" property returns the change in the process value.

Type

Int32, HmiValueTendency

Returns the modification:

- Steady (0): No change
- Upwards (1): Change upwards
- Downwards (2): Change downwards

Access

Read-only

Syntax

```
Bar.ComputedValueTendency
```

See also

Bar (Page 1869)

Bar.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the bar.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
Bar.CurrentQuality
```

See also

Bar (Page 1869)

Bar.Enabled

Description

The "Enabled" property specifies whether the bar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
Bar.Enabled
```

See also

Bar (Page 1869)

Bar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Bar.Font
```

See also

Bar (Page 1869)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Bar.Font (Page 1879)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Bar.Font (Page 1879)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Bar.Font (Page 1879)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Bar.Font (Page 1879)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Bar.Font (Page 1879)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Bar.Font (Page 1879)

Bar.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Bar.Height
```

See also

Bar (Page 1869)

Bar.Label

Description

The "Label" property specifies the label below the bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
Bar.Label
```

See also

Bar (Page 1869)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

Bar.Label (Page 1883)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 1884)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 1884)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 1884)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 1884)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 1884)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 1884)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

Bar.Label (Page 1883)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

Bar.Label (Page 1883)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

Bar.Label (Page 1883)

Bar.Layer

Description

The "Layer" property returns the layer of the screen in which the bar is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
Bar.Layer
```

See also

Bar (Page 1869)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

Bar.Layer (Page 1889)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

Bar.Layer (Page 1889)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

Bar.Layer (Page 1889)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

Bar.Layer (Page 1889)

Bar.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
Bar.Left
```

See also

Bar (Page 1869)

Bar.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
Bar.Margin
```

See also

Bar (Page 1869)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

Bar.Margin (Page 1892)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

Bar.Margin (Page 1892)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

Bar.Margin (Page 1892)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

Bar.Margin (Page 1892)

Bar.Name

Description

The "Name" property returns the name of the bar.

Type

String

Access

Read-only

Syntax

```
Bar.Name
```

See also

Bar (Page 1869)

Bar.NormalRangeColor

Description

The "NormalRangeColor" property specifies the color of the normal range.

Type

UInt32

Access

Read-write

Syntax

```
Bar.NormalRangeColor
```

See also

Bar (Page 1869)

Bar.Opacity

Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

Type

Float

Access

Read-write

Syntax

```
Bar.Opacity
```

See also

Bar (Page 1869)

Bar.Operability

Description

The "Operability" property returns whether the bar is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
Bar.Operability
```

See also

Bar (Page 1869)

Bar.OriginValue

Description

The "OriginValue" property specifies the output value of the normal range to be visualized.

Type

Float

Access

Read-write

Syntax

```
Bar.OriginValue
```

See also

Bar (Page 1869)

Bar.OutputFormat

Description

The "OutputFormat" property specifies the format for displaying the process values, e.g. "{0000}" for a 4-digit integer with leading zeros.

Type

String

Access

Read-write

Syntax

```
Bar.OutputFormat
```

See also

Bar (Page 1869)

Bar.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
Bar.Parent
```

See also

Bar (Page 1869)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

Bar.PeakIndicators

Description

The "PeakIndicators" property specifies whether the highest and lowest process value up to this time are displayed.

Type

Int32, HmiPeakIndicator

Specifies the display of the peak indicator:

- None (0): No display
- Low (1): Only the lowest process value
- High (2): Only the highest process value

Access

Read-write

Syntax

```
Bar.PeakIndicators
```

See also

Bar (Page 1869)

Bar.ProcessValue

Description

The "ProcessValue" property specifies the process value.

Type

Variant

Access

Read-write

Syntax

```
Bar.ProcessValue
```

See also

Bar (Page 1869)

Bar.ProcessValueIndicatorBackColor

Description

The "ProcessValueIndicatorBackColor" property specifies the background color for the process value indicator.

Type

UInt32

Access

Read-write

Syntax

```
Bar.ProcessValueIndicatorBackColor
```

See also

Bar (Page 1869)

Bar.ProcessValueIndicatorForeColor (Page 1900)

Bar.ProcessValueIndicatorForeColor

Description

The "ProcessValueIndicatorForeColor" property specifies the foreground color for the process value indicator.

Type

UInt32

Access

Read-write

Syntax

```
Bar.ProcessValueIndicatorForeColor
```

See also

Bar (Page 1869)

Bar.ProcessValueIndicatorBackColor (Page 1899)

Bar.ProcessValueIndicatorMode

Description

The "ProcessValueIndicatorMode" property specifies the type of display of the current process value.

Type

Int32, HmiProcessIndicatorMode

Specifies the type of display:

- Bar (0): Bar only
- Indicator (1): Hair line or needle, no numerical display of the process value.
- DetailedIndicator (2): Detailed display with numerical value
- BarWithDetailedIndicator (3): Bar with numerical value

Access

Read-write

Syntax

```
Bar.ProcessValueIndicatorMode
```

See also

Bar (Page 1869)

Bar.RelativeToOrigin

Description

The "RelativeToOrigin" property specifies whether the output value is an absolute or a percentage value between minimum and maximum value.

Type

Bool

Access

Read-write

Syntax

```
Bar.RelativeToOrigin
```

See also

Bar (Page 1869)

Bar.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the bar was created.

Type

String

Access

Read-only

Syntax

```
Bar.RenderingTemplate
```

See also

Bar (Page 1869)

Bar.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the bar can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
Bar.RequireExplicitUnlock
```

See also

Bar (Page 1869)

Bar.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
Bar.RotationAngle
```

See also

Bar (Page 1869)
Bar.RotationCenterPlacement (Page 1903)
Bar.RotationCenterX (Page 1904)
Bar.RotationCenterY (Page 1905)

Bar.RotationCenterPlacement

Description

The "RotationCenterPlacement" property sets the reference point around which the bar rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
Bar.RotationCenterPlacement
```

See also

Bar (Page 1869)

Bar.RotationAngle (Page 1903)

Bar.RotationCenterX (Page 1904)

Bar.RotationCenterY (Page 1905)

Bar.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
Bar.RotationCenterX
```

See also

Bar (Page 1869)

Bar.RotationAngle (Page 1903)

Bar.RotationCenterPlacement (Page 1903)

Bar.RotationCenterY (Page 1905)

Bar.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
Bar.RotationCenterY
```

See also

Bar (Page 1869)

Bar.RotationAngle (Page 1903)

Bar.RotationCenterPlacement (Page 1903)

Bar.RotationCenterX (Page 1904)

Bar.ScaleBackColor

Description

The "ScaleBackColor" property specifies the background color of the scale.

Type

UInt32

Access

Read-write

Syntax

```
Bar.ScaleBackColor
```

See also

Bar (Page 1869)

Bar.ScaleForeColor (Page 1906)

Bar.ScaleForeColor

Description

The "ScaleForeColor" property specifies the foreground color of the scale.

Type

UInt32

Access

Read-write

Syntax

```
Bar.ScaleForeColor
```

See also

Bar (Page 1869)

Bar.ScaleBackColor (Page 1905)

Bar.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the bar is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
Bar.ShowFocusVisual
```

See also

Bar (Page 1869)

Bar.ShowTrendIndicator

Description

The "ShowTrendIndicator" property specifies whether the tendency (rising or falling) of the process value to be monitored is indicated by means of a small arrow.

Type

Bool

Access

Read-write

Syntax

```
Bar.ShowTrendIndicator
```

See also

Bar (Page 1869)

Bar.StraightScale

Description

The "StraightScale" property specifies the scale of the bar.

Type

Object, HmiStraightScalePart

Access

Read-write

Syntax

```
Bar.StraightScale
```

See also

Bar (Page 1869)

StraightScale.AutoScaling

Description

The "AutoScaling" property specifies whether automatic scaling is activated.

Type

Bool

Access

Read-write

Syntax

```
StraightScale.AutoScaling
```

See also

Bar.StraightScale (Page 1907)

StraightScale.BeginValue

Description

The "BeginValue" property specifies the start of a value range or value range section.

Type

Float

Access

Read-write

Syntax

```
StraightScale.BeginValue
```

See also

Bar.StraightScale (Page 1907)

StraightScale.DivisionCount

Description

The "DivisionCount" property specifies the number of main units with subdivisions. To this purpose the automatic scaling must be switched off.

Type

Int32

Access

Read-write

Syntax

```
StraightScale.DivisionCount
```

See also

Bar.StraightScale (Page 1907)

StraightScale.EndValue

Description

The "EndValue" property specifies the end of a value range or value range section.

Type

Float

Access

Read-write

Syntax

```
StraightScale.EndValue
```

See also

Bar.StraightScale (Page 1907)

StraightScale.LabelColor

Description

The "LabelColor" property specifies the color of the labeling.

Type

UInt32

Access

Read-write

Syntax

```
StraightScale.LabelColor
```

See also

Bar.StraightScale (Page 1907)

StraightScale.LabelFont

Description

The "LabelFont" property specifies the font of the labeling.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
StraightScale.LabelFont
```

See also

Bar.StraightScale (Page 1907)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

StraightScale.LabelFont (Page 1910)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

StraightScale.LabelFont (Page 1910)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

StraightScale.LabelFont (Page 1910)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

StraightScale.LabelFont (Page 1910)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

StraightScale.LabelFont (Page 1910)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal

- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

StraightScale.LabelFont (Page 1910)

StraightScale.LargeTickLabelingStep

Description

The "LargeTickLabelingStep" property specifies the interval at which scale sections are labeled.

Type

UInt8

Access

Read-write

Syntax

```
StraightScale.LargeTickLabelingStep
```

See also

Bar.StraightScale (Page 1907)

StraightScale.MeasurementUnit

Description

The "MeasurementUnit" property returns the displayed unit.

Type

String

Access

Read-only

Syntax

```
StraightScale.MeasurementUnit
```

See also

Bar.StraightScale (Page 1907)

StraightScale.MeasurementUnitType

Description

The "MeasurementUnitType" property specifies the display format of the unit.

Type

Int32, HmiMeasurementUnit

Specifies the display format:

- None (0): No unit
- Name (1): Unit name, for example "kilogram"
- Symbol (2): Unit, for example "kg"

Access

Read-write

Syntax

```
StraightScale.MeasurementUnitType
```

See also

Bar.StraightScale (Page 1907)

StraightScale.Orientation

Description

The "Orientation" property specifies the orientation of the scale.

Type

Int32, HmiOrientation

Specifies the alignment:

- Horizontal (0): Horizontal
- Vertical (1): Vertical

Access

Read-write

Syntax

```
StraightScale.Orientation
```

See also

Bar.StraightScale (Page 1907)

StraightScale.OutputFormat

Description

The "OutputFormat" property specifies the format for displaying the process values, e.g. "{0000}" for a 4-digit integer with leading zeros.

Type

String

Access

Read-write

Syntax

```
StraightScale.OutputFormat
```

See also

Bar.StraightScale (Page 1907)

StraightScale.ScaleMode

Description

The "ScaleMode" property specifies the type of scaling.

Type

Int32, HmiScaleMode

Specifies the scaling:

- None (0): None
- Labels (1): Labels
- Ticks (2): Tick marks

Access

Read-write

Syntax

```
StraightScale.ScaleMode
```

See also

Bar.StraightScale (Page 1907)

StraightScale.ScalingType

Description

The "ScalingType" property specifies the scaling.

Type

Int32, HmiScalingType

Specifies the scaling:

- Linear (0): Linear
- Logarithmic (1): Logarithmic
- NegativeLogarithmic (2): Negative logarithmic

- Tangent (4): Tangential
- Quadratic (5): Square
- Cubic (6): Cubic

Access

Read-write

Syntax

```
StraightScale.ScalingType
```

See also

Bar.StraightScale (Page 1907)

StraightScale.SubDivisionCount

Description

The "SubDivisionCount" property specifies the number of subdivisions of the main units.

Type

Int32

Access

Read-write

Syntax

```
StraightScale.SubDivisionCount
```

See also

Bar.StraightScale (Page 1907)

StraightScale.TickColor

Description

The "TickColor" property specifies the color of the tick marks.

Type

UInt32

Access

Read-write

Syntax

```
StraightScale.TickColor
```

See also

Bar.StraightScale (Page 1907)

Bar.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the bar.

Type

String

Access

Read-only

Syntax

```
Bar.StyleItemClass
```

See also

Bar (Page 1869)

Bar.TabIndex

Description

The "TabIndex" property returns the position of the bar in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
Bar.TabIndex
```

See also

Bar (Page 1869)

Bar.ThresholdIndicators

Description

The "ThresholdIndicators" property specifies how parameterized limit values are visualized.

Type

Int32, HmiThresholdIndicator

Specifies the visualization:

- None (0): None
- Lines (1): Lines
- Markers (2): Markers

Access

Read-write

Syntax

```
Bar.ThresholdIndicators
```

See also

Bar (Page 1869)

Bar.Thresholds

Description

The "Thresholds" property returns the list of all limit values ("Threshold" objects) of the bar.

Type

Object, HmiThresholdCollection (Page 1921)

Access

Read-only

Syntax

```
Bar.Thresholds
```

See also

Bar (Page 1869)

HmiThresholdCollection (Page 1921)

HmiThresholdCollection

Description

The "HmiThresholdCollection" object is a list of all limit values ("Threshold" objects).

Use

The "HmiThresholdCollection" object is a list and can be counted and enumerated. You can access the "HmiThresholdCollection" list using the index or the tag name.

Object type

HmiThresholdCollection

Properties

The "HmiThresholdCollection" object has the following properties:

- **Count**
  Returns the number of limit values of the "HmiThresholdCollection" list.

Methods

The "HmiThresholdCollection" object has the following methods:

- **Item()**
  Returns a limit value of the "HmiThresholdCollection" list.

See also

Bar.Thresholds (Page 1920)

HmiThresholdCollection.Count

Description

The "Count" property returns the number of limit values in the "HmiThresholdCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiThresholdCollection.Count
```

See also

HmiThresholdCollection (Page 1921)

HmiThresholdCollection.Item()

Description

The "Item" method returns a limit value of the "HmiThresholdCollection" list.

Syntax

```
HmiThresholdCollection[.Item](HmiThresholdName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiThresholdCollection" object.

Parameters

`HmiThresholdName`

Type: String

Name of the limit value

Return value

Object, HmiThresholdPart (Page 1923)

See also

HmiThresholdCollection (Page 1921)

Threshold (Page 1923)

Threshold

Description

The "Threshold" object represents a limit value.

Object type

HmiThresholdPart

Properties

The "Threshold" object has the following properties:

- **Color**
  Specifies the color of the limit value.
- **DisplayName**
  Specifies the display name of the limit value.
- **Name**
  Specifies the name of the limit value.
- **ThresholdMode**
  Specifies the type of limit value.
- **Value**
  Returns the limit value.

Methods

--

See also

HmiThresholdCollection (Page 1921)

Threshold.Color

Description

The "Color" property specifies the color of the limit value.

Type

UInt32

Access

Read-write

Syntax

```
Threshold.Color
```

See also

Threshold (Page 1923)

Threshold.DisplayName

Description

The "DisplayName" property specifies the display name of the limit value.

Type

String

Access

Read-write

Syntax

```
Threshold.DisplayName
```

See also

Threshold (Page 1923)

Threshold.Name

Description

The "Name" property specifies the name of the limit value.

Type

String

Access

Read-write

Syntax

```
Threshold.Name
```

See also

Threshold (Page 1923)

Threshold.ThresholdMode

Description

The "ThresholdMode" property specifies the type of limit value.

Type

Int32, HmiThresholdMode

Specifies the threshold value:

- Undefined (0): Undefined
- Upper (1): Upper threshold
- Lower (2): Lower threshold
- Normal (3): Normal threshold
- Minimum (4): Minimum threshold
- Maximum (5): Maximum threshold

Access

Read-write

Syntax

```
Threshold.ThresholdMode
```

See also

Threshold (Page 1923)

Threshold.Value

Description

The "Value" property returns the limit value of the tag.

Type

Float

Access

Read-only

Syntax

```
Threshold.Value
```

See also

Threshold (Page 1923)

Bar.Title

Description

The "Title" property specifies the caption that appears as the title.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
Bar.Title
```

See also

Bar (Page 1869)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

Bar.Title (Page 1926)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 1927)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 1927)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 1927)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 1927)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 1927)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 1927)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

Bar.Title (Page 1926)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

Bar.Title (Page 1926)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

Bar.Title (Page 1926)

Bar.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
Bar.ToolTipText
```

See also

Bar (Page 1869)

Bar.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
Bar.Top
```

See also

Bar (Page 1869)

Bar.TrendIndicatorColor

Description

The "TrendIndicatorColor" property specifies the color of the trend indicator. The trend indicator uses a small arrow to represent the tendency (rising or falling) of the process value to be monitored. To activate the trend indicator, the "ShowTrendIndicator" property must be activated.

Type

UInt32

Access

Read-write

Syntax

```
Bar.TrendIndicatorColor
```

See also

Bar (Page 1869)

Bar.Visible

Description

The "Visible" property specifies whether the bar is visible.

Type

Bool

Access

Read-write

Syntax

```
Bar.Visible
```

See also

Bar (Page 1869)

Bar.VisualizeQuality

Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

Type

Bool

Access

Read-write

Syntax

```
Bar.VisualizeQuality
```

See also

Bar (Page 1869)

Bar.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Bar.Width
```

See also

Bar (Page 1869)

Bar.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the bar.

Syntax

```
Bar.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

Bar (Page 1869)

Bar.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
Bar.PropertyFlashing(propertyName, enable[, value][, alternateValue]
[, rate])
```

Parameters

`propertyName`

Type: String

Name of the property for which flashing is configured.

`enable`

Type: Bool

Specifies that flashing is activated.

`value`

Optional, type: Variant

Value of the property for which flashing is configured.

`alternateValue`

Optional, type: Variant

Specifies the second value for flashing.

`rate`

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

Bar (Page 1869)

Bar_OnActivated()

Description

The "OnActivated" event occurs when a bar receives focus:

- A bar is selected via the configured tab sequence.
- A bar that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
Bar_OnActivated(item)
```

Context

item

Type: Object

Bar where the event occurs.

See also

Bar (Page 1869)

Bar_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A bar is right-clicked.
- A bar is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
Bar_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Bar where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Bar (Page 1869)

Bar_OnDeactivated()

Description

The "OnDeactivated" event occurs when a bar loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
Bar_OnDeactivated(item)
```

Context

item

Type: Object

Bar where the event occurs.

See also

Bar (Page 1869)

Bar_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the bar is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Bar_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

Bar where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Bar (Page 1869)

Bar_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the bar is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Bar_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Bar where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Bar (Page 1869)

Bar_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A bar is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a bar has the focus.
- A bar is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
Bar_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Bar where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Bar (Page 1869)

BindingSourceElement

Description

The "BindingSourceElement" object represents a data source in runtime.

Object type

HmiBindingSourceElement

Properties

The "BindingSourceElement" object has the following properties:

- **AutoRequery**
  Specifies whether the data source is queried automatically.
- **ConsideredColumns**
  Returns information about the selected columns.
- **CursorPosition**
  Specifies the position of the cursor.
- **DataConnection**
  Returns the data connection.
- **Parent**
  Returns the higher-level screen object.
- **ReadCommand**
  Returns information about the command.
- **RowCount**
  Returns the row count.
- **SourceState**
  Returns the state of the data source.

Methods

The "BindingSourceElement" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the combo box.
- **MoveFirst()**
  Moves the data source to the first position.
- **MoveLast()**
  Moves the data source to the last position.
- **MoveNext()**
  Moves the data source forwards.
- **MovePrevious()**
  Moves the data source backwards.
- **PropertyFlashing()**
  Configures flashing of a property.

BindingSourceElement.AutoRequery

Description

The "AutoRequery" property specifies whether the data source is queried automatically.

Type

Bool

Access

Read-write

Syntax

```
BindingSourceElement.AutoRequery
```

See also

BindingSourceElement (Page 1943)

BindingSourceElement.ConsideredColumns

Description

The "ConsideredColumns" returns information about the selected columns.

Type

Object, HmiConsideredColumnCollection (Page 1945)

Access

Read-only

Syntax

```
BindingSourceElement.ConsideredColumns
```

See also

BindingSourceElement (Page 1943)

HmiConsideredColumnCollection (Page 1945)

HmiConsideredColumnCollection

Description

The "HmiConsideredColumnCollection" object is a list of all columns ("ConsideredColumn" objects).

Use

The "HmiConsideredColumnCollection" object is a list which can be counted and enumerated. You can access the "HmiConsideredColumnCollection" list using the index or the tag names.

Object type

HmiConsideredColumnCollection

Properties

The "HmiConsideredColumnCollection" object has the following properties:

- **Count**
  Returns the number of columns in the "HmiConsideredColumnCollection" list.

Methods

The "HmiConsideredColumnCollection" object has the following methods:

- **Item()**
  Returns a column of the "HmiConsideredColumnCollection" list.

See also

BindingSourceElement.ConsideredColumns (Page 1945)

HmiConsideredColumnCollection.Count

Description

The "Count" property returns the number of columns in the "HmiConsideredColumnCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiConsideredColumnCollection.Count
```

See also

HmiConsideredColumnCollection (Page 1945)

HmiConsideredColumnCollection.Item()

Description

The "Item" method returns a column of the "HmiConsideredColumnCollection" list.

Syntax

```
HmiConsideredColumnCollection.[.Item](HmiConsideredColumnName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiConsideredColumnCollection" object.

Parameters

`HmiConsideredColumnName`

Type: String

Name of the column

Return value

Object, HmiConsideredColumnPart (Page 1947)

See also

HmiConsideredColumnCollection (Page 1945)

ConsideredColumn (Page 1947)

ConsideredColumn

Description

The "ConsideredColumn" object represents a column.

Object type

HmiConsideredColumnPart

Properties

The "ConsideredColumn" object has the following properties:

- **IsPrimary**
  Returns whether the column is the primary column.
- **Key**
  Returns the key of the column.

Methods

--

See also

HmiConsideredColumnCollection (Page 1945)

ConsideredColumn.IsPrimary

Description

The "IsPrimary" property returns whether the column is the primary column.

Type

Bool

Access

Read-only

Syntax

```
ConsideredColumn.IsPrimary
```

See also

ConsideredColumn (Page 1947)

ConsideredColumn.Key

Description

The "Key" property returns the key of the column.

Type

String

Access

Read-only

Syntax

```
ConsideredColumn.Key
```

See also

ConsideredColumn (Page 1947)

BindingSourceElement.CursorPosition

Description

The "CursorPosition" property specifies the position of the cursor.

Type

UInt32

Access

Read-write

Syntax

```
BindingSourceElement.CursorPosition
```

See also

BindingSourceElement (Page 1943)

BindingSourceElement.DataConnection

Description

The "DataConnection" property returns the data connection.

Type

String, DataConnection

Access

Read-only

Syntax

```
BindingSourceElement.DataConnection
```

See also

BindingSourceElement (Page 1943)

BindingSourceElement.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
BindingSourceElement.Parent
```

See also

BindingSourceElement (Page 1943)
Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

BindingSourceElement.ReadCommand

Description

The "ReadCommand" property returns information about the command.

Type

Object, HmiCommandPart

Access

Read-only

Syntax

```
BindingSourceElement.ReadCommand
```

See also

BindingSourceElement (Page 1943)

Command.CommandParameters

Description

The "CommandParameters" property returns the parameters of the command.

Type

Object, HmiParameterCollection (Page 1953)

Access

Read-only

Syntax

```
Command.CommandParameters
```

See also

BindingSourceElement.ReadCommand (Page 1950)

HmiParameterCollection (Page 1953)

Command.CommandText

Description

The "CommandText" property returns the text of the command.

Type

String

Access

Read-only

Syntax

```
Command.CommandText
```

See also

BindingSourceElement.ReadCommand (Page 1950)

Command.CommandType

Description

The "CommandType" property returns the type of the command.

Type

String

Access

Read-only

Syntax

```
Command.CommandType
```

See also

BindingSourceElement.ReadCommand (Page 1950)

Command.Execute()

Description

The "Execute" method executes the command.

Syntax

```
Command.Execute()
```

Parameters

--

Return value

--

See also

BindingSourceElement.ReadCommand (Page 1950)

HmiParameterCollection

Description

The "HmiParameterCollection" object is a list of all parameters ("Parameter" objects).

Use

The "HmiParameterCollection" object is a list which can be counted and enumerated. You can access the "HmiParameterCollection" list using the index or the tag names.

Object type

HmiParameterCollection

Properties

The "HmiParameterCollection" object has the following properties:

- **Count**
  Returns the number of parameters in the "HmiParameterCollection" list.

Methods

The "HmiParameterCollection" object has the following methods:

- **Item()**
  Returns a parameter of the "HmiParameterCollection" list.

HmiParameterCollection.Count

Description

The "Count" property returns the number of parameters in the "HmiParameterCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiParameterCollection.Count
```

See also

HmiParameterCollection (Page 1953)

HmiParameterCollection.Item()

Description

The "Item" method returns a parameter of the "HmiParameterCollection" list.

Syntax

```
HmiParameterCollection.[.Item](HmiParameterName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiParameterCollection" object.

Parameters

`HmiParameterName`

Type: String

Name of the parameter

Return value

Object, HmiParameterPart (Page 1955)

See also

Parameter (Page 1955)

HmiParameterCollection (Page 1953)

Parameter

Description

The "Parameter" object represents a parameter.

Object type

HmiParameterPart

Properties

The "Parameter" object has the following properties:

- **ParameterName**
  Specifies the name of the parameter.
- **ParameterValue**
  Specifies the value of the parameter.

Methods

--

See also

HmiParameterCollection (Page 1953)

Parameter.ParameterName

Description

The "ParameterName" property specifies the name of the parameter.

Type

String

Access

Read-write

Syntax

```
Parameter.ParameterName
```

See also

Parameter (Page 1955)

Parameter.ParameterValue

Description

The "ParameterValue" property specifies the value of the parameter.

Type

Variant

Access

Read-write

Syntax

```
Parameter.ParameterValue
```

See also

Parameter (Page 1955)

BindingSourceElement.RowCount

Description

The "RowCount" property returns the number of rows.

Type

UInt32

Access

Read-only

Syntax

```
BindingSourceElement.RowCount
```

See also

BindingSourceElement (Page 1943)

BindingSourceElement.SourceState

Description

The "SourceState" property returns the state of the data source.

Type

Int32, HmiSourceState

Returns the state:

- Idle (0): Ready
- Busy (1): Busy

Access

Read-only

Syntax

```
BindingSourceElement.SourceState
```

See also

BindingSourceElement (Page 1943)

BindingSourceElement.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the data source.

Syntax

```
BindingSourceElement.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

BindingSourceElement (Page 1943)

BindingSourceElement.MoveFirst()

Description

The "MoveFirst" method moves the data source to the first position.

Syntax

```
BindingSourceElement.MoveFirst()
```

Parameters

--

Return value

--

See also

BindingSourceElement (Page 1943)

BindingSourceElement.MoveLast()

Description

The "MoveLast" method moves the data source to the last position.

Syntax

```
BindingSourceElement.MoveLast()
```

Parameters

--

Return value

See also

BindingSourceElement (Page 1943)

BindingSourceElement.MoveNext()

Description

The "MoveNext" method moves the data source forward.

Syntax

```
BindingSourceElement.MoveNext()
```

Parameters

--

Return value

See also

BindingSourceElement (Page 1943)

BindingSourceElement.MovePrevious()

Description

The "MovePrevious" method moves the data source backwards.

Syntax

```
BindingSourceElement.MovePrevious()
```

Parameters

--

Return value

--

See also

BindingSourceElement (Page 1943)

BindingSourceElement.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
BindingSourceElement.PropertyFlashing(propertyName, enable[, value]
[, alternateValue][, rate])
```

Parameters

`propertyName`

Type: String

Name of the property for which flashing is configured.

`enable`

Type: Bool

Specifies that flashing is activated.

`value`

Optional, type: Variant

Value of the property for which flashing is configured.

`alternateValue`

Optional, type: Variant

Specifies the second value for flashing.

`rate`

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

BindingSourceElement (Page 1943)

Button

Description

The "Button" object represents a button.

You can reference a "Button" object using the "ScreenItems" list or the "FindItem" method.

Object type

HmiButton

Properties

The "Button" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **AlternateGraphic**
  Specifies the graphic for the "pressed" state.
- **AlternateText**
  Specifies the text for the "pressed" state.
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.

- **Content**
  Specifies display options for text and graphics.
- **CurrentQuality**
  Returns the poorest quality code of all tags that affect the button.
- **Enabled**
  Specifies whether the button can be operated in runtime.
- **Font**
  Specifies the font of the text.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the button.
- **Layer**
  Returns the screen layer in which the button is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the button.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the button is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **Parent**
  Returns the higher-level screen object.
- **RenderingTemplate**
  Returns the name of the template from which the button was created.
- **RequireExplicitUnlock**
  Returns whether the object can only be operated while the associated button is being pressed.
- **RotationAngle**
  Specifies the rotation angle in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the button rotates.

- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**
  Specifies that the focus rectangle is displayed.
- **StyleItemClass**
  Returns the style which is applied to the button.
- **TabIndex**
  Returns the position of the button in the tab sequence.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the button is visible.
- **VisualizeQuality**
  Specifies whether the connection quality of the process value is displayed.
- **Width**
  Specifies the width.

Methods

The "Button" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the button.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "Button" object has the following events:

- **OnActivated()**
  Occurs when a button receives focus.
- **OnContextTapped()**
  Occurs when a button is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when a button loses focus.
- **OnDown()**
  Occurs when the operator presses a button.

- **OnKeyDown()**
  Occurs when a button is pressed while the button is in focus.
- **OnKeyUp()**
  Occurs when a button is released while the button is in focus.
- **OnTapped()**
  Occurs when a button is left-clicked or short-touched.
- **OnUp()**
  Occurs when the operator resolves the pressure on a button via the input device.

Button.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
Button.AlternateBackColor
```

See also

Button (Page 1961)

Button.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
Button.AlternateBorderColor
```

See also

Button (Page 1961)

Button.AlternateGraphic

Description

The "AlternateGraphic" property specifies the graphic of the button for the "pressed" state.

Type

String

Access

Read-write

Syntax

```
Button.AlternateGraphic
```

See also

Button (Page 1961)

Button.AlternateText

Description

The "AlternateText" property specifies the text of the button for the "pressed" state.

Type

String

Access

Read-write

Syntax

```
Button.AlternateText
```

See also

Button (Page 1961)

Button.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
Button.Authorization
```

See also

Button (Page 1961)

Button.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
Button.BackColor
```

See also

Button (Page 1961)

Button.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
Button.BorderColor
```

See also

Button (Page 1961)

Button.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
Button.BorderWidth
```

See also

Button (Page 1961)

Button.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
Button.Content
```

See also

Button (Page 1961)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

Button.Content (Page 1968)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

Button.Content (Page 1968)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

Button.Content (Page 1968)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

Button.Content (Page 1968)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

Button.Content (Page 1968)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

Button.Content (Page 1968)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

Button.Content (Page 1968)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

Button.Content (Page 1968)

Button.CurrentQuality

Description

The "CurrentQuality" property returns the current worst quality code of all tags which influence the button.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable. Quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
Button.CurrentQuality
```

See also

Button (Page 1961)

Button.Enabled

Description

The "Enabled" property specifies whether the button can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
Button.Enabled
```

See also

Button (Page 1961)

Button.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Button.Font
```

See also

Button (Page 1961)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Button.Font (Page 1974)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Button.Font (Page 1974)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Button.Font (Page 1974)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Button.Font (Page 1974)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Button.Font (Page 1974)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Button.Font (Page 1974)

Button.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Button.ForeColor
```

See also

Button (Page 1961)

Button.Graphic

Description

The "Graphic" property specifies the graphic of the button.

Type

String

Access

Read-write

Syntax

```
Button.Graphic
```

See also

Button (Page 1961)

Button.HotKey

Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
Button.HotKey
```

See also

Button (Page 1961)

Button.Height

Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Button.Height
```

See also

Button (Page 1961)

Button.Layer

Description

The "Layer" property returns the layer of the screen in which the button is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
Button.Layer
```

See also

Button (Page 1961)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

Button.Layer (Page 1980)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

Button.Layer (Page 1980)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

Button.Layer (Page 1980)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

Button.Layer (Page 1980)

Button.Left

Description

The "Left" property specifies the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
Button.Left
```

See also

Button (Page 1961)

Button.Margin

Description

The "Margin" property specifies the surrounded outer distance of the button.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
Button.Margin
```

See also

Button (Page 1961)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

Button.Margin (Page 1983)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

Button.Margin (Page 1983)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

Button.Margin (Page 1983)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

Button.Margin (Page 1983)

Button.Name

Description

The "Name" property returns the name of the button.

Type

String

Access

Read-only

Syntax

```
Button.Name
```

See also

Button (Page 1961)

Button.Opacity

Description

The "Opacity" property specifies the opacity of the button. The value "0.0" means completely transparent.

Type

Float

Access

Read-write

Syntax

```
Button.Opacity
```

See also

Button (Page 1961)

Button.Operability

Description

The "Operability" property returns whether the button is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
Button.Operability
```

See also

Button (Page 1961)

Button.Padding

Description

The "Padding" property specifies the distance of the content from the border of the button.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
Button.Padding
```

See also

Button (Page 1961)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

Button.Padding (Page 1987)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

Button.Padding (Page 1987)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

Button.Padding (Page 1987)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

Button.Padding (Page 1987)

Button.Parent

Description

The "Parent" property returns the parent screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
Button.Parent
```

See also

Button (Page 1961)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

Button.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the button was created.

Type

String

Access

Read-only

Syntax

```
Button.RenderingTemplate
```

See also

Button (Page 1961)

Button.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the object can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
Button.RequireExplicitUnlock
```

See also

Button (Page 1961)

Button.RotationAngle

Description

The "RotationAngle" property specifies the rotation angle of the button in degrees.

Type

Int16

Access

Read-write

Syntax

```
Button.RotationAngle
```

See also

Button (Page 1961)

Button.RotationCenterPlacement

Description

The "RotationCenterPlacement" property specifies the reference point around which the button rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also be outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
Button.RotationCenterPlacement
```

See also

Button (Page 1961)

Button.RotationCenterX (Page 1993)

Button.RotationCenterY (Page 1993)

Button.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point.

Type

Float

Access

Read-write

Syntax

```
Button.RotationCenterX
```

See also

Button (Page 1961)
Button.RotationCenterPlacement (Page 1992)
Button.RotationCenterY (Page 1993)

Button.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point.

Type

Float

Access

Read-write

Syntax

```
Button.RotationCenterY
```

See also

Button (Page 1961)
Button.RotationCenterX (Page 1993)
Button.RotationCenterPlacement (Page 1992)

Button.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the button is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
Button.ShowFocusVisual
```

See also

Button (Page 1961)

Button.StyleItemClass

Description

The "StyleItemClass" property returns the style that will be applied to the button.

Type

String

Access

Read-only

Syntax

```
Button.StyleItemClass
```

See also

Button (Page 1961)

Button.TabIndex

Description

The "TabIndex" property returns the position of the button in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
Button.TabIndex
```

See also

Button (Page 1961)

Button.Text

Description

The "Text" property specifies the label of the button.

Type

String

Access

Read-write

Syntax

```
Button.Text
```

See also

Button (Page 1961)

Button.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the button.

Type

String

Access

Read-write

Syntax

```
Button.ToolTipText
```

See also

Button (Page 1961)

Button.Top

Description

The "Top" property specifies the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
Button.Top
```

See also

Button (Page 1961)

Button.Visible

Description

The "Visible" property specifies whether the button is visible.

Type

Bool

Access

Read-write

Syntax

```
Button.Visible
```

See also

Button (Page 1961)

Button.VisualizeQuality

Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

Type

Bool

Access

Read-write

Syntax

```
Button.VisualizeQuality
```

See also

Button (Page 1961)

Button.Width

Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Button.Width
```

See also

Button (Page 1961)

Button.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the button.

Syntax

```
Button.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

Button (Page 1961)

Button.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing means the change between two values of a property.

Syntax

```
Button.PropertyFlashing(propertyName,enable[,value][,alternateValue]
[,rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flashing frequency:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

Button (Page 1961)

Button_OnActivated()

Description

The "OnActivated" event occurs when a button receives focus:

- A button is selected via the configured tab sequence.
- A button that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and receives focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
Button_OnActivated(item)
```

Context

Item

Type: Object

Button at which the event occurs.

See also

Button (Page 1961)

Button_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A button is clicked with the right mouse button.
- A button is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnDown
2. OnUp
3. OnContextTapped

Syntax

```
Button_OnContextTapped(item,x,y,modifiers,trigger)
```

Context

Item

Type: Object

Button at which the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Button (Page 1961)

Button_OnDeactivated()

Description

The "OnDeactivated" event occurs when a button loses focus when the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
Button_OnDeactivated(item)
```

Context

`Item`

Type: Object

Button at which the event occurs.

See also

Button (Page 1961)

Button_OnDown()

Description

The "OnDown" event occurs when the operator presses a button:

- A button is clicked with a mouse button.
- The <RETURN> or <SPACE> key is pressed when a button has the focus.
- A button is touched.

Order

The events are triggered in the following order:

1. OnDown
2. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
3. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
4. OnUp

Syntax

```
Button_OnDown(item,x,y,modifiers,trigger)
```

Context

`Item`

Type: Object

Button at which the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Button (Page 1961)

Button_OnKeyDown()

Description

The "OnKeyDown" event occurs when a button is pressed while the button is in focus. If the key is <RETURN> or <SPACE>, an "OnKeyDown" event is triggered before an "OnDown" event.

Syntax

```
Button_OnKeyDown(item,keyCode,modifiers)
```

Order

The events are triggered in the following order:

1. OnDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyDown
3. OnKeyUp
4. OnUp (if triggered by the <RETURN> or <SPACE> key)

Context

`Item`

Type: Object

Button at which the event occurs.

`keyCode`

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

`modifiers`

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Button (Page 1961)

Button_OnKeyUp()

Description

The "OnKeyUp" event occurs when a button is released while the button is in focus. If the key is <RETURN> or <SPACE>, an event "OnUp" is triggered after the event "OnKeyUp".

Syntax

```
Button_OnKeyUp(item,keyCode,modifiers)
```

Order

The events are triggered in the following order:

1. OnDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyDown
3. OnKeyUp
4. OnUp (if triggered by the <RETURN> or <SPACE> key)

Context

Item

Type: Object

Button at which the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Button (Page 1961)

Button_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A button is clicked with the left mouse button.
- The <RETURN> or <SPACE> key is pressed when a button has the focus.
- A button is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnDown
2. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
3. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
4. OnUp
5. OnTapped

Syntax

```
Button_OnTapped(item,x,y,modifiers,trigger)
```

Context

`Item`

Type: Object

Button at which the event occurs.

`x`

Type: DInt

X-coordinate of the input point

`y`

Type: DInt

Y-coordinate of the input point

`modifiers`

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Button (Page 1961)

Button_OnUp()

Description

The event "OnUp" occurs when the operator releases the pressure on a button via the input device:

- The mouse button is released via a button.
- The <RETURN> or <SPACE> key is released when a button has the focus.
- The touch of a button is canceled.
- A button is exited while pressed.

This event does not occur as long as the operator keeps the button pressed.

Order

The events are triggered in the following order:

1. OnDown
2. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
3. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
4. OnUp

Syntax

```
Button_OnUp(item,x,y,modifiers,trigger)
```

Context

Item

Type: Object

Button at which the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

Button (Page 1961)

CheckBoxGroup

Description

The "CheckBoxGroup" object represents a checkbox (group of checkboxes) in runtime.

Object type

HmiCheckBoxGroup

Properties

The "CheckBoxGroup" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the border color.
- **BorderWidth**
  Specifies the border thickness.
- **Content**
  Specifies the display options for text and graphics.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the checkbox.
- **Enabled**
  Specifies whether the checkbox can be operated in runtime.
- **Font**
  Specifies the font of the text.
- **ForeColor**
  Specifies the font color of the text.
- **Height**
  Specifies the height.
- **Layer**
  Returns the layer of the screen in which the checkbox is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the checkbox.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the checkbox is operable.
- **Padding**
  Specifies the distance of the content from the border of the checkbox.
- **Parent**
  Returns the higher-level screen object.

- **ProcessValue**
  Specifies the process value.
- **RenderingTemplate**
  Returns the name of the template from which the check box was created.
- **RequireExplicitUnlock**
  Returns whether the checkbox is only operable while the associated button is being pressed.
- **RotationAngle**
  Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the checkbox rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **SelectionItemHeight**
  Specifies the height of the checkbox entries.
- **SelectionItems**
  Returns the list of all the checkbox entries.
- **SelectorPosition**
  Specifies the horizontal alignment of the checkbox entries.
- **ShowFocusVisual**
  Specifies whether the checkbox is highlighted when in focus.
- **StyleItemClass**
  Returns the style which is applied to the checkbox.
- **TabIndex**
  Returns the position of the checkbox in the tab sequence.
- **ToolTipText**
  Specifies the tooltip text.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the checkbox is visible.
- **VisualizeQuality**
  Specifies whether the connection quality of the process value is displayed.
- **Width**
  Specifies the width.

Methods

The "CheckBoxGroup" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the checkbox.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "CheckBoxGroup" object has the following events:

- **OnActivated()**
  Occurs when a checkbox receives focus.
- **OnContextTapped()**
  Occurs when a checkbox is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when a checkbox loses focus.
- **OnKeyDown()**
  Occurs when a button is pressed while the checkbox is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the checkbox is in focus.
- **OnTapped()**
  Occurs when a checkbox is left-clicked or short-touched.

CheckBoxGroup.AlternateBackColor

Description

The "AlternateBackColor" specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
CheckBoxGroup.AlternateBackColor
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
CheckBoxGroup.AlternateBorderColor
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
CheckBoxGroup.Authorization
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
CheckBoxGroup.BackColor
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
CheckBoxGroup.BorderColor
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
CheckBoxGroup.BorderWidth
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.Content

Description

The "Content" property specifies the display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
CheckBoxGroup.Content
```

See also

CheckBoxGroup (Page 2010)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

CheckBoxGroup.Content (Page 2016)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

CheckBoxGroup.Content (Page 2016)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

CheckBoxGroup.Content (Page 2016)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

CheckBoxGroup.Content (Page 2016)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

CheckBoxGroup.Content (Page 2016)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

CheckBoxGroup.Content (Page 2016)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

CheckBoxGroup.Content (Page 2016)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

CheckBoxGroup.Content (Page 2016)

CheckBoxGroup.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the checkbox.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
CheckBoxGroup.CurrentQuality
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.Enabled

Description

The "Enabled" property specifies whether the checkbox can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
CheckBoxGroup.Enabled
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
CheckBoxGroup.Font
```

See also

CheckBoxGroup (Page 2010)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

CheckBoxGroup.Font (Page 2023)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

CheckBoxGroup.Font (Page 2023)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

CheckBoxGroup.Font (Page 2023)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

CheckBoxGroup.Font (Page 2023)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

CheckBoxGroup.Font (Page 2023)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

CheckBoxGroup.Font (Page 2023)

CheckBoxGroup.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
CheckBoxGroup.ForeColor
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
CheckBoxGroup.Height
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.Layer

Description

The "Layer" property returns the layer of the screen in which the checkbox is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
CheckBoxGroup.Layer
```

See also

CheckBoxGroup (Page 2010)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

CheckBoxGroup.Layer (Page 2027)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

CheckBoxGroup.Layer (Page 2027)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

CheckBoxGroup.Layer (Page 2027)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

CheckBoxGroup.Layer (Page 2027)

CheckBoxGroup.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
CheckBoxGroup.Left
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
CheckBoxGroup.Margin
```

See also

CheckBoxGroup (Page 2010)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

CheckBoxGroup.Margin (Page 2030)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

CheckBoxGroup.Margin (Page 2030)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

CheckBoxGroup.Margin (Page 2030)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

CheckBoxGroup.Margin (Page 2030)

CheckBoxGroup.Name

Description

The "Name" property returns the name of the checkbox.

Type

String

Access

Read-only

Syntax

```
CheckBoxGroup.Name
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.Opacity

Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

Type

Float

Access

Read-write

Syntax

```
CheckBoxGroup.Opacity
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.Operability

Description

The "Operability" property returns whether the checkbox is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
CheckBoxGroup.Operability
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the checkbox.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
CheckBoxGroup.Padding
```

See also

CheckBoxGroup (Page 2010)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

CheckBoxGroup.Padding (Page 2034)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

CheckBoxGroup.Padding (Page 2034)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

CheckBoxGroup.Padding (Page 2034)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

CheckBoxGroup.Padding (Page 2034)

CheckBoxGroup.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
CheckBoxGroup.Parent
```

See also

CheckBoxGroup (Page 2010)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

CheckBoxGroup.ProcessValue

Description

The "ProcessValue" property specifies the process value.

Type

Variant

Access

Read-write

Syntax

```
CheckBoxGroup.ProcessValue
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the checkbox was created.

Type

String

Access

Read-only

Syntax

```
CheckBoxGroup.RenderingTemplate
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the checkbox can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
CheckBoxGroup.RequireExplicitUnlock
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
CheckBoxGroup.RotationAngle
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.RotationCenterPlacement (Page 2040)

CheckBoxGroup.RotationCenterX (Page 2040)

CheckBoxGroup.RotationCenterY (Page 2041)

CheckBoxGroup.RotationCenterPlacement

Description

The "RotationCenterPlacement" property specifies the reference point around which the checkbox rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
CheckBoxGroup.RotationCenterPlacement
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.RotationAngle (Page 2039)

CheckBoxGroup.RotationCenterX (Page 2040)

CheckBoxGroup.RotationCenterY (Page 2041)

CheckBoxGroup.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
CheckBoxGroup.RotationCenterX
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.RotationAngle (Page 2039)

CheckBoxGroup.RotationCenterPlacement (Page 2040)

CheckBoxGroup.RotationCenterY (Page 2041)

CheckBoxGroup.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
CheckBoxGroup.RotationCenterY
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.RotationAngle (Page 2039)

CheckBoxGroup.RotationCenterPlacement (Page 2040)

CheckBoxGroup.RotationCenterX (Page 2040)

CheckBoxGroup.SelectionItemHeight

Description

The "SelectionItemHeight" property specifies the height of the checkbox entries. The value "0" indicates that the height is calculated automatically.

Type

UInt16

Access

Read-write

Syntax

```
CheckBoxGroup.SelectionItemHeight
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.SelectionItems

Description

The "SelectionItems" property returns the list of all checkbox entries ("SelectionItem" objects).

Type

Object, HmiSelectionItemCollection (Page 2043)

Access

Read-only

Syntax

```
CheckBoxGroup.SelectionItems
```

See also

CheckBoxGroup (Page 2010)

HmiSelectionItemCollection (Page 2043)

HmiSelectionItemCollection

Description

The "HmiSelectionItemCollection" object is a list of all entries ("SelectionItem" objects) of a list object.

Use

The "HmiSelectionItemCollection" object is a list and can be counted and enumerated. You can access the "HmiSelectionItemCollection" list using the index or the tag name.

Object type

HmiSelectionItemCollection

Properties

The "HmiSelectionItemCollection" object has the following properties:

- **Count**
  Returns the number of list entries of the "HmiSelectionItemCollection" list.

Methods

The "HmiSelectionItemCollection" object has the following methods:

- **Item()**
  Returns a list entry of the "HmiSelectionItemCollection" list.

See also

CheckBoxGroup.SelectionItems (Page 2042)

HmiSelectionItemCollection.Count

Description

The "Count" property returns the number of list entries in the "HmiSelectionItemCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiSelectionItemCollection.Count
```

See also

HmiSelectionItemCollection (Page 2043)

HmiSelectionItemCollection.Item()

Description

The "Item" method returns a list entry of the "HmiSelectionItemCollection" list.

Syntax

```
HmiSelectionItemCollection[.Item](HmiSelectionItemName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiSelectionItemCollection" object.

Parameters

`HmiSelectionItemName`

Type: String

Name of the list entry

Return value

Object, HmiSelectionItemPart (Page 2044)

See also

HmiSelectionItemCollection (Page 2043)

SelectionItem (Page 2044)

SelectionItem

Description

The "SelectionItem" object represents a list entry.

Object type

HmiSelectionItemPart

Properties

The "SelectionItem" object has the following properties:

- **Graphic**
  Specifies the graphic of the list entry.
- **IsSelected**
  Specifies whether the list entry is selected.
- **Text**
  Specifies the list entry text.

Methods

--

See also

HmiSelectionItemCollection (Page 2043)

SelectionItem.Graphic

Description

The "Graphic" property specifies the graphic of the list entry.

Type

String

Access

Read-write

Syntax

```
SelectionItem.Graphic
```

See also

SelectionItem (Page 2044)

SelectionItem.IsSelected

Description

The "IsSelected" property specifies whether the list entry is selected.

Type

Bool

Access

Read-write

Syntax

```
SelectionItem.IsSelected
```

See also

SelectionItem (Page 2044)

SelectionItem.Text

Description

The "Text" property specifies the text of the list entry.

Type

String

Access

Read-write

Syntax

```
SelectionItem.Text
```

See also

SelectionItem (Page 2044)

CheckBoxGroup.SelectorPosition

Description

The "SelectorPosition" property specifies the horizontal alignment of the checkbox entries.

Type

Int32, HmiHorizontalAlignment

Specifies the text alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched. Can only be used with layout containers, Fallback behaves like Center

Access

Read-write

Syntax

```
CheckBoxGroup.SelectorPosition
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the checkbox is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
CheckBoxGroup.ShowFocusVisual
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the checkbox.

Type

String

Access

Read-only

Syntax

```
CheckBoxGroup.StyleItemClass
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.TabIndex

Description

The "TabIndex" property returns the position of the checkbox in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
CheckBoxGroup.TabIndex
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
CheckBoxGroup.ToolTipText
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
CheckBoxGroup.Top
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.Visible

Description

The "Visible" property specifies whether the checkbox is visible.

Type

Bool

Access

Read-write

Syntax

```
CheckBoxGroup.Visible
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.VisualizeQuality

Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

Type

Bool

Access

Read-write

Syntax

```
CheckBoxGroup.VisualizeQuality
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
CheckBoxGroup.Width
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the checkbox.

Syntax

```
CheckBoxGroup.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
CheckBoxGroup.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

`propertyName`

Type: String

Name of the property for which flashing is configured.

`enable`

Type: Bool

Specifies that flashing is activated.

`value`

Optional, type: Variant

Value of the property for which flashing is configured.

`alternateValue`

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup_OnActivated()

Description

The "OnActivated" event occurs when a checkbox receives focus:

- A checkbox is selected via the configured tab sequence.
- A checkbox that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
CheckBoxGroup_OnActivated(item)
```

Context

item

Type: Object

Checkbox where the event occurs.

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A checkbox is right-clicked.
- A checkbox is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
CheckBoxGroup_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Checkbox where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key

- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup_OnDeactivated()

Description

The "OnDeactivated" event occurs when the checkbox loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
CheckBoxGroup_OnDeactivated(item)
```

Context

`item`

Type: Object

Checkbox where the event occurs.

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the checkbox is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
CheckBoxGroup_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

Checkbox where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the checkbox is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
CheckBoxGroup_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Checkbox where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

CheckBoxGroup (Page 2010)

CheckBoxGroup_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A checkbox is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a checkbox has the focus.
- A checkbox is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
CheckBoxGroup_OnTapped(item, x, y, modifiers, trigger)
```

Context

`item`

Type: Object

Checkbox where the event occurs.

`x`

Type: DInt

X-coordinate of the input point

`y`

Type: DInt

Y-coordinate of the input point

`modifiers`

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

CheckBoxGroup (Page 2010)

Circle

Description

The "Circle" object represents a circle in runtime.

Object type

HmiCircle

Properties

The "Circle" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BackFillPattern**
  Specifies the pattern of the background or the fill.
- **BorderColor**
  Specifies the border color.
- **BorderWidth**
  Specifies the border thickness.
- **CenterX**
  Specifies the X coordinate of the center.
- **CenterY**
  Sets the Y coordinate of the center.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the circle.
- **DashType**
  Specifies the stroke style of the border or line.
- **Enabled**
  Specifies whether the circle can be operated in runtime.
- **FillDirection**
  Specifies the direction from which the circle is filled.
- **FillLevel**
  Specifies the fill of the circle in percent.
- **Layer**
  Returns the layer of the screen in which the circle is located.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the circle.
- **Opacity**
  Specifies the opacity.

- **Operability**
  Returns whether the circle is operable.
- **Parent**
  Returns the higher-level screen object.
- **Radius**
  Specifies the radius.
- **RequireExplicitUnlock**
  Returns whether the circle is only operable while the associated button is being pressed.
- **RotationAngle**
  Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the circle rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ShowFillLevel**
  Specifies whether the fill level is displayed.
- **ShowFocusVisual**
  Specifies whether the circle is highlighted when in focus.
- **StyleItemClass**
  Returns the style which is applied to the circle.
- **TabIndex**
  Returns the position of the circle in the tab sequence.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the circle is visible.

Methods

The "Circle" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the circle.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "Circle" object has the following events:

- **OnActivated()**
  Occurs when a circle receives focus.
- **OnContextTapped()**
  Occurs when a circle is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when a circle loses focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the circle is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the circle is in focus.
- **OnTapped()**
  Occurs when a circle is left-clicked or short-touched.

Circle.AlternateBackColor

Description

The "AlternateBackColor" specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
Circle.AlternateBackColor
```

See also

Circle (Page 2059)

Circle.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
Circle.AlternateBorderColor
```

See also

Circle (Page 2059)

Circle.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
Circle.Authorization
```

See also

Circle (Page 2059)

Circle.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
Circle.BackColor
```

See also

Circle (Page 2059)

Circle.BackFillPattern

Description

The "BackFillPattern" property specifies the pattern of the background or the fill.

Type

Int32, HmiFillPattern

Specifies the filling:

- Solid (0): Solid
- Transparent (65536): Transparent
- Horizontal (131072): Horizontal
- Vertical (131073): Vertical
- ForwardDiagonal (131074): Forward diagonally striped
- BackwardDiagonal (131075): Backward diagonally striped
- Cross (131076): Grid
- DiagonalCross (131077): Diagonal grid
- GradientHorizontal (1048576): Horizontal gradient
- GradientVertical (1048577): Vertical gradient
- GradientForwardDiagonal (1048578): Gradient forward diagonal
- GradientBackwardDiagonal (1048579): Gradient backward diagonal
- GradientHorizontalTricolor (1048832): Horizontal tricolor gradient
- GradientVerticalTricolor (1048833): Gradient vertical tricolor

- GradientForwardDiagonalTricolor (1048834): Gradient forward diagonal tricolor
- GradientBackwardDiagonalTricolor (1048835): Gradient backward diagonal tricolor

Access

Read-write

Syntax

```
Circle.BackFillPattern
```

See also

Circle (Page 2059)
Circle.FillDirection (Page 2069)
Circle.FillLevel (Page 2070)
Circle.ShowFillLevel (Page 2081)

Circle.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
Circle.BorderColor
```

See also

Circle (Page 2059)

Circle.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
Circle.BorderWidth
```

See also

Circle (Page 2059)

Circle.CenterX

Description

The "CenterX" property specifies the X coordinate of the center.

Type

Int32

Access

Read-write

Syntax

```
Circle.CenterX
```

See also

Circle (Page 2059)

Circle.CenterY

Description

The "CenterY" property specifies the Y coordinate of the center.

Type

Int32

Access

Read-write

Syntax

```
Circle.CenterY
```

See also

Circle (Page 2059)

Circle.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the circle.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
Circle.CurrentQuality
```

See also

Circle (Page 2059)

Circle.DashType

Description

The "DashType" property specifies the dash type of the border or the line.

Type

Int32, HmiDashType

Specifies the dash type:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted
- DashDot (3): Dash-dot
- DashDotDot (4): Dash-dot-dot

Access

Read-write

Syntax

```
Circle.DashType
```

See also

Circle (Page 2059)

Circle.Enabled

Description

The "Enabled" property specifies whether the circle can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
Circle.Enabled
```

See also

Circle (Page 2059)

Circle.FillDirection

Description

The "FillDirection" property specifies the direction from which the circle is filled.

Type

Int32, HmiFillDirection

Specifies the filling direction:

- BottomToTop (0): From bottom to top
- TopToBottom (1): From top to bottom
- LeftToRight (2): From left to right
- RightToLeft (3): From right to left

Access

Read-write

Syntax

```
Circle.FillDirection
```

See also

Circle (Page 2059)

Circle.BackFillPattern (Page 2064)

Circle.FillLevel (Page 2070)
Circle.ShowFillLevel (Page 2081)

Circle.FillLevel

Description

The "FillLevel" property specifies the fill level of the circle in percent.

Type

UInt8

Access

Read-write

Syntax

```
Circle.FillLevel
```

See also

Circle (Page 2059)
Circle.BackFillPattern (Page 2064)
Circle.FillDirection (Page 2069)
Circle.ShowFillLevel (Page 2081)

Circle.Layer

Description

The "Layer" property returns the layer of the screen in which the circle is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
Circle.Layer
```

See also

Circle (Page 2059)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

Circle.Layer (Page 2070)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

Circle.Layer (Page 2070)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

Circle.Layer (Page 2070)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

Circle.Layer (Page 2070)

Circle.Margin

Description

The Margin property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
Circle.Margin
```

See also

Circle (Page 2059)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

Circle.Margin (Page 2073)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

Circle.Margin (Page 2073)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

Circle.Margin (Page 2073)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

Circle.Margin (Page 2073)

Circle.Name

Description

The "Name" property returns the name of the circle.

Type

String

Access

Read-only

Syntax

```
Circle.Name
```

See also

Circle (Page 2059)

Circle.Opacity

Description

The "Opacity" property specifies the opacity. The value "0" means completely transparent.

Type

Float

Access

Read-write

Syntax

```
Cricle.Opacity
```

See also

Circle (Page 2059)

Circle.Operability

Description

The "Operability" property returns whether the circle is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
Circle.Operability
```

See also

Circle (Page 2059)

Circle.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
Circle.Parent
```

See also

Circle (Page 2059)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

Circle.Radius

Description

The "Radius" property specifies the radius.

Type

UInt32

Access

Read-write

Syntax

```
Circle.Radius
```

See also

Circle (Page 2059)

Circle.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the circle can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
Circle.RequireExplicitUnlock
```

See also

Circle (Page 2059)

Circle.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
Circle.RotationAngle
```

See also

Circle (Page 2059)

Circle.RotationCenterPlacement (Page 2079)

Circle.RotationCenterX (Page 2080)

Circle.RotationCenterY (Page 2081)

Circle.RotationCenterPlacement

Description

The "RotationCenterPlacement" property sets the reference point around which the circle rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also be outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
Circle.RotationCenterPlacement
```

See also

Circle (Page 2059)

Circle.RotationAngle (Page 2079)

Circle.RotationCenterX (Page 2080)

Circle.RotationCenterY (Page 2081)

Circle.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
Circle.RotationCenterX
```

See also

Circle (Page 2059)

Circle.RotationAngle (Page 2079)

Circle.RotationCenterPlacement (Page 2079)

Circle.RotationCenterY (Page 2081)

Circle.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
Circle.RotationCenterY
```

See also

Circle (Page 2059)

Circle.RotationAngle (Page 2079)

Circle.RotationCenterPlacement (Page 2079)

Circle.RotationCenterX (Page 2080)

Circle.ShowFillLevel

Description

The "ShowFillLevel" property specifies whether the fill level is displayed.

Type

Bool

Access

Read-write

Syntax

```
Circle.ShowFillLevel
```

See also

Circle (Page 2059)
Circle.BackFillPattern (Page 2064)
Circle.FillDirection (Page 2069)
Circle.FillLevel (Page 2070)

Circle.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the circle is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
Circle.ShowFocusVisual
```

See also

Circle (Page 2059)

Circle.StyleItemClass

Description

The "StyleItemClass" property returns the style applied to the circle.

Type

String

Access

Read-only

Syntax

```
Circle.StyleItemClass
```

See also

Circle (Page 2059)

Circle.TabIndex

Description

The "TabIndex" property returns the position of the circle in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
Circle.TabIndex
```

See also

Circle (Page 2059)

Circle.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
Circle.ToolTipText
```

See also

Circle (Page 2059)

Circle.Visible

Description

The "Visible" property specifies whether the circle is visible.

Type

Bool

Access

Read-write

Syntax

```
Circle.Visible
```

See also

Circle (Page 2059)

Circle.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the circle.

Syntax

```
Circle.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

Circle (Page 2059)

Circle.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
Circle.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

Circle (Page 2059)

Circle_OnActivated()

Description

The "OnActivated" event occurs when a circle receives focus:

- A circle is selected via the configured tab sequence.
- A circle that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and receives focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
Circle_OnActivated(item)
```

Context

item

Type: Object

Circle at which the event occurs.

See also

Circle (Page 2059)

Circle_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A circle is clicked with the right mouse button.
- A circle is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
Circle_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Circle where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key

- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Circle (Page 2059)

Circle_OnDeactivated()

Description

The "OnDeactivated" event occurs when a circle loses focus when the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
Circle_OnDeactivated(item)
```

Context

`item`

Type: Object

Circle at which the event occurs.

See also

Circle (Page 2059)

Circle_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the circle is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Circle_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

Circle where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Circle (Page 2059)

Circle_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the circle is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Circle_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Circle where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Circle (Page 2059)

Circle_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A circle is clicked with the left mouse button.
- The <RETURN> or <SPACE> key is pressed when a circle has the focus.
- A circle is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
Circle_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Circle where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Circle (Page 2059)

CircleSegment

Description

The "CircleSegment" object represents a circle segment in runtime.

Object type

HmiCircleSegment

Properties

The "CircleSegment" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **AngleRange**
  Specifies the arc angle.
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BackFillPattern**
  Specifies the pattern of the background or the fill.
- **BorderColor**
  Specifies the border color.
- **BorderWidth**
  Specifies the border thickness.
- **CenterX**
  Specifies the X coordinate of the rotation point.
- **CenterY**
  Specifies the Y coordinate of the rotation point.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the circle segment.
- **DashType**
  Specifies the stroke style of the border or line.
- **Enabled**
  Specifies whether the circle segment can be operated in runtime.
- **FillDirection**
  Specifies the direction from which the circle segment is filled.
- **FillLevel**
  Specifies the fill of the circle segment in percent.
- **Layer**
  Returns the layer of the screen in which the circle segment is located.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the circle segment.

- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the circle segment is operable.
- **Parent**
  Returns the higher-level screen object.
- **Radius**
  Specifies the radius.
- **RequireExplicitUnlock**
  Returns whether the circle segment is only operable while the associated button is being pressed.
- **RotationAngle**
  Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the circle segment rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ShowFillLevel**
  Specifies whether the fill level is displayed.
- **ShowFocusVisual**
  Specifies whether the circle segment is highlighted when in focus.
- **StartAngle**
  Specifies the angle by which the start point deviates from the zero position (0°).
- **StyleItemClass**
  Returns the style which is applied to the circle segment.
- **TabIndex**
  Returns the position of the circle segment in the tab sequence.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the circle segment is visible.

Methods

The "CircleSegment" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the circle segment.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "CircleSegment" object has the following events:

- **OnActivated()**
  Occurs when a circle segment receives focus.
- **OnContextTapped()**
  Occurs when a circle segment is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when a circle segment loses focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the circle segment is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the circle segment is in focus.
- **OnTapped()**
  Occurs when a circle segment is left-clicked or short-touched.

CircleSegment.AlternateBackColor

Description

The "AlternateBackColor" specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
CircleSegment.AlternateBackColor
```

See also

CircleSegment (Page 2092)

CircleSegment.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
CircleSegment.AlternateBorderColor
```

See also

CircleSegment (Page 2092)

CircleSegment.AngleRange

Description

The AngleRange property specifies the arc angle clockwise.

Type

Int32

Access

Read-write

Syntax

```
CircleSegment.AngleRange
```

See also

CircleSegment (Page 2092)

CircleSegment.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
CircleSegment.Authorization
```

See also

CircleSegment (Page 2092)

CircleSegment.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
CircleSegment.BackColor
```

See also

CircleSegment (Page 2092)

CircleSegment.BackFillPattern

Description

The "BackFillPattern" property specifies the pattern of the background or the fill.

Type

Int32, HmiFillPattern

Specifies the filling:

- Solid (0): Solid
- Transparent (65536): Transparent

- Horizontal (131072): Horizontal
- Vertical (131073): Vertical
- ForwardDiagonal (131074): Forward diagonally striped
- BackwardDiagonal (131075): Backward diagonally striped
- Cross (131076): Grid
- DiagonalCross (131077): Diagonal grid
- GradientHorizontal (1048576): Horizontal gradient
- GradientVertical (1048577): Vertical gradient
- GradientForwardDiagonal (1048578): Gradient forward diagonal
- GradientBackwardDiagonal (1048579): Gradient backward diagonal
- GradientHorizontalTricolor (1048832): Horizontal tricolor gradient
- GradientVerticalTricolor (1048833): Gradient vertical tricolor
- GradientForwardDiagonalTricolor (1048834): Gradient forward diagonal tricolor
- GradientBackwardDiagonalTricolor (1048835): Gradient backward diagonal tricolor

Access

Read-write

Syntax

```
CircleSegment.BackFillPattern
```

See also

CircleSegment (Page 2092)
CircleSegment.FillDirection (Page 2102)
CircleSegment.FillLevel (Page 2103)
CircleSegment.ShowFillLevel (Page 2114)

CircleSegment.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
CircleSegment.BorderColor
```

See also

CircleSegment (Page 2092)

CircleSegment.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
CircleSegment.BorderWidth
```

See also

CircleSegment (Page 2092)

CircleSegment.CenterX

Description

The "CenterX" property specifies the X coordinate of the rotation point.

Type

Int32

Access

Read-write

Syntax

```
CircleSegment.CenterX
```

See also

CircleSegment (Page 2092)

CircleSegment.CenterY

Description

The "CenterY" property specifies the Y coordinate of the rotation point.

Type

Int32

Access

Read-write

Syntax

```
CircleSegment.CenterY
```

See also

CircleSegment (Page 2092)

CircleSegment.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the circle segment.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.

- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
CircleSegment.CurrentQuality
```

See also

CircleSegment (Page 2092)

CircleSegment.DashType

Description

The "DashType" property specifies the dash type of the border or the line.

Type

Int32, HmiDashType

Specifies the dash type:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted
- DashDot (3): Dash-dot
- DashDotDot (4): Dash-dot-dot

Access

Read-write

Syntax

```
CircleSegment.DashType
```

See also

CircleSegment (Page 2092)

CircleSegment.Enabled

Description

The "Enabled" property specifies whether the circle segment can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
CircleSegment.Enabled
```

See also

CircleSegment (Page 2092)

CircleSegment.FillDirection

Description

The "FillDirection" property specifies the direction from which the circle segment is filled.

Type

Int32, HmiFillDirection

Specifies the filling direction:

- BottomToTop (0): From bottom to top
- TopToBottom (1): From top to bottom
- LeftToRight (2): From left to right
- RightToLeft (3): From right to left

Access

Read-write

Syntax

```
CircleSegment.FillDirection
```

See also

CircleSegment (Page 2092)
CircleSegment.BackFillPattern (Page 2097)
CircleSegment.FillLevel (Page 2103)
CircleSegment.ShowFillLevel (Page 2114)

CircleSegment.FillLevel

Description

The "FillLevel" property specifies the fill level of the circle segment in percent.

Type

UInt8

Access

Read-write

Syntax

```
CircleSegment.FillLevel
```

See also

CircleSegment (Page 2092)
CircleSegment.BackFillPattern (Page 2097)
CircleSegment.FillDirection (Page 2102)
CircleSegment.ShowFillLevel (Page 2114)

CircleSegment.Layer

Description

The "Layer" property returns the layer of the screen in which the circle segment is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
CircleSegment.Layer
```

See also

CircleSegment (Page 2092)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

CircleSegment.Layer (Page 2103)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

CircleSegment.Layer (Page 2103)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

CircleSegment.Layer (Page 2103)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

CircleSegment.Layer (Page 2103)

CircleSegment.Margin

Description

The Margin property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
CircleSegment.Margin
```

See also

CircleSegment (Page 2092)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

CircleSegment.Margin (Page 2106)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

CircleSegment.Margin (Page 2106)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

CircleSegment.Margin (Page 2106)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

CircleSegment.Margin (Page 2106)

CircleSegment.Name

Description

The "Name" property returns the name of the circle segment.

Type

String

Access

Read-only

Syntax

```
CircleSegment.Name
```

See also

CircleSegment (Page 2092)

CircleSegment.Opacity

Description

The "Opacity" property specifies the opacity. The value "0" means completely transparent.

Type

Float

Access

Read-write

Syntax

```
CircleSegment.Opacity
```

See also

CircleSegment (Page 2092)

CircleSegment.Operability

Description

The "Operability" property returns whether the circle segment is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.

- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
CircleSegment.Operability
```

See also

CircleSegment (Page 2092)

CircleSegment.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
CircleSegment.Parent
```

See also

CircleSegment (Page 2092)
Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

CircleSegment.Radius

Description

The "Radius" property specifies the radius.

Type

UInt32

Access

Read-write

Syntax

```
CircleSegment.Radius
```

See also

CircleSegment (Page 2092)

CircleSegment.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the circle segment can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
CircleSegment.RequireExplicitUnlock
```

See also

CircleSegment (Page 2092)

CircleSegment.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
CircleSegment.RotationAngle
```

See also

CircleSegment (Page 2092)

CircleSegment.RotationCenterPlacement (Page 2112)

CircleSegment.RotationCenterX (Page 2113)

CircleSegment.RotationCenterY (Page 2114)

CircleSegment.RotationCenterPlacement

Description

The "RotationCenterPlacement" property sets the reference point around which the circle segment rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also be outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
CircleSegment.RotationCenterPlacement
```

See also

CircleSegment (Page 2092)

CircleSegment.RotationAngle (Page 2112)

CircleSegment.RotationCenterX (Page 2113)

CircleSegment.RotationCenterY (Page 2114)

CircleSegment.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
CircleSegment.RotationCenterX
```

See also

CircleSegment (Page 2092)

CircleSegment.RotationAngle (Page 2112)

CircleSegment.RotationCenterPlacement (Page 2112)

CircleSegment.RotationCenterY (Page 2114)

CircleSegment.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
CircleSegment.RotationCenterY
```

See also

CircleSegment (Page 2092)

CircleSegment.RotationAngle (Page 2112)

CircleSegment.RotationCenterPlacement (Page 2112)

CircleSegment.RotationCenterX (Page 2113)

CircleSegment.ShowFillLevel

Description

The "ShowFillLevel" property specifies whether the fill level is displayed.

Type

Bool

Access

Read-write

Syntax

```
CircleSegment.ShowFillLevel
```

See also

CircleSegment (Page 2092)

CircleSegment.BackFillPattern (Page 2097)

CircleSegment.FillDirection (Page 2102)

CircleSegment.FillLevel (Page 2103)

CircleSegment.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the circle segment is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
CircleSegment.ShowFocusVisual
```

See also

CircleSegment (Page 2092)

CircleSegment.StartAngle

Description

The "StartAngle" specifies the angle by which the start point deviates from the zero position (0° corresponds to 3 o'clock).

Type

Int32

Access

Read-write

Syntax

```
CircleSegment.StartAngle
```

See also

CircleSegment (Page 2092)

CircleSegment.StyleItemClass

Description

The "StyleItemClass" property returns the style applied to the circle segment.

Type

String

Access

Read-only

Syntax

```
CircleSegment.StyleItemClass
```

See also

CircleSegment (Page 2092)

CircleSegment.TabIndex

Description

The "TabIndex" property returns the position of the circle segment in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
CircleSegment.TabIndex
```

See also

CircleSegment (Page 2092)

CircleSegment.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
CircleSegment.ToolTipText
```

See also

CircleSegment (Page 2092)

CircleSegment.Visible

Description

The "Visible" property specifies whether the circle segment is visible.

Type

Bool

Access

Read-write

Syntax

```
CircleSegment.Visible
```

See also

CircleSegment (Page 2092)

CircleSegment.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the circle segment.

Syntax

```
CircleSegment.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

CircleSegment (Page 2092)

CircleSegment.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
CircleSegment.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

`propertyName`

Type: String

Name of the property for which flashing is configured.

`enable`

Type: Bool

Specifies that flashing is activated.

`value`

Optional, type: Variant

Value of the property for which flashing is configured.

`alternateValue`

Optional, type: Variant

Specifies the second value for flashing.

`rate`

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

CircleSegment (Page 2092)

CircleSegment_OnActivated()

Description

The "OnActivated" event occurs when a circle segment receives focus:

- A circle segment is selected via the configured tab sequence.
- A circle segment that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and receives focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
CircleSegment_OnActivated(item)
```

Context

`item`

Type: Object

Circle segment at which the event occurs.

See also

CircleSegment (Page 2092)

CircleSegment_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A circle segment is clicked with the right mouse button.
- A circle segment is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
CircleSegment_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Circle segment where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

CircleSegment (Page 2092)

CircleSegment_OnDeactivated()

Description

The "OnDeactivated" event occurs when a circle segment loses focus when the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
CircleSegment_OnDeactivated(item)
```

Context

`item`

Type: Object

Circle segment at which the event occurs.

See also

CircleSegment (Page 2092)

CircleSegment_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the circle segment is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
CircleSegment_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

Circle segment where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

CircleSegment (Page 2092)

CircleSegment_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the circle segment is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
CircleSegment_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Circle segment where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

CircleSegment (Page 2092)

CircleSegment_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A circle segment is clicked with the left mouse button.
- The <RETURN> or <SPACE> key is pressed when a circle segment has the focus.
- A circle segment is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
CircleSegment_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Circle segment where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

CircleSegment (Page 2092)

CircularArc

Description

The "CircularArc" object represents a circular arc in runtime.

Object type

HmiCircularArc

Properties

The "CircularArc" object has the following properties:

- **AlternateLineColor**
  Specifies the second line color which is displayed for line styles such as "Dash".
- **AngleRange**
  Specifies the arc angle.
- **Authorization**
  Returns the operator authorization.
- **CapType**
  Specifies the shape of the line ends.
- **CenterX**
  Specifies the X coordinate of the rotation point.
- **CenterY**
  Specifies the Y coordinate of the rotation point.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the circular arc.
- **DashType**
  Specifies the stroke style of the border or line.
- **Enabled**
  Specifies whether the circular arc can be operated in runtime.
- **EndType**
  Specifies the type of line end.
- **Layer**
  Returns the layer of the screen in which the circular arc is located.
- **LineColor**
  Specifies the line color.
- **LineWidth**
  Specifies the line thickness.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the circular arc.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the circular arc is operable.
- **Parent**
  Returns the higher-level screen object.
- **Radius**
  Specifies the radius.
- **RequireExplicitUnlock**
  Returns whether the circular arc is only operable while the associated button is being pressed.

- **RotationAngle**
  Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the circular arc rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**
  Specifies whether the circular arc is highlighted when in focus.
- **StartAngle**
  Specifies the angle by which the start point deviates from the zero position (0°).
- **StartType**
  Specifies the type of line start.
- **StyleItemClass**
  Returns the style which is applied to the circular arc.
- **TabIndex**
  Returns the position of the circular arc in the tab sequence.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the circular arc is visible.

Methods

The "CircularArc" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the circular arc.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "CircularArc" object has the following events:

- **OnActivated()**
  Occurs when a circular arc receives focus.
- **OnContextTapped()**
  Occurs when a circular arc is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when a circular arc loses focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the circular arc is in focus.

- **OnKeyUp()**
  Occurs when a key is released while the circular arc is in focus.
- **OnTapped()**
  Occurs when a circular arc is left-clicked or short-touched.

CircularArc.AlternateLineColor

Description

The "AlternateLineColor" property specifies the second line color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
CircularArc.AlternateLineColor
```

See also

CircularArc (Page 2126)

CircularArc.AngleRange

Description

The AngleRange property specifies the arc angle clockwise.

Type

Int32

Access

Read-write

Syntax

```
CircularArc.AngleRange
```

See also

CircularArc (Page 2126)

CircularArc.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
CircularArc.Authorization
```

See also

CircularArc (Page 2126)

CircularArc.CapType

Description

The "CapType" property specifies the shape of the line ends.

Type

Int32, HmiCapType

Specifies the line ends:

- Round (0): Round (line extends beyond the line end point with half the line thickness)
- Square (256): Square (line extends beyond the line end point with half the line thickness)
- Flat (512): Justified (line ends at the line end point)

Access

Read-write

Syntax

```
CircularArc.CapType
```

See also

CircularArc (Page 2126)

CircularArc.CenterX

Description

The "CenterX" property specifies the X coordinate of the rotation point.

Type

Int32

Access

Read-write

Syntax

```
CircularArc.CenterX
```

See also

CircularArc (Page 2126)

CircularArc.CenterY

Description

The "CenterY" property specifies the Y coordinate of the rotation point.

Type

Int32

Access

Read-write

Syntax

```
CircularArc.CenterY
```

See also

CircularArc (Page 2126)

CircularArc.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the circular arc.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
CircularArc.CurrentQuality
```

See also

CircularArc (Page 2126)

CircularArc.DashType

Description

The "DashType" property specifies the dash type of the border or the line.

Type

Int32, HmiDashType

Specifies the dash type:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted
- DashDot (3): Dash-dot
- DashDotDot (4): Dash-dot-dot

Access

Read-write

Syntax

```
CircularArc.DashType
```

See also

CircularArc (Page 2126)

CircularArc.Enabled

Description

The "Enabled" property specifies whether the circular arc can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
CircularArc.Enabled
```

See also

CircularArc (Page 2126)

CircularArc.EndType

Description

The "EndType" property specifies the type of line end.

Type

Int32, HmiLineEndType

Specifies the end of the line:

- Line (0): Line
- EmptyArrow (1): Empty arrow
- Arrow (2): Arrow
- ReversedArrow (3): Reversed arrow
- EmptyCircle (5): Empty circle
- Circle (6): Circle

Access

Read-write

Syntax

```
CircularArc.EndType
```

See also

CircularArc (Page 2126)

CircularArc.Layer

Description

The "Layer" property returns the layer of the screen in which the circular arc is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
CircularArc.Layer
```

See also

CircularArc (Page 2126)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

CircularArc.Layer (Page 2134)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

CircularArc.Layer (Page 2134)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

CircularArc.Layer (Page 2134)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

CircularArc.Layer (Page 2134)

CircularArc.LineColor

Description

The "LineColor" property specifies the line color.

Type

UInt32

Access

Read-write

Syntax

```
CircularArc.LineColor
```

See also

CircularArc (Page 2126)

CircularArc.LineWidth

Description

The "LineWidth" property specifies the line thickness.

Type

UInt8

Access

Read-write

Syntax

```
CircularArc.LineWidth
```

See also

CircularArc (Page 2126)

CircularArc.Margin

Description

The Margin property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
CircularArc.Margin
```

See also

CircularArc (Page 2126)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

CircularArc.Margin (Page 2138)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

CircularArc.Margin (Page 2138)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

CircularArc.Margin (Page 2138)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

CircularArc.Margin (Page 2138)

CircularArc.Name

Description

The "Name" property returns the name of the circular arc.

Type

String

Access

Read-only

Syntax

```
CircularArc.Name
```

See also

CircularArc (Page 2126)

CircularArc.Opacity

Description

The "Opacity" property specifies the opacity. The value "0" means completely transparent.

Type

Float

Access

Read-write

Syntax

```
CircularArc.Opacity
```

See also

CircularArc (Page 2126)

CircularArc.Operability

Description

The "Operability" property returns whether the circular arc is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
CircularArc.Operability
```

See also

CircularArc (Page 2126)

CircularArc.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
CircularArc.Parent
```

See also

CircularArc (Page 2126)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

CircularArc.Radius

Description

The "Radius" property specifies the radius.

Type

UInt32

Access

Read-write

Syntax

```
CircularArc.Radius
```

See also

CircularArc (Page 2126)

CircularArc.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the circular arc can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
CircularArc.RequireExplicitUnlock
```

See also

CircularArc (Page 2126)

CircularArc.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
CircularArc.RotationAngle
```

See also

CircularArc (Page 2126)

CircularArc.RotationCenterPlacement (Page 2144)

CircularArc.RotationCenterX (Page 2145)

CircularArc.RotationCenterY (Page 2145)

CircularArc.RotationCenterPlacement

Description

The "RotationCenterPlacement" property sets the reference point around which the circular arc rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also be outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
CircularArc.RotationCenterPlacement
```

See also

CircularArc (Page 2126)

CircularArc.RotationAngle (Page 2143)

CircularArc.RotationCenterX (Page 2145)

CircularArc.RotationCenterY (Page 2145)

CircularArc.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
CircularArc.RotationCenterX
```

See also

CircularArc (Page 2126)

CircularArc.RotationAngle (Page 2143)

CircularArc.RotationCenterPlacement (Page 2144)

CircularArc.RotationCenterY (Page 2145)

CircularArc.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
CircularArc.RotationCenterY
```

See also

CircularArc (Page 2126)

CircularArc.RotationAngle (Page 2143)

CircularArc.RotationCenterX (Page 2145)

CircularArc.RotationCenterPlacement (Page 2144)

CircularArc.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the circular arc is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
CircularArc.ShowFocusVisual
```

See also

CircularArc (Page 2126)

CircularArc.StartAngle

Description

The "StartAngle" specifies the angle by which the start point deviates from the zero position (0° corresponds to 3 o'clock).

Type

Int32

Access

Read-write

Syntax

```
CircularArc.StartAngle
```

See also

CircularArc (Page 2126)

CircularArc.StartType

Description

The "StartType" property specifies the type of line start.

Type

Int32, HmiLineEndType

Specifies the start of the line:

- Line (0): Line
- EmptyArrow (1): Empty arrow
- Arrow (2): Arrow
- ReversedArrow (3): Reversed arrow
- EmptyCircle (5): Empty circle
- Circle (6): Circle

Access

Read-write

Syntax

```
CircularArc.StartType
```

See also

CircularArc (Page 2126)

CircularArc.StyleItemClass

Description

The "StyleItemClass" property returns the style applied to the circular arc.

Type

String

Access

Read-only

Syntax

```
CircularArc.StyleItemClass
```

See also

CircularArc (Page 2126)

CircularArc.TabIndex

Description

The "TabIndex" property returns the position of the circular arc in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
CircularArc.TabIndex
```

See also

CircularArc (Page 2126)

CircularArc.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
CircularArc.ToolTipText
```

See also

CircularArc (Page 2126)

CircularArc.Visible

Description

The "Visible" property specifies whether the circular arc is visible.

Type

Bool

Access

Read-write

Syntax

```
CircularArc.Visible
```

See also

CircularArc (Page 2126)

CircularArc.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the circular arc.

Syntax

```
CircularArc.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

CircularArc (Page 2126)

CircularArc.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
CircularArc.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

`propertyName`

Type: String

Name of the property for which flashing is configured.

`enable`

Type: Bool

Specifies that flashing is activated.

`value`

Optional, type: Variant

Value of the property for which flashing is configured.

`alternateValue`

Optional, type: Variant

Specifies the second value for flashing.

`rate`

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

CircularArc (Page 2126)

CircularArc_OnActivated()

Description

The "OnActivated" event occurs when a circular arc receives focus:

- A circular arc is selected via the configured tab sequence.
- A circular arc that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and receives focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
CircularArc_OnActivated(item)
```

Context

`item`

Type: Object

Circle segment at which the event occurs.

See also

CircularArc (Page 2126)

CircularArc_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A circular arc is clicked with the right mouse button.
- A circular arc is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
CircularArc_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Circular arc where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

CircularArc (Page 2126)

CircularArc_OnDeactivated()

Description

The "OnDeactivated" event occurs when an arc loses focus when the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
CircularArc_OnDeactivated(item)
```

Context

`item`

Type: Object

Circle segment at which the event occurs.

See also

CircularArc (Page 2126)

CircularArc_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the circular arc is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
CircularArc_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

Circular arc where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

CircularArc (Page 2126)

CircularArc_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the circular arc is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
CircularArc_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Circular arc where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

CircularArc (Page 2126)

CircularArc_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A circular arc is clicked with the left mouse button.
- The <RETURN> or <SPACE> key is pressed when a circular arc has the focus.
- A circular arc is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
CircularArc_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Circular arc where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

CircularArc (Page 2126)

Clock

Description

The "Clock" object represents a clock in runtime.

Object type

HmiClock

Properties

The "Clock" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the border color.
- **BorderWidth**
  Specifies the border thickness.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the clock.
- **DialBackColor**
  Specifies the background color of the dial.
- **DialLabelColor**
  Specifies the color of the dial label.
- **DialLabelFont**
  Specifies the font of the dial.
- **DialMode**
  Specifies the details of the dial that are displayed.
- **DialTickColor**
  Specifies the color of the dial divisions.
- **Enabled**
  Specifies whether the clock can be operated in runtime.
- **Height**
  Specifies the height.
- **Layer**
  Returns the layer of the screen in which the clock is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the clock.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the clock is operable.

- **Parent**
  Returns the higher-level screen object.
- **RenderingTemplate**
  Returns the name of the template from which the clock was created.
- **RequireExplicitUnlock**
  Returns whether the clock is only operable while the associated button is being pressed.
- **RotationAngle**
  Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the clock rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**
  Specifies whether the clock is highlighted when in focus.
- **ShowHours**
  Specifies whether the hour hand is displayed.
- **ShowMinutes**
  Specifies whether the minute hand is displayed.
- **ShowSeconds**
  Specifies whether the second hand is displayed.
- **StyleItemClass**
  Returns the style which is applied to the clock.
- **TabIndex**
  Returns the position of the clock in the tab sequence.
- **TimeSource**
  Specifies the source for the displayed time.
- **Title**
  Specifies the caption which appears as the title.
- **ToolTipText**
  Specifies the tooltip text.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the clock is visible.
- **VisualizeQuality**
  Specifies whether the connection quality of the process value is displayed.
- **Width**
  Specifies the width.

Methods

The "Clock" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the clock.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "Clock" object has the following events:

- **OnActivated()**
  Occurs when a clock receives focus.
- **OnContextTapped()**
  Occurs when a clock is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when a clock loses focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the clock is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the clock is in focus.
- **OnTapped()**
  Occurs when a clock is left-clicked or short-touched.

Clock.AlternateBackColor

Description

The "AlternateBackColor" specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
Clock.AlternateBackColor
```

See also

Clock (Page 2158)

Clock.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
Clock.AlternateBorderColor
```

See also

Clock (Page 2158)

Clock.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
Clock.Authorization
```

See also

Clock (Page 2158)

Clock.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
Clock.BackColor
```

See also

Clock (Page 2158)

Clock.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
Clock.BorderColor
```

See also

Clock (Page 2158)

Clock.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
Clock.BorderWidth
```

See also

Clock (Page 2158)

Clock.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the clock.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
Clock.CurrentQuality
```

See also

Clock (Page 2158)

Clock.DialBackColor

Description

The "DialBackColor" property specifies the background color of the dial.

Type

UInt32

Access

Read-write

Syntax

```
Clock.DialBackColor
```

See also

Clock (Page 2158)

Clock.DialLabelColor

Description

The "DialLabelColor" property specifies the color of the dial labeling.

Type

UInt32

Access

Read-write

Syntax

```
Clock.DialLabelColor
```

See also

Clock (Page 2158)

Clock.DialLabelFont

Description

The "DialLabelFont" property specifies the font of the dial.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Clock.DialLabelFont
```

See also

Clock (Page 2158)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Clock.DialLabelFont (Page 2166)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Clock.DialLabelFont (Page 2166)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Clock.DialLabelFont (Page 2166)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Clock.DialLabelFont (Page 2166)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Clock.DialLabelFont (Page 2166)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Clock.DialLabelFont (Page 2166)

Clock.DialMode

Description

The "DialMode" property specifies the details of the dial that are displayed.

Type

Int32, HmiScaleMode

Specifies the displayed details:

- None (0): None
- Labels (1): Labels
- Ticks (2): Tick marks

Access

Read-write

Syntax

```
Clock.DialMode
```

See also

Clock (Page 2158)

Clock.DialTickColor

Description

The "DialTickColor" property specifies the color of the dial divisions.

Type

UInt32

Access

Read-write

Syntax

```
Clock.DialTickColor
```

See also

Clock (Page 2158)

Clock.Enabled

Description

The "Enabled" property specifies whether the parameter set display can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
Clock.Enabled
```

See also

Clock (Page 2158)

Clock.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Clock.Height
```

See also

Clock (Page 2158)

Clock.Layer

Description

The "Layer" property returns the layer of the screen in which the parameter set display is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
Clock.Layer
```

See also

Clock (Page 2158)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

Clock.Layer (Page 2172)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

Clock.Layer (Page 2172)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

Clock.Layer (Page 2172)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

Clock.Layer (Page 2172)

Clock.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
Clock.Left
```

See also

Clock (Page 2158)

Clock.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
Clock.Margin
```

See also

Clock (Page 2158)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

Clock.Margin (Page 2175)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

Clock.Margin (Page 2175)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

Clock.Margin (Page 2175)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

Clock.Margin (Page 2175)

Clock.Name

Description

The "Name" property returns the name of the clock.

Type

String

Access

Read-only

Syntax

```
Clock.Name
```

See also

Clock (Page 2158)

Clock.Opacity

Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

Type

Float

Access

Read-write

Syntax

```
Clock.Opacity
```

See also

Clock (Page 2158)

Clock.Operability

Description

The "Operability" property returns whether the clock is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
Clock.Operability
```

See also

Clock (Page 2158)

Clock.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
Clock.Parent
```

See also

Clock (Page 2158)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

Clock.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the clock was created.

Type

String

Access

Read-only

Syntax

```
Clock.RenderingTemplate
```

See also

Clock (Page 2158)

Clock.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the clock can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
Clock.RequireExplicitUnlock
```

See also

Clock (Page 2158)

Clock.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
Clock.RotationAngle
```

See also

Clock (Page 2158)

Clock.RotationCenterPlacement (Page 2181)

Clock.RotationCenterX (Page 2182)

Clock.RotationCenterY (Page 2182)

Clock.RotationCenterPlacement

Description

The "RotationCenterPlacement" property specifies the reference point around which the clock rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
Clock.RotationCenterPlacement
```

See also

Clock (Page 2158)

Clock.RotationAngle (Page 2180)

Clock.RotationCenterX (Page 2182)

Clock.RotationCenterY (Page 2182)

Clock.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
Clock.RotationCenterX
```

See also

Clock (Page 2158)

Clock.RotationAngle (Page 2180)

Clock.RotationCenterPlacement (Page 2181)

Clock.RotationCenterY (Page 2182)

Clock.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
Clock.RotationCenterY
```

See also

Clock (Page 2158)
Clock.RotationAngle (Page 2180)
Clock.RotationCenterPlacement (Page 2181)
Clock.RotationCenterX (Page 2182)

Clock.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the clock is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
Clock.ShowFocusVisual
```

See also

Clock (Page 2158)

Clock.ShowHours

Description

The "ShowHours" property specifies whether the hour hand is displayed.

Type

Bool

Access

Read-write

Syntax

```
Clock.ShowHours
```

See also

Clock (Page 2158)
Clock.ShowMinutes (Page 2184)
Clock.ShowSeconds (Page 2184)

Clock.ShowMinutes

Description

The "ShowMinutes" property specifies whether the minute hand is displayed.

Type

Bool

Access

Read-write

Syntax

```
Clock.ShowMinutes
```

See also

Clock (Page 2158)
Clock.ShowHours (Page 2183)
Clock.ShowSeconds (Page 2184)

Clock.ShowSeconds

Description

The "ShowSeconds" property specifies whether the second hand is displayed.

Type

Bool

Access

Read-write

Syntax

```
Clock.ShowSeconds
```

See also

Clock (Page 2158)
Clock.ShowHours (Page 2183)
Clock.ShowMinutes (Page 2184)

Clock.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the clock.

Type

String

Access

Read-only

Syntax

```
Clock.StyleItemClass
```

See also

Clock (Page 2158)

Clock.TabIndex

Description

The "TabIndex" property returns the position of the clock in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
Clock.TabIndex
```

See also

Clock (Page 2158)

Clock.TimeSource

Description

The "TimeSource" property specifies the source for the displayed time. If the property is not configured, local time is used.

Type

Variant

Access

Read-write

Syntax

```
Clock.TimeSource
```

See also

Clock (Page 2158)

Clock.Title

Description

The "Title" property specifies the caption that appears as the title.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
Clock.Title
```

See also

Clock (Page 2158)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

Clock.Title (Page 2186)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 2187)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 2187)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 2187)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 2187)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 2187)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 2187)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

Clock.Title (Page 2186)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

Clock.Title (Page 2186)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

Clock.Title (Page 2186)

Clock.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
Clock.ToolTipText
```

See also

Clock (Page 2158)

Clock.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
Clock.Top
```

See also

Clock (Page 2158)

Clock.Visible

Description

The "Visible" property specifies whether the clock is visible.

Type

Bool

Access

Read-write

Syntax

```
Clock.Visible
```

See also

Clock (Page 2158)

Clock.VisualizeQuality

Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

Type

Bool

Access

Read-write

Syntax

```
Clock.VisualizeQuality
```

See also

Clock (Page 2158)

Clock.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Clock.Width
```

See also

Clock (Page 2158)

Clock.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the clock.

Syntax

```
Clock.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

Clock (Page 2158)

Clock.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
Clock.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

`propertyName`

Type: String

Name of the property for which flashing is configured.

`enable`

Type: Bool

Specifies that flashing is activated.

`value`

Optional, type: Variant

Value of the property for which flashing is configured.

`alternateValue`

Optional, type: Variant

Specifies the second value for flashing.

`rate`

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

Clock (Page 2158)

Clock_OnActivated()

Description

The "OnActivated" event occurs when a clock receives focus:

- A clock is selected via the configured tab sequence.
- A clock that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
Clock_OnActivated(item)
```

Context

item

Type: Object

Clock where the event occurs.

See also

Clock (Page 2158)

Clock_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A clock is right-clicked.
- A clock is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
Clock_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

`item`

Type: Object

Clock where the event occurs.

`x`

Type: DInt

X-coordinate of the input point

`y`

Type: DInt

Y-coordinate of the input point

`modifiers`

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Clock (Page 2158)

Clock_OnDeactivated()

Description

The "OnDeactivated" event occurs when the clock loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
Clock_OnDeactivated(item)
```

Context

item

Type: Object

Clock where the event occurs.

See also

Clock (Page 2158)

Clock_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the clock is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Clock_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

Clock where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Clock (Page 2158)

Clock_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the clock is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Clock_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Clock where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Clock (Page 2158)

Clock_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A clock is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a clock has the focus.
- A clock is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
Clock_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Clock where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Clock (Page 2158)

ComboBox

Description

The "ComboBox" object represents a combo box in runtime. The combo box is a combination of text box and list box.

Object type

HmiComboBox

Properties

The "ComboBox" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the border color.
- **BorderWidth**
  Specifies the border width.
- **Content**
  Specifies display options for text and graphics.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the combo box.
- **Enabled**
  Specifies whether the combo box can be operated in runtime.
- **Font**
  Specifies the font of the text.
- **ForeColor**
  Specifies the font color of the text.
- **Height**
  Specifies the height.
- **Layer**
  Returns the screen layer in which the combo box is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the combo box.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the combo box is operable.
- **Padding**
  Specifies the distance of the content from the border of the combo box.
- **Parent**
  Returns the higher-level screen object.

- **ProcessValue**
  Specifies the process value.
- **RenderingTemplate**
  Returns the name of the template from which the combo box was created.
- **RequireExplicitUnlock**
  Returns whether the combo box is only operable while the corresponding button is being pressed.
- **RotationAngle**
  Specifies the rotation angle in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the combo box rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **SelectionItemHeight**
  Specifies the height of the list entries.
- **SelectionItems**
  Returns the list of all list entries in the combo box.
- **SelectionMode**
  Specifies whether one or more list entries can be selected in the combo box.
- **SelectorPosition**
  Specifies the horizontal alignment of the list entries.
- **ShowFocusVisual**
  Specifies whether the combo box is highlighted when in focus.
- **StyleItemClass**
  Returns the style which is applied to the combo box.
- **TabIndex**
  Returns the position of the combo box in the tab sequence.
- **ToolTipText**
  Specifies the tooltip text.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the combo box is visible.
- **VisualizeQuality**
  Specifies whether the connection quality of the process value is displayed.
- **Width**
  Specifies the width.

Methods

The "ComboBox" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the combo box.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "ComboBox" object has the following events:

- **OnActivated()**
  Occurs when a combo box receives focus.
- **OnContextTapped()**
  Occurs when a combo box is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when a combo box loses focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the combo box is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the combo box is in focus.
- **OnTapped()**
  Occurs when a combo box is left-clicked or short-touched.

ComboBox.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ComboBox.AlternateBackColor
```

See also

ComboBox (Page 2203)

ComboBox.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ComboBox.AlternateBorderColor
```

See also

ComboBox (Page 2203)

ComboBox.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ComboBox.Authorization
```

See also

ComboBox (Page 2203)

ComboBox.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ComboBox.BackColor
```

See also

ComboBox (Page 2203)

ComboBox.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ComboBox.BorderColor
```

See also

ComboBox (Page 2203)

ComboBox.BorderWidth

Description

The "BorderWidth" property specifies the border width.

Type

UInt8

Access

Read-write

Syntax

```
ComboBox.BorderWidth
```

See also

ComboBox (Page 2203)

ComboBox.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ComboBox.Content
```

See also

ComboBox (Page 2203)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ComboBox.Content (Page 2209)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ComboBox.Content (Page 2209)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ComboBox.Content (Page 2209)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ComboBox.Content (Page 2209)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ComboBox.Content (Page 2209)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ComboBox.Content (Page 2209)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ComboBox.Content (Page 2209)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ComboBox.Content (Page 2209)

ComboBox.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the combo box.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
ComboBox.CurrentQuality
```

See also

ComboBox (Page 2203)

ComboBox.Enabled

Description

The "Enabled" property specifies whether the combo box can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ComboBox.Enabled
```

See also

ComboBox (Page 2203)

ComboBox.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ComboBox.Font
```

See also

ComboBox (Page 2203)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ComboBox.Font (Page 2216)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ComboBox.Font (Page 2216)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ComboBox.Font (Page 2216)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ComboBox.Font (Page 2216)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ComboBox.Font (Page 2216)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ComboBox.Font (Page 2216)

ComboBox.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ComboBox.ForeColor
```

See also

ComboBox (Page 2203)

ComboBox.Height

Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ComboBox.Height
```

See also

ComboBox (Page 2203)

ComboBox.Layer

Description

The "Layer" property returns the screen layer in which the combo box is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
ComboBox.Layer
```

See also

ComboBox (Page 2203)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

ComboBox.Layer (Page 2220)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

ComboBox.Layer (Page 2220)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

ComboBox.Layer (Page 2220)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

ComboBox.Layer (Page 2220)

ComboBox.Left

Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
ComboBox.Left
```

See also

ComboBox (Page 2203)

ComboBox.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ComboBox.Margin
```

See also

ComboBox (Page 2203)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ComboBox.Margin (Page 2223)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ComboBox.Margin (Page 2223)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ComboBox.Margin (Page 2223)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ComboBox.Margin (Page 2223)

ComboBox.Name

Description

The "Name" property returns the name of the combo box.

Type

String

Access

Read-only

Syntax

```
ComboBox.Name
```

See also

ComboBox (Page 2203)

ComboBox.Opacity

Description

The "Opacity" property specifies the opacity. The "0" value indicates completely transparency.

Type

Float

Access

Read-write

Syntax

```
ComboBox.Opacity
```

See also

ComboBox (Page 2203)

ComboBox.Operability

Description

The "Operability" property returns whether the combo box is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ComboBox.Operability
```

See also

ComboBox (Page 2203)

ComboBox.Padding

Description

The "Padding" property specifies the distance of the content from the border of the combo box.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ComboBox.Padding
```

See also

ComboBox (Page 2203)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ComboBox.Padding (Page 2227)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ComboBox.Padding (Page 2227)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ComboBox.Padding (Page 2227)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ComboBox.Padding (Page 2227)

ComboBox.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
ComboBox.Parent
```

See also

ComboBox (Page 2203)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

ComboBox.ProcessValue

Description

The "ProcessValue" property specifies the process value.

Type

Variant

Access

Read-write

Syntax

```
ComboBox.ProcessValue
```

See also

ComboBox (Page 2203)

ComboBox.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the combo box was created.

Type

String

Access

Read-only

Syntax

```
ComboBox.RenderingTemplate
```

See also

ComboBox (Page 2203)

ComboBox.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the combo box can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ComboBox.RequireExplicitUnlock
```

See also

ComboBox (Page 2203)

ComboBox.RotationAngle

Description

The "RotationAngle" property specifies the rotation angle in degrees.

Type

Int16

Access

Read-write

Syntax

```
ComboBox.RotationAngle
```

See also

ComboBox (Page 2203)

ComboBox.RotationCenterPlacement (Page 2233)

ComboBox.RotationCenterX (Page 2233)

ComboBox.RotationCenterY (Page 2234)

ComboBox.RotationCenterPlacement

Description

The "RotationCenterPlacement" property sets the reference point around which the combo box rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in the DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
ComboBox.RotationCenterPlacement
```

See also

ComboBox (Page 2203)

ComboBox.RotationAngle (Page 2232)

ComboBox.RotationCenterX (Page 2233)

ComboBox.RotationCenterY (Page 2234)

ComboBox.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
ComboBox.RotationCenterX
```

See also

ComboBox (Page 2203)

ComboBox.RotationAngle (Page 2232)

ComboBox.RotationCenterPlacement (Page 2233)

ComboBox.RotationCenterY (Page 2234)

ComboBox.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
ComboBox.RotationCenterY
```

See also

ComboBox (Page 2203)

ComboBox.RotationAngle (Page 2232)

ComboBox.RotationCenterPlacement (Page 2233)

ComboBox.RotationCenterX (Page 2233)

ComboBox.SelectionItemHeight

Description

The "SelectionItemHeight" property specifies the height of the list entries. The value "0" indicates that the height is calculated automatically.

Type

UInt16

Access

Read-write

Syntax

```
ComboBox.SelectionItemHeight
```

See also

ComboBox (Page 2203)

ComboBox.SelectionItems

Description

The "SelectionItems" property returns the list of all list entries ("SelectionItem" objects) of the combo box.

Type

Object, HmiSelectionItemCollection (Page 2236)

Access

Read-only

Syntax

```
ComboBox.SelectionItems
```

See also

ComboBox (Page 2203)

HmiSelectionItemCollection (Page 2236)

HmiSelectionItemCollection

Description

The "HmiSelectionItemCollection" object is a list of all entries ("SelectionItem" objects) of a list object.

Use

The "HmiSelectionItemCollection" object is a list and can be counted and enumerated. You can access the "HmiSelectionItemCollection" list using the index or the tag name.

Object type

HmiSelectionItemCollection

Properties

The "HmiSelectionItemCollection" object has the following properties:

- **Count**
  Returns the number of list entries of the "HmiSelectionItemCollection" list.

Methods

The "HmiSelectionItemCollection" object has the following methods:

- **Item()**
  Returns a list entry of the "HmiSelectionItemCollection" list.

See also

ComboBox.SelectionItems (Page 2235)

HmiSelectionItemCollection.Count

Description

The "Count" property returns the number of list entries in the "HmiSelectionItemCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiSelectionItemCollection.Count
```

See also

HmiSelectionItemCollection (Page 2236)

HmiSelectionItemCollection.Item()

Description

The "Item" method returns a list entry of the "HmiSelectionItemCollection" list.

Syntax

```
HmiSelectionItemCollection[.Item](HmiSelectionItemName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiSelectionItemCollection" object.

Parameters

`HmiSelectionItemName`

Type: String

Name of the list entry

Return value

Object, HmiSelectionItemPart (Page 2237)

See also

HmiSelectionItemCollection (Page 2236)

SelectionItem (Page 2237)

SelectionItem

Description

The "SelectionItem" object represents a list entry.

Object type

HmiSelectionItemPart

Properties

The "SelectionItem" object has the following properties:

- **Graphic**
  Specifies the graphic of the list entry.
- **IsSelected**
  Specifies whether the list entry is selected.
- **Text**
  Specifies the list entry text.

Methods

--

See also

HmiSelectionItemCollection (Page 2236)

SelectionItem.Graphic

Description

The "Graphic" property specifies the graphic of the list entry.

Type

String

Access

Read-write

Syntax

```
SelectionItem.Graphic
```

See also

SelectionItem (Page 2237)

SelectionItem.IsSelected

Description

The "IsSelected" property specifies whether the list entry is selected.

Type

Bool

Access

Read-write

Syntax

```
SelectionItem.IsSelected
```

See also

SelectionItem (Page 2237)

SelectionItem.Text

Description

The "Text" property specifies the text of the list entry.

Type

String

Access

Read-write

Syntax

```
SelectionItem.Text
```

See also

SelectionItem (Page 2237)

ComboBox.SelectionMode

Description

The "SelectionMode" property specifies whether one or more list entries can be selected in the combo box.

Type

Int32, HmiSelectionMode

Specifies the type of the selection:

- NonExclusive (0): Selection of multiple list entries possible
- Exclusive (1): Selection of only one list entry possible

Access

Read-write

Syntax

```
ComboBox.SelectionMode
```

See also

ComboBox (Page 2203)

ComboBox.SelectorPosition

Description

The "SelectorPosition" property specifies the horizontal alignment of the list entries.

Type

Int32, HmiHorizontalAlignment

Specifies the text alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched. Can only be used with layout containers, Fallback behaves like Center

Access

Read-write

Syntax

```
ComboBox.SelectorPosition
```

See also

ComboBox (Page 2203)

ComboBox.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the combo box is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
ComboBox.ShowFocusVisual
```

See also

ComboBox (Page 2203)

ComboBox.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the combo box.

Type

String

Access

Read-only

Syntax

```
ComboBox.StyleItemClass
```

See also

ComboBox (Page 2203)

ComboBox.TabIndex

Description

The "TabIndex" property returns the position of the combo box in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
ComboBox.TabIndex
```

See also

ComboBox (Page 2203)

ComboBox.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
ComboBox.ToolTipText
```

See also

ComboBox (Page 2203)

ComboBox.Top

Description

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
ComboBox.Top
```

See also

ComboBox (Page 2203)

ComboBox.Visible

Description

The "Visible" property specifies whether the combo box is visible.

Type

Bool

Access

Read-write

Syntax

```
ComboBox.Visible
```

See also

ComboBox (Page 2203)

ComboBox.VisualizeQuality

Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

Type

Bool

Access

Read-write

Syntax

```
ComboBox.VisualizeQuality
```

See also

ComboBox (Page 2203)

ComboBox.Width

Description

The "Width" property specifies the width in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ComboBox.Width
```

See also

ComboBox (Page 2203)

ComboBox.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the combo box.

Syntax

```
ComboBox.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

ComboBox (Page 2203)

ComboBox.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
ComboBox.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

`propertyName`

Type: String

Name of the property for which flashing is configured.

`enable`

Type: Bool

Specifies that flashing is activated.

`value`

Optional, type: Variant

Value of the property for which flashing is configured.

`alternateValue`

Optional, type: Variant

Specifies the second value for flashing.

`rate`

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

ComboBox (Page 2203)

ComboBox_OnActivated()

Description

The "OnActivated" event occurs when a combo box receives focus:

- A combo box is selected via the configured tab sequence.
- A combo box that had no focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
ComboBox_OnActivated(item)
```

Context

item

Type: Object

Combo box where the event occurs.

See also

ComboBox (Page 2203)

ComboBox_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A combo box is right-clicked.
- A combo box is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
ComboBox_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

`item`

Type: Object

Combo box where the event occurs.

`x`

Type: DInt

X-coordinate of the input point

`y`

Type: DInt

Y-coordinate of the input point

`modifiers`

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

ComboBox (Page 2203)

ComboBox_OnDeactivated()

Description

The "OnDeactivated" event occurs when the combo box loses focus because the operator has pressed the <TAB> key or executed another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
ComboBox_OnDeactivated(item)
```

Context

item

Type: Object

Combo box where the event occurs.

See also

ComboBox (Page 2203)

ComboBox_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the combo box is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
ComboBox_OnKeyDown(item, keyCode, modifiers)
```

Context

`item`

Type: Object

Combo box where the event occurs.

`keyCode`

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

`modifiers`

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

ComboBox (Page 2203)

ComboBox_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the combo box is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
ComboBox_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Combo box where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

ComboBox (Page 2203)

ComboBox_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A combo box is left-clicked.
- The <RETURN> or <SPACE> key is pressed when an combo box has the focus.
- A combo box is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
ComboBox_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Combo box where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

ComboBox (Page 2203)

CommandSourceElement

Description

The "CommandSourceElement" object represents a command source in runtime.

Object type

HmiCommandSourceElement

Properties

The "CommandSourceElement" object has the following properties:

- **Command**
  Returns information about the command.
- **DataConnection**
  Returns the data connection.
- **Parent**
  Returns the higher-level screen object.
- **ResultSet**
  Returns the last result of the executed command.
- **SourceState**
  Returns the state of the data source.

Methods

The "CommandSourceElement" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the command source.
- **PropertyFlashing()**
  Configures flashing of a property.

CommandSourceElement.Command

Description

The "Command" property returns information about the command.

Type

Object, HmiCommandPart

Access

Read-only

Syntax

```
CommandSourceElement.Command
```

See also

CommandSourceElement (Page 2253)

Command.CommandParameters

Description

The "CommandParameters" property returns the parameters of the command.

Type

Object, HmiParameterCollection (Page 2257)

Access

Read-only

Syntax

```
Command.CommandParameters
```

See also

CommandSourceElement.Command (Page 2254)

HmiParameterCollection (Page 2257)

Command.CommandText

Description

The "CommandText" property returns the text of the command.

Type

String

Access

Read-only

Syntax

```
Command.CommandText
```

See also

CommandSourceElement.Command (Page 2254)

Command.CommandType

Description

The "CommandType" property returns the type of the command.

Type

String

Access

Read-only

Syntax

```
Command.CommandType
```

See also

CommandSourceElement.Command (Page 2254)

Command.Execute()

Description

The "Execute" method executes the command.

Syntax

```
Command.Execute()
```

Parameters

--

Return value

--

See also

CommandSourceElement.Command (Page 2254)

HmiParameterCollection

Description

The "HmiParameterCollection" object is a list of all parameters ("Parameter" objects).

Use

The "HmiParameterCollection" object is a list which can be counted and enumerated. You can access the "HmiParameterCollection" list using the index or the tag names.

Object type

HmiParameterCollection

Properties

The "HmiParameterCollection" object has the following properties:

- **Count**
  Returns the number of parameters in the "HmiParameterCollection" list.

Methods

The "HmiParameterCollection" object has the following methods:

- **Item()**
  Returns a parameter of the "HmiParameterCollection" list.

See also

Command.CommandParameters (Page 2255)

HmiParameterCollection.Count

Description

The "Count" property returns the number of parameters in the "HmiParameterCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiParameterCollection.Count
```

See also

HmiParameterCollection (Page 2257)

HmiParameterCollection.Item()

Description

The "Item" method returns a parameter of the "HmiParameterCollection" list.

Syntax

```
HmiParameterCollection.[.Item](HmiParameterName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiParameterCollection" object.

Parameters

`HmiParameterName`

Type: String

Name of the parameter

Return value

Object, HmiParameterPart (Page 2258)

See also

Parameter (Page 2258)

HmiParameterCollection (Page 2257)

Parameter

Description

The "Parameter" object represents a parameter.

Object type

HmiParameterPart

Properties

The "Parameter" object has the following properties:

- **ParameterName**
  Specifies the name of the parameter.
- **ParameterValue**
  Specifies the value of the parameter.

Methods

--

Parameter.ParameterName

Description

The "ParameterName" property specifies the name of the parameter.

Type

String

Access

Read-write

Syntax

```
Parameter.ParameterName
```

See also

Parameter (Page 2258)

Parameter.ParameterValue

Description

The "ParameterValue" property specifies the value of the parameter.

Type

Variant

Access

Read-write

Syntax

```
Parameter.ParameterValue
```

See also

Parameter (Page 2258)

CommandSourceElement.DataConnection

Description

The "DataConnection" property returns the data connection.

Type

Object, HmiDataConnection

Access

Read-only

Syntax

```
CommandSourceElement.DataConnection
```

See also

CommandSourceElement (Page 2253)

CommandSourceElement.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
CommandSourceElement.Parent
```

See also

CommandSourceElement (Page 2253)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

CommandSourceElement.ResultSet

Description

The "ResultSet" property returns the last result of the executed command.

Type

Object, HmiParameterCollection (Page 2262)

Access

Read-only

Syntax

```
CommandSourceElement.ResultSet
```

See also

CommandSourceElement (Page 2253)

HmiParameterCollection (Page 2262)

HmiParameterCollection

Description

The "HmiParameterCollection" object is a list of all parameters ("Parameter" objects).

Use

The "HmiParameterCollection" object is a list which can be counted and enumerated. You can access the "HmiParameterCollection" list using the index or the tag names.

Object type

HmiParameterCollection

Properties

The "HmiParameterCollection" object has the following properties:

- **Count**
  Returns the number of parameters in the "HmiParameterCollection" list.

Methods

The "HmiParameterCollection" object has the following methods:

- **Item()**
  Returns a parameter of the "HmiParameterCollection" list.

See also

CommandSourceElement.ResultSet (Page 2261)

HmiParameterCollection.Count

Description

The "Count" property returns the number of parameters in the "HmiParameterCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiParameterCollection.Count
```

See also

HmiParameterCollection (Page 2262)

HmiParameterCollection.Item()

Description

The "Item" method returns a parameter of the "HmiParameterCollection" list.

Syntax

```
HmiParameterCollection.[.Item](HmiParameterName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiParameterCollection" object.

Parameters

`HmiParameterName`

Type: String

Name of the parameter

Return value

Object, HmiParameterPart (Page 2263)

See also

HmiParameterCollection (Page 2262)

Parameter (Page 2263)

Parameter

Description

The "Parameter" object represents a parameter.

Object type

HmiParameterPart

Properties

The "Parameter" object has the following properties:

- **ParameterName**
  Specifies the name of the parameter.
- **ParameterValue**
  Specifies the value of the parameter.

Methods

--

Parameter.ParameterName

Description

The "ParameterName" property specifies the name of the parameter.

Type

String

Access

Read-write

Syntax

```
Parameter.ParameterName
```

See also

Parameter (Page 2263)

Parameter.ParameterValue

Description

The "ParameterValue" property specifies the value of the parameter.

Type

Variant

Access

Read-write

Syntax

```
Parameter.ParameterValue
```

See also

Parameter (Page 2263)

CommandSourceElement.SourceState

Description

The "SourceState" property returns the state of the data source.

Type

Int32, HmiSourceState

Returns the state:

- Idle (0): Ready
- Busy (1): Busy

Access

Read-only

Syntax

```
CommandSourceElement.SourceState
```

See also

CommandSourceElement (Page 2253)

CommandSourceElement.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the command source.

Syntax

```
CommandSourceElement.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

CommandSourceElement (Page 2253)

CommandSourceElement.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
CommandSourceElement.PropertyFlashing(propertyName, enable[, value]
[, alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

CommandSourceElement (Page 2253)

CustomWebControlContainer

Description

The "CustomWebControlContainer" object represents a container as a custom display for user-defined access to web objects in runtime.

The following predefined displays are available:

- AuditAG
- Calendar control
- Performance analyzer
- Performance bar chart
- Performance control
- Performance Gantt chart
- Performance pie chart
- Plant overview
- Reports

Object type

HmiCustomWebControlContainer

Properties

The "CustomWebControlContainer" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **Caption**
  Specifies the text that is displayed in the title bar.
- **CaptionColor**
  Specifies the background color of the title bar.
- **ContainedType**
  Returns the type of the contained objects.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the custom display.
- **Enabled**
  Specifies whether the custom display can be operated in runtime.
- **Height**
  Specifies the height.
- **Icon**
  Specifies the icon of the custom display.
- **Layer**
  Returns the screen layer in which the custom display is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.

- **Name**
  Returns the name of the custom display.
- **Operability**
  Returns whether the custom display is operable.
- **Parent**
  Returns the higher-level screen object.
- **Properties**
  Enables access to the dynamic properties of the web objects.
- **RenderingTemplate**
  Returns the name of the template from which the custom display was created.
- **RequireExplicitUnlock**
  Returns whether the custom display is only operable while the corresponding button is being pressed.
- **ShowFocusVisual**
  Specifies whether the custom display is highlighted when in focus.
- **StyleItemClass**
  Returns the style which is applied to the custom display.
- **TabIndex**
  Returns the position of the custom display in the tab sequence.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the custom display is visible.
- **Width**
  Specifies the width.
- **WindowFlags**
  Specifies the window configuration of the custom display.

Methods

The "CustomWebControlContainer" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the custom display.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "CustomWebControlContainer" object has the following events:

- **OnActivated()**
  Occurs when a custom display receives focus.
- **OnDeactivated()**
  Occurs when a custom display loses focus.

The following events are only available for the "Plant overview" custom display:

- **OnCollapse()**
  Occurs when a custom display is minimized.
- **OnCollapseAll()**
  Occurs when all custom displays are minimized.
- **OnExpand()**
  Occurs when the custom display is expanded.
- **OnExpandAll()**
  Occurs when all custom displays are expanded.
- **OnSelectionChanged()**
  Occurs when the selection is changed.

CustomWebControlContainer.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
CustomWebControlContainer.Authorization
```

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer.Caption

Description

The "Caption" property specifies the text that is displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
CustomWebControlContainer.Caption
```

See also

CustomWebControlContainer (Page 2267)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

CustomWebControlContainer.Caption (Page 2270)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 2271)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 2271)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 2271)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 2271)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 2271)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 2271)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

CustomWebControlContainer.Caption (Page 2270)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

CustomWebControlContainer.Caption (Page 2270)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

CustomWebControlContainer.Caption (Page 2270)

CustomWebControlContainer.CaptionColor

Description

The "CaptionColor" property specifies the color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
CustomWebControlContainer.CaptionColor
```

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer.ContainedType

Description

The "ContainedType" property returns the type of the contained objects (CustomControl, SwacComponent, or WidgetType).

Type

String

Access

Read-only

Syntax

```
CustomWebControlContainer.ContainedType
```

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the custom display.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
CustomWebControlContainer.CurrentQuality
```

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer.Enabled

Description

The "Enabled" property specifies whether the custom display can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
CustomWebControlContainer.Enabled
```

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer.Height

Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
CustomWebControlContainer.Height
```

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer.Icon

Description

The "Icon" property specifies the icon of the custom display.

Type

String

Access

Read-write

Syntax

```
CustomWebControlContainer.Icon
```

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer.Layer

Description

The "Layer" property returns the screen layer in which the custom display is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
CustomWebControlContainer.Layer
```

See also

CustomWebControlContainer (Page 2267)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

CustomWebControlContainer.Layer (Page 2279)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

CustomWebControlContainer.Layer (Page 2279)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

CustomWebControlContainer.Layer (Page 2279)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

CustomWebControlContainer.Layer (Page 2279)

CustomWebControlContainer.Left

Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
CustomWebControlContainer.Left
```

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
CustomWebControlContainer.Margin
```

See also

CustomWebControlContainer (Page 2267)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

CustomWebControlContainer.Margin (Page 2282)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

CustomWebControlContainer.Margin (Page 2282)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

CustomWebControlContainer.Margin (Page 2282)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

CustomWebControlContainer.Margin (Page 2282)

CustomWebControlContainer.Name

Description

The "Name" property returns the name of the custom display.

Type

String

Access

Read-only

Syntax

```
CustomWebControlContainer.Name
```

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer.Operability

Description

The "Operability" property returns whether the custom display is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
CustomWebControlContainer.Operability
```

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
CustomWebControlContainer.Parent
```

See also

CustomWebControlContainer (Page 2267)
Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

CustomWebControlContainer.Properties

Description

The "Properties" property allows access to the dynamic properties of the web objects.

Type

Object, HmiDynamicPropertyPart

Access

Read-write

Syntax

```
CustomWebControlContainer.Properties
```

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the custom display was created.

Type

String

Access

Read-only

Syntax

```
CustomWebControlContainer.RenderingTemplate
```

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the custom display can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
CustomWebControlContainer.RequireExplicitUnlock
```

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the custom display is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
CustomWebControlContainer.ShowFocusVisual
```

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the custom display.

Type

String

Access

Read-only

Syntax

```
CustomWebControlContainer.StyleItemClass
```

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer.TabIndex

Description

The "TabIndex" property returns the position of the custom display in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
CustomWebControlContainer.TabIndex
```

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer.Top

Description

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
CustomWebControlContainer.Top
```

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer.Visible

Description

The "Visible" property specifies whether the custom display is visible.

Type

Bool

Access

Read-write

Syntax

```
CustomWebControlContainer.Visible
```

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer.Width

Description

The "Width" property specifies the width in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
CustomWebControlContainer.Width
```

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer.WindowFlags

Description

The "WindowFlags" property specifies the window configuration of the custom display.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be moved
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

You can enable multiple properties by adding integer values or bit operators.

Access

Read-write

Syntax

```
CustomWebControlContainer.WindowFlags
```

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the custom display.

Syntax

```
CustomWebControlContainer.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
CustomWebControlContainer.PropertyFlashing(propertyName, enable[,
value][, alternateValue][, rate])
```

Parameters

`propertyName`

Type: String

Name of the property for which flashing is configured.

`enable`

Type: Bool

Specifies that flashing is activated.

`value`

Optional, type: Variant

Value of the property for which flashing is configured.

`alternateValue`

Optional, type: Variant

Specifies the second value for flashing.

`rate`

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer_OnActivated()

Description

The "OnActivated" event occurs when a custom display receives focus:

- A custom display is selected via the configured tab sequence.
- A custom display that had no focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
CustomWebControlContainer_OnActivated(item)
```

Context

item

Type: Object

Custom display where the event occurs.

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer_OnDeactivated()

Description

The "OnDeactivated" event occurs when the custom display loses focus because the operator has pressed the <TAB> key or executed another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
CustomWebControlContainer_OnDeactivated(item)
```

Context

item

Type: Object

Custom display where the event occurs.

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer_OnCollapse()

Description

The "OnCollapse" event occurs when a custom display is minimized:

Note

The "OnCollapse" event is only available with the "Plant overview" custom display.

Syntax

```
CustomWebControlContainer_OnCollapse(item, collapsedNode)
```

Context

item

Type: Object

Custom display where the event occurs.

collapsedNode

Type: Object

Custom display which was minimized.

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer_OnCollapseAll()

Description

The "OnCollapseAll" event occurs when all custom displays are minimized.

Note

The "OnCollapseAll" event is only available with the "Plant overview" custom display.

Syntax

```
CustomWebControlContainer_OnCollapseAll(item, isCollapsed)
```

Context

`item`

Type: Object

Custom display where the event occurs.

`isCollapsed`

Type: Object

Returns whether the custom display is minimized.

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer_OnExpand()

Description

The "OnExpand" event occurs when the custom display is expanded.

Note

The "OnExpand" event is only available with the "Plant overview" custom display.

Syntax

```
CustomWebControlContainer_OnExpand(item, expandedNode)
```

Context

item

Type: Object

Custom display where the event occurs.

expandedNode

Type: Object

Custom display which was expanded.

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer_OnExpandAll()

Description

The "OnExpandAll" event occurs when all custom displays are expanded.

Note

The "OnExpandAll" event is only available with the "Plant overview" custom display.

Syntax

```
CustomWebControlContainer_OnExpandAll(item, isExpanded)
```

Context

item

Type: Object

Custom display where the event occurs.

isExpanded

Type: Object

Returns whether the custom display is expanded.

See also

CustomWebControlContainer (Page 2267)

CustomWebControlContainer_OnSelectionChanged()

Description

The "OnSelectionChanged" event occurs when the selection is changed.

Note

The "OnSelectionChanged" event is only available with the "Plant overview" custom display.

Syntax

```
CustomWebControlContainer_OnSelectionChanged(item, selectedNode)
```

Context

`item`

Type: Object

Custom display where the event occurs.

`selectedNode`

Type: Object

Custom display which was selected.

See also

CustomWebControlContainer (Page 2267)

CustomWidgetContainer

Description

The "CustomWidgetContainer" object represents a container as custom display in runtime.

Object type

HmiCustomWidgetContainer

Properties

The "CustomWidgetContainer" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **ContainedType**
  Returns the type of the contained objects.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the custom display.
- **Enabled**
  Specifies whether the custom display can be operated in runtime.
- **Height**
  Specifies the height.
- **Layer**
  Returns the screen layer in which the custom display is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the custom display.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the custom display is operable.
- **Parent**
  Returns the higher-level screen object.
- **Properties**
  Enables access to the dynamic properties of the web objects in the customized display.
- **RenderingTemplate**
  Returns the name of the template from which the custom display was created.
- **RequireExplicitUnlock**
  Returns whether the custom display is only operable while the corresponding button is being pressed.
- **RotationAngle**
  Specifies the rotation angle in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the custom display rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.

- **ShowFocusVisual**
  Specifies whether the custom display is highlighted when in focus.
- **StyleItemClass**
  Returns the style which is applied to the custom display.
- **TabIndex**
  Returns the position of the custom display in the tab sequence.
- **ToolTipText**
  Specifies the tooltip text.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the custom display is visible.
- **VisualizeQuality**
  Specifies whether the connection quality of the process value is displayed.
- **Width**
  Specifies the width.

Methods

The "CustomWidgetContainer" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the custom display.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "CustomWidgetContainer" object has the following events:

- **OnActivated()**
  Occurs when a custom display receives focus.
- **OnContextTapped()**
  Occurs when a custom display is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when a custom display loses focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the custom display is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the custom display is in focus.
- **OnTapped()**
  Occurs when a custom display is left-clicked or short-touched.

CustomWidgetContainer.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
CustomWidgetContainer.Authorization
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.ContainedType

Description

The "ContainedType" property returns the type of the contained objects (CustomControl, SwacComponent, or WidgetType).

Type

String

Access

Read-only

Syntax

```
CustomWidgetContainer.ContainedType
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the custom display.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
CustomWidgetContainer.CurrentQuality
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.Enabled

Description

The "Enabled" property specifies whether the custom display can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
CustomWidgetContainer.Enabled
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.Height

Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
CustomWidgetContainer.Height
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.Layer

Description

The "Layer" property returns the screen layer in which the custom display is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
CustomWidgetContainer.Layer
```

See also

CustomWidgetContainer (Page 2298)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

CustomWidgetContainer.Layer (Page 2303)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

CustomWidgetContainer.Layer (Page 2303)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

CustomWidgetContainer.Layer (Page 2303)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

CustomWidgetContainer.Layer (Page 2303)

CustomWidgetContainer.Left

Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
CustomWidgetContainer.Left
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
CustomWidgetContainer.Margin
```

See also

CustomWidgetContainer (Page 2298)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

CustomWidgetContainer.Margin (Page 2306)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

CustomWidgetContainer.Margin (Page 2306)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

CustomWidgetContainer.Margin (Page 2306)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

CustomWidgetContainer.Margin (Page 2306)

CustomWidgetContainer.Name

Description

The "Name" property returns the name of the custom display.

Type

String

Access

Read-only

Syntax

```
CustomWidgetContainer.Name
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.Opacity

Description

The "Opacity" property specifies the opacity. The "0" value indicates completely transparency.

Type

Float

Access

Read-write

Syntax

```
CustomWidgetContainer.Opacity
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.Operability

Description

The "Operability" property returns whether the custom display is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
CustomWidgetContainer.Operability
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
CustomWidgetContainer.Parent
```

See also

CustomWidgetContainer (Page 2298)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

CustomWidgetContainer.Properties

Description

The "Properties" property allows access to the dynamic properties of the objects in the customized display.

Type

Object, HmiDynamicPropertyPart

Access

Read-write

Syntax

```
CustomWidgetContainer.Properties
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the custom display was created.

Type

String

Access

Read-only

Syntax

```
CustomWidgetContainer.RenderingTemplate
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the custom display can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
CustomWidgetContainer.RequireExplicitUnlock
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.RotationAngle

Description

The "RotationAngle" property specifies the rotation angle in degrees.

Type

Int16

Access

Read-write

Syntax

```
CustomWidgetContainer.RotationAngle
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.RotationCenterPlacement (Page 2313)

CustomWidgetContainer.RotationCenterX (Page 2314)

CustomWidgetContainer.RotationCenterY (Page 2314)

CustomWidgetContainer.RotationCenterPlacement

Description

The "RotationCenterPlacement" property specifies the reference point around which the custom display rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in the DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
CustomWidgetContainer.RotationCenterPlacement
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.RotationAngle (Page 2312)

CustomWidgetContainer.RotationCenterX (Page 2314)

CustomWidgetContainer.RotationCenterY (Page 2314)

CustomWidgetContainer.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
CustomWidgetContainer.RotationCenterX
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.RotationAngle (Page 2312)

CustomWidgetContainer.RotationCenterPlacement (Page 2313)

CustomWidgetContainer.RotationCenterY (Page 2314)

CustomWidgetContainer.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
CustomWidgetContainer.RotationCenterY
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.RotationAngle (Page 2312)

CustomWidgetContainer.RotationCenterPlacement (Page 2313)

CustomWidgetContainer.RotationCenterX (Page 2314)

CustomWidgetContainer.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the custom display is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
CustomWidgetContainer.ShowFocusVisual
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the custom display.

Type

String

Access

Read-only

Syntax

```
CustomWidgetContainer.StyleItemClass
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.TabIndex

Description

The "TabIndex" property returns the position of the custom display in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
CustomWidgetContainer.TabIndex
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
CustomWidgetContainer.ToolTipText
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.Top

Description

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
CustomWidgetContainer.Top
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.Visible

Description

The "Visible" property specifies whether the custom display is visible.

Type

Bool

Access

Read-write

Syntax

```
CustomWidgetContainer.Visible
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.VisualizeQuality

Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

Type

Bool

Access

Read-write

Syntax

```
CustomWidgetContainer.VisualizeQuality
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.Width

Description

The "Width" property specifies the width in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
CustomWidgetContainer.Width
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the custom display.

Syntax

```
CustomWidgetContainer.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
CustomWidgetContainer.PropertyFlashing(propertyName, enable[, value]
[, alternateValue][, rate])
```

Parameters

`propertyName`

Type: String

Name of the property for which flashing is configured.

`enable`

Type: Bool

Specifies that flashing is activated.

`value`

Optional, type: Variant

Value of the property for which flashing is configured.

`alternateValue`

Optional, type: Variant

Specifies the second value for flashing.

`rate`

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer_OnActivated()

Description

The "OnActivated" event occurs when a custom display receives focus:

- A custom display is selected via the configured tab sequence.
- A custom display that had no focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
CustomWidgetContainer_OnActivated(item)
```

Context

item

Type: Object

Custom display where the event occurs.

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A custom display is right-clicked.
- A custom display is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
CustomWidgetContainer_OnContextTapped(item, x, y, modifiers,
trigger)
```

Context

`item`

Type: Object

Custom display where the event occurs.

`x`

Type: DInt

X-coordinate of the input point

`y`

Type: DInt

Y-coordinate of the input point

`modifiers`

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer_OnDeactivated()

Description

The "OnDeactivated" event occurs when the custom display loses focus because the operator has pressed the <TAB> key or executed another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
CustomWidgetContainer_OnDeactivated(item)
```

Context

item

Type: Object

Custom display where the event occurs.

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the custom display is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
CustomWidgetContainer_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

Custom display where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the custom display is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
CustomWidgetContainer_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Custom display where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

CustomWidgetContainer (Page 2298)

CustomWidgetContainer_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A custom display is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a custom display has the focus.
- A custom display is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
CustomWidgetContainer_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Custom display where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

CustomWidgetContainer (Page 2298)

DataGridControl

Description

The "DataGridControl" object represents a data table display for showing tag values in runtime.

Object type

HmiDataGridControl

Properties

The "DataGridControl" object has the following properties:

- **BackColor**
  Specifies the background color.
- **BindingSource**
  Returns the data source.
- **Caption**
  Specifies the text that is displayed in the title bar.
- **CaptionColor**
  Specifies the background color of the title bar.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the data table display.
- **DataGridView**
  Specifies the appearance of the data table.
- **Enabled**
  Specifies whether the data table display can be operated in runtime.
- **Height**
  Specifies the height.
- **Icon**
  Specifies the icon of the data table display.
- **Layer**
  Returns the screen layer in which the data table display is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the data table display.
- **Parent**
  Returns the higher-level screen object.
- **RenderingTemplate**
  Returns the name of the template from which the data table display was created.
- **ShowFocusVisual**
  Specifies whether the data table display is highlighted when in focus.
- **StatusBar**
  Specifies the information bar of the data table display.
- **StyleItemClass**
  Returns the style which is applied to the data table display.
- **TabIndex**
  Returns the position of the data table display in the tab sequence.
- **ToolBar**
  Specifies the toolbar of the data table display.

- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the data table display is visible.
- **Width**
  Specifies the width.
- **WindowFlags**
  Specifies the window configuration of the data table display.

Methods

The "DataGridControl" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the data table display.
- **FireCommand()**
  Configures the occurrence of an event for an element.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "DataGridControl" object has the following events:

- **OnActivated()**
  Occurs when a data table display receives focus.
- **OnCommandFired()**
  Occurs when the operator has operated an element in the toolbar or information bar of the data table display.
- **OnDeactivated()**
  Occurs when a data table display loses focus.
- **OnInitialized()**
  Occurs when a data table display has been successfully initialized and the data connection to the PLC has been established.

DataGridControl.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
DataGridControl.BackColor
```

See also

DataGridControl (Page 2327)

DataGridControl.BindingSource

Description

The "BindingSource" property returns the data source.

Type

Object, HmiBindingSourceElement (Page 1943)

Access

Read-only

Syntax

```
DataGridControl.BindingSource
```

See also

DataGridControl (Page 2327)

BindingSourceElement (Page 1943)

BindingSourceElement

Description

BindingSourceElement (Page 1943)

DataGridControl.Caption

Description

The "Caption" property specifies the text that is displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
DataGridControl.Caption
```

See also

DataGridControl (Page 2327)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

DataGridControl.Caption (Page 2330)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 2331)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 2331)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 2331)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 2331)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 2331)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 2331)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

DataGridControl.Caption (Page 2330)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

DataGridControl.Caption (Page 2330)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

DataGridControl.Caption (Page 2330)

DataGridControl.CaptionColor

Description

The "CaptionColor" property specifies the color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
DataGridControl.CaptionColor
```

See also

DataGridControl (Page 2327)

DataGridControl.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the data table display.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
DataGridControl.CurrentQuality
```

See also

DataGridControl (Page 2327)

DataGridControl.DataGridView

Description

The "DataGridView" property specifies the appearance of the data table.

Type

Object, HmiDataGridViewPart (Page 2338)

Access

Read-write

Syntax

```
DataGridControl.DataGridView
```

See also

DataGridControl (Page 2327)

DataGridView (Page 2338)

DataGridView

DataGridView.AllowFilter

Description

The "AllowFilter" property specifies whether filtering of columns is permitted.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.AllowFilter
```

See also

DataGridControl.DataGridView (Page 2337)

DataGridView.AllowSort

Description

The "AllowSort" property specifies whether the sorting of columns is permitted.

- True: Activates the sorting and sets the "AllowSort" property of all columns to "true".
- False: Disables the sorting for all columns. The individual column properties remain unchanged.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.AllowSort
```

See also

DataGridControl.DataGridView (Page 2337)

DataGridView.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.AlternateBackColor
```

See also

DataGridControl.DataGridView (Page 2337)

DataGridView.AlternateForeColor

Description

The "AlternateForeColor" property specifies the flashing color for the text.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.AlternateForeColor
```

See also

DataGridControl.DataGridView (Page 2337)

DataGridView.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.BackColor
```

See also

DataGridControl.DataGridView (Page 2337)

DataGridView.CellPadding

Description

The "CellPadding" property specifies the inner spacing of the content from the cell border.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
DataGridView.CellPadding
```

See also

DataGridControl.DataGridView (Page 2337)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

DataGridView.CellPadding (Page 2341)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

DataGridView.CellPadding (Page 2341)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

DataGridView.CellPadding (Page 2341)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

DataGridView.CellPadding (Page 2341)

DataGridView.ColoringMode

Description

The "ColoringMode" property specifies whether alternate coloring of every other row or column is enabled.

Type

Int32, HmiGridColoringMode

Specifies the type of the coloring:

- None (0): None
- Columns (1): Color the columns alternately.
- Rows (2): Color the rows alternately.

Access

Read-write

Syntax

```
DataGridView.ColoringMode
```

See also

DataGridControl.DataGridView (Page 2337)

DataGridView.Columns

Description

The "Columns" property represents the quantity of columns.

Type

Object, HmiDataGridColumnCollection (Page 2344)

Access

Read-only

Syntax

```
DataGridView.Columns
```

See also

DataGridControl.DataGridView (Page 2337)

HmiDataGridColumnCollection (Page 2344)

HmiDataGridColumnCollection

Description

The "HmiDataGridColumnCollection" object is a list of all columns ("DataGridColumn" objects) of the table.

You reference a "HmiDataGridColumnCollection" object via the `DataGridView.Columns` property.

Use

The "HmiDataGridColumnCollection" object is a list and can be counted and enumerated. You can access the "HmiDataGridColumnCollection" list using the index or the tag name.

Object type

HmiDataGridColumnCollection

Properties

The "HmiDataGridColumnCollection" object has the following properties:

- **Count**
  Returns the number of columns in the "HmiDataGridColumnCollection" list.

Methods

The "HmiDataGridColumnCollection" object has the following methods:

- **Item()**
  Returns a column of the "HmiDataGridColumnCollection" list.

HmiDataGridColumnCollection.Count

Description

The "Count" property returns the number of columns in the "HmiDataGridColumnCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiDataGridColumnCollection.Count
```

See also

HmiDataGridColumnCollection (Page 2344)

HmiDataGridColumnCollection.Item()

Description

The "Item" method returns a column of the "HmiDataGridColumnCollection" list.

Syntax

```
HmiDataGridColumnCollection[.Item](HmiDataGridColumnName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiDataGridColumnCollection" object.

Parameters

`HmiDataGridColumnName`

Type: String

Name of the column

Return value

Object, HmiDataGridColumnPartBase (Page 2346)

See also

HmiDataGridColumnCollection (Page 2344)

DataGridColumn (Page 2346)

DataGridColumn

Description

The "DataGridColumn" object represents a value column.

Object type

HmiDataGridColumnPart

Properties

The "DataGridColumn" object has the following properties:

- **AllowSort**
  Specifies whether column sorting is allowed.
- **BackColor**
  Specifies the background color.
- **Content**
  Specifies display options for text and graphics.

- **Enabled**
  Specifies whether the column can be operated in runtime.
- **ForeColor**
  Specifies the font color of the text.
- **Header**
  Specifies the properties of the column header.
- **Key**
  Corresponds to the column definition from the "ConsideredColumns" property of the connected source.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumWidth**
  Specifies the minimum width.
- **Name**
  Returns the name of the column.
- **OutputFormat**
  Specifies the format for displaying values.
- **SortDirection**
  Specifies the sorting direction.
- **SortOrder**
  Specifies the sorting order.
- **Visible**
  Specifies whether the column is visible.
- **Width**
  Specifies the width of the column in the DIU (Device Independent Unit).

Methods

--

See also

HmiDataGridColumnCollection (Page 2344)

DataGridColumn.AllowSort

Description

The "AllowSort" property specifies whether column sorting is permitted.

This property is ignored if the parent object has the "AllowSort" property set to "False".

Type

Bool

Access

Read-write

Syntax

```
DataGridColumn.AllowSort
```

See also

DataGridColumn (Page 2346)

DataGridColumn.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
DataGridColumn.BackColor
```

See also

DataGridColumn (Page 2346)

DataGridColumn.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
DataGridColumn.Content
```

See also

DataGridColumn (Page 2346)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

DataGridColumn.Content (Page 2348)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

DataGridColumn.Content (Page 2348)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered

- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

DataGridColumn.Content (Page 2348)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

DataGridColumn.Content (Page 2348)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

DataGridColumn.Content (Page 2348)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

DataGridColumn.Content (Page 2348)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

DataGridColumn.Content (Page 2348)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

DataGridColumn.Content (Page 2348)

DataGridColumn.Enabled

Description

The "Enabled" property specifies whether the column can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
DataGridColumn.Enabled
```

See also

DataGridColumn (Page 2346)

DataGridColumn.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
DataGridColumn.ForeColor
```

See also

DataGridColumn (Page 2346)

DataGridColumn.Header

Description

The "Header" property specifies the properties of the column header.

Type

Object, HmiDataGridColumnHeaderPart

Access

Read-write

Syntax

```
DataGridColumn.Header
```

See also

DataGridColumn (Page 2346)

DataGridColumnHeader.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
DataGridColumnHeader.Content
```

See also

DataGridColumn.Header (Page 2355)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

DataGridColumnHeader.Content (Page 2355)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

DataGridColumnHeader.Content (Page 2355)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

DataGridColumnHeader.Content (Page 2355)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

DataGridColumnHeader.Content (Page 2355)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

DataGridColumnHeader.Content (Page 2355)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

DataGridColumnHeader.Content (Page 2355)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

DataGridColumnHeader.Content (Page 2355)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

DataGridColumnHeader.Content (Page 2355)

DataGridColumnHeader.Graphic

Description

The "Graphic" property specifies the graphic of the column header.

Type

String

Access

Read-write

Syntax

```
DataGridColumnHeader.Graphic
```

See also

DataGridColumn.Header (Page 2355)

DataGridColumnHeader.Text

Description

The "Text" property specifies the label of the column header.

Type

String

Access

Read-write

Syntax

```
DataGridColumnHeader.Text
```

See also

DataGridColumn.Header (Page 2355)

DataGridColumn.Key

Description

The "Key" property corresponds to the column definition from the "ConsideredColumns" property of the connected source.

Type

String

Access

Read-only

Syntax

```
DataGridColumn.Key
```

See also

DataGridColumn (Page 2346)

DataGridColumn.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
DataGridColumn.MaximumWidth
```

See also

DataGridColumn (Page 2346)

DataGridColumn.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
DataGridColumn.MinimumWidth
```

See also

DataGridColumn (Page 2346)

DataGridColumn.Name

Description

The "Name" property returns the name of the column.

Type

String

Access

Read-only

Syntax

```
DataGridColumn.Name
```

See also

DataGridColumn (Page 2346)

DataGridColumn.OutputFormat

Description

The "OutputFormat" property specifies the format for displaying values.

Type

String

Access

Read-write

Syntax

```
DataGridColumn.OutputFormat
```

See also

DataGridColumn (Page 2346)

DataGridColumn.SortDirection

Description

The "SortDirection" property specifies the sorting direction.

Type

Int32, HmiSortDirection

Specifies the sorting order:

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

Access

Read-write

Syntax

```
DataGridColumn.SortDirection
```

See also

DataGridColumn (Page 2346)

DataGridColumn.SortOrder

Description

The "SortOrder" property specifies the sorting order.

The sorting index begins at "1" (highest priority) in ascending order. Zero is ignored.

Type

UInt16

Access

Read-write

Syntax

```
DataGridColumn.SortOrder
```

See also

DataGridColumn (Page 2346)

DataGridColumn.Visible

Description

The "Visible" property specifies whether the column is visible.

Type

Bool

Access

Read-write

Syntax

```
DataGridColumn.Visible
```

See also

DataGridColumn (Page 2346)

DataGridColumn.Width

Description

The "Width" property specifies the width of the column in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
DataGridColumn.Width
```

See also

DataGridColumn (Page 2346)

DataGridView.Font

Description

The "Font" property specifies the font of the cells.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
DataGridView.Font
```

See also

DataGridControl.DataGridView (Page 2337)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

DataGridView.Font (Page 2366)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

DataGridView.Font (Page 2366)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

DataGridView.Font (Page 2366)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

DataGridView.Font (Page 2366)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

DataGridView.Font (Page 2366)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal

- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

DataGridView.Font (Page 2366)

DataGridView.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.ForeColor
```

See also

DataGridControl.DataGridView (Page 2337)

DataGridView.GridLineColor

Description

The "GridLineColor" property specifies the color of grid lines.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.GridLineColor
```

See also

DataGridControl.DataGridView (Page 2337)

DataGridView.GridLineVisibility

Description

The "GridLineVisibility" property specifies the visibility of the grid lines.

Type

Int32, HmiSimpleGridLine

Specifies the grid lines:

- None (0): None
- Vertikal (1): Vertical
- Horizontal (2): Horizontal

Access

Read-write

Syntax

```
DataGridView.GridLineVisibility
```

See also

DataGridControl.DataGridView (Page 2337)

DataGridView.GridLineWidth

Description

The "GridLineWidth" property specifies the thickness of the grid lines in pixels.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.GridLineWidth
```

See also

DataGridControl.DataGridView (Page 2337)

DataGridView.GridSelectionMode

Description

The "GridSelectionMode" property specifies whether multiple selection is enabled in the table content.

Type

Int32, HmiGridSelectionMode

Specifies the type of the selection:

- None (0): None
- Single (1): Only single selection
- Multi (2): Multiple selection

Access

Read-write

Syntax

```
DataGridView.GridSelectionMode
```

See also

DataGridControl.DataGridView (Page 2337)

DataGridView.HeaderSettings

Description

The "HeaderSettings" property specifies the settings for all column headers in the table.

Type

Object, HmiDataGridHeaderSettingsPart

Access

Read-write

Syntax

```
DataGridView.HeaderSettings
```

See also

DataGridControl.DataGridView (Page 2337)

DataGridHeaderSettings.AllowColumnReorder

Description

The "AllowColumnReorder" property specifies whether the order of the columns can be changed.

Type

Bool

Access

Read-write

Syntax

```
DataGridHeaderSettings.AllowColumnReorder
```

See also

DataGridView.HeaderSettings (Page 2373)

DataGridHeaderSettings.AllowColumnResize

Description

The "AllowColumnResize" property specifies whether the width of the columns can be changed.

Type

Bool

Access

Read-write

Syntax

```
DataGridHeaderSettings.AllowColumnResize
```

See also

DataGridView.HeaderSettings (Page 2373)

DataGridHeaderSettings.ColumnHeaderType

Description

The "ColumnHeaderType" property specifies the type of content of a column header.

Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

Access

Read-write

Syntax

```
DataGridHeaderSettings.ColumnHeaderType
```

See also

DataGridView.HeaderSettings (Page 2373)

DataGridHeaderSettings.Font

Description

The "Font" property specifies the font of the headers.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
DataGridHeaderSettings.Font
```

See also

DataGridView.HeaderSettings (Page 2373)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

DataGridHeaderSettings.Font (Page 2375)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

DataGridHeaderSettings.Font (Page 2375)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

DataGridHeaderSettings.Font (Page 2375)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

DataGridHeaderSettings.Font (Page 2375)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

DataGridHeaderSettings.Font (Page 2375)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

DataGridHeaderSettings.Font (Page 2375)

DataGridHeaderSettings.HeaderBackColor

Description

The "HeaderBackColor" property specifies the background color of the header.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderBackColor
```

See also

DataGridView.HeaderSettings (Page 2373)

DataGridHeaderSettings.HeaderForeColor

Description

The "HeaderForeColor" property specifies the font color of the headers.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderForeColor
```

See also

DataGridView.HeaderSettings (Page 2373)

DataGridHeaderSettings.HeaderGridLineColor

Description

The "HeaderGridLineColor" property specifies the color of the separation line between column headers.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderGridLineColor
```

See also

DataGridView.HeaderSettings (Page 2373)

DataGridHeaderSettings.HeaderSelectionBackColor

Description

The "HeaderSelectionBackColor" property specifies the background color of the header of a selected line or column.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderSelectionBackColor
```

See also

DataGridView.HeaderSettings (Page 2373)

DataGridHeaderSettings.HeaderSelectionForeColor

Description

The "HeaderSelectionForeColor" property specifies the font color of the header of a selected line or column.

Type

UInt32

Access

Read-write

Syntax

```
Object.HeaderSelectionForeColor
```

Object

Required. An object from the "Availability" section.

See also

DataGridView.HeaderSettings (Page 2373)

DataGridHeaderSettings.RowHeaderType

Description

The "RowHeaderType" property specifies the type of content of a row header.

Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

Access

Read-write

Syntax

```
DataGridHeaderSettings.RowHeaderType
```

See also

DataGridView.HeaderSettings (Page 2373)

DataGridView.HorizontalScrollBarVisibility

Description

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar of the display.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
DataGridView.HorizontalScrollBarVisibility
```

See also

DataGridControl.DataGridView (Page 2337)

DataGridView.RowHeight

Description

The "RowHeight" property specifies the height of all rows in the table in DIU (Device Independent Unit).

"0" corresponds to a automatic mechanism, which adjusts the height of each line according to the font size and number of paragraphs.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.RowHeight
```

See also

DataGridControl.DataGridView (Page 2337)

DataGridView.SelectFullRow

Description

The "SelectFullRow" property specifies whether only the cell or the entire row is included in the selection.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.SelectFullRow
```

See also

DataGridControl.DataGridView (Page 2337)

DataGridView.SelectionBackColor

Description

The "SelectionBackColor" property specifies the background color of the selected cells.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.SelectionBackColor
```

See also

DataGridControl.DataGridView (Page 2337)

DataGridView.SelectionBorderColor

Description

The "SelectionBorderColor" property specifies the border color of the selected cells.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.SelectionBorderColor
```

See also

DataGridControl.DataGridView (Page 2337)

DataGridView.SelectionBorderWidth

Description

The "SelectionBorderWidth" property specifies the border width of the selected cells.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.SelectionBorderWidth
```

See also

DataGridControl.DataGridView (Page 2337)

DataGridView.SelectionForeColor

Description

The "SelectionForeColor" property specifies the font color of the selected cells.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.SelectionForeColor
```

See also

DataGridControl.DataGridView (Page 2337)

DataGridView.VerticalScrollBarVisibility

Description

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the display.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
DataGridView.VerticalScrollBarVisibility
```

See also

DataGridControl.DataGridView (Page 2337)

DataGridControl.Enabled

Description

The "Enabled" property specifies whether the data table display can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
DataGridControl.Enabled
```

See also

DataGridControl (Page 2327)

DataGridControl.Height

Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
DataGridControl.Height
```

See also

DataGridControl (Page 2327)

DataGridControl.Icon

Description

The "Icon" property specifies the icon of the data table display.

Type

String

Access

Read-write

Syntax

```
DataGridControl.Icon
```

See also

DataGridControl (Page 2327)

DataGridControl.Layer

Description

The "Layer" property returns the screen layer in which the data tables display is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
DataGridControl.Layer
```

See also

DataGridControl (Page 2327)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

DataGridControl.Layer (Page 2388)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

DataGridControl.Layer (Page 2388)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

DataGridControl.Layer (Page 2388)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

DataGridControl.Layer (Page 2388)

DataGridControl.Left

Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
DataGridControl.Left
```

See also

DataGridControl (Page 2327)

DataGridControl.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
DataGridControl.Margin
```

See also

DataGridControl (Page 2327)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

DataGridControl.Margin (Page 2391)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

DataGridControl.Margin (Page 2391)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

DataGridControl.Margin (Page 2391)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

DataGridControl.Margin (Page 2391)

DataGridControl.Name

Description

The "Name" property returns the name of the data table display.

Type

String

Access

Read-only

Syntax

```
DataGridControl.Name
```

See also

DataGridControl (Page 2327)

DataGridControl.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
DataGridControl.Parent
```

See also

DataGridControl (Page 2327)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

DataGridControl.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the data table display was created.

Type

String

Access

Read-only

Syntax

```
DataGridControl.RenderingTemplate
```

See also

DataGridControl (Page 2327)

DataGridControl.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the data table display is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
DataGridControl.ShowFocusVisual
```

See also

DataGridControl (Page 2327)

DataGridControl.StatusBar

Description

The "StatusBar" property specifies the information bar of the data table display.

Type

Object, HmiStatusBarPart

Access

Read-write

Syntax

```
DataGridControl.StatusBar
```

See also

DataGridControl (Page 2327)

StatusBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
StatusBar.BackColor
```

See also

DataGridControl.StatusBar (Page 2395)

StatusBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

Type

Object, HmiControlBarElementCollection (Page 2397)

Access

Read-only

Syntax

```
StatusBar.Elements
```

See also

DataGridControl.StatusBar (Page 2395)

HmiControlBarElementCollection (Page 2397)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

StatusBar.Elements (Page 2396)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 2397)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 2414)

See also

HmiControlBarElementCollection (Page 2397)

Control Bar Elements (Page 2414)

Control Bar Elements

Description

Control Bar Elements (Page 2414)

StatusBar.Enabled

Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Enabled
```

See also

DataGridControl.StatusBar (Page 2395)

StatusBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
StatusBar.Font
```

See also

DataGridControl.StatusBar (Page 2395)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

StatusBar.Font (Page 2399)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

StatusBar.Font (Page 2399)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

StatusBar.Font (Page 2399)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

StatusBar.Font (Page 2399)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

StatusBar.Font (Page 2399)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

StatusBar.Font (Page 2399)

StatusBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
StatusBar.Margin
```

See also

DataGridControl.StatusBar (Page 2395)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

StatusBar.Margin (Page 2403)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

StatusBar.Margin (Page 2403)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

StatusBar.Margin (Page 2403)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

StatusBar.Margin (Page 2403)

StatusBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
StatusBar.Padding
```

See also

DataGridControl.StatusBar (Page 2395)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

StatusBar.Padding (Page 2406)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

StatusBar.Padding (Page 2406)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

StatusBar.Padding (Page 2406)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

StatusBar.Padding (Page 2406)

StatusBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.ShowToolTips
```

See also

DataGridControl.StatusBar (Page 2395)

StatusBar.Visible

Description

The "Visible" property specifies whether the information bar is visible.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Visible
```

See also

DataGridControl.StatusBar (Page 2395)

DataGridControl.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the data table display.

Type

String

Access

Read-only

Syntax

```
DataGridControl.StyleItemClass
```

See also

DataGridControl (Page 2327)

DataGridControl.TabIndex

Description

The "TabIndex" property returns the position of the data table display in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
DataGridControl.TabIndex
```

See also

DataGridControl (Page 2327)

DataGridControl.ToolBar

Description

The "ToolBar" property specifies the toolbar of the data table display.

Type

Object, HmiToolBarPart

Access

Read-write

Syntax

```
DataGridControl.ToolBar
```

See also

DataGridControl (Page 2327)

ToolBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ToolBar.BackColor
```

See also

DataGridControl.ToolBar (Page 2410)

ToolBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

Type

Object, HmiControlBarElementCollection (Page 2412)

Access

Read-only

Syntax

```
ToolBar.Elements
```

See also

DataGridControl.ToolBar (Page 2410)

HmiControlBarElementCollection (Page 2412)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

ToolBar.Elements (Page 2411)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 2412)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 2414)

See also

HmiControlBarElementCollection (Page 2412)

Control Bar Elements (Page 2414)

Control Bar Elements

ControlBarButton

Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarButtonPart

Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the label of the button.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the button can be operated in runtime.

- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the button.
- **Mapping**
  Returns the function of the button.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the button is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the button is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarButton.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBackColor
```

See also

ControlBarButton (Page 2414)

ControlBarButton.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBorderColor
```

See also

ControlBarButton (Page 2414)

ControlBarButton.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarButton.Authorization
```

See also

ControlBarButton (Page 2414)

ControlBarButton.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BackColor
```

See also

ControlBarButton (Page 2414)

ControlBarButton.Badge

Description

The "Badge" property specifies the label of the button.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarButton.Badge
```

See also

ControlBarButton (Page 2414)

ControlBarButton.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BorderColor
```

See also

ControlBarButton (Page 2414)

ControlBarButton.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarButton.BorderWidth
```

See also

ControlBarButton (Page 2414)

ControlBarButton.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarButton.Content
```

See also

ControlBarButton (Page 2414)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarButton.Content (Page 2419)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarButton.Content (Page 2419)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarButton.Content (Page 2419)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarButton.Content (Page 2419)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarButton.Content (Page 2419)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarButton.Content (Page 2419)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarButton.Content (Page 2419)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarButton.Content (Page 2419)

ControlBarButton.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarButton.CustomID
```

See also

ControlBarButton (Page 2414)

ControlBarButton.Enabled

Description

The "Enabled" property specifies whether the button can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Enabled
```

See also

ControlBarButton (Page 2414)

ControlBarButton.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.ForeColor
```

See also

ControlBarButton (Page 2414)

ControlBarButton.Graphic

Description

The "Graphic" property specifies the graphic of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Graphic
```

See also

ControlBarButton (Page 2414)

ControlBarButton.Height

Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Height
```

See also

ControlBarButton (Page 2414)

ControlBarButton.HotKey

Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
ControlBarButton.HotKey
```

See also

ControlBarButton (Page 2414)

ControlBarButton.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarButton.Mapping
```

See also

ControlBarButton (Page 2414)

ControlBarButton.Margin

Description

The "Margin" property specifies the surrounded outer distance of the button.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarButton.Margin
```

See also

ControlBarButton (Page 2414)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarButton.Margin (Page 2430)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarButton.Margin (Page 2430)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarButton.Margin (Page 2430)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarButton.Margin (Page 2430)

ControlBarButton.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumHeight
```

See also

ControlBarButton (Page 2414)

ControlBarButton.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumWidth
```

See also

ControlBarButton (Page 2414)

ControlBarButton.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumHeight
```

See also

ControlBarButton (Page 2414)

ControlBarButton.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumWidth
```

See also

ControlBarButton (Page 2414)

ControlBarButton.Operability

Description

The "Operability" property returns whether the button is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarButton.Operability
```

See also

ControlBarButton (Page 2414)

ControlBarButton.Padding

Description

The "Padding" property specifies the distance of the content from the border of the button.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarButton.Padding
```

See also

ControlBarButton (Page 2414)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarButton.Padding (Page 2435)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarButton.Padding (Page 2435)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarButton.Padding (Page 2435)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarButton.Padding (Page 2435)

ControlBarButton.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarButton.RequireExplicitUnlock
```

See also

ControlBarButton (Page 2414)

ControlBarButton.Text

Description

The "Text" property specifies the label of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Text
```

See also

ControlBarButton (Page 2414)

ControlBarButton.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.ToolTipText
```

See also

ControlBarButton (Page 2414)

ControlBarButton.Visible

Description

The "Visible" property specifies whether the button is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Visible
```

See also

ControlBarButton (Page 2414)

ControlBarButton.Width

Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Width
```

See also

ControlBarButton (Page 2414)

ControlBarDisplay

Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarDisplayPart

Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the display area is enabled in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the display area.

- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the display area is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the display area is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarDisplay.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarDislay.Authorization
```

See also

ControlBarDisplay (Page 2440)

ControlBarDisplay.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarDislay.Content
```

See also

ControlBarDisplay (Page 2440)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarDisplay.Content (Page 2442)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarDisplay.Content (Page 2442)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarDisplay.Content (Page 2442)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarDisplay.Content (Page 2442)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarDisplay.Content (Page 2442)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarDisplay.Content (Page 2442)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarDisplay.Content (Page 2442)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarDisplay.Content (Page 2442)

ControlBarDisplay.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarDislay.CustomID
```

See also

ControlBarDisplay (Page 2440)

ControlBarDisplay.Enabled

Description

The "Enabled" property specifies whether the display is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Enabled
```

See also

ControlBarDisplay (Page 2440)

ControlBarDisplay.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.ForeColor
```

See also

ControlBarDisplay (Page 2440)

ControlBarDisplay.Graphic

Description

The "Graphic" property specifies the graphic of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Graphic
```

See also

ControlBarDisplay (Page 2440)

ControlBarDisplay.Height

Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Height
```

See also

ControlBarDisplay (Page 2440)

ControlBarDisplay.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarDislay.Mapping
```

See also

ControlBarDisplay (Page 2440)

ControlBarDisplay.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the display.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarDislay.Margin
```

See also

ControlBarDisplay (Page 2440)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarDisplay.Margin (Page 2452)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarDisplay.Margin (Page 2452)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarDisplay.Margin (Page 2452)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarDisplay.Margin (Page 2452)

ControlBarDisplay.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumHeight
```

See also

ControlBarDisplay (Page 2440)

ControlBarDisplay.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumWidth
```

See also

ControlBarDisplay (Page 2440)

ControlBarDisplay.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumHeight
```

See also

ControlBarDisplay (Page 2440)

ControlBarDisplay.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumWidth
```

See also

ControlBarDisplay (Page 2440)

ControlBarDisplay.Operability

Description

The "Operability" property returns whether the display is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarDislay.Operability
```

See also

ControlBarDisplay (Page 2440)

ControlBarDisplay.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the display.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarDislay.Padding
```

See also

ControlBarDisplay (Page 2440)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarDisplay.Padding (Page 2457)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarDisplay.Padding (Page 2457)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarDisplay.Padding (Page 2457)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarDisplay.Padding (Page 2457)

ControlBarDisplay.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarDislay.RequireExplicitUnlock
```

See also

ControlBarDisplay (Page 2440)

ControlBarDisplay.Text

Description

The "Text" property specifies the label of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Text
```

See also

ControlBarDisplay (Page 2440)

ControlBarDisplay.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.ToolTipText
```

See also

ControlBarDisplay (Page 2440)

ControlBarDisplay.Visible

Description

The "Visible" property specifies whether the display is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Visible
```

See also

ControlBarDisplay (Page 2440)

ControlBarDisplay.Width

Description

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Width
```

See also

ControlBarDisplay (Page 2440)

ControlBarLabel

Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar.

You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarLabelPart

Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the identifier can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the identifier.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.

- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the identifier is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the identifier is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarLabel.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarLabel.Authorization
```

See also

ControlBarLabel (Page 2462)

ControlBarLabel.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarLabel.CustomID
```

See also

ControlBarLabel (Page 2462)

ControlBarLabel.Enabled

Description

The "Enabled" property specifies whether the identifier is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Enabled
```

See also

ControlBarLabel (Page 2462)

ControlBarLabel.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.ForeColor
```

See also

ControlBarLabel (Page 2462)

ControlBarLabel.Height

Description

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Height
```

See also

ControlBarLabel (Page 2462)

ControlBarLabel.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

See also

ControlBarLabel (Page 2462)

ControlBarLabel.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarLabel.Mapping
```

See also

ControlBarLabel (Page 2462)

ControlBarLabel.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarLabel.Margin
```

See also

ControlBarLabel (Page 2462)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarLabel.Margin (Page 2469)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarLabel.Margin (Page 2469)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarLabel.Margin (Page 2469)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarLabel.Margin (Page 2469)

ControlBarLabel.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumHeight
```

ControlBarLabel (Page 2462)

ControlBarLabel.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumWidth
```

See also

ControlBarLabel (Page 2462)

ControlBarLabel.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumHeight
```

See also

ControlBarLabel (Page 2462)

ControlBarLabel.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumWidth
```

See also

ControlBarLabel (Page 2462)

ControlBarLabel.Operability

Description

The "Operability" property returns whether the identifier is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarLabel.Operability
```

See also

ControlBarLabel (Page 2462)

ControlBarLabel.Padding

Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarLabel.Padding
```

See also

ControlBarLabel (Page 2462)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarLabel.Padding (Page 2474)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarLabel.Padding (Page 2474)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarLabel.Padding (Page 2474)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarLabel.Padding (Page 2474)

ControlBarLabel.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarLabel.RequireExplicitUnlock
```

See also

ControlBarLabel (Page 2462)

ControlBarLabel.Text

Description

The "Text" property specifies the label of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.Text
```

See also

ControlBarLabel (Page 2462)

ControlBarLabel.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.ToolTipText
```

See also

ControlBarLabel (Page 2462)

ControlBarLabel.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.VerticalTextAlignment
```

See also

ControlBarLabel (Page 2462)

ControlBarLabel.Visible

Description

The "Visible" property specifies whether the identifier is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Visible
```

See also

ControlBarLabel (Page 2462)

ControlBarLabel.Width

Description

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Width
```

See also

ControlBarLabel (Page 2462)

ControlBarSeparator

Description

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarSeparatorPart

Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the disconnector can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the separator.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the separator is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the disconnector is only operable while the associated button is being pressed.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the disconnector is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarSeparator.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarSeparator.Authorization
```

See also

ControlBarSeparator (Page 2479)

ControlBarSeparator.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarSeparator.CustomID
```

See also

ControlBarSeparator (Page 2479)

ControlBarSeparator.Enabled

Description

The "Enabled" property specifies whether the separator is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Enabled
```

See also

ControlBarSeparator (Page 2479)

ControlBarSeparator.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.ForeColor
```

See also

ControlBarSeparator (Page 2479)

ControlBarSeparator.Height

Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Height
```

See also

ControlBarSeparator (Page 2479)

ControlBarSeparator.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarSeparator.Mapping
```

See also

ControlBarSeparator (Page 2479)

ControlBarSeparator.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the separator.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarSeparator.Margin
```

See also

ControlBarSeparator (Page 2479)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarSeparator.Margin (Page 2485)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarSeparator.Margin (Page 2485)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarSeparator.Margin (Page 2485)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarSeparator.Margin (Page 2485)

ControlBarSeparator.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumHeight
```

See also

ControlBarSeparator (Page 2479)

ControlBarSeparator.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumWidth
```

See also

ControlBarSeparator (Page 2479)

ControlBarSeparator.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumHeight
```

See also

ControlBarSeparator (Page 2479)

ControlBarSeparator.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumWidth
```

See also

ControlBarSeparator (Page 2479)

ControlBarSeparator.Operability

Description

The "Operability" property returns whether the separator is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarSeparator.Operability
```

See also

ControlBarSeparator (Page 2479)

ControlBarSeparator.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the separator.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarSeparator.Padding
```

See also

ControlBarSeparator (Page 2479)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarSeparator.Padding (Page 2490)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarSeparator.Padding (Page 2490)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarSeparator.Padding (Page 2490)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarSeparator.Padding (Page 2490)

ControlBarSeparator.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the disconnector can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarSeparator.RequireExplicitUnlock
```

See also

ControlBarSeparator (Page 2479)

ControlBarSeparator.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

Type

String

Access

Read-write

Syntax

```
ControlBarSeparator.ToolTipText
```

See also

ControlBarSeparator (Page 2479)

ControlBarSeparator.Visible

Description

The "Visible" property specifies whether the separator is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Visible
```

See also

ControlBarSeparator (Page 2479)

ControlBarSeparator.Width

Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Width
```

See also

ControlBarSeparator (Page 2479)

ControlBarTextBox

Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarTextBoxPart

Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the text box can be operated in runtime.
- **ForeColor**
  Specifies the font color.

- **Height**
  Specifies the height.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Mapping**
  Returns the function of the text box.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the text box is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **Readonly**
  Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**
  Returns whether the text box is only operable while the associated button is being pressed.
- **Text**
  Specifies the labeling.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the text box is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarTextBox.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.AlternateBorderColor
```

See also

ControlBarTextBox (Page 2495)

ControlBarTextBox.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarTextBox.Authorization
```

See also

ControlBarTextBox (Page 2495)

ControlBarTextBox.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BackColor
```

See also

ControlBarTextBox (Page 2495)

ControlBarTextBox.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BorderColor
```

See also

ControlBarTextBox (Page 2495)

ControlBarTextBox.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarTextBox.BorderWidth
```

See also

ControlBarTextBox (Page 2495)

ControlBarTextBox.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarTextBox.CustomID
```

See also

ControlBarTextBox (Page 2495)

ControlBarTextBox.Enabled

Description

The "Enabled" property specifies whether the text box can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Enabled
```

See also

ControlBarTextBox (Page 2495)

ControlBarTextBox.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.ForeColor
```

See also

ControlBarTextBox (Page 2495)

ControlBarTextBox.Height

Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Height
```

See also

ControlBarTextBox (Page 2495)

ControlBarTextBox.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

See also

ControlBarTextBox (Page 2495)

ControlBarTextBox.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarTextBox.Mapping
```

See also

ControlBarTextBox (Page 2495)

ControlBarTextBox.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the text box.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarTextBox.Margin
```

See also

ControlBarTextBox (Page 2495)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarTextBox.Margin (Page 2504)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarTextBox.Margin (Page 2504)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarTextBox.Margin (Page 2504)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarTextBox.Margin (Page 2504)

ControlBarTextBox.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumHeight
```

See also

ControlBarTextBox (Page 2495)

ControlBarTextBox.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumWidth
```

See also

ControlBarTextBox (Page 2495)

ControlBarTextBox.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumHeight
```

See also

ControlBarTextBox (Page 2495)

ControlBarTextBox.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumWidth
```

See also

ControlBarTextBox (Page 2495)

ControlBarTextBox.Operability

Description

The "Operability" property returns whether the text box is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarTextBox.Operability
```

See also

ControlBarTextBox (Page 2495)

ControlBarTextBox.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the text box.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarTextBox.Padding
```

See also

ControlBarTextBox (Page 2495)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarTextBox.Padding (Page 2509)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarTextBox.Padding (Page 2509)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarTextBox.Padding (Page 2509)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarTextBox.Padding (Page 2509)

ControlBarTextBox.ReadOnly

Description

The "ReadOnly" property specifies whether the text box is read-only.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.ReadOnly
```

See also

ControlBarTextBox (Page 2495)

ControlBarTextBox.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

See also

ControlBarTextBox (Page 2495)

ControlBarTextBox.Text

Description

The "Text" property specifies the label of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.Text
```

See also

ControlBarTextBox (Page 2495)

ControlBarTextBox.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.ToolTipText
```

See also

ControlBarTextBox (Page 2495)

ControlBarTextBox.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

See also

ControlBarTextBox (Page 2495)

ControlBarTextBox.Visible

Description

The "Visible" property specifies whether the text box is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Visible
```

See also

ControlBarTextBox (Page 2495)

ControlBarTextBox.Width

Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Width
```

See also

ControlBarTextBox (Page 2495)

ControlBarToggleSwitch

Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar.

You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarToggleSwitchPart

Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".

- **AlternateGraphic**
  Specifies the graphic for the "pressed" state.
- **AlternateText**
  Specifies the text for the "pressed" state.
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the identifier of the switch.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the switch can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the switch.
- **IsAlternateState**
  Specifies the current state of the switch.
- **Mapping**
  Returns the function of the switch.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.

- **Operability**
  Returns whether the switch is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the switch is only operable while the associated button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the switch is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarToggleSwitch.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.AlternateGraphic

Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateGraphic
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.AlternateText

Description

The "AlternateText" property specifies the text of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateText
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Authorization
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BackColor
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.Badge

Description

The "Badge" property specifies the identifier of the switch.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Badge
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderColor
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderWidth
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Content
```

See also

ControlBarToggleSwitch (Page 2515)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarToggleSwitch.Content (Page 2522)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarToggleSwitch.Content (Page 2522)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 2522)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarToggleSwitch.Content (Page 2522)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarToggleSwitch.Content (Page 2522)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarToggleSwitch.Content (Page 2522)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarToggleSwitch.Content (Page 2522)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 2522)

ControlBarToggleSwitch.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarToggleSwitch.CustomID
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.Enabled

Description

The "Enabled" property specifies whether the switch can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Enabled
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ForeColor
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.Graphic

Description

The "Graphic" property specifies the graphic of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Graphic
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.Height

Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Height
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.HotKey

Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
Button.HotKey
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.IsAlternateState

Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Mapping
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the switch.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Margin
```

See also

ControlBarToggleSwitch (Page 2515)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarToggleSwitch.Margin (Page 2533)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarToggleSwitch.Margin (Page 2533)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarToggleSwitch.Margin (Page 2533)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarToggleSwitch.Margin (Page 2533)

ControlBarToggleSwitch.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumHeight
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumWidth
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumHeight
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumWidth
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.Operability

Description

The property "Operability" returns whether the switch is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Operability
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the switch.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Padding
```

See also

ControlBarToggleSwitch (Page 2515)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarToggleSwitch.Padding (Page 2538)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarToggleSwitch.Padding (Page 2538)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarToggleSwitch.Padding (Page 2538)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarToggleSwitch.Padding (Page 2538)

ControlBarToggleSwitch.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.Text

Description

The "Text" property specifies the label of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Text
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ToolTipText
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.Visible

Description

The "Visible" property specifies whether the switch is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Visible
```

See also

ControlBarToggleSwitch (Page 2515)

ControlBarToggleSwitch.Width

Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Width
```

See also

ControlBarToggleSwitch (Page 2515)

ToolBar.Enabled

Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Enabled
```

See also

DataGridControl.ToolBar (Page 2410)

ToolBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ToolBar.Font
```

See also

DataGridControl.ToolBar (Page 2410)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ToolBar.Font (Page 2544)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ToolBar.Font (Page 2544)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ToolBar.Font (Page 2544)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ToolBar.Font (Page 2544)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ToolBar.Font (Page 2544)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ToolBar.Font (Page 2544)

ToolBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the toolbar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ToolBar.Margin
```

See also

DataGridControl.ToolBar (Page 2410)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ToolBar.Margin (Page 2547)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ToolBar.Margin (Page 2547)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ToolBar.Margin (Page 2547)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ToolBar.Margin (Page 2547)

ToolBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ToolBar.Padding
```

See also

DataGridControl.ToolBar (Page 2410)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ToolBar.Padding (Page 2550)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ToolBar.Padding (Page 2550)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ToolBar.Padding (Page 2550)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ToolBar.Padding (Page 2550)

ToolBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.ShowToolTips
```

See also

DataGridControl.ToolBar (Page 2410)

ToolBar.UseHotKeys

Description

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.UseHotKeys
```

See also

DataGridControl.ToolBar (Page 2410)

ToolBar.Visible

Description

The "Visible" property specifies whether the toolbar is visible.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Visible
```

See also

DataGridControl.ToolBar (Page 2410)

DataGridControl.Top

Description

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
DataGridControl.Top
```

See also

DataGridControl (Page 2327)

DataGridControl.Visible

Description

The "Visible" property specifies whether the data table display is visible.

Type

Bool

Access

Read-write

Syntax

```
DataGridControl.Visible
```

See also

DataGridControl (Page 2327)

DataGridControl.Width

Description

The "Width" property specifies the width in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
DataGridControl.Width
```

See also

DataGridControl (Page 2327)

DataGridControl.WindowFlags

Description

The "WindowFlags" property specifies the window configuration of the data table display.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title

- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be moved
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

You can enable multiple properties by adding integer values or bit operators.

Access

Read-write

Syntax

```
DataGridControl.WindowFlags
```

Example

Adapting the "windowFlags" tag depending on the window configuration:

Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose){
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

See also

DataGridControl (Page 2327)

DataGridControl.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the data table display.

Syntax

```
DataGridControl.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

DataGridControl (Page 2327)

DataGridControl.FireCommand()

Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the data table display.

Syntax

```
DataGridControl.FireCommand(commandId, custom)
```

Parameters

commandId

Type: Int32

ID of the element of the toolbar or information bar

custom

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

Return value

--

DataGridControl.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
DataGridControl.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

DataGridControl (Page 2327)

DataGridControl_OnActivated()

Description

The "OnActivated" event occurs when a data table display receives focus:

- A data table display is selected via the configured tab sequence.
- A data table display that had no focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
DataGridControl_OnActivated(item)
```

Context

item

Type: Object

Data table display where the event occurs.

See also

DataGridControl (Page 2327)

DataGridControl_OnCommandFired()

Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the data table display.

Syntax

```
DataGridControl_OnCommandFired(item, commandId, custom)
```

Context

item

Type: Object

Data table display where the event occurs.

commandId

Type: DInt

ID of the element of the toolbar or information bar that was operated.

custom

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

See also

DataGridControl (Page 2327)

DataGridControl_OnDeactivated()

Description

The "OnDeactivated" event occurs when the data table display loses focus because the operator has pressed the <TAB> key or executed another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
DataGridControl_OnDeactivated(item)
```

Context

item

Type: Object

Data table display where the event occurs.

See also

DataGridControl (Page 2327)

DataGridControl_OnInitialized()

Description

The "OnInitialized" event occurs when a data table display has been successfully initialized and the data connection to the PLC has been established.

Syntax

```
DataGridControl_OnInitialized(item)
```

Context

item

Type: Object

Data table display where the event occurs.

See also

DataGridControl (Page 2327)

DcsFaceplateContainer

Description

The "DcsFaceplateContainer" object represents a container for faceplate instances that can only be used by DCS+ products.

Object type

HmiDcsFaceplateContainer

Properties

The "DcsFaceplateContainer" object has the following properties:

- **Caption**
  Specifies the text that is displayed in the title bar.
- **CaptionColor**
  Specifies the background color of the title bar.
- **ContainedType**
  Returns the type of the contained objects.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the faceplate container.
- **DomainSubTypeGUID**
  Returns the unique designation for the subtype of the displayed faceplate container.
- **DomainTypeGUID**
  Returns the unique designation for the type of displayed faceplate container.
- **Enabled**
  Specifies whether the faceplate container can be operated in runtime.
- **Height**
  Specifies the height.
- **Icon**
  Specifies the icon.
- **Layer**
  Returns the layer of the screen in which the faceplate container is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the faceplate container.
- **Parent**
  Returns the higher-level screen object.
- **RenderingTemplate**
  Returns the name of the template from which the faceplate container was created.
- **ShowFocusVisual**
  Specifies whether the faceplate container is highlighted when in focus.
- **StyleItemClass**
  Returns the style which is applied to the faceplate container.
- **TabIndex**
  Returns the position of the faceplate container in the tab sequence.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the faceplate container is visible.

- **Width**
  Specifies the width.
- **WindowFlags**
  Specifies the window configuration of the faceplate container.

Methods

The "DcsFaceplateContainer" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the faceplate container.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "DcsFaceplateContainer" object has the following events:

- **OnActivated()**
  Occurs when a faceplate container receives focus.
- **OnDeactivated()**
  Occurs when a faceplate container loses focus.

DcsFaceplateContainer.Caption

Description

The "Caption" property specifies the text that is displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
DcsFaceplateContainer.Caption
```

See also

DcsFaceplateContainer (Page 2561)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

DcsFaceplateContainer.Caption (Page 2563)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 2564)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 2564)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 2564)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 2564)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 2564)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 2564)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

DcsFaceplateContainer.Caption (Page 2563)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

DcsFaceplateContainer.Caption (Page 2563)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

DcsFaceplateContainer.Caption (Page 2563)

DcsFaceplateContainer.CaptionColor

Description

The "CaptionColor" property specifies the background color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
DcsFaceplateContainer.CaptionColor
```

See also

DcsFaceplateContainer (Page 2561)

DcsFaceplateContainer.ContainedType

Description

The "ContainedType" property returns the type of the contained objects.

Type

String

Access

Read-only

Syntax

```
DcsFaceplateContainer.ContainedType
```

See also

DcsFaceplateContainer (Page 2561)

DcsFaceplateContainer.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the faceplate container.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
DcsFaceplateContainer.CurrentQuality
```

See also

DcsFaceplateContainer (Page 2561)

DcsFaceplateContainer.DomainSubTypeGUID

Description

The "DomainSubTypeGUID" property returns the unique designation for the subtype of the displayed faceplate container.

Type

String

Access

Read-only

Syntax

```
DcsFaceplateContainer.DomainSubTypeGUID
```

See also

DcsFaceplateContainer (Page 2561)

DcsFaceplateContainer.DomainTypeGUID

Description

The "DomainTypeGUID" property returns the unique designation for the type of the displayed faceplate container.

Type

String

Access

Read-only

Syntax

```
DcsFaceplateContainer.DomainTypeGUID
```

See also

DcsFaceplateContainer (Page 2561)

DcsFaceplateContainer.Enabled

Description

The "Enabled" property specifies whether the faceplate container can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
DcsFaceplateContainer.Enabled
```

See also

DcsFaceplateContainer (Page 2561)

DcsFaceplateContainer.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
DcsFaceplateContainer.Height
```

See also

DcsFaceplateContainer (Page 2561)

DcsFaceplateContainer.Icon

Description

The "Icon" property specifies the icon.

Type

String

Access

Read-write

Syntax

```
DcsFaceplateContainer.Icon
```

See also

DcsFaceplateContainer (Page 2561)

DcsFaceplateContainer.Layer

Description

The "Layer" property returns the layer of the screen in which the faceplate container is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
DcsFaceplateContainer.Layer
```

See also

DcsFaceplateContainer (Page 2561)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

DcsFaceplateContainer.Layer (Page 2573)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

DcsFaceplateContainer.Layer (Page 2573)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

DcsFaceplateContainer.Layer (Page 2573)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

DcsFaceplateContainer.Layer (Page 2573)

DcsFaceplateContainer.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
DcsFaceplateContainer.Left
```

See also

DcsFaceplateContainer (Page 2561)

DcsFaceplateContainer.Margin

Description

The Margin property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
DcsFaceplateContainer.Margin
```

See also

DcsFaceplateContainer (Page 2561)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

DcsFaceplateContainer.Margin (Page 2576)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

DcsFaceplateContainer.Margin (Page 2576)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

DcsFaceplateContainer.Margin (Page 2576)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

DcsFaceplateContainer.Margin (Page 2576)

DcsFaceplateContainer.Name

Description

The "Name" property returns the name of the faceplate container.

Type

String

Access

Read-only

Syntax

```
DcsFaceplateContainer.Name
```

See also

DcsFaceplateContainer (Page 2561)

DcsFaceplateContainer.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
DcsFaceplateContainer.Parent
```

See also

DcsFaceplateContainer (Page 2561)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

DcsFaceplateContainer.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the faceplate container was created.

Type

String

Access

Read-only

Syntax

```
DcsFaceplateContainer.RenderingTemplate
```

See also

DcsFaceplateContainer (Page 2561)

DcsFaceplateContainer.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the faceplate container is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
DcsFaceplateContainer.ShowFocusVisual
```

See also

DcsFaceplateContainer (Page 2561)

DcsFaceplateContainer.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the faceplate container.

Type

String

Access

Read-only

Syntax

```
DcsFaceplateContainer.StyleItemClass
```

See also

DcsFaceplateContainer (Page 2561)

DcsFaceplateContainer.TabIndex

Description

The "TabIndex" property returns the position of the faceplate container in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
DcsFaceplateContainer.TabIndex
```

See also

DcsFaceplateContainer (Page 2561)

DcsFaceplateContainer.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
DcsFaceplateContainer.Top
```

See also

DcsFaceplateContainer (Page 2561)

DcsFaceplateContainer.Visible

Description

The "Visible" property specifies whether the faceplate container is visible.

Type

Bool

Access

Read-write

Syntax

```
DcsFaceplateContainer.Visible
```

See also

DcsFaceplateContainer (Page 2561)

DcsFaceplateContainer.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
DcsFaceplateContainer.Width
```

See also

DcsFaceplateContainer (Page 2561)

DcsFaceplateContainer.WindowFlags

Description

The "WindowFlags" property specifies the window configuration of the faceplate container.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

Enable multiple properties by adding the integer values or bit operators.

Access

Read-write

Syntax

```
DcsFaceplateContainer.WindowFlags
```

Example

Adapt the "windowFlags" tag depending on the window configuration:

Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose){
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

See also

DcsFaceplateContainer (Page 2561)

DcsFaceplateContainer.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the faceplate container.

Syntax

```
DcsFaceplateContainer.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

DcsFaceplateContainer (Page 2561)

DcsFaceplateContainer.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
DcsFaceplateContainer.PropertyFlashing(propertyName, enable[, value]
[, alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

DcsFaceplateContainer (Page 2561)

DcsFaceplateContainer_OnActivated()

Description

The "OnActivated" event occurs when a faceplate container receives focus:

- A faceplate container is selected via the configured tab sequence.
- A faceplate container that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
DcsFaceplateContainer_OnActivated(item)
```

Context

item

Type: Object

Faceplate container where the event occurs.

See also

DcsFaceplateContainer (Page 2561)

DcsFaceplateContainer_OnDeactivated()

Description

The "OnDeactivated" event occurs when a faceplate container loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
DcsFaceplateContainer_OnDeactivated(item)
```

Context

item

Type: Object

Faceplate container where the event occurs.

See also

DcsFaceplateContainer (Page 2561)

DetailedParameterControl

Description

The "DetailedParameterControl" object represents a parameter set display of tag values from the current process or the archive in runtime.

Object type

HmiDetailedParameterControl

Properties

The "DetailedParameterControl" object has the following properties:

- **BackColor**
  Specifies the background color.
- **Caption**
  Specifies the text that is displayed in the title bar.
- **CaptionColor**
  Specifies the background color of the title bar.
- **CurrentParameterSetID**
  Specifies the current parameter set ID.
- **CurrentParameterSetTypeID**
  Specifies the current parameter set type ID.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the parameter set display.
- **EditMode**
  Specifies the editing mode for values in runtime.
- **Enabled**
  Specifies whether the parameter set display can be operated in runtime.
- **Font**
  Specifies the font of the text.
- **ForeColor**
  Specifies the font color of the text.
- **Height**
  Specifies the height.
- **HideDetails**
  Specifies whether the table for value display is hidden.
- **Icon**
  Specifies the icon of the parameter set display.
- **Layer**
  Returns the screen layer in which the parameter set display is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the parameter set display.
- **ParameterSetTypeFixed**
  Specifies a parameter set type which cannot be changed in runtime.
- **ParameterView**
  Defines the appearance of the parameter table.
- **Parent**
  Returns the higher-level screen object.

- **RenderingTemplate**
  Returns the name of the template from which the parameter set display was created.
- **SelectionBackColor**
  Specifies the background color of the selected cells.
- **SelectionForeColor**
  Specifies the foreground color of the selected cells.
- **ShowFocusVisual**
  Specifies whether the parameter set display is highlighted when in focus.
- **StatusBar**
  Sets the information bar of the parameter set display.
- **StyleItemClass**
  Returns the style which is applied to the parameter set display.
- **TabIndex**
  Returns the position of the parameter set display in the tab sequence.
- **TimeZone**
  Specifies the time zone.
- **ToolBar**
  Sets the toolbar of the parameter set display.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the parameter set display is visible.
- **Width**
  Specifies the width.
- **WindowFlags**
  Specifies the window configuration of the parameter set display.

Methods

The "DetailedParameterControl" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the parameter set display.
- **FireCommand()**
  Configures the occurrence of an event for an element.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "DetailedParameterControl" object has the following events:

- **OnActivated()**
  Occurs when a parameter set display receives focus.
- **OnCommandFired()**
  Occurs when the operator has operated an element in the toolbar or information bar of the parameter set display.
- **OnDeactivated()**
  Occurs when a parameter set display loses focus.
- **OnInitialized()**
  Occurs when a parameter set display has been successfully initialized and the data connection to the PLC has been established.

DetailedParameterControl.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
DetailedParameterControl.BackColor
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.Caption

Description

The "Caption" property specifies the text that is displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
DetailedParameterControl.Caption
```

See also

DetailedParameterControl (Page 2587)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

DetailedParameterControl.Caption (Page 2590)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 2591)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 2591)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 2591)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 2591)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 2591)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 2591)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

DetailedParameterControl.Caption (Page 2590)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

DetailedParameterControl.Caption (Page 2590)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

DetailedParameterControl.Caption (Page 2590)

DetailedParameterControl.CaptionColor

Description

The "CaptionColor" property specifies the color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
DetailedParameterControl.CaptionColor
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.CurrentParameterSetID

Description

The "CurrentParameterSetID" property specifies the current parameter set ID.

Type

UInt32

Access

Read-write

Syntax

```
DetailedParameterControl.CurrentParameterSetID
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.CurrentParameterSetTypeID

Description

The "CurrentParameterSetTypeID" property specifies the current parameter set ID.

Type

UInt32

Access

Read-write

Syntax

```
DetailedParameterControl.CurrentParameterSetTypeID
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the parameter set display.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
DetailedParameterControl.CurrentQuality
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.EditMode

Description

The "EditMode" property specifies the editing mode for values in runtime.

Type

Int32, HmiEditMode

Specifies the editing mode:

- None (0): No access
- Update (1): Update values

- Create (2): Create values
- Delete (4): Delete values

Access

Read-write

Syntax

```
DetailedParameterControl.EditMode
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.Enabled

Description

The "Enabled" property specifies whether the parameter set display can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
DetailedParameterControl.Enabled
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
DetailedParameterControl.Font
```

See also

DetailedParameterControl (Page 2587)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

DetailedParameterControl.Font (Page 2599)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

DetailedParameterControl.Font (Page 2599)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

DetailedParameterControl.Font (Page 2599)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

DetailedParameterControl.Font (Page 2599)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

DetailedParameterControl.Font (Page 2599)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

DetailedParameterControl.Font (Page 2599)

DetailedParameterControl.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
DetailedParameterControl.ForeColor
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
DetailedParameterControl.Height
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.HideDetails

Description

The "HideDetails" property specifies whether the table is hidden for the value display.

Type

Bool

Access

Read-write

Syntax

```
DetailedParameterControl.HideDetails
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.Icon

Description

The "Icon" property specifies the icon of the parameter set display.

Type

String

Access

Read-write

Syntax

```
DetailedParameterControl.Icon
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.Layer

Description

The "Layer" property returns the layer of the screen in which the parameter set display is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
DetailedParameterControl.Layer
```

See also

DetailedParameterControl (Page 2587)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

DetailedParameterControl.Layer (Page 2605)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

DetailedParameterControl.Layer (Page 2605)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

DetailedParameterControl.Layer (Page 2605)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

DetailedParameterControl.Layer (Page 2605)

DetailedParameterControl.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
DetailedParameterControl.Left
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
DetailedParameterControl.Margin
```

See also

DetailedParameterControl (Page 2587)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

DetailedParameterControl.Margin (Page 2608)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

DetailedParameterControl.Margin (Page 2608)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

DetailedParameterControl.Margin (Page 2608)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

DetailedParameterControl.Margin (Page 2608)

DetailedParameterControl.Name

Description

The "Name" property returns the parameter set display of the column.

Type

String

Access

Read-only

Syntax

```
DetailedParameterControl.Name
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.ParameterSetTypeFixed

Description

The "ParameterSetTypeFixed" property specifies a parameter set type which cannot be changed in runtime.

Type

String, HmiParameterSetType (Page 1234)

Access

Read-write

Syntax

```
DetailedParameterControl.ParameterSetTypeFixed
```

See also

DetailedParameterControl (Page 2587)

ParameterSetType (Page 1234)

ParameterSetType

Description

ParameterSetType (Page 1234)

DetailedParameterControl.ParameterView

Description

The "ParameterView" property defines the appearance of the parameter table.

Type

Object, HmiDataGridViewPart (Page 2612)

Access

Read-write

Syntax

```
DetailedParameterControl.ParameterView
```

See also

DetailedParameterControl (Page 2587)

DataGridView (Page 2612)

DataGridView

DataGridView.AllowFilter

Description

The "AllowFilter" property specifies whether filtering of columns is permitted.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.AllowFilter
```

See also

DetailedParameterControl.ParameterView (Page 2612)

DataGridView.AllowSort

Description

The "AllowSort" property specifies whether the sorting of columns is permitted.

- True: Activates the sorting and sets the "AllowSort" property of all columns to "true".
- False: Disables the sorting for all columns. The individual column properties remain unchanged.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.AllowSort
```

See also

DetailedParameterControl.ParameterView (Page 2612)

DataGridView.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.AlternateBackColor
```

See also

DetailedParameterControl.ParameterView (Page 2612)

DataGridView.AlternateForeColor

Description

The "AlternateForeColor" property specifies the flashing color for the text.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.AlternateForeColor
```

See also

DetailedParameterControl.ParameterView (Page 2612)

DataGridView.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.BackColor
```

See also

DetailedParameterControl.ParameterView (Page 2612)

DataGridView.CellPadding

Description

The "CellPadding" property specifies the inner spacing of the content from the cell border.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
DataGridView.CellPadding
```

See also

DetailedParameterControl.ParameterView (Page 2612)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

DataGridView.CellPadding (Page 2615)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

DataGridView.CellPadding (Page 2615)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

DataGridView.CellPadding (Page 2615)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

DataGridView.CellPadding (Page 2615)

DataGridView.ColoringMode

Description

The "ColoringMode" property specifies whether alternate coloring of every other row or column is enabled.

Type

Int32, HmiGridColoringMode

Specifies the type of the coloring:

- None (0): None
- Columns (1): Color the columns alternately.
- Rows (2): Color the rows alternately.

Access

Read-write

Syntax

```
DataGridView.ColoringMode
```

See also

DetailedParameterControl.ParameterView (Page 2612)

DataGridView.Columns

Description

The "Columns" property represents the quantity of columns.

Type

Object, HmiDataGridColumnCollection (Page 2619)

Access

Read-only

Syntax

```
DataGridView.Columns
```

See also

DetailedParameterControl.ParameterView (Page 2612)
HmiDataGridColumnCollection (Page 2619)

HmiDataGridColumnCollection

Description

The "HmiDataGridColumnCollection" object is a list of all columns ("DataGridColumn" objects) of the table.

You reference a "HmiDataGridColumnCollection" object via the `DataGridView.Columns` property.

Use

The "HmiDataGridColumnCollection" object is a list and can be counted and enumerated. You can access the "HmiDataGridColumnCollection" list using the index or the tag name.

Object type

HmiDataGridColumnCollection

Properties

The "HmiDataGridColumnCollection" object has the following properties:

- **Count**
  Returns the number of columns in the "HmiDataGridColumnCollection" list.

Methods

The "HmiDataGridColumnCollection" object has the following methods:

- **Item()**
  Returns a column of the "HmiDataGridColumnCollection" list.

See also

DataGridView.Columns (Page 2618)

HmiDataGridColumnCollection.Count

Description

The "Count" property returns the number of columns in the "HmiDataGridColumnCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiDataGridColumnCollection.Count
```

See also

HmiDataGridColumnCollection (Page 2619)

HmiDataGridColumnCollection.Item()

Description

The "Item" method returns a column of the "HmiDataGridColumnCollection" list.

Syntax

```
HmiDataGridColumnCollection[.Item](HmiDataGridColumnName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiDataGridColumnCollection" object.

Parameters

`HmiDataGridColumnName`

Type: String

Name of the column

Return value

Object, HmiDataGridColumnPartBase (Page 2621)

See also

HmiDataGridColumnCollection (Page 2619)

DetailedParameterControlColumn (Page 2621)

DetailedParameterControlColumn

Description

The "DetailedParameterControlColumn" object represents a value column.

Object type

HmiDetailedParameterControlColumnPart

Properties

The "DetailedParameterControlColumn" object has the following properties:

- **AllowSort**
  Specifies whether column sorting is allowed.
- **BackColor**
  Specifies the background color.
- **Content**
  Specifies the display options for text and graphics.
- **DetailedParameterControlBlock**
  Specifies the information blocks.
- **Enabled**
  Specifies whether the column can be operated in runtime.
- **ForeColor**
  Specifies the font color of the text.
- **Header**
  Specifies the properties of the column header.
- **Key**
  Corresponds to the column definition from the "ConsideredColumns" property of the connected source.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumWidth**
  Specifies the minimum width.
- **Name**
  Returns the name of the column.
- **OutputFormat**
  Specifies the format for displaying values.
- **SortDirection**
  Specifies the sorting direction.
- **SortOrder**
  Specifies the sorting order.

- **Visible**
  Specifies whether the column is visible.
- **Width**
  Specifies the width.

Methods

--

See also

HmiDataGridColumnCollection (Page 2619)

DetailedParameterControlColumn.AllowSort

Description

The "AllowSort" property specifies whether column sorting is permitted.

This property is ignored if the parent object has the "AllowSort" property set to "False".

Type

Bool

Access

Read-write

Syntax

```
DetailedParameterControlColumn.AllowSort
```

See also

DetailedParameterControlColumn (Page 2621)

DetailedParameterControlColumn.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
DetailedParameterControlColumn.BackColor
```

See also

DetailedParameterControlColumn (Page 2621)

DetailedParameterControlColumn.Content

Description

The "Content" property specifies the display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
DetailedParameterControlColumn.Content
```

See also

DetailedParameterControlColumn (Page 2621)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics

- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

DetailedParameterControlColumn.Content (Page 2623)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

DetailedParameterControlColumn.Content (Page 2623)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

DetailedParameterControlColumn.Content (Page 2623)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

DetailedParameterControlColumn.Content (Page 2623)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

DetailedParameterControlColumn.Content (Page 2623)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

DetailedParameterControlColumn.Content (Page 2623)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

DetailedParameterControlColumn.Content (Page 2623)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

DetailedParameterControlColumn.Content (Page 2623)

DetailedParameterControlColumn.DetailedParameterControlBlock

Description

The "DetailedParameterControlBlock" property specifies the information blocks.

Type

Int32, HmiDetailedParameterControlBlock

Specifies the information blocks:

- None (0): None
- ParameterSetElementName (1): Unit name, for example "kilogram", must always be set
- ParameterSetValue (2): Value, must always be set
- ParameterSetElementUnit (3): Unit, for example "kg"

Access

Read-write

Syntax

```
DetailedParameterControlColumn.DetailedParameterControlBlock
```

See also

DetailedParameterControlColumn (Page 2621)

DetailedParameterControlColumn.Enabled

Description

The "Enabled" property specifies whether the column can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
DetailedParameterControlColumn.Enabled
```

See also

DetailedParameterControlColumn (Page 2621)

DetailedParameterControlColumn.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
DetailedParameterControlColumn.ForeColor
```

See also

DetailedParameterControlColumn (Page 2621)

DetailedParameterControlColumn.Header

Description

The "Header" property specifies the properties of the column header.

Type

Object, HmiDataGridColumnHeaderPart

Access

Read-write

Syntax

```
DetailedParameterControlColumn.Header
```

See also

DetailedParameterControlColumn (Page 2621)

DataGridColumnHeader.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
DataGridColumnHeader.Content
```

See also

DetailedParameterControlColumn.Header (Page 2630)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

DataGridColumnHeader.Content (Page 2630)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

DataGridColumnHeader.Content (Page 2630)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

DataGridColumnHeader.Content (Page 2630)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

DataGridColumnHeader.Content (Page 2630)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

DataGridColumnHeader.Content (Page 2630)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

DataGridColumnHeader.Content (Page 2630)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

DataGridColumnHeader.Content (Page 2630)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

DataGridColumnHeader.Content (Page 2630)

DataGridColumnHeader.Graphic

Description

The "Graphic" property specifies the graphic of the column header.

Type

String

Access

Read-write

Syntax

```
DataGridColumnHeader.Graphic
```

See also

DetailedParameterControlColumn.Header (Page 2630)

DataGridColumnHeader.Text

Description

The "Text" property specifies the label of the column header.

Type

String

Access

Read-write

Syntax

```
DataGridColumnHeader.Text
```

See also

DetailedParameterControlColumn.Header (Page 2630)

DetailedParameterControlColumn.Key

Description

The "Key" property corresponds to the column definition from the "ConsideredColumns" property of the connected source.

Type

String

Access

Read-only

Syntax

```
DetailedParameterControlColumn.Key
```

See also

DetailedParameterControlColumn (Page 2621)

DetailedParameterControlColumn.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
DetailedParameterControlColumn.MaximumWidth
```

See also

DetailedParameterControlColumn (Page 2621)

DetailedParameterControlColumn.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
DetailedParameterControlColumn.MinimumWidth
```

See also

DetailedParameterControlColumn (Page 2621)

DetailedParameterControlColumn.Name

Description

The "Name" property returns the name of the column.

Type

String

Access

Read-only

Syntax

```
DetailedParameterControlColumn.Name
```

See also

DetailedParameterControlColumn (Page 2621)

DetailedParameterControlColumn.OutputFormat

Description

The "OutputFormat" property specifies the format for displaying values.

Type

String

Access

Read-write

Syntax

```
DetailedParameterControlColumn.OutputFormat
```

See also

DetailedParameterControlColumn (Page 2621)

DetailedParameterControlColumn.SortDirection

Description

The "SortDirection" property specifies the sorting direction.

Type

Int32, HmiSortDirection

Specifies the sorting order:

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

Access

Read-write

Syntax

```
DetailedParameterControlColumn.SortDirection
```

See also

DetailedParameterControlColumn (Page 2621)

DetailedParameterControlColumn.SortOrder

Description

The "SortOrder" property specifies the sorting order.

The sorting index starts at "1" (highest priority) in ascending order. Zero is ignored.

Type

UInt16

Access

Read-write

Syntax

```
DetailedParameterControlColumn.SortOrder
```

See also

DetailedParameterControlColumn (Page 2621)

DetailedParameterControlColumn.Visible

Description

The "Visible" property specifies whether the column is visible.

Type

Bool

Access

Read-write

Syntax

```
DetailedParameterControlColumn.Visible
```

See also

DetailedParameterControlColumn (Page 2621)

DetailedParameterControlColumn.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
DetailedParameterControlColumn.Width
```

See also

DetailedParameterControlColumn (Page 2621)

DataGridView.Font

Description

The "Font" property specifies the font of the cells.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
DataGridView.Font
```

See also

DetailedParameterControl.ParameterView (Page 2612)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

DataGridView.Font (Page 2641)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

DataGridView.Font (Page 2641)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

DataGridView.Font (Page 2641)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

DataGridView.Font (Page 2641)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

DataGridView.Font (Page 2641)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

DataGridView.Font (Page 2641)

DataGridView.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.ForeColor
```

See also

DetailedParameterControl.ParameterView (Page 2612)

DataGridView.GridLineColor

Description

The "GridLineColor" property specifies the color of grid lines.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.GridLineColor
```

See also

DetailedParameterControl.ParameterView (Page 2612)

DataGridView.GridLineVisibility

Description

The "GridLineVisibility" property specifies the visibility of the grid lines.

Type

Int32, HmiSimpleGridLine

Specifies the grid lines:

- None (0): None
- Vertikal (1): Vertical
- Horizontal (2): Horizontal

Access

Read-write

Syntax

```
DataGridView.GridLineVisibility
```

See also

DetailedParameterControl.ParameterView (Page 2612)

DataGridView.GridLineWidth

Description

The "GridLineWidth" property specifies the thickness of the grid lines in pixels.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.GridLineWidth
```

See also

DetailedParameterControl.ParameterView (Page 2612)

DataGridView.GridSelectionMode

Description

The "GridSelectionMode" property specifies whether multiple selection is enabled in the table content.

Type

Int32, HmiGridSelectionMode

Specifies the type of the selection:

- None (0): None
- Single (1): Only single selection
- Multi (2): Multiple selection

Access

Read-write

Syntax

```
DataGridView.GridSelectionMode
```

See also

DetailedParameterControl.ParameterView (Page 2612)

DataGridView.HeaderSettings

Description

The "HeaderSettings" property specifies the settings for all column headers in the table.

Type

Object, HmiDataGridHeaderSettingsPart

Access

Read-write

Syntax

```
DataGridView.HeaderSettings
```

See also

DetailedParameterControl.ParameterView (Page 2612)

DataGridHeaderSettings.AllowColumnReorder

Description

The "AllowColumnReorder" property specifies whether the order of the columns can be changed.

Type

Bool

Access

Read-write

Syntax

```
DataGridHeaderSettings.AllowColumnReorder
```

See also

DataGridView.HeaderSettings (Page 2647)

DataGridHeaderSettings.AllowColumnResize

Description

The "AllowColumnResize" property specifies whether the width of the columns can be changed.

Type

Bool

Access

Read-write

Syntax

```
DataGridHeaderSettings.AllowColumnResize
```

See also

DataGridView.HeaderSettings (Page 2647)

DataGridHeaderSettings.ColumnHeaderType

Description

The "ColumnHeaderType" property specifies the type of content of a column header.

Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

Access

Read-write

Syntax

```
DataGridHeaderSettings.ColumnHeaderType
```

See also

DataGridView.HeaderSettings (Page 2647)

DataGridHeaderSettings.Font

Description

The "Font" property specifies the font of the headers.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
DataGridHeaderSettings.Font
```

See also

DataGridView.HeaderSettings (Page 2647)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

DataGridHeaderSettings.Font (Page 2649)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

DataGridHeaderSettings.Font (Page 2649)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

DataGridHeaderSettings.Font (Page 2649)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

DataGridHeaderSettings.Font (Page 2649)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

DataGridHeaderSettings.Font (Page 2649)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

DataGridHeaderSettings.Font (Page 2649)

DataGridHeaderSettings.HeaderBackColor

Description

The "HeaderBackColor" property specifies the background color of the header.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderBackColor
```

See also

DataGridView.HeaderSettings (Page 2647)

DataGridHeaderSettings.HeaderForeColor

Description

The "HeaderForeColor" property specifies the font color of the headers.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderForeColor
```

See also

DataGridView.HeaderSettings (Page 2647)

DataGridHeaderSettings.HeaderGridLineColor

Description

The "HeaderGridLineColor" property specifies the color of the separation line between column headers.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderGridLineColor
```

See also

DataGridView.HeaderSettings (Page 2647)

DataGridHeaderSettings.HeaderSelectionBackColor

Description

The "HeaderSelectionBackColor" property specifies the background color of the header of a selected line or column.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderSelectionBackColor
```

See also

DataGridView.HeaderSettings (Page 2647)

DataGridHeaderSettings.HeaderSelectionForeColor

Description

The "HeaderSelectionForeColor" property specifies the font color of the header of a selected line or column.

Type

UInt32

Access

Read-write

Syntax

```
Object.HeaderSelectionForeColor
```

`Object`

Required. An object from the "Availability" section.

See also

DataGridView.HeaderSettings (Page 2647)

DataGridHeaderSettings.RowHeaderType

Description

The "RowHeaderType" property specifies the type of content of a row header.

Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

Access

Read-write

Syntax

```
DataGridHeaderSettings.RowHeaderType
```

See also

DataGridView.HeaderSettings (Page 2647)

DataGridView.HorizontalScrollBarVisibility

Description

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar of the display.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
DataGridView.HorizontalScrollBarVisibility
```

See also

DetailedParameterControl.ParameterView (Page 2612)

DataGridView.RowHeight

Description

The "RowHeight" property specifies the height of all rows in the table in DIU (Device Independent Unit).

"0" corresponds to a automatic mechanism, which adjusts the height of each line according to the font size and number of paragraphs.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.RowHeight
```

See also

DetailedParameterControl.ParameterView (Page 2612)

DataGridView.SelectFullRow

Description

The "SelectFullRow" property specifies whether only the cell or the entire row is included in the selection.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.SelectFullRow
```

See also

DetailedParameterControl.ParameterView (Page 2612)

DataGridView.SelectionBackColor

Description

The "SelectionBackColor" property specifies the background color of the selected cells.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.SelectionBackColor
```

See also

DetailedParameterControl.ParameterView (Page 2612)

DataGridView.SelectionBorderColor

Description

The "SelectionBorderColor" property specifies the border color of the selected cells.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.SelectionBorderColor
```

See also

DetailedParameterControl.ParameterView (Page 2612)

DataGridView.SelectionForeColor

Description

The "SelectionForeColor" property specifies the font color of the selected cells.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.SelectionForeColor
```

See also

DetailedParameterControl.ParameterView (Page 2612)

DataGridView.VerticalScrollBarVisibility

Description

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the display.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
DataGridView.VerticalScrollBarVisibility
```

See also

DetailedParameterControl.ParameterView (Page 2612)

DetailedParameterControl.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
DetailedParameterControl.Parent
```

See also

DetailedParameterControl (Page 2587)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

DetailedParameterControl.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the parameter set display was created.

Type

String

Access

Read-only

Syntax

```
DetailedParameterControl.RenderingTemplate
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.SelectionBackColor

Description

The "SelectionBackColor" property specifies the background color of the selected cells.

Type

UInt32

Access

Read-write

Syntax

```
DetailedParameterControl.SelectionBackColor
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.SelectionForeColor

Description

The "SelectionForeColor" property specifies the foreground color of the selected cells.

Type

UInt32

Access

Read-write

Syntax

```
DetailedParameterControl.SelectionForeColor
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the parameter set display is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
DetailedParameterControl.ShowFocusVisual
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.StatusBar

Description

The "StatusBar" property specifies the information bar of the parameter set display.

Type

Object, HmiStatusBarPart

Access

Read-write

Syntax

```
DetailedParameterControl.StatusBar
```

See also

DetailedParameterControl (Page 2587)

StatusBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
StatusBar.BackColor
```

See also

DetailedParameterControl.StatusBar (Page 2663)

StatusBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

Type

Object, HmiControlBarElementCollection (Page 2664)

Access

Read-only

Syntax

```
StatusBar.Elements
```

See also

DetailedParameterControl.StatusBar (Page 2663)

HmiControlBarElementCollection (Page 2664)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

StatusBar.Elements (Page 2664)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 2664)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 2682)

See also

HmiControlBarElementCollection (Page 2664)

Control Bar Elements (Page 2682)

Control Bar Elements

Description

Control Bar Elements (Page 2682)

StatusBar.Enabled

Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Enabled
```

See also

DetailedParameterControl.StatusBar (Page 2663)

StatusBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
StatusBar.Font
```

See also

DetailedParameterControl.StatusBar (Page 2663)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

StatusBar.Font (Page 2667)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

StatusBar.Font (Page 2667)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

StatusBar.Font (Page 2667)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

StatusBar.Font (Page 2667)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

StatusBar.Font (Page 2667)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

StatusBar.Font (Page 2667)

StatusBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
StatusBar.Margin
```

See also

DetailedParameterControl.StatusBar (Page 2663)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

StatusBar.Margin (Page 2671)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

StatusBar.Margin (Page 2671)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

StatusBar.Margin (Page 2671)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

StatusBar.Margin (Page 2671)

StatusBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
StatusBar.Padding
```

See also

DetailedParameterControl.StatusBar (Page 2663)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

StatusBar.Padding (Page 2673)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

StatusBar.Padding (Page 2673)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

StatusBar.Padding (Page 2673)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

StatusBar.Padding (Page 2673)

StatusBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.ShowToolTips
```

See also

DetailedParameterControl.StatusBar (Page 2663)

StatusBar.Visible

Description

The "Visible" property specifies whether the information bar is visible.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Visible
```

See also

DetailedParameterControl.StatusBar (Page 2663)

DetailedParameterControl.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the parameter set display.

Type

String

Access

Read-only

Syntax

```
DetailedParameterControl.StyleItemClass
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.TabIndex

Description

The "TabIndex" property returns the position of the parameter set display in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
DetailedParameterControl.TabIndex
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.TimeZone

Description

The "TimeZone" property specifies the time zone.

Type

Int32, HmiTimeZone

Access

Read-write

Syntax

```
DetailedParameterControl.TimeZone
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.ToolBar

Description

The "ToolBar" property specifies the toolbar of the parameter set display.

Type

Object, HmiToolBarPart

Access

Read-write

Syntax

```
DetailedParameterControl.ToolBar
```

See also

DetailedParameterControl (Page 2587)

ToolBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ToolBar.BackColor
```

See also

DetailedParameterControl.ToolBar (Page 2678)

ToolBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

Type

Object, HmiControlBarElementCollection (Page 2680)

Access

Read-only

Syntax

```
ToolBar.Elements
```

See also

DetailedParameterControl.ToolBar (Page 2678)

HmiControlBarElementCollection (Page 2680)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

ToolBar.Elements (Page 2679)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 2680)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 2682)

See also

HmiControlBarElementCollection (Page 2680)

Control Bar Elements (Page 2682)

Control Bar Elements

ControlBarButton

Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarButtonPart

Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the label of the button.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the button can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.

- **HotKey**
  Returns the hotkey specified for the button.
- **Mapping**
  Returns the function of the button.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the button is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the button is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarButton.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBackColor
```

See also

ControlBarButton (Page 2682)

ControlBarButton.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBorderColor
```

See also

ControlBarButton (Page 2682)

ControlBarButton.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarButton.Authorization
```

See also

ControlBarButton (Page 2682)

ControlBarButton.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BackColor
```

See also

ControlBarButton (Page 2682)

ControlBarButton.Badge

Description

The "Badge" property specifies the label of the button.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarButton.Badge
```

See also

ControlBarButton (Page 2682)

ControlBarButton.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BorderColor
```

See also

ControlBarButton (Page 2682)

ControlBarButton.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarButton.BorderWidth
```

See also

ControlBarButton (Page 2682)

ControlBarButton.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarButton.Content
```

See also

ControlBarButton (Page 2682)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarButton.Content (Page 2687)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarButton.Content (Page 2687)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarButton.Content (Page 2687)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarButton.Content (Page 2687)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarButton.Content (Page 2687)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above

- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarButton.Content (Page 2687)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarButton.Content (Page 2687)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarButton.Content (Page 2687)

ControlBarButton.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarButton.CustomID
```

See also

ControlBarButton (Page 2682)

ControlBarButton.Enabled

Description

The "Enabled" property specifies whether the button can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Enabled
```

See also

ControlBarButton (Page 2682)

ControlBarButton.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.ForeColor
```

See also

ControlBarButton (Page 2682)

ControlBarButton.Graphic

Description

The "Graphic" property specifies the graphic of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Graphic
```

See also

ControlBarButton (Page 2682)

ControlBarButton.Height

Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Height
```

See also

ControlBarButton (Page 2682)

ControlBarButton.HotKey

Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
ControlBarButton.HotKey
```

See also

ControlBarButton (Page 2682)

ControlBarButton.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog

- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled

- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarButton.Mapping
```

See also

ControlBarButton (Page 2682)

ControlBarButton.Margin

Description

The "Margin" property specifies the surrounded outer distance of the button.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarButton.Margin
```

See also

ControlBarButton (Page 2682)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarButton.Margin (Page 2697)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarButton.Margin (Page 2697)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarButton.Margin (Page 2697)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarButton.Margin (Page 2697)

ControlBarButton.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumHeight
```

See also

ControlBarButton (Page 2682)

ControlBarButton.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumWidth
```

See also

ControlBarButton (Page 2682)

ControlBarButton.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumHeight
```

See also

ControlBarButton (Page 2682)

ControlBarButton.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumWidth
```

See also

ControlBarButton (Page 2682)

ControlBarButton.Operability

Description

The "Operability" property returns whether the button is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarButton.Operability
```

See also

ControlBarButton (Page 2682)

ControlBarButton.Padding

Description

The "Padding" property specifies the distance of the content from the border of the button.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarButton.Padding
```

See also

ControlBarButton (Page 2682)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarButton.Padding (Page 2703)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarButton.Padding (Page 2703)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarButton.Padding (Page 2703)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarButton.Padding (Page 2703)

ControlBarButton.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarButton.RequireExplicitUnlock
```

See also

ControlBarButton (Page 2682)

ControlBarButton.Text

Description

The "Text" property specifies the label of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Text
```

See also

ControlBarButton (Page 2682)

ControlBarButton.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.ToolTipText
```

See also

ControlBarButton (Page 2682)

ControlBarButton.Visible

Description

The "Visible" property specifies whether the button is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Visible
```

See also

ControlBarButton (Page 2682)

ControlBarButton.Width

Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Width
```

See also

ControlBarButton (Page 2682)

ControlBarDisplay

Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarDisplayPart

Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the display area is enabled in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the display area.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.

- **Operability**
  Returns whether the display area is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the display area is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarDisplay.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarDislay.Authorization
```

See also

ControlBarDisplay (Page 2708)

ControlBarDisplay.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarDislay.Content
```

See also

ControlBarDisplay (Page 2708)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarDisplay.Content (Page 2710)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarDisplay.Content (Page 2710)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarDisplay.Content (Page 2710)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarDisplay.Content (Page 2710)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarDisplay.Content (Page 2710)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarDisplay.Content (Page 2710)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarDisplay.Content (Page 2710)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarDisplay.Content (Page 2710)

ControlBarDisplay.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarDislay.CustomID
```

See also

ControlBarDisplay (Page 2708)

ControlBarDisplay.Enabled

Description

The "Enabled" property specifies whether the display is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Enabled
```

See also

ControlBarDisplay (Page 2708)

ControlBarDisplay.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.ForeColor
```

See also

ControlBarDisplay (Page 2708)

ControlBarDisplay.Graphic

Description

The "Graphic" property specifies the graphic of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Graphic
```

See also

ControlBarDisplay (Page 2708)

ControlBarDisplay.Height

Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Height
```

See also

ControlBarDisplay (Page 2708)

ControlBarDisplay.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarDislay.Mapping
```

See also

ControlBarDisplay (Page 2708)

ControlBarDisplay.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the display.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarDislay.Margin
```

See also

ControlBarDisplay (Page 2708)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarDisplay.Margin (Page 2720)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarDisplay.Margin (Page 2720)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarDisplay.Margin (Page 2720)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarDisplay.Margin (Page 2720)

ControlBarDisplay.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumHeight
```

See also

ControlBarDisplay (Page 2708)

ControlBarDisplay.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumWidth
```

See also

ControlBarDisplay (Page 2708)

ControlBarDisplay.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumHeight
```

See also

ControlBarDisplay (Page 2708)

ControlBarDisplay.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumWidth
```

See also

ControlBarDisplay (Page 2708)

ControlBarDisplay.Operability

Description

The "Operability" property returns whether the display is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarDislay.Operability
```

See also

ControlBarDisplay (Page 2708)

ControlBarDisplay.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the display.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarDislay.Padding
```

See also

ControlBarDisplay (Page 2708)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarDisplay.Padding (Page 2725)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarDisplay.Padding (Page 2725)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarDisplay.Padding (Page 2725)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarDisplay.Padding (Page 2725)

ControlBarDisplay.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarDislay.RequireExplicitUnlock
```

See also

ControlBarDisplay (Page 2708)

ControlBarDisplay.Text

Description

The "Text" property specifies the label of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Text
```

See also

ControlBarDisplay (Page 2708)

ControlBarDisplay.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.ToolTipText
```

See also

ControlBarDisplay (Page 2708)

ControlBarDisplay.Visible

Description

The "Visible" property specifies whether the display is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Visible
```

See also

ControlBarDisplay (Page 2708)

ControlBarDisplay.Width

Description

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Width
```

See also

ControlBarDisplay (Page 2708)

ControlBarLabel

Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar.

You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarLabelPart

Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the identifier can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the identifier.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.

- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the identifier is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the identifier is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarLabel.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarLabel.Authorization
```

See also

ControlBarLabel (Page 2730)

ControlBarLabel.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarLabel.CustomID
```

See also

ControlBarLabel (Page 2730)

ControlBarLabel.Enabled

Description

The "Enabled" property specifies whether the identifier is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Enabled
```

See also

ControlBarLabel (Page 2730)

ControlBarLabel.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.ForeColor
```

See also

ControlBarLabel (Page 2730)

ControlBarLabel.Height

Description

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Height
```

See also

ControlBarLabel (Page 2730)

ControlBarLabel.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

See also

ControlBarLabel (Page 2730)

ControlBarLabel.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarLabel.Mapping
```

See also

ControlBarLabel (Page 2730)

ControlBarLabel.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarLabel.Margin
```

See also

ControlBarLabel (Page 2730)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarLabel.Margin (Page 2737)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarLabel.Margin (Page 2737)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarLabel.Margin (Page 2737)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarLabel.Margin (Page 2737)

ControlBarLabel.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumHeight
```

See also

ControlBarLabel (Page 2730)

ControlBarLabel.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumWidth
```

See also

ControlBarLabel (Page 2730)

ControlBarLabel.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumHeight
```

See also

ControlBarLabel (Page 2730)

ControlBarLabel.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumWidth
```

See also

ControlBarLabel (Page 2730)

ControlBarLabel.Operability

Description

The "Operability" property returns whether the identifier is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarLabel.Operability
```

See also

ControlBarLabel (Page 2730)

ControlBarLabel.Padding

Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarLabel.Padding
```

See also

ControlBarLabel (Page 2730)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarLabel.Padding (Page 2742)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarLabel.Padding (Page 2742)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarLabel.Padding (Page 2742)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarLabel.Padding (Page 2742)

ControlBarLabel.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarLabel.RequireExplicitUnlock
```

See also

ControlBarLabel (Page 2730)

ControlBarLabel.Text

Description

The "Text" property specifies the label of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.Text
```

See also

ControlBarLabel (Page 2730)

ControlBarLabel.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.ToolTipText
```

See also

ControlBarLabel (Page 2730)

ControlBarLabel.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.VerticalTextAlignment
```

See also

ControlBarLabel (Page 2730)

ControlBarLabel.Visible

Description

The "Visible" property specifies whether the identifier is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Visible
```

See also

ControlBarLabel (Page 2730)

ControlBarLabel.Width

Description

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Width
```

See also

ControlBarLabel (Page 2730)

ControlBarSeparator

Description

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarSeparatorPart

Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the disconnector can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the separator.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the separator is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the disconnector is only operable while the associated button is being pressed.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the disconnector is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarSeparator.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarSeparator.Authorization
```

See also

ControlBarSeparator (Page 2747)

ControlBarSeparator.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarSeparator.CustomID
```

See also

ControlBarSeparator (Page 2747)

ControlBarSeparator.Enabled

Description

The "Enabled" property specifies whether the separator is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Enabled
```

See also

ControlBarSeparator (Page 2747)

ControlBarSeparator.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.ForeColor
```

See also

ControlBarSeparator (Page 2747)

ControlBarSeparator.Height

Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Height
```

See also

ControlBarSeparator (Page 2747)

ControlBarSeparator.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarSeparator.Mapping
```

See also

ControlBarSeparator (Page 2747)

ControlBarSeparator.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the separator.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarSeparator.Margin
```

See also

ControlBarSeparator (Page 2747)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarSeparator.Margin (Page 2753)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarSeparator.Margin (Page 2753)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarSeparator.Margin (Page 2753)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarSeparator.Margin (Page 2753)

ControlBarSeparator.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumHeight
```

See also

ControlBarSeparator (Page 2747)

ControlBarSeparator.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumWidth
```

See also

ControlBarSeparator (Page 2747)

ControlBarSeparator.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumHeight
```

See also

ControlBarSeparator (Page 2747)

ControlBarSeparator.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumWidth
```

See also

ControlBarSeparator (Page 2747)

ControlBarSeparator.Operability

Description

The "Operability" property returns whether the separator is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarSeparator.Operability
```

See also

ControlBarSeparator (Page 2747)

ControlBarSeparator.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the separator.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarSeparator.Padding
```

See also

ControlBarSeparator (Page 2747)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarSeparator.Padding (Page 2758)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarSeparator.Padding (Page 2758)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarSeparator.Padding (Page 2758)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarSeparator.Padding (Page 2758)

ControlBarSeparator.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the disconnector can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarSeparator.RequireExplicitUnlock
```

See also

ControlBarSeparator (Page 2747)

ControlBarSeparator.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

Type

String

Access

Read-write

Syntax

```
ControlBarSeparator.ToolTipText
```

See also

ControlBarSeparator (Page 2747)

ControlBarSeparator.Visible

Description

The "Visible" property specifies whether the separator is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Visible
```

See also

ControlBarSeparator (Page 2747)

ControlBarSeparator.Width

Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Width
```

See also

ControlBarSeparator (Page 2747)

ControlBarTextBox

Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarTextBoxPart

Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the text box can be operated in runtime.
- **ForeColor**
  Specifies the font color.

- **Height**
  Specifies the height.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Mapping**
  Returns the function of the text box.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the text box is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **Readonly**
  Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**
  Returns whether the text box is only operable while the associated button is being pressed.
- **Text**
  Specifies the labeling.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the text box is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarTextBox.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.AlternateBorderColor
```

See also

ControlBarTextBox (Page 2763)

ControlBarTextBox.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarTextBox.Authorization
```

See also

ControlBarTextBox (Page 2763)

ControlBarTextBox.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BackColor
```

See also

ControlBarTextBox (Page 2763)

ControlBarTextBox.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BorderColor
```

See also

ControlBarTextBox (Page 2763)

ControlBarTextBox.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarTextBox.BorderWidth
```

See also

ControlBarTextBox (Page 2763)

ControlBarTextBox.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarTextBox.CustomID
```

See also

ControlBarTextBox (Page 2763)

ControlBarTextBox.Enabled

Description

The "Enabled" property specifies whether the text box can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Enabled
```

See also

ControlBarTextBox (Page 2763)

ControlBarTextBox.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.ForeColor
```

See also

ControlBarTextBox (Page 2763)

ControlBarTextBox.Height

Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Height
```

See also

ControlBarTextBox (Page 2763)

ControlBarTextBox.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

See also

ControlBarTextBox (Page 2763)

ControlBarTextBox.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarTextBox.Mapping
```

See also

ControlBarTextBox (Page 2763)

ControlBarTextBox.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the text box.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarTextBox.Margin
```

See also

ControlBarTextBox (Page 2763)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarTextBox.Margin (Page 2772)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarTextBox.Margin (Page 2772)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarTextBox.Margin (Page 2772)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarTextBox.Margin (Page 2772)

ControlBarTextBox.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumHeight
```

See also

ControlBarTextBox (Page 2763)

ControlBarTextBox.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumWidth
```

See also

ControlBarTextBox (Page 2763)

ControlBarTextBox.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumHeight
```

See also

ControlBarTextBox (Page 2763)

ControlBarTextBox.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumWidth
```

See also

ControlBarTextBox (Page 2763)

ControlBarTextBox.Operability

Description

The "Operability" property returns whether the text box is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarTextBox.Operability
```

See also

ControlBarTextBox (Page 2763)

ControlBarTextBox.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the text box.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarTextBox.Padding
```

See also

ControlBarTextBox (Page 2763)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarTextBox.Padding (Page 2777)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarTextBox.Padding (Page 2777)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarTextBox.Padding (Page 2777)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarTextBox.Padding (Page 2777)

ControlBarTextBox.ReadOnly

Description

The "ReadOnly" property specifies whether the text box is read-only.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.ReadOnly
```

See also

ControlBarTextBox (Page 2763)

ControlBarTextBox.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

See also

ControlBarTextBox (Page 2763)

ControlBarTextBox.Text

Description

The "Text" property specifies the label of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.Text
```

See also

ControlBarTextBox (Page 2763)

ControlBarTextBox.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.ToolTipText
```

See also

ControlBarTextBox (Page 2763)

ControlBarTextBox.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

See also

ControlBarTextBox (Page 2763)

ControlBarTextBox.Visible

Description

The "Visible" property specifies whether the text box is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Visible
```

See also

ControlBarTextBox (Page 2763)

ControlBarTextBox.Width

Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Width
```

See also

ControlBarTextBox (Page 2763)

ControlBarToggleSwitch

Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar.

You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarToggleSwitchPart

Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".

- **AlternateGraphic**
  Specifies the graphic for the "pressed" state.
- **AlternateText**
  Specifies the text for the "pressed" state.
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the identifier of the switch.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the switch can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the switch.
- **IsAlternateState**
  Specifies the current state of the switch.
- **Mapping**
  Returns the function of the switch.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.

- **Operability**
  Returns whether the switch is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the switch is only operable while the associated button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the switch is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarToggleSwitch.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.AlternateGraphic

Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateGraphic
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.AlternateText

Description

The "AlternateText" property specifies the text of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateText
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Authorization
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BackColor
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.Badge

Description

The "Badge" property specifies the identifier of the switch.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Badge
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderColor
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderWidth
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Content
```

See also

ControlBarToggleSwitch (Page 2783)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarToggleSwitch.Content (Page 2790)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarToggleSwitch.Content (Page 2790)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 2790)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarToggleSwitch.Content (Page 2790)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarToggleSwitch.Content (Page 2790)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarToggleSwitch.Content (Page 2790)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarToggleSwitch.Content (Page 2790)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 2790)

ControlBarToggleSwitch.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarToggleSwitch.CustomID
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.Enabled

Description

The "Enabled" property specifies whether the switch can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Enabled
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ForeColor
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.Graphic

Description

The "Graphic" property specifies the graphic of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Graphic
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.Height

Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Height
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.HotKey

Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
Button.HotKey
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.IsAlternateState

Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Mapping
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the switch.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Margin
```

See also

ControlBarToggleSwitch (Page 2783)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarToggleSwitch.Margin (Page 2801)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarToggleSwitch.Margin (Page 2801)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarToggleSwitch.Margin (Page 2801)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarToggleSwitch.Margin (Page 2801)

ControlBarToggleSwitch.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumHeight
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumWidth
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumHeight
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumWidth
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.Operability

Description

The property "Operability" returns whether the switch is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Operability
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the switch.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Padding
```

See also

ControlBarToggleSwitch (Page 2783)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarToggleSwitch.Padding (Page 2806)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarToggleSwitch.Padding (Page 2806)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarToggleSwitch.Padding (Page 2806)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarToggleSwitch.Padding (Page 2806)

ControlBarToggleSwitch.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.Text

Description

The "Text" property specifies the label of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Text
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ToolTipText
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.Visible

Description

The "Visible" property specifies whether the switch is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Visible
```

See also

ControlBarToggleSwitch (Page 2783)

ControlBarToggleSwitch.Width

Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Width
```

See also

ControlBarToggleSwitch (Page 2783)

ToolBar.Enabled

Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Enabled
```

See also

DetailedParameterControl.ToolBar (Page 2678)

ToolBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ToolBar.Font
```

See also

DetailedParameterControl.ToolBar (Page 2678)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ToolBar.Font (Page 2812)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ToolBar.Font (Page 2812)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ToolBar.Font (Page 2812)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ToolBar.Font (Page 2812)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ToolBar.Font (Page 2812)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ToolBar.Font (Page 2812)

ToolBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the toolbar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ToolBar.Margin
```

See also

DetailedParameterControl.ToolBar (Page 2678)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ToolBar.Margin (Page 2815)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ToolBar.Margin (Page 2815)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ToolBar.Margin (Page 2815)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ToolBar.Margin (Page 2815)

ToolBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ToolBar.Padding
```

See also

DetailedParameterControl.ToolBar (Page 2678)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ToolBar.Padding (Page 2818)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ToolBar.Padding (Page 2818)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ToolBar.Padding (Page 2818)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ToolBar.Padding (Page 2818)

ToolBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.ShowToolTips
```

See also

DetailedParameterControl.ToolBar (Page 2678)

ToolBar.UseHotKeys

Description

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.UseHotKeys
```

See also

DetailedParameterControl.ToolBar (Page 2678)

ToolBar.Visible

Description

The "Visible" property specifies whether the toolbar is visible.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Visible
```

See also

DetailedParameterControl.ToolBar (Page 2678)

DetailedParameterControl.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
DetailedParameterControl.Top
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.Visible

Description

The "Visible" property specifies whether the parameter set display is visible.

Type

Bool

Access

Read-write

Syntax

```
DetailedParameterControl.Visible
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
DetailedParameterControl.Width
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.WindowFlags

Description

The "WindowFlags" property specifies the window configuration of the parameter set display.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title

- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be moved
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

Enable multiple properties by adding the integer values or bit operators.

Access

Read-write

Syntax

```
DetailedParameterControl.WindowFlags
```

Example

Adapting the "windowFlags" tag depending on the window configuration:

Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose){
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the parameter set display.

Syntax

```
DetailedParameterControl.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.FireCommand()

Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the parameter set control.

Syntax

```
DetailedParameterControl.FireCommand(commandId, custom)
```

Parameters

commandId

Type: Int32

ID of the element of the toolbar or information bar

custom

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

Return value

--

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
DetailedParameterControl.PropertyFlashing(propertyName, enable[,
value][, alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl_OnActivated()

Description

The "OnActivated" event occurs when a parameter set display receives focus:

- A parameter set display is selected via the configured tab sequence.
- A parameter set display that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
DetailedParameterControl_OnActivated(item)
```

Context

`item`

Type: Object

Parameter set display where the event occurs.

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl_OnCommandFired()

Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the parameter set display.

Syntax

```
DetailedParameterControl_OnCommandFired(item, commandId, custom)
```

Context

item

Type: Object

Parameter set display where the event occurs.

commandId

Type: DInt

ID of the element of the toolbar or information bar that was operated.

custom

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl_OnDeactivated()

Description

The "OnDeactivated" event occurs when the parameter set display loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
DetailedParameterControl_OnDeactivated(item)
```

Context

item

Type: Object

Parameter set display where the event occurs.

See also

DetailedParameterControl (Page 2587)

DetailedParameterControl_OnInitialized()

Description

The "OnInitialized" event occurs when a parameter set display has been successfully initialized and the data connection to the PLC has been established.

Syntax

```
DetailedParameterControl_OnInitialized(item)
```

Context

item

Type: Object

Parameter set display where the event occurs.

See also

DetailedParameterControl (Page 2587)

DotNetControlContainer

Description

The "DotNetControlContainer" object represents a container for the display of WPF and WinForms control elements in runtime.

Object type

HmiDotNetControlContainer

Properties

The "DotNetControlContainer" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **Caption**
  Specifies the text that is displayed in the title bar.
- **CaptionColor**
  Specifies the background color of the title bar.
- **ContainedType**
  Returns the type of the contained objects.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the display.
- **Enabled**
  Specifies whether the display can be operated in runtime.
- **Height**
  Specifies the height.
- **Icon**
  Specifies the icon of the display.
- **Layer**
  Returns the screen layer in which the display is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the display.
- **Operability**
  Returns whether the display is operable.
- **Parent**
  Returns the higher-level screen object.
- **Properties**
  allows access to the dynamic properties of the control elements in the display.
- **RenderingTemplate**
  Returns the name of the template from which the display was created.
- **RequireExplicitUnlock**
  Returns whether the display is only operable while the associated button is being pressed.
- **ShowFocusVisual**
  Specifies whether the display is highlighted when in focus.
- **StyleItemClass**
  Returns the style which is applied to the display.
- **TabIndex**
  Returns the position of the display in the tab sequence.

- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the display is visible.
- **Width**
  Specifies the width.
- **WindowFlags**
  Specifies the window configuration of the display.

Methods

The "DotNetControlContainer" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the display.
- **PropertyFlashing()**
  Configures flashing of a property.

DotNetControlContainer.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
DotNetControlContainer.Authorization
```

See also

DotNetControlContainer (Page 2829)

DotNetControlContainer.Caption

Description

The "Caption" property specifies the text that is displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
DotNetControlContainer.Caption
```

See also

DotNetControlContainer (Page 2829)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

DotNetControlContainer.Caption (Page 2831)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 2832)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 2832)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 2832)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 2832)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 2832)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 2832)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

DotNetControlContainer.Caption (Page 2831)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

DotNetControlContainer.Caption (Page 2831)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

DotNetControlContainer.Caption (Page 2831)

DotNetControlContainer.CaptionColor

Description

The "CaptionColor" property specifies the color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
DotNetControlContainer.CaptionColor
```

See also

DotNetControlContainer (Page 2829)

DotNetControlContainer.ContainedType

Description

The "ContainedType" property returns the type of the contained objects (CustomControl, SwacComponent, or WidgetType).

Type

String

Access

Read-only

Syntax

```
DotNetControlContainer.ContainedType
```

See also

DotNetControlContainer (Page 2829)

DotNetControlContainer.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the control.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.

- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
DotNetControlContainer.CurrentQuality
```

See also

DotNetControlContainer (Page 2829)

DotNetControlContainer.Enabled

Description

The "Enabled" property specifies whether the display can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
DotNetControlContainer.Enabled
```

See also

DotNetControlContainer (Page 2829)

DotNetControlContainer.Height

Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
DotNetControlContainer.Height
```

See also

DotNetControlContainer (Page 2829)

DotNetControlContainer.Icon

Description

The "Icon" property specifies the icon of the display.

Type

String

Access

Read-write

Syntax

```
DotNetControlContainer.Icon
```

See also

DotNetControlContainer (Page 2829)

DotNetControlContainer.Layer

Description

The "Layer" property returns the screen layer in which the control is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
DotNetControlContainer.Layer
```

See also

DotNetControlContainer (Page 2829)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

DotNetControlContainer.Layer (Page 2840)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

DotNetControlContainer.Layer (Page 2840)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

DotNetControlContainer.Layer (Page 2840)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

DotNetControlContainer.Layer (Page 2840)

DotNetControlContainer.Left

Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
DotNetControlContainer.Left
```

See also

DotNetControlContainer (Page 2829)

DotNetControlContainer.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
DotNetControlContainer.Margin
```

See also

DotNetControlContainer (Page 2829)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

DotNetControlContainer.Margin (Page 2843)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

DotNetControlContainer.Margin (Page 2843)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

DotNetControlContainer.Margin (Page 2843)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

DotNetControlContainer.Margin (Page 2843)

DotNetControlContainer.Name

Description

The "Name" property returns the name of the control.

Type

String

Access

Read-only

Syntax

```
DotNetControlContainer.Name
```

See also

DotNetControlContainer (Page 2829)

DotNetControlContainer.Operability

Description

The "Operability" property returns whether the display is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
DotNetControlContainer.Operability
```

See also

DotNetControlContainer (Page 2829)

DotNetControlContainer.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
DotNetControlContainer.Parent
```

See also

DotNetControlContainer (Page 2829)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

DotNetControlContainer.Properties

Description

The "Properties" property allows access to the dynamic properties of the control elements in the display.

Type

Object, HmiDynamicPropertyPart

Access

Read-write

Syntax

```
DotNetControlContainer.Properties
```

See also

DotNetControlContainer (Page 2829)

DotNetControlContainer.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the control was created.

Type

String

Access

Read-only

Syntax

```
DotNetControlContainer.RenderingTemplate
```

See also

DotNetControlContainer (Page 2829)

DotNetControlContainer.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
DotNetControlContainer.RequireExplicitUnlock
```

See also

DotNetControlContainer (Page 2829)

DotNetControlContainer.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the display is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
DotNetControlContainer.ShowFocusVisual
```

See also

DotNetControlContainer (Page 2829)

DotNetControlContainer.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the display.

Type

String

Access

Read-only

Syntax

```
DotNetControlContainer.StyleItemClass
```

See also

DotNetControlContainer (Page 2829)

DotNetControlContainer.TabIndex

Description

The "TabIndex" property returns the position of the display in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
DotNetControlContainer.TabIndex
```

See also

DotNetControlContainer (Page 2829)

DotNetControlContainer.Top

Description

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
DotNetControlContainer.Top
```

See also

DotNetControlContainer (Page 2829)

DotNetControlContainer.Visible

Description

The "Visible" property specifies whether the display is visible.

Type

Bool

Access

Read-write

Syntax

```
DotNetControlContainer.Visible
```

See also

DotNetControlContainer (Page 2829)

DotNetControlContainer.Width

Description

The "Width" property specifies the width in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
DotNetControlContainer.Width
```

See also

DotNetControlContainer (Page 2829)

DotNetControlContainer.WindowFlags

Description

The "WindowFlags" property specifies the window configuration of the display.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be moved
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

You can enable multiple properties by adding integer values or bit operators.

Access

Read-write

Syntax

```
DotNetControlContainer.WindowFlags
```

Example

Adapting the "windowFlags" tag depending on the window configuration:

Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose){
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

See also

DotNetControlContainer (Page 2829)

DotNetControlContainer.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the display.

Syntax

```
DotNetControlContainer.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

DotNetControlContainer (Page 2829)

DotNetControlContainer.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
DotNetControlContainer.PropertyFlashing(propertyName, enable[,
value][, alternateValue][, rate])
```

Parameters

`propertyName`

Type: String

Name of the property for which flashing is configured.

`enable`

Type: Bool

Specifies that flashing is activated.

`value`

Optional, type: Variant

Value of the property for which flashing is configured.

`alternateValue`

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

DotNetControlContainer (Page 2829)

Ellipse

Description

The "Ellipse" object represents an ellipse in runtime.

Object type

HmiEllipse

Properties

The "Ellipse" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BackFillPattern**
  Specifies the pattern of the background or the fill.

- **BorderColor**
  Specifies the border color.
- **BorderWidth**
  Specifies the border thickness.
- **CenterX**
  Specifies the X coordinate of the center.
- **CenterY**
  Sets the Y coordinate of the center.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the ellipse.
- **DashType**
  Specifies the stroke style of the border or line.
- **Enabled**
  Specifies whether the ellipse can be operated in runtime.
- **FillDirection**
  Specifies the direction from which the ellipse is filled.
- **FillLevel**
  Specifies the fill of the ellipse in percent.
- **Layer**
  Returns the layer of the screen in which the ellipse is located.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the ellipse.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the ellipse is operable.
- **Parent**
  Returns the higher-level screen object.
- **RadiusX**
  Specifies the X radius.
- **RadiusY**
  Specifies the Y radius.
- **RequireExplicitUnlock**
  Returns whether the ellipse is only operable while the associated button is being pressed.
- **RotationAngle**
  Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the ellipse rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.

- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ShowFillLevel**
  Specifies whether the fill level is displayed.
- **ShowFocusVisual**
  Specifies whether the ellipse is highlighted when in focus.
- **StyleItemClass**
  Returns the style which is applied to the ellipse.
- **TabIndex**
  Returns the position of the ellipse in the tab sequence.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the ellipse is visible.

Methods

The "Ellipse" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the ellipse.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "Ellipse" object has the following events:

- **OnActivated()**
  Occurs when an ellipse receives focus.
- **OnContextTapped()**
  Occurs when an ellipse is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when an ellipse loses focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the ellipse is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the ellipse is in focus.
- **OnTapped()**
  Occurs when an ellipse is left-clicked or short-touched.

Ellipse.AlternateBackColor

Description

The "AlternateBackColor" specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
Ellipse.AlternateBackColor
```

See also

Ellipse (Page 2855)

Ellipse.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
Ellipse.AlternateBorderColor
```

See also

Ellipse (Page 2855)

Ellipse.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
Ellipse.Authorization
```

See also

Ellipse (Page 2855)

Ellipse.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
Ellipse.BackColor
```

See also

Ellipse (Page 2855)

Ellipse.BackFillPattern

Description

The "BackFillPattern" property specifies the pattern of the background or the fill.

Type

Int32, HmiFillPattern

Specifies the filling:

- Solid (0): Solid
- Transparent (65536): Transparent
- Horizontal (131072): Horizontal
- Vertical (131073): Vertical
- ForwardDiagonal (131074): Forward diagonal stripe
- BackwardDiagonal (131075): Backward diagonal stripe
- Cross (131076): Cross
- DiagonalCross (131077): Diagonal cross
- GradientHorizontal (1048576): Horizontal gradient
- GradientVertical (1048577): Vertical gradient
- GradientForwardDiagonal (1048578): Gradient forward diagonal
- GradientBackwardDiagonal (1048579): Gradient backward diagonal
- GradientHorizontalTricolor (1048832): Horizontal tricolor gradient
- GradientVerticalTricolor (1048833): Vertical tricolor gradient
- GradientForwardDiagonalTricolor (1048834): Forward diagonal tricolor gradient
- GradientBackwardDiagonalTricolor (1048835): Backward diagonal tricolor gradient

Access

Read-write

Syntax

```
Ellipse.BackFillPattern
```

See also

Ellipse (Page 2855)

Ellipse.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
Ellipse.BorderColor
```

See also

Ellipse (Page 2855)

Ellipse.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
Ellipse.BorderWidth
```

See also

Ellipse (Page 2855)

Ellipse.CenterX

Description

The "CenterX" property specifies the X coordinate of the center.

Type

Int32

Access

Read-write

Syntax

```
Ellipse.CenterX
```

See also

Ellipse (Page 2855)
Ellipse.CenterY (Page 2862)

Ellipse.CenterY

Description

The "CenterY" property specifies the Y coordinate of the center.

Type

Int32

Access

Read-write

Syntax

```
Ellipse.CenterY
```

See also

Ellipse (Page 2855)
Ellipse.CenterX (Page 2862)

Ellipse.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the ellipse.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
Ellipse.CurrentQuality
```

See also

Ellipse (Page 2855)

Ellipse.DashType

Description

The "DashType" property specifies the stroke type of the border or line.

Type

Int32, HmiDashType

Specifies the stroke style:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted

- DashDot (3): Dash-dotted
- DashDotDot (4): Dash-dot-dot

Access

Read-write

Syntax

```
Ellipse.DashType
```

See also

Ellipse (Page 2855)

Ellipse.Enabled

Description

The "Enabled" property specifies whether the ellipse can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
Ellipse.Enabled
```

See also

Ellipse (Page 2855)

Ellipse.FillDirection

Description

The "FillDirection" property specifies the direction from which the ellipse is filled.

Type

Int32, HmiFillDirection

Specifies the filling direction:

- BottomToTop (0): From bottom to top
- TopToBottom (1): From top to bottom
- LeftToRight (2): From left to right
- RightToLeft (3): From right to left

Access

Read-write

Syntax

```
Ellipse.FillDirection
```

See also

Ellipse (Page 2855)

Ellipse.FillLevel

Description

The "FillLevel" property specifies the fill level of the ellipse in percent.

Type

UInt8

Access

Read-write

Syntax

```
Ellipse.FillLevel
```

See also

Ellipse (Page 2855)

Ellipse.Layer

Description

The "Layer" property returns the layer of the screen in which the ellipse is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
Ellipse.Layer
```

See also

Ellipse (Page 2855)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

Ellipse.Layer (Page 2865)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

Ellipse.Layer (Page 2865)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

Ellipse.Layer (Page 2865)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

Ellipse.Layer (Page 2865)

Ellipse.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
Ellipse.Margin
```

See also

Ellipse (Page 2855)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

Ellipse.Margin (Page 2868)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

Ellipse.Margin (Page 2868)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

Ellipse.Margin (Page 2868)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

Ellipse.Margin (Page 2868)

Ellipse.Name

Description

The "Name" property returns the name of the ellipse.

Type

String

Access

Read-only

Syntax

```
Ellipse.Name
```

See also

Ellipse (Page 2855)

Ellipse.Opacity

Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

Type

Float

Access

Read-write

Syntax

```
Ellipse.Opacity
```

See also

Ellipse (Page 2855)

Ellipse.Operability

Description

The "Operability" property returns whether the ellipse is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
Ellipse.Operability
```

See also

Ellipse (Page 2855)

Ellipse.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
Ellipse.Parent
```

See also

Ellipse (Page 2855)
Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

Ellipse.RadiusX

Description

The "RadiusX" property specifies the X radius.

Type

UInt32

Access

Read-write

Syntax

```
Ellipse.RadiusX
```

See also

Ellipse (Page 2855)

Ellipse.RadiusY (Page 2873)

Ellipse.RadiusY

Description

The "RadiusY" property specifies the Y radius.

Type

UInt32

Access

Read-write

Syntax

```
Ellipse.RadiusY
```

See also

Ellipse (Page 2855)

Ellipse.RadiusX (Page 2873)

Ellipse.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the ellipse can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
Ellipse.RequireExplicitUnlock
```

See also

Ellipse (Page 2855)

Ellipse.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
Ellipse.RotationAngle
```

See also

Ellipse (Page 2855)

Ellipse.RotationCenterPlacement (Page 2875)

Ellipse.RotationCenterX (Page 2876)

Ellipse.RotationCenterY (Page 2876)

Ellipse.RotationCenterPlacement

Description

The "RotationCenterPlacement" property specifies the reference point around which the ellipse rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
Ellipse.RotationCenterPlacement
```

See also

Ellipse (Page 2855)

Ellipse.RotationAngle (Page 2874)

Ellipse.RotationCenterX (Page 2876)

Ellipse.RotationCenterY (Page 2876)

Ellipse.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
Ellipse.RotationCenterX
```

See also

Ellipse (Page 2855)

Ellipse.RotationAngle (Page 2874)

Ellipse.RotationCenterPlacement (Page 2875)

Ellipse.RotationCenterY (Page 2876)

Ellipse.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
Ellipse.RotationCenterY
```

See also

Ellipse (Page 2855)
Ellipse.RotationAngle (Page 2874)
Ellipse.RotationCenterPlacement (Page 2875)
Ellipse.RotationCenterX (Page 2876)

Ellipse.ShowFillLevel

Description

The "ShowFillLevel" property specifies whether the fill level is displayed.

Type

Bool

Access

Read-write

Syntax

```
Ellipse.ShowFillLevel
```

See also

Ellipse (Page 2855)

Ellipse.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the ellipse is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
Ellipse.ShowFocusVisual
```

See also

Ellipse (Page 2855)

Ellipse.StyleItemClass

Description

The "StyleItemClass" property returns the style is applied to the ellipse.

Type

String

Access

Read-only

Syntax

```
Ellipse.StyleItemClass
```

See also

Ellipse (Page 2855)

Ellipse.TabIndex

Description

The "TabIndex" property returns the position of the ellipse in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
Ellipse.TabIndex
```

See also

Ellipse (Page 2855)

Ellipse.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
Ellipse.ToolTipText
```

See also

Ellipse (Page 2855)

Ellipse.Visible

Description

The "Visible" property specifies whether the ellipse is visible.

Type

Bool

Access

Read-write

Syntax

```
Ellipse.Visible
```

See also

Ellipse (Page 2855)

Ellipse.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the ellipse.

Syntax

```
Ellipse.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

Ellipse (Page 2855)

Ellipse.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
Ellipse.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

`propertyName`

Type: String

Name of the property for which flashing is configured.

`enable`

Type: Bool

Specifies that flashing is activated.

`value`

Optional, type: Variant

Value of the property for which flashing is configured.

`alternateValue`

Optional, type: Variant

Specifies the second value for flashing.

`rate`

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

Ellipse (Page 2855)

Ellipse_OnActivated()

Description

The "OnActivated" event occurs when an ellipse receives focus:

- An ellipse is selected via the configured tab sequence.
- An ellipse that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
Ellipse_OnActivated(item)
```

Context

`item`

Type: Object

Ellipse where the event occurs.

See also

Ellipse (Page 2855)

Ellipse_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- An ellipse is right-clicked.
- An ellipse is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
Ellipse_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Ellipse where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Ellipse (Page 2855)

Ellipse_OnDeactivated()

Description

The "OnDeactivated" event occurs when the ellipse loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
Ellipse_OnDeactivated(item)
```

Context

item

Type: Object

Ellipse where the event occurs.

See also

Ellipse (Page 2855)

Ellipse_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the ellipse is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Ellipse_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

Ellipse where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Ellipse (Page 2855)

Ellipse_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the ellipse is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Ellipse_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Ellipse where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Ellipse (Page 2855)

Ellipse_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- An ellipse is left-clicked.
- The <RETURN> or <SPACE> key is pressed when an ellipse has the focus.
- An ellipse is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
Ellipse_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Ellipse where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Ellipse (Page 2855)

EllipseSegment

Description

The "EllipseSegment" object represents an ellipse segment in runtime.

Object type

HmiEllipseSegment

Properties

The "EllipseSegment" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **AngleRange**
  Specifies the arc angle.
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BackFillPattern**
  Specifies the pattern of the background or the fill.
- **BorderColor**
  Specifies the border color.
- **BorderWidth**
  Specifies the border thickness.
- **CenterX**
  Specifies the X coordinate of the rotation point.
- **CenterY**
  Specifies the Y coordinate of the rotation point.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the ellipse segment.
- **DashType**
  Specifies the stroke style of the border or line.
- **Enabled**
  Specifies whether the ellipse segment can be operated in runtime.
- **FillDirection**
  Specifies the direction from which the ellipse segment is filled.
- **FillLevel**
  Specifies the fill of the ellipse segment in percent.
- **Layer**
  Returns the layer of the screen in which the ellipse segment is located.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the ellipse segment.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the ellipse segment is operable.

- **Parent**
  Returns the higher-level screen object.
- **RadiusX**
  Specifies the X radius.
- **RadiusY**
  Specifies the Y radius.
- **RequireExplicitUnlock**
  Returns whether the ellipse segment is only operable while the associated button is being pressed.
- **RotationAngle**
  Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the ellipse segment rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ShowFillLevel**
  Specifies whether the fill level is displayed.
- **ShowFocusVisual**
  Specifies whether the ellipse segment is highlighted when in focus.
- **StartAngle**
  Specifies the angle by which the start point deviates from the zero position (0°).
- **StyleItemClass**
  Returns the style which is applied to the ellipse segment.
- **TabIndex**
  Returns the position of the ellipse segment in the tab sequence.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the ellipse segment is visible.

Methods

The "EllipseSegment" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the ellipse segment.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "EllipseSegment" object has the following events:

- **OnActivated()**
  Occurs when an ellipse segment receives focus.
- **OnContextTapped()**
  Occurs when an ellipse segment is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when an ellipse segment loses the focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the ellipse segment is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the ellipse segment is in focus.
- **OnTapped()**
  Occurs when an ellipse segment is left-clicked or short-touched.

EllipseSegment.AlternateBackColor

Description

The "AlternateBackColor" specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
EllipseSegment.AlternateBackColor
```

See also

EllipseSegment (Page 2888)

EllipseSegment.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
EllipseSegment.AlternateBorderColor
```

See also

EllipseSegment (Page 2888)

EllipseSegment.AngleRange

Description

The "AngleRange" property specifies the arc angle clockwise.

Type

Int32

Access

Read-write

Syntax

```
EllipseSegment.AngleRange
```

See also

EllipseSegment (Page 2888)

EllipseSegment.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
EllipseSegment.Authorization
```

See also

EllipseSegment (Page 2888)

EllipseSegment.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
EllipseSegment.BackColor
```

See also

EllipseSegment (Page 2888)

EllipseSegment.BackFillPattern

Description

The "BackFillPattern" property specifies the pattern of the background or the fill.

Type

Int32, HmiFillPattern

Specifies the filling:

- Solid (0): Solid
- Transparent (65536): Transparent

- Horizontal (131072): Horizontal
- Vertical (131073): Vertical
- ForwardDiagonal (131074): Forward diagonal stripe
- BackwardDiagonal (131075): Backward diagonal stripe
- Cross (131076): Cross
- DiagonalCross (131077): Diagonal cross
- GradientHorizontal (1048576): Horizontal gradient
- GradientVertical (1048577): Vertical gradient
- GradientForwardDiagonal (1048578): Gradient forward diagonal
- GradientBackwardDiagonal (1048579): Gradient backward diagonal
- GradientHorizontalTricolor (1048832): Horizontal tricolor gradient
- GradientVerticalTricolor (1048833): Vertical tricolor gradient
- GradientForwardDiagonalTricolor (1048834): Forward diagonal tricolor gradient
- GradientBackwardDiagonalTricolor (1048835): Backward diagonal tricolor gradient

Access

Read-write

Syntax

```
EllipseSegment.BackFillPattern
```

See also

EllipseSegment (Page 2888)

EllipseSegment.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
EllipseSegment.BorderColor
```

See also

EllipseSegment (Page 2888)

EllipseSegment.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
EllipseSegment.BorderWidth
```

See also

EllipseSegment (Page 2888)

EllipseSegment.CenterX

Description

The "CenterX" property specifies the X coordinate of the rotation point.

Type

Int32

Access

Read-write

Syntax

```
EllipseSegment.CenterX
```

See also

EllipseSegment (Page 2888)

EllipseSegment.CenterY

Description

The "CenterY" property specifies the Y coordinate of the rotation point.

Type

Int32

Access

Read-write

Syntax

```
EllipseSegment.CenterY
```

See also

EllipseSegment (Page 2888)

EllipseSegment.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the ellipse segment.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
EllipseSegment.CurrentQuality
```

See also

EllipseSegment (Page 2888)

EllipseSegment.DashType

Description

The "DashType" property specifies the stroke type of the border or line.

Type

Int32, HmiDashType

Specifies the stroke style:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted
- DashDot (3): Dash-dotted
- DashDotDot (4): Dash-dot-dot

Access

Read-write

Syntax

```
EllipseSegment.DashType
```

See also

EllipseSegment (Page 2888)

EllipseSegment.Enabled

Description

The "Enabled" property specifies whether the ellipse segment can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
EllipseSegment.Enabled
```

See also

EllipseSegment (Page 2888)

EllipseSegment.FillDirection

Description

The "FillDirection" property specifies the direction from which the ellipse segment is filled.

Type

Int32, HmiFillDirection

Specifies the filling direction:

- BottomToTop (0): From bottom to top
- TopToBottom (1): From top to bottom
- LeftToRight (2): From left to right
- RightToLeft (3): From right to left

Access

Read-write

Syntax

```
EllipseSegment.FillDirection
```

See also

EllipseSegment (Page 2888)

EllipseSegment.FillLevel

Description

The "FillLevel" property specifies the fill level of the ellipse segment in percent.

Type

UInt8

Access

Read-write

Syntax

```
EllipseSegment.FillLevel
```

See also

EllipseSegment (Page 2888)

EllipseSegment.Layer

Description

The "Layer" property returns the layer of the screen in which the ellipse segment is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
EllipseSegment.Layer
```

See also

EllipseSegment (Page 2888)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

EllipseSegment.Layer (Page 2899)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

EllipseSegment.Layer (Page 2899)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

EllipseSegment.Layer (Page 2899)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

EllipseSegment.Layer (Page 2899)

EllipseSegment.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
EllipseSegment.Margin
```

See also

EllipseSegment (Page 2888)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

EllipseSegment.Margin (Page 2902)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

EllipseSegment.Margin (Page 2902)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

EllipseSegment.Margin (Page 2902)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

EllipseSegment.Margin (Page 2902)

EllipseSegment.Name

Description

The "Name" property returns the name of the ellipse segment.

Type

String

Access

Read-only

Syntax

```
EllipseSegment.Name
```

See also

EllipseSegment (Page 2888)

EllipseSegment.Opacity

Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

Type

Float

Access

Read-write

Syntax

```
EllipseSegment.Opacity
```

See also

EllipseSegment (Page 2888)

EllipseSegment.Operability

Description

The "Operability" property returns whether the ellipse segment is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
EllipseSegment.Operability
```

See also

EllipseSegment (Page 2888)

EllipseSegment.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
EllipseSegment.Parent
```

See also

EllipseSegment (Page 2888)
Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

EllipseSegment.RadiusX

Description

The "RadiusX" property specifies the X radius.

Type

UInt32

Access

Read-write

Syntax

```
EllipseSegment.RadiusX
```

See also

EllipseSegment (Page 2888)

EllipseSegment.RadiusY

Description

The "RadiusY" property specifies the Y radius.

Type

UInt32

Access

Read-write

Syntax

```
EllipseSegment.RadiusY
```

See also

EllipseSegment (Page 2888)

EllipseSegment.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the ellipse segment can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
EllipseSegment.RequireExplicitUnlock
```

See also

EllipseSegment (Page 2888)

EllipseSegment.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
EllipseSegment.RotationAngle
```

See also

EllipseSegment (Page 2888)

EllipseSegment.RotationCenterPlacement (Page 2908)

EllipseSegment.RotationCenterX (Page 2909)

EllipseSegment.RotationCenterY (Page 2910)

EllipseSegment.RotationCenterPlacement

Description

The "RotationCenterPlacement" property sets the reference point around which the ellipse segment rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
EllipseSegment.RotationCenterPlacement
```

See also

EllipseSegment (Page 2888)

EllipseSegment.RotationAngle (Page 2908)

EllipseSegment.RotationCenterX (Page 2909)

EllipseSegment.RotationCenterY (Page 2910)

EllipseSegment.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
EllipseSegment.RotationCenterX
```

See also

EllipseSegment (Page 2888)

EllipseSegment.RotationAngle (Page 2908)

EllipseSegment.RotationCenterPlacement (Page 2908)

EllipseSegment.RotationCenterY (Page 2910)

EllipseSegment.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
EllipseSegment.RotationCenterY
```

See also

EllipseSegment (Page 2888)

EllipseSegment.RotationAngle (Page 2908)

EllipseSegment.RotationCenterPlacement (Page 2908)

EllipseSegment.RotationCenterX (Page 2909)

EllipseSegment.ShowFillLevel

Description

The "ShowFillLevel" property specifies whether the fill level is displayed.

Type

Bool

Access

Read-write

Syntax

```
EllipseSegment.ShowFillLevel
```

See also

EllipseSegment (Page 2888)

EllipseSegment.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the ellipse segment is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
EllipseSegment.ShowFocusVisual
```

See also

EllipseSegment (Page 2888)

EllipseSegment.StartAngle

Description

The "StartAngle" specifies the angle by which the start point deviates from the zero position (0° corresponds to 3 o'clock).

Type

Int32

Access

Read-write

Syntax

```
EllipseSegment.StartAngle
```

See also

EllipseSegment (Page 2888)

EllipseSegment.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the ellipse segment.

Type

String

Access

Read-only

Syntax

```
EllipseSegment.StyleItemClass
```

See also

EllipseSegment (Page 2888)

EllipseSegment.TabIndex

Description

The "TabIndex" property returns the position of the ellipse segment in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
EllipseSegment.TabIndex
```

See also

EllipseSegment (Page 2888)

EllipseSegment.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
EllipseSegment.ToolTipText
```

See also

EllipseSegment (Page 2888)

EllipseSegment.Visible

Description

The "Visible" property specifies whether the ellipse segment is visible.

Type

Bool

Access

Read-write

Syntax

```
EllipseSegment.Visible
```

See also

EllipseSegment (Page 2888)

EllipseSegment.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the ellipse segment.

Syntax

```
EllipseSegment.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

EllipseSegment (Page 2888)

EllipseSegment.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
EllipseSegment.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

EllipseSegment (Page 2888)

EllipseSegment_OnActivated()

Description

The "OnActivated" event occurs when an ellipse segment receives focus:

- An ellipse segment is selected via the configured tab sequence.
- An ellipse segment that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
EllipseSegment_OnActivated(item)
```

Context

`item`

Type: Object

Ellipse segment where the event occurs.

See also

EllipseSegment (Page 2888)

EllipseSegment_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- An ellipse segment is right-clicked.
- An ellipse segment is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
EllipseSegment_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Ellipse segment where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

EllipseSegment (Page 2888)

EllipseSegment_OnDeactivated()

Description

The "OnDeactivated" event occurs when an ellipse segment loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
EllipseSegment_OnDeactivated(item)
```

Context

item

Type: Object

Ellipse segment where the event occurs.

See also

EllipseSegment (Page 2888)

EllipseSegment_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the ellipse segment is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
EllipseSegment_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

Ellipse segment where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

EllipseSegment (Page 2888)

EllipseSegment_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the ellipse segment is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
EllipseSegment_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Ellipse segment where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

EllipseSegment (Page 2888)

EllipseSegment_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- An ellipse segment is left-clicked.
- The <RETURN> or <SPACE> key is pressed when an ellipse segment has the focus.
- An ellipse segment is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
EllipseSegment_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Ellipse segment where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

EllipseSegment (Page 2888)

EllipticalArc

Description

The "EllipticalArc" object represents an elliptical arc in runtime.

Object type

HmiEllipticalArc

Properties

The "EllipticalArc" object has the following properties:

- **AlternateLineColor**
  Specifies the second line color which is displayed for line styles such as "Dash".
- **AngleRange**
  Specifies the arc angle.
- **Authorization**
  Returns the operator authorization.
- **CapType**
  Specifies the shape of the line ends.
- **CenterX**
  Specifies the X coordinate of the rotation point.
- **CenterY**
  Specifies the Y coordinate of the rotation point.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the elliptical arc.
- **DashType**
  Specifies the stroke style of the border or line.
- **Enabled**
  Specifies whether the elliptical arc can be operated in runtime.
- **EndType**
  Specifies the type of line end.
- **Layer**
  Returns the layer of the screen in which the elliptical arc is located.
- **LineColor**
  Specifies the line color.
- **LineWidth**
  Specifies the line thickness.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the elliptical arc.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the elliptical arc is operable.
- **Parent**
  Returns the higher-level screen object.
- **RadiusX**
  Specifies the X radius.
- **RadiusY**
  Specifies the Y radius.

- **RequireExplicitUnlock**
  Returns whether the elliptical arc is only operable while the associated button is being pressed.
- **RotationAngle**
  Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the elliptical arc rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**
  Specifies whether the elliptical arc is highlighted when in focus.
- **StartAngle**
  Specifies the angle by which the start point deviates from the zero position (0°).
- **StartType**
  Specifies the type of line start.
- **StyleItemClass**
  Returns the style which is applied to the elliptical arc.
- **TabIndex**
  Returns the position of the elliptical arc in the tab sequence.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the elliptical arc is visible.

Methods

The "EllipticalArc" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the elliptical arc.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "EllipticalArc" object has the following events:

- **OnActivated()**
  Occurs when an elliptical arc receives focus.
- **OnContextTapped()**
  Occurs when an elliptical arc is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when an elliptical arc loses focus.

- **OnKeyDown()**
  Occurs when a key is pressed while the elliptical arc is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the elliptical arc is in focus.
- **OnTapped()**
  Occurs when an elliptical arc is left-clicked or short-touched.

EllipticalArc.AlternateLineColor

Description

The "AlternateLineColor" property specifies the second line color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
EllipticalArc.AlternateLineColor
```

See also

EllipticalArc (Page 2922)

EllipticalArc.AngleRange

Description

The "AngleRange" property specifies the arc angle clockwise.

Type

Int32

Access

Read-write

Syntax

```
EllipticalArc.AngleRange
```

See also

EllipticalArc (Page 2922)

EllipticalArc.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
EllipticalArc.Authorization
```

See also

EllipticalArc (Page 2922)

EllipticalArc.CapType

Description

The "CapType" property specifies the shape of the line ends.

Type

Int32, HmiCapType

Specifies the line ends:

- Round (0): Round (line extends beyond the line end point with half the line thickness)
- Square (256): Square (line extends beyond the line end point with half the line thickness)
- Flat (512): Justified (line ends at the line end point)

Access

Read-write

Syntax

```
EllipticalArc.CapType
```

See also

EllipticalArc (Page 2922)

EllipticalArc.CenterX

Description

The "CenterX" property specifies the X coordinate of the rotation point.

Type

Int32

Access

Read-write

Syntax

```
EllipticalArc.CenterX
```

See also

EllipticalArc (Page 2922)

EllipticalArc.CenterY

Description

The "CenterY" property specifies the Y coordinate of the rotation point.

Type

Int32

Access

Read-write

Syntax

```
EllipticalArc.CenterY
```

See also

EllipticalArc (Page 2922)

EllipticalArc.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the elliptical arc.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
EllipticalArc.CurrentQuality
```

See also

EllipticalArc (Page 2922)

EllipticalArc.DashType

Description

The "DashType" property specifies the stroke type of the border or line.

Type

Int32, HmiDashType

Specifies the stroke style:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted
- DashDot (3): Dash-dotted
- DashDotDot (4): Dash-dot-dot

Access

Read-write

Syntax

```
EllipticalArc.DashType
```

See also

EllipticalArc (Page 2922)

EllipticalArc.Enabled

Description

The "Enabled" property specifies whether the elliptical arc can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
EllipticalArc.Enabled
```

See also

EllipticalArc (Page 2922)

EllipticalArc.EndType

Description

The "EndType" property specifies the line end type.

Type

Int32, HmiLineEndType

Specifies the line end type:

- Line (0): Line
- EmptyArrow (1): Empty arrow
- Arrow (2): Arrow
- ReversedArrow (3): Reverse arrow
- EmptyCircle (5): Empty circle
- Circle (6): Circle

Access

Read-write

Syntax

```
EllipticalArc.EndType
```

See also

EllipticalArc (Page 2922)

EllipticalArc.Layer

Description

The "Layer" property returns the layer of the screen in which the elliptical arc is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
EllipticalArc.Layer
```

See also

EllipticalArc (Page 2922)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

EllipticalArc.Layer (Page 2930)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

EllipticalArc.Layer (Page 2930)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

EllipticalArc.Layer (Page 2930)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

EllipticalArc.Layer (Page 2930)

EllipticalArc.LineColor

Description

The "LineColor" property specifies the line color.

Type

UInt32

Access

Read-write

Syntax

```
EllipticalArc.LineColor
```

See also

EllipticalArc (Page 2922)

EllipticalArc.LineWidth

Description

The "LineWidth" property specifies the line thickness.

Type

UInt8

Access

Read-write

Syntax

```
EllipticalArc.LineWidth
```

See also

EllipticalArc (Page 2922)

EllipticalArc.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
EllipticalArc.Margin
```

See also

EllipticalArc (Page 2922)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

EllipticalArc.Margin (Page 2934)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

EllipticalArc.Margin (Page 2934)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

EllipticalArc.Margin (Page 2934)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

EllipticalArc.Margin (Page 2934)

EllipticalArc.Name

Description

The "Name" property returns the name of the elliptical arc.

Type

String

Access

Read-only

Syntax

```
EllipticalArc.Name
```

See also

EllipticalArc (Page 2922)

EllipticalArc.Opacity

Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

Type

Float

Access

Read-write

Syntax

```
EllipticalArc.Opacity
```

See also

EllipticalArc (Page 2922)

EllipticalArc.Operability

Description

The "Operability" property returns whether the elliptical arc is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
EllipticalArc.Operability
```

See also

EllipticalArc (Page 2922)

EllipticalArc.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
EllipticalArc.Parent
```

See also

EllipticalArc (Page 2922)
Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

EllipticalArc.RadiusX

Description

The "RadiusX" property specifies the X radius.

Type

UInt32

Access

Read-write

Syntax

```
EllipticalArc.RadiusX
```

See also

EllipticalArc (Page 2922)

EllipticalArc.RadiusY

Description

The "RadiusY" property specifies the Y radius.

Type

UInt32

Access

Read-write

Syntax

```
EllipticalArc.RadiusY
```

See also

EllipticalArc (Page 2922)

EllipticalArc.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the elliptical arc can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
EllipticalArc.RequireExplicitUnlock
```

See also

EllipticalArc (Page 2922)

EllipticalArc.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
EllipticalArc.RotationAngle
```

See also

EllipticalArc (Page 2922)

EllipticalArc.RotationCenterPlacement (Page 2940)

EllipticalArc.RotationCenterX (Page 2941)

EllipticalArc.RotationCenterY (Page 2942)

EllipticalArc.RotationCenterPlacement

Description

The "RotationCenterPlacement" property sets the reference point around which the elliptical arc rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
EllipticalArc.RotationCenterPlacement
```

See also

EllipticalArc (Page 2922)

EllipticalArc.RotationAngle (Page 2940)

EllipticalArc.RotationCenterX (Page 2941)

EllipticalArc.RotationCenterY (Page 2942)

EllipticalArc.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
EllipticalArc.RotationCenterX
```

See also

EllipticalArc (Page 2922)
EllipticalArc.RotationAngle (Page 2940)
EllipticalArc.RotationCenterPlacement (Page 2940)
EllipticalArc.RotationCenterY (Page 2942)

EllipticalArc.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
EllipticalArc.RotationCenterY
```

See also

EllipticalArc (Page 2922)
EllipticalArc.RotationAngle (Page 2940)
EllipticalArc.RotationCenterPlacement (Page 2940)
EllipticalArc.RotationCenterX (Page 2941)

EllipticalArc.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the elliptical arc is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
EllipticalArc.ShowFocusVisual
```

See also

EllipticalArc (Page 2922)

EllipticalArc.StartAngle

Description

The "StartAngle" specifies the angle by which the start point deviates from the zero position (0° corresponds to 3 o'clock).

Type

Int32

Access

Read-write

Syntax

```
EllipticalArc.StartAngle
```

See also

EllipticalArc (Page 2922)

EllipticalArc.StartType

Description

The "StartType" property specifies the type of line start.

Type

Int32, HmiLineEndType

Specifies the start of the line:

- Line (0): Line
- EmptyArrow (1): Empty arrow
- Arrow (2): Arrow
- ReversedArrow (3): Reverse arrow
- EmptyCircle (5): Empty circle
- Circle (6): Circle

Access

Read-write

Syntax

```
EllipticalArc.StartType
```

See also

EllipticalArc (Page 2922)

EllipticalArc.StyleItemClass

Description

The "StyleItemClass" property returns the style which applied to the elliptical arc.

Type

String

Access

Read-only

Syntax

```
EllipticalArc.StyleItemClass
```

See also

EllipticalArc (Page 2922)

EllipticalArc.TabIndex

Description

The "TabIndex" property returns the position of the elliptical arc in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
EllipticalArc.TabIndex
```

See also

EllipticalArc (Page 2922)

EllipticalArc.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
EllipticalArc.ToolTipText
```

See also

EllipticalArc (Page 2922)

EllipticalArc.Visible

Description

The "Visible" property specifies whether the elliptical arc is visible.

Type

Bool

Access

Read-write

Syntax

```
EllipticalArc.Visible
```

See also

EllipticalArc (Page 2922)

EllipticalArc.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the elliptical arc.

Syntax

```
EllipticalArc.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

EllipticalArc (Page 2922)

EllipticalArc.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
EllipticalArc.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

EllipticalArc (Page 2922)

EllipticalArc_OnActivated()

Description

The "OnActivated" event occurs when an elliptical arc receives focus:

- An elliptical arc is selected via the configured tab sequence.
- An elliptical arc that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
EllipticalArc_OnActivated(item)
```

Context

item

Type: Object

Elliptical arc where the event occurs.

See also

EllipticalArc (Page 2922)

EllipticalArc_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- An elliptical arc is right-clicked.
- An elliptical arc is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
EllipticalArc_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Elliptical arc where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key

- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

EllipticalArc (Page 2922)

EllipticalArc_OnDeactivated()

Description

The "OnDeactivated" event occurs when an elliptical arc loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
EllipticalArc_OnDeactivated(item)
```

Context

`item`

Type: Object

Elliptical arc where the event occurs.

See also

EllipticalArc (Page 2922)

EllipticalArc_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the elliptical arc is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
EllipticalArc_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

Elliptical arc where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

EllipticalArc (Page 2922)

EllipticalArc_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the elliptical arc is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
EllipticalArc_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Elliptical arc where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

EllipticalArc (Page 2922)

EllipticalArc_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- An elliptical arc is left-clicked.
- The <RETURN> or <SPACE> key is pressed when an elliptical arc has the focus.
- An elliptical arc is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
EllipticalArc_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Elliptical arc where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

EllipticalArc (Page 2922)

FaceplateContainer

Description

The "FaceplateContainer" object represents a container for faceplate instances in runtime.

Object type

HmiFaceplateContainer

Properties

The "FaceplateContainer" object has the following properties:

- **Adaption**
  Specifies whether the faceplate container adapts its size.
- **Caption**
  Specifies the text that is displayed in the title bar.
- **CaptionColor**
  Specifies the background color of the title bar.
- **ContainedType**
  Returns the type of the contained objects.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the faceplate container.
- **Enabled**
  Specifies whether the faceplate container can be operated in runtime.
- **Height**
  Specifies the height.
- **Icon**
  Specifies the icon.
- **Layer**
  Returns the layer of the screen in which the faceplate container is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the faceplate container.
- **Parent**
  Returns the higher-level screen object.
- **Properties**
  Enables access to the interface data of the faceplate container.
- **RenderingTemplate**
  Returns the name of the template from which the faceplate container was created.
- **RotationAngle**
  Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the faceplate container rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.

- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**
  Specifies whether the faceplate container is highlighted when in focus.
- **StyleItemClass**
  Returns the style which is applied to the faceplate container.
- **TabIndex**
  Returns the position of the faceplate container in the tab sequence.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the faceplate container is visible.
- **Width**
  Specifies the width.
- **WindowFlags**
  Specifies the window configuration of the faceplate container.

Methods

The "FaceplateContainer" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the faceplate container.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "FaceplateContainer" object has the following events:

- **OnActivated()**
  Occurs when a faceplate container receives focus.
- **OnDeactivated()**
  Occurs when a faceplate container loses focus.

FaceplateContainer.Adaption

Description

The "Adaption" property specifies whether the faceplate container adapts its size.

Type

Int32, HmiScreenWindowAdaption

Specifies the adaptation:

- None (0): No adaptation.
- WindowToScreen (1): Window size corresponds to screen size.
- ScreenToWindow (2): Screen size is adapted to window size.

Access

Read-write

Syntax

```
FaceplateContainer.Adaption
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.Caption

Description

The "Caption" property specifies the text that is displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
FaceplateContainer.Caption
```

See also

FaceplateContainer (Page 2954)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

FaceplateContainer.Caption (Page 2957)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 2957)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 2957)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 2957)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 2957)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 2957)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 2957)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

FaceplateContainer.Caption (Page 2957)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

FaceplateContainer.Caption (Page 2957)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

FaceplateContainer.Caption (Page 2957)

FaceplateContainer.CaptionColor

Description

The "CaptionColor" property specifies the background color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
FaceplateContainer.CaptionColor
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.ContainedType

Description

The "ContainedType" property returns the type of the contained objects.

Type

String

Access

Read-only

Syntax

```
FaceplateContainer.ContainedType
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the faceplate container.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
FaceplateContainer.CurrentQuality
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.Enabled

Description

The "Enabled" property specifies whether the faceplate container can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
FaceplateContainer.Enabled
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
FaceplateContainer.Height
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.Icon

Description

The "Icon" property specifies the icon.

Type

String

Access

Read-write

Syntax

```
FaceplateContainer.Icon
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.Layer

Description

The "Layer" property returns the layer of the screen in which the faceplate container is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
FaceplateContainer.Layer
```

See also

FaceplateContainer (Page 2954)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

FaceplateContainer.Layer (Page 2966)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

FaceplateContainer.Layer (Page 2966)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

FaceplateContainer.Layer (Page 2966)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

FaceplateContainer.Layer (Page 2966)

FaceplateContainer.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
FaceplateContainer.Left
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
FaceplateContainer.Margin
```

See also

FaceplateContainer (Page 2954)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

FaceplateContainer.Margin (Page 2969)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

FaceplateContainer.Margin (Page 2969)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

FaceplateContainer.Margin (Page 2969)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

FaceplateContainer.Margin (Page 2969)

FaceplateContainer.Name

Description

The "Name" property returns the name of the faceplate container.

Type

String

Access

Read-only

Syntax

```
FaceplateContainer.Name
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
FaceplateContainer.Parent
```

See also

FaceplateContainer (Page 2954)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

FaceplateContainer.Properties

Description

The "Properties" property enables access to the interface data (interface tags and interface properties) of the faceplate container.

Type

Object, HmiDynamicPropertyPart

Access

Read-write

Syntax

```
FaceplateContainer.Properties
```

Example

Outputting the name of the connected project tag to the "Tag_1" interface tag:

Copy code

```
let TagName;
TagName = Faceplate.Parent.Properties.Tag_1.Tag;
HMIRuntime.Trace("System Tag Name: " + TagName);
```

Outputting the value of the "CustomProperty_1" interface property:

Copy code

```
let PropertyValue;
PropertyValue = Faceplate.Parent.Properties.CustomProperty_1;
HMIRuntime.Trace("Value of CustomProperty_1: " + PropertyValue);
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the faceplate container was created.

Type

String

Access

Read-only

Syntax

```
FaceplateContainer.RenderingTemplate
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
FaceplateContainer.RotationAngle
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.RotationCenterPlacement (Page 2974)

FaceplateContainer.RotationCenterX (Page 2975)

FaceplateContainer.RotationCenterY (Page 2976)

FaceplateContainer.RotationCenterPlacement

Description

The "RotationCenterPlacement" property sets the reference point around which the faceplate container rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
FaceplateContainer.RotationCenterPlacement
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.RotationAngle (Page 2974)

FaceplateContainer.RotationCenterX (Page 2975)

FaceplateContainer.RotationCenterY (Page 2976)

FaceplateContainer.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
FaceplateContainer.RotationCenterX
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.RotationAngle (Page 2974)

FaceplateContainer.RotationCenterPlacement (Page 2974)

FaceplateContainer.RotationCenterY (Page 2976)

FaceplateContainer.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
FaceplateContainer.RotationCenterY
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.RotationAngle (Page 2974)

FaceplateContainer.RotationCenterPlacement (Page 2974)

FaceplateContainer.RotationCenterX (Page 2975)

FaceplateContainer.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the faceplate container is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
FaceplateContainer.ShowFocusVisual
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the faceplate container.

Type

String

Access

Read-only

Syntax

```
FaceplateContainer.StyleItemClass
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.TabIndex

Description

The "TabIndex" property returns the position of the faceplate container in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
FaceplateContainer.TabIndex
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
FaceplateContainer.Top
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.Visible

Description

The "Visible" property specifies whether the faceplate container is visible.

Type

Bool

Access

Read-write

Syntax

```
FaceplateContainer.Visible
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
FaceplateContainer.Width
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.WindowFlags

Description

The "WindowFlags" property specifies the window configuration of the faceplate container.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be moved
- CanMaximize (32): Can be maximized

- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

Enable multiple properties by adding the integer values or bit operators.

Access

Read-write

Syntax

```
FaceplateContainer.WindowFlags
```

Example

Adapting the "windowFlags" tag depending on the window configuration:

Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose){
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the faceplate container.

Syntax

```
FaceplateContainer.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

FaceplateContainer (Page 2954)

FaceplateContainer.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
FaceplateContainer.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

FaceplateContainer (Page 2954)

FaceplateContainer_OnActivated()

Description

The "OnActivated" event occurs when a faceplate container receives focus:

- A faceplate container is selected via the configured tab sequence.
- A faceplate container that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
FaceplateContainer_OnActivated(item)
```

Context

item

Type: Object

Faceplate container where the event occurs.

See also

FaceplateContainer (Page 2954)

FaceplateContainer_OnDeactivated()

Description

The "OnDeactivated" event occurs when a faceplate container loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
FaceplateContainer_OnDeactivated(item)
```

Context

item

Type: Object

Faceplate container where the event occurs.

See also

FaceplateContainer (Page 2954)

FaceplateContainer_OnInterface_Event()

Description

The "OnInterface_Event" event stands for user-defined interface events of a faceplate type. In the "Faceplate types" editor you can add any number of interface events with parameters to the faceplate type.

A user-defined interface event can only be triggered via the `FaceplateType.RaiseEvent()` method.

Syntax

```
FaceplateContainer_OnInterface_Event(item[, Parameter_1][,...
Parameter_n])
```

Context

`item`

Type: Object

Faceplate container where the event occurs.

`Parameter_1`

Type: Bool | Byte | Char | Color | DateTime | DInt | DWord | HmiEventTrigger | HmiGesture | HmiKeyboardModifier | Int | LInt | LReal | LString | LWord | Real | SInt | String | Time | UDInt | UInt | ULInt | USInt | Word

Parameters of the event. Any number of parameters can be added to a user-defined interface event.

See also

FaceplateContainer (Page 2954)

FaceplateType.RaiseEvent() (Page 3008)

FaceplateType

Description

The "FaceplateType" object represents a faceplate type in runtime.

Object type

HmiFaceplateType

Properties

The "FaceplateType" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **BackColor**
  Specifies the background color.
- **BackFillPattern**
  Specifies the pattern of the background or the fill.
- **BackGraphic**
  Specifies the background graphic of the faceplate type.
- **BackGraphicStretchMode**
  Specifies the type of scaling of the background graphic of the faceplate type.
- **BackgroundFillMode**
  Specifies the fill area of the background fill.

- **DisplayName**
  Specifies the display name of the faceplate type.
- **Enabled**
  Specifies whether the faceplate type can be operated in runtime.
- **EnableExplicitUnlock**
  Returns which button must be pressed for the faceplate type to be operable.
- **Height**
  Specifies the height.
- **HorizontalAlignment**
  Specifies the horizontal alignment.
- **HotKeys**
  Returns the hotkeys specified for the faceplate type.
- **Items**
  Returns a list of all screen objects of the faceplate type.
- **Layers**
  Returns the list of all layers of the faceplate type.
- **Name**
  Returns the name of the faceplate type.
- **Parent**
  Returns the faceplate container which contains the current faceplate instance as a child.
- **Properties**
  Enables access to the interface data of the faceplate type.
- **VerticalAlignment**
  Specifies the vertical alignment.
- **Width**
  Specifies the width.

Methods

The "FaceplateType" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the faceplate type.
- **Close()**
  Hides a faceplate container or closes a faceplate popup window.
- **FindItem()**
  Searches for and references screen windows or screen items through their object path.
- **OpenFaceplateInPopup()**
  Opens a faceplate from a faceplate type in a popup window.
- **PropertyFlashing()**
  Configures flashing of a property.
- **RaiseEvent()**
  Triggers a user-defined interface event of a faceplate type.

Events

The "FaceplateType" object has the following events:

- **OnContextTapped()**
  Occurs when a faceplate type is right-clicked or long-touched.
- **OnHotKey()**
  Occurs when a hotkey is pressed.
- **OnLoaded()**
  Occurs after the faceplate has been built.
- **OnTapped()**
  Occurs when a faceplate type is left-clicked or short-touched.
- **OnUnloaded()**
  Occurs after the faceplate has been cleared.

FaceplateType.AlternateBackColor

Description

The "AlternateBackColor" specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
Faceplate.AlternateBackColor
```

See also

FaceplateType (Page 2984)

FaceplateType.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
Faceplate.BackColor
```

See also

FaceplateType (Page 2984)

FaceplateType.BackFillPattern

Description

The "BackFillPattern" property specifies the pattern of the background or the fill.

Type

Int32, HmiFillPattern

Specifies the filling:

- Solid (0): Solid
- Transparent (65536): Transparent. Depending on the runtime settings, visible objects in the background can be selected.
- Horizontal (131072): Horizontal
- Vertical (131073): Vertical
- ForwardDiagonal (131074): Forward diagonal stripe
- BackwardDiagonal (131075): Backward diagonal stripe
- Cross (131076): Cross
- DiagonalCross (131077): Diagonal cross
- GradientHorizontal (1048576): Horizontal gradient
- GradientVertical (1048577): Vertical gradient
- GradientForwardDiagonal (1048578): Gradient forward diagonal
- GradientBackwardDiagonal (1048579): Gradient backward diagonal
- GradientHorizontalTricolor (1048832): Horizontal tricolor gradient
- GradientVerticalTricolor (1048833): Vertical tricolor gradient
- GradientForwardDiagonalTricolor (1048834): Forward diagonal tricolor gradient
- GradientBackwardDiagonalTricolor (1048835): Backward diagonal tricolor gradient

Access

Read-write

Syntax

```
Faceplate.BackFillPattern
```

See also

FaceplateType (Page 2984)

FaceplateType.BackGraphic

Description

The "BackGraphic" property specifies the background graphic of the faceplate type.

Type

String

Access

Read-write

Syntax

```
Faceplate.BackGraphic
```

See also

FaceplateType (Page 2984)

FaceplateType.BackGraphicStretchMode

Description

The "BackGraphicStretchMode" property specifies the type of scaling of the background graphic of the faceplate type.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling:

- None (0): The graphic is shown in its original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Faceplate.BackGraphicStretchMode
```

See also

FaceplateType (Page 2984)

FaceplateType.BackgroundFillMode

Description

The "BackgroundFillMode" property specifies the fill area of the background fill.

Type

Int32, HmiBackgroundFillMode

Specifies the fill area:

- Window (0): The filling is adapted to the size of the window.
- Screen (1): The filling is adapted to the size of the screen.

Access

Read-write

Syntax

```
Faceplate.BackgroundFillMode
```

See also

FaceplateType (Page 2984)

FaceplateType.DisplayName

Description

The "DisplayName" property specifies the display name of the faceplate type.

Type

String

Access

Read-write

Syntax

```
Faceplate.DisplayName
```

See also

FaceplateType (Page 2984)

FaceplateType.Enabled

Description

The "Enabled" property specifies whether the faceplate type can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
Faceplate.Enabled
```

See also

FaceplateType (Page 2984)

FaceplateType.EnableExplicitUnlock

Description

The "EnableExplicitUnlock" property returns which button must be pressed for the faceplate type to be operable.

Type

Object, HmiButton (Page 1961)

Access

Read-only

Syntax

```
Faceplate.EnableExplicitUnlock
```

See also

FaceplateType (Page 2984)

Button (Page 1961)

Button

Description

Button (Page 1961)

FaceplateType.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Faceplate.Height
```

See also

FaceplateType (Page 2984)

FaceplateType.HorizontalAlignment

Description

The "HorizontalAlignment" property specifies the horizontal alignment.

Type

Int32, HmiHorizontalAlignment

Specifies the alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched. Can only be used with layout containers, Fallback behaves like Center

Access

Read-write

Syntax

```
Faceplate.HorizontalAlignment
```

See also

FaceplateType (Page 2984)

FaceplateType.Items

Description

The "Items" property returns a list of all the screen objects of the faceplate type.

Type

Object, HMIScreenItems (Page 2993)

Access

Read-only

Syntax

```
Faceplate.Items
```

See also

FaceplateType (Page 2984)

ScreenItems (Page 2993)

ScreenItems

Description

The "ScreenItems" object is a list of all screen objects ("HmiScreenItemBase" objects) of the screen.

You reference a "ScreenItems" object via the `Screen.Items` property.

Use

The "ScreenItems" object is a list and can be enumerated. You can access the "ScreenItems" list using the index or the tag name.

Object type

HMIScreenItems

Properties

--

Methods

The "ScreenItems" object has the following methods:

- **Item()**
  Returns a screen object of the "ScreenItems" list.

See also

FaceplateType.Items (Page 2992)

ScreenItems.Item()

Description

The "Item" method returns a screen object of a screen window via the "ScreenItems" list.

Syntax

```
ScreenItems[.Item](ScreenItemName);
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "ScreenItems" object.

Parameters

`ScreenItemName`

Type: String, HmiScreenItemBase

Name of the screen object

Return value

Object, HmiScreenItemBase (Page 1571)

See also

ScreenItems (Page 2993)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

FaceplateType.Layers

Description

The "Layers" property returns the list of all layers ("HmiLayerPart" objects) of the faceplate type.

Type

Object, HmiLayerCollection (Page 2995)

Access

Read-only

Syntax

```
Faceplate.Layers
```

See also

FaceplateType (Page 2984)

HmiLayerCollection (Page 2995)

HmiLayerCollection

Description

The "HmiLayerCollection" object is a list of all layers ("Layer" objects) of the screen.

You reference a "HmiLayerCollection" object via the `Screen.Layers` property.

Use

The "HmiLayerCollection" object is a list and can be counted and enumerated. You can access the "HmiLayerCollection" list using the index or the tag name.

Object type

HmiLayerCollection

Properties

The "HmiLayerCollection" object has the following properties:

- **Count**
  Returns the number of layers of the "HmiLayerCollection" list.

Methods

The "HmiLayerCollection" object has the following methods:

- **Item()**
  Returns a level of the "HmiLayerCollection" list.

See also

FaceplateType.Layers (Page 2994)

HmiLayerCollection.Count

Description

The "Count" property returns the number of screen layers of the "HmiLayerCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiLayerCollection.Count
```

See also

HmiLayerCollection (Page 2995)

HmiLayerCollection.Item()

Description

The "Item" method returns a screen layer of the "HmiLayerCollection" list.

Syntax

```
HmiLayerCollection[.Item](HmiLayerName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiLayerCollection" object.

Parameters

`HmiLayerName`

Type: String, HmiLayerPart

Name of the screen layer

Return value

Object, HmiLayerPart (Page 2997)

See also

HmiLayerCollection (Page 2995)

Layer (Page 2997)

Layer

Description

The "Layer" object represents the layers of an object (e.g. screen).

Object type

HmiLayerPart

Properties

The "Layer" object has the following properties:

- **MaximumZoom**
  Specifies the maximum zoom of the screen up to which the level is to be seen.
- **MinimumZoom**
  Specifies the minimum zoom of the screen up to which the level is to be seen.
- **Name**
  Returns the name of the screen layer.
- **Visible**
  Specifies whether the screen layer and contained objects are visible.

Methods

--

See also

FaceplateType.Layers (Page 2994)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

Layer (Page 2997)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

Layer (Page 2997)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

Layer (Page 2997)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

Layer (Page 2997)

FaceplateType.Name

Description

The "Name" property returns the name of the faceplate type.

Type

String

Access

Read-only

Syntax

```
Faceplate.Name
```

See also

FaceplateType (Page 2984)

FaceplateType.Parent

Description

The "Parent" property returns the faceplate container which contains the current faceplate instance as a child.

Type

Object, HmiFaceplateContainer (Page 2954)

Access

Read-only

Syntax

```
Faceplate.Parent
```

See also

FaceplateType (Page 2984)

FaceplateContainer (Page 2954)

FaceplateContainer

Description

FaceplateContainer (Page 2954)

FaceplateType.Properties

Description

The "Properties" property enables access to the interface data (interface tags and interface properties) of the faceplate type.

Type

Object, HmiDynamicPropertyPart

Access

Read-write

Syntax

```
Faceplate.Properties
```

Example

Outputting the name of the connected project tag to the "Tag_1" interface tag:

Copy code

```
let TagName;
TagName = Faceplate.Properties.Tag_1.Tag;
HMIRuntime.Trace("System Tag Name: " + TagName);
```

Outputting the value of the "CustomProperty_1" interface property:

Copy code

```
let PropertyValue;
PropertyValue = Faceplate.Properties.CustomProperty_1;
HMIRuntime.Trace("Value of CustomProperty_1: " + PropertyValue);
```

See also

FaceplateType (Page 2984)

FaceplateType.VerticalAlignment

Description

The "VerticalAlignment" property specifies the vertical alignment.

Type

Int32, HmiVerticalAlignment

Specifies the alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched. Can only be used with layout containers, Fallback behaves like Center

Access

Read-write

Syntax

```
Faceplate.VerticalAlignment
```

See also

FaceplateType (Page 2984)

FaceplateType.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Faceplate.Width
```

See also

FaceplateType (Page 2984)

FaceplateType.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the faceplate type.

Syntax

```
Faceplate.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

FaceplateType (Page 2984)

FaceplateType.Close()

Description

The "Close" method hides a faceplate container or closes a faceplate popup window.

Syntax

```
Faceplate.Close()
```

Parameters

--

Return value

Bool

See also

FaceplateType (Page 2984)

FaceplateType.FindItem()

Description

The "FindItem" method searches for and references screen windows or screen objects through their object path.

Syntax

```
Faceplate.FindItem(screenItemPath)
```

Parameters

`ScreenItemPath`

Type: String

Object path of the screen window or screen object you are looking for.

Note

The "Faceplate.FindItem" method has the faceplate in which the script is running as the search context and can also use relative object paths.

Formulation of the object path

The syntax of the object path orients itself to the notation of the file system paths. The object path consists of the names of the screen windows (Screen Windows) and screen objects (Screen Items). The names are connected via a slash ("/") according to the hierarchical positioning. Screens (Screens) and their names are not used in the formulation.

Relative and absolute object paths are distinguished by the prefix of the object path. The following prefixes can be used:

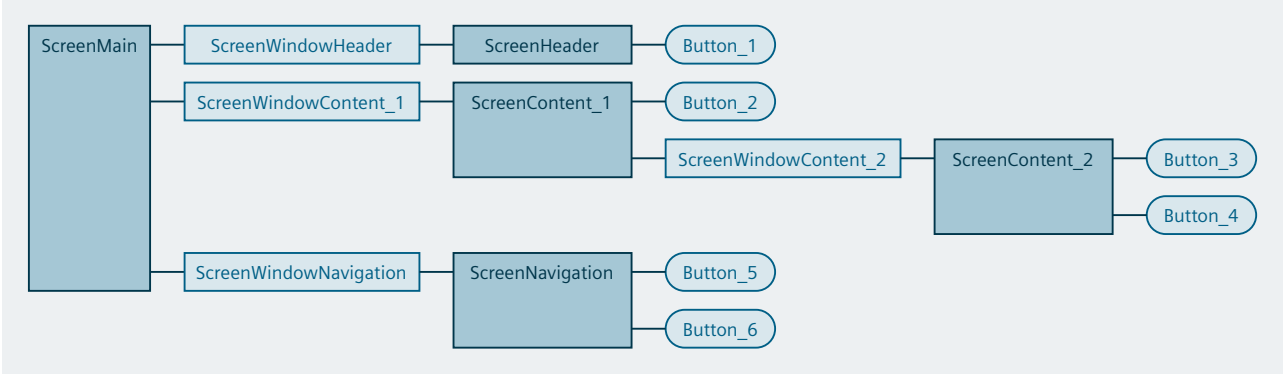
- Relative object path
  - "..": References the higher-level screen window (parent) in the context of the current screen window.
  - ".": References own screen window (self).
  - "": Without a prefix, a screen object of the current screen window is referenced.
- Absolute object paths
  - "/": References a screen window on the highest level, whose name must follow.
  - "~": References the screen window on the highest level in own screen hierarchy.

Additional rules for formulating an object path:

- The ".." string may be used multiple times in the object path, but only together at the beginning of the object path, for example, "../../Window5".
- If the object path does not end with a screen object name, a screen window is referenced.
- A search is performed for screen objects of the object path in the screens of the referenced screen window. It is not permitted to specify a screen name.

Examples of object paths

The following window-screen object hierarchy is adopted for the examples:



This results in the following object paths for addressing the objects:

- Relative addressing:
  - "Button_2" changes the label of "Button_1":
    ```
    // Navigate one level up and find "Button_1" inside the
    "ScreenWindowHeader"
    Screen.FindItem("../ScreenWindowHeader/Button_1").Text =
    "Changed by Button_2"
    ```
  - "Button_3" changes the label of "Button_5":
    ```
    // Navigate two levels up and find "Button 2" inside the
    "ScreenWindowNavigation"
    Screen.FindItem("../../ScreenWindowNavigation/Button_5").Text =
    "Changed by Button_3"
    ```
  - "Button_3" changes the label of "Button_4":
    ```
    // Find "Button_4" in same screen ("ScreenContent_2")
    Screen.FindItem("Button_4").Text = "Changed by Button_3"
    Screen.FindItem("./Button_4").Text = "Changed by Button_3"
    ```
- Absolute addressing:
  - "Button_4" changes the label of "Button_6":
    ```
    // Navigate to the root screen and find "Button_6" inside the
    "ScreenWindowNavigation"
    Screen.FindItem("~/ScreenWindowNavigation/Button_6").Text =
    "Changed by Button_4"
    ```

Return value

Object, HmiScreenObjectBase (Page 1571)

See also

FaceplateType (Page 2984)

Screen Items (Page 1571)

FaceplateType.OpenFaceplateInPopup()

Description

The "OpenFaceplateInPopup" method opens a faceplate from a faceplate type in a popup window.

Syntax

```
Faceplate.OpenFaceplateInPopup(faceplateType, title[,
independentWindow][, invisible])
```

Parameters

faceplateType

Type: String, HmiFaceplateType

Name of the faceplate type

title

Type: String

Title of the popup window

independentWindow

Optional, type: Bool

Specifies the dependency of the popup window on the calling faceplate:

- True: The popup window remains open until either the popup window is closed manually or runtime is exited.
- False: The popup window is closed when the faceplate or the screen is exited.

invisible

Optional, type: Bool

Causes the faceplate to be configured so that it is invisible to the operator.

To then display the faceplate, set the property `visible=true`.

Return value

Object, HmiPopupScreenWindow (Page 4288)

See also

FaceplateType (Page 2984)

PopupScreenWindow (Page 4288)

FaceplateType.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
Faceplate.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

`propertyName`

Type: String

Name of the property for which flashing is configured.

`enable`

Type: Bool

Specifies that flashing is activated.

`value`

Optional, type: Variant

Value of the property for which flashing is configured.

`alternateValue`

Optional, type: Variant

Specifies the second value for flashing.

`rate`

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

FaceplateType (Page 2984)

FaceplateType.RaiseEvent()

Description

The "RaiseEvent" method triggers a user-defined interface event of a faceplate type.

Syntax

```
Faceplate.RaiseEvent(name, parameters)
```

Parameters

`name`

Type: String

Name of the interface event

`parameters`

Type: Object

Parameter of the interface event

Return value

Bool

See also

FaceplateType (Page 2984)

FaceplateContainer_OnInterface_Event() (Page 2983)

FaceplateType_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A faceplate type is right-clicked.
- A faceplate type is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
FaceplateType_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

`item`

Type: Object

Faceplate type where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

FaceplateType (Page 2984)

FaceplateType_OnHotKey()

Description

The "OnHotKey" event occurs when the operator presses a hotkey:

Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Syntax

```
FaceplateType_OnHotKey(item,keyCode,modifiers)
```

Context

item

Type: Object

Faceplate type where the event occurs.

keyCode

Type: DInt

Numeric identifier of the pressed hotkey

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

FaceplateType (Page 2984)

FaceplateType_OnLoaded()

Description

The "OnLoaded" event occurs after the faceplate type has been built.

Syntax

```
FaceplateType_OnLoaded(item)
```

Context

item

Type: Object

Faceplate type where the event occurs.

See also

FaceplateType (Page 2984)

FaceplateType_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A faceplate type is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a faceplate type has the focus.
- A faceplate type is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
FaceplateType_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Faceplate type where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

FaceplateType (Page 2984)

FaceplateType_OnUnloaded()

Description

The "OnUnloaded" event occurs after the faceplate type has been cleared.

Syntax

```
FaceplateType_OnUnloaded(item)
```

Context

item

Type: Object

Faceplate type where the event occurs.

FaceplateType (Page 2984)

PopupScreenWindow

Description

PopupScreenWindow (Page 4288)

FunctionTrendControl

Description

The "FunctionTrendControl" object represents an f(x) trend view of tag values as a function of a different tag in runtime.

Object type

HmiFunctionTrendControl

Properties

The "FunctionTrendControl" object has the following properties:

- **AreaSpacing**
  Specifies the distance between function trend areas.
- **BackColor**
  Specifies the background color.

- **Caption**
  Specifies the text to be displayed in the title bar.
- **CaptionColor**
  Specifies the color of the title bar.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the f(x) trend view.
- **Enabled**
  Specifies whether the f(x) trend view can be operated in runtime.
- **ExtendRulerToAxis**
  Specifies whether the ruler is extended into the axis.
- **FunctionTrendAreas**
  Returns the function trend areas of the f(x) trend view.
- **Height**
  Specifies the height.
- **Icon**
  Specifies the icon of the f(x) trend view.
- **Layer**
  Returns the screen layer in which the f(x) trend view is located.
- **Left**
  Specifies the value of the X coordinate.
- **Legend**
  Specifies the appearance of the legend.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the f(x) trend view.
- **Online**
  Specifies the start and stop of the update of the f(x) trend view.
- **Parent**
  Returns the higher-level screen object.
- **RenderingTemplate**
  Returns the name of the template from which the f(x) trend view.was created.
- **ShiftAxis**
  Specifies whether to swap the X axis and Y axis of the f(x) trend view.
- **ShowFocusVisual**
  Specifies whether the f(x) trend view is highlighted when in focus.
- **ShowRuler**
  Specifies whether the ruler is displayed for determining a function trend value.
- **ShowStatisticRulers**
  Specifies whether to display the two rulers for specifying the statistics area.
- **StatusBar**
  Specifies the information bar of the f(x) trend view.

- **StyleItemClass**
  Returns the style which is applied to the f(x) trend view.
- **TabIndex**
  Returns the position of the f(x) trend view in the tab sequence.
- **TimeZone**
  Specifies the time zone.
- **ToolBar**
  Specifies the toolbar of the f(x) trend view.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the f(x) trend view is visible.
- **Width**
  Specifies the width.
- **WindowFlags**
  Specifies the window configuration of the f(x) trend view.

Methods

The "FunctionTrendControl" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the f(x) trend view.
- **FireCommand()**
  Executes the command of an element of the toolbar or information bar of the f(x) trend view.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "FunctionTrendControl" object has the following events:

- **OnActivated()**
  Occurs when a f(x) trend view receives focus.
- **OnCommandFired()**
  Occurs when the operator has operated an element in the toolbar or information bar of the f(x) trend view.
- **OnDeactivated()**
  Occurs when a f(x) trend view loses focus.
- **OnInitialized()**
  Occurs when a f(x) trend view has been successfully initialized and the data connection to the PLC has been established.

FunctionTrendControl.AreaSpacing

Description

The "AreaSpacing" property specifies the spacing between function trend areas.

Type

UInt16

Access

Read-write

Syntax

```
FunctionTrendControl.AreaSpacing
```

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
FunctionTrendControl.BackColor
```

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl.Caption

Description

The "Caption" property specifies the text to be displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
FunctionTrendControl.Caption
```

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

FunctionTrendControl.Caption (Page 3018)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 3018)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 3018)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 3018)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 3018)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 3018)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 3018)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

FunctionTrendControl.Caption (Page 3018)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

FunctionTrendControl.Caption (Page 3018)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

FunctionTrendControl.Caption (Page 3018)

FunctionTrendControl.CaptionColor

Description

The "CaptionColor" property specifies the color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
FunctionTrendControl.CaptionColor
```

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the f(x) trend view.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
FunctionTrendControl.CurrentQuality
```

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl.Enabled

Description

The "Enabled" property specifies whether the f(x) trend view can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
FunctionTrendControl.Enabled
```

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl.ExtendRulerToAxis

Description

The "ExtendRulerToAxis" property specifies whether the ruler is extended to the axis.

Type

Bool

Access

Read-write

Syntax

```
FunctionTrendControl.ExtendRulerToAxis
```

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl.FunctionTrendAreas

Description

The "FunctionTrendAreas" property returns the function trend areas ("FunctionTrendArea" objects) of the f(x) trend view.

Type

Object, HmiFunctionTrendAreaCollection (Page 3026)

Access

Read-only

Syntax

```
FunctionTrendControl.TrendAreas
```

See also

FunctionTrendControl (Page 3014)

HmiFunctionTrendAreaCollection (Page 3026)

HmiFunctionTrendAreaCollection

Description

The "HmiFunctionTrendAreaCollection" object is a list of all function trend areas ("FunctionTrendArea" objects) of the f(x) trend view.

Use

The "HmiFunctionTrendAreaCollection" object is a list and can be counted and enumerated. You can access the "HmiFunctionTrendAreaCollection" list using the index or the tag names.

Object type

HmiFunctionTrendAreaCollection

Properties

The "HmiFunctionTrendAreaCollection" object has the following properties:

- **Count**
  Returns the number of function trend areas of the "HmiFunctionTrendAreaCollection" list.

Methods

The "HmiFunctionTrendAreaCollection" object has the following methods:

- **Item()**
  Returns a function trend area of the "HmiFunctionTrendAreaCollection" list.

See also

FunctionTrendControl.FunctionTrendAreas (Page 3025)

HmiFunctionTrendAreaCollection.Count

Description

The "Count" property returns the number of trend areas in the "HmiFunctionTrendAreaCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiFunctionTrendAreaCollection.Count
```

See also

HmiFunctionTrendAreaCollection (Page 3026)

HmiFunctionTrendAreaCollection.Item()

Description

The "Item" method returns a function trend area of the "HmiFunctionTrendAreaCollection" list.

Syntax

```
HmiFunctionTrendAreaCollection[.Item](HmiFunctionTrendAreaName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiFunctionTrendAreaCollection" object.

Parameters

`HmiFunctionTrendAreaName`

Type: String

Name of the function trend area

Return value

Object, HmiFunctionTrendAreaPart (Page 3026)

See also

HmiFunctionTrendAreaCollection (Page 3026)

FunctionTrendArea (Page 3028)

FunctionTrendArea

Description

The "TrendArea" object represents a function trend area of the f(x) trend view.

Object type

HmiFunctionTrendAreaPart

Properties

The "FunctionTrendArea" object has the following properties:

- **BackColor**
  Specifies the background color.
- **BottomValueAxes**
  Returns the lower value axes of the function trend area.
- **FunctionTrends**
  Returns the function trends of the function trend area.
- **GridLines**
  Specifies the grid lines of the function trend area.
- **LeftValueAxes**
  Returns the left value axes of the function trend area.
- **MajorGridLinesColor**
  Specifies the color of the main grid lines.
- **MinorGridLinesColor**
  Specifies the color of the auxiliary grid lines.
- **Name**
  Returns the name of the function trend area.
- **RightValueAxes**
  Returns the right value axes of the function trend area.

- **Ruler**
  Specifies the appearance of the ruler to determine the function trend value.
- **SelectedFunctionTrend**
  Specifies the selected trend of the function trend area.
- **SizeFactor**
  Specifies the scaling factor of the function trend area relative to its height.
- **TopValueAxes**
  Returns the upper value axes of the function trend area.
- **Visible**
  Specifies whether the function trend area is visible.

Methods

--

See also

HmiFunctionTrendAreaCollection (Page 3026)

HmiFunctionTrendAreaCollection.Item() (Page 3027)

FunctionTrendArea.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
FunctionTrendArea.BackColor
```

See also

FunctionTrendArea (Page 3028)

FunctionTrendArea.BottomValueAxes

Description

The "BottomValueAxes" property returns the lower value axes of the function trend area.

Type

Object, HmiXValueAxisCollection (Page 3030)

Access

Read-only

Syntax

```
FunctionTrendArea.BottomValueAxes
```

See also

FunctionTrendArea (Page 3028)

HmiXValueAxisCollection (Page 3030)

HmiXValueAxisCollection

Description

The "HmiXValueAxisCollection" object is a list of all value axes ("XValueAxis" objects) of the function trend area.

Use

The "HmiXValueAxisCollection" object is a list and can be counted and enumerated. You can access the "HmiXValueAxisCollection" list using the index or the tag names.

Object type

HmiXValueAxisCollection

Properties

The "HmiXValueAxisCollection" object has the following properties:

- **Count**
  Returns the number of value axes in the "HmiXValueAxisCollection" list.

Methods

The "HmiXValueAxisCollection" object has the following methods:

- **Item()**
  Returns a value axis of the "HmiXValueAxisCollection" list.

See also

FunctionTrendArea.BottomValueAxes (Page 3030)

HmiXValueAxisCollection.Count

Description

The "Count" property returns the number of value axes in the "HmiXValueAxisCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiXValueAxisCollection.Count
```

See also

HmiXValueAxisCollection (Page 3030)

HmiXValueAxisCollection.Item()

Description

The "Item" method returns a value axis of the "HmiXValueAxisCollection" list.

Syntax

```
HmiXValueAxisCollection[.Item](HmiXValueAxisName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiXValueAxisCollection" object.

Parameters

`HmiXValueAxisName`

Type: String

Name of the value axis

Return value

Object, HmiXValueAxisPart (Page 3032)

See also

HmiXValueAxisCollection (Page 3030)

XValueAxis (Page 3032)

XValueAxis

Description

The "XValueAxis" object represents a value axis of the function trend area.

Object type

HmiXValueAxisPart

Properties

The "XValueAxis" object has the following properties:

- **ApplyScalingEntries**
  Specifies whether the user scaling of the axis section is applied.
- **AutoRange**
  Specifies whether automatic determination of the value range is activated by the minimum and maximum value of the function trend.
- **AutoScaling**
  Specifies whether the automatic scaling is activated.
- **AxisColor**
  Specifies the color of the value axis.
- **BeginValue**
  Specifies the start of a value range or value range section.
- **DisplayName**
  Specifies the display name of the value axis.
- **DivisionCount**
  Specifies the number of main units with subdivisions.

- **EndValue**
  Specifies the end of a value range or value range section.
- **HelpLines**
  Returns the appearance of the help lines.
- **LabelColor**
  Specifies the color of the axis labeling.
- **LabelFont**
  Specifies the font of the axis labeling.
- **LargeTickLabelingStep**
  Specifies the interval at which scale sections are labeled.
- **MeasurementUnit**
  Returns the displayed unit.
- **MeasurementUnitType**
  Specifies the display format of the unit.
- **OutputFormat**
  Specifies the format for displaying the axis values.
- **ScalingEntries**
  Returns the specification of the user scaling of the axis sections.
- **ScaleMode**
  Specifies the scale mode:
- **ScalingType**
  Specifies the scaling.
- **ShowScalingDisplayNames**
  Specifies whether the display names of the user scaling are used.
- **SubDivisionCount**
  Specifies the number of divisions of the main units.
- **TickColor**
  Specifies the color of the tick marks.
- **Visible**
  Specifies whether the value axis is visible.

Methods

--

See also

HmiXValueAxisCollection (Page 3030)

HmiXValueAxisCollection.Item() (Page 3031)

XValueAxis.ApplyScalingEntries

Description

The "ApplyScalingEntries" property specifies whether the user scaling of the axis sections is applied.

Type

Bool

Access

Read-write

Syntax

```
XValueAxis.ApplyScalingEntries
```

See also

XValueAxis (Page 3032)

XValueAxis.AutoRange

Description

The "AutoRange" property specifies whether automatic determination of the value range is activated by the minimum and maximum value of the function trend.

Type

Bool

Access

Read-write

Syntax

```
XValueAxis.AutoRange
```

See also

XValueAxis (Page 3032)

XValueAxis.AutoScaling

Description

The "AutoScaling" property specifies whether automatic scaling is activated.

Type

Bool

Access

Read-write

Syntax

```
XValueAxis.AutoScaling
```

See also

XValueAxis (Page 3032)

XValueAxis.AxisColor

Description

The "AxisColor" property specifies the color of the value axis.

Type

UInt32

Access

Read-write

Syntax

```
XValueAxis.BackColor
```

See also

XValueAxis (Page 3032)

XValueAxis.BeginValue

Description

The "BeginValue" property specifies the start of a value range or value range section.

Type

Float

Access

Read-write

Syntax

```
XValueAxis.BeginValue
```

See also

XValueAxis (Page 3032)

XValueAxis.DisplayName

Description

The "DisplayName" property specifies the display name of the value axis.

Type

String

Access

Read-write

Syntax

```
XValueAxis.DisplayName
```

See also

XValueAxis (Page 3032)

XValueAxis.DivisionCount

Description

The "DivisionCount" property specifies the number of main units with subdivisions. To this purpose the automatic scaling must be switched off.

Type

Int32

Access

Read-write

Syntax

```
XValueAxis.DivisionCount
```

See also

XValueAxis (Page 3032)

XValueAxis.EndValue

Description

The "EndValue" property specifies the end of a value range or value range section.

Type

Float

Access

Read-write

Syntax

```
XValueAxis.EndValue
```

See also

XValueAxis (Page 3032)

XValueAxis.HelpLines

Description

The "HelpLines" property returns the appearance of the help lines.

Type

Object, HmiHelpLineCollection (Page 3038)

Access

Read-only

Syntax

```
XValueAxis.HelpLines
```

See also

XValueAxis (Page 3032)

HmiHelpLineCollection (Page 3038)

HmiHelpLineCollection

Description

The "HmiHelpLineCollection" object is a list of all help lines ("HelpLine" objects).

Use

The "HmiHelpLineCollection" object is a list and can be counted and enumerated. You can access the "HmiHelpLineCollection" list using the index or the tag name.

Object type

HmiHelpLineCollection

Properties

The "HmiHelpLineCollection" object has the following properties:

- **Count**
  Returns the number of help lines of the "HmiHelpLineCollection" list.

Methods

The "HmiHelpLineCollection" object has the following methods:

- **Item()**
  Returns a help line of the "HmiHelpLineCollection" list.

See also

XValueAxis.HelpLines (Page 3038)

HmiHelpLineCollection.Count

Description

The "Count" property returns the number of help lines in the "HmiHelpLineCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiHelpLineCollection.Count
```

See also

HmiHelpLineCollection (Page 3038)

HmiHelpLineCollection.Item()

Description

The "Item" method returns help line of the "HmiHelpLineCollection" list.

Syntax

```
HmiHelpLineCollection[.Item](HmiHelpLineName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiHelpLineCollection" object.

Parameters

HmiHelpLineName

Type: String

Name of the help line

Return value

Object, HmiHelpLinePart (Page 3040)

See also

HmiHelpLineCollection (Page 3038)

HelpLine (Page 3040)

HelpLine

Description

The "HelpLine" object represents a help line of the value axis.

Object type

HmiHelpLinePart

Properties

The "HelpLine" object has the following properties:

- **Value**
  Specifies the value of the help line.
- **Visible**
  Specifies whether the help line is visible.

Methods

--

See also

HmiHelpLineCollection (Page 3038)

HmiHelpLineCollection.Item() (Page 3039)

HelpLine.Value

Description

The "Value" property sets the value of the help line.

Type

Float

Access

Read-write

Syntax

```
HelpLine.Value
```

See also

HelpLine (Page 3040)

HelpLine.Visible

Description

The "Visible" property specifies whether the help line is visible.

Type

Bool

Access

Read-write

Syntax

```
HelpLine.Visible
```

See also

HelpLine (Page 3040)

XValueAxis.LabelColor

Description

The "LabelColor" property specifies the color of the axis labeling.

Type

UInt32

Access

Read-write

Syntax

```
XValueAxis.LabelColor
```

See also

XValueAxis (Page 3032)

XValueAxis.LabelFont

Description

The "LabelFont" property specifies the font of the axis labeling.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
XValueAxis.LabelFont
```

See also

XValueAxis (Page 3032)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

XValueAxis.LabelFont (Page 3042)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

XValueAxis.LabelFont (Page 3042)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

XValueAxis.LabelFont (Page 3042)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

XValueAxis.LabelFont (Page 3042)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

XValueAxis.LabelFont (Page 3042)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

XValueAxis.LabelFont (Page 3042)

XValueAxis.LargeTickLabelingStep

Description

The "LargeTickLabelingStep" property specifies the interval at which scale sections are labeled.

Type

UInt8

Access

Read-write

Syntax

```
XValueAxis.LargeTickLabelingStep
```

See also

XValueAxis (Page 3032)

XValueAxis.MeasurementUnit

Description

The "MeasurementUnit" property returns the displayed unit.

Type

String

Access

Read-only

Syntax

```
XValueAxis.MeasurementUnit
```

See also

XValueAxis (Page 3032)

XValueAxis.MeasurementUnitType

Description

The "MeasurementUnitType" property specifies the display format of the unit.

Type

Int32, HmiMeasurementUnit

Specifies the display format:

- None (0): No unit
- Name (1): Unit name, for example "kilogram"
- Symbol (2): Unit, for example "kg"

Access

Read-write

Syntax

```
XValueAxis.MeasurementUnitType
```

See also

XValueAxis (Page 3032)

XValueAxis.OutputFormat

Description

The "OutputFormat" property specifies the format for displaying the axis values, e.g. "{0000}" for a 4-digit integer with leading zeros.

Type

String

Access

Read-write

Syntax

```
XValueAxis.OutputFormat
```

See also

XValueAxis (Page 3032)

XValueAxis.ScalingEntries

Description

The "ScalingEntries" property returns the user scaling of the axes sections.

Type

Object, HmiScalingEntryCollection (Page 3048)

Access

Read-only

Syntax

```
XValueAxis.ScalingEntries
```

See also

XValueAxis (Page 3032)

HmiScalingEntryCollection (Page 3048)

HmiScalingEntryCollection

Description

The "HmiScalingEntryCollection" object is a list of all user-defined axis sections ("ScalingEntry" objects).

Use

The "HmiScalingEntryCollection" object is a list and can be counted and enumerated. You can access the "HmiScalingEntryCollection" list using the index or the tag name.

Object type

HmiHelpLineCollection

Properties

The "HmiScalingEntryCollection" object has the following properties:

- **Count**
  Returns the number of user-defined axis sections of the "HmiScalingEntryCollection" list.

Methods

The "HmiScalingEntryCollection" object has the following methods:

- **Item()**
  Returns a user-defined axis section of the "HmiScalingEntryCollection" list.

See also

XValueAxis.ScalingEntries (Page 3048)

HmiScalingEntryCollection.Count

Description

The "Count" property returns the number of the user-defined axis sections in the "HmiScalingEntryCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiScalingEntryCollection.Count
```

See also

HmiScalingEntryCollection (Page 3048)

HmiScalingEntryCollection.Item()

Description

The "Item" method returns a user-defined axis section of the "HmiScalingEntryCollection" list.

Syntax

```
HmiScalingEntryCollection[.Item](HmiScalingEntryName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiScalingEntryCollection" object.

Parameters

`HmiScalingEntryName`

Type: String

Name of the user-defined axis section

Return value

Object, HmiScalingEntryPart (Page 3050)

See also

HmiScalingEntryCollection (Page 3048)

Scaling Entry (Page 3050)

Scaling Entry

Description

The "ScalingEntry" object represents a user-defined axis section of the value axis.

Object type

HmiScalingEntryPart

Properties

The "YValueAxis" object has the following properties:

- **BeginValue**
  Specifies the start of a value range section.
- **BeginValueTarget**
  Specifies the scaled value for the start of a value range section.
- **DisplayName**
  Specifies the display name of an axis section.
- **EndValue**
  Specifies the end of a value range section.
- **EndValueTarget**
  Specifies the scaled value for the end of a value range section.

Methods

--

See also

HmiScalingEntryCollection (Page 3048)

HmiScalingEntryCollection.Item() (Page 3050)

ScalingEntry.BeginValue

Description

The "BeginValue" property specifies the start of a value range section.

Type

Float

Access

Read-write

Syntax

```
ScalingEntry.BeginValue
```

See also

Scaling Entry (Page 3050)

ScalingEntry.BeginValueTarget

Description

The"BeginValueTarget" property specifies the scaled value for the start of a value range section.

Type

Float

Access

Read-write

Syntax

```
ScalingEntry.BeginValueTarget
```

See also

Scaling Entry (Page 3050)

ScalingEntry.DisplayName

Description

The "DisplayName" property specifies the display name of an axis section.

Type

String

Access

Read-write

Syntax

```
ScalingEntry.DisplayName
```

See also

Scaling Entry (Page 3050)

ScalingEntry.EndValue

Description

The "EndValue" property specifies the end of a value range section.

Type

Float

Access

Read-write

Syntax

```
ScalingEntry.EndValue
```

See also

Scaling Entry (Page 3050)

ScalingEntry.EndValueTarget

Description

The"EndValueTarget" property specifies the scaled value for the end of a value range section.

Type

Float

Access

Read-write

Syntax

```
ScalingEntry.EndValueTarget
```

See also

Scaling Entry (Page 3050)

XValueAxis.ScaleMode

Description

The "ScaleMode" property specifies the scale mode.

Type

Int32, HmiScaleMode

Specifies the scale mode:

- None (0): None
- Labels (1): Labels
- Ticks (2): Tick marks

Access

Read-write

Syntax

```
XValueAxis.ScaleMode
```

See also

XValueAxis (Page 3032)

XValueAxis.ScalingType

Description

The "ScalingType" property specifies the scaling.

Type

Int32, HmiScalingType

Specifies the scaling:

- Linear (0): Linear
- Logarithmic (1): Logarithmic
- NegativeLogarithmic (2): Negative logarithmic
- Tangent (4): Tangential
- Quadratic (5): Square
- Cubic (6): Cubic

Access

Read-write

Syntax

```
XValueAxis.ScalingType
```

See also

XValueAxis (Page 3032)

XValueAxis.ShowScalingDisplayNames

Description

The "ShowScalingDisplayNames" property specifies whether the display names of the user scaling are used.

Type

Bool

Access

Read-write

Syntax

```
XValueAxis.ShowScalingDisplayNames
```

See also

XValueAxis (Page 3032)

XValueAxis.SubDivisionCount

Description

The "SubDivisionCount" property specifies the number of subdivisions of the main units.

Type

Int32

Access

Read-write

Syntax

```
XValueAxis.SubDivisionCount
```

See also

XValueAxis (Page 3032)

XValueAxis.TickColor

Description

The "TickColor" property specifies the color of the tick marks.

Type

UInt32

Access

Read-write

Syntax

```
XValueAxis.TickColor
```

See also

XValueAxis (Page 3032)

XValueAxis.Visible

Description

The "Visible" property specifies whether the value axis is visible.

Type

Bool

Access

Read-write

Syntax

```
XValueAxis.Visible
```

See also

XValueAxis (Page 3032)

FunctionTrendArea.FunctionTrends

Description

The "Trends" property returns the function trends ("FunctionTrend" objects) of the function trend area.

Type

Object, HmiFunctionTrendCollection (Page 3057)

Access

Read-only

Syntax

```
FunctionTrendArea.FunctionTrends
```

See also

FunctionTrendArea (Page 3028)

HmiFunctionTrendCollection (Page 3057)

HmiFunctionTrendCollection

Description

The "HmiFunctionTrendCollection" object is a list of all function trends ("FunctionTrend" objects) of the f(x) trend view.

Use

The "HmiFunctionTrendCollection" object is a list and can be counted and enumerated. You can access the "HmiFunctionTrendCollection" list using the index or the tag names.

Object type

HmiFunctionTrendCollection

Properties

The "HmiFunctionTrendCollection" object has the following properties:

- **Count**
  Returns the number of function trends of the "HmiFunctionTrendCollection" list.

Methods

The "HmiFunctionTrendCollection" object has the following methods:

- **Item()**
  Returns a function trend of the "HmiFunctionTrendCollection" list.

See also

FunctionTrendArea.FunctionTrends (Page 3057)

HmiFunctionTrendCollection.Count

Description

The "Count" property returns the number of function trends in the "HmiFunctionTrendCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiFunctionTrendCollection.Count
```

See also

HmiFunctionTrendCollection (Page 3057)

HmiFunctionTrendCollection.Item()

Description

The "Item" method returns a function trend of the "HmiFunctionTrendCollection" list.

Syntax

```
HmiFunctionTrendCollection[.Item](HmiFunctionTrendName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiFunctionTrendCollection" object.

Parameters

`HmiFunctionTrendName`

Type: String

Name of the function trend.

Return value

Object, HmiFunctionTrendPart (Page 3059)

See also

HmiFunctionTrendCollection (Page 3057)

FunctionTrend (Page 3059)

FunctionTrend

Description

The "FunctionTrend" object represents a trend of the trend area.

Object type

HmiFunctionTrendPart

Properties

The "FunctionTrend" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **BackColor**
  Specifies the background color.
- **BackFillPattern**
  Specifies the pattern of the background or the fill.
- **BeginTime**
  Specifies the date and time for the start time of the time range.
- **DashType**
  Specifies the stroke style of the function trend.
- **DataSourceX**
  Specifies the tag for the data source of the x value axis.
- **DataSourceY**
  Specifies the tag for the data source of the y value axis.
- **DisplayName**
  Specifies the display name of the function trend.
- **EndTime**
  Specifies the date and time for the end time of the time range.
- **LineColor**
  Specifies the function trend color.
- **LineWidth**
  Specifies the function trend width.
- **MarkerColor**
  Specifies the color of the function trend points.
- **MarkerDimension**
  Specifies the width of the function trend points.
- **MarkerGraphic**
  Specifies a graphic element as a function trend point.
- **MarkerType**
  Specifies the type of the function trend points.
- **PointCount**
  Specifies the number of measurement points from the start time.
- **QualityVisualization**
  Specifies the colors for values of a specific quality.
- **RangeType**
  Specifies the type of time range.
- **ShowLoggedDataImmediately**
  Specifies which logged values are displayed.
- **Thresholds**
  Returns the list of all limit values of the function trend.

- **TimeRangeBase**
  Specifies the base of the time range.
- **TimeRangeFactor**
  Specifies the factor of the time base for defining the time range.
- **TrendMode**
  Specifies the type of function trend display.
- **Visible**
  Specifies whether the function trend is visible.
- **XValueAxis**
  References an x value axis of the function trend.
- **YValueAxis**
  References a y value axis of the function trend.

Methods

--

See also

HmiFunctionTrendCollection (Page 3057)

HmiFunctionTrendCollection.Item() (Page 3059)

FunctionTrend.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
FunctionTrend.AlternateBackColor
```

See also

FunctionTrend (Page 3059)

FunctionTrend.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
FunctionTrend.BackColor
```

See also

FunctionTrend (Page 3059)

FunctionTrend.BackFillPattern

Description

The "BackFillPattern" property specifies the pattern of the background or the fill.

Type

Int32, HmiFillPattern

Specifies the filling:

- Solid (0): Solid
- Transparent (65536): Transparent
- Horizontal (131072): Horizontal
- Vertical (131073): Vertical
- ForwardDiagonal (131074): Forward diagonal stripe
- BackwardDiagonal (131075): Backward diagonal stripe
- Cross (131076): Cross
- DiagonalCross (131077): Diagonal cross
- GradientHorizontal (1048576): Horizontal gradient
- GradientVertical (1048577): Vertical gradient

- GradientForwardDiagonal (1048578): Gradient forward diagonal
- GradientBackwardDiagonal (1048579): Gradient backward diagonal
- GradientHorizontalTricolor (1048832): Horizontal tricolor gradient
- GradientVerticalTricolor (1048833): Vertical tricolor gradient
- GradientForwardDiagonalTricolor (1048834): Forward diagonal tricolor gradient
- GradientBackwardDiagonalTricolor (1048835): Backward diagonal tricolor gradient

Access

Read-write

Syntax

```
FunctionTrend.BackFillPattern
```

See also

FunctionTrend (Page 3059)

FunctionTrend.BeginTime

Description

The "BeginTime" property specifies the date and time for the start time of the time range.

Type

DateTime

Access

Read-write

Syntax

```
FunctionTrend.BeginValue
```

See also

FunctionTrend (Page 3059)

FunctionTrend.DashType

Description

The "DashType" property specifies the stroke style of the function trend.

Type

Int32, HmiDashType

Specifies the stroke style:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted
- DashDot (3): Dash-dot
- DashDotDot (4): Dash-dot-dot

Access

Read-write

Syntax

```
FunctionTrend.DashType
```

See also

FunctionTrend (Page 3059)

FunctionTrend.DataSourceX

Description

The "DataSourceX" property specifies the tag for the data source of the x value axis.

Type

Object, HmiDataSourcePart

Access

Read-write

Syntax

```
FunctionTrend.DataSourceX
```

See also

FunctionTrend (Page 3059)

DataSource.Source

Description

The "Source" property specifies the data source, e.g. a tag or logging tag.

Type

String

Access

Read-write

Syntax

```
DataSource.Source
```

See also

FunctionTrend.DataSourceX (Page 3064)

DataSource.VisualizeQuality

Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

Type

Bool

Access

Read-write

Syntax

```
DataSource.VisualizeQuality
```

See also

FunctionTrend.DataSourceX (Page 3064)

FunctionTrend.DataSourceY

Description

The "DataSourceY" property specifies the tag for the data source of the y value axis.

Type

Object, HmiDataSourcePart

Access

Read-write

Syntax

```
FunctionTrend.DataSourceX
```

See also

FunctionTrend (Page 3059)

DataSource.Source

Description

The "Source" property specifies the data source, e.g. a tag or logging tag.

Type

String

Access

Read-write

Syntax

```
DataSource.Source
```

See also

FunctionTrend.DataSourceY (Page 3066)

DataSource.VisualizeQuality

Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

Type

Bool

Access

Read-write

Syntax

```
DataSource.VisualizeQuality
```

See also

FunctionTrend.DataSourceY (Page 3066)

FunctionTrend.DisplayName

Description

The "DisplayName" property specifies the display name of the function trend.

Type

String

Access

Read-write

Syntax

```
FunctionTrend.DisplayName
```

See also

FunctionTrend (Page 3059)

FunctionTrend.EndTime

Description

The "EndTime" property specifies the date and time for the end time of the time range.

Type

DateTime

Access

Read-write

Syntax

```
FunctionTrend.EndValue
```

See also

FunctionTrend (Page 3059)

FunctionTrend.LineColor

Description

The "LineColor" property specifies the function trend color.

Type

UInt32

Access

Read-write

Syntax

```
FunctionTrend.LineColor
```

See also

FunctionTrend (Page 3059)

FunctionTrend.LineWidth

Description

The "LineWidth" property specifies the function trend width.

Type

UInt8

Access

Read-write

Syntax

```
FunctionTrend.LineWidth
```

See also

FunctionTrend (Page 3059)

FunctionTrend.MarkerColor

Description

The "MarkerColor" property specifies the color of the function trend points.

Type

UInt32

Access

Read-write

Syntax

```
FunctionTrend.MarkerColor
```

See also

FunctionTrend (Page 3059)

FunctionTrend.MarkerDimension

Description

The "MarkerDimension" property specifies the width of the function trend points.

Type

UInt32

Access

Read-write

Syntax

```
FunctionTrend.MarkerDimension
```

See also

FunctionTrend (Page 3059)

FunctionTrend.MarkerGraphic

Description

The "MarkerGraphic" property specifies a graphic element as a function trend point.

Type

String

Access

Read-write

Syntax

```
FunctionTrend.MarkerGraphic
```

See also

FunctionTrend (Page 3059)

FunctionTrend.MarkerType

Description

The "MarkerType" property specifies the type of function trend points.

Type

Int32, HmiMarkerType

Specifies the type of the trend points:

- None (0): None
- Points (1): Dots
- Square (2): Square
- Circle (3): Circles
- Graphic (4): Graphic

Access

Read-write

Syntax

```
FunctionTrend.MarkerType
```

See also

FunctionTrend (Page 3059)

FunctionTrend.PointCount

Description

The "PointCount" property specifies the number of measurement points from the start time.

Type

Int32

Access

Read-write

Syntax

```
FunctionTrend.PointCount
```

See also

FunctionTrend (Page 3059)

FunctionTrend.QualityVisualization

Description

The "QualityVisualization" property specifies the colors for values of a specific quality.

Type

Object, HmiQualityPart

Access

Read-write

Syntax

```
FunctionTrend.QualityVisualization
```

See also

FunctionTrend (Page 3059)

Quality.BadColor

Description

The "BadColor" property specifies the color for values of the quality "Bad". Values of this quality cannot be used.

Type

UInt32

Access

Read-write

Syntax

```
Quality.BadColor
```

See also

FunctionTrend.QualityVisualization (Page 3072)

Quality.UncertainColor

Description

The "UncertainColor" property specifies the color for values of the quality "Uncertain". The quality of this level's values is worse than usual. It might still be possible to use the values, however.

Type

UInt32

Access

Read-write

Syntax

```
Quality.UncertainColor
```

See also

FunctionTrend.QualityVisualization (Page 3072)

Quality.Visible

Description

The "Visible" property specifies whether the colors are visible.

Type

Bool

Access

Read-write

Syntax

```
Quality.Visible
```

See also

FunctionTrend.QualityVisualization (Page 3072)

FunctionTrend.RangeType

Description

The "RangeType" property specifies the type of time range.

Type

Int32, HmiTimeRangeType

Specifies the time range:

- TimeRange (0): Any time range
- FromBeginToEnd (1): Total time range
- PointCount (2): Number of measurement points

Access

Read-write

Syntax

```
FunctionTrend.RangeType
```

See also

FunctionTrend (Page 3059)

FunctionTrend.ShowLoggedDataImmediately

Description

The "ShowLoggedDataImmediately" property specifies which logged values are displayed:

- True: Entire visible range
- False: Only from current time

Type

Bool

Access

Read-write

Syntax

```
Trend.ShowLoggedDataImmediately
```

See also

FunctionTrend (Page 3059)

FunctionTrend.Thresholds

Description

The "Thresholds" property returns the list of all limit values ("Threshold" objects) of the function trend.

Type

Object, HmiThresholdCollection (Page 3076)

Access

Read-only

Syntax

```
FunctionTrend.Thresholds
```

See also

FunctionTrend (Page 3059)

HmiThresholdCollection (Page 3076)

HmiThresholdCollection

Description

The "HmiThresholdCollection" object is a list of all limit values ("Threshold" objects).

Use

The "HmiThresholdCollection" object is a list and can be counted and enumerated. You can access the "HmiThresholdCollection" list using the index or the tag name.

Object type

HmiThresholdCollection

Properties

The "HmiThresholdCollection" object has the following properties:

- **Count**
  Returns the number of limit values of the "HmiThresholdCollection" list.

Methods

The "HmiThresholdCollection" object has the following methods:

- **Item()**
  Returns a limit value of the "HmiThresholdCollection" list.

See also

FunctionTrend.Thresholds (Page 3075)

HmiThresholdCollection.Count

Description

The "Count" property returns the number of limit values in the "HmiThresholdCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiThresholdCollection.Count
```

See also

HmiThresholdCollection (Page 3076)

HmiThresholdCollection.Item()

Description

The "Item" method returns a limit value of the "HmiThresholdCollection" list.

Syntax

```
HmiThresholdCollection[.Item](HmiThresholdName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiThresholdCollection" object.

Parameters

`HmiThresholdName`

Type: String

Name of the limit value

Return value

Object, HmiThresholdPart (Page 3078)

See also

HmiThresholdCollection (Page 3076)

Threshold (Page 3078)

Threshold

Description

The "Threshold" object represents a limit value.

Object type

HmiThresholdPart

Properties

The "Threshold" object has the following properties:

- **Color**
  Specifies the color of the limit value.
- **DisplayName**
  Specifies the display name of the limit value.
- **Name**
  Specifies the name of the limit value.
- **ThresholdMode**
  Specifies the type of limit value.
- **Value**
  Returns the limit value.

Methods

--

See also

HmiThresholdCollection (Page 3076)

HmiThresholdCollection.Item() (Page 3077)

Threshold.Color

Description

The "Color" property specifies the color of the limit value.

Type

UInt32

Access

Read-write

Syntax

```
Threshold.Color
```

See also

Threshold (Page 3078)

Threshold.DisplayName

Description

The "DisplayName" property specifies the display name of the limit value.

Type

String

Access

Read-write

Syntax

```
Threshold.DisplayName
```

See also

Threshold (Page 3078)

Threshold.Name

Description

The "Name" property specifies the name of the limit value.

Type

String

Access

Read-write

Syntax

```
Threshold.Name
```

See also

Threshold (Page 3078)

Threshold.ThresholdMode

Description

The "ThresholdMode" property specifies the type of limit value.

Type

Int32, HmiThresholdMode

Specifies the threshold value:

- Undefined (0): Undefined
- Upper (1): Upper threshold
- Lower (2): Lower threshold
- Normal (3): Normal threshold
- Minimum (4): Minimum threshold
- Maximum (5): Maximum threshold

Access

Read-write

Syntax

```
Threshold.ThresholdMode
```

See also

Threshold (Page 3078)

Threshold.Value

Description

The "Value" property returns the limit value of the tag.

Type

Float

Access

Read-only

Syntax

```
Threshold.Value
```

See also

Threshold (Page 3078)

FunctionTrend.TimeRangeBase

Description

The "TimeRangeBase" property specifies the base of the time range.

Type

Int32, HmiTimeRangeBase

Specifies a time range:

- Undefined (0): Not defined
- Millisecond (1): Millisecond
- Second (2): Second
- Minute (3): Minute
- Hour (4): Hour
- Day (5): Day
- Month (6): Month
- Year (7): Year

Access

Read-write

Syntax

```
FunctionTrend.TimeRangeBase
```

See also

FunctionTrend (Page 3059)

FunctionTrend.TimeRangeFactor

Description

The "TimeRangeFactor" property specifies the factor of the time base for defining the time range.

Type

Int32

Access

Read-write

Syntax

```
FunctionTrend.TimeRangeFactor
```

See also

FunctionTrend (Page 3059)

FunctionTrend.TrendMode

Description

The "TrendMode" property specifies the type of function trend display.

Type

Int32, HmiTrendMode

Specifies the trend type:

- Points (0): Dots
- Interpolated (1): Interpolated
- Stepped (2): Levels
- Bar (3): Bar
- Value (4): Values

Access

Read-write

Syntax

```
FunctionTrend.TrendMode
```

See also

FunctionTrend (Page 3059)

FunctionTrend.Visible

Description

The "Visible" property specifies whether the function trend is visible.

Type

Bool

Access

Read-write

Syntax

```
FunctionTrend.Visible
```

See also

FunctionTrend (Page 3059)

FunctionTrend.XValueAxis

Description

The "XValueAxis" property references an x value axis of the function trend.

Type

Object, HmiXValueAxisPart (Page 3032)

Access

Read-write

Syntax

```
FunctionTrend.XValueAxis
```

See also

FunctionTrend (Page 3059)

XValueAxis (Page 3032)

XValueAxis

Description

XValueAxis (Page 3032)

FunctionTrend.YValueAxis

Description

The "YValueAxis" property references a y value axis of the function trend.

Type

Object, HmiYValueAxisPart (Page 3088)

Access

Read-write

Syntax

```
FunctionTrend.YValueAxis
```

See also

FunctionTrend (Page 3059)

YValueAxis (Page 3088)

YValueAxis

Description

YValueAxis (Page 3088)

FunctionTrendArea.GridLines

Description

The "GridLines" property specifies the grid lines of the function trend area.

Type

Int32, HmiGridLine

Specifies the display of the grid lines:

- None (0): None
- VerticalMajor (1): Vertical, coarse
- HorizontalMajor (2): Horizontal, coarse
- VerticalMinor (4): Vertical, fine
- HorizontalMinor (8): Horizontal, fine

Access

Read-write

Syntax

```
FunctionTrendArea.GridLines
```

See also

FunctionTrendArea (Page 3028)

FunctionTrendArea.LeftValueAxes

Description

The "LeftValueAxes" property returns the left value axes of the function trend area.

Type

Object, HmiYValueAxisCollection (Page 3086)

Access

Read-only

Syntax

```
TrendArea.LeftValueAxes
```

See also

FunctionTrendArea (Page 3028)

HmiYValueAxisCollection (Page 3086)

HmiYValueAxisCollection

Description

The "HmiYValueAxisCollection" object is a list of all value axes ("YValueAxis" objects) of the trend area.

Use

The "HmiYValueAxisCollection" object is a list and can be counted and enumerated. You can access the "HmiYValueAxisCollection" list using the index or the tag name.

Object type

HmiYValueAxisCollection

Properties

The "HmiYValueAxisCollection" object has the following properties:

- **Count**
  Returns the number of value axes in the "HmiYValueAxisCollection" list.

Methods

The "HmiYValueAxisCollection" object has the following methods:

- **Item()**
  Returns a value axis of the "HmiYValueAxisCollection" list.

See also

TrendArea.LeftValueAxes (Page 6581)

HmiYValueAxisCollection (Page 3086)

HmiYValueAxisCollection.Count

Description

The "Count" property returns the number of value axes in the "HmiYValueAxisCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiYValueAxisCollection.Count
```

See also

HmiYValueAxisCollection (Page 3086)

HmiYValueAxisCollection.Item()

Description

The "Item" method returns a value axis of the "HmiYValueAxisCollection" list.

Syntax

```
HmiYValueAxisCollection[.Item](HmiYValueAxisName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiYValueAxisCollection" object.

Parameters

`HmiYValueAxisName`

Type: String

Name of the value axis

Return value

Object, HmiYValueAxisPart (Page 3088)

See also

HmiYValueAxisCollection (Page 3086)

YValueAxis (Page 3088)

YValueAxis

Description

The "YValueAxis" object represents a value axis of the trend area.

Object type

HmiYValueAxisPart

Properties

The "YValueAxis" object has the following properties:

- **ApplyScalingEntries**
  Specifies whether the user scaling of the axis section is applied.
- **AutoRange**
  Specifies whether automatic determination of the value range is activated by the minimum and maximum value of the trend.
- **AutoScaling**
  Specifies whether the automatic scaling is activated.
- **AxisColor**
  Specifies the color of the value axis.
- **BeginValue**
  Specifies the start of a value range or value range section.
- **DisplayName**
  Specifies the display name of the value axis.
- **DivisionCount**
  Specifies the number of main units with subdivisions.
- **EndValue**
  Specifies the end of a value range or value range section.
- **HelpLines**
  Returns the appearance of the help lines.
- **LabelColor**
  Specifies the color of the axis labeling.

- **LabelFont**
  Specifies the font of the axis labeling.
- **LargeTickLabelingStep**
  Specifies the interval at which scale sections are labeled.
- **MeasurementUnit**
  Returns the displayed unit.
- **MeasurementUnitType**
  Specifies the display format of the unit.
- **OutputFormat**
  Specifies the format for displaying the axis values.
- **ScalingEntries**
  Returns the specification of the user scaling of the axis sections.
- **ScaleMode**
  Specifies the scale mode:
- **ScalingType**
  Specifies the scaling.
- **ShowScalingDisplayNames**
  Specifies whether the display names of the user scaling are used.
- **SubDivisionCount**
  Specifies the number of divisions of the main units.
- **TickColor**
  Specifies the color of the tick marks.
- **Visible**
  Specifies whether the value axis is visible.

Methods

--

See also

HmiYValueAxisCollection (Page 3086)

HmiYValueAxisCollection.Item() (Page 3087)

YValueAxis.ApplyScalingEntries

Description

The "ApplyScalingEntries" property specifies whether the user scaling of the axis sections is applied.

Type

Bool

Access

Read-write

Syntax

```
YValueAxis.ApplyScalingEntries
```

See also

YValueAxis (Page 3088)

YValueAxis.AutoRange

Description

The "AutoRange" property specifies whether automatic determination of the value range is activated by the minimum and maximum value of the trend.

Type

Bool

Access

Read-write

Syntax

```
YValueAxis.AutoRange
```

See also

YValueAxis (Page 3088)

YValueAxis.AutoScaling

Description

The "AutoScaling" property specifies whether automatic scaling is activated.

Type

Bool

Access

Read-write

Syntax

```
YValueAxis.AutoScaling
```

See also

YValueAxis (Page 3088)

YValueAxis.AxisColor

Description

The "AxisColor" property specifies the color of the value axis.

Type

UInt32

Access

Read-write

Syntax

```
YValueAxis.BackColor
```

See also

YValueAxis (Page 3088)

YValueAxis.BeginValue

Description

The "BeginValue" property specifies the start of a value range or value range section.

Type

Float

Access

Read-write

Syntax

```
YValueAxis.BeginValue
```

See also

YValueAxis (Page 3088)

YValueAxis.DisplayName

Description

The "DisplayName" property specifies the display name of the value axis.

Type

String

Access

Read-write

Syntax

```
YValueAxis.DisplayName
```

See also

YValueAxis (Page 3088)

YValueAxis.DivisionCount

Description

The "DivisionCount" property specifies the number of main units with subdivisions. To this purpose the automatic scaling must be switched off.

Type

Int32

Access

Read-write

Syntax

```
YValueAxis.DivisionCount
```

See also

YValueAxis (Page 3088)

YValueAxis.EndValue

Description

The "EndValue" property specifies the end of a value range or value range section.

Type

Float

Access

Read-write

Syntax

```
YValueAxis.EndValue
```

See also

YValueAxis (Page 3088)

YValueAxis.HelpLines

Description

The "HelpLines" property returns the appearance of the help lines.

Type

Object, HmiHelpLineCollection (Page 3094)

Access

Read-only

Syntax

```
YValueAxis.HelpLines
```

See also

YValueAxis (Page 3088)

HmiHelpLineCollection (Page 3094)

HmiHelpLineCollection

Description

The "HmiHelpLineCollection" object is a list of all help lines ("HelpLine" objects).

Use

The "HmiHelpLineCollection" object is a list and can be counted and enumerated. You can access the "HmiHelpLineCollection" list using the index or the tag name.

Object type

HmiHelpLineCollection

Properties

The "HmiHelpLineCollection" object has the following properties:

- **Count**
  Returns the number of help lines of the "HmiHelpLineCollection" list.

Methods

The "HmiHelpLineCollection" object has the following methods:

- **Item()**
  Returns a help line of the "HmiHelpLineCollection" list.

See also

YValueAxis.HelpLines (Page 3093)

HmiHelpLineCollection.Count

Description

The "Count" property returns the number of help lines in the "HmiHelpLineCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiHelpLineCollection.Count
```

See also

HmiHelpLineCollection (Page 3094)

HmiHelpLineCollection.Item()

Description

The "Item" method returns help line of the "HmiHelpLineCollection" list.

Syntax

```
HmiHelpLineCollection[.Item](HmiHelpLineName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiHelpLineCollection" object.

Parameters

`HmiHelpLineName`

Type: String

Name of the help line

Return value

Object, HmiHelpLinePart (Page 3096)

See also

HmiHelpLineCollection (Page 3094)

HelpLine (Page 3096)

HelpLine

Description

The "HelpLine" object represents a help line of the value axis.

Object type

HmiHelpLinePart

Properties

The "HelpLine" object has the following properties:

- **Value**
  Specifies the value of the help line.
- **Visible**
  Specifies whether the help line is visible.

Methods

--

See also

HmiHelpLineCollection (Page 3094)

HmiHelpLineCollection.Item() (Page 3095)

HelpLine.Value

Description

The "Value" property sets the value of the help line.

Type

Float

Access

Read-write

Syntax

```
HelpLine.Value
```

See also

HelpLine (Page 3096)

HelpLine.Visible

Description

The "Visible" property specifies whether the help line is visible.

Type

Bool

Access

Read-write

Syntax

```
HelpLine.Visible
```

See also

HelpLine (Page 3096)

YValueAxis.LabelColor

Description

The "LabelColor" property specifies the color of the axis labeling.

Type

UInt32

Access

Read-write

Syntax

```
YValueAxis.LabelColor
```

See also

YValueAxis (Page 3088)

YValueAxis.LabelFont

Description

The "LabelFont" property specifies the font of the axis labeling.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
YValueAxis.LabelFont
```

See also

YValueAxis (Page 3088)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

YValueAxis.LabelFont (Page 3098)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

YValueAxis.LabelFont (Page 3098)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

YValueAxis.LabelFont (Page 3098)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

YValueAxis.LabelFont (Page 3098)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

YValueAxis.LabelFont (Page 3098)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

YValueAxis.LabelFont (Page 3098)

YValueAxis.LargeTickLabelingStep

Description

The "LargeTickLabelingStep" property specifies the interval at which scale sections are labeled.

Type

UInt8

Access

Read-write

Syntax

```
YValueAxis.LargeTickLabelingStep
```

See also

YValueAxis (Page 3088)

YValueAxis.MeasurementUnit

Description

The "MeasurementUnit" property returns the displayed unit.

Type

String

Access

Read-only

Syntax

```
YValueAxis.MeasurementUnit
```

See also

YValueAxis (Page 3088)

YValueAxis.MeasurementUnitType

Description

The "MeasurementUnitType" property specifies the display format of the unit.

Type

Int32, HmiMeasurementUnit

Specifies the display format:

- None (0): No unit
- Name (1): Unit name, for example "kilogram"
- Symbol (2): Unit, for example "kg"

Access

Read-write

Syntax

```
YValueAxis.MeasurementUnitType
```

See also

YValueAxis (Page 3088)

YValueAxis.OutputFormat

Description

The "OutputFormat" property specifies the format for displaying the axis values, e.g. "{0000}" for a 4-digit integer with leading zeros.

Type

String

Access

Read-write

Syntax

```
YValueAxis.OutputFormat
```

See also

YValueAxis (Page 3088)

YValueAxis.ScalingEntries

Description

The "ScalingEntries" property returns the user scaling of the axes sections.

Type

Object, HmiScalingEntryCollection (Page 3104)

Access

Read-only

Syntax

```
YValueAxis.ScalingEntries
```

See also

YValueAxis (Page 3088)

HmiScalingEntryCollection (Page 3104)

HmiScalingEntryCollection

Description

The "HmiScalingEntryCollection" object is a list of all user-defined axis sections ("ScalingEntry" objects).

Use

The "HmiScalingEntryCollection" object is a list and can be counted and enumerated. You can access the "HmiScalingEntryCollection" list using the index or the tag name.

Object type

HmiHelpLineCollection

Properties

The "HmiScalingEntryCollection" object has the following properties:

- **Count**
  Returns the number of user-defined axis sections of the "HmiScalingEntryCollection" list.

Methods

The "HmiScalingEntryCollection" object has the following methods:

- **Item()**
  Returns a user-defined axis section of the "HmiScalingEntryCollection" list.

See also

YValueAxis.ScalingEntries (Page 3103)

HmiScalingEntryCollection.Count

Description

The "Count" property returns the number of the user-defined axis sections in the "HmiScalingEntryCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiScalingEntryCollection.Count
```

See also

HmiScalingEntryCollection (Page 3104)

HmiScalingEntryCollection.Item()

Description

The "Item" method returns a user-defined axis section of the "HmiScalingEntryCollection" list.

Syntax

```
HmiScalingEntryCollection[.Item](HmiScalingEntryName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiScalingEntryCollection" object.

Parameters

`HmiScalingEntryName`

Type: String

Name of the user-defined axis section

Return value

Object, HmiScalingEntryPart (Page 3106)

See also

HmiScalingEntryCollection (Page 3104)

Scaling Entry (Page 3106)

Scaling Entry

Description

The "ScalingEntry" object represents a user-defined axis section of the value axis.

Object type

HmiScalingEntryPart

Properties

The "YValueAxis" object has the following properties:

- **BeginValue**
  Specifies the start of a value range section.
- **BeginValueTarget**
  Specifies the scaled value for the start of a value range section.
- **DisplayName**
  Specifies the display name of an axis section.
- **EndValue**
  Specifies the end of a value range section.
- **EndValueTarget**
  Specifies the scaled value for the end of a value range section.

Methods

--

See also

HmiScalingEntryCollection (Page 3104)

HmiScalingEntryCollection.Item() (Page 3105)

ScalingEntry.BeginValue

Description

The "BeginValue" property specifies the start of a value range section.

Type

Float

Access

Read-write

Syntax

```
ScalingEntry.BeginValue
```

See also

Scaling Entry (Page 3106)

ScalingEntry.BeginValueTarget

Description

The"BeginValueTarget" property specifies the scaled value for the start of a value range section.

Type

Float

Access

Read-write

Syntax

```
ScalingEntry.BeginValueTarget
```

See also

Scaling Entry (Page 3106)

ScalingEntry.DisplayName

Description

The "DisplayName" property specifies the display name of an axis section.

Type

String

Access

Read-write

Syntax

```
ScalingEntry.DisplayName
```

See also

Scaling Entry (Page 3106)

ScalingEntry.EndValue

Description

The "EndValue" property specifies the end of a value range section.

Type

Float

Access

Read-write

Syntax

```
ScalingEntry.EndValue
```

See also

Scaling Entry (Page 3106)

ScalingEntry.EndValueTarget

Description

The"EndValueTarget" property specifies the scaled value for the end of a value range section.

Type

Float

Access

Read-write

Syntax

```
ScalingEntry.EndValueTarget
```

See also

Scaling Entry (Page 3106)

YValueAxis.ScaleMode

Description

The "ScaleMode" property specifies the scale mode.

Type

Int32, HmiScaleMode

Specifies the scale mode:

- None (0): None
- Labels (1): Labels
- Ticks (2): Tick marks

Access

Read-write

Syntax

```
YValueAxis.ScaleMode
```

See also

YValueAxis (Page 3088)

YValueAxis.ScalingType

Description

The "ScalingType" property specifies the scaling.

Type

Int32, HmiScalingType

Specifies the scaling:

- Linear (0): Linear
- Logarithmic (1): Logarithmic
- NegativeLogarithmic (2): Negative logarithmic
- Tangent (4): Tangential
- Quadratic (5): Square
- Cubic (6): Cubic

Access

Read-write

Syntax

```
YValueAxis.ScalingType
```

See also

YValueAxis (Page 3088)

YValueAxis.ShowScalingDisplayNames

Description

The "ShowScalingDisplayNames" property specifies whether the display names of the user scaling are used.

Type

Bool

Access

Read-write

Syntax

```
YValueAxis.ShowScalingDisplayNames
```

See also

YValueAxis (Page 3088)

YValueAxis.SubDivisionCount

Description

The "SubDivisionCount" property specifies the number of subdivisions of the main units.

Type

Int32

Access

Read-write

Syntax

```
YValueAxis.SubDivisionCount
```

See also

YValueAxis (Page 3088)

YValueAxis.TickColor

Description

The "TickColor" property specifies the color of the tick marks.

Type

UInt32

Access

Read-write

Syntax

```
YValueAxis.TickColor
```

See also

YValueAxis (Page 3088)

YValueAxis.Visible

Description

The "Visible" property specifies whether the value axis is visible.

Type

Bool

Access

Read-write

Syntax

```
YValueAxis.Visible
```

See also

YValueAxis (Page 3088)

FunctionTrendArea.MajorGridLinesColor

Description

The "MajorGridLinesColor" property specifies the color of the main grid lines.

Type

UInt32

Access

Read-write

Syntax

```
FunctionTrendArea.MajorGridLinesColor
```

See also

FunctionTrendArea (Page 3028)

FunctionTrendArea.MinorGridLinesColor

Description

The "MinorGridLinesColor" specifies the color of the auxiliary grid lines.

Type

UInt32

Access

Read-write

Syntax

```
FunctionTrendArea.MinorGridLinesColor
```

See also

FunctionTrendArea (Page 3028)

FunctionTrendArea.Name

Description

The "Name" property returns the name of the function trend area.

Type

String

Access

Read-only

Syntax

```
FunctionTrendArea.Name
```

See also

FunctionTrendArea (Page 3028)

FunctionTrendArea.RightValueAxes

Description

The "RightValueAxes" property returns the right value axes of the function trend area.

Type

Object, HmiYValueAxisCollection (Page 3086)

Access

Read-only

Syntax

```
FunctionTrendArea.RightValueAxes
```

See also

FunctionTrendArea (Page 3028)
HmiYValueAxisCollection (Page 3086)

YValueAxisCollection

Description

YValueAxisCollection (Page 3086)

FunctionTrendArea.Ruler

Description

The "Ruler" property specifies the appearance of the ruler to determine the function trend value.

Type

Object, HmiRulerPart

Access

Read-write

Syntax

```
FunctionTrendArea.Ruler
```

See also

FunctionTrendArea (Page 3028)

Ruler.Color

Description

The "Color" property specifies the color of the ruler.

Type

UInt32

Access

Read-write

Syntax

```
Ruler.Color
```

See also

FunctionTrendArea.Ruler (Page 3114)

Ruler.Width

Description

The "Width" property specifies the width of the ruler.

Type

UInt32

Access

Read-write

Syntax

```
Ruler.Width
```

See also

FunctionTrendArea.Ruler (Page 3114)

FunctionTrendArea.SelectedFunctionTrend

Description

The "SelectedFunctionTrend" property specifies the selected function trend of the function trend area.

Type

Object, HmiFunctionTrendPart (Page 3059)

Access

Read-write

Syntax

```
FunctionTrendArea.SelectedFunctionTrend
```

See also

FunctionTrendArea (Page 3028)

FunctionTrend (Page 3059)

FunctionTrend

Description

FunctionTrend (Page 3059)

FunctionTrendArea.SizeFactor

Description

The "SizeFactor" property specifies the scaling factor of the function trend area relative to its height.

Type

UInt16

Access

Read-write

Syntax

```
FunctionTrendArea.SizeFactor
```

See also

FunctionTrendArea (Page 3028)

FunctionTrendArea.TopValueAxes

Description

The "TopValueAxes" property returns the upper value axes of the function trend area.

Type

Object, HmiXValueAxisCollection (Page 3030)

Access

Read-only

Syntax

```
FunctionTrendArea.TopValueAxes
```

See also

FunctionTrendArea (Page 3028)

HmiXValueAxisCollection (Page 3030)

XValueAxisCollection

Description

XValueAxisCollection (Page 3030)

FunctionTrendArea.Visible

Description

The "Visible" property specifies whether the function trend area is visible.

Type

Bool

Access

Read-write

Syntax

```
FunctionTrendArea.Visible
```

See also

FunctionTrendArea (Page 3028)

FunctionTrendControl.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
FunctionTrendControl.Height
```

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl.Icon

Description

The "Icon" property specifies the icon of the f(x) trend view.

Type

String

Access

Read-write

Syntax

```
FunctionTrendControl.Icon
```

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl.Layer

Description

The "Layer" property returns the layer of the screen in which the f(x) trend view is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
FunctionTrendControl.Layer
```

See also

FunctionTrendControl (Page 3014)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

FunctionTrendControl.Layer (Page 3119)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

FunctionTrendControl.Layer (Page 3119)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

FunctionTrendControl.Layer (Page 3119)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

FunctionTrendControl.Layer (Page 3119)

FunctionTrendControl.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
FunctionTrendControl.Left
```

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl.Legend

Description

The "Legend" property specifies the appearance of the legend ("Legend" object).

Type

Object, HmiLegendPart

Access

Read-write

Syntax

```
FunctionTrendControl.Legend
```

See also

FunctionTrendControl (Page 3014)

Legend.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Legend.ForeColor
```

See also

FunctionTrendControl.Legend (Page 3122)

Legend.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Legend.Font
```

See also

FunctionTrendControl.Legend (Page 3122)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Legend.Font (Page 3123)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Legend.Font (Page 3123)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Legend.Font (Page 3123)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Legend.Font (Page 3123)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Legend.Font (Page 3123)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Legend.Font (Page 3123)

Legend.Visible

Description

The "Visible" property specifies whether the legend is visible.

Type

Bool

Access

Read-write

Syntax

```
Legend.Visible
```

See also

FunctionTrendControl.Legend (Page 3122)

FunctionTrendControl.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
FunctionTrendControl.Margin
```

See also

FunctionTrendControl (Page 3014)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

FunctionTrendControl.Margin (Page 3127)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

FunctionTrendControl.Margin (Page 3127)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

FunctionTrendControl.Margin (Page 3127)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

FunctionTrendControl.Margin (Page 3127)

FunctionTrendControl.Name

Description

The "Name" property returns the name of the f(x) trend view.

Type

String

Access

Read-only

Syntax

```
FunctionTrendControl.Name
```

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl.Online

Description

The "Online" property specifies the start and stop of the update of the f(x) trend view.

- True: Online. The f(x) trend view is updated with new values.
- False: Offline. No new values are added to the f(x) trend view.

Type

Bool

Access

Read-write

Syntax

```
FunctionTrendControl.Online
```

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
FunctionTrendControl.Parent
```

See also

FunctionTrendControl (Page 3014)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

FunctionTrendControl.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the f(x) trend view was created.

Type

String

Access

Read-only

Syntax

```
FunctionTrendControl.RenderingTemplate
```

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl.ShiftAxis

Description

The "ShiftAxis" property specifies whether to swap the x axis and y axis of the f(x) trend view.

Type

Bool

Access

Read-write

Syntax

```
FunctionTrendControl.ShiftAxis
```

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the f(x) trend view is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
FunctionTrendControl.ShowFocusVisual
```

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl.ShowRuler

Description

The "ShowRuler" property specifies whether the ruler is displayed for determining a function trend value.

Type

Bool

Access

Read-write

Syntax

```
FunctionTrendControl.ShowRuler
```

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl.StatusBar

Description

The "StatusBar" property specifies the information bar of the f(x) trend view.

Type

Object, HmiStatusBarPart

Access

Read-write

Syntax

```
FunctionTrendControl.StatusBar
```

See also

FunctionTrendControl (Page 3014)

StatusBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
StatusBar.BackColor
```

See also

FunctionTrendControl.StatusBar (Page 3134)

StatusBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

Type

Object, HmiControlBarElementCollection (Page 3135)

Access

Read-only

Syntax

```
StatusBar.Elements
```

See also

HmiControlBarElementCollection (Page 3135)

FunctionTrendControl.StatusBar (Page 3134)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

StatusBar.Elements (Page 3135)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 3135)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 6421)

See also

HmiControlBarElementCollection (Page 3135)

Control Bar Elements (Page 6421)

Control Bar Elements

Description

Control Bar Elements (Page 3152)

StatusBar.Enabled

Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Enabled
```

See also

FunctionTrendControl.StatusBar (Page 3134)

StatusBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
StatusBar.Font
```

See also

FunctionTrendControl.StatusBar (Page 3134)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

StatusBar.Font (Page 3138)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

StatusBar.Font (Page 3138)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

StatusBar.Font (Page 3138)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

StatusBar.Font (Page 3138)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

StatusBar.Font (Page 3138)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

StatusBar.Font (Page 3138)

StatusBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
StatusBar.Margin
```

See also

FunctionTrendControl.StatusBar (Page 3134)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

StatusBar.Margin (Page 3142)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

StatusBar.Margin (Page 3142)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

StatusBar.Margin (Page 3142)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

StatusBar.Margin (Page 3142)

StatusBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
StatusBar.Padding
```

See also

FunctionTrendControl.StatusBar (Page 3134)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

StatusBar.Padding (Page 3144)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

StatusBar.Padding (Page 3144)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

StatusBar.Padding (Page 3144)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

StatusBar.Padding (Page 3144)

StatusBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.ShowToolTips
```

See also

FunctionTrendControl.StatusBar (Page 3134)

StatusBar.Visible

Description

The "Visible" property specifies whether the information bar is visible.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Visible
```

See also

FunctionTrendControl.StatusBar (Page 3134)

FunctionTrendControl.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the f(x) trend view.

Type

String

Access

Read-only

Syntax

```
FunctionTrendControl.StyleItemClass
```

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl.TabIndex

Description

The "TabIndex" property returns the position of the f(x) trend view in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
FunctionTrendControl.TabIndex
```

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl.ToolBar

Description

The "ToolBar" property specifies the toolbar of the f(x) trend view.

Type

Object, HmiToolBarPart

Access

Read-write

Syntax

```
FunctionTrendControl.ToolBar
```

See also

FunctionTrendControl (Page 3014)

ToolBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ToolBar.BackColor
```

See also

FunctionTrendControl.ToolBar (Page 3149)

ToolBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

Type

Object, HmiControlBarElementCollection (Page 3150)

Access

Read-only

Syntax

```
ToolBar.Elements
```

See also

HmiControlBarElementCollection (Page 3150)

FunctionTrendControl.ToolBar (Page 3149)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

ToolBar.Elements (Page 3150)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 3150)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 3152)

See also

HmiControlBarElementCollection (Page 3150)

Control Bar Elements (Page 3152)

Control Bar Elements

ControlBarButton

Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarButtonPart

Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the label of the button.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the button can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the button.
- **Mapping**
  Returns the function of the button.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.

- **Operability**
  Returns whether the button is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the button is visible.
- **Width**
  Specifies the width.

Methods

HmiControlBarElementCollection (Page 3150)

HmiControlBarElementCollection.Item() (Page 3151)

ControlBarButton.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBackColor
```

See also

ControlBarButton (Page 3152)

ControlBarButton.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBorderColor
```

See also

ControlBarButton (Page 3152)

ControlBarButton.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarButton.Authorization
```

See also

ControlBarButton (Page 3152)

ControlBarButton.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BackColor
```

See also

ControlBarButton (Page 3152)

ControlBarButton.Badge

Description

The "Badge" property specifies the label of the button.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarButton.Badge
```

See also

ControlBarButton (Page 3152)

ControlBarButton.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BorderColor
```

See also

ControlBarButton (Page 3152)

ControlBarButton.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarButton.BorderWidth
```

See also

ControlBarButton (Page 3152)

ControlBarButton.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarButton.Content
```

See also

ControlBarButton (Page 3152)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarButton.Content (Page 3158)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarButton.Content (Page 3158)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarButton.Content (Page 3158)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarButton.Content (Page 3158)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarButton.Content (Page 3158)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarButton.Content (Page 3158)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarButton.Content (Page 3158)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarButton.Content (Page 3158)

ControlBarButton.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarButton.CustomID
```

See also

ControlBarButton (Page 3152)

ControlBarButton.Enabled

Description

The "Enabled" property specifies whether the button can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Enabled
```

See also

ControlBarButton (Page 3152)

ControlBarButton.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.ForeColor
```

See also

ControlBarButton (Page 3152)

ControlBarButton.Graphic

Description

The "Graphic" property specifies the graphic of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Graphic
```

See also

ControlBarButton (Page 3152)

ControlBarButton.Height

Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Height
```

See also

ControlBarButton (Page 3152)

ControlBarButton.HotKey

Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
ControlBarButton.HotKey
```

See also

ControlBarButton (Page 3152)

ControlBarButton.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent

- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms

- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarButton.Mapping
```

ControlBarButton (Page 3152)

ControlBarButton.Margin

Description

The "Margin" property specifies the surrounded outer distance of the button.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarButton.Margin
```

See also

ControlBarButton (Page 3152)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarButton.Margin (Page 3168)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarButton.Margin (Page 3168)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarButton.Margin (Page 3168)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarButton.Margin (Page 3168)

ControlBarButton.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumHeight
```

See also

ControlBarButton (Page 3152)

ControlBarButton.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumWidth
```

See also

ControlBarButton (Page 3152)

ControlBarButton.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumHeight
```

See also

ControlBarButton (Page 3152)

ControlBarButton.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumWidth
```

See also

ControlBarButton (Page 3152)

ControlBarButton.Operability

Description

The "Operability" property returns whether the button is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarButton.Operability
```

See also

ControlBarButton (Page 3152)

ControlBarButton.Padding

Description

The "Padding" property specifies the distance of the content from the border of the button.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarButton.Padding
```

See also

ControlBarButton (Page 3152)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarButton.Padding (Page 3173)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarButton.Padding (Page 3173)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarButton.Padding (Page 3173)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarButton.Padding (Page 3173)

ControlBarButton.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarButton.RequireExplicitUnlock
```

See also

ControlBarButton (Page 3152)

ControlBarButton.Text

Description

The "Text" property specifies the label of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Text
```

See also

ControlBarButton (Page 3152)

ControlBarButton.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.ToolTipText
```

See also

ControlBarButton (Page 3152)

ControlBarButton.Visible

Description

The "Visible" property specifies whether the button is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Visible
```

See also

ControlBarButton (Page 3152)

ControlBarButton.Width

Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Width
```

See also

ControlBarButton (Page 3152)

ControlBarDisplay

Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarDisplayPart

Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the display area is enabled in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the display area.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the display area is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.

- **Visible**
  Specifies whether the display area is visible.
- **Width**
  Specifies the width.

HmiControlBarElementCollection (Page 3150)

HmiControlBarElementCollection.Item() (Page 3151)

ControlBarDisplay.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarDislay.Authorization
```

See also

ControlBarDisplay (Page 3178)

ControlBarButton.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarDislay.Content
```

See also

ControlBarDisplay (Page 3178)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarButton.Content (Page 3180)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarButton.Content (Page 3180)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered

- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarButton.Content (Page 3180)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarButton.Content (Page 3180)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarButton.Content (Page 3180)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarButton.Content (Page 3180)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarButton.Content (Page 3180)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarButton.Content (Page 3180)

ControlBarDisplay.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarDislay.CustomID
```

See also

ControlBarDisplay (Page 3178)

ControlBarDisplay.Enabled

Description

The "Enabled" property specifies whether the display is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Enabled
```

See also

ControlBarDisplay (Page 3178)

ControlBarDisplay.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.ForeColor
```

See also

ControlBarDisplay (Page 3178)

ControlBarDisplay.Graphic

Description

The "Graphic" property specifies the graphic of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Graphic
```

See also

ControlBarDisplay (Page 3178)

ControlBarDisplay.Height

Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Height
```

See also

ControlBarDisplay (Page 3178)

ControlBarDisplay.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control

- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms

- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarDislay.Mapping
```

See also

ControlBarDisplay (Page 3178)

ControlBarButton.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the display.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarDislay.Margin
```

See also

ControlBarDisplay (Page 3178)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarButton.Margin (Page 3190)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarButton.Margin (Page 3190)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarButton.Margin (Page 3190)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarButton.Margin (Page 3190)

ControlBarDisplay.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumHeight
```

See also

ControlBarDisplay (Page 3178)

ControlBarDisplay.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumWidth
```

See also

ControlBarDisplay (Page 3178)

ControlBarDisplay.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumHeight
```

See also

ControlBarDisplay (Page 3178)

ControlBarDisplay.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumWidth
```

See also

ControlBarDisplay (Page 3178)

ControlBarDisplay.Operability

Description

The "Operability" property returns whether the display is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarDislay.Operability
```

See also

ControlBarDisplay (Page 3178)

ControlBarButton.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the display.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarDislay.Padding
```

See also

ControlBarDisplay (Page 3178)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarButton.Padding (Page 3196)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarButton.Padding (Page 3196)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarButton.Padding (Page 3196)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarButton.Padding (Page 3196)

ControlBarDisplay.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarDislay.RequireExplicitUnlock
```

See also

ControlBarDisplay (Page 3178)

ControlBarDisplay.Text

Description

The "Text" property specifies the label of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Text
```

See also

ControlBarDisplay (Page 3178)

ControlBarDisplay.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.ToolTipText
```

See also

ControlBarDisplay (Page 3178)

ControlBarDisplay.Visible

Description

The "Visible" property specifies whether the display is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Visible
```

See also

ControlBarDisplay (Page 3178)

ControlBarDisplay.Width

Description

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Width
```

See also

ControlBarDisplay (Page 3178)

ControlBarLabel

Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar.

You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarLabelPart

Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the identifier can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the identifier.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the identifier is operable.
- **Padding**
  Specifies the distance of the content from the border.

- **RequireExplicitUnlock**
  Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the identifier is visible.
- **Width**
  Specifies the width.

ControlBarLabel.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarLabel.Authorization
```

See also

ControlBarLabel (Page 3201)

ControlBarLabel.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarLabel.CustomID
```

See also

ControlBarLabel (Page 3201)

ControlBarLabel.Enabled

Description

The "Enabled" property specifies whether the identifier is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Enabled
```

See also

ControlBarLabel (Page 3201)

ControlBarLabel.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.ForeColor
```

See also

ControlBarLabel (Page 3201)

ControlBarLabel.Height

Description

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Height
```

See also

ControlBarLabel (Page 3201)

ControlBarLabel.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

See also

ControlBarLabel (Page 3201)

ControlBarLabel.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display

- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status

- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

ControlBarLabel.Margin (Page 3207)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarLabel.Margin (Page 3207)

ControlBarLabel.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumHeight
```

See also

ControlBarLabel (Page 3201)

ControlBarLabel.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumWidth
```

See also

ControlBarLabel (Page 3201)

ControlBarLabel.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumHeight
```

See also

ControlBarLabel (Page 3201)

ControlBarLabel.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumWidth
```

See also

ControlBarLabel (Page 3201)

ControlBarLabel.Operability

Description

The "Operability" property returns whether the identifier is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarLabel.Operability
```

See also

ControlBarLabel (Page 3201)

ControlBarLabel.Padding

Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarLabel.Padding
```

See also

ControlBarLabel (Page 3201)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarLabel.Padding (Page 3213)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarLabel.Padding (Page 3213)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarLabel.Padding (Page 3213)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarLabel.Padding (Page 3213)

ControlBarLabel.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarLabel.RequireExplicitUnlock
```

See also

ControlBarLabel (Page 3201)

ControlBarLabel.Text

Description

The "Text" property specifies the label of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.Text
```

See also

ControlBarLabel (Page 3201)

ControlBarLabel.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.ToolTipText
```

See also

ControlBarLabel (Page 3201)

ControlBarLabel.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.VerticalTextAlignment
```

See also

ControlBarLabel (Page 3201)

ControlBarLabel.Visible

Description

The "Visible" property specifies whether the identifier is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Visible
```

See also

ControlBarLabel (Page 3201)

ControlBarLabel.Width

Description

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Width
```

See also

ControlBarLabel (Page 3201)

ControlBarSeparator

Description

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarSeparatorPart

Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.

- **Enabled**
  Specifies whether the disconnector can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the separator.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the separator is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the disconnector is only operable while the associated button is being pressed.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the disconnector is visible.
- **Width**
  Specifies the width.

Methods

HmiControlBarElementCollection (Page 3150)

HmiControlBarElementCollection.Item() (Page 3151)

ControlBarSeparator.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarSeparator.Authorization
```

See also

ControlBarSeparator (Page 3218)

ControlBarSeparator.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarSeparator.CustomID
```

See also

ControlBarSeparator (Page 3218)

ControlBarSeparator.Enabled

Description

The "Enabled" property specifies whether the separator is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Enabled
```

See also

ControlBarSeparator (Page 3218)

ControlBarSeparator.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.ForeColor
```

See also

ControlBarSeparator (Page 3218)

ControlBarSeparator.Height

Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Height
```

See also

ControlBarSeparator (Page 3218)

ControlBarSeparator.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarSeparator.Mapping
```

See also

ControlBarSeparator (Page 3218)

ControlBarSeparator.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the separator.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarSeparator.Margin
```

See also

ControlBarSeparator (Page 3218)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarSeparator.Margin (Page 3224)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarSeparator.Margin (Page 3224)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarSeparator.Margin (Page 3224)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarSeparator.Margin (Page 3224)

ControlBarSeparator.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumHeight
```

See also

ControlBarSeparator (Page 3218)

ControlBarSeparator.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumWidth
```

See also

ControlBarSeparator (Page 3218)

ControlBarSeparator.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumHeight
```

See also

ControlBarSeparator (Page 3218)

ControlBarSeparator.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumWidth
```

See also

ControlBarSeparator (Page 3218)

ControlBarSeparator.Operability

Description

The "Operability" property returns whether the separator is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarSeparator.Operability
```

See also

ControlBarSeparator (Page 3218)

ControlBarSeparator.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the separator.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarSeparator.Padding
```

See also

ControlBarSeparator (Page 3218)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarSeparator.Padding (Page 3229)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarSeparator.Padding (Page 3229)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarSeparator.Padding (Page 3229)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarSeparator.Padding (Page 3229)

ControlBarSeparator.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the disconnector can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarSeparator.RequireExplicitUnlock
```

See also

ControlBarSeparator (Page 3218)

ControlBarSeparator.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

Type

String

Access

Read-write

Syntax

```
ControlBarSeparator.ToolTipText
```

See also

ControlBarSeparator (Page 3218)

ControlBarSeparator.Visible

Description

The "Visible" property specifies whether the separator is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Visible
```

See also

ControlBarSeparator (Page 3218)

ControlBarSeparator.Width

Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Width
```

See also

ControlBarSeparator (Page 3218)

ControlBarTextBox

Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarTextBoxPart

Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the text box can be operated in runtime.
- **ForeColor**
  Specifies the font color.

- **Height**
  Specifies the height.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Mapping**
  Returns the function of the text box.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the text box is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **Readonly**
  Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**
  Returns whether the text box is only operable while the associated button is being pressed.
- **Text**
  Specifies the labeling.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the text box is visible.
- **Width**
  Specifies the width.

ControlBarTextBox.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.AlternateBorderColor
```

See also

ControlBarTextBox (Page 3234)

ControlBarTextBox.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarTextBox.Authorization
```

See also

ControlBarTextBox (Page 3234)

ControlBarTextBox.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BackColor
```

See also

ControlBarTextBox (Page 3234)

ControlBarTextBox.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BorderColor
```

See also

ControlBarTextBox (Page 3234)

ControlBarTextBox.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarTextBox.BorderWidth
```

See also

ControlBarTextBox (Page 3234)

ControlBarTextBox.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarTextBox.CustomID
```

See also

ControlBarTextBox (Page 3234)

ControlBarTextBox.Enabled

Description

The "Enabled" property specifies whether the text box can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Enabled
```

See also

ControlBarTextBox (Page 3234)

ControlBarTextBox.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

ControlBarTextBox.ForeColor
```

See also

ControlBarTextBox (Page 3234)

ControlBarTextBox.Height

Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Height
```

See also

ControlBarTextBox (Page 3234)

ControlBarTextBox.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

See also

ControlBarTextBox (Page 3234)

ControlBarTextBox.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

ControlBarTextBox (Page 3234)

ControlBarTextBox.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the text box.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarTextBox.Margin
```

See also

ControlBarTextBox (Page 3234)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarTextBox.Margin (Page 3243)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarTextBox.Margin (Page 3243)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarTextBox.Margin (Page 3243)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarTextBox.Margin (Page 3243)

ControlBarTextBox.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumHeight
```

See also

ControlBarTextBox (Page 3234)

ControlBarTextBox.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumWidth
```

See also

ControlBarTextBox (Page 3234)

ControlBarTextBox.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumHeight
```

See also

ControlBarTextBox (Page 3234)

ControlBarTextBox.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumWidth
```

See also

ControlBarTextBox (Page 3234)

ControlBarTextBox.Operability

Description

The "Operability" property returns whether the text box is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarTextBox.Operability
```

See also

ControlBarTextBox (Page 3234)

ControlBarTextBox.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the text box.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarTextBox.Padding
```

See also

ControlBarTextBox (Page 3234)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarTextBox.Padding (Page 3248)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarTextBox.Padding (Page 3248)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarTextBox.Padding (Page 3248)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarTextBox.Padding (Page 3248)

ControlBarTextBox.ReadOnly

Description

The "ReadOnly" property specifies whether the text box is read-only.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.ReadOnly
```

See also

ControlBarTextBox (Page 3234)

ControlBarTextBox.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

See also

ControlBarTextBox (Page 3234)

ControlBarTextBox.Text

Description

The "Text" property specifies the label of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.Text
```

See also

ControlBarTextBox (Page 3234)

ControlBarTextBox.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.ToolTipText
```

See also

ControlBarTextBox (Page 3234)

ControlBarTextBox.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

See also

ControlBarTextBox (Page 3234)

ControlBarTextBox.Visible

Description

The "Visible" property specifies whether the text box is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Visible
```

See also

ControlBarTextBox (Page 3234)

ControlBarTextBox.Width

Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Width
```

See also

ControlBarTextBox (Page 3234)

ControlBarToggleSwitch

Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar.

You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarToggleSwitchPart

Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".

- **AlternateGraphic**
  Specifies the graphic for the "pressed" state.
- **AlternateText**
  Specifies the text for the "pressed" state.
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the identifier of the switch.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the switch can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the switch.
- **IsAlternateState**
  Specifies the current state of the switch.
- **Mapping**
  Returns the function of the switch.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.

- **Operability**
  Returns whether the switch is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the switch is only operable while the associated button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the switch is visible.
- **Width**
  Specifies the width.

HmiControlBarElementCollection (Page 3150)

HmiControlBarElementCollection.Item() (Page 3151)

ControlBarToggleSwitch.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.AlternateGraphic

Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateGraphic
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.AlternateText

Description

The "AlternateText" property specifies the text of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateText
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Authorization
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BackColor
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.Badge

Description

The "Badge" property specifies the identifier of the switch.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Badge
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderColor
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderWidth
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Content
```

See also

ControlBarToggleSwitch (Page 3254)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarToggleSwitch.Content (Page 3261)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarToggleSwitch.Content (Page 3261)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 3261)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarToggleSwitch.Content (Page 3261)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarToggleSwitch.Content (Page 3261)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarToggleSwitch.Content (Page 3261)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarToggleSwitch.Content (Page 3261)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 3261)

ControlBarToggleSwitch.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarToggleSwitch.CustomID
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.Enabled

Description

The "Enabled" property specifies whether the switch can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Enabled
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ForeColor
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.Graphic

Description

The "Graphic" property specifies the graphic of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Graphic
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.Height

Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Height
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.HotKey

Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
Button.HotKey
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.IsAlternateState

Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Mapping
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the switch.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Margin
```

See also

ControlBarToggleSwitch (Page 3254)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarToggleSwitch.Margin (Page 3272)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarToggleSwitch.Margin (Page 3272)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarToggleSwitch.Margin (Page 3272)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarToggleSwitch.Margin (Page 3272)

ControlBarToggleSwitch.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumHeight
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumWidth
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumHeight
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumWidth
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.Operability

Description

The property "Operability" returns whether the switch is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Operability
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the switch.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Padding
```

See also

ControlBarToggleSwitch (Page 3254)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarToggleSwitch.Padding (Page 3277)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarToggleSwitch.Padding (Page 3277)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarToggleSwitch.Padding (Page 3277)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarToggleSwitch.Padding (Page 3277)

ControlBarToggleSwitch.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.Text

Description

The "Text" property specifies the label of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Text
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ToolTipText
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.Visible

Description

The "Visible" property specifies whether the switch is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Visible
```

See also

ControlBarToggleSwitch (Page 3254)

ControlBarToggleSwitch.Width

Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Width
```

See also

ControlBarToggleSwitch (Page 3254)

ToolBar.Enabled

Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Enabled
```

See also

FunctionTrendControl.ToolBar (Page 3149)

ToolBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ToolBar.Font
```

See also

FunctionTrendControl.ToolBar (Page 3149)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ToolBar.Font (Page 3283)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ToolBar.Font (Page 3283)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ToolBar.Font (Page 3283)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ToolBar.Font (Page 3283)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ToolBar.Font (Page 3283)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ToolBar.Font (Page 3283)

ToolBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the toolbar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ToolBar.Margin
```

See also

FunctionTrendControl.ToolBar (Page 3149)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ToolBar.Margin (Page 3286)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ToolBar.Margin (Page 3286)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ToolBar.Margin (Page 3286)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ToolBar.Margin (Page 3286)

ToolBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ToolBar.Padding
```

See also

FunctionTrendControl.ToolBar (Page 3149)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ToolBar.Padding (Page 3289)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ToolBar.Padding (Page 3289)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ToolBar.Padding (Page 3289)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ToolBar.Padding (Page 3289)

ToolBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.ShowToolTips
```

See also

FunctionTrendControl.ToolBar (Page 3149)

ToolBar.UseHotKeys

Description

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.UseHotKeys
```

See also

FunctionTrendControl.ToolBar (Page 3149)

ToolBar.Visible

Description

The "Visible" property specifies whether the toolbar is visible.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Visible
```

See also

FunctionTrendControl.ToolBar (Page 3149)

FunctionTrendControl.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
FunctionTrendControl.Top
```

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl.Visible

Description

The "Visible" property specifies whether the f(x) trend view is visible.

Type

Bool

Access

Read-write

Syntax

```
FunctionTrendControl.Visible
```

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
FunctionTrendControl.Width
```

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl.WindowFlags

Description

The "WindowFlags" property specifies the window configuration of the f(x) trend view.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title

- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

Enable multiple properties by adding the integer values or bit operators.

Access

Read-write

Syntax

```
FunctionTrendControl.WindowFlags
```

Example

Adapt the "windowFlags" tag depending on the window configuration:

Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose){
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the f(x) trend view.

Syntax

```
FunctionTrendControl.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

FunctionTrendControl (Page 3014)

FunctionTrendControl.FireCommand()

Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the f(x) trend view.

Syntax

```
FunctionTrendControl.FireCommand(commandId, custom)
```

Parameters

commandId

Type: Int32

ID of the element of the toolbar or information bar

custom

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

Return value

--

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
FunctionTrendControl.PropertyFlashing(propertyName, enable[, value]
[, alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl_OnActivated()

Description

The "OnActivated" event occurs when a f(x) trend view receives focus:

- An f(x) trend view is selected via the configured tab sequence.
- An f(x) trend view that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
FunctionTrendControl_OnActivated(item)
```

Context

`item`

Type: Object

f(x) trend view where the event occurs.

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl_OnCommandFired()

Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the f(x) trend view.

Syntax

```
FunctionTrendControl_OnCommandFired(item, commandId, custom)
```

Context

item

Type: Object

f(x) trend view where the event occurs.

commandId

Type: DInt

ID of the element of the toolbar or information bar that was operated.

custom

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl_OnDeactivated()

Description

The "OnDeactivated" event occurs when an f(x) trend view loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

Syntax

```
FunctionTrendControl_OnDeactivated(item)
```

Context

item

Type: Object

f(x) trend view where the event occurs.

See also

FunctionTrendControl (Page 3014)

FunctionTrendControl_OnInitialized()

Description

The "OnInitialized" event occurs when an f(x) trend view has been successfully initialized and the data connection to the PLC has been established.

Syntax

```
FunctionTrendControl_OnInitialized(item)
```

Context

item

Type: Object

f(x) trend view where the event occurs.

See also

FunctionTrendControl (Page 3014)

Gauge

Description

The "Gauge" object represents a pointer instrument as an analog dial gauge for monitoring process values in runtime.

Object type

HmiGauge

Properties

The "Gauge" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the border color.
- **BorderWidth**
  Specifies the border thickness.
- **ComputedMaxPeakValue**
  Returns the highest process value that occurred.
- **ComputedMinPeakValue**
  Returns the lowest process value that occurred.
- **ComputedValueTendency**
  Returns the change of the process value.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the gauge.
- **CurvedScale**
  Specifies the scale of the gauge.
- **Enabled**
  Specifies whether the gauge can be operated in runtime.
- **Font**
  Specifies the font of the text.
- **Height**
  Specifies the height.
- **Label**
  Specifies the labeling of the gauge.
- **Layer**
  Returns the layer of the screen in which the gauge is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.

- **Name**
  Returns the name of the gauge.
- **NormalRangeColor**
  Specifies the color of the normal range.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the gauge is operable.
- **OriginValue**
  Specifies the output value of the normal range that is visualized.
- **OutputFormat**
  Specifies the format for displaying the process values.
- **Parent**
  Returns the higher-level screen object.
- **PeakIndicators**
  Specifies whether the highest and lowest process value up to this time are displayed.
- **ProcessValue**
  Specifies the process value.
- **ProcessValueIndicatorBackColor**
  Specifies the background color for the process value.
- **ProcessValueIndicatorForeColor**
  Specifies the foreground color for the process value.
- **ProcessValueIndicatorMode**
  Specifies the type of display of the current process value.
- **RelativeToOrigin**
  Specifies whether the output value is an absolute or a percentage value between the minimum and maximum value.
- **RenderingTemplate**
  Returns the name of the template from which the gauge was created.
- **RequireExplicitUnlock**
  Returns whether the gauge is only operable while the associated button is being pressed.
- **RotationAngle**
  Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the gauge rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ScaleBackColor**
  Specifies the background color of the scale.

- **ScaleForeColor**
  Specifies the foreground color of the scale.
- **ShowFocusVisual**
  Specifies whether the gauge is highlighted when in focus.
- **ShowTrendIndicator**
  Specifies whether the tendency (rising or falling) of the process value to be monitored is indicated by means of a small arrow.
- **StyleItemClass**
  Returns the style which is applied to the gauge.
- **TabIndex**
  Returns the position of the gauge in the tab sequence.
- **ThresholdIndicators**
  Specifies how parameterized limit values are visualized.
- **Thresholds**
  Returns the list of all limit values of the gauge.
- **Title**
  Specifies the caption which appears as the title.
- **ToolTipText**
  Specifies the tooltip text.
- **Top**
  Specifies the value of the Y coordinate.
- **TrendIndicatorColor**
  Specifies the color of the trend indicator.
- **Visible**
  Specifies whether the gauge is visible.
- **VisualizeQuality**
  Specifies whether the connection quality of the process value is displayed.
- **Width**
  Specifies the width.

Methods

The "Gauge" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the gauge.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "Gauge" object has the following events:

- **OnActivated()**
  Occurs when a gauge receives focus.
- **OnContextTapped()**
  Occurs when a gauge is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when a gauge loses focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the gauge is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the gauge is in focus.
- **OnTapped()**
  Occurs when a gauge is left-clicked or short-touched.

Gauge.AlternateBackColor

Description

The "AlternateBackColor" specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
Gauge.AlternateBackColor
```

See also

Gauge (Page 3300)

Gauge.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
Gauge.AlternateBorderColor
```

See also

Gauge (Page 3300)

Gauge.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
Gauge.Authorization
```

See also

Gauge (Page 3300)

Gauge.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
Gauge.BackColor
```

See also

Gauge (Page 3300)

Gauge.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
Gauge.BorderColor
```

See also

Gauge (Page 3300)

Gauge.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
Gauge.BorderWidth
```

See also

Gauge (Page 3300)

Gauge.ComputedMaxPeakValue

Description

The "ComputedMaxPeakValue" property returns the highest process value that occurred.

Type

Variant

Access

Read-only

Syntax

```
Gauge.ComputedMaxPeakValue
```

See also

Gauge (Page 3300)

Gauge.ComputedMinPeakValue (Page 3307)

Gauge.ComputedMinPeakValue

Description

The "ComputedMinPeakValue" property returns the lowest process value which occurred.

Type

Variant

Access

Read-only

Syntax

```
Gauge.ComputedMinPeakValue
```

See also

Gauge (Page 3300)

Gauge.ComputedMaxPeakValue (Page 3307)

Gauge.ComputedValueTendency

Description

The "ComputedValueTendency" property returns the change in the process value.

Type

Int32, HmiValueTendency

Returns the modification:

- Steady (0): No change
- Upwards (1): Change upwards
- Downwards (2): Change downwards

Access

Read-only

Syntax

```
Gauge.ComputedValueTendency
```

See also

Gauge (Page 3300)

Gauge.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the gauge.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
Gauge.CurrentQuality
```

See also

Gauge (Page 3300)

Gauge.CurvedScale

Description

The "CurvedScale" property specifies the scale of the gauge.

Type

Object, HmiCurvedScalePart

Access

Read-write

Syntax

```
Gauge.CurvedScale
```

See also

Gauge (Page 3300)

CurvedScale.AngleRange

Description

The "AngleRange" property specifies the arc angle of the displayed scale clockwise.

Type

Int32

Access

Read-write

Syntax

```
CurvedScale.AngleRange
```

See also

Gauge.CurvedScale (Page 3309)

CurvedScale.AutoScaling

Description

The "AutoScaling" property specifies whether automatic scaling is activated.

Type

Bool

Access

Read-write

Syntax

```
CurvedScale.AutoScaling
```

See also

Gauge.CurvedScale (Page 3309)

CurvedScale.BeginValue

Description

The "BeginValue" property specifies the start of a value range or value range section.

Type

Float

Access

Read-write

Syntax

```
CurvedScale.BeginValue
```

See also

Gauge.CurvedScale (Page 3309)

CurvedScale.DivisionCount

Description

The "DivisionCount" property specifies the number of main units with subdivisions. To this purpose the automatic scaling must be switched off.

Type

Int32

Access

Read-write

Syntax

```
CurvedScale.DivisionCount
```

See also

Gauge.CurvedScale (Page 3309)

CurvedScale.EndValue

Description

The "EndValue" property specifies the end of a value range or value range section.

Type

Float

Access

Read-write

Syntax

```
CurvedScale.EndValue
```

See also

Gauge.CurvedScale (Page 3309)

CurvedScale.LabelColor

Description

The "LabelColor" property specifies the color of the labeling.

Type

UInt32

Access

Read-write

Syntax

```
CurvedScale.LabelColor
```

See also

Gauge.CurvedScale (Page 3309)

CurvedScale.LabelFont

Description

The "LabelFont" property specifies the font of the labeling.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
CurvedScale.LabelFont
```

See also

Gauge.CurvedScale (Page 3309)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

CurvedScale.LabelFont (Page 3313)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

CurvedScale.LabelFont (Page 3313)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

CurvedScale.LabelFont (Page 3313)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

CurvedScale.LabelFont (Page 3313)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

CurvedScale.LabelFont (Page 3313)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

CurvedScale.LabelFont (Page 3313)

CurvedScale.LargeTickLabelingStep

Description

The "LargeTickLabelingStep" property specifies the interval at which scale sections are labeled.

Type

UInt8

Access

Read-write

Syntax

```
CurvedScale.LargeTickLabelingStep
```

See also

Gauge.CurvedScale (Page 3309)

CurvedScale.MeasurementUnit

Description

The "MeasurementUnit" property returns the displayed unit.

Type

String

Access

Read-only

Syntax

```
CurvedScale.MeasurementUnit
```

See also

Gauge.CurvedScale (Page 3309)

CurvedScale.MeasurementUnitType

Description

The "MeasurementUnitType" property specifies the display format of the unit.

Type

Int32, HmiMeasurementUnit

Specifies the display format:

- None (0): No unit
- Name (1): Unit name, for example "kilogram"
- Symbol (2): Unit, for example "kg"

Access

Read-write

Syntax

```
CurvedScale.MeasurementUnitType
```

See also

Gauge.CurvedScale (Page 3309)

CurvedScale.OutputFormat

Description

The "OutputFormat" property specifies the format for displaying the process values, e.g. "{0000}" for a 4-digit integer with leading zeros.

Type

String

Access

Read-write

Syntax

```
CurvedScale.OutputFormat
```

See also

Gauge.CurvedScale (Page 3309)

CurvedScale.ScaleMode

Description

The "ScaleMode" property specifies the type of scaling.

Type

Int32, HmiScaleMode

Specifies the scaling:

- None (0): None
- Labels (1): Labels
- Ticks (2): Tick marks

Access

Read-write

Syntax

```
CurvedScale.ScaleMode
```

See also

Gauge.CurvedScale (Page 3309)

CurvedScale.ScalingType

Description

The "ScalingType" property specifies the scaling.

Type

Int32, HmiScalingType

Specifies the scaling:

- Linear (0): Linear
- Logarithmic (1): Logarithmic
- NegativeLogarithmic (2): Negative logarithmic
- Tangent (4): Tangential
- Quadratic (5): Square
- Cubic (6): Cubic

Access

Read-write

Syntax

```
CurvedScale.ScalingType
```

See also

Gauge.CurvedScale (Page 3309)

CurvedScale.StartAngle

Description

The "StartAngle" specifies the angle by which the start point deviates from the zero position (0° corresponds to 3 o'clock).

Type

Int32

Access

Read-write

Syntax

```
CurvedScale.StartAngle
```

See also

Gauge.CurvedScale (Page 3309)

CurvedScale.SubDivisionCount

Description

The "SubDivisionCount" property specifies the number of subdivisions of the main units.

Type

Int32

Access

Read-write

Syntax

```
CurvedScale.SubDivisionCount
```

See also

Gauge.CurvedScale (Page 3309)

CurvedScale.TickColor

Description

The "TickColor" property specifies the color of the tick marks.

Type

UInt32

Access

Read-write

Syntax

```
CurvedScale.TickColor
```

See also

Gauge.CurvedScale (Page 3309)

Gauge.Enabled

Description

The "Enabled" property specifies whether the gauge can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
Gauge.Enabled
```

See also

Gauge (Page 3300)

Gauge.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Gauge.Font
```

See also

Gauge (Page 3300)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Gauge.Font (Page 3322)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Gauge.Font (Page 3322)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Gauge.Font (Page 3322)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Gauge.Font (Page 3322)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Gauge.Font (Page 3322)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Gauge.Font (Page 3322)

Gauge.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Gauge.Height
```

See also

Gauge (Page 3300)

Gauge.Label

Description

The "Label" property specifies the labeling of the gauge.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
Gauge.Label
```

See also

Gauge (Page 3300)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

Gauge.Label (Page 3326)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 3326)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 3326)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 3326)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 3326)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 3326)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 3326)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

Gauge.Label (Page 3326)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

Gauge.Label (Page 3326)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

Gauge.Label (Page 3326)

Gauge.Layer

Description

The "Layer" property returns the layer of the screen in which the gauge is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
Gauge.Layer
```

See also

Gauge (Page 3300)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

Gauge.Layer (Page 3332)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

Gauge.Layer (Page 3332)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

Gauge.Layer (Page 3332)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

Gauge.Layer (Page 3332)

Gauge.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
Gauge.Left
```

See also

Gauge (Page 3300)

Gauge.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
Gauge.Margin
```

See also

Gauge (Page 3300)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

Gauge.Margin (Page 3335)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

Gauge.Margin (Page 3335)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

Gauge.Margin (Page 3335)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

Gauge.Margin (Page 3335)

Gauge.Name

Description

The "Name" property returns the name of the gauge.

Type

String

Access

Read-only

Syntax

```
Gauge.Name
```

See also

Gauge (Page 3300)

Gauge.NormalRangeColor

Description

The "NormalRangeColor" property specifies the color of the normal range.

Type

UInt32

Access

Read-write

Syntax

```
Gauge.NormalRangeColor
```

See also

Gauge (Page 3300)

Gauge.Opacity

Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

Type

Float

Access

Read-write

Syntax

```
Gauge.Opacity
```

See also

Gauge (Page 3300)

Gauge.Operability

Description

The "Operability" property returns whether the gauge is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
Gauge.Operability
```

See also

Gauge (Page 3300)

Gauge.OriginValue

Description

The "OriginValue" property specifies the output value of the normal range to be visualized.

Type

Float

Access

Read-write

Syntax

```
Gauge.OriginValue
```

See also

Gauge (Page 3300)

Gauge.OutputFormat

Description

The "OutputFormat" property specifies the format for displaying the process values, e.g. "{0000}" for a 4-digit integer with leading zeros.

Type

String

Access

Read-write

Syntax

```
Gauge.OutputFormat
```

See also

Gauge (Page 3300)

Gauge.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
Gauge.Parent
```

See also

Gauge (Page 3300)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

Gauge.PeakIndicators

Description

The "PeakIndicators" property specifies whether the highest and lowest process value up to this time are displayed.

Type

Int32, HmiPeakIndicator

Specifies the display of the peak indicator:

- None (0): No display
- Low (1): Only the lowest process value
- High (2): Only the highest process value

Access

Read-write

Syntax

```
Gauge.PeakIndicators
```

See also

Gauge (Page 3300)

Gauge.ProcessValue

Description

The "ProcessValue" property specifies the process value.

Type

Variant

Access

Read-write

Syntax

```
Gauge.ProcessValue
```

See also

Gauge (Page 3300)

Gauge.ProcessValueIndicatorBackColor

Description

The "ProcessValueIndicatorBackColor" property specifies the background color for the process value indicator.

Type

UInt32

Access

Read-write

Syntax

```
Gauge.ProcessValueIndicatorBackColor
```

See also

Gauge (Page 3300)

Gauge.ProcessValueIndicatorForeColor (Page 3342)

Gauge.ProcessValueIndicatorForeColor

Description

The "ProcessValueIndicatorForeColor" property specifies the foreground color for the process value indicator.

Type

UInt32

Access

Read-write

Syntax

```
Gauge.ProcessValueIndicatorForeColor
```

See also

Gauge (Page 3300)

Gauge.ProcessValueIndicatorBackColor (Page 3342)

Gauge.ProcessValueIndicatorMode

Description

The "ProcessValueIndicatorMode" property specifies the type of display of the current process value.

Type

Int32, HmiProcessIndicatorMode

Specifies the type of display:

- Bar (0): Bar only
- Indicator (1): Hair line or needle, no numerical display of the process value.
- DetailedIndicator (2): Detailed display with numerical value
- BarWithDetailedIndicator (3): Bar with numerical value

Access

Read-write

Syntax

```
Gauge.ProcessValueIndicatorMode
```

See also

Gauge (Page 3300)

Gauge.RelativeToOrigin

Description

The "RelativeToOrigin" property specifies whether the output value is an absolute or a percentage value between minimum and maximum value.

Type

Bool

Access

Read-write

Syntax

```
Gauge.RelativeToOrigin
```

See also

Gauge (Page 3300)

Gauge.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the gauge was created.

Type

String

Access

Read-only

Syntax

```
Gauge.RenderingTemplate
```

See also

Gauge (Page 3300)

Gauge.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the gauge can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
Gauge.RequireExplicitUnlock
```

See also

Gauge (Page 3300)

Gauge.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
Gauge.RotationAngle
```

See also

Gauge (Page 3300)

Gauge.RotationCenterPlacement (Page 3346)

Gauge.RotationCenterX (Page 3346)

Gauge.RotationCenterY (Page 3347)

Gauge.RotationCenterPlacement

Description

The "RotationCenterPlacement" property sets the reference point around which the gauge rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
Gauge.RotationCenterPlacement
```

See also

Gauge (Page 3300)

Gauge.RotationAngle (Page 3345)

Gauge.RotationCenterX (Page 3346)

Gauge.RotationCenterY (Page 3347)

Gauge.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
Gauge.RotationCenterX
```

See also

Gauge (Page 3300)

Gauge.RotationAngle (Page 3345)

Gauge.RotationCenterPlacement (Page 3346)

Gauge.RotationCenterY (Page 3347)

Gauge.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
Gauge.RotationCenterY
```

See also

Gauge (Page 3300)

Gauge.RotationAngle (Page 3345)

Gauge.RotationCenterPlacement (Page 3346)

Gauge.RotationCenterX (Page 3346)

Gauge.ScaleBackColor

Description

The "ScaleBackColor" property specifies the background color of the scale.

Type

UInt32

Access

Read-write

Syntax

```
Gauge.ScaleBackColor
```

See also

Gauge (Page 3300)

Gauge.ScaleForeColor (Page 3348)

Gauge.ScaleForeColor

Description

The "ScaleForeColor" property specifies the foreground color of the scale.

Type

UInt32

Access

Read-write

Syntax

```
Gauge.ScaleForeColor
```

See also

Gauge (Page 3300)

Gauge.ScaleBackColor (Page 3348)

Gauge.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the gauge is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
Gauge.ShowFocusVisual
```

See also

Gauge (Page 3300)

Gauge.ShowTrendIndicator

Description

The "ShowTrendIndicator" property specifies whether the tendency (rising or falling) of the process value to be monitored is indicated by means of a small arrow.

Type

Bool

Access

Read-write

Syntax

```
Gauge.ShowTrendIndicator
```

See also

Gauge (Page 3300)

Gauge.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the gauge.

Type

String

Access

Read-only

Syntax

```
Gauge.StyleItemClass
```

See also

Gauge (Page 3300)

Gauge.TabIndex

Description

The "TabIndex" property returns the position of the gauge in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
Gauge.TabIndex
```

See also

Gauge (Page 3300)

Gauge.ThresholdIndicators

Description

The "ThresholdIndicators" property specifies how parameterized limit values are visualized.

Type

Int32, HmiThresholdIndicator

Specifies the visualization:

- None (0): None
- Lines (1): Lines
- Markers (2): Markers

Access

Read-write

Syntax

```
Gauge.ThresholdIndicators
```

See also

Gauge (Page 3300)

Gauge.Thresholds

Description

The "Thresholds" property returns the list of all limit values ("Threshold" objects) of the gauge.

Type

Object, HmiThresholdCollection (Page 3352)

Access

Read-only

Syntax

```
Gauge.Thresholds
```

See also

Gauge (Page 3300)

HmiThresholdCollection (Page 3352)

HmiThresholdCollection

Description

The "HmiThresholdCollection" object is a list of all limit values ("Threshold" objects).

Use

The "HmiThresholdCollection" object is a list and can be counted and enumerated. You can access the "HmiThresholdCollection" list using the index or the tag name.

Object type

HmiThresholdCollection

Properties

The "HmiThresholdCollection" object has the following properties:

- **Count**
  Returns the number of limit values of the "HmiThresholdCollection" list.

Methods

The "HmiThresholdCollection" object has the following methods:

- **Item()**
  Returns a limit value of the "HmiThresholdCollection" list.

See also

Gauge.Thresholds (Page 3351)

HmiThresholdCollection.Count

Description

The "Count" property returns the number of limit values in the "HmiThresholdCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiThresholdCollection.Count
```

See also

HmiThresholdCollection (Page 3352)

HmiThresholdCollection.Item()

Description

The "Item" method returns a limit value of the "HmiThresholdCollection" list.

Syntax

```
HmiThresholdCollection[.Item](HmiThresholdName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiThresholdCollection" object.

Parameters

`HmiThresholdName`

Type: String

Name of the limit value

Return value

Object, HmiThresholdPart (Page 3354)

See also

Threshold (Page 3354)

HmiThresholdCollection (Page 3352)

Threshold

Description

The "Threshold" object represents a limit value.

Object type

HmiThresholdPart

Properties

The "Threshold" object has the following properties:

- **Color**
  Specifies the color of the limit value.
- **DisplayName**
  Specifies the display name of the limit value.
- **Name**
  Specifies the name of the limit value.
- **ThresholdMode**
  Specifies the type of limit value.
- **Value**
  Returns the limit value.

Methods

--

See also

HmiThresholdCollection (Page 3352)

Threshold.Color

Description

The "Color" property specifies the color of the limit value.

Type

UInt32

Access

Read-write

Syntax

```
Threshold.Color
```

See also

Threshold (Page 3354)

Threshold.DisplayName

Description

The "DisplayName" property specifies the display name of the limit value.

Type

String

Access

Read-write

Syntax

```
Threshold.DisplayName
```

See also

Threshold (Page 3354)

Threshold.Name

Description

The "Name" property specifies the name of the limit value.

Type

String

Access

Read-write

Syntax

```
Threshold.Name
```

See also

Threshold (Page 3354)

Threshold.ThresholdMode

Description

The "ThresholdMode" property specifies the type of limit value.

Type

Int32, HmiThresholdMode

Specifies the threshold value:

- Undefined (0): Undefined
- Upper (1): Upper threshold
- Lower (2): Lower threshold
- Normal (3): Normal threshold
- Minimum (4): Minimum threshold
- Maximum (5): Maximum threshold

Access

Read-write

Syntax

```
Threshold.ThresholdMode
```

See also

Threshold (Page 3354)

Threshold.Value

Description

The "Value" property returns the limit value of the tag.

Type

Float

Access

Read-only

Syntax

```
Threshold.Value
```

See also

Threshold (Page 3354)

Gauge.Title

Description

The "Title" property specifies the caption that appears as the title.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
Gauge.Title
```

See also

Gauge (Page 3300)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

Gauge.Title (Page 3357)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 3357)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 3357)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 3357)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 3357)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 3357)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 3357)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

Gauge.Title (Page 3357)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

Gauge.Title (Page 3357)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

Gauge.Title (Page 3357)

Gauge.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
Gauge.ToolTipText
```

See also

Gauge (Page 3300)

Gauge.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
Gauge.Top
```

See also

Gauge (Page 3300)

Gauge.TrendIndicatorColor

Description

The "TrendIndicatorColor" property specifies the color of the trend indicator. The trend indicator uses a small arrow to represent the tendency (rising or falling) of the process value to be monitored. To activate the trend indicator, the "ShowTrendIndicator" property must be activated.

Type

UInt32

Access

Read-write

Syntax

```
Gauge.TrendIndicatorColor
```

See also

Gauge (Page 3300)

Gauge.Visible

Description

The "Visible" property specifies whether the gauge is visible.

Type

Bool

Access

Read-write

Syntax

```
Gauge.Visible
```

See also

Gauge (Page 3300)

Gauge.VisualizeQuality

Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

Type

Bool

Access

Read-write

Syntax

```
Gauge.VisualizeQuality
```

See also

Gauge (Page 3300)

Gauge.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Gauge.Width
```

See also

Gauge (Page 3300)

Gauge.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the gauge.

Syntax

```
Gauge.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

Gauge (Page 3300)

Gauge.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
Gauge.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

Gauge (Page 3300)

Gauge_OnActivated()

Description

The "OnActivated" event occurs when a gauge receives focus:

- A gauge is selected via the configured tab sequence.
- A gauge that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
Gauge_OnActivated(item)
```

Context

`item`

Type: Object

Gauge where the event occurs.

See also

Gauge (Page 3300)

Gauge_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A gauge is right-clicked.
- A gauge is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
Gauge_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Gauge where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Gauge (Page 3300)

Gauge_OnDeactivated()

Description

The "OnDeactivated" event occurs when the gauge loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
Gauge_OnDeactivated(item)
```

Context

`item`

Type: Object

Gauge where the event occurs.

See also

Gauge (Page 3300)

Gauge_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the gauge is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Gauge_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

Gauge where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Gauge (Page 3300)

Gauge_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the gauge is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Gauge_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Gauge where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Gauge (Page 3300)

Gauge_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A gauge is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a gauge has the focus.
- A gauge is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
Gauge_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Gauge where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Gauge (Page 3300)

GraphicView

Description

The "GraphicView" object represents a graphic display in runtime.

Object type

HmiGraphicView

Properties

The "GraphicView" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BackFillPattern**
  Specifies the pattern of the background or the fill.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the graphic display.
- **Enabled**
  Specifies whether the graphic display can be operated in runtime.
- **FillDirection**
  Specifies the direction from which the graphic display is filled.
- **FillLevel**
  Specifies the fill of the graphic display in percent.
- **Graphic**
  Specifies the graphic.
- **GraphicStretchMode**
  Specifies the type of scaling of the graphic in the screen.
- **Height**
  Specifies the height.
- **Layer**
  Returns the layer of the screen in which the graphic display is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the graphic display.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the graphic display is operable.
- **Padding**
  Specifies the distance of the graphic from the frame of the graphic display.
- **Parent**
  Returns the higher-level screen object.

- **RequireExplicitUnlock**
  Returns whether the graphic display is only operable while the associated button is being pressed.
- **RotationAngle**
  Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the graphic display rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ShowFillLevel**
  Specifies whether the fill level is displayed.
- **ShowFocusVisual**
  Specifies whether the graphic display is highlighted when in focus.
- **StyleItemClass**
  Returns the style which is applied to the graphic display.
- **TabIndex**
  Returns the position of the graphic display in the tab sequence.
- **ToolTipText**
  Specifies the tooltip text.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the graphic display is visible.
- **Width**
  Specifies the width.

Methods

The "GraphicView" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the graphic display.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "GraphicView" object has the following events:

- **OnActivated()**
  Occurs when a graphic display receives focus.
- **OnContextTapped()**
  Occurs when a graphic display is right-clicked or long-touched.

- **OnDeactivated()**
  Occurs when a graphic display loses focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the graphic display is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the graphic display is in focus.
- **OnTapped()**
  Occurs when a graphic display is left-clicked or short-touched.

GraphicView.AlternateBackColor

Description

The "AlternateBackColor" specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
GraphicView.AlternateBackColor
```

See also

GraphicView (Page 3374)

GraphicView.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
GraphicView.Authorization
```

See also

GraphicView (Page 3374)

GraphicView.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
GraphicView.BackColor
```

See also

GraphicView (Page 3374)

GraphicView.BackFillPattern

Description

The "BackFillPattern" property specifies the pattern of the background or the fill.

Type

Int32, HmiFillPattern

Specifies the filling:

- Solid (0): Solid
- Transparent (65536): Transparent
- Horizontal (131072): Horizontal
- Vertical (131073): Vertical
- ForwardDiagonal (131074): Forward diagonal stripe

- BackwardDiagonal (131075): Backward diagonal stripe
- Cross (131076): Cross
- DiagonalCross (131077): Diagonal cross
- GradientHorizontal (1048576): Horizontal gradient
- GradientVertical (1048577): Vertical gradient
- GradientForwardDiagonal (1048578): Gradient forward diagonal
- GradientBackwardDiagonal (1048579): Gradient backward diagonal
- GradientHorizontalTricolor (1048832): Horizontal tricolor gradient
- GradientVerticalTricolor (1048833): Vertical tricolor gradient
- GradientForwardDiagonalTricolor (1048834): Forward diagonal tricolor gradient
- GradientBackwardDiagonalTricolor (1048835): Backward diagonal tricolor gradient

Access

Read-write

Syntax

```
GraphicView.BackFillPattern
```

See also

GraphicView (Page 3374)

GraphicView.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the graphic display.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
GraphicView.CurrentQuality
```

See also

GraphicView (Page 3374)

GraphicView.Enabled

Description

The "Enabled" property specifies whether the graphic display can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
GraphicView.Enabled
```

See also

GraphicView (Page 3374)

GraphicView.FillDirection

Description

The "FillDirection" property specifies the direction from which the graphic display is filled.

Type

Int32, HmiFillDirection

Specifies the filling direction:

- BottomToTop (0): From bottom to top
- TopToBottom (1): From top to bottom

- LeftToRight (2): From left to right
- RightToLeft (3): From right to left

Access

Read-write

Syntax

```
GraphicView.FillDirection
```

See also

GraphicView (Page 3374)

GraphicView.FillLevel

Description

The "FillLevel" property specifies the fill level of the graphic display in percent.

Type

UInt8

Access

Read-write

Syntax

```
GraphicView.FillLevel
```

See also

GraphicView (Page 3374)

GraphicView.Graphic

Description

The "Graphic" property specifies the graphic.

Type

String

Access

Read-write

Syntax

```
GraphicView.Graphic
```

See also

GraphicView (Page 3374)

GraphicView.GraphicStretchMode

Description

The "GraphicStretchMode" property specifies the type of scaling of the graphic in the screen.

Type

Int32, HmiGraphicStretchMode

Specifies the graphic scaling:

- None (0): The graphic is shown in its original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
GraphicView.GraphicStretchMode
```

See also

GraphicView (Page 3374)

GraphicView.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
GraphicView.Height
```

See also

GraphicView (Page 3374)

GraphicView.Layer

Description

The "Layer" property returns the layer of the screen in which the graphic display is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
GraphicView.Layer
```

See also

GraphicView (Page 3374)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

GraphicView.Layer (Page 3383)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

GraphicView.Layer (Page 3383)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

GraphicView.Layer (Page 3383)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

GraphicView.Layer (Page 3383)

GraphicView.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
GraphicView.Left
```

See also

GraphicView (Page 3374)

GraphicView.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
GraphicView.Margin
```

See also

GraphicView (Page 3374)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

GraphicView.Margin (Page 3386)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

GraphicView.Margin (Page 3386)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

GraphicView.Margin (Page 3386)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

GraphicView.Margin (Page 3386)

GraphicView.Name

Description

The "Name" property returns the name of the graphic display.

Type

String

Access

Read-only

Syntax

```
GraphicView.Name
```

See also

GraphicView (Page 3374)

GraphicView.Opacity

Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

Type

Float

Access

Read-write

Syntax

```
GraphicView.Opacity
```

See also

GraphicView (Page 3374)

GraphicView.Operability

Description

The "Operability" property returns whether the graphic display is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
GraphicView.Operability
```

See also

GraphicView (Page 3374)

GraphicView.Padding

Description

The "Padding" property specifies the distance of the graphic from the frame of the graphic display.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
GraphicView.Padding
```

See also

GraphicView (Page 3374)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

GraphicView.Padding (Page 3390)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

GraphicView.Padding (Page 3390)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

GraphicView.Padding (Page 3390)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

GraphicView.Padding (Page 3390)

GraphicView.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
GraphicView.Parent
```

See also

GraphicView (Page 3374)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

GraphicView.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the graphic display can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
GraphicView.RequireExplicitUnlock
```

See also

GraphicView (Page 3374)

GraphicView.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
GraphicView.RotationAngle
```

See also

GraphicView.RotationCenterX (Page 3395)

GraphicView.RotationCenterY (Page 3396)

GraphicView.RotationCenterPlacement (Page 3394)

GraphicView (Page 3374)

GraphicView.RotationCenterPlacement

Description

The "RotationCenterPlacement" property specifies the reference point around which the graphic display rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
GraphicView.RotationCenterPlacement
```

See also

GraphicView.RotationAngle (Page 3394)

GraphicView.RotationCenterX (Page 3395)

GraphicView.RotationCenterY (Page 3396)

GraphicView (Page 3374)

GraphicView.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
GraphicView.RotationCenterX
```

See also

GraphicView.RotationAngle (Page 3394)

GraphicView.RotationCenterY (Page 3396)

GraphicView.RotationCenterPlacement (Page 3394)

GraphicView (Page 3374)

GraphicView.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
GraphicView.RotationCenterY
```

See also

GraphicView.RotationAngle (Page 3394)

GraphicView.RotationCenterX (Page 3395)

GraphicView.RotationCenterPlacement (Page 3394)

GraphicView (Page 3374)

GraphicView.ShowFillLevel

Description

The "ShowFillLevel" property specifies whether the fill level is displayed.

Type

Bool

Access

Read-write

Syntax

```
GraphicView.ShowFillLevel
```

See also

GraphicView (Page 3374)

GraphicView.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the graphic display is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
GraphicView.ShowFocusVisual
```

See also

GraphicView (Page 3374)

GraphicView.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the graphic display.

Type

String

Access

Read-only

Syntax

```
GraphicView.StyleItemClass
```

See also

GraphicView (Page 3374)

GraphicView.TabIndex

Description

The "TabIndex" property returns the position of the graphic display in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
GraphicView.TabIndex
```

See also

GraphicView (Page 3374)

GraphicView.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
GraphicView.ToolTipText
```

See also

GraphicView (Page 3374)

GraphicView.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
GraphicView.Top
```

See also

GraphicView (Page 3374)

GraphicView.Visible

Description

The "Visible" property specifies whether the graphic display is visible.

Type

Bool

Access

Read-write

Syntax

```
GraphicView.Visible
```

See also

GraphicView (Page 3374)

GraphicView.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
GraphicView.Width
```

See also

GraphicView (Page 3374)

GraphicView.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the graphic display.

Syntax

```
GraphicView.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

GraphicView (Page 3374)

GraphicView.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
GraphicView.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

GraphicView (Page 3374)

GraphicView_OnActivated()

Description

The "OnActivated" event occurs when a graphic display receives focus:

- A graphic display is selected via the configured tab sequence.
- A graphic display that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
GraphicView_OnActivated(item)
```

Context

item

Type: Object

Graphic display at which the event occurs.

See also

GraphicView (Page 3374)

GraphicView_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A graphic display is right-clicked.
- A graphic display is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
GraphicView_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Graphic display at which the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key

- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

GraphicView (Page 3374)

GraphicView_OnDeactivated()

Description

The "OnDeactivated" event occurs when the graphic display loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
GraphicView_OnDeactivated(item)
```

Context

`item`

Type: Object

Graphic display at which the event occurs.

See also

GraphicView (Page 3374)

GraphicView_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the graphic display is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
GraphicView_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

Graphic display at which the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

GraphicView (Page 3374)

GraphicView_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the graphic display is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
GraphicView_OnKeyUp(item, keyCode, modifiers)
```

Context

`item`

Type:

Graphic display at which the event occurs.

`keyCode`

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

`modifiers`

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

GraphicView (Page 3374)

GraphicView_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A graphic display is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a graphic display has the focus.
- A graphic display is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
GraphicView_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Graphic display at which the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

GraphicView (Page 3374)

Group

Description

The "Group" object represents grouped objects in runtime.

Object type

HmiGroup

Properties

The "Group" object has the following properties:

- **ContainedItems**
  Returns an array with the references of the contained objects.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the group.
- **Enabled**
  Specifies whether the group can be operated in runtime.
- **Height**
  Specifies the height.
- **Layer**
  Returns the screen layer in which the group is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the group.
- **Parent**
  Returns the higher-level screen object.
- **Properties**
  Allows access to the dynamic properties of the objects of the group.
- **RotationAngle**
  Specifies the rotation angle in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the group rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**
  Specifies whether the group is highlighted when in focus.
- **StyleItemClass**
  Returns the style which is applied to the group.
- **TabIndex**
  Returns the position of the group in the tab sequence.
- **Top**
  Specifies the value of the Y coordinate.

- **Visible**
  Specifies whether the group is visible.
- **Width**
  Specifies the width.

Methods

The "Group" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the group.
- **PropertyFlashing()**
  Configures flashing of a property.

Group.ContainedItems

Description

The "ContainedItems" property returns an array with the references of the grouped objects.

Type

ArrayOfSomRef

Access

Read-only

Syntax

```
Group.ContainedItems
```

See also

Group (Page 3408)

Group.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the group.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
Group.CurrentQuality
```

See also

Group (Page 3408)

Group.Enabled

Description

The "Enabled" property specifies whether the group can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
Group.Enabled
```

See also

Group (Page 3408)

Group.Height

Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Group.Height
```

See also

Group (Page 3408)

Group.Layer

Description

The "Layer" property returns the screen layer in which the group is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
Group.Layer
```

See also

Group (Page 3408)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

Group.Layer (Page 3412)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

Group.Layer (Page 3412)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

Group.Layer (Page 3412)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

Group.Layer (Page 3412)

Group.Left

Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
Group.Left
```

See also

Group (Page 3408)

Group.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
Group.Margin
```

See also

Group (Page 3408)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

Group.Margin (Page 3415)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

Group.Margin (Page 3415)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

Group.Margin (Page 3415)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

Group.Margin (Page 3415)

Group.Name

Description

The "Name" property returns the name of the group.

Type

String

Access

Read-only

Syntax

```
Group.Name
```

See also

Group (Page 3408)

Group.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
Group.Parent
```

See also

Group (Page 3408)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

Group.Properties

Description

The "Properties" property allows access to the dynamic properties of the objects of the group.

Type

Object, HmiDynamicPropertyPart

Access

Read-write

Syntax

```
Group.Properties
```

See also

Group (Page 3408)

Group.RotationAngle

Description

The "RotationAngle" property specifies the rotation angle in degrees.

Type

Int16

Access

Read-write

Syntax

```
Group.RotationAngle
```

See also

Group (Page 3408)

Group.RotationCenterPlacement (Page 3420)

Group.RotationCenterX (Page 3421)

Group.RotationCenterY (Page 3421)

Group.RotationCenterPlacement

Description

The "RotationCenterPlacement" property specifies the reference point around which the group rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in the DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
Group.RotationCenterPlacement
```

See also

Group (Page 3408)

Group.RotationAngle (Page 3419)

Group.RotationCenterX (Page 3421)

Group.RotationCenterY (Page 3421)

Group.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
Group.RotationCenterX
```

See also

Group (Page 3408)

Group.RotationAngle (Page 3419)

Group.RotationCenterPlacement (Page 3420)

Group.RotationCenterY (Page 3421)

Group.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
Group.RotationCenterY
```

See also

Group (Page 3408)
Group.RotationAngle (Page 3419)
Group.RotationCenterPlacement (Page 3420)
Group.RotationCenterX (Page 3421)

Group.ShowFocusVisual

Description

The property "ShowFocusVisual" specifies whether the group is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
Group.ShowFocusVisual
```

See also

Group (Page 3408)

Group.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the group.

Type

String

Access

Read-only

Syntax

```
Group.StyleItemClass
```

See also

Group (Page 3408)

Group.TabIndex

Description

The "TabIndex" property returns the position of the group in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
Group.TabIndex
```

See also

Group (Page 3408)

Group.Top

Description

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
Group.Top
```

See also

Group (Page 3408)

Group.Visible

Description

The "Visible" property specifies whether the group is visible.

Type

Bool

Access

Read-write

Syntax

```
Group.Visible
```

See also

Group (Page 3408)

Group.Width

Description

The "Width" property specifies the width in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Group.Width
```

See also

Group (Page 3408)

Group.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the group.

Syntax

```
Group.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

Group (Page 3408)

Group.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
Group.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

`propertyName`

Type: String

Name of the property for which flashing is configured.

`enable`

Type: Bool

Specifies that flashing is activated.

`value`

Optional, type: Variant

Value of the property for which flashing is configured.

`alternateValue`

Optional, type: Variant

Specifies the second value for flashing.

`rate`

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

Group (Page 3408)

IOField

Description

The "IOField" object represents an I/O field for the entry and display of process values in runtime.

Object type

HmiIOField

Properties

The "IOField" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the border color.
- **BorderWidth**
  Specifies the border thickness.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the I/O field.
- **Enabled**
  Specifies whether the I/O field can be operated in runtime.
- **Font**
  Specifies the font of the text.
- **ForeColor**
  Specifies the font color of the text.
- **Height**
  Specifies the height.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **InputBehavior**
  Specifies the input behavior.
- **IOFieldType**
  Specifies the mode of the I/O field.
- **Layer**
  Returns the layer of the screen in which the I/O field is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **MeasurementUnit**
  Returns the displayed unit.

- **MeasurementUnitType**
  Specifies the display format of the unit.
- **Name**
  Returns the name of the I/O field.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the I/O field is operable.
- **OutputFormat**
  Specifies the format for displaying the process values.
- **Padding**
  Specifies the distance of the content from the border of the I/O field.
- **Parent**
  Returns the higher-level screen object.
- **ProcessValue**
  Specifies the process value.
- **RenderingTemplate**
  Returns the name of the template from which the I/O field was created.
- **RequireExplicitUnlock**
  Returns whether the I/O field is only operable while the associated button is being pressed.
- **RotationAngle**
  Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the I/O field rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**
  Specifies whether the I/O field is highlighted when in focus.
- **StyleItemClass**
  Returns the style which is applied to the I/O field.
- **TabIndex**
  Returns the position of the I/O field in the tab sequence.
- **TextTrimming**
  Specifies the type of text trimming if space is not sufficient.
- **Thresholds**
  Returns the list of all limit values of the I/O field.
- **ToolTipText**
  Specifies the tooltip text.
- **Top**
  Specifies the value of the Y coordinate.

- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the I/O field is visible.
- **VisualizeQuality**
  Specifies whether the connection quality of the process value is displayed.
- **Width**
  Specifies the width.

Methods

The "IOField" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the I/O field.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "IOField" object has the following events:

- **OnActivated()**
  Occurs when an I/O field receives focus.
- **OnContextTapped()**
  Occurs when an I/O field is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when an I/O field loses focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the I/O field is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the I/O field is in focus.
- **OnTapped()**
  Occurs when an I/O field is left-clicked or short-touched.

IOField.AlternateBackColor

Description

The "AlternateBackColor" specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
IOField.AlternateBackColor
```

See also

IOField (Page 3426)

IOField.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
IOField.AlternateBorderColor
```

See also

IOField (Page 3426)

IOField.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
IOField.Authorization
```

See also

IOField (Page 3426)

IOField.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
IOField.BackColor
```

See also

IOField (Page 3426)

IOField.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
IOField.BorderColor
```

See also

IOField (Page 3426)

IOField.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
IOField.BorderWidth
```

See also

IOField (Page 3426)

IOField.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the I/O field.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.

- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
IOField.CurrentQuality
```

See also

IOField (Page 3426)

IOField.Enabled

Description

The "Enabled" property specifies whether the I/O field can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
IOField.Enabled
```

See also

IOField (Page 3426)

IOField.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
IOField.Font
```

See also

IOField (Page 3426)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

IOField.Font (Page 3433)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

IOField.Font (Page 3433)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

IOField.Font (Page 3433)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

IOField.Font (Page 3433)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

IOField.Font (Page 3433)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

IOField.Font (Page 3433)

IOField.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
IOField.ForeColor
```

See also

IOField (Page 3426)

IOField.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
IOField.Height
```

See also

IOField (Page 3426)

IOField.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the text alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched. Can only be used with layout containers, Fallback behaves like Center

Access

Read-write

Syntax

```
IOField.HorizontalTextAlignment
```

See also

IOField (Page 3426)

IOField.InputBehavior

Description

The "InputBehavior" property specifies the input behavior.

Type

Object, HmiInputBehaviorPart

Access

Read-write

Syntax

```
IOField.InputBehavior
```

See also

IOField (Page 3426)

InputBehavior.AcceptOnDeactivated

Description

The "AcceptOnDeactivated" property specifies whether the process value is written when the object loses the input focus.

Type

Bool

Access

Read-write

Syntax

```
InputBehavior.AcceptOnDeactivated
```

See also

IOField.InputBehavior (Page 3439)

InputBehavior.ClearOnActivate

Description

The "ClearOnActivate" property specifies whether the last value is deleted during input focus.

Type

Bool

Access

Read-write

Syntax

```
InputBehavior.ClearOnActivate
```

See also

IOField.InputBehavior (Page 3439)

InputBehavior.HiddenInput

Description

The "HiddenInput" property specifies whether the input value or an * is shown for each character during the input.

Type

Bool

Access

Read-write

Syntax

```
InputBehavior.HiddenInput
```

See also

IOField.InputBehavior (Page 3439)

InputBehavior.InputOnActivate

Description

The "InputOnActivate" property determines whether the input field accepts input when it receives focus.

Type

Bool

Access

Read-write

Syntax

```
InputBehavior.InputOnActivate
```

See also

IOField.InputBehavior (Page 3439)

IOField.IOFieldType

Description

The "IOFieldType" property specifies the mode of the I/O field.

Type

Int32, HmiIOFieldType

Specifies the type:

- Output (0): Output only
- InputOutput (2): Input and output

Access

Read-write

Syntax

```
IOField.IOFieldType
```

See also

IOField (Page 3426)

IOField.Layer

Description

The "Layer" property returns the layer of the screen in which the I/O field is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
IOField.Layer
```

See also

IOField (Page 3426)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

IOField.Layer (Page 3442)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

IOField.Layer (Page 3442)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

IOField.Layer (Page 3442)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

IOField.Layer (Page 3442)

IOField.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
IOField.Left
```

See also

IOField (Page 3426)

IOField.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
IOField.Margin
```

See also

IOField (Page 3426)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

IOField.Margin (Page 3445)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

IOField.Margin (Page 3445)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

IOField.Margin (Page 3445)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

IOField.Margin (Page 3445)

IOField.MeasurementUnit

Description

The "MeasurementUnit" property returns the displayed unit.

Type

String

Access

Read-only

Syntax

```
IOField.MeasurementUnit
```

See also

IOField (Page 3426)

IOField.MeasurementUnitType

Description

The "MeasurementUnitType" property specifies the display format of the unit.

Type

Int32, HmiMeasurementUnit

Specifies the display format:

- None (0): No unit
- Name (1): Unit name, for example "kilogram"
- Symbol (2): Unit, for example "kg"

Access

Read-write

Syntax

```
IOField.MeasurementUnitType
```

See also

IOField (Page 3426)

IOField.Name

Description

The "Name" property returns the name of the I/O field.

Type

String

Access

Read-only

Syntax

```
IOField.Name
```

See also

IOField (Page 3426)

IOField.Opacity

Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

Type

Float

Access

Read-write

Syntax

```
IOField.Opacity
```

See also

IOField (Page 3426)

IOField.Operability

Description

The "Operability" property returns whether the I/O field is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
IOField.Operability
```

See also

IOField (Page 3426)

IOField.OutputFormat

Description

The "OutputFormat" property specifies the format for displaying the process values, e.g. "{0000}" for a 4-digit integer with leading zeros.

Type

String

Access

Read-write

Syntax

```
IOField.OutputFormat
```

See also

IOField (Page 3426)

IOField.Padding

Description

The "Padding" property specifies the distance of the content from the border of the I/O field.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
IOField.Padding
```

See also

IOField (Page 3426)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

IOField.Padding (Page 3450)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

IOField.Padding (Page 3450)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

IOField.Padding (Page 3450)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

IOField.Padding (Page 3450)

IOField.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
IOField.Parent
```

See also

IOField (Page 3426)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

IOField.ProcessValue

Description

The "ProcessValue" property specifies the process value.

Type

Variant

Access

Read-write

Syntax

```
IOField.ProcessValue
```

See also

IOField (Page 3426)

IOField.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the I/O field was created.

Type

String

Access

Read-only

Syntax

```
IOField.RenderingTemplate
```

See also

IOField (Page 3426)

IOField.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the I/O field can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
IOField.RequireExplicitUnlock
```

See also

IOField (Page 3426)

IOField.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
IOField.RotationAngle
```

See also

IOField (Page 3426)

IOField.RotationCenterX (Page 3456)

IOField.RotationCenterY (Page 3457)

IOField.RotationCenterPlacement (Page 3456)

IOField.RotationCenterPlacement

Description

The "RotationCenterPlacement" property sets the reference point around which the I/O field rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
IOField.RotationCenterPlacement
```

See also

IOField (Page 3426)

IOField.RotationAngle (Page 3455)

IOField.RotationCenterX (Page 3456)

IOField.RotationCenterY (Page 3457)

IOField.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
IOField.RotationCenterX
```

See also

IOField (Page 3426)

IOField.RotationAngle (Page 3455)

IOField.RotationCenterY (Page 3457)

IOField.RotationCenterPlacement (Page 3456)

IOField.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
IOField.RotationCenterY
```

See also

IOField (Page 3426)

IOField.RotationAngle (Page 3455)

IOField.RotationCenterX (Page 3456)

IOField.RotationCenterPlacement (Page 3456)

IOField.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the I/O field is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
IOField.ShowFocusVisual
```

See also

IOField (Page 3426)

IOField.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the I/O field.

Type

String

Access

Read-only

Syntax

```
IOField.StyleItemClass
```

See also

IOField (Page 3426)

IOField.TabIndex

Description

The "TabIndex" property returns the position of the I/O field in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
IOField.TabIndex
```

See also

IOField (Page 3426)

IOField.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
IOField.TextTrimming
```

See also

IOField (Page 3426)

IOField.Thresholds

Description

The "Thresholds" property returns the list of all limit values ("Threshold" objects) of the I/O field.

Type

Object, HmiThresholdCollection (Page 3460)

Access

Read-only

Syntax

```
IOField.Thresholds
```

See also

IOField (Page 3426)

HmiThresholdCollection (Page 3460)

HmiThresholdCollection

Description

The "HmiThresholdCollection" object is a list of all limit values ("Threshold" objects).

Use

The "HmiThresholdCollection" object is a list and can be counted and enumerated. You can access the "HmiThresholdCollection" list using the index or the tag name.

Object type

HmiThresholdCollection

Properties

The "HmiThresholdCollection" object has the following properties:

- **Count**
  Returns the number of limit values of the "HmiThresholdCollection" list.

Methods

The "HmiThresholdCollection" object has the following methods:

- **Item()**
  Returns a limit value of the "HmiThresholdCollection" list.

See also

IOField.Thresholds (Page 3460)

HmiThresholdCollection.Count

Description

The "Count" property returns the number of limit values in the "HmiThresholdCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiThresholdCollection.Count
```

See also

HmiThresholdCollection (Page 3460)

HmiThresholdCollection.Item()

Description

The "Item" method returns a limit value of the "HmiThresholdCollection" list.

Syntax

```
HmiThresholdCollection[.Item](HmiThresholdName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiThresholdCollection" object.

Parameters

`HmiThresholdName`

Type: String

Name of the limit value

Return value

Object, HmiThresholdPart (Page 3462)

See also

HmiThresholdCollection (Page 3460)

Threshold (Page 3462)

Threshold

Description

The "Threshold" object represents a limit value.

Object type

HmiThresholdPart

Properties

The "Threshold" object has the following properties:

- **Color**
  Specifies the color of the limit value.
- **DisplayName**
  Specifies the display name of the limit value.
- **Name**
  Specifies the name of the limit value.
- **ThresholdMode**
  Specifies the type of limit value.
- **Value**
  Returns the limit value.

Methods

--

See also

HmiThresholdCollection (Page 3460)

Threshold.Color

Description

The "Color" property specifies the color of the limit value.

Type

UInt32

Access

Read-write

Syntax

```
Threshold.Color
```

See also

Threshold (Page 3462)

Threshold.DisplayName

Description

The "DisplayName" property specifies the display name of the limit value.

Type

String

Access

Read-write

Syntax

```
Threshold.DisplayName
```

See also

Threshold (Page 3462)

Threshold.Name

Description

The "Name" property specifies the name of the limit value.

Type

String

Access

Read-write

Syntax

```
Threshold.Name
```

See also

Threshold (Page 3462)

Threshold.ThresholdMode

Description

The "ThresholdMode" property specifies the type of limit value.

Type

Int32, HmiThresholdMode

Specifies the threshold value:

- Undefined (0): Undefined
- Upper (1): Upper threshold
- Lower (2): Lower threshold
- Normal (3): Normal threshold
- Minimum (4): Minimum threshold
- Maximum (5): Maximum threshold

Access

Read-write

Syntax

```
Threshold.ThresholdMode
```

See also

Threshold (Page 3462)

Threshold.Value

Description

The "Value" property returns the limit value of the tag.

Type

Float

Access

Read-only

Syntax

```
Threshold.Value
```

See also

Threshold (Page 3462)

IOField.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
IOField.ToolTipText
```

See also

IOField (Page 3426)

IOField.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
IOField.Top
```

See also

IOField (Page 3426)

IOField.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the text alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched. Can only be used with layout containers, Fallback behaves like Center

Access

Read-write

Syntax

```
IOField.VerticalTextAlignment
```

See also

IOField (Page 3426)

IOField.Visible

Description

The "Visible" property specifies whether the I/O field is visible.

Type

Bool

Access

Read-write

Syntax

```
IOField.Visible
```

See also

IOField (Page 3426)

IOField.VisualizeQuality

Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

Type

Bool

Access

Read-write

Syntax

```
IOField.VisualizeQuality
```

See also

IOField (Page 3426)

IOField.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
IOField.Width
```

See also

IOField (Page 3426)

IOField.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the I/O field.

Syntax

```
IOField.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

IOField (Page 3426)

IOField.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
IOField.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

IOField (Page 3426)

IOField_OnActivated()

Description

The "OnActivated" event occurs when an I/O field receives focus:

- An I/O field is selected via the configured tab sequence.
- An I/O field that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
IOField_OnActivated(item)
```

Context

item

Type: Object

I/O field where the event occurs.

See also

IOField (Page 3426)

IOField_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- An I/O field is right-clicked.
- An I/O field is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
IOField_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

I/O field where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key

- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

IOField (Page 3426)

IOField_OnDeactivated()

Description

The "OnDeactivated" event occurs when the I/O field loses focus when because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
IOField_OnDeactivated(item)
```

Context

item

Type: Object

I/O field where the event occurs.

See also

IOField (Page 3426)

IOField_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the I/O field is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
IOField_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

I/O field where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

IOField (Page 3426)

IOField_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the I/O field is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
IOField_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

I/O field where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

IOField (Page 3426)

IOField_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- An I/O field is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a I/O field has the focus.
- An I/O field is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
IOField_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

I/O field where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

IOField (Page 3426)

Label

Description

The "Label" object represents an editable text box.

Object type

HmiLabel

Properties

The "Label" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the border color.
- **BorderWidth**
  Specifies the border width.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the editable text box.
- **Enabled**
  Specifies whether the editable text box can be operated in runtime.
- **Font**
  Specifies the font of the text.
- **ForeColor**
  Specifies the font color of the text.
- **Height**
  Specifies the height in the (Device Independent Unit).
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of a text.
- **Layer**
  Returns the screen layer in which the editable text box is located.
- **Left**
  Specifies the value of the X coordinate in the (Device Independent Unit).
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the editable text box.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the editable text box is operable.

- **Padding**
  Specifies the distance of the content from the border of the editable text box.
- **Parent**
  Returns the higher-level screen object (Parent container).
- **RenderingTemplate**
  Returns the name of the template from which the editable text box was created.
- **RequireExplicitUnlock**
  Returns whether the editable text box can only be operated while the associated button is being pressed.
- **RotationAngle**
  Specifies the rotation angle of the editable text box in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the editable text box rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**
  Specifies whether the editable text box is highlighted when in focus.
- **StyleItemClass**
  Specifies the style which is applied to the editable text box.
- **TabIndex**
  Returns the position of the editable text box in the tab sequence.
- **Text**
  Specifies the label.
- **TextTrimming**
  Specifies the type of text trimming if space is insufficient.
- **TextWrapping**
  Specifies how text is wrapped if space is insufficient.
- **ToolTipText**
  Specifies the tooltip text.
- **Top**
  Specifies the value of the Y coordinate.
- **VerticalTextAlignment**
  Specifies the vertical alignment of a text.
- **Visible**
  Specifies whether the editable text box is visible.
- **VisualizeQuality**
  Specifies whether the connection quality of the process value is displayed.
- **Width**
  Specifies the width in (Device Independent Unit).

Methods

The "Label" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the editable text box.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "Label" object has the following events:

- **OnActivated()**
  Occurs when the editable text box receives focus.
- **OnContextTapped()**
  Occurs when the editable text box is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when the editable text box loses focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the text box is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the text box is in focus.
- **OnTapped()**
  Occurs when the editable text box is left-clicked or short-touched.

Label.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
Label.AlternateBackColor
```

See also

Label (Page 3476)

Label.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
Label.AlternateBorderColor
```

See also

Label (Page 3476)

Label.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
Label.Authorization
```

See also

Label (Page 3476)

Label.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
Label.BackColor
```

See also

Label (Page 3476)

Label.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
Label.BorderColor
```

See also

Label (Page 3476)

Label.BorderWidth

Description

The "BorderWidth" property specifies the border width.

Type

UInt32

Access

Read-write

Syntax

```
Label.BorderWidth
```

See also

Label (Page 3476)

Label.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the editable text box.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
Label.CurrentQuality
```

See also

Label (Page 3476)

Label.Enabled

Description

The "Enabled" property specifies whether the editable text box can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
Label.Enabled
```

See also

Label (Page 3476)

Label.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Label.Font
```

See also

Label (Page 3476)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Label.Font (Page 3483)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Label.Font (Page 3483)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Label.Font (Page 3483)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Label.Font (Page 3483)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Label.Font (Page 3483)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal

- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Label.Font (Page 3483)

Label.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Label.ForeColor
```

See also

Label (Page 3476)

Label.Height

Description

The "Height" property specifies the height in the (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Label.Height
```

See also

Label (Page 3476)

Label.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of a text.

Type

Int32, HmiHorizontalAlignment

Specifies the text alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Label.HorizontalTextAlignment
```

See also

Label (Page 3476)

Label.Layer

Description

The "Layer" property returns the screen layer in which the editable text box is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
Label.Layer
```

See also

Label (Page 3476)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

Label.Layer (Page 3489)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

Label.Layer (Page 3489)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

Label.Layer (Page 3489)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

Label.Layer (Page 3489)

Label.Left

Description

The "Left" property sets the value of the X coordinate in the (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
Label.Left
```

See also

Label (Page 3476)

Label.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
Label.Margin
```

See also

Label (Page 3476)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

Label.Margin (Page 3492)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

Label.Margin (Page 3492)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

Label.Margin (Page 3492)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

Label.Margin (Page 3492)

Label.Name

Description

The "Name" property returns the name of the editable text box.

Type

String

Access

Read-only

Syntax

```
Label.Name
```

See also

Label (Page 3476)

Label.Opacity

Description

The "Opacity" property specifies the opacity. The "0" value indicates completely transparency.

Type

Float

Access

Read-write

Syntax

```
Label.Opacity
```

See also

Label (Page 3476)

Label.Operability

Description

The "Operability" property returns whether the editable text box is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
Label.Operability
```

See also

Label (Page 3476)

Label.Padding

Description

The "Padding" property specifies the distance of the content from the border of the editable text box.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
Label.Padding
```

See also

Label (Page 3476)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

Label.Padding (Page 3496)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

Label.Padding (Page 3496)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

Label.Padding (Page 3496)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

Label.Padding (Page 3496)

Label.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
Label.Parent
```

See also

Label (Page 3476)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

Label.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the editable text box was created.

Type

String

Access

Read-only

Syntax

```
Label.RenderingTemplate
```

See also

Label (Page 3476)

Label.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the editable text box can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
Label.RequireExplicitUnlock
```

See also

Label (Page 3476)

Label.RotationAngle

Description

The "RotationAngle" property specifies the rotation angle of the editable text box in degrees.

Type

Int16

Access

Read-write

Syntax

```
Label.RotationAngle
```

See also

Label (Page 3476)

Label.RotationCenterPlacement (Page 3500)

Label.RotationCenterX (Page 3501)

Label.RotationCenterY (Page 3502)

Label.RotationCenterPlacement

Description

The "RotationCenterPlacement" property sets the reference point around which the editable text box rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in the DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
Label.RotationCenterPlacement
```

See also

Label (Page 3476)

Label.RotationAngle (Page 3500)

Label.RotationCenterX (Page 3501)

Label.RotationCenterY (Page 3502)

Label.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point.

Type

Float

Access

Read-write

Syntax

```
Label.RotationCenterX
```

See also

Label (Page 3476)

Label.RotationAngle (Page 3500)

Label.RotationCenterPlacement (Page 3500)

Label.RotationCenterY (Page 3502)

Label.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point.

Type

Float

Access

Read-write

Syntax

```
Label.RotationCenterY
```

See also

Label (Page 3476)

Label.RotationAngle (Page 3500)

Label.RotationCenterPlacement (Page 3500)

Label.RotationCenterX (Page 3501)

Label.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the editable text box is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
Label.ShowFocusVisual
```

See also

Label (Page 3476)

Label.StyleItemClass

Description

The "StyleItemClass" property specifies the style which is applied to the editable text box.

Type

String

Access

Read-only

Syntax

```
Label.StyleItemClass
```

See also

Label (Page 3476)

Label.TabIndex

Description

The "TabIndex" property returns the position of the editable text box in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
Label.TabIndex
```

See also

Label (Page 3476)

Label.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Label.Text
```

See also

Label (Page 3476)

Label.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Label.TextTrimming
```

See also

Label (Page 3476)

Label.TextWrapping

Description

The "TextWrapping" property specifies how text is wrapped if there is insufficient space.

Type

Int32, HmiTextWrapping

Specifies the text break:

- NoWrap (0): No text break
- WordWrap (1): Text break at the end of the line

Access

Read-write

Syntax

```
Label.TextWrapping
```

See also

Label (Page 3476)

Label.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
Label.ToolTipText
```

See also

Label (Page 3476)

Label.Top

Description

The "Top" property specifies the value of the Y coordinate.

Type

Int32

Access

Read-write

Syntax

```
Label.Top
```

See also

Label (Page 3476)

Label.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of a text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Label.VerticalTextAlignment
```

See also

Label (Page 3476)

Label.Visible

Description

The "Visible" property specifies whether the editable text box is visible.

Type

Bool

Access

Read-write

Syntax

```
Label.Visible
```

See also

Label (Page 3476)

Label.VisualizeQuality

Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

Type

Bool

Access

Read-write

Syntax

```
Label.VisualizeQuality
```

See also

Label (Page 3476)

Label.Width

Description

The "Width" property specifies the width in the (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Label.Width
```

See also

Label (Page 3476)

Label.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the editable text box.

Syntax

```
Label.CheckAuthorization()
```

Parameters

-

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

Label (Page 3476)

Label.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
Label.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

Label (Page 3476)

Label_OnActivated()

Description

The "OnActivated" event occurs when an editable text box receives focus:

- A text box is selected via the configured tab sequence.
- A text box that had no focus is clicked/tapped.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
Label_OnActivated(item)
```

Context

item

Type: Object

Text box where the event occurs.

See also

Label (Page 3476)

Label_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A text box is right-clicked.
- A text box is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
Label_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Text box where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Label (Page 3476)

Label_OnDeactivated()

Description

The "OnDeactivated" event occurs when the text box loses focus because the operator has pressed the <TAB> key or executed another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
Label_OnDeactivated(item)
```

Context

item

Type: Object

Text box where the event occurs.

See also

Label (Page 3476)

Label_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the text box is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Label_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

Text box where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Label (Page 3476)

Label_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the text box is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Label_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Text box where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Label (Page 3476)

Label_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A text box is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a text box has the focus.
- A text box is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
Label_OnTapped(item, x, y, modifiers, trigger)
```

Context

`item`

Type: Object

Text box where the event occurs.

`x`

Type: DInt

X-coordinate of the input point

`y`

Type: DInt

Y-coordinate of the input point

`modifiers`

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Label (Page 3476)

Line

Description

The "Line" object represents a line in runtime.

Object type

HmiLine

Properties

The "Line" object has the following properties:

- **AlternateLineColor**
  Specifies the second line color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **CapType**
  Specifies the shape of the line ends.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the line.
- **DashType**
  Specifies the stroke style of the line.
- **Enabled**
  Specifies whether the line can be operated in runtime.
- **EndType**
  Specifies the type of line end.
- **Height**
  Specifies the height.
- **Layer**
  Returns the layer of the screen in which the line is located.
- **Left**
  Specifies the value of the X coordinate.
- **LineColor**
  Specifies the line color.
- **LineWidth**
  Specifies the line thickness.
- **Margin**
  Specifies the margin.

- **Name**
  Returns the name of the line.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the line is operable.
- **Parent**
  Returns the higher-level screen object.
- **RequireExplicitUnlock**
  Returns whether the line is only operable while the associated button is being pressed.
- **RotationAngle**
  Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the line rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**
  Specifies whether the line is highlighted when in focus.
- **StartType**
  Specifies the type of line start.
- **StyleItemClass**
  Returns the style which is applied to the line.
- **TabIndex**
  Returns the position of the line in the tab sequence.
- **ToolTipText**
  Specifies the tooltip text.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the line is visible.
- **Width**
  Specifies the width.
- **X1**
  Specifies the X coordinate of the starting point of the line.
- **X2**
  Specifies the X coordinate of the end point of the line.
- **Y1**
  Specifies the Y coordinate of the starting point of the line.
- **Y2**
  Specifies the Y coordinate of the end point of the line.

Methods

The "Line" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the line.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "Line" object has the following events:

- **OnActivated()**
  Occurs when a line receives focus.
- **OnContextTapped()**
  Occurs when a line is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when a line loses focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the line is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the line is in focus.
- **OnTapped()**
  Occurs when a line is left-clicked or short-touched.

Line.AlternateLineColor

Description

The "AlternateLineColor" property specifies the second line color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
Line.AlternateLineColor
```

See also

Line (Page 3517)

Line.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
Line.Authorization
```

See also

Line (Page 3517)

Line.CapType

Description

The "CapType" property specifies the shape of the line ends.

Type

Int32, HmiCapType

Specifies the line ends:

- Round (0): Round (line extends beyond the line end point with half the line thickness)
- Square (256): Square (line extends beyond the line end point with half the line thickness)
- Flat (512): Justified (line ends at the line end point)

Access

Read-write

Syntax

```
Line.CapType
```

See also

Line (Page 3517)

Line.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the line.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
Line.CurrentQuality
```

See also

Line (Page 3517)

Line.DashType

Description

The "DashType" property specifies the stroke style of the line.

Type

Int32, HmiDashType

Specifies the stroke style:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted
- DashDot (3): Dash-dotted
- DashDotDot (4): Dash-dot-dot

Access

Read-write

Syntax

```
Line.DashType
```

See also

Line (Page 3517)

Line.Enabled

Description

The "Enabled" property specifies whether the line can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
Line.Enabled
```

See also

Line (Page 3517)

Line.EndType

Description

The "EndType" property specifies the line end type.

Type

Int32, HmiLineEndType

Specifies the line end type:

- Line (0): Line
- EmptyArrow (1): Empty arrow
- Arrow (2): Arrow
- ReversedArrow (3): Reverse arrow
- EmptyCircle (5): Empty circle
- Circle (6): Circle

Access

Read-write

Syntax

```
Line.EndType
```

See also

Line (Page 3517)

Line.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Line.Height
```

See also

Line (Page 3517)

Line.Layer

Description

The "Layer" property returns the layer of the screen in which the line is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
Line.Layer
```

See also

Line (Page 3517)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

Line.Layer (Page 3524)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

Line.Layer (Page 3524)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

Line.Layer (Page 3524)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

Line.Layer (Page 3524)

Line.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
Line.Left
```

See also

Line (Page 3517)

Line.LineColor

Description

The "LineColor" property specifies the line color.

Type

UInt32

Access

Read-write

Syntax

```
Line.LineColor
```

See also

Line (Page 3517)

Line.LineWidth

Description

The "LineWidth" property specifies the line thickness.

Type

UInt8

Access

Read-write

Syntax

```
Line.LineWidth
```

See also

Line (Page 3517)

Line.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
Line.Margin
```

See also

Line (Page 3517)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

Line.Margin (Page 3528)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

Line.Margin (Page 3528)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

Line.Margin (Page 3528)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

Line.Margin (Page 3528)

Line.Name

Description

The "Name" property returns the name of the line.

Type

String

Access

Read-only

Syntax

```
Line.Name
```

See also

Line (Page 3517)

Line.Opacity

Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

Type

Float

Access

Read-write

Syntax

```
Line.Opacity
```

See also

Line (Page 3517)

Line.Operability

Description

The "Operability" property returns whether the line is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
Line.Operability
```

See also

Line (Page 3517)

Line.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
Line.Parent
```

See also

Line (Page 3517)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

Line.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the line can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
Line.RequireExplicitUnlock
```

See also

Line (Page 3517)

Line.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
Line.RotationAngle
```

See also

Line (Page 3517)

Line.RotationCenterPlacement (Page 3533)

Line.RotationCenterX (Page 3534)

Line.RotationCenterY (Page 3535)

Line.RotationCenterPlacement

Description

The "RotationCenterPlacement" property specifies the reference point around which the line rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
Line.RotationCenterPlacement
```

See also

Line (Page 3517)

Line.RotationAngle (Page 3533)

Line.RotationCenterX (Page 3534)

Line.RotationCenterY (Page 3535)

Line.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
Line.RotationCenterX
```

See also

Line (Page 3517)

Line.RotationAngle (Page 3533)

Line.RotationCenterPlacement (Page 3533)

Line.RotationCenterY (Page 3535)

Line.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
Line.RotationCenterY
```

See also

Line (Page 3517)

Line.RotationAngle (Page 3533)

Line.RotationCenterPlacement (Page 3533)

Line.RotationCenterX (Page 3534)

Line.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the line is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
Line.ShowFocusVisual
```

See also

Line (Page 3517)

Line.StartType

Description

The "StartType" property specifies the type of line start.

Type

Int32, HmiLineEndType

Specifies the start of the line:

- Line (0): Line
- EmptyArrow (1): Empty arrow
- Arrow (2): Arrow
- ReversedArrow (3): Reverse arrow
- EmptyCircle (5): Empty circle
- Circle (6): Circle

Access

Read-write

Syntax

```
Line.StartType
```

See also

Line (Page 3517)

Line.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the line.

Type

String

Access

Read-only

Syntax

```
Line.StyleItemClass
```

See also

Line (Page 3517)

Line.TabIndex

Description

The "TabIndex" property returns the position of the line in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
Line.TabIndex
```

See also

Line (Page 3517)

Line.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
Line.ToolTipText
```

See also

Line (Page 3517)

Line.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
Line.Top
```

See also

Line (Page 3517)

Line.Visible

Description

The "Visible" property specifies whether the line is visible.

Type

Bool

Access

Read-write

Syntax

```
Line.Visible
```

See also

Line (Page 3517)

Line.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Line.Width
```

See also

Line (Page 3517)

Line.X1

Description

The "X1" property specifies the X coordinate of the starting point of the line.

Type

Int32

Access

Read-write

Syntax

```
Line.X1
```

See also

Line (Page 3517)
Line.X2 (Page 3540)
Line.Y1 (Page 3541)

Line.X2

Description

The "X2" property specifies the X coordinate of the end point of the line.

Type

Int32

Access

Read-write

Syntax

```
Line.X2
```

See also

Line (Page 3517)
Line.X1 (Page 3540)
Line.Y2 (Page 3541)

Line.Y1

Description

The "Y1" property specifies the Y coordinate of the starting point of the line.

Type

Int32

Access

Read-write

Syntax

```
Line.Y1
```

See also

Line (Page 3517)
Line.X1 (Page 3540)
Line.Y2 (Page 3541)

Line.Y2

Description

The "Y2" property specifies the Y coordinate of the end point of the line.

Type

Int32

Access

Read-write

Syntax

```
Line.Y2
```

See also

Line (Page 3517)

Line.X2 (Page 3540)

Line.Y1 (Page 3541)

Line.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the line.

Syntax

```
Line.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

Line (Page 3517)

Line.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
Line.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

Line (Page 3517)

Line_OnActivated()

Description

The "OnActivated" event occurs when a line receives focus:

- A line is selected via the configured tab sequence.
- A line that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
Line_OnActivated(item)
```

Context

item

Type: Object

Line where the event occurs.

See also

Line (Page 3517)

Line_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A line is right-clicked.
- A line is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
Line_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Line where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Line (Page 3517)

Line_OnDeactivated()

Description

The "OnDeactivated" event occurs when the line loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
Line_OnDeactivated(item)
```

Context

item

Type: Object

Line where the event occurs.

See also

Line (Page 3517)

Line_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the line is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Line_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

Line where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Line (Page 3517)

Line_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while a line is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Line_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Line where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Line (Page 3517)

Line_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A line is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a line has the focus.
- A line is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
Line_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Line where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Line (Page 3517)

ListBox

Description

The "ListBox" object represents a list box in runtime.

Object type

HmiListBox

Properties

The "ListBox" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the border color.
- **BorderWidth**
  Specifies the border thickness.
- **Content**
  Specifies the display options for text and graphics.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the list box.
- **Enabled**
  Specifies whether the list box can be operated in runtime.
- **Font**
  Specifies the font of the text.
- **ForeColor**
  Specifies the font color of the text.
- **Height**
  Specifies the height.
- **Layer**
  Returns the layer of the screen in which the list box is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the list box.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the list box is operable.
- **Padding**
  Specifies the distance of the content from the border of the list box.
- **Parent**
  Returns the higher-level screen object.

- **ProcessValue**
  Specifies the process value.
- **RenderingTemplate**
  Returns the name of the template from which the list box was created.
- **RequireExplicitUnlock**
  Returns whether the list box is only operable while the associated button is being pressed.
- **RotationAngle**
  Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the list box rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **SelectionItemHeight**
  Specifies the height of the list entries.
- **SelectionItems**
  Returns the list of all list entries of the list box.
- **SelectionMode**
  Specifies whether one or more list entries can be selected from the list box.
- **SelectorPosition**
  Specifies the horizontal alignment of the list entries.
- **ShowFocusVisual**
  Specifies whether the list box is highlighted when in focus.
- **StyleItemClass**
  Returns the style which is applied to the list box.
- **TabIndex**
  Returns the position of the list box in the tab sequence.
- **ToolTipText**
  Specifies the tooltip text.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the list box is visible.
- **VisualizeQuality**
  Specifies whether the connection quality of the process value is displayed.
- **Width**
  Specifies the width.

Methods

The "ListBox" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the list box.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "ListBox" object has the following events:

- **OnActivated()**
  Occurs when a list box receives focus.
- **OnContextTapped()**
  Occurs when a list box is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when a list box loses focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the list box is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the list box is in focus.
- **OnTapped()**
  Occurs when a list box is left-clicked or short-touched.

ListBox.AlternateBackColor

Description

The "AlternateBackColor" specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ListBox.AlternateBackColor
```

See also

ListBox (Page 3550)

ListBox.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ListBox.AlternateBorderColor
```

See also

ListBox (Page 3550)

ListBox.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ListBox.Authorization
```

See also

ListBox (Page 3550)

ListBox.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ListBox.BackColor
```

See also

ListBox (Page 3550)

ListBox.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ListBox.BorderColor
```

See also

ListBox (Page 3550)

ListBox.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ListBox.BorderWidth
```

See also

ListBox (Page 3550)

ListBox.Content

Description

The "Content" property specifies the display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ListBox.Content
```

See also

ListBox (Page 3550)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ListBox.Content (Page 3556)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ListBox.Content (Page 3556)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ListBox.Content (Page 3556)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ListBox.Content (Page 3556)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ListBox.Content (Page 3556)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ListBox.Content (Page 3556)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ListBox.Content (Page 3556)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ListBox.Content (Page 3556)

ListBox.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the list box.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
ListBox.CurrentQuality
```

See also

ListBox (Page 3550)

ListBox.Enabled

Description

The "Enabled" property specifies whether the list box can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ListBox.Enabled
```

See also

ListBox (Page 3550)

ListBox.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ListBox.Font
```

See also

ListBox (Page 3550)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ListBox.Font (Page 3563)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ListBox.Font (Page 3563)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ListBox.Font (Page 3563)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ListBox.Font (Page 3563)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ListBox.Font (Page 3563)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ListBox.Font (Page 3563)

ListBox.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ListBox.ForeColor
```

See also

ListBox (Page 3550)

ListBox.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ListBox.Height
```

See also

ListBox (Page 3550)

ListBox.Layer

Description

The "Layer" property returns the layer of the screen in which the list box is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
ListBox.Layer
```

See also

ListBox (Page 3550)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

ListBox.Layer (Page 3567)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

ListBox.Layer (Page 3567)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

ListBox.Layer (Page 3567)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

ListBox.Layer (Page 3567)

ListBox.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
ListBox.Left
```

See also

ListBox (Page 3550)

ListBox.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ListBox.Margin
```

See also

ListBox (Page 3550)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ListBox.Margin (Page 3570)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ListBox.Margin (Page 3570)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ListBox.Margin (Page 3570)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ListBox.Margin (Page 3570)

ListBox.Name

Description

The "Name" property returns the name of the list box.

Type

String

Access

Read-only

Syntax

```
ListBox.Name
```

See also

ListBox (Page 3550)

ListBox.Opacity

Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

Type

Float

Access

Read-write

Syntax

```
ListBox.Opacity
```

See also

ListBox (Page 3550)

ListBox.Operability

Description

The "Operability" property returns whether the list box is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ListBox.Operability
```

See also

ListBox (Page 3550)

ListBox.Padding

Description

The "Padding" property specifies the distance of the content from the border of the list box.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ListBox.Padding
```

See also

ListBox (Page 3550)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ListBox.Padding (Page 3574)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ListBox.Padding (Page 3574)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ListBox.Padding (Page 3574)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ListBox.Padding (Page 3574)

ListBox.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
ListBox.Parent
```

See also

ListBox (Page 3550)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

ListBox.ProcessValue

Description

The "ProcessValue" property specifies the process value.

Type

Variant

Access

Read-write

Syntax

```
ListBox.ProcessValue
```

See also

ListBox (Page 3550)

ListBox.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the list box was created.

Type

String

Access

Read-only

Syntax

```
ListBox.RenderingTemplate
```

See also

ListBox (Page 3550)

ListBox.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the list box can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ListBox.RequireExplicitUnlock
```

See also

ListBox (Page 3550)

ListBox.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
ListBox.RotationAngle
```

See also

ListBox (Page 3550)

ListBox.RotationCenterPlacement (Page 3580)

ListBox.RotationCenterX (Page 3580)

ListBox.RotationCenterY (Page 3581)

ListBox.RotationCenterPlacement

Description

The "RotationCenterPlacement" property sets the reference point around which the list box rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
ListBox.RotationCenterPlacement
```

See also

ListBox (Page 3550)

ListBox.RotationAngle (Page 3579)

ListBox.RotationCenterX (Page 3580)

ListBox.RotationCenterY (Page 3581)

ListBox.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
ListBox.RotationCenterX
```

See also

ListBox (Page 3550)

ListBox.RotationAngle (Page 3579)

ListBox.RotationCenterPlacement (Page 3580)

ListBox.RotationCenterY (Page 3581)

ListBox.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
ListBox.RotationCenterY
```

See also

ListBox (Page 3550)

ListBox.RotationAngle (Page 3579)

ListBox.RotationCenterPlacement (Page 3580)

ListBox.RotationCenterX (Page 3580)

ListBox.SelectionItemHeight

Description

The "SelectionItemHeight" property specifies the height of the list entries. The value "0" indicates that the height is calculated automatically.

Type

UInt16

Access

Read-write

Syntax

```
ListBox.SelectionItemHeight
```

See also

ListBox (Page 3550)

ListBox.SelectionItems

Description

The "SelectionItems" property returns the list of all list entries ("SelectionItem" objects) of the list box.

Type

Object, HmiSelectionItemCollection (Page 3583)

Access

Read-only

Syntax

```
ListBox.SelectionItems
```

See also

ListBox (Page 3550)

HmiSelectionItemCollection (Page 3583)

HmiSelectionItemCollection

Description

The "HmiSelectionItemCollection" object is a list of all entries ("SelectionItem" objects) of a list object.

Use

The "HmiSelectionItemCollection" object is a list and can be counted and enumerated. You can access the "HmiSelectionItemCollection" list using the index or the tag name.

Object type

HmiSelectionItemCollection

Properties

The "HmiSelectionItemCollection" object has the following properties:

- **Count**
  Returns the number of list entries of the "HmiSelectionItemCollection" list.

Methods

The "HmiSelectionItemCollection" object has the following methods:

- **Item()**
  Returns a list entry of the "HmiSelectionItemCollection" list.

See also

ListBox.SelectionItems (Page 3582)

HmiSelectionItemCollection.Count

Description

The "Count" property returns the number of list entries in the "HmiSelectionItemCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiSelectionItemCollection.Count
```

See also

HmiSelectionItemCollection (Page 3583)

HmiSelectionItemCollection.Item()

Description

The "Item" method returns a list entry of the "HmiSelectionItemCollection" list.

Syntax

```
HmiSelectionItemCollection[.Item](HmiSelectionItemName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiSelectionItemCollection" object.

Parameters

`HmiSelectionItemName`

Type: String

Name of the list entry

Return value

Object, HmiSelectionItemPart (Page 3584)

See also

HmiSelectionItemCollection (Page 3583)

SelectionItem (Page 3584)

SelectionItem

Description

The "SelectionItem" object represents a list entry.

Object type

HmiSelectionItemPart

Properties

The "SelectionItem" object has the following properties:

- **Graphic**
  Specifies the graphic of the list entry.
- **IsSelected**
  Specifies whether the list entry is selected.
- **Text**
  Specifies the list entry text.

Methods

--

See also

HmiSelectionItemCollection (Page 3583)

SelectionItem.Graphic

Description

The "Graphic" property specifies the graphic of the list entry.

Type

String

Access

Read-write

Syntax

```
SelectionItem.Graphic
```

See also

SelectionItem (Page 3584)

SelectionItem.IsSelected

Description

The "IsSelected" property specifies whether the list entry is selected.

Type

Bool

Access

Read-write

Syntax

```
SelectionItem.IsSelected
```

See also

SelectionItem (Page 3584)

SelectionItem.Text

Description

The "Text" property specifies the text of the list entry.

Type

String

Access

Read-write

Syntax

```
SelectionItem.Text
```

See also

SelectionItem (Page 3584)

ListBox.SelectionMode

Description

The "SelectionMode" property specifies whether one or more list entries can be selected in a list box.

Type

Int32, HmiSelectionMode

Specifies the selection type:

- NonExclusive (0): Selection of multiple list entries possible
- Exclusive (1): Selection of only one list entry possible

Access

Read-write

Syntax

```
ListBox.SelectionMode
```

See also

ListBox (Page 3550)

ListBox.SelectorPosition

Description

The "SelectorPosition" property specifies the horizontal alignment of the list entries.

Type

Int32, HmiHorizontalAlignment

Specifies the text alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched. Can only be used with layout containers, Fallback behaves like Center

Access

Read-write

Syntax

```
ListBox.SelectorPosition
```

See also

ListBox (Page 3550)

ListBox.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the list box is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
ListBox.ShowFocusVisual
```

See also

ListBox (Page 3550)

ListBox.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the list box.

Type

String

Access

Read-only

Syntax

```
ListBox.StyleItemClass
```

See also

ListBox (Page 3550)

ListBox.TabIndex

Description

The "TabIndex" property returns the position of the list box in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
ListBox.TabIndex
```

See also

ListBox (Page 3550)

ListBox.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
ListBox.ToolTipText
```

See also

ListBox (Page 3550)

ListBox.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
ListBox.Top
```

See also

ListBox (Page 3550)

ListBox.Visible

Description

The "Visible" property specifies whether the list box is visible.

Type

Bool

Access

Read-write

Syntax

```
ListBox.Visible
```

See also

ListBox (Page 3550)

ListBox.VisualizeQuality

Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

Type

Bool

Access

Read-write

Syntax

```
ListBox.VisualizeQuality
```

See also

ListBox (Page 3550)

ListBox.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ListBox.Width
```

See also

ListBox (Page 3550)

ListBox.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the list box.

Syntax

```
ListBox.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

ListBox (Page 3550)

ListBox.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
ListBox.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

ListBox (Page 3550)

ListBox_OnActivated()

Description

The "OnActivated" event occurs when a list box receives focus:

- A list box is selected via the configured tab sequence.
- A list box that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
ListBox_OnActivated(item)
```

Context

`item`

Type: Object

List box where the event occurs.

See also

ListBox (Page 3550)

ListBox_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A list box is right-clicked.
- A list box is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
ListBox_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

List box where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

ListBox (Page 3550)

ListBox_OnDeactivated()

Description

The "OnDeactivated" event occurs when the list box loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
ListBox_OnDeactivated(item)
```

Context

item

Type: Object

List box where the event occurs.

See also

ListBox (Page 3550)

ListBox_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the list box is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
ListBox_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

List box where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

ListBox (Page 3550)

ListBox_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the list box is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
ListBox_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

List box where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

ListBox (Page 3550)

ListBox_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A list box is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a list box has the focus.
- A list box is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
ListBox_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

List box where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

ListBox (Page 3550)

MediaControl

Description

The "MediaControl" object represents a Media Player for playback in runtime.

Object type

HmiMediaControl

Properties

The "MediaControl" object has the following properties:

- **AutoPlay**
  Specifies whether Autoplay is activated.
- **BackColor**
  Specifies the background color.
- **Caption**
  Specifies the text that is displayed in the title bar.
- **CaptionColor**
  Specifies the background color of the title bar.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the Media Player.
- **Enabled**
  Specifies whether the Media Player can be operated in runtime.
- **Height**
  Specifies the height.
- **Icon**
  Specifies the icon of the Media Player.
- **Layer**
  Returns the screen layer in which the Media Player is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the Media Player.
- **Parent**
  Returns the higher-level screen object.
- **RenderingTemplate**
  Returns the name of the template from which the Media Player was created.
- **ShowFocusVisual**
  Specifies whether the Media Player is highlighted when in focus.
- **StatusBar**
  Specifies the information bar of the Media Player.
- **StyleItemClass**
  Specifies the information bar of the Media Player.
- **TabIndex**
  Returns the position of the Media Player in the tab sequence.
- **ToolBar**
  Specifies the toolbar of the Media Player.
- **Top**
  Specifies the value of the Y coordinate.

- **Url**
  Specifies the URL played by the Media Player.
- **VideoOutput**
  Specifies the scaling of the video output.
- **Visible**
  Specifies whether the Media Player is visible.
- **Width**
  Specifies the width.
- **WindowFlags**
  Specifies the window configuration of the Media Player.

Methods

The "MediaControl" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the Media Player.
- **FireCommand()**
  Configures the occurrence of an event for an element.
- **Pause()**
  Pauses playback.
- **Play()**
  Starts or resumes playback.
- **PropertyFlashing()**
  Configures flashing of a property.
- **Stop()**
  Stops playback.

Events

The "MediaControl" object has the following events:

- **OnActivated()**
  Occurs when a Media Player receives focus.
- **OnCommandFired()**
  Occurs when the operator has operated an element in the toolbar or information bar of the Media Player.
- **OnDeactivated()**
  Occurs when a Media Player loses focus.
- **OnInitialized()**
  Occurs when a Media Player has been successfully initialized and the data connection to the PLC has been established.
- **OnPaused()**
  Occurs when playback is paused in the Media Player.

- **OnPlaying()**
  Occurs when playback is started or resumed in the Media Player.
- **OnStopped()**
  Occurs when playback is stopped in the Media Player.

MediaControl.AutoPlay

Description

The "AutoPlay" property specifies whether Autoplay is activated.

Type

Bool

Access

Read-write

Syntax

```
MediaControl.AutoPlay
```

See also

MediaControl (Page 3600)

MediaControl.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
MediaControl.BackColor
```

See also

MediaControl (Page 3600)

MediaControl.Caption

Description

The "Caption" property specifies the text that is displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
MediaControl.Caption
```

See also

MediaControl (Page 3600)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

MediaControl.Caption (Page 3604)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 3604)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 3604)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 3604)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 3604)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 3604)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal

- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 3604)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

MediaControl.Caption (Page 3604)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

MediaControl.Caption (Page 3604)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

MediaControl.Caption (Page 3604)

MediaControl.CaptionColor

Description

The "CaptionColor" property specifies the color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
MediaControl.CaptionColor
```

See also

MediaControl (Page 3600)

MediaControl.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the Media Player.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
MediaControl.CurrentQuality
```

See also

MediaControl (Page 3600)

MediaControl.Enabled

Description

The "Enabled" property specifies whether the Media Player can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
MediaControl.Enabled
```

See also

MediaControl (Page 3600)

MediaControl.Height

Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
MediaControl.Height
```

See also

MediaControl (Page 3600)

MediaControl.Icon

Description

The "Icon" property specifies the icon of the Media Player.

Type

String

Access

Read-write

Syntax

```
MediaControl.Icon
```

See also

MediaControl (Page 3600)

MediaControl.Layer

Description

The "Layer" property returns the screen layer in which the Media Player is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
MediaControl.Layer
```

See also

MediaControl (Page 3600)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

MediaControl.Layer (Page 3612)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

MediaControl.Layer (Page 3612)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

MediaControl.Layer (Page 3612)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

MediaControl.Layer (Page 3612)

MediaControl.Left

Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
MediaControl.Left
```

See also

MediaControl (Page 3600)

MediaControl.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
MediaControl.Margin
```

See also

MediaControl (Page 3600)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

MediaControl.Margin (Page 3615)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

MediaControl.Margin (Page 3615)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

MediaControl.Margin (Page 3615)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

MediaControl.Margin (Page 3615)

MediaControl.Name

Description

The "Name" property returns the name of the Media Player.

Type

String

Access

Read-only

Syntax

```
MediaControl.Name
```

See also

MediaControl (Page 3600)

MediaControl.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
MediaControl.Parent
```

See also

MediaControl (Page 3600)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

MediaControl.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the Media Player was created.

Type

String

Access

Read-only

Syntax

```
MediaControl.RenderingTemplate
```

See also

MediaControl (Page 3600)

MediaControl.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the Media Player is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
MediaControl.ShowFocusVisual
```

See also

MediaControl (Page 3600)

MediaControl.StatusBar

Description

The "StatusBar" property specifies the information bar of the Media Player.

Type

Object, HmiStatusBarPart

Access

Read-write

Syntax

```
MediaControl.StatusBar
```

See also

MediaControl (Page 3600)

StatusBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
StatusBar.BackColor
```

See also

MediaControl.StatusBar (Page 3620)

StatusBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

Type

Object, HmiControlBarElementCollection (Page 3621)

Access

Read-only

Syntax

```
StatusBar.Elements
```

See also

MediaControl.StatusBar (Page 3620)

HmiControlBarElementCollection (Page 3621)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

StatusBar.Elements (Page 3621)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 3621)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 3638)

See also

HmiControlBarElementCollection (Page 3621)

Control Bar Elements (Page 3638)

Control Bar Elements

Description

Control Bar Elements (Page 3638)

StatusBar.Enabled

Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Enabled
```

See also

MediaControl.StatusBar (Page 3620)

StatusBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
StatusBar.Font
```

See also

MediaControl.StatusBar (Page 3620)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

StatusBar.Font (Page 3624)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

StatusBar.Font (Page 3624)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

StatusBar.Font (Page 3624)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

StatusBar.Font (Page 3624)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

StatusBar.Font (Page 3624)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

StatusBar.Font (Page 3624)

StatusBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
StatusBar.Margin
```

See also

MediaControl.StatusBar (Page 3620)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

StatusBar.Margin (Page 3628)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

StatusBar.Margin (Page 3628)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

StatusBar.Margin (Page 3628)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

StatusBar.Margin (Page 3628)

StatusBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
StatusBar.Padding
```

See also

MediaControl.StatusBar (Page 3620)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

StatusBar.Padding (Page 3630)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

StatusBar.Padding (Page 3630)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

StatusBar.Padding (Page 3630)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

StatusBar.Padding (Page 3630)

StatusBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.ShowToolTips
```

See also

MediaControl.StatusBar (Page 3620)

StatusBar.Visible

Description

The "Visible" property specifies whether the information bar is visible.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Visible
```

See also

MediaControl.StatusBar (Page 3620)

MediaControl.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the Media Player.

Type

String

Access

Read-only

Syntax

```
MediaControl.StyleItemClass
```

See also

MediaControl (Page 3600)

MediaControl.ToolBar

Description

The "ToolBar" property specifies the toolbar of the Media Player.

Type

Object, HmiToolBarPart

Access

Read-write

Syntax

```
MediaControl.ToolBar
```

See also

MediaControl (Page 3600)

ToolBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ToolBar.BackColor
```

See also

MediaControl.ToolBar (Page 3634)

ToolBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

Type

Object, HmiControlBarElementCollection (Page 3636)

Access

Read-only

Syntax

```
ToolBar.Elements
```

See also

MediaControl.ToolBar (Page 3634)

HmiControlBarElementCollection (Page 3636)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

ToolBar.Elements (Page 3635)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 3636)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 3638)

See also

HmiControlBarElementCollection (Page 3636)

Control Bar Elements (Page 3638)

Control Bar Elements

ControlBarButton

Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarButtonPart

Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the label of the button.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the button can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.

- **HotKey**
  Returns the hotkey specified for the button.
- **Mapping**
  Returns the function of the button.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the button is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the button is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarButton.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBackColor
```

See also

ControlBarButton (Page 3638)

ControlBarButton.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBorderColor
```

See also

ControlBarButton (Page 3638)

ControlBarButton.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarButton.Authorization
```

See also

ControlBarButton (Page 3638)

ControlBarButton.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BackColor
```

See also

ControlBarButton (Page 3638)

ControlBarButton.Badge

Description

The "Badge" property specifies the label of the button.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarButton.Badge
```

See also

ControlBarButton (Page 3638)

ControlBarButton.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BorderColor
```

See also

ControlBarButton (Page 3638)

ControlBarButton.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarButton.BorderWidth
```

See also

ControlBarButton (Page 3638)

ControlBarButton.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarButton.Content
```

See also

ControlBarButton (Page 3638)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarButton.Content (Page 3643)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarButton.Content (Page 3643)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarButton.Content (Page 3643)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarButton.Content (Page 3643)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarButton.Content (Page 3643)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above

- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarButton.Content (Page 3643)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarButton.Content (Page 3643)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarButton.Content (Page 3643)

ControlBarButton.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarButton.CustomID
```

See also

ControlBarButton (Page 3638)

ControlBarButton.Enabled

Description

The "Enabled" property specifies whether the button can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Enabled
```

See also

ControlBarButton (Page 3638)

ControlBarButton.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.ForeColor
```

See also

ControlBarButton (Page 3638)

ControlBarButton.Graphic

Description

The "Graphic" property specifies the graphic of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Graphic
```

See also

ControlBarButton (Page 3638)

ControlBarButton.Height

Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Height
```

See also

ControlBarButton (Page 3638)

ControlBarButton.HotKey

Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
ControlBarButton.HotKey
```

See also

ControlBarButton (Page 3638)

ControlBarButton.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog

- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled

- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarButton.Mapping
```

See also

ControlBarButton (Page 3638)

ControlBarButton.Margin

Description

The "Margin" property specifies the surrounded outer distance of the button.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarButton.Margin
```

See also

ControlBarButton (Page 3638)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarButton.Margin (Page 3653)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarButton.Margin (Page 3653)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarButton.Margin (Page 3653)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarButton.Margin (Page 3653)

ControlBarButton.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumHeight
```

See also

ControlBarButton (Page 3638)

ControlBarButton.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumWidth
```

See also

ControlBarButton (Page 3638)

ControlBarButton.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumHeight
```

See also

ControlBarButton (Page 3638)

ControlBarButton.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumWidth
```

See also

ControlBarButton (Page 3638)

ControlBarButton.Operability

Description

The "Operability" property returns whether the button is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarButton.Operability
```

See also

ControlBarButton (Page 3638)

ControlBarButton.Padding

Description

The "Padding" property specifies the distance of the content from the border of the button.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarButton.Padding
```

See also

ControlBarButton (Page 3638)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarButton.Padding (Page 3659)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarButton.Padding (Page 3659)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarButton.Padding (Page 3659)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarButton.Padding (Page 3659)

ControlBarButton.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarButton.RequireExplicitUnlock
```

See also

ControlBarButton (Page 3638)

ControlBarButton.Text

Description

The "Text" property specifies the label of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Text
```

See also

ControlBarButton (Page 3638)

ControlBarButton.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.ToolTipText
```

See also

ControlBarButton (Page 3638)

ControlBarButton.Visible

Description

The "Visible" property specifies whether the button is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Visible
```

See also

ControlBarButton (Page 3638)

ControlBarButton.Width

Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Width
```

See also

ControlBarButton (Page 3638)

ControlBarDisplay

Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarDisplayPart

Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the display area is enabled in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the display area.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.

- **Operability**
  Returns whether the display area is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the display area is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarDisplay.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarDislay.Authorization
```

See also

ControlBarDisplay (Page 3664)

ControlBarDisplay.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarDislay.Content
```

See also

ControlBarDisplay (Page 3664)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarDisplay.Content (Page 3666)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarDisplay.Content (Page 3666)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarDisplay.Content (Page 3666)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarDisplay.Content (Page 3666)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarDisplay.Content (Page 3666)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarDisplay.Content (Page 3666)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarDisplay.Content (Page 3666)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarDisplay.Content (Page 3666)

ControlBarDisplay.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarDislay.CustomID
```

See also

ControlBarDisplay (Page 3664)

ControlBarDisplay.Enabled

Description

The "Enabled" property specifies whether the display is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Enabled
```

See also

ControlBarDisplay (Page 3664)

ControlBarDisplay.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.ForeColor
```

See also

ControlBarDisplay (Page 3664)

ControlBarDisplay.Graphic

Description

The "Graphic" property specifies the graphic of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Graphic
```

See also

ControlBarDisplay (Page 3664)

ControlBarDisplay.Height

Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Height
```

See also

ControlBarDisplay (Page 3664)

ControlBarDisplay.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarDislay.Mapping
```

See also

ControlBarDisplay (Page 3664)

ControlBarDisplay.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the display.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarDislay.Margin
```

See also

ControlBarDisplay (Page 3664)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarDisplay.Margin (Page 3676)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarDisplay.Margin (Page 3676)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarDisplay.Margin (Page 3676)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarDisplay.Margin (Page 3676)

ControlBarDisplay.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumHeight
```

See also

ControlBarDisplay (Page 3664)

ControlBarDisplay.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumWidth
```

See also

ControlBarDisplay (Page 3664)

ControlBarDisplay.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumHeight
```

See also

ControlBarDisplay (Page 3664)

ControlBarDisplay.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumWidth
```

See also

ControlBarDisplay (Page 3664)

ControlBarDisplay.Operability

Description

The "Operability" property returns whether the display is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarDislay.Operability
```

See also

ControlBarDisplay (Page 3664)

ControlBarDisplay.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the display.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarDislay.Padding
```

See also

ControlBarDisplay (Page 3664)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarDisplay.Padding (Page 3681)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarDisplay.Padding (Page 3681)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarDisplay.Padding (Page 3681)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarDisplay.Padding (Page 3681)

ControlBarDisplay.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarDislay.RequireExplicitUnlock
```

See also

ControlBarDisplay (Page 3664)

ControlBarDisplay.Text

Description

The "Text" property specifies the label of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Text
```

See also

ControlBarDisplay (Page 3664)

ControlBarDisplay.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.ToolTipText
```

See also

ControlBarDisplay (Page 3664)

ControlBarDisplay.Visible

Description

The "Visible" property specifies whether the display is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Visible
```

See also

ControlBarDisplay (Page 3664)

ControlBarDisplay.Width

Description

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Width
```

See also

ControlBarDisplay (Page 3664)

ControlBarLabel

Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar.

You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarLabelPart

Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the identifier can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the identifier.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.

- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the identifier is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the identifier is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarLabel.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarLabel.Authorization
```

See also

ControlBarLabel (Page 3686)

ControlBarLabel.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarLabel.CustomID
```

See also

ControlBarLabel (Page 3686)

ControlBarLabel.Enabled

Description

The "Enabled" property specifies whether the identifier is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Enabled
```

See also

ControlBarLabel (Page 3686)

ControlBarLabel.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.ForeColor
```

See also

ControlBarLabel (Page 3686)

ControlBarLabel.Height

Description

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Height
```

See also

ControlBarLabel (Page 3686)

ControlBarLabel.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

See also

ControlBarLabel (Page 3686)

ControlBarLabel.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarLabel.Mapping
```

See also

ControlBarLabel (Page 3686)

ControlBarLabel.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarLabel.Margin
```

See also

ControlBarLabel (Page 3686)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarLabel.Margin (Page 3693)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarLabel.Margin (Page 3693)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarLabel.Margin (Page 3693)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarLabel.Margin (Page 3693)

ControlBarLabel.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumHeight
```

See also

ControlBarLabel (Page 3686)

ControlBarLabel.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumWidth
```

See also

ControlBarLabel (Page 3686)

ControlBarLabel.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumHeight
```

See also

ControlBarLabel (Page 3686)

ControlBarLabel.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumWidth
```

See also

ControlBarLabel (Page 3686)

ControlBarLabel.Operability

Description

The "Operability" property returns whether the identifier is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarLabel.Operability
```

See also

ControlBarLabel (Page 3686)

ControlBarLabel.Padding

Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarLabel.Padding
```

See also

ControlBarLabel (Page 3686)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarLabel.Padding (Page 3698)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarLabel.Padding (Page 3698)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarLabel.Padding (Page 3698)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarLabel.Padding (Page 3698)

ControlBarLabel.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarLabel.RequireExplicitUnlock
```

See also

ControlBarLabel (Page 3686)

ControlBarLabel.Text

Description

The "Text" property specifies the label of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.Text
```

See also

ControlBarLabel (Page 3686)

ControlBarLabel.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.ToolTipText
```

See also

ControlBarLabel (Page 3686)

ControlBarLabel.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.VerticalTextAlignment
```

See also

ControlBarLabel (Page 3686)

ControlBarLabel.Visible

Description

The "Visible" property specifies whether the identifier is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Visible
```

See also

ControlBarLabel (Page 3686)

ControlBarLabel.Width

Description

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Width
```

See also

ControlBarLabel (Page 3686)

ControlBarSeparator

Description

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarSeparatorPart

Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the disconnector can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the separator.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the separator is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the disconnector is only operable while the associated button is being pressed.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the disconnector is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarSeparator.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarSeparator.Authorization
```

See also

ControlBarSeparator (Page 3703)

ControlBarSeparator.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarSeparator.CustomID
```

See also

ControlBarSeparator (Page 3703)

ControlBarSeparator.Enabled

Description

The "Enabled" property specifies whether the separator is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Enabled
```

See also

ControlBarSeparator (Page 3703)

ControlBarSeparator.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.ForeColor
```

See also

ControlBarSeparator (Page 3703)

ControlBarSeparator.Height

Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Height
```

See also

ControlBarSeparator (Page 3703)

ControlBarSeparator.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarSeparator.Mapping
```

See also

ControlBarSeparator (Page 3703)

ControlBarSeparator.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the separator.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarSeparator.Margin
```

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarSeparator.Margin (Page 3709)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarSeparator.Margin (Page 3709)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarSeparator.Margin (Page 3709)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarSeparator.Margin (Page 3709)

ControlBarSeparator.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumHeight
```

See also

ControlBarSeparator (Page 3703)

ControlBarSeparator.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumWidth
```

See also

ControlBarSeparator (Page 3703)

ControlBarSeparator.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumHeight
```

See also

ControlBarSeparator (Page 3703)

ControlBarSeparator.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumWidth
```

See also

ControlBarSeparator (Page 3703)

ControlBarSeparator.Operability

Description

The "Operability" property returns whether the separator is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarSeparator.Operability
```

See also

ControlBarSeparator (Page 3703)

ControlBarSeparator.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the separator.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarSeparator.Padding
```

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarSeparator.Padding (Page 3714)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarSeparator.Padding (Page 3714)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarSeparator.Padding (Page 3714)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarSeparator.Padding (Page 3714)

ControlBarSeparator.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the disconnector can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarSeparator.RequireExplicitUnlock
```

See also

ControlBarSeparator (Page 3703)

ControlBarSeparator.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

Type

String

Access

Read-write

Syntax

```
ControlBarSeparator.ToolTipText
```

See also

ControlBarSeparator (Page 3703)

ControlBarSeparator.Visible

Description

The "Visible" property specifies whether the separator is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Visible
```

See also

ControlBarSeparator (Page 3703)

ControlBarSeparator.Width

Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Width
```

See also

ControlBarSeparator (Page 3703)

ControlBarTextBox

Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarTextBoxPart

Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the text box can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Mapping**
  Returns the function of the text box.
- **Margin**
  Specifies the margin.

- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the text box is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **Readonly**
  Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**
  Returns whether the text box is only operable while the associated button is being pressed.
- **Text**
  Specifies the labeling.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the text box is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarTextBox.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.AlternateBorderColor
```

See also

ControlBarTextBox (Page 3719)

ControlBarTextBox.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarTextBox.Authorization
```

See also

ControlBarTextBox (Page 3719)

ControlBarTextBox.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BackColor
```

See also

ControlBarTextBox (Page 3719)

ControlBarTextBox.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BorderColor
```

See also

ControlBarTextBox (Page 3719)

ControlBarTextBox.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarTextBox.BorderWidth
```

See also

ControlBarTextBox (Page 3719)

ControlBarTextBox.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarTextBox.CustomID
```

See also

ControlBarTextBox (Page 3719)

ControlBarTextBox.Enabled

Description

The "Enabled" property specifies whether the text box can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Enabled
```

See also

ControlBarTextBox (Page 3719)

ControlBarTextBox.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.ForeColor
```

See also

ControlBarTextBox (Page 3719)

ControlBarTextBox.Height

Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Height
```

See also

ControlBarTextBox (Page 3719)

ControlBarTextBox.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

See also

ControlBarTextBox (Page 3719)

ControlBarTextBox.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms

- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarTextBox.Mapping
```

See also

ControlBarTextBox (Page 3719)

ControlBarTextBox.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the text box.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarTextBox.Margin
```

See also

ControlBarTextBox (Page 3719)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarTextBox.Margin (Page 3728)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarTextBox.Margin (Page 3728)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarTextBox.Margin (Page 3728)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarTextBox.Margin (Page 3728)

ControlBarTextBox.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumHeight
```

See also

ControlBarTextBox (Page 3719)

ControlBarTextBox.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumWidth
```

See also

ControlBarTextBox (Page 3719)

ControlBarTextBox.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumHeight
```

See also

ControlBarTextBox (Page 3719)

ControlBarTextBox.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumWidth
```

See also

ControlBarTextBox (Page 3719)

ControlBarTextBox.Operability

Description

The "Operability" property returns whether the text box is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarTextBox.Operability
```

See also

ControlBarTextBox (Page 3719)

ControlBarTextBox.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the text box.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarTextBox.Padding
```

See also

ControlBarTextBox (Page 3719)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarTextBox.Padding (Page 3733)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarTextBox.Padding (Page 3733)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarTextBox.Padding (Page 3733)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarTextBox.Padding (Page 3733)

ControlBarTextBox.ReadOnly

Description

The "ReadOnly" property specifies whether the text box is read-only.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.ReadOnly
```

See also

ControlBarTextBox (Page 3719)

ControlBarTextBox.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

See also

ControlBarTextBox (Page 3719)

ControlBarTextBox.Text

Description

The "Text" property specifies the label of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.Text
```

See also

ControlBarTextBox (Page 3719)

ControlBarTextBox.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.ToolTipText
```

See also

ControlBarTextBox (Page 3719)

ControlBarTextBox.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

See also

ControlBarTextBox (Page 3719)

ControlBarTextBox.Visible

Description

The "Visible" property specifies whether the text box is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Visible
```

See also

ControlBarTextBox (Page 3719)

ControlBarTextBox.Width

Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Width
```

See also

ControlBarTextBox (Page 3719)

ControlBarToggleSwitch

Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar.

You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarToggleSwitchPart

Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **AlternateGraphic**
  Specifies the graphic for the "pressed" state.
- **AlternateText**
  Specifies the text for the "pressed" state.
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the identifier of the switch.
- **BorderColor**
  Specifies the line color.

- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the switch can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the switch.
- **IsAlternateState**
  Specifies the current state of the switch.
- **Mapping**
  Returns the function of the switch.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the switch is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the switch is only operable while the associated button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.

- **Visible**
  Specifies whether the switch is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarToggleSwitch.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.AlternateGraphic

Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateGraphic
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.AlternateText

Description

The "AlternateText" property specifies the text of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateText
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Authorization
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BackColor
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.Badge

Description

The "Badge" property specifies the identifier of the switch.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Badge
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderColor
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderWidth
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Content
```

See also

ControlBarToggleSwitch (Page 3739)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarToggleSwitch.Content (Page 3745)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarToggleSwitch.Content (Page 3745)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 3745)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarToggleSwitch.Content (Page 3745)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarToggleSwitch.Content (Page 3745)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarToggleSwitch.Content (Page 3745)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarToggleSwitch.Content (Page 3745)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 3745)

ControlBarToggleSwitch.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarToggleSwitch.CustomID
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.Enabled

Description

The "Enabled" property specifies whether the switch can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Enabled
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ForeColor
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.Graphic

Description

The "Graphic" property specifies the graphic of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Graphic
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.Height

Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Height
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.HotKey

Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
Button.HotKey
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.IsAlternateState

Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment

- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms

- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Mapping
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the switch.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Margin
```

See also

ControlBarToggleSwitch (Page 3739)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarToggleSwitch.Margin (Page 3756)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarToggleSwitch.Margin (Page 3756)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarToggleSwitch.Margin (Page 3756)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarToggleSwitch.Margin (Page 3756)

ControlBarToggleSwitch.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumHeight
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumWidth
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumHeight
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumWidth
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.Operability

Description

The property "Operability" returns whether the switch is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Operability
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the switch.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Padding
```

See also

ControlBarToggleSwitch (Page 3739)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarToggleSwitch.Padding (Page 3761)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarToggleSwitch.Padding (Page 3761)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarToggleSwitch.Padding (Page 3761)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarToggleSwitch.Padding (Page 3761)

ControlBarToggleSwitch.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.Text

Description

The "Text" property specifies the label of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Text
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ToolTipText
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.Visible

Description

The "Visible" property specifies whether the switch is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Visible
```

See also

ControlBarToggleSwitch (Page 3739)

ControlBarToggleSwitch.Width

Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Width
```

See also

ControlBarToggleSwitch (Page 3739)

ToolBar.Enabled

Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Enabled
```

See also

MediaControl.ToolBar (Page 3634)

ToolBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ToolBar.Font
```

See also

MediaControl.ToolBar (Page 3634)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ToolBar.Font (Page 3767)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ToolBar.Font (Page 3767)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ToolBar.Font (Page 3767)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ToolBar.Font (Page 3767)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ToolBar.Font (Page 3767)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ToolBar.Font (Page 3767)

ToolBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the toolbar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ToolBar.Margin
```

See also

MediaControl.ToolBar (Page 3634)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ToolBar.Margin (Page 3771)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ToolBar.Margin (Page 3771)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ToolBar.Margin (Page 3771)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ToolBar.Margin (Page 3771)

ToolBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ToolBar.Padding
```

See also

MediaControl.ToolBar (Page 3634)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ToolBar.Padding (Page 3773)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ToolBar.Padding (Page 3773)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ToolBar.Padding (Page 3773)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ToolBar.Padding (Page 3773)

ToolBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.ShowToolTips
```

See also

MediaControl.ToolBar (Page 3634)

ToolBar.UseHotKeys

Description

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.UseHotKeys
```

See also

MediaControl.ToolBar (Page 3634)

ToolBar.Visible

Description

The "Visible" property specifies whether the toolbar is visible.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Visible
```

See also

MediaControl.ToolBar (Page 3634)

MediaControl.TabIndex

Description

The "TabIndex" property returns the position of the Media Player in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
MediaControl.TabIndex
```

See also

MediaControl (Page 3600)

MediaControl.Top

Description

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
MediaControl.Top
```

See also

MediaControl (Page 3600)

MediaControl.Url

Description

The "Url" property specifies the URL played by the Media Player.

Type

String

Access

Read-write

Syntax

```
MediaControl.Url
```

See also

MediaControl (Page 3600)

MediaControl.VideoOutput

Description

The "VideoOutput" property specifies the scaling of the video output.

Type

Int32, HmiVideoOutput

Specifies the scaling:

- Undefined (0): Not defined.
- Stretch (1): The video is scaled to match.
- PreserveAspectFit (2): The video is scaled uniformly so that it fits without being cropped.
- PreserveAspectCrop (3): The video is scaled uniformly so that it fits, with cropping if required.

Access

Read-write

Syntax

```
MediaControl.VideoOutput
```

See also

MediaControl (Page 3600)

MediaControl.Visible

Description

The "Visible" property specifies whether the Media Player is visible.

Type

Bool

Access

Read-write

Syntax

```
MediaControl.Visible
```

See also

MediaControl (Page 3600)

MediaControl.Width

Description

The "Width" property specifies the width in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
MediaControl.Width
```

See also

MediaControl (Page 3600)

MediaControl.WindowFlags

Description

The "WindowFlags" property specifies the window configuration of the Media Player.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized

- CanMove (16): Can be moved
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

You can enable multiple properties by adding integer values or bit operators.

Access

Read-write

Syntax

```
MediaControl.WindowFlags
```

See also

MediaControl (Page 3600)

MediaControl.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the Media Player.

Syntax

```
MediaControl.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

MediaControl (Page 3600)

MediaControl.FireCommand()

Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the Media Player.

Syntax

```
MediaControl.FireCommand(commandId, custom)
```

Parameters

`commandId`

Type: Int32

ID of the element of the toolbar or information bar

`custom`

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

Return value

--

See also

MediaControl (Page 3600)

MediaControl.Pause()

Description

The "Pause" method pauses the playback.

Syntax

```
MediaControl.Pause()
```

Parameters

--

Return value

--

See also

MediaControl (Page 3600)

MediaControl.Play()

Description

The "Play" method starts or resumes playback.

Syntax

```
MediaControl.Play()
```

Parameters

--

Return value

See also

MediaControl (Page 3600)

MediaControl.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
MediaControl.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

`propertyName`

Type: String

Name of the property for which flashing is configured.

`enable`

Type: Bool

Specifies that flashing is activated.

`value`

Optional, type: Variant

Value of the property for which flashing is configured.

`alternateValue`

Optional, type: Variant

Specifies the second value for flashing.

`rate`

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

MediaControl (Page 3600)

MediaControl.Stop()

Description

The "Stop" method stops playback.

Syntax

```
MediaControl.Stop()
```

Parameters

--

Return value

--

See also

MediaControl (Page 3600)

MediaControl_OnActivated()

Description

The "OnActivated" event occurs when a Media Player receives focus:

- A Media Player is selected via the configured tab sequence.
- A Media Player that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
MediaControl_OnActivated(item)
```

Context

item

Type: Object

Media Player where the event occurs.

See also

MediaControl (Page 3600)

MediaControl_OnCommandFired()

Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the Media Player.

Syntax

```
MediaControl_OnCommandFired(item, commandId, custom)
```

Context

item

Type: Object

Media Player where the event occurs.

commandId

Type: DInt

ID of the element of the toolbar or information bar that was operated.

custom

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

See also

MediaControl (Page 3600)

MediaControl_OnDeactivated()

Description

The "OnDeactivated" event occurs when a Media Player loses focus because the operator presses the <TAB> key or executes a different action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
MediaControl_OnDeactivated(item)
```

Context

item

Type: Object

Media Player where the event occurs.

See also

MediaControl (Page 3600)

MediaControl_OnInitialized()

Description

The "OnInitialized" event occurs when a Media Player has been successfully initialized and the data connection to the PLC has been established.

Syntax

```
MediaControl_OnInitialized(item)
```

Context

item

Type: Object

Media Player where the event occurs.

See also

MediaControl (Page 3600)

MediaControl_OnPaused()

Description

The "OnPaused" event occurs when playback is paused in the Media Player.

Syntax

```
MediaControl_OnPaused(item)
```

Context

item

Type: Object

Media Player where the event occurs.

See also

MediaControl (Page 3600)

MediaControl_OnPlaying()

Description

The "OnPlaying" event occurs when playback is started or resumed in the Media Player.

Syntax

```
MediaControl_OnPlaying(item)
```

Context

item

Type: Object

Media Player where the event occurs.

See also

MediaControl (Page 3600)

MediaControl_OnStopped()

Description

The "OnStopped" event occurs when playback is stopped in the Media Player.

Syntax

```
MediaControl_OnStopped(item)
```

Context

item

Type: Object

Media Player where the event occurs.

See also

MediaControl (Page 3600)

ObjectExplorerControl

Description

The "ObjectExplorerControl" object specifies the properties of the display for building objects.

Object type

HmiObjectExplorerControl

Properties

The "ObjectExplorerControl" object has the following properties:

- **BackColor**
  Specifies the background color.
- **Caption**
  Specifies the text that is displayed in the title bar.
- **CaptionColor**
  Specifies the background color of the title bar.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the display.
- **DisplayViewType**
  Specifies the display type.

- **Enabled**
  Specifies whether the display can be operated in runtime.
- **Height**
  Specifies the height.
- **Icon**
  Specifies the icon of the display.
- **Layer**
  Returns the screen layer in which the display is located.
- **Left**
  Specifies the value of the X coordinate.
- **LinkedItem**
  Specifies the referenced object.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the display.
- **Parent**
  Returns the higher-level screen object.
- **RenderingTemplate**
  Returns the name of the template from which the display was created.
- **ShowFocusVisual**
  Specifies whether the display is highlighted when in focus.
- **StatusBar**
  Specifies the information bar of the display.
- **StyleItemClass**
  Returns the style which is applied to the display.
- **TabIndex**
  Returns the position of the display in the tab sequence.
- **TargetObjectType**
  Specifies the object that will be displayed.
- **ToolBar**
  Specifies the toolbar of the display.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the display is visible.
- **Width**
  Specifies the width.
- **WindowFlags**
  Specifies the window configuration of the display.

Methods

The "ObjectExplorerControl" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the display.
- **FireCommand()**
  Configures the occurrence of an event for an element.
- **PropertyFlashing()**
  Configures flashing of a property.

ObjectExplorerControl.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ObjectExplorerControl.BackColor
```

See also

ObjectExplorerControl (Page 3789)

ObjectExplorerControl.Caption

Description

The "Caption" property specifies the text that is displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
ObjectExplorerControl.Caption
```

See also

ObjectExplorerControl (Page 3789)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

ObjectExplorerControl.Caption (Page 3791)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 3792)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 3792)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 3792)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 3792)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 3792)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 3792)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

ObjectExplorerControl.Caption (Page 3791)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

ObjectExplorerControl.Caption (Page 3791)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

ObjectExplorerControl.Caption (Page 3791)

ObjectExplorerControl.CaptionColor

Description

The "CaptionColor" property specifies the color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
ObjectExplorerControl.CaptionColor
```

See also

ObjectExplorerControl (Page 3789)

ObjectExplorerControl.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the control.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
ObjectExplorerControl.CurrentQuality
```

See also

ObjectExplorerControl (Page 3789)

ObjectExplorerControl.DisplayViewType

Description

The "DisplayViewType" property specifies the display type.

Type

Int32, HmiDisplayViewType

Specifies the display type.

- Standard (0): Default setting; usually list display
- List (1): List display without details
- Details (2): List display with details

- SmallIcons (3): Small icons
- MediumIcons (4): Medium icons
- LargeIcons (5): Large icons

Access

Read-write

Syntax

```
ObjectExplorerControl.DisplayViewType
```

See also

ObjectExplorerControl (Page 3789)

ObjectExplorerControl.Enabled

Description

The "Enabled" property specifies whether the display can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ObjectExplorerControl.Enabled
```

See also

ObjectExplorerControl (Page 3789)

ObjectExplorerControl.Height

Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ObjectExplorerControl.Height
```

See also

ObjectExplorerControl (Page 3789)

ObjectExplorerControl.Icon

Description

The "Icon" property specifies the icon of the display.

Type

String

Access

Read-write

Syntax

```
ObjectExplorerControl.Icon
```

See also

ObjectExplorerControl (Page 3789)

ObjectExplorerControl.Layer

Description

The "Layer" property returns the screen layer in which the control is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
ObjectExplorerControl.Layer
```

See also

ObjectExplorerControl (Page 3789)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

ObjectExplorerControl.Layer (Page 3800)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

ObjectExplorerControl.Layer (Page 3800)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

ObjectExplorerControl.Layer (Page 3800)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

ObjectExplorerControl.Layer (Page 3800)

ObjectExplorerControl.Left

Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
ObjectExplorerControl.Left
```

See also

ObjectExplorerControl (Page 3789)

ObjectExplorerControl.LinkedItem

Description

The "LinkedItem" property specifies the referenced object.

Type

Object, HmiControlWindowBase (Page 1571)

Access

Read-write

Syntax

```
ObjectExplorerControl.LinkedItem
```

See also

ObjectExplorerControl (Page 3789)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

ObjectExplorerControl.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ObjectExplorerControl.Margin
```

See also

ObjectExplorerControl (Page 3789)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ObjectExplorerControl.Margin (Page 3804)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ObjectExplorerControl.Margin (Page 3804)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ObjectExplorerControl.Margin (Page 3804)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ObjectExplorerControl.Margin (Page 3804)

ObjectExplorerControl.Name

Description

The "Name" property returns the name of the control.

Type

String

Access

Read-only

Syntax

```
ObjectExplorerControl.Name
```

See also

ObjectExplorerControl (Page 3789)

ObjectExplorerControl.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
ObjectExplorerControl.Parent
```

See also

ObjectExplorerControl (Page 3789)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

ObjectExplorerControl.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the control was created.

Type

String

Access

Read-only

Syntax

```
ObjectExplorerControl.RenderingTemplate
```

See also

ObjectExplorerControl (Page 3789)

ObjectExplorerControl.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the display is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
ObjectExplorerControl.ShowFocusVisual
```

See also

ObjectExplorerControl (Page 3789)

ObjectExplorerControl.StatusBar

Description

The "StatusBar" property specifies the information bar of the display.

Type

Object, HmiStatusBarPart

Access

Read-write

Syntax

```
ObjectExplorerControl.StatusBar
```

See also

ObjectExplorerControl (Page 3789)

StatusBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
StatusBar.BackColor
```

See also

ObjectExplorerControl.StatusBar (Page 3809)

StatusBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

Type

Object, HmiControlBarElementCollection (Page 3810)

Access

Read-only

Syntax

```
StatusBar.Elements
```

See also

ObjectExplorerControl.StatusBar (Page 3809)

HmiControlBarElementCollection (Page 3810)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

StatusBar.Elements (Page 3810)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 3810)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 3828)

See also

HmiControlBarElementCollection (Page 3810)

Control Bar Elements (Page 3828)

Control Bar Elements

Description

Control Bar Elements (Page 3828)

StatusBar.Enabled

Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Enabled
```

See also

ObjectExplorerControl.StatusBar (Page 3809)

StatusBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
StatusBar.Font
```

See also

ObjectExplorerControl.StatusBar (Page 3809)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

StatusBar.Font (Page 3813)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

StatusBar.Font (Page 3813)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

StatusBar.Font (Page 3813)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

StatusBar.Font (Page 3813)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

StatusBar.Font (Page 3813)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

StatusBar.Font (Page 3813)

StatusBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
StatusBar.Margin
```

See also

ObjectExplorerControl.StatusBar (Page 3809)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

StatusBar.Margin (Page 3817)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

StatusBar.Margin (Page 3817)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

StatusBar.Margin (Page 3817)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

StatusBar.Margin (Page 3817)

StatusBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
StatusBar.Padding
```

See also

ObjectExplorerControl.StatusBar (Page 3809)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

StatusBar.Padding (Page 3819)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

StatusBar.Padding (Page 3819)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

StatusBar.Padding (Page 3819)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

StatusBar.Padding (Page 3819)

StatusBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.ShowToolTips
```

See also

ObjectExplorerControl.StatusBar (Page 3809)

StatusBar.Visible

Description

The "Visible" property specifies whether the information bar is visible.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Visible
```

See also

ObjectExplorerControl.StatusBar (Page 3809)

ObjectExplorerControl.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the display.

Type

String

Access

Read-only

Syntax

```
ObjectExplorerControl.StyleItemClass
```

See also

ObjectExplorerControl (Page 3789)

ObjectExplorerControl.TabIndex

Description

The "TabIndex" property returns the position of the display in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
ObjectExplorerControl.TabIndex
```

See also

ObjectExplorerControl (Page 3789)

ObjectExplorerControl.TargetObjectType

Description

The "TargetObjectType" property specifies the object that will be displayed.

Type

UInt32

Access

Read-write

Syntax

```
ObjectExplorerControl.TargetObjectType
```

See also

ObjectExplorerControl (Page 3789)

ObjectExplorerControl.ToolBar

Description

The "ToolBar" property specifies the toolbar of the display.

Type

Object, HmiToolBarPart

Access

Read-write

Syntax

```
ObjectExplorerControl.ToolBar
```

See also

ObjectExplorerControl (Page 3789)

ToolBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ToolBar.BackColor
```

See also

ObjectExplorerControl.ToolBar (Page 3824)

ToolBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

Type

Object, HmiControlBarElementCollection (Page 3826)

Access

Read-only

Syntax

```
ToolBar.Elements
```

See also

ObjectExplorerControl.ToolBar (Page 3824)

HmiControlBarElementCollection (Page 3826)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

ToolBar.Elements (Page 3825)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 3826)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 3828)

See also

HmiControlBarElementCollection (Page 3826)

Control Bar Elements (Page 3828)

Control Bar Elements

ControlBarButton

Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarButtonPart

Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the label of the button.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the button can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.

- **HotKey**
  Returns the hotkey specified for the button.
- **Mapping**
  Returns the function of the button.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the button is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the button is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarButton.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBackColor
```

See also

ControlBarButton (Page 3828)

ControlBarButton.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBorderColor
```

See also

ControlBarButton (Page 3828)

ControlBarButton.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarButton.Authorization
```

See also

ControlBarButton (Page 3828)

ControlBarButton.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BackColor
```

See also

ControlBarButton (Page 3828)

ControlBarButton.Badge

Description

The "Badge" property specifies the label of the button.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarButton.Badge
```

See also

ControlBarButton (Page 3828)

ControlBarButton.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BorderColor
```

See also

ControlBarButton (Page 3828)

ControlBarButton.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarButton.BorderWidth
```

See also

ControlBarButton (Page 3828)

ControlBarButton.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarButton.Content
```

See also

ControlBarButton (Page 3828)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarButton.Content (Page 3833)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarButton.Content (Page 3833)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarButton.Content (Page 3833)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarButton.Content (Page 3833)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarButton.Content (Page 3833)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above

- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarButton.Content (Page 3833)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarButton.Content (Page 3833)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarButton.Content (Page 3833)

ControlBarButton.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarButton.CustomID
```

See also

ControlBarButton (Page 3828)

ControlBarButton.Enabled

Description

The "Enabled" property specifies whether the button can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Enabled
```

See also

ControlBarButton (Page 3828)

ControlBarButton.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.ForeColor
```

See also

ControlBarButton (Page 3828)

ControlBarButton.Graphic

Description

The "Graphic" property specifies the graphic of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Graphic
```

See also

ControlBarButton (Page 3828)

ControlBarButton.Height

Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Height
```

See also

ControlBarButton (Page 3828)

ControlBarButton.HotKey

Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
ControlBarButton.HotKey
```

See also

ControlBarButton (Page 3828)

ControlBarButton.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog

- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled

- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarButton.Mapping
```

See also

ControlBarButton (Page 3828)

ControlBarButton.Margin

Description

The "Margin" property specifies the surrounded outer distance of the button.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarButton.Margin
```

See also

ControlBarButton (Page 3828)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarButton.Margin (Page 3843)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarButton.Margin (Page 3843)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarButton.Margin (Page 3843)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarButton.Margin (Page 3843)

ControlBarButton.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumHeight
```

See also

ControlBarButton (Page 3828)

ControlBarButton.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumWidth
```

See also

ControlBarButton (Page 3828)

ControlBarButton.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumHeight
```

See also

ControlBarButton (Page 3828)

ControlBarButton.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumWidth
```

See also

ControlBarButton (Page 3828)

ControlBarButton.Operability

Description

The "Operability" property returns whether the button is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarButton.Operability
```

See also

ControlBarButton (Page 3828)

ControlBarButton.Padding

Description

The "Padding" property specifies the distance of the content from the border of the button.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarButton.Padding
```

See also

ControlBarButton (Page 3828)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarButton.Padding (Page 3849)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarButton.Padding (Page 3849)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarButton.Padding (Page 3849)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarButton.Padding (Page 3849)

ControlBarButton.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarButton.RequireExplicitUnlock
```

See also

ControlBarButton (Page 3828)

ControlBarButton.Text

Description

The "Text" property specifies the label of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Text
```

See also

ControlBarButton (Page 3828)

ControlBarButton.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.ToolTipText
```

See also

ControlBarButton (Page 3828)

ControlBarButton.Visible

Description

The "Visible" property specifies whether the button is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Visible
```

See also

ControlBarButton (Page 3828)

ControlBarButton.Width

Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Width
```

See also

ControlBarButton (Page 3828)

ControlBarDisplay

Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarDisplayPart

Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the display area is enabled in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the display area.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.

- **Operability**
  Returns whether the display area is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the display area is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarDisplay.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarDislay.Authorization
```

See also

ControlBarDisplay (Page 3854)

ControlBarDisplay.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarDislay.Content
```

See also

ControlBarDisplay (Page 3854)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarDisplay.Content (Page 3856)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarDisplay.Content (Page 3856)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarDisplay.Content (Page 3856)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarDisplay.Content (Page 3856)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarDisplay.Content (Page 3856)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarDisplay.Content (Page 3856)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarDisplay.Content (Page 3856)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarDisplay.Content (Page 3856)

ControlBarDisplay.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarDislay.CustomID
```

See also

ControlBarDisplay (Page 3854)

ControlBarDisplay.Enabled

Description

The "Enabled" property specifies whether the display is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Enabled
```

See also

ControlBarDisplay (Page 3854)

ControlBarDisplay.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.ForeColor
```

See also

ControlBarDisplay (Page 3854)

ControlBarDisplay.Graphic

Description

The "Graphic" property specifies the graphic of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Graphic
```

See also

ControlBarDisplay (Page 3854)

ControlBarDisplay.Height

Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Height
```

See also

ControlBarDisplay (Page 3854)

ControlBarDisplay.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarDislay.Mapping
```

See also

ControlBarDisplay (Page 3854)

ControlBarDisplay.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the display.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarDislay.Margin
```

See also

ControlBarDisplay (Page 3854)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarDisplay.Margin (Page 3866)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarDisplay.Margin (Page 3866)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarDisplay.Margin (Page 3866)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarDisplay.Margin (Page 3866)

ControlBarDisplay.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumHeight
```

See also

ControlBarDisplay (Page 3854)

ControlBarDisplay.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumWidth
```

See also

ControlBarDisplay (Page 3854)

ControlBarDisplay.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumHeight
```

See also

ControlBarDisplay (Page 3854)

ControlBarDisplay.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumWidth
```

See also

ControlBarDisplay (Page 3854)

ControlBarDisplay.Operability

Description

The "Operability" property returns whether the display is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarDislay.Operability
```

See also

ControlBarDisplay (Page 3854)

ControlBarDisplay.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the display.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarDislay.Padding
```

See also

ControlBarDisplay (Page 3854)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarDisplay.Padding (Page 3871)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarDisplay.Padding (Page 3871)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarDisplay.Padding (Page 3871)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarDisplay.Padding (Page 3871)

ControlBarDisplay.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarDislay.RequireExplicitUnlock
```

See also

ControlBarDisplay (Page 3854)

ControlBarDisplay.Text

Description

The "Text" property specifies the label of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Text
```

See also

ControlBarDisplay (Page 3854)

ControlBarDisplay.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.ToolTipText
```

See also

ControlBarDisplay (Page 3854)

ControlBarDisplay.Visible

Description

The "Visible" property specifies whether the display is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Visible
```

See also

ControlBarDisplay (Page 3854)

ControlBarDisplay.Width

Description

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Width
```

See also

ControlBarDisplay (Page 3854)

ControlBarLabel

Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar.

You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarLabelPart

Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the identifier can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the identifier.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.

- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the identifier is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the identifier is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarLabel.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarLabel.Authorization
```

See also

ControlBarLabel (Page 3876)

ControlBarLabel.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarLabel.CustomID
```

See also

ControlBarLabel (Page 3876)

ControlBarLabel.Enabled

Description

The "Enabled" property specifies whether the identifier is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Enabled
```

See also

ControlBarLabel (Page 3876)

ControlBarLabel.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.ForeColor
```

See also

ControlBarLabel (Page 3876)

ControlBarLabel.Height

Description

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Height
```

See also

ControlBarLabel (Page 3876)

ControlBarLabel.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

See also

ControlBarLabel (Page 3876)

ControlBarLabel.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarLabel.Mapping
```

See also

ControlBarLabel (Page 3876)

ControlBarLabel.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarLabel.Margin
```

See also

ControlBarLabel (Page 3876)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarLabel.Margin (Page 3883)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarLabel.Margin (Page 3883)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarLabel.Margin (Page 3883)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarLabel.Margin (Page 3883)

ControlBarLabel.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumHeight
```

See also

ControlBarLabel (Page 3876)

ControlBarLabel.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumWidth
```

See also

ControlBarLabel (Page 3876)

ControlBarLabel.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumHeight
```

See also

ControlBarLabel (Page 3876)

ControlBarLabel.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumWidth
```

See also

ControlBarLabel (Page 3876)

ControlBarLabel.Operability

Description

The "Operability" property returns whether the identifier is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarLabel.Operability
```

See also

ControlBarLabel (Page 3876)

ControlBarLabel.Padding

Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarLabel.Padding
```

See also

ControlBarLabel (Page 3876)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarLabel.Padding (Page 3888)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarLabel.Padding (Page 3888)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarLabel.Padding (Page 3888)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarLabel.Padding (Page 3888)

ControlBarLabel.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarLabel.RequireExplicitUnlock
```

See also

ControlBarLabel (Page 3876)

ControlBarLabel.Text

Description

The "Text" property specifies the label of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.Text
```

See also

ControlBarLabel (Page 3876)

ControlBarLabel.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.ToolTipText
```

See also

ControlBarLabel (Page 3876)

ControlBarLabel.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.VerticalTextAlignment
```

See also

ControlBarLabel (Page 3876)

ControlBarLabel.Visible

Description

The "Visible" property specifies whether the identifier is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Visible
```

See also

ControlBarLabel (Page 3876)

ControlBarLabel.Width

Description

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Width
```

See also

ControlBarLabel (Page 3876)

ControlBarSeparator

Description

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarSeparatorPart

Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the disconnector can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the separator.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the separator is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the disconnector is only operable while the associated button is being pressed.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the disconnector is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarSeparator.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarSeparator.Authorization
```

See also

ControlBarSeparator (Page 3893)

ControlBarSeparator.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarSeparator.CustomID
```

See also

ControlBarSeparator (Page 3893)

ControlBarSeparator.Enabled

Description

The "Enabled" property specifies whether the separator is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Enabled
```

See also

ControlBarSeparator (Page 3893)

ControlBarSeparator.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.ForeColor
```

See also

ControlBarSeparator (Page 3893)

ControlBarSeparator.Height

Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Height
```

See also

ControlBarSeparator (Page 3893)

ControlBarSeparator.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarSeparator.Mapping
```

See also

ControlBarSeparator (Page 3893)

ControlBarSeparator.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the separator.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarSeparator.Margin
```

See also

ControlBarSeparator (Page 3893)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarSeparator.Margin (Page 3899)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarSeparator.Margin (Page 3899)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarSeparator.Margin (Page 3899)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarSeparator.Margin (Page 3899)

ControlBarSeparator.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumHeight
```

See also

ControlBarSeparator (Page 3893)

ControlBarSeparator.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumWidth
```

See also

ControlBarSeparator (Page 3893)

ControlBarSeparator.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumHeight
```

See also

ControlBarSeparator (Page 3893)

ControlBarSeparator.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumWidth
```

See also

ControlBarSeparator (Page 3893)

ControlBarSeparator.Operability

Description

The "Operability" property returns whether the separator is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarSeparator.Operability
```

See also

ControlBarSeparator (Page 3893)

ControlBarSeparator.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the separator.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarSeparator.Padding
```

See also

ControlBarSeparator (Page 3893)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarSeparator.Padding (Page 3904)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarSeparator.Padding (Page 3904)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarSeparator.Padding (Page 3904)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarSeparator.Padding (Page 3904)

ControlBarSeparator.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the disconnector can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarSeparator.RequireExplicitUnlock
```

See also

ControlBarSeparator (Page 3893)

ControlBarSeparator.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

Type

String

Access

Read-write

Syntax

```
ControlBarSeparator.ToolTipText
```

See also

ControlBarSeparator (Page 3893)

ControlBarSeparator.Visible

Description

The "Visible" property specifies whether the separator is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Visible
```

See also

ControlBarSeparator (Page 3893)

ControlBarSeparator.Width

Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Width
```

See also

ControlBarSeparator (Page 3893)

ControlBarTextBox

Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarTextBoxPart

Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the text box can be operated in runtime.
- **ForeColor**
  Specifies the font color.

- **Height**
  Specifies the height.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Mapping**
  Returns the function of the text box.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the text box is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **Readonly**
  Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**
  Returns whether the text box is only operable while the associated button is being pressed.
- **Text**
  Specifies the labeling.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the text box is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarTextBox.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.AlternateBorderColor
```

See also

ControlBarTextBox (Page 3909)

ControlBarTextBox.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarTextBox.Authorization
```

See also

ControlBarTextBox (Page 3909)

ControlBarTextBox.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BackColor
```

See also

ControlBarTextBox (Page 3909)

ControlBarTextBox.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BorderColor
```

See also

ControlBarTextBox (Page 3909)

ControlBarTextBox.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarTextBox.BorderWidth
```

See also

ControlBarTextBox (Page 3909)

ControlBarTextBox.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarTextBox.CustomID
```

See also

ControlBarTextBox (Page 3909)

ControlBarTextBox.Enabled

Description

The "Enabled" property specifies whether the text box can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Enabled
```

See also

ControlBarTextBox (Page 3909)

ControlBarTextBox.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.ForeColor
```

See also

ControlBarTextBox (Page 3909)

ControlBarTextBox.Height

Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Height
```

See also

ControlBarTextBox (Page 3909)

ControlBarTextBox.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

See also

ControlBarTextBox (Page 3909)

ControlBarTextBox.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarTextBox.Mapping
```

See also

ControlBarTextBox (Page 3909)

ControlBarTextBox.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the text box.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarTextBox.Margin
```

See also

ControlBarTextBox (Page 3909)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarTextBox.Margin (Page 3918)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarTextBox.Margin (Page 3918)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarTextBox.Margin (Page 3918)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarTextBox.Margin (Page 3918)

ControlBarTextBox.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumHeight
```

See also

ControlBarTextBox (Page 3909)

ControlBarTextBox.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumWidth
```

See also

ControlBarTextBox (Page 3909)

ControlBarTextBox.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumHeight
```

See also

ControlBarTextBox (Page 3909)

ControlBarTextBox.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumWidth
```

See also

ControlBarTextBox (Page 3909)

ControlBarTextBox.Operability

Description

The "Operability" property returns whether the text box is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarTextBox.Operability
```

See also

ControlBarTextBox (Page 3909)

ControlBarTextBox.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the text box.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarTextBox.Padding
```

See also

ControlBarTextBox (Page 3909)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarTextBox.Padding (Page 3923)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarTextBox.Padding (Page 3923)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarTextBox.Padding (Page 3923)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarTextBox.Padding (Page 3923)

ControlBarTextBox.ReadOnly

Description

The "ReadOnly" property specifies whether the text box is read-only.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.ReadOnly
```

See also

ControlBarTextBox (Page 3909)

ControlBarTextBox.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

See also

ControlBarTextBox (Page 3909)

ControlBarTextBox.Text

Description

The "Text" property specifies the label of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.Text
```

See also

ControlBarTextBox (Page 3909)

ControlBarTextBox.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.ToolTipText
```

See also

ControlBarTextBox (Page 3909)

ControlBarTextBox.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

See also

ControlBarTextBox (Page 3909)

ControlBarTextBox.Visible

Description

The "Visible" property specifies whether the text box is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Visible
```

See also

ControlBarTextBox (Page 3909)

ControlBarTextBox.Width

Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Width
```

See also

ControlBarTextBox (Page 3909)

ControlBarToggleSwitch

Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar.

You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarToggleSwitchPart

Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".

- **AlternateGraphic**
  Specifies the graphic for the "pressed" state.
- **AlternateText**
  Specifies the text for the "pressed" state.
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the identifier of the switch.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the switch can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the switch.
- **IsAlternateState**
  Specifies the current state of the switch.
- **Mapping**
  Returns the function of the switch.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.

- **Operability**
  Returns whether the switch is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the switch is only operable while the associated button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the switch is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarToggleSwitch.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.AlternateGraphic

Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateGraphic
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.AlternateText

Description

The "AlternateText" property specifies the text of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateText
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Authorization
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BackColor
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.Badge

Description

The "Badge" property specifies the identifier of the switch.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Badge
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderColor
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderWidth
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Content
```

See also

ControlBarToggleSwitch (Page 3929)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarToggleSwitch.Content (Page 3936)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarToggleSwitch.Content (Page 3936)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 3936)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarToggleSwitch.Content (Page 3936)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarToggleSwitch.Content (Page 3936)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarToggleSwitch.Content (Page 3936)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarToggleSwitch.Content (Page 3936)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 3936)

ControlBarToggleSwitch.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarToggleSwitch.CustomID
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.Enabled

Description

The "Enabled" property specifies whether the switch can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Enabled
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ForeColor
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.Graphic

Description

The "Graphic" property specifies the graphic of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Graphic
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.Height

Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Height
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.HotKey

Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
Button.HotKey
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.IsAlternateState

Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Mapping
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the switch.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Margin
```

See also

ControlBarToggleSwitch (Page 3929)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarToggleSwitch.Margin (Page 3947)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarToggleSwitch.Margin (Page 3947)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarToggleSwitch.Margin (Page 3947)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarToggleSwitch.Margin (Page 3947)

ControlBarToggleSwitch.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumHeight
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumWidth
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumHeight
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumWidth
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.Operability

Description

The property "Operability" returns whether the switch is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Operability
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the switch.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Padding
```

See also

ControlBarToggleSwitch (Page 3929)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarToggleSwitch.Padding (Page 3952)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarToggleSwitch.Padding (Page 3952)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarToggleSwitch.Padding (Page 3952)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarToggleSwitch.Padding (Page 3952)

ControlBarToggleSwitch.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.Text

Description

The "Text" property specifies the label of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Text
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ToolTipText
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.Visible

Description

The "Visible" property specifies whether the switch is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Visible
```

See also

ControlBarToggleSwitch (Page 3929)

ControlBarToggleSwitch.Width

Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Width
```

See also

ControlBarToggleSwitch (Page 3929)

ToolBar.Enabled

Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Enabled
```

See also

ObjectExplorerControl.ToolBar (Page 3824)

ToolBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ToolBar.Font
```

See also

ObjectExplorerControl.ToolBar (Page 3824)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ToolBar.Font (Page 3958)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ToolBar.Font (Page 3958)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ToolBar.Font (Page 3958)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ToolBar.Font (Page 3958)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ToolBar.Font (Page 3958)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ToolBar.Font (Page 3958)

ToolBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the toolbar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ToolBar.Margin
```

See also

ObjectExplorerControl.ToolBar (Page 3824)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ToolBar.Margin (Page 3961)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ToolBar.Margin (Page 3961)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ToolBar.Margin (Page 3961)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ToolBar.Margin (Page 3961)

ToolBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ToolBar.Padding
```

See also

ObjectExplorerControl.ToolBar (Page 3824)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ToolBar.Padding (Page 3964)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ToolBar.Padding (Page 3964)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ToolBar.Padding (Page 3964)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ToolBar.Padding (Page 3964)

ToolBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.ShowToolTips
```

See also

ObjectExplorerControl.ToolBar (Page 3824)

ToolBar.UseHotKeys

Description

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.UseHotKeys
```

See also

ObjectExplorerControl.ToolBar (Page 3824)

ToolBar.Visible

Description

The "Visible" property specifies whether the toolbar is visible.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Visible
```

See also

ObjectExplorerControl.ToolBar (Page 3824)

ObjectExplorerControl.Top

Description

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
ObjectExplorerControl.Top
```

See also

ObjectExplorerControl (Page 3789)

ObjectExplorerControl.Visible

Description

The "Visible" property specifies whether the display is visible.

Type

Bool

Access

Read-write

Syntax

```
ObjectExplorerControl.Visible
```

See also

ObjectExplorerControl (Page 3789)

ObjectExplorerControl.Width

Description

The "Width" property specifies the width in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ObjectExplorerControl.Width
```

See also

ObjectExplorerControl (Page 3789)

ObjectExplorerControl.WindowFlags

Description

The "WindowFlags" property specifies the window configuration of the display.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title

- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

You can enable multiple properties by adding integer values or bit operators.

Access

Read-write

Syntax

```
ObjectExplorerControl.WindowFlags
```

See also

ObjectExplorerControl (Page 3789)

ObjectExplorerControl.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the display.

Syntax

```
ObjectExplorerControl.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

ObjectExplorerControl (Page 3789)

ObjectExplorerControl.FireCommand()

Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the display.

Syntax

```
ObjectExplorerControl.FireCommand(commandId, custom)
```

Parameters

commandId

Type: Int32

ID of the element of the toolbar or information bar

custom

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

Return value

--

See also

ObjectExplorerControl (Page 3789)

ObjectExplorerControl.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
ObjectExplorerControl.PropertyFlashing(propertyName, enable[, value]
[, alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

ObjectExplorerControl (Page 3789)

OpenLinkElement

Description

The "OpenLinkElement" object displays the connection to a database.

Object type

HmiOpenLinkElement

Properties

The "OpenLinkElement" object has the following properties:

- **ActiveOnStartup**
  Returns whether the connection is active on startup.
- **Application**
  Specifies the application.
- **ContainedType**
  Returns the type of the contained properties.
- **OpenLinkMode**
  Returns the connection.
- **Parent**
  Returns the higher-level screen object.
- **Pipe**
  Specifies the data stream.
- **Properties**
  Enables access to the properties of the connected object.

Methods

The "OpenLinkElement" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the connection.
- **PropertyFlashing()**
  Configures flashing of a property.

- **Start()**
  Starts the connection.
- **Stop()**
  Terminates the connection.

OpenLinkElement.ActiveOnStartup

Description

The "ActiveOnStartup" property returns whether the connection is active on startup.

Type

Bool

Access

Read-only

Syntax

```
OpenLinkElement.ActiveOnStartup
```

See also

OpenLinkElement (Page 3973)

OpenLinkElement.Application

Description

The "Application" property specifies the application.

Type

Object, HmiApplicationPart

Access

Read-write

Syntax

```
OpenLinkElement.Application
```

See also

OpenLinkElement (Page 3973)

Application.ApplicationExitCode

Description

The "ApplicationExitCode" property returns the exit code of the application.

Type

UInt32

Access

Read-only

Syntax

```
Application.ApplicationExitCode
```

See also

OpenLinkElement.Application (Page 3974)

Application.ApplicationName

Description

The "ApplicationName" property returns the name of the application.

Type

String

Access

Read-only

Syntax

```
Application.ApplicationName
```

See also

OpenLinkElement.Application (Page 3974)

Application.ApplicationState

Description

The "ApplicationState" property returns the status of the application.

Type

Int32, HmiApplicationState

Returns the status.

- None (0): None
- Running (1): Running
- Terminated (2): Completed
- Crashed (3): Crashed
- CreateFailed (4): Create failed

Access

Read-only

Syntax

```
Application.ApplicationState
```

See also

OpenLinkElement.Application (Page 3974)

Application.Arguments

Description

The "Arguments" property returns the parameters of the application.

Type

String

Access

Read-only

Syntax

```
Application.Arguments
```

See also

OpenLinkElement.Application (Page 3974)

Application.Environment

Description

The "Environment" property returns the environment of the application.

Type

String

Access

Read-only

Syntax

```
Application.Environment
```

See also

OpenLinkElement.Application (Page 3974)

Application.TerminateApplicationOnLeave

Description

The "TerminateApplicationOnLeave" property returns whether the application is terminated on exit.

Type

Bool

Access

Read-only

Syntax

```
Application.TerminateApplicationOnLeave
```

See also

OpenLinkElement.Application (Page 3974)

Application.WorkingDirectory

Description

The "WorkingDirectory" property returns the working directory of the application.

Type

String

Access

Read-only

Syntax

```
Application.WorkingDirectory
```

See also

OpenLinkElement.Application (Page 3974)

OpenLinkElement.ContainedType

Description

The "ContainedType" property returns the type of the contained properties (CustomControl, SwacComponent, or WidgetType).

Type

String

Access

Read-only

Syntax

```
OpenLinkElement.ContainedType
```

See also

OpenLinkElement (Page 3973)

OpenLinkElement.OpenLinkMode

Description

The "OpenLinkMode" property returns the type of connection.

Type

Int32, HmiOpenLinkMode

Returns the type of connection.

- None (0): None
- Create (1): Create or end external process.
- CreateAndConnect (2): Create data stream and end data stream.
- Connect (3): Use a named data stream that already exists (connect and disconnect).

Access

Read-only

Syntax

```
OpenLinkElement.OpenLinkMode
```

See also

OpenLinkElement (Page 3973)

OpenLinkElement.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
OpenLinkElement.Parent
```

See also

OpenLinkElement (Page 3973)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

OpenLinkElement.Pipe

Description

The "Pipe" property specifies the data stream.

Type

Object, HmiPipePart

Access

Read-write

Syntax

```
OpenLinkElement.Pipe
```

See also

OpenLinkElement (Page 3973)

Pipe.CharSet

Description

The "CharSet" property specifies the character set of the data stream.

Type

Int32, HmiCharSet

Specifies the character set:

- Console (0): Depending on the setting of the operating system during runtime
- UTF8 (1): UTF-8
- UTF16 (2): UTF 16

Access

Read-write

Syntax

```
Pipe.CharSet
```

See also

OpenLinkElement.Pipe (Page 3980)

Pipe.LastPropertyRequestResult

Description

The "LastPropertyRequestResult" property returns the result of the last read or write operation of a property of the data stream.

Type

Int32, HmiRequestResult

Returns the result:

- None (0): None
- Success (1): Success
- AccessDenied (2): Access denied
- InvalidName (3): Invalid name

Access

Read-only

Syntax

```
Pipe.LastPropertyRequestResult
```

See also

OpenLinkElement.Pipe (Page 3980)

Pipe.PipeName

Description

The "PipeName" property returns the name of the data stream.

Type

String

Access

Read-only

Syntax

```
Pipe.PipeName
```

See also

OpenLinkElement.Pipe (Page 3980)

Pipe.PipeState

Description

The "PipeState" property returns the connection status of the data stream.

Type

Int32, HmiPipeConnectionState

Returns the connection status:

- Unavailable (0): Initial state or closed
- Connected (1): Connected
- Disconnected (2): Disconnected

Access

Read-only

Syntax

```
Pipe.PipeState
```

See also

OpenLinkElement.Pipe (Page 3980)

Pipe.ReconnectAutomatically

Description

The "ReconnectAutomatically" property returns whether the data stream is automatically reconnected.

Type

Bool

Access

Read-only

Syntax

```
Pipe.ReconnectAutomatically
```

See also

OpenLinkElement.Pipe (Page 3980)

OpenLinkElement.Properties

Description

The "Properties" property enables access to dynamic properties of the connected object (e.g. interface tags and interface properties of a faceplate type).

Type

Object, HmiDynamicPropertyPart

Access

Read-write

Syntax

```
OpenLinkElement.Properties
```

See also

OpenLinkElement (Page 3973)

OpenLinkElement.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the connection.

Syntax

```
OpenLinkElement.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

OpenLinkElement (Page 3973)

OpenLinkElement.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
OpenLinkElement.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

OpenLinkElement (Page 3973)

OpenLinkElement.Start()

Description

The "Start" method starts the connection.

Syntax

```
OpenLinkElement.Start()
```

Parameters

--

Return value

--

See also

OpenLinkElement (Page 3973)

OpenLinkElement.Stop()

Description

The "Stop" method terminates the connection.

Syntax

```
OpenLinkElement.Stop()
```

Parameters

--

Return value

--

See also

OpenLinkElement (Page 3973)

OverviewParameterControl

Description

The "OverviewParameterControl" object represents a parameter overview in runtime.

Object type

HmiOverviewParameterControl

Properties

The "OverviewParameterControl" object has the following properties:

- **BackColor**
  Specifies the background color.
- **Caption**
  Specifies the text that is displayed in the title bar.
- **CaptionColor**
  Specifies the background color of the title bar.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the parameter overview.
- **DetailedParameterControl**
  Specifies the parameter set control of tag values.
- **EditMode**
  Specifies the editing mode for values in runtime.
- **Enabled**
  Specifies whether the parameter overview can be operated in runtime.
- **Filter**
  Specifies a string for filtering parameters.
- **Height**
  Specifies the height.
- **Icon**
  Specifies the icon of the parameter overview.
- **Layer**
  Returns the screen layer in which the parameter overview is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the parameter overview.
- **ParameterSetTypeDefault**
  Specifies the standard parameter set type.

- **ParameterView**
  Defines the appearance of the parameter table.
- **Parent**
  Returns the higher-level screen object.
- **RenderingTemplate**
  Returns the name of the template from which the parameter overview was created.
- **ShowFocusVisual**
  Specifies whether the parameter overview is highlighted when in focus.
- **StatusBar**
  Specifies the information bar of the parameter overview.
- **StyleItemClass**
  Returns the style which is applied to the parameter overview.
- **TabIndex**
  Returns the position of the parameter overview in the tab sequence.
- **TimeZone**
  Specifies the time zone.
- **ToolBar**
  Specifies the toolbar of the parameter overview.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the parameter overview is visible.
- **Width**
  Specifies the width.
- **WindowFlags**
  Specifies the window configuration of the parameter overview.

Methods

The "OverviewParameterControl" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the parameter overview.
- **FireCommand()**
  Configures the occurrence of an event for an element.
- **PropertyFlashing()**
  Configures flashing of a property.

OverviewParameterControl.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
OverviewParameterControl.BackColor
```

See also

OverviewParameterControl (Page 3987)

OverviewParameterControl.Caption

Description

The "Caption" property specifies the text that is displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
OverviewParameterControl.Caption
```

See also

OverviewParameterControl (Page 3987)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

OverviewParameterControl.Caption (Page 3989)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 3989)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 3989)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 3989)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 3989)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 3989)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 3989)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

OverviewParameterControl.Caption (Page 3989)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

OverviewParameterControl.Caption (Page 3989)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

OverviewParameterControl.Caption (Page 3989)

OverviewParameterControl.CaptionColor

Description

The "CaptionColor" property specifies the color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
OverviewParameterControl.CaptionColor
```

See also

OverviewParameterControl (Page 3987)

OverviewParameterControl.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the parameter overview.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
OverviewParameterControl.CurrentQuality
```

See also

OverviewParameterControl (Page 3987)

OverviewParameterControl.DetailedParameterControl

Description

The "DetailedParameterControl" property specifies the parameter set control of tag values.

Type

Object, HmiDetailedParameterControl (Page 2587)

Access

Read-write

Syntax

```
OverviewParameterControl.DetailedParameterControl
```

See also

OverviewParameterControl (Page 3987)

DetailedParameterControl (Page 2587)

DetailedParameterControl

Description

DetailedParameterControl (Page 2587)

OverviewParameterControl.EditMode

Description

The "EditMode" property specifies the editing mode for values in runtime.

Type

Int32, HmiEditMode

Specifies the editing mode:

- None (0): No access
- Update (1): Update values
- Create (2): Create values
- Delete (4): Delete values

Access

Read-write

Syntax

```
OverviewParameterControl.EditMode
```

See also

OverviewParameterControl (Page 3987)

OverviewParameterControl.Enabled

Description

The "Enabled" property specifies whether the parameter overview can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
OverviewParameterControl.Enabled
```

See also

OverviewParameterControl (Page 3987)

OverviewParameterControl.Filter

Description

The "Filter" property specifies a string for filtering parameters.

The syntax of the filter string corresponds to the WHERE clause of an SQL command.

Type

String

Access

Read-write

Syntax

```
OverviewParameterControl.Filter
```

Operators

The following operators can be used in the filter string:

Operator	Description	Example
`=`	equal to	`AlarmClassName = 'demo'`
`IS NOT string`	is not equal to the string *string*	`AlarmText4 IS NOT 'Text5'`
`<>`	not equal	`Value <> 0.0`
`>`	greater than	`ModificationTime > '11.08.2016'`
`<`	less than	`Value < 75.0`
`>=`	greater than or equal to	`Value >= 25.0`
`<=`	less than or equal to	`Value <= 75.0`
`OR, ||`	logical OR	`State = 1 OR State = 3`
`AND, &&`	logical AND	`EventText = 'Text1' AND Origin = 'Motor'`
`BETWEEN`	within a range	`Value BETWEEN 25.0 AND 75.0`
`NOT BETWEEN`	outside a range	`Value NOT BETWEEN 25.0 AND 75.0`
`LIKE string`	corresponds to the string *string*	`Name LIKE 'Motor*'`
`NOT LIKE string`	does not correspond to the string *string*	`Name NOT LIKE 'Valve*'`
`IN (v1, v2, …)`	corresponds to one or more values	`State IN (1, 4, 7)`
`NOT IN (v1, v2, …)`	does not correspond to one or more values	`State NOT IN (0, 2, 3, 5, 6)`
`IS NULL`	compares to zero (missing data)	`Context IS NULL`
`IS NOT NULL`	compares to zero (unknown data)	`Context IS NOT NULL`

Wildcards

The following wildcards can be used for characters of filter strings:

Wildcard	Description	Example
*	replaces 0, 1 or more characters	`Name LIKE 'Motor*'`
?	replaces exactly 1 character	`Name = 'Recipe?'`

See also

OverviewParameterControl (Page 3987)

OverviewParameterControl.Height

Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
OverviewParameterControl.Height
```

See also

OverviewParameterControl (Page 3987)

OverviewParameterControl.Icon

Description

The "Icon" property specifies the icon of the parameter overview.

Type

String

Access

Read-write

Syntax

```
OverviewParameterControl.Icon
```

See also

OverviewParameterControl (Page 3987)

OverviewParameterControl.Layer

Description

The "Layer" property returns the screen layer in which the parameter overview is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
OverviewParameterControl.Layer
```

See also

OverviewParameterControl (Page 3987)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

OverviewParameterControl.Layer (Page 4000)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

OverviewParameterControl.Layer (Page 4000)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

OverviewParameterControl.Layer (Page 4000)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

OverviewParameterControl.Layer (Page 4000)

OverviewParameterControl.Left

Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
OverviewParameterControl.Left
```

See also

OverviewParameterControl (Page 3987)

OverviewParameterControl.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
OverviewParameterControl.Margin
```

See also

OverviewParameterControl (Page 3987)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

OverviewParameterControl.Margin (Page 4003)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

OverviewParameterControl.Margin (Page 4003)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

OverviewParameterControl.Margin (Page 4003)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

OverviewParameterControl.Margin (Page 4003)

OverviewParameterControl.Name

Description

The "Name" property returns the name of the parameter overview.

Type

String

Access

Read-only

Syntax

```
OverviewParameterControl.Name
```

See also

OverviewParameterControl (Page 3987)

OverviewParameterControl.ParameterSetTypeDefault

Description

The "ParameterSetTypeDefault" property specifies the standard parameter set type.

Type

Object, HmiParameterSetType (Page 1234)

Access

Read-write

Syntax

```
OverviewParameterControl.ParameterSetTypeDefault
```

See also

OverviewParameterControl (Page 3987)

ParameterSetType (Page 1234)

ParameterSetType

Description

ParameterSetType (Page 1234)

OverviewParameterControl.ParameterView

Description

The "ParameterView" property defines the appearance of the parameter table.

Type

Object, HmiDataGridViewPart (Page 4007)

Access

Read-write

Syntax

```
OverviewParameterControl.ParameterView
```

See also

DataGridView (Page 4007)

DataGridView

DataGridView.AllowFilter

Description

The "AllowFilter" property specifies whether filtering of columns is permitted.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.AllowFilter
```

See also

OverviewParameterControl.ParameterView (Page 4006)

DataGridView.AllowSort

Description

The "AllowSort" property specifies whether the sorting of columns is permitted.

- True: Activates the sorting and sets the "AllowSort" property of all columns to "true".
- False: Disables the sorting for all columns. The individual column properties remain unchanged.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.AllowSort
```

See also

OverviewParameterControl.ParameterView (Page 4006)

DataGridView.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.AlternateBackColor
```

See also

OverviewParameterControl.ParameterView (Page 4006)

DataGridView.AlternateForeColor

Description

The "AlternateForeColor" property specifies the flashing color for the text.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.AlternateForeColor
```

See also

OverviewParameterControl.ParameterView (Page 4006)

DataGridView.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.BackColor
```

See also

OverviewParameterControl.ParameterView (Page 4006)

DataGridView.CellPadding

Description

The "CellPadding" property specifies the inner spacing of the content from the cell border.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
DataGridView.CellPadding
```

See also

OverviewParameterControl.ParameterView (Page 4006)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

DataGridView.CellPadding (Page 4009)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

DataGridView.CellPadding (Page 4009)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

DataGridView.CellPadding (Page 4009)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

DataGridView.CellPadding (Page 4009)

DataGridView.ColoringMode

Description

The "ColoringMode" property specifies whether alternate coloring of every other row or column is enabled.

Type

Int32, HmiGridColoringMode

Specifies the type of the coloring:

- None (0): None
- Columns (1): Color the columns alternately.
- Rows (2): Color the rows alternately.

Access

Read-write

Syntax

```
DataGridView.ColoringMode
```

See also

OverviewParameterControl.ParameterView (Page 4006)

DataGridView.Columns

Description

The "Columns" property represents the quantity of columns.

Type

Object, HmiDataGridColumnCollection (Page 4013)

Access

Read-only

Syntax

```
DataGridView.Columns
```

See also

OverviewParameterControl.ParameterView (Page 4006)

HmiDataGridColumnCollection (Page 4013)

HmiDataGridColumnCollection

Description

The "HmiDataGridColumnCollection" object is a list of all columns ("DataGridColumn" objects) of the table.

You reference a "HmiDataGridColumnCollection" object via the `DataGridView.Columns` property.

Use

The "HmiDataGridColumnCollection" object is a list and can be counted and enumerated. You can access the "HmiDataGridColumnCollection" list using the index or the tag name.

Object type

HmiDataGridColumnCollection

Properties

The "HmiDataGridColumnCollection" object has the following properties:

- **Count**
  Returns the number of columns in the "HmiDataGridColumnCollection" list.

Methods

The "HmiDataGridColumnCollection" object has the following methods:

- **Item()**
  Returns a column of the "HmiDataGridColumnCollection" list.

See also

DataGridView.Columns (Page 4013)

HmiDataGridColumnCollection.Count

Description

The "Count" property returns the number of columns in the "HmiDataGridColumnCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiDataGridColumnCollection.Count
```

See also

HmiDataGridColumnCollection (Page 4013)

HmiDataGridColumnCollection.Item()

Description

The "Item" method returns a column of the "HmiDataGridColumnCollection" list.

Syntax

```
HmiDataGridColumnCollection[.Item](HmiDataGridColumnName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiDataGridColumnCollection" object.

Parameters

`HmiDataGridColumnName`

Type: String

Name of the column

Return value

Object, HmiDataGridColumnPartBase (Page 4015)

See also

HmiDataGridColumnCollection (Page 4013)

OverviewParameterControlColumn (Page 4015)

OverviewParameterControlColumn

Description

The "OverviewParameterControlColumn" object represents a value column.

Object type

HmiOverviewParameterControlColumnPart

Properties

The "OverviewParameterControlColumn" object has the following properties:

- **AllowSort**
  Specifies whether column sorting is allowed.
- **BackColor**
  Specifies the background color.
- **Content**
  Specifies display options for text and graphics.

- **Enabled**
  Specifies whether the column can be operated in runtime.
- **ForeColor**
  Specifies the font color of the text.
- **Header**
  Specifies the properties of the column header.
- **Key**
  Corresponds to the column definition from the "ConsideredColumns" property of the connected source.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumWidth**
  Specifies the minimum width.
- **Name**
  Returns the name of the column.
- **OutputFormat**
  Specifies the format for displaying values.
- **OverviewParameterControlBlock**
  Specifies the information blocks.
- **SortDirection**
  Specifies the sorting direction.
- **SortOrder**
  Specifies the sorting order.
- **Visible**
  Specifies whether the column is visible.
- **Width**
  Specifies the width.

Methods

--

See also

HmiDataGridColumnCollection (Page 4013)

OverviewParameterControlColumn.AllowSort

Description

The "AllowSort" property specifies whether column sorting is permitted.

This property is ignored if the parent object has the "AllowSort" property set to "False".

Type

Bool

Access

Read-write

Syntax

```
OverviewParameterControlColumn.AllowSort
```

See also

OverviewParameterControlColumn (Page 4015)

OverviewParameterControlColumn.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
OverviewParameterControlColumn.BackColor
```

See also

OverviewParameterControlColumn (Page 4015)

OverviewParameterControlColumn.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
OverviewParameterControlColumn.Content
```

See also

OverviewParameterControlColumn (Page 4015)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

OverviewParameterControlColumn.Content (Page 4017)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

OverviewParameterControlColumn.Content (Page 4017)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

OverviewParameterControlColumn.Content (Page 4017)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

OverviewParameterControlColumn.Content (Page 4017)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

OverviewParameterControlColumn.Content (Page 4017)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

OverviewParameterControlColumn.Content (Page 4017)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

OverviewParameterControlColumn.Content (Page 4017)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

OverviewParameterControlColumn.Content (Page 4017)

OverviewParameterControlColumn.Enabled

Description

The "Enabled" property specifies whether the column can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
OverviewParameterControlColumn.Enabled
```

See also

OverviewParameterControlColumn (Page 4015)

OverviewParameterControlColumn.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
OverviewParameterControlColumn.ForeColor
```

See also

OverviewParameterControlColumn (Page 4015)

OverviewParameterControlColumn.Header

Description

The "Header" property specifies the properties of the column header.

Type

Object, HmiDataGridColumnHeaderPart

Access

Read-write

Syntax

```
OverviewParameterControlColumn.Header
```

See also

OverviewParameterControlColumn (Page 4015)

DataGridColumnHeader.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
DataGridColumnHeader.Content
```

See also

OverviewParameterControlColumn.Header (Page 4024)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

DataGridColumnHeader.Content (Page 4024)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

DataGridColumnHeader.Content (Page 4024)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

DataGridColumnHeader.Content (Page 4024)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

DataGridColumnHeader.Content (Page 4024)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

DataGridColumnHeader.Content (Page 4024)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

DataGridColumnHeader.Content (Page 4024)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

DataGridColumnHeader.Content (Page 4024)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

DataGridColumnHeader.Content (Page 4024)

DataGridColumnHeader.Graphic

Description

The "Graphic" property specifies the graphic of the column header.

Type

String

Access

Read-write

Syntax

```
DataGridColumnHeader.Graphic
```

See also

OverviewParameterControlColumn.Header (Page 4024)

DataGridColumnHeader.Text

Description

The "Text" property specifies the label of the column header.

Type

String

Access

Read-write

Syntax

```
DataGridColumnHeader.Text
```

See also

OverviewParameterControlColumn.Header (Page 4024)

OverviewParameterControlColumn.Key

Description

The "Key" property corresponds to the column definition from the "ConsideredColumns" property of the connected source.

Type

String

Access

Read-only

Syntax

```
OverviewParameterControlColumn.Key
```

See also

OverviewParameterControlColumn (Page 4015)

OverviewParameterControlColumn.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
OverviewParameterControlColumn.MaximumWidth
```

See also

OverviewParameterControlColumn (Page 4015)

OverviewParameterControlColumn.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
OverviewParameterControlColumn.MinimumWidth
```

See also

OverviewParameterControlColumn (Page 4015)

OverviewParameterControlColumn.Name

Description

The "Name" property returns the name of the column.

Type

String

Access

Read-only

Syntax

```
OverviewParameterControlColumn.Name
```

See also

OverviewParameterControlColumn (Page 4015)

OverviewParameterControlColumn.OutputFormat

Description

The "OutputFormat" property specifies the format for displaying values.

Type

String

Access

Read-write

Syntax

```
OverviewParameterControlColumn.OutputFormat
```

See also

OverviewParameterControlColumn (Page 4015)

OverviewParameterControlColumn.OverviewParameterControlBlock

Description

The "OverviewParameterControlBlock" property specifies the information blocks.

Type

Int32, HmiOverviewParameterControlBlock

Specifies the information blocks:

- None (0): None
- ParameterSetID (1): ID
- LastUser (2): Last user
- LastAccess (3): Last access
- ParameterSetElementOdd (4): Generic columns (odd numbering)
- ParameterSetElementEven (5): Generic columns (even numbering)

Access

Read-write

Syntax

```
OverviewParameterControlColumn.OverviewParameterControlBlock
```

See also

OverviewParameterControlColumn (Page 4015)

OverviewParameterControlColumn.SortDirection

Description

The "SortDirection" property specifies the sorting direction.

Type

Int32, HmiSortDirection

Specifies the sorting order:

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

Access

Read-write

Syntax

```
OverviewParameterControlColumn.SortDirection
```

See also

OverviewParameterControlColumn (Page 4015)

OverviewParameterControlColumn.SortOrder

Description

The "SortOrder" property specifies the order of the sorting.

The sorting index starts at "1" (highest priority) in ascending order. Zero is ignored.

Type

UInt16

Access

Read-write

Syntax

```
OverviewParameterControlColumn.SortOrder
```

See also

OverviewParameterControlColumn (Page 4015)

OverviewParameterControlColumn.Visible

Description

The "Visible" property specifies whether the column is visible.

Type

Bool

Access

Read-write

Syntax

```
OverviewParameterControlColumn.Visible
```

See also

OverviewParameterControlColumn (Page 4015)

OverviewParameterControlColumn.Width

Description

The "Width" property specifies the width in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
OverviewParameterControlColumn.Width
```

See also

OverviewParameterControlColumn (Page 4015)

DataGridView.Font

Description

The "Font" property specifies the font of the cells.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
DataGridView.Font
```

See also

OverviewParameterControl.ParameterView (Page 4006)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

DataGridView.Font (Page 4036)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

DataGridView.Font (Page 4036)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

DataGridView.Font (Page 4036)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

DataGridView.Font (Page 4036)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

DataGridView.Font (Page 4036)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

DataGridView.Font (Page 4036)

DataGridView.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.ForeColor
```

See also

OverviewParameterControl.ParameterView (Page 4006)

DataGridView.GridLineColor

Description

The "GridLineColor" property specifies the color of grid lines.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.GridLineColor
```

See also

OverviewParameterControl.ParameterView (Page 4006)

DataGridView.GridLineVisibility

Description

The "GridLineVisibility" property specifies the visibility of the grid lines.

Type

Int32, HmiSimpleGridLine

Specifies the grid lines:

- None (0): None
- Vertikal (1): Vertical
- Horizontal (2): Horizontal

Access

Read-write

Syntax

```
DataGridView.GridLineVisibility
```

See also

OverviewParameterControl.ParameterView (Page 4006)

DataGridView.GridLineWidth

Description

The "GridLineWidth" property specifies the thickness of the grid lines in pixels.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.GridLineWidth
```

See also

OverviewParameterControl.ParameterView (Page 4006)

DataGridView.GridSelectionMode

Description

The "GridSelectionMode" property specifies whether multiple selection is enabled in the table content.

Type

Int32, HmiGridSelectionMode

Specifies the type of the selection:

- None (0): None
- Single (1): Only single selection
- Multi (2): Multiple selection

Access

Read-write

Syntax

```
DataGridView.GridSelectionMode
```

See also

OverviewParameterControl.ParameterView (Page 4006)

DataGridView.HeaderSettings

Description

The "HeaderSettings" property specifies the settings for all column headers in the table.

Type

Object, HmiDataGridHeaderSettingsPart

Access

Read-write

Syntax

```
DataGridView.HeaderSettings
```

See also

OverviewParameterControl.ParameterView (Page 4006)

DataGridHeaderSettings.AllowColumnReorder

Description

The "AllowColumnReorder" property specifies whether the order of the columns can be changed.

Type

Bool

Access

Read-write

Syntax

```
DataGridHeaderSettings.AllowColumnReorder
```

See also

DataGridView.HeaderSettings (Page 4042)

DataGridHeaderSettings.AllowColumnResize

Description

The "AllowColumnResize" property specifies whether the width of the columns can be changed.

Type

Bool

Access

Read-write

Syntax

```
DataGridHeaderSettings.AllowColumnResize
```

See also

DataGridView.HeaderSettings (Page 4042)

DataGridHeaderSettings.ColumnHeaderType

Description

The "ColumnHeaderType" property specifies the type of content of a column header.

Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

Access

Read-write

Syntax

```
DataGridHeaderSettings.ColumnHeaderType
```

See also

DataGridView.HeaderSettings (Page 4042)

DataGridHeaderSettings.Font

Description

The "Font" property specifies the font of the headers.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
DataGridHeaderSettings.Font
```

See also

DataGridView.HeaderSettings (Page 4042)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

DataGridHeaderSettings.Font (Page 4044)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

DataGridHeaderSettings.Font (Page 4044)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

DataGridHeaderSettings.Font (Page 4044)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

DataGridHeaderSettings.Font (Page 4044)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

DataGridHeaderSettings.Font (Page 4044)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

DataGridHeaderSettings.Font (Page 4044)

DataGridHeaderSettings.HeaderBackColor

Description

The "HeaderBackColor" property specifies the background color of the header.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderBackColor
```

See also

DataGridView.HeaderSettings (Page 4042)

DataGridHeaderSettings.HeaderForeColor

Description

The "HeaderForeColor" property specifies the font color of the headers.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderForeColor
```

See also

DataGridView.HeaderSettings (Page 4042)

DataGridHeaderSettings.HeaderGridLineColor

Description

The "HeaderGridLineColor" property specifies the color of the separation line between column headers.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderGridLineColor
```

See also

DataGridView.HeaderSettings (Page 4042)

DataGridHeaderSettings.HeaderSelectionBackColor

Description

The "HeaderSelectionBackColor" property specifies the background color of the header of a selected line or column.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderSelectionBackColor
```

See also

DataGridView.HeaderSettings (Page 4042)

DataGridHeaderSettings.HeaderSelectionForeColor

Description

The "HeaderSelectionForeColor" property specifies the font color of the header of a selected line or column.

Type

UInt32

Access

Read-write

Syntax

```
Object.HeaderSelectionForeColor
```

`Object`

Required. An object from the "Availability" section.

See also

DataGridView.HeaderSettings (Page 4042)

DataGridHeaderSettings.RowHeaderType

Description

The "RowHeaderType" property specifies the type of content of a row header.

Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

Access

Read-write

Syntax

```
DataGridHeaderSettings.RowHeaderType
```

See also

DataGridView.HeaderSettings (Page 4042)

DataGridView.HorizontalScrollBarVisibility

Description

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar of the display.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
DataGridView.HorizontalScrollBarVisibility
```

See also

OverviewParameterControl.ParameterView (Page 4006)

DataGridView.RowHeight

Description

The "RowHeight" property specifies the height of all rows in the table in DIU (Device Independent Unit).

"0" corresponds to a automatic mechanism, which adjusts the height of each line according to the font size and number of paragraphs.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.RowHeight
```

See also

OverviewParameterControl.ParameterView (Page 4006)

DataGridView.SelectFullRow

Description

The "SelectFullRow" property specifies whether only the cell or the entire row is included in the selection.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.SelectFullRow
```

See also

OverviewParameterControl.ParameterView (Page 4006)

DataGridView.SelectionBackColor

Description

The "SelectionBackColor" property specifies the background color of the selected cells.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.SelectionBackColor
```

See also

OverviewParameterControl.ParameterView (Page 4006)

DataGridView.SelectionBorderColor

Description

The "SelectionBorderColor" property specifies the border color of the selected cells.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.SelectionBorderColor
```

See also

OverviewParameterControl.ParameterView (Page 4006)

DataGridView.SelectionBorderWidth

Description

The "SelectionBorderWidth" property specifies the border width of the selected cells.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.SelectionBorderWidth
```

See also

OverviewParameterControl.ParameterView (Page 4006)

DataGridView.SelectionForeColor

Description

The "SelectionForeColor" property specifies the font color of the selected cells.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.SelectionForeColor
```

See also

OverviewParameterControl.ParameterView (Page 4006)

DataGridView.VerticalScrollBarVisibility

Description

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the display.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
DataGridView.VerticalScrollBarVisibility
```

See also

OverviewParameterControl.ParameterView (Page 4006)

OverviewParameterControl.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
OverviewParameterControl.Parent
```

See also

OverviewParameterControl (Page 3987)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

OverviewParameterControl.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the parameter overview was created.

Type

String

Access

Read-only

Syntax

```
OverviewParameterControl.RenderingTemplate
```

See also

OverviewParameterControl (Page 3987)

OverviewParameterControl.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the parameter overview is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
OverviewParameterControl.ShowFocusVisual
```

See also

OverviewParameterControl (Page 3987)

OverviewParameterControl.StatusBar

Description

The "StatusBar" property specifies the information bar of the parameter overview.

Type

Object, HmiStatusBarPart

Access

Read-write

Syntax

```
OverviewParameterControl.StatusBar
```

See also

OverviewParameterControl (Page 3987)

StatusBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
StatusBar.BackColor
```

See also

OverviewParameterControl.StatusBar (Page 4057)

StatusBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

Type

Object, HmiControlBarElementCollection (Page 4059)

Access

Read-only

Syntax

```
StatusBar.Elements
```

See also

OverviewParameterControl.StatusBar (Page 4057)

HmiControlBarElementCollection (Page 4059)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

StatusBar.Elements (Page 4058)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 4059)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 4076)

See also

HmiControlBarElementCollection (Page 4059)

Control Bar Elements (Page 4076)

Control Bar Elements

Description

Control Bar Elements (Page 4076)

StatusBar.Enabled

Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Enabled
```

See also

OverviewParameterControl.StatusBar (Page 4057)

StatusBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
StatusBar.Font
```

See also

OverviewParameterControl.StatusBar (Page 4057)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

StatusBar.Font (Page 4061)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

StatusBar.Font (Page 4061)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

StatusBar.Font (Page 4061)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

StatusBar.Font (Page 4061)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

StatusBar.Font (Page 4061)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

StatusBar.Font (Page 4061)

StatusBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
StatusBar.Margin
```

See also

OverviewParameterControl.StatusBar (Page 4057)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

StatusBar.Margin (Page 4065)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

StatusBar.Margin (Page 4065)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

StatusBar.Margin (Page 4065)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

StatusBar.Margin (Page 4065)

StatusBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
StatusBar.Padding
```

See also

OverviewParameterControl.StatusBar (Page 4057)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

StatusBar.Padding (Page 4068)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

StatusBar.Padding (Page 4068)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

StatusBar.Padding (Page 4068)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

StatusBar.Padding (Page 4068)

StatusBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.ShowToolTips
```

See also

OverviewParameterControl.StatusBar (Page 4057)

StatusBar.Visible

Description

The "Visible" property specifies whether the information bar is visible.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Visible
```

See also

OverviewParameterControl.StatusBar (Page 4057)

OverviewParameterControl.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the parameter overview.

Type

String

Access

Read-only

Syntax

```
OverviewParameterControl.StyleItemClass
```

See also

OverviewParameterControl (Page 3987)

OverviewParameterControl.TabIndex

Description

The "TabIndex" property returns the position of the parameter overview in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
OverviewParameterControl.TabIndex
```

See also

OverviewParameterControl (Page 3987)

OverviewParameterControl.TimeZone

Description

The "TimeZone" property specifies the time zone.

Type

Int32, HmiTimeZone

Access

Read-write

Syntax

```
OverviewParameterControl.TimeZone
```

See also

OverviewParameterControl (Page 3987)

OverviewParameterControl.ToolBar

Description

The "ToolBar" property specifies the toolbar of the parameter overview.

Type

Object, HmiToolBarPart

Access

Read-write

Syntax

```
OverviewParameterControl.ToolBar
```

See also

OverviewParameterControl (Page 3987)

ToolBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ToolBar.BackColor
```

See also

OverviewParameterControl.ToolBar (Page 4073)

ToolBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

Type

Object, HmiControlBarElementCollection (Page 4074)

Access

Read-only

Syntax

```
ToolBar.Elements
```

See also

OverviewParameterControl.ToolBar (Page 4073)

HmiControlBarElementCollection (Page 4074)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

ToolBar.Elements (Page 4074)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 4074)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 4076)

See also

HmiControlBarElementCollection (Page 4074)

Control Bar Elements (Page 4076)

Control Bar Elements

ControlBarButton

Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarButtonPart

Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the label of the button.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the button can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the button.
- **Mapping**
  Returns the function of the button.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.

- **Operability**
  Returns whether the button is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the button is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarButton.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBackColor
```

See also

ControlBarButton (Page 4076)

ControlBarButton.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBorderColor
```

See also

ControlBarButton (Page 4076)

ControlBarButton.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarButton.Authorization
```

See also

ControlBarButton (Page 4076)

ControlBarButton.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BackColor
```

See also

ControlBarButton (Page 4076)

ControlBarButton.Badge

Description

The "Badge" property specifies the label of the button.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarButton.Badge
```

See also

ControlBarButton (Page 4076)

ControlBarButton.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BorderColor
```

See also

ControlBarButton (Page 4076)

ControlBarButton.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarButton.BorderWidth
```

See also

ControlBarButton (Page 4076)

ControlBarButton.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarButton.Content
```

See also

ControlBarButton (Page 4076)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarButton.Content (Page 4082)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarButton.Content (Page 4082)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarButton.Content (Page 4082)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarButton.Content (Page 4082)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarButton.Content (Page 4082)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarButton.Content (Page 4082)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarButton.Content (Page 4082)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarButton.Content (Page 4082)

ControlBarButton.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarButton.CustomID
```

See also

ControlBarButton (Page 4076)

ControlBarButton.Enabled

Description

The "Enabled" property specifies whether the button can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Enabled
```

See also

ControlBarButton (Page 4076)

ControlBarButton.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.ForeColor
```

See also

ControlBarButton (Page 4076)

ControlBarButton.Graphic

Description

The "Graphic" property specifies the graphic of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Graphic
```

See also

ControlBarButton (Page 4076)

ControlBarButton.Height

Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Height
```

See also

ControlBarButton (Page 4076)

ControlBarButton.HotKey

Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
ControlBarButton.HotKey
```

See also

ControlBarButton (Page 4076)

ControlBarButton.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent

- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms

- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarButton.Mapping
```

See also

ControlBarButton (Page 4076)

ControlBarButton.Margin

Description

The "Margin" property specifies the surrounded outer distance of the button.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarButton.Margin
```

See also

ControlBarButton (Page 4076)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarButton.Margin (Page 4092)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarButton.Margin (Page 4092)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarButton.Margin (Page 4092)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarButton.Margin (Page 4092)

ControlBarButton.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumHeight
```

See also

ControlBarButton (Page 4076)

ControlBarButton.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumWidth
```

See also

ControlBarButton (Page 4076)

ControlBarButton.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumHeight
```

See also

ControlBarButton (Page 4076)

ControlBarButton.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumWidth
```

See also

ControlBarButton (Page 4076)

ControlBarButton.Operability

Description

The "Operability" property returns whether the button is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarButton.Operability
```

See also

ControlBarButton (Page 4076)

ControlBarButton.Padding

Description

The "Padding" property specifies the distance of the content from the border of the button.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarButton.Padding
```

See also

ControlBarButton (Page 4076)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarButton.Padding (Page 4097)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarButton.Padding (Page 4097)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarButton.Padding (Page 4097)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarButton.Padding (Page 4097)

ControlBarButton.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarButton.RequireExplicitUnlock
```

See also

ControlBarButton (Page 4076)

ControlBarButton.Text

Description

The "Text" property specifies the label of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Text
```

See also

ControlBarButton (Page 4076)

ControlBarButton.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.ToolTipText
```

See also

ControlBarButton (Page 4076)

ControlBarButton.Visible

Description

The "Visible" property specifies whether the button is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Visible
```

See also

ControlBarButton (Page 4076)

ControlBarButton.Width

Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Width
```

See also

ControlBarButton (Page 4076)

ControlBarDisplay

Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarDisplayPart

Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the display area is enabled in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the display area.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the display area is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.

- **Visible**
  Specifies whether the display area is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarDisplay.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarDislay.Authorization
```

See also

ControlBarDisplay (Page 4102)

ControlBarDisplay.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarDislay.Content
```

See also

ControlBarDisplay (Page 4102)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarDisplay.Content (Page 4104)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarDisplay.Content (Page 4104)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarDisplay.Content (Page 4104)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarDisplay.Content (Page 4104)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarDisplay.Content (Page 4104)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarDisplay.Content (Page 4104)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarDisplay.Content (Page 4104)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarDisplay.Content (Page 4104)

ControlBarDisplay.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarDislay.CustomID
```

See also

ControlBarDisplay (Page 4102)

ControlBarDisplay.Enabled

Description

The "Enabled" property specifies whether the display is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Enabled
```

See also

ControlBarDisplay (Page 4102)

ControlBarDisplay.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.ForeColor
```

See also

ControlBarDisplay (Page 4102)

ControlBarDisplay.Graphic

Description

The "Graphic" property specifies the graphic of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Graphic
```

See also

ControlBarDisplay (Page 4102)

ControlBarDisplay.Height

Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Height
```

See also

ControlBarDisplay (Page 4102)

ControlBarDisplay.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarDislay.Mapping
```

See also

ControlBarDisplay (Page 4102)

ControlBarDisplay.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the display.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarDislay.Margin
```

See also

ControlBarDisplay (Page 4102)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarDisplay.Margin (Page 4114)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarDisplay.Margin (Page 4114)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarDisplay.Margin (Page 4114)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarDisplay.Margin (Page 4114)

ControlBarDisplay.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumHeight
```

See also

ControlBarDisplay (Page 4102)

ControlBarDisplay.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumWidth
```

See also

ControlBarDisplay (Page 4102)

ControlBarDisplay.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumHeight
```

See also

ControlBarDisplay (Page 4102)

ControlBarDisplay.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumWidth
```

See also

ControlBarDisplay (Page 4102)

ControlBarDisplay.Operability

Description

The "Operability" property returns whether the display is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarDislay.Operability
```

See also

ControlBarDisplay (Page 4102)

ControlBarDisplay.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the display.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarDislay.Padding
```

See also

ControlBarDisplay (Page 4102)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarDisplay.Padding (Page 4119)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarDisplay.Padding (Page 4119)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarDisplay.Padding (Page 4119)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarDisplay.Padding (Page 4119)

ControlBarDisplay.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarDislay.RequireExplicitUnlock
```

See also

ControlBarDisplay (Page 4102)

ControlBarDisplay.Text

Description

The "Text" property specifies the label of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Text
```

See also

ControlBarDisplay (Page 4102)

ControlBarDisplay.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.ToolTipText
```

See also

ControlBarDisplay (Page 4102)

ControlBarDisplay.Visible

Description

The "Visible" property specifies whether the display is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Visible
```

See also

ControlBarDisplay (Page 4102)

ControlBarDisplay.Width

Description

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Width
```

See also

ControlBarDisplay (Page 4102)

ControlBarLabel

Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar.

You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarLabelPart

Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the identifier can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the identifier.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the identifier is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.

- **Visible**
  Specifies whether the identifier is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarLabel.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarLabel.Authorization
```

See also

ControlBarLabel (Page 4124)

ControlBarLabel.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarLabel.CustomID
```

See also

ControlBarLabel (Page 4124)

ControlBarLabel.Enabled

Description

The "Enabled" property specifies whether the identifier is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Enabled
```

See also

ControlBarLabel (Page 4124)

ControlBarLabel.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.ForeColor
```

See also

ControlBarLabel (Page 4124)

ControlBarLabel.Height

Description

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Height
```

See also

ControlBarLabel (Page 4124)

ControlBarLabel.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

See also

ControlBarLabel (Page 4124)

ControlBarLabel.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms

- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export

- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarLabel.Mapping
```

See also

ControlBarLabel (Page 4124)

ControlBarLabel.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarLabel.Margin
```

See also

ControlBarLabel (Page 4124)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarLabel.Margin (Page 4131)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarLabel.Margin (Page 4131)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarLabel.Margin (Page 4131)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarLabel.Margin (Page 4131)

ControlBarLabel.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumHeight
```

See also

ControlBarLabel (Page 4124)

ControlBarLabel.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumWidth
```

See also

ControlBarLabel (Page 4124)

ControlBarLabel.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumHeight
```

See also

ControlBarLabel (Page 4124)

ControlBarLabel.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumWidth
```

See also

ControlBarLabel (Page 4124)

ControlBarLabel.Operability

Description

The "Operability" property returns whether the identifier is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarLabel.Operability
```

See also

ControlBarLabel (Page 4124)

ControlBarLabel.Padding

Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarLabel.Padding
```

See also

ControlBarLabel (Page 4124)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarLabel.Padding (Page 4136)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarLabel.Padding (Page 4136)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarLabel.Padding (Page 4136)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarLabel.Padding (Page 4136)

ControlBarLabel.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarLabel.RequireExplicitUnlock
```

See also

ControlBarLabel (Page 4124)

ControlBarLabel.Text

Description

The "Text" property specifies the label of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.Text
```

See also

ControlBarLabel (Page 4124)

ControlBarLabel.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.ToolTipText
```

See also

ControlBarLabel (Page 4124)

ControlBarLabel.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.VerticalTextAlignment
```

See also

ControlBarLabel (Page 4124)

ControlBarLabel.Visible

Description

The "Visible" property specifies whether the identifier is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Visible
```

See also

ControlBarLabel (Page 4124)

ControlBarLabel.Width

Description

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Width
```

See also

ControlBarLabel (Page 4124)

ControlBarSeparator

Description

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarSeparatorPart

Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the disconnector can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the separator.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.

- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the separator is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the disconnector is only operable while the associated button is being pressed.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the disconnector is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarSeparator.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarSeparator.Authorization
```

See also

ControlBarSeparator (Page 4142)

ControlBarSeparator.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarSeparator.CustomID
```

See also

ControlBarSeparator (Page 4142)

ControlBarSeparator.Enabled

Description

The "Enabled" property specifies whether the separator is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Enabled
```

See also

ControlBarSeparator (Page 4142)

ControlBarSeparator.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.ForeColor
```

See also

ControlBarSeparator (Page 4142)

ControlBarSeparator.Height

Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Height
```

See also

ControlBarSeparator (Page 4142)

ControlBarSeparator.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarSeparator.Mapping
```

See also

ControlBarSeparator (Page 4142)

ControlBarSeparator.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the separator.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarSeparator.Margin
```

See also

ControlBarSeparator (Page 4142)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarSeparator.Margin (Page 4148)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarSeparator.Margin (Page 4148)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarSeparator.Margin (Page 4148)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarSeparator.Margin (Page 4148)

ControlBarSeparator.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumHeight
```

See also

ControlBarSeparator (Page 4142)

ControlBarSeparator.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumWidth
```

See also

ControlBarSeparator (Page 4142)

ControlBarSeparator.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumHeight
```

See also

ControlBarSeparator (Page 4142)

ControlBarSeparator.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumWidth
```

See also

ControlBarSeparator (Page 4142)

ControlBarSeparator.Operability

Description

The "Operability" property returns whether the separator is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarSeparator.Operability
```

See also

ControlBarSeparator (Page 4142)

ControlBarSeparator.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the separator.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarSeparator.Padding
```

See also

ControlBarSeparator (Page 4142)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarSeparator.Padding (Page 4153)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarSeparator.Padding (Page 4153)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarSeparator.Padding (Page 4153)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarSeparator.Padding (Page 4153)

ControlBarSeparator.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the disconnector can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarSeparator.RequireExplicitUnlock
```

See also

ControlBarSeparator (Page 4142)

ControlBarSeparator.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

Type

String

Access

Read-write

Syntax

```
ControlBarSeparator.ToolTipText
```

See also

ControlBarSeparator (Page 4142)

ControlBarSeparator.Visible

Description

The "Visible" property specifies whether the separator is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Visible
```

See also

ControlBarSeparator (Page 4142)

ControlBarSeparator.Width

Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Width
```

See also

ControlBarSeparator (Page 4142)

ControlBarTextBox

Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarTextBoxPart

Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the text box can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Mapping**
  Returns the function of the text box.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.

- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the text box is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **Readonly**
  Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**
  Returns whether the text box is only operable while the associated button is being pressed.
- **Text**
  Specifies the labeling.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the text box is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarTextBox.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.AlternateBorderColor
```

See also

ControlBarTextBox (Page 4158)

ControlBarTextBox.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarTextBox.Authorization
```

See also

ControlBarTextBox (Page 4158)

ControlBarTextBox.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BackColor
```

See also

ControlBarTextBox (Page 4158)

ControlBarTextBox.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BorderColor
```

See also

ControlBarTextBox (Page 4158)

ControlBarTextBox.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarTextBox.BorderWidth
```

See also

ControlBarTextBox (Page 4158)

ControlBarTextBox.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarTextBox.CustomID
```

See also

ControlBarTextBox (Page 4158)

ControlBarTextBox.Enabled

Description

The "Enabled" property specifies whether the text box can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Enabled
```

See also

ControlBarTextBox (Page 4158)

ControlBarTextBox.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.ForeColor
```

See also

ControlBarTextBox (Page 4158)

ControlBarTextBox.Height

Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Height
```

See also

ControlBarTextBox (Page 4158)

ControlBarTextBox.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

See also

ControlBarTextBox (Page 4158)

ControlBarTextBox.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarTextBox.Mapping
```

See also

ControlBarTextBox (Page 4158)

ControlBarTextBox.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the text box.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarTextBox.Margin
```

See also

ControlBarTextBox (Page 4158)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarTextBox.Margin (Page 4167)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarTextBox.Margin (Page 4167)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarTextBox.Margin (Page 4167)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarTextBox.Margin (Page 4167)

ControlBarTextBox.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumHeight
```

See also

ControlBarTextBox (Page 4158)

ControlBarTextBox.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumWidth
```

See also

ControlBarTextBox (Page 4158)

ControlBarTextBox.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumHeight
```

See also

ControlBarTextBox (Page 4158)

ControlBarTextBox.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumWidth
```

See also

ControlBarTextBox (Page 4158)

ControlBarTextBox.Operability

Description

The "Operability" property returns whether the text box is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarTextBox.Operability
```

See also

ControlBarTextBox (Page 4158)

ControlBarTextBox.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the text box.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarTextBox.Padding
```

See also

ControlBarTextBox (Page 4158)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarTextBox.Padding (Page 4172)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarTextBox.Padding (Page 4172)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarTextBox.Padding (Page 4172)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarTextBox.Padding (Page 4172)

ControlBarTextBox.ReadOnly

Description

The "ReadOnly" property specifies whether the text box is read-only.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.ReadOnly
```

See also

ControlBarTextBox (Page 4158)

ControlBarTextBox.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

See also

ControlBarTextBox (Page 4158)

ControlBarTextBox.Text

Description

The "Text" property specifies the label of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.Text
```

See also

ControlBarTextBox (Page 4158)

ControlBarTextBox.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.ToolTipText
```

See also

ControlBarTextBox (Page 4158)

ControlBarTextBox.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

See also

ControlBarTextBox (Page 4158)

ControlBarTextBox.Visible

Description

The "Visible" property specifies whether the text box is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Visible
```

See also

ControlBarTextBox (Page 4158)

ControlBarTextBox.Width

Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Width
```

See also

ControlBarTextBox (Page 4158)

ControlBarToggleSwitch

Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar.

You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarToggleSwitchPart

Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **AlternateGraphic**
  Specifies the graphic for the "pressed" state.
- **AlternateText**
  Specifies the text for the "pressed" state.
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the identifier of the switch.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.

- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the switch can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the switch.
- **IsAlternateState**
  Specifies the current state of the switch.
- **Mapping**
  Returns the function of the switch.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the switch is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the switch is only operable while the associated button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the switch is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarToggleSwitch.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.AlternateGraphic

Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateGraphic
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.AlternateText

Description

The "AlternateText" property specifies the text of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateText
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Authorization
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BackColor
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.Badge

Description

The "Badge" property specifies the identifier of the switch.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Badge
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderColor
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderWidth
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Content
```

See also

ControlBarToggleSwitch (Page 4178)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarToggleSwitch.Content (Page 4184)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.

- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarToggleSwitch.Content (Page 4184)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 4184)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarToggleSwitch.Content (Page 4184)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarToggleSwitch.Content (Page 4184)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarToggleSwitch.Content (Page 4184)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarToggleSwitch.Content (Page 4184)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 4184)

ControlBarToggleSwitch.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarToggleSwitch.CustomID
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.Enabled

Description

The "Enabled" property specifies whether the switch can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Enabled
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ForeColor
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.Graphic

Description

The "Graphic" property specifies the graphic of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Graphic
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.Height

Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Height
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.HotKey

Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
Button.HotKey
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.IsAlternateState

Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment

- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms

- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Mapping
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the switch.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Margin
```

See also

ControlBarToggleSwitch (Page 4178)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarToggleSwitch.Margin (Page 4195)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarToggleSwitch.Margin (Page 4195)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarToggleSwitch.Margin (Page 4195)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarToggleSwitch.Margin (Page 4195)

ControlBarToggleSwitch.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumHeight
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumWidth
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumHeight
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumWidth
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.Operability

Description

The property "Operability" returns whether the switch is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Operability
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the switch.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Padding
```

See also

ControlBarToggleSwitch (Page 4178)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarToggleSwitch.Padding (Page 4200)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarToggleSwitch.Padding (Page 4200)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarToggleSwitch.Padding (Page 4200)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarToggleSwitch.Padding (Page 4200)

ControlBarToggleSwitch.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.Text

Description

The "Text" property specifies the label of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Text
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ToolTipText
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.Visible

Description

The "Visible" property specifies whether the switch is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Visible
```

See also

ControlBarToggleSwitch (Page 4178)

ControlBarToggleSwitch.Width

Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Width
```

See also

ControlBarToggleSwitch (Page 4178)

ToolBar.Enabled

Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Enabled
```

See also

OverviewParameterControl.ToolBar (Page 4073)

ToolBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ToolBar.Font
```

See also

OverviewParameterControl.ToolBar (Page 4073)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ToolBar.Font (Page 4206)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ToolBar.Font (Page 4206)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ToolBar.Font (Page 4206)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ToolBar.Font (Page 4206)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ToolBar.Font (Page 4206)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ToolBar.Font (Page 4206)

ToolBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the toolbar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ToolBar.Margin
```

See also

OverviewParameterControl.ToolBar (Page 4073)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ToolBar.Margin (Page 4210)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ToolBar.Margin (Page 4210)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ToolBar.Margin (Page 4210)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ToolBar.Margin (Page 4210)

ToolBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ToolBar.Padding
```

See also

OverviewParameterControl.ToolBar (Page 4073)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ToolBar.Padding (Page 4212)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ToolBar.Padding (Page 4212)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ToolBar.Padding (Page 4212)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ToolBar.Padding (Page 4212)

ToolBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.ShowToolTips
```

See also

OverviewParameterControl.ToolBar (Page 4073)

ToolBar.UseHotKeys

Description

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.UseHotKeys
```

See also

OverviewParameterControl.ToolBar (Page 4073)

ToolBar.Visible

Description

The "Visible" property specifies whether the toolbar is visible.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Visible
```

See also

OverviewParameterControl.ToolBar (Page 4073)

OverviewParameterControl.Top

Description

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
OverviewParameterControl.Top
```

See also

OverviewParameterControl (Page 3987)

OverviewParameterControl.Visible

Description

The "Visible" property specifies whether the parameter overview is visible.

Type

Bool

Access

Read-write

Syntax

```
OverviewParameterControl.Visible
```

See also

OverviewParameterControl (Page 3987)

OverviewParameterControl.Width

Description

The "Width" property specifies the width in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
OverviewParameterControl.Width
```

See also

OverviewParameterControl (Page 3987)

OverviewParameterControl.WindowFlags

Description

The "WindowFlags" property specifies the window configuration of the parameter overview.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

You can enable multiple properties by adding integer values or bit operators.

Access

Read-write

Syntax

```
OverviewParameterControl.WindowFlags
```

Example

Adapting the "windowFlags" tag depending on the window configuration:

Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose){
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

See also

OverviewParameterControl (Page 3987)

OverviewParameterControl.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the parameter overview.

Syntax

```
OverviewParameterControl.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

OverviewParameterControl (Page 3987)

OverviewParameterControl.FireCommand()

Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the parameter overview.

Syntax

```
OverviewParameterControl.FireCommand(commandId, custom)
```

Parameters

commandId

Type: Int32

ID of the element of the toolbar or information bar

custom

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

Return value

--

See also

OverviewParameterControl (Page 3987)

OverviewParameterControl.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
OverviewParameterControl.PropertyFlashing(propertyName, enable[,
value][, alternateValue][, rate])
```

Parameters

`propertyName`

Type: String

Name of the property for which flashing is configured.

`enable`

Type: Bool

Specifies that flashing is activated.

`value`

Optional, type: Variant

Value of the property for which flashing is configured.

`alternateValue`

Optional, type: Variant

Specifies the second value for flashing.

`rate`

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

OverviewParameterControl (Page 3987)

Polygon

Description

The "Polygon" object represents a polygon in runtime.

Object type

HmiPolygon

Properties

The "Polygon" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BackFillPattern**
  Specifies the pattern of the background or the fill.
- **BorderColor**
  Specifies the border color.
- **BorderWidth**
  Specifies the border thickness.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the polygon.
- **DashType**
  Specifies the stroke style of the border or line.
- **Enabled**
  Specifies whether the polygon can be operated in runtime.
- **FillDirection**
  Specifies the direction from which the polygon is filled.
- **FillLevel**
  Specifies the fill of the polygon in percent.
- **Height**
  Specifies the height.
- **JoinType**
  Specifies the corner style of the polygon
- **Layer**
  Returns the layer of the screen in which the polygon is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the polygon.

- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the polygon is operable.
- **Parent**
  Returns the higher-level screen object.
- **Points**
  Specifies the coordinates of the polygon points.
- **RequireExplicitUnlock**
  Returns whether the polygon is only operable while the associated button is being pressed.
- **RotationAngle**
  Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the polygon rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ShowFillLevel**
  Specifies whether the fill level is displayed.
- **ShowFocusVisual**
  Specifies whether the polygon is highlighted when in focus.
- **StyleItemClass**
  Returns the style which is applied to the polygon.
- **TabIndex**
  Returns the position of the polygon in the tab sequence.
- **ToolTipText**
  Specifies the tooltip text.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the polygon is visible.
- **Width**
  Specifies the width.

Methods

The "Polygon" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the polygon.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "Polygon" object has the following events:

- **OnActivated()**
  Occurs when a polygon receives focus.
- **OnContextTapped()**
  Occurs when a polygon is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when a polygon loses focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the polygon is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the polygon is in focus.
- **OnTapped()**
  Occurs when a polygon is left-clicked or short-touched.

Polygon.AlternateBackColor

Description

The "AlternateBackColor" specifies the second color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
Polygon.AlternateBackColor
```

See also

Polygon (Page 4221)

Polygon.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
Polygon.AlternateBorderColor
```

See also

Polygon (Page 4221)

Polygon.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
Polygon.Authorization
```

See also

Polygon (Page 4221)

Polygon.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
Polygon.BackColor
```

See also

Polygon (Page 4221)

Polygon.BackFillPattern

Description

The "BackFillPattern" property specifies the pattern of the background or the fill.

Type

Int32, HmiFillPattern

Specifies the filling:

- Solid (0): Solid
- Transparent (65536): Transparent
- Horizontal (131072): Horizontal
- Vertical (131073): Vertical
- ForwardDiagonal (131074): Forward diagonal stripe
- BackwardDiagonal (131075): Backward diagonal stripe
- Cross (131076): Cross
- DiagonalCross (131077): Diagonal cross
- GradientHorizontal (1048576): Horizontal gradient
- GradientVertical (1048577): Vertical gradient
- GradientForwardDiagonal (1048578): Gradient forward diagonal
- GradientBackwardDiagonal (1048579): Gradient backward diagonal
- GradientHorizontalTricolor (1048832): Horizontal tricolor gradient
- GradientVerticalTricolor (1048833): Vertical tricolor gradient
- GradientForwardDiagonalTricolor (1048834): Forward diagonal tricolor gradient
- GradientBackwardDiagonalTricolor (1048835): Backward diagonal tricolor gradient

Access

Read-write

Syntax

```
Polygon.BackFillPattern
```

See also

Polygon (Page 4221)

Polygon.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
Polygon.BorderColor
```

See also

Polygon (Page 4221)

Polygon.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
Polygon.BorderWidth
```

See also

Polygon (Page 4221)

Polygon.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the polygon.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
Polygon.CurrentQuality
```

See also

Polygon (Page 4221)

Polygon.DashType

Description

The "DashType" property specifies the stroke type of the border or line.

Type

Int32, HmiDashType

Specifies the stroke style:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted
- DashDot (3): Dash-dotted
- DashDotDot (4): Dash-dot-dot

Access

Read-write

Syntax

```
Polygon.DashType
```

See also

Polygon (Page 4221)

Polygon.Enabled

Description

The "Enabled" property specifies whether the polygon can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
Polygon.Enabled
```

See also

Polygon (Page 4221)

Polygon.FillDirection

Description

The "FillDirection" property specifies the direction from which the polygon is filled.

Type

Int32, HmiFillDirection

Specifies the filling direction:

- BottomToTop (0): From bottom to top
- TopToBottom (1): From top to bottom
- LeftToRight (2): From left to right
- RightToLeft (3): From right to left

Access

Read-write

Syntax

```
Polygon.FillDirection
```

See also

Polygon (Page 4221)

Polygon.FillLevel

Description

The "FillLevel" property specifies the fill level of the polygons in percent.

Type

UInt8

Access

Read-write

Syntax

```
Polygon.FillLevel
```

See also

Polygon (Page 4221)

Polygon.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Polygon.Height
```

See also

Polygon (Page 4221)

Polygon.JoinType

Description

The "JoinType" property specifies the corner style of the polygon.

Type

Int32, HmiLineJoinType

Specifies the corner style:

- Round (0): Round
- Bevel (4096): Smooth
- Miter (8192): Miter

Access

Read-write

Syntax

```
Polygon.JoinType
```

See also

Polygon (Page 4221)

Polygon.Layer

Description

The "Layer" property returns the layer of the screen in which the polygon is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
Polygon.Layer
```

See also

Polygon (Page 4221)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

Polygon.Layer (Page 4232)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

Polygon.Layer (Page 4232)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

Polygon.Layer (Page 4232)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

Polygon.Layer (Page 4232)

Polygon.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
Polygon.Left
```

See also

Polygon (Page 4221)

Polygon.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
Polygon.Margin
```

See also

Polygon (Page 4221)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

Polygon.Margin (Page 4235)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

Polygon.Margin (Page 4235)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

Polygon.Margin (Page 4235)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

Polygon.Margin (Page 4235)

Polygon.Name

Description

The "Name" property returns the name of the polygon.

Type

String

Access

Read-only

Syntax

```
Polygon.Name
```

See also

Polygon (Page 4221)

Polygon.Opacity

Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

Type

Float

Access

Read-write

Syntax

```
Polygon.Opacity
```

See also

Polygon (Page 4221)

Polygon.Operability

Description

The "Operability" property returns whether the polygon is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
Polygon.Operability
```

See also

Polygon (Page 4221)

Polygon.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
Polygon.Parent
```

See also

Polygon (Page 4221)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

Polygon.Points

Description

The "Points" property specifies the coordinates of the polygon points.

Type

Variant

Access

Read-write

Syntax

```
Polygon.Points
```

Example

Output the coordinates of the polygon "Polygon_1" with 3 points via debug output in runtime:

Copy code

```
const p = Screen.Items('Polygon_1').Points;
HMIRuntime.Trace("x1=" + p[0] + ", y1=" + p[1] + ", x2=" + p[2] + ", y2=" + p[3] + ", x3="
+ p[4] + ", y3=" + p[5]);
```

See also

Polygon (Page 4221)

Polygon.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the polygon can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
Polygon.RequireExplicitUnlock
```

See also

Polygon (Page 4221)

Polygon.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
Polygon.RotationAngle
```

See also

Polygon (Page 4221)

Polygon.RotationCenterPlacement (Page 4241)

Polygon.RotationCenterX (Page 4242)

Polygon.RotationCenterY (Page 4243)

Polygon.RotationCenterPlacement

Description

The "RotationCenterPlacement" property sets the reference point around which the polygon rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
Polygon.RotationCenterPlacement
```

See also

Polygon (Page 4221)

Polygon.RotationAngle (Page 4241)

Polygon.RotationCenterX (Page 4242)

Polygon.RotationCenterY (Page 4243)

Polygon.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
Polygon.RotationCenterX
```

See also

Polygon (Page 4221)

Polygon.RotationAngle (Page 4241)

Polygon.RotationCenterPlacement (Page 4241)

Polygon.RotationCenterY (Page 4243)

Polygon.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
Polygon.RotationCenterY
```

See also

Polygon (Page 4221)

Polygon.RotationAngle (Page 4241)

Polygon.RotationCenterPlacement (Page 4241)

Polygon.RotationCenterX (Page 4242)

Polygon.ShowFillLevel

Description

The "ShowFillLevel" property specifies whether the fill level is displayed.

Type

Bool

Access

Read-write

Syntax

```
Polygon.ShowFillLevel
```

See also

Polygon (Page 4221)

Polygon.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the polygon is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
Polygon.ShowFocusVisual
```

See also

Polygon (Page 4221)

Polygon.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the polygon.

Type

String

Access

Read-only

Syntax

```
Polygon.StyleItemClass
```

See also

Polygon (Page 4221)

Polygon.TabIndex

Description

The "TabIndex" property returns the position of the polygon in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
Polygon.TabIndex
```

See also

Polygon (Page 4221)

Polygon.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
Polygon.ToolTipText
```

See also

Polygon (Page 4221)

Polygon.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
Polygon.Top
```

See also

Polygon (Page 4221)

Polygon.Visible

Description

The "Visible" property specifies whether the polygon is visible.

Type

Bool

Access

Read-write

Syntax

```
Polygon.Visible
```

See also

Polygon (Page 4221)

Polygon.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Polygon.Width
```

See also

Polygon (Page 4221)

Polygon.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the polygon.

Syntax

```
Polygon.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

Polygon (Page 4221)

Polygon.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
Polygon.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

`propertyName`

Type: String

Name of the property for which flashing is configured.

`enable`

Type: Bool

Specifies that flashing is activated.

`value`

Optional, type: Variant

Value of the property for which flashing is configured.

`alternateValue`

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

Polygon (Page 4221)

Polygon_OnActivated()

Description

The "OnActivated" event occurs when a polygon receives focus:

- A polygon is selected via the configured tab sequence.
- A polygon that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
Polygon_OnActivated(item)
```

Context

item

Type: Object

Polygon where the event occurs.

See also

Polygon (Page 4221)

Polygon_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A polygon is right-clicked.
- A polygon is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
Polygon_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Polygon where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key

- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Polygon (Page 4221)

Polygon_OnDeactivated()

Description

The "OnDeactivated" event occurs when the polygon loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
Polygon_OnDeactivated(item)
```

Context

`item`

Type: Object

Polygon where the event occurs.

See also

Polygon (Page 4221)

Polygon_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the polygon is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Polygon_OnKeyDown(item, keyCode, modifiers)
```

Context

`item`

Type: Object

Polygon where the event occurs.

`keyCode`

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

`modifiers`

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Polygon (Page 4221)

Polygon_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the polygon is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Polygon_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Polygon where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key

- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Polygon (Page 4221)

Polygon_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A polygon is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a polygon has the focus.
- A polygon is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
Polygon_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Polygon where the event occurs.

x

Type: DInt

X-coordinate of the input point

`y`

Type: DInt

Y-coordinate of the input point

`modifiers`

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

Polygon (Page 4221)

Polyline

Description

The "Polyline" object represents a polyline in runtime.

Object type

HmiPolyline

Properties

The "Polyline" object has the following properties:

- **AlternateLineColor**
  Specifies the second line color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **CapType**
  Specifies the shape of the line ends.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the polyline.
- **DashType**
  Specifies the stroke style of the polyline.
- **Enabled**
  Specifies whether the polyline can be operated in runtime.
- **EndType**
  Specifies the type of line end.
- **Height**
  Specifies the height.
- **JoinType**
  Specifies the corner style of the polyline.
- **Layer**
  Returns the layer of the screen in which the polyline is located.
- **Left**
  Specifies the value of the X coordinate.
- **LineColor**
  Specifies the line color.
- **LineWidth**
  Specifies the line thickness.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the polyline.
- **Opacity**
  Specifies the opacity.
- **Operability**
  Returns whether the polyline is operable.
- **Parent**
  Returns the higher-level screen object.

- **Points**
  Specifies the coordinates of the polyline points.
- **RequireExplicitUnlock**
  Returns whether the polyline is only operable while the associated button is being pressed.
- **RotationAngle**
  Specifies the angle of rotation in degrees.
- **RotationCenterPlacement**
  Specifies the reference point around which the polyline rotates.
- **RotationCenterX**
  Specifies the X coordinate of the rotation point.
- **RotationCenterY**
  Specifies the Y coordinate of the rotation point.
- **ShowFocusVisual**
  Specifies whether the polyline is highlighted when in focus.
- **StartType**
  Specifies the type of line start.
- **StyleItemClass**
  Returns the style which is applied to the polyline.
- **TabIndex**
  Returns the position of the polyline in the tab sequence.
- **ToolTipText**
  Specifies the tooltip text.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the polyline is visible.
- **Width**
  Specifies the width.

Methods

The "Polyline" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the polyline.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "Polyline" object has the following events:

- **OnActivated()**
  Occurs when a polyline receives focus.
- **OnContextTapped()**
  Occurs when a polyline is right-clicked or long-touched.
- **OnDeactivated()**
  Occurs when a polyline loses focus.
- **OnKeyDown()**
  Occurs when a key is pressed while the polyline is in focus.
- **OnKeyUp()**
  Occurs when a key is released while the polyline is in focus.
- **OnTapped()**
  Occurs when a polyline is left-clicked or short-touched.

Polyline.AlternateLineColor

Description

The "AlternateLineColor" property specifies the second line color which is displayed for line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
Polyline.AlternateLineColor
```

See also

Polyline (Page 4255)

Polyline.Authorization

Description

The "Authorization" property returns the operator authorization.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
Polyline.Authorization
```

See also

Polyline (Page 4255)

Polyline.CapType

Description

The "CapType" property specifies the shape of the line ends.

Type

Int32, HmiCapType

Specifies the line ends:

- Round (0): Round (line extends beyond the line end point with half the line thickness)
- Square (256): Square (line extends beyond the line end point with half the line thickness)
- Flat (512): Justified (line ends at the line end point)

Access

Read-write

Syntax

```
Polyline.CapType
```

See also

Polyline (Page 4255)

Polyline.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the polyline.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable, quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
Polyline.CurrentQuality
```

See also

Polyline (Page 4255)

Polyline.DashType

Description

The "DashType" property specifies the stroke style of the polyline.

Type

Int32, HmiDashType

Specifies the stroke style:

- Solid (0): Solid
- Dash(1): Dashed
- Dot (2): Dotted

- DashDot (3): Dash-dotted
- DashDotDot (4): Dash-dot-dot

Access

Read-write

Syntax

```
Polyline.DashType
```

See also

Polyline (Page 4255)

Polyline.Enabled

Description

The "Enabled" property specifies whether the polyline can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
Polyline.Enabled
```

See also

Polyline (Page 4255)

Polyline.EndType

Description

The "EndType" property specifies the line end type.

Type

Int32, HmiLineEndType

Specifies the line end type:

- Line (0): Line
- EmptyArrow (1): Empty arrow
- Arrow (2): Arrow
- ReversedArrow (3): Reverse arrow
- EmptyCircle (5): Empty circle
- Circle (6): Circle

Access

Read-write

Syntax

```
Polyline.EndType
```

See also

Polyline (Page 4255)

Polyline.Height

Description

The "Height" property specifies the height in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Polyline.Height
```

See also

Polyline (Page 4255)

Polyline.JoinType

Description

The "JoinType" property specifies the corner style of the polyline.

Type

Int32, HmiLineJoinType

Specifies the corner style:

- Round (0): Round
- Bevel (4096): Smooth
- Miter (8192): Miter

Access

Read-write

Syntax

```
Polyline.JoinType
```

See also

Polyline (Page 4255)

Polyline.Layer

Description

The "Layer" property returns the layer of the screen in which the polyline is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
Polyline.Layer
```

See also

Polyline (Page 4255)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

Polyline.Layer (Page 4263)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

Polyline.Layer (Page 4263)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

Polyline.Layer (Page 4263)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

Polyline.Layer (Page 4263)

Polyline.Left

Description

The "Left" property sets the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
Polyline.Left
```

See also

Polyline (Page 4255)

Polyline.LineColor

Description

The "LineColor" property specifies the line color.

Type

UInt32

Access

Read-write

Syntax

```
Polyline.LineColor
```

See also

Polyline (Page 4255)

Polyline.LineWidth

Description

The "LineWidth" property specifies the line thickness.

Type

UInt8

Access

Read-write

Syntax

```
Polyline.LineWidth
```

See also

Polyline (Page 4255)

Polyline.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
Polyline.Margin
```

See also

Polyline (Page 4255)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

Polyline.Margin (Page 4267)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

Polyline.Margin (Page 4267)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

Polyline.Margin (Page 4267)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

Polyline.Margin (Page 4267)

Polyline.Name

Description

The "Name" property returns the name of the polyline.

Type

String

Access

Read-only

Syntax

```
Polyline.Name
```

See also

Polyline (Page 4255)

Polyline.Opacity

Description

The "Opacity" property specifies the opacity. The value "0" indicates completely transparent.

Type

Float

Access

Read-write

Syntax

```
Polyline.Opacity
```

See also

Polyline (Page 4255)

Polyline.Operability

Description

The property "Operability" returns whether the polyline is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
Polyline.Operability
```

See also

Polyline (Page 4255)

Polyline.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
Polyline.Parent
```

See also

Polyline (Page 4255)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

Polyline.Points

Description

The "Points" polyline specifies the coordinates of the points of the polyline.

Type

Variant

Access

Read-write

Syntax

```
Polyline.Points
```

Example

Output the coordinates of the polyline "Polyline_1" with 3 points via debug output in runtime:

Copy code

```
const p = Screen.Items('Polyline_1').Points;
HMIRuntime.Trace("x1=" + p[0] + ", y1=" + p[1] + ", x2=" + p[2] + ", y2=" + p[3] + ", x3="
+ p[4] + ", y3=" + p[5]);
```

See also

Polyline (Page 4255)

Polyline.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the polyline can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
Polyline.RequireExplicitUnlock
```

See also

Polyline (Page 4255)

Polyline.RotationAngle

Description

The "RotationAngle" property specifies the angle of rotation in degrees.

Type

Int16

Access

Read-write

Syntax

```
Polyline.RotationAngle
```

See also

Polyline (Page 4255)

Polyline.RotationCenterPlacement (Page 4274)

Polyline.RotationCenterX (Page 4274)

Polyline.RotationCenterY (Page 4275)

Polyline.RotationCenterPlacement

Description

The "RotationCenterPlacement" property sets the reference point around which the polyline rotates.

Type

Int32, HmiRotationCenterPlacement

Specifies the reference point:

- AbsoluteFromCenter (0): Absolute distance from the object center in DIU (Device Independent Unit).
- NormedFromCenter (1): Relative distance from the center of the object to the surrounding object. The frame of the object is represented by the values "1" or "-1". The center of rotation can also lie outside the object.
- AbsoluteToContainer (2): Absolute distance from the screen origin (Top,Left: 0.0) in DIU (Device Independent Unit).

Access

Read-write

Syntax

```
Polyline.RotationCenterPlacement
```

See also

Polyline (Page 4255)

Polyline.RotationAngle (Page 4273)

Polyline.RotationCenterX (Page 4274)

Polyline.RotationCenterY (Page 4275)

Polyline.RotationCenterX

Description

The "RotationCenterX" property specifies the X coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
Polyline.RotationCenterX
```

See also

Polyline (Page 4255)

Polyline.RotationAngle (Page 4273)

Polyline.RotationCenterPlacement (Page 4274)

Polyline.RotationCenterY (Page 4275)

Polyline.RotationCenterY

Description

The "RotationCenterY" property specifies the Y coordinate of the rotation point. The value is the relative or absolute deviation from the center of the reference object.

Type

Float

Access

Read-write

Syntax

```
Polyline.RotationCenterY
```

See also

Polyline (Page 4255)

Polyline.RotationAngle (Page 4273)

Polyline.RotationCenterPlacement (Page 4274)

Polyline.RotationCenterX (Page 4274)

Polyline.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the polyline is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
Polyline.ShowFocusVisual
```

See also

Polyline (Page 4255)

Polyline.StartType

Description

The "StartType" property specifies the type of line start.

Type

Int32, HmiLineEndType

Specifies the start of the line:

- Line (0): Line
- EmptyArrow (1): Empty arrow
- Arrow (2): Arrow
- ReversedArrow (3): Reverse arrow
- EmptyCircle (5): Empty circle
- Circle (6): Circle

Access

Read-write

Syntax

```
Polyline.StartType
```

See also

Polyline (Page 4255)

Polyline.StyleItemClass

Description

The "StyleItemClass" property returns the style which is applied to the polyline.

Type

String

Access

Read-only

Syntax

```
Polyline.StyleItemClass
```

See also

Polyline (Page 4255)

Polyline.TabIndex

Description

The "TabIndex" property returns the position of the polyline in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
Polyline.TabIndex
```

See also

Polyline (Page 4255)

Polyline.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip.

Type

String

Access

Read-write

Syntax

```
Polyline.ToolTipText
```

See also

Polyline (Page 4255)

Polyline.Top

Description

The "Top" property sets the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
Polyline.Top
```

See also

Polyline (Page 4255)

Polyline.Visible

Description

The "Visible" property specifies whether the polyline is visible.

Type

Bool

Access

Read-write

Syntax

```
Polyline.Visible
```

See also

Polyline (Page 4255)

Polyline.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
Polyline.Width
```

See also

Polyline (Page 4255)

Polyline.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the polyline.

Syntax

```
Polyline.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

Polyline (Page 4255)

Polyline.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
Polyline.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

`propertyName`

Type: String

Name of the property for which flashing is configured.

`enable`

Type: Bool

Specifies that flashing is activated.

`value`

Optional, type: Variant

Value of the property for which flashing is configured.

`alternateValue`

Optional, type: Variant

Specifies the second value for flashing.

`rate`

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

Polyline (Page 4255)

Polyline_OnActivated()

Description

The "OnActivated" event occurs when a polyline receives focus:

- A polyline is selected via the configured tab sequence.
- A polyline that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
Polyline_OnActivated(item)
```

Context

`item`

Type: Object

Polyline where the event occurs.

See also

Polyline (Page 4255)

Polyline_OnContextTapped()

Description

The "OnContextTapped" event occurs with the following inputs of the operator:

- A polyline is right-clicked.
- A polyline is long-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Syntax

```
Polyline_OnContextTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Polyline where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

trigger

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

See also

Polyline (Page 4255)

Polyline_OnDeactivated()

Description

The "OnDeactivated" event occurs when a polyline loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
Polyline_OnDeactivated(item)
```

Context

`item`

Type: Object

Polyline where the event occurs.

See also

Polyline (Page 4255)

Polyline_OnKeyDown()

Description

The "OnKeyDown" event occurs when a key is pressed while the polyline is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Polyline_OnKeyDown(item, keyCode, modifiers)
```

Context

item

Type: Object

Polyline where the event occurs.

keyCode

Type: UInt

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Polyline (Page 4255)

Polyline_OnKeyUp()

Description

The "OnKeyUp" event occurs when a key is released while the polyline is in focus.

Order

The events are triggered in the following order:

1. OnKeyDown
2. OnKeyUp

Syntax

```
Polyline_OnKeyUp(item, keyCode, modifiers)
```

Context

item

Type:

Polyline where the event occurs.

keyCode

Type:

Virtual key code of the key that triggered the event (for example "27" for ESC).

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

See also

Polyline (Page 4255)

Polyline_OnTapped()

Description

The "OnTapped" event occurs with the following inputs of the operator:

- A polyline is left-clicked.
- The <RETURN> or <SPACE> key is pressed when a polyline has the focus.
- A polyline is short-touched.

Note

The length of the contact is defined by a limit value: 1000 ms if it is not specified by the operating system or web browser.

Order

The events are triggered in the following order:

1. OnKeyDown (if triggered by the <RETURN> or <SPACE> key)
2. OnKeyUp (if triggered by the <RETURN> or <SPACE> key)
3. OnTapped

Syntax

```
Polyline_OnTapped(item, x, y, modifiers, trigger)
```

Context

item

Type: Object

Polyline where the event occurs.

x

Type: DInt

X-coordinate of the input point

y

Type: DInt

Y-coordinate of the input point

modifiers

Type: Int32, HmiKeyboardModifier

Help key that is pressed as you type:

- None (0): None
- Control (1): Control key
- Shift (2): Shift key
- Control + Shift (3): Control key + Shift key
- Alt (4): Alternate key
- Control + Alt (5): Control key + Alternate key
- Shift + Alt (6): Shift key + Alternate key
- Control + Shift + Alt (7): Control key + Shift key + Alternate key

`trigger`

Type: Int32, HmiEventTrigger

The event is triggered as follows:

- Unknown (0): Unknown
- Touch (1): Touch (touch device)
- Left (16): Left-click (mouse)
- Middle (17): Middle-click (mouse)
- Right (18): Right-click (mouse)
- Enter (256): Enter key (keyboard)
- Space (257): Space key (keyboard)
- Escape (258): Escape key (keyboard)

Polyline (Page 4255)

PopupScreenWindow

Description

The "PopupScreenWindow" object represents a popup screen window.

Object type

HMIPopupScreenWindow

Properties

The "PopupScreenWindow" object has the following properties:

- **Adaption**
  Specifies how the window size adapts.
- **Caption**
  Specifies the text to be displayed in the title bar.
- **CaptionColor**
  Specifies the background color of the title bar.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the popup screen window.
- **CurrentScreen**
  Returns the screen of the current popup screen window.
- **CurrentZoomFactor**
  Specifies the zoom factor which is applied to the displayed screen.
- **Enabled**
  Specifies whether the popup screen window can be operated in runtime.
- **Height**
  Specifies the height.
- **HorizontalScrollBarPosition**
  Specifies the horizontal alignment for the scroll bar.
- **HorizontalScrollBarVisibility**
  Specifies the setting for the horizontal scroll bar of the window.
- **Icon**
  Specifies the icon.
- **IsModal**
  Returns whether the popup screen window is modal.
- **InteractiveZooming**
  Specifies whether zooming is supported.
- **Layer**
  Returns the layer of the screen where the popup screen window is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin of the popup screen window.
- **Monitor**
  Returns the monitor on which the popup screen window is displayed.
- **Name**
  Returns the name of the popup screen window .
- **Parent**
  Returns the parent screen object (Parent container).
- **Path**
  Returns the absolute object path of the popup screen window.

- **RenderingTemplate**
  Returns the name of the template from which the object was created.
- **Screen**
  Specifies the name of the screen contained in the pop-up screen window.
- **ScreenName**
  Returns the screen name.
- **ScreenNumber**
  Returns the screen number.
- **ShowFocusVisual**
  Specifies whether the popup screen window is highlighted when in focus.
- **StartupPosition**
  Specifies the position of the popup screen window at runtime start.
- **StyleItemClass**
  Returns the style applied to the popup screen window.
- **System**
  Specifies the server prefix.
- **TabIndex**
  Returns the position of the screen window in the tab sequence.
- **TabIntoWindow**
  Specifies that the configured tab sequence of the displayed screen is resumed on activation via the tab sequence.
- **Top**
  Specifies the value of the Y coordinate.
- **VerticalScrollBarPosition**
  Specifies the vertical alignment for the scroll bar.
- **VerticalScrollBarVisibility**
  Specifies the setting for the vertical scroll bar of the window.
- **Visible**
  Specifies whether the popup screen window is visible.
- **Width**
  Specifies the width.
- **WindowFlags**
  Specifies the screen window configuration.

Methods

The "PopupScreenWindow" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the screen window.
- **Close()**
  Closes the screen window.
- **PropertyFlashing()**
  Configures flashing of a property.

PopupScreenWindow.Adaption

Description

The "Adaption" property specifies how the window size adapts.

Type

Int32, HmiScreenWindowAdaption

Specifies how the window size adapts:

- None (0): No adaptation
- WindowToScreen (1): Window size corresponds to screen size
- ScreenToWindow (2): Screen is scaled to window size.

Access

Read-write

Syntax

```
PopupScreenWindow.Adaption
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.Caption

Description

The "Caption" property specifies the text to be displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
PopupScreenWindow.Caption
```

See also

PopupScreenWindow (Page 4288)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

PopupScreenWindow.Caption (Page 4291)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 4292)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 4292)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 4292)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 4292)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 4292)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 4292)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

PopupScreenWindow.Caption (Page 4291)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

PopupScreenWindow.Caption (Page 4291)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

PopupScreenWindow.Caption (Page 4291)

PopupScreenWindow.CaptionColor

Description

The "CaptionColor" property specifies the color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
PopupScreenWindow.CaptionColor
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.CurrentQuality

Description

The "CurrentQuality" property returns the current worst quality code of all tags which influence the specified popup screen window.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the quality of the value is worse than usual.
- Good (4): Usable. Quality of the value is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
PopupScreenWindow.CurrentQuality
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.CurrentScreen

Description

The "CurrentScreen" property returns the screen of the current popup screen window.

Type

Object, HmiScreen (Page 1397)

Access

Read-only

Syntax

```
PopupScreenWindow.CurrentScreen
```

See also

PopupScreenWindow (Page 4288)

Screen (Page 1397)

Screen

Description

Screen (Page 1397)

PopupScreenWindow.CurrentZoomFactor

Description

The "CurrentZoomFactor" property specifies the zoom factor of the popup screen window. The zoom factor may differ from the containing screen. The value 1.0 corresponds to a zoom factor of 100%.

Type

Float

Access

Read-write

Syntax

```
PopupScreenWindow.CurrentZoomFactor
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.Enabled

Description

The "Enabled" property specifies whether the popup screen window can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
PopupScreenWindow.Enabled
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.Height

Description

The "Height" property specifies the height of the popup screen window in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
PopupScreenWindow.Height
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.HorizontalScrollBarPosition

Description

The "HorizontalScrollBarPosition" property specifies the horizontal alignment for the scroll bar.

Type

Int32

Access

Read-write

Syntax

```
PopupScreenWindow.HorizontalScrollBarPosition
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.HorizontalScrollBarVisibility

Description

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
PopupScreenWindow.HorizontalScrollBarVisibility
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.Icon

Description

The "Icon" property specifies the icon of the popup screen window.

Type

String

Access

Read-write

Syntax

```
PopupScreenWindow.Icon
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.InteractiveZooming

Description

The "InteractiveZooming" property specifies whether zooming is supported.

Type

Bool

Access

Read-write

Syntax

```
PopupScreenWindow.InteractiveZooming
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.IsModal

Description

The "IsModal" property returns whether the popup screen window is modal.

Type

Bool

Access

Read-only

Syntax

```
PopupScreenWindow.IsModal
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.Layer

Description

The "Layer" property returns the layer of the screen where the popup screen window is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
PopupScreenWindow.Layer
```

See also

PopupScreenWindow (Page 4288)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

PopupScreenWindow.Layer (Page 4303)

Layer.MinimumZoom (Page 4304)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

PopupScreenWindow.Layer (Page 4303)

Layer.MaximumZoom (Page 4303)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

PopupScreenWindow.Layer (Page 4303)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

PopupScreenWindow.Layer (Page 4303)

PopupScreenWindow.Left

Description

The "Left" property specifies the value of the X coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
PopupScreenWindow.Left
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.Margin

Description

The "Margin" property specifies the surrounded outer distance of the popup screen window.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
PopupScreenWindow.Margin
```

See also

PopupScreenWindow (Page 4288)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

PopupScreenWindow.Margin (Page 4306)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

PopupScreenWindow.Margin (Page 4306)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

PopupScreenWindow.Margin (Page 4306)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

PopupScreenWindow.Margin (Page 4306)

PopupScreenWindow.Monitor

Description

The "Monitor" property returns the monitor on which the window is displayed.

Type

UInt8

Access

Read-only

Syntax

```
PopupScreenWindow.Monitor
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.Name

Description

The "Name" property returns the name of the pop- up screen window.

Type

String

Access

Read-only

Syntax

```
PopupScreenWindow.Name
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.Parent

Description

The "Parent" property returns the parent screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
PopupScreenWindow.Parent
```

See also

PopupScreenWindow (Page 4288)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

PopupScreenWindow.Path

Description

The "Path" property returns the absolute object path of the popup screen window in runtime, starting from the top-level screen window.

Note

For the syntax of an object path, see the "FindItem" method (Page 1549).

Type

String

Access

Read-only

Syntax

```
PopupScreenWindow.Path
```

See also

UI.FindItem() (Page 1549)

PopupScreenWindow (Page 4288)

PopupScreenWindow.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the object has been created.

Type

String

Access

Read-only

Syntax

```
PopupScreenWindow.RenderingTemplate
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.Screen

Description

The "Screen" property specifies the name of the screen ("HMIScreen" type) contained in the pop-up screen window. Loads a new screen via its name into the popup screen window.

The "Screen" property returns a different value than the "CurrentScreen" when the referenced screen is not yet loaded completely or does not exist.

Type

String, HmiStoredScreen

Access

Read-write

Syntax

```
PopupScreenWindow.Screen
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.ScreenName

Description

The "ScreenName" property returns the screen name.

Type

String

Access

Read-only

Syntax

```
PopupScreenWindow.ScreenName
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.ScreenNumber

Description

The "ScreenNumber" property returns the screen number.

Type

UInt16

Access

Read-only

Syntax

```
PopupScreenWindow.ScreenNumber
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the popup screen window is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
PopupScreenWindow.ShowFocusVisual
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.StartupPosition

Description

The "StartupPosition" property specifies the position of the popup screen window at runtime start.

Type

Int32, HmiWindowStartupPosition

Specifies the position of the screen window:

- None (0): Relative placement on the configured monitor via "Left" and "Top".
- CenteredMonitor (1): Centered on the configured monitor.

- Maximized (2): Maximized on the configured monitor.
- CenteredOwner (3): Centered on the displayed screen.

Access

Read-write

Syntax

```
PopupScreenWindow.StartupPosition
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.StyleItemClass

Description

The "StyleItemClass" property returns the style applied to the popup screen window.

Type

String

Access

Read-only

Syntax

```
PopupScreenWindow.StyleItemClass
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.System

Description

The "System" property specifies the server prefix.

Type

String, HmiSystem

Access

Read-write

Syntax

```
PopupScreenWindow.System
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.TabIndex

Description

The "TabIndex" property returns the position of the popup screen window in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
PopupScreenWindow.TabIndex
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.TabIntoWindow

Description

The "TabIntoWindow" property specifies that the configured tab sequence of the displayed screen is resumed on activation via the configured tab sequence.

Type

Bool

Access

Read-write

Syntax

```
PopupScreenWindow.TabIntoWindow
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.Top

Description

The "Top" property specifies the value of the Y coordinate in DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
PopupScreenWindow.Top
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.VerticalScrollBarPosition

Description

The "VerticalScrollBarPosition" property specifies the vertical position for the scroll bar.

Type

Int32

Access

Read-write

Syntax

```
PopupScreenWindow.VerticalScrollBarPosition
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.VerticalScrollBarVisibility

Description

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the window.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
PopupScreenWindow.VerticalScrollBarVisibility
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.Visible

Description

The "Visible" property specifies whether the popup screen window is visible.

Type

Bool

Access

Read-write

Syntax

```
PopupScreenWindow.Visible
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.Width

Description

The "Width" property specifies the width of the popup screen window in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
PopupScreenWindow.Width
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.WindowFlags

Description

The "WindowFlags" property specifies the screen window configuration.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

Enable multiple properties by adding the integer values or bit operators.

Access

Read-write

Syntax

```
PopupScreenWindow.WindowFlags
```

Example

Adapt the "windowFlags" tag depending on the window configuration:

Copy code

```
var windowFlags = HmiWindowFlag.ShowCaption | HmiWindowFlag.ShowBorder;
if (CanClose){
    windowFlags |= HmiWindowFlag.CanClose;
} else {
    windowFlags &= HmiWindowFlag.CanClose;
}
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the popup screen window.

Syntax

```
PopupScreenWindow.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.Close()

Description

The "Close" method closes the popup screen window.

Syntax

```
PopupScreenWindow.Close()
```

Parameters

--

Return value

Bool

See also

PopupScreenWindow (Page 4288)

PopupScreenWindow.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing means the change between two values of a property.

Syntax

```
PopupScreenWindow.PropertyFlashing(propertyName,enable[,value]
[,alternateValue][,rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flashing frequency:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

PopupScreenWindow (Page 4288)

ProcessControl

Description

The "ProcessControl" object shows a process control of tag values from the current process or the log in runtime.

Object type

HmiProcessControl

Properties

The "ProcessControl" object has the following properties:

- **BackColor**
  Specifies the background color.
- **Caption**
  Specifies the text that is displayed in the title bar.
- **CaptionColor**
  Specifies the background color of the title bar.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the process control.
- **EditMode**
  Specifies the editing mode for values in runtime.
- **Enabled**
  Specifies whether the process control can be operated in runtime.

- **Height**
  Specifies the height.
- **Icon**
  Specifies the icon of the process control.
- **Layer**
  Returns the screen layer in which the process control is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the process control.
- **Online**
  Specifies the start and stop of updating the process control.
- **Parent**
  Returns the higher-level screen object.
- **ProcessView**
  Specifies the appearance of the process control.
- **RenderingTemplate**
  Returns the name of the template from which the process control was created.
- **ShowFocusVisual**
  Specifies whether the process control is highlighted when in focus.
- **StatusBar**
  Specifies the information bar of the process control.
- **StyleItemClass**
  Returns the style which is applied to the process control.
- **TabIndex**
  Returns the position of the process control in the tab sequence.
- **TimeStepSmoothingBase**
  Specifies the base of the time range for the smoothing the values/times.
- **TimeStepSmoothingFactor**
  Specifies the time base factor for smoothing.
- **TimeZone**
  Specifies the time zone.
- **ToolBar**
  Specifies the toolbar of the process control.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the process control is visible.

- **Width**
  Specifies the width.
- **WindowFlags**
  Specifies the window configuration of the process control.

Methods

The "ProcessControl" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the process control.
- **FireCommand()**
  Configures the occurrence of an event for an element.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "ProcessControl" object has the following events:

- **OnActivated()**
  Occurs when a process control receives focus.
- **OnCommandFired()**
  Occurs when the operator has operated an element in the toolbar or information bar of the process control.
- **OnDeactivated()**
  Occurs when a process control loses focus.
- **OnInitialized()**
  Occurs when a process control has been successfully initialized and the data connection to the PLC has been established.

ProcessControl.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ProcessControl.BackColor
```

See also

ProcessControl (Page 4322)

ProcessControl.Caption

Description

The "Caption" property specifies the text that is displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
ProcessControl.Caption
```

See also

ProcessControl (Page 4322)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

ProcessControl.Caption (Page 4325)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 4325)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 4325)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 4325)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 4325)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 4325)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal

- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 4325)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

ProcessControl.Caption (Page 4325)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

ProcessControl.Caption (Page 4325)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

ProcessControl.Caption (Page 4325)

ProcessControl.CaptionColor

Description

The "CaptionColor" property specifies the color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
ProcessControl.CaptionColor
```

See also

ProcessControl (Page 4322)

ProcessControl.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the process control.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
ProcessControl.CurrentQuality
```

See also

ProcessControl (Page 4322)

ProcessControl.EditMode

Description

The "EditMode" property specifies the editing mode for values in runtime.

Type

Int32, HmiEditMode

Specifies the editing mode:

- None (0): No access
- Update (1): Update values
- Create (2): Create values
- Delete (4): Delete values

Access

Read-write

Syntax

```
ProcessControl.EditMode
```

See also

ProcessControl (Page 4322)

ProcessControl.Enabled

Description

The "Enabled" property specifies whether the process control can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ProcessControl.Enabled
```

See also

ProcessControl (Page 4322)

ProcessControl.Height

Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ProcessControl.Height
```

See also

ProcessControl (Page 4322)

ProcessControl.Icon

Description

The "Icon" property specifies the icon of the process control.

Type

String

Access

Read-write

Syntax

```
ProcessControl.Icon
```

See also

ProcessControl (Page 4322)

ProcessControl.Layer

Description

The "Layer" property returns the screen layer in which the process control is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
ProcessControl.Layer
```

See also

ProcessControl (Page 4322)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

ProcessControl.Layer (Page 4334)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

ProcessControl.Layer (Page 4334)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

ProcessControl.Layer (Page 4334)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

ProcessControl.Layer (Page 4334)

ProcessControl.Left

Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
ProcessControl.Left
```

See also

ProcessControl (Page 4322)

ProcessControl.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ProcessControl.Margin
```

See also

ProcessControl (Page 4322)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ProcessControl.Margin (Page 4337)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ProcessControl.Margin (Page 4337)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ProcessControl.Margin (Page 4337)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ProcessControl.Margin (Page 4337)

ProcessControl.Name

Description

The "Name" property returns the name of the process control.

Type

String

Access

Read-only

Syntax

```
ProcessControl.Name
```

See also

ProcessControl (Page 4322)

ProcessControl.Online

Description

The "Online" property specifies the start and stop of the table view updating.

- True: Online. The table view is updated with new values.
- False: Offline. No new values are added to the table view.

Type

Bool

Access

Read-write

Syntax

```
ProcessControl.Online
```

See also

ProcessControl (Page 4322)

ProcessControl.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
ProcessControl.Parent
```

See also

ProcessControl (Page 4322)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

ProcessControl.ProcessView

Description

The "ProcessView" specifies the appearance of the table display.

Type

Object, HmiDataGridViewPart (Page 4341)

Access

Read-write

Syntax

```
ProcessControl.ProcessView
```

See also

ProcessControl (Page 4322)

DataGridView (Page 4341)

DataGridView

DataGridView.AllowFilter

Description

The "AllowFilter" property specifies whether filtering of columns is permitted.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.AllowFilter
```

See also

ProcessControl.ProcessView (Page 4341)

DataGridView.AllowSort

Description

The "AllowSort" property specifies whether the sorting of columns is permitted.

- True: Activates the sorting and sets the "AllowSort" property of all columns to "true".
- False: Disables the sorting for all columns. The individual column properties remain unchanged.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.AllowSort
```

See also

ProcessControl.ProcessView (Page 4341)

DataGridView.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.AlternateBackColor
```

See also

ProcessControl.ProcessView (Page 4341)

DataGridView.AlternateForeColor

Description

The "AlternateForeColor" property specifies the flashing color for the text.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.AlternateForeColor
```

See also

ProcessControl.ProcessView (Page 4341)

DataGridView.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.BackColor
```

See also

ProcessControl.ProcessView (Page 4341)

DataGridView.CellPadding

Description

The "CellPadding" property specifies the inner spacing of the content from the cell border.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
DataGridView.CellPadding
```

See also

ProcessControl.ProcessView (Page 4341)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

DataGridView.CellPadding (Page 4344)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

DataGridView.CellPadding (Page 4344)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

DataGridView.CellPadding (Page 4344)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

DataGridView.CellPadding (Page 4344)

DataGridView.ColoringMode

Description

The "ColoringMode" property specifies whether alternate coloring of every other row or column is enabled.

Type

Int32, HmiGridColoringMode

Specifies the type of the coloring:

- None (0): None
- Columns (1): Color the columns alternately.
- Rows (2): Color the rows alternately.

Access

Read-write

Syntax

```
DataGridView.ColoringMode
```

See also

ProcessControl.ProcessView (Page 4341)

DataGridView.Columns

Description

The "Columns" property represents the quantity of columns.

Type

Object, HmiDataGridColumnCollection (Page 4348)

Access

Read-only

Syntax

```
DataGridView.Columns
```

See also

ProcessControl.ProcessView (Page 4341)

HmiDataGridColumnCollection (Page 4348)

HmiDataGridColumnCollection

Description

The "HmiDataGridColumnCollection" object is a list of all columns ("DataGridColumn" objects) of the table.

You reference a "HmiDataGridColumnCollection" object via the `DataGridView.Columns` property.

Use

The "HmiDataGridColumnCollection" object is a list and can be counted and enumerated. You can access the "HmiDataGridColumnCollection" list using the index or the tag name.

Object type

HmiDataGridColumnCollection

Properties

The "HmiDataGridColumnCollection" object has the following properties:

- **Count**
  Returns the number of columns in the "HmiDataGridColumnCollection" list.

Methods

The "HmiDataGridColumnCollection" object has the following methods:

- **Item()**
  Returns a column of the "HmiDataGridColumnCollection" list.

See also

DataGridView.Columns (Page 4347)

HmiDataGridColumnCollection.Count

Description

The "Count" property returns the number of columns in the "HmiDataGridColumnCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiDataGridColumnCollection.Count
```

See also

HmiDataGridColumnCollection (Page 4348)

HmiDataGridColumnCollection.Item()

Description

The "Item" method returns a column of the "HmiDataGridColumnCollection" list.

Syntax

```
HmiDataGridColumnCollection[.Item](HmiDataGridColumnName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiDataGridColumnCollection" object.

Parameters

`HmiDataGridColumnName`

Type: String

Name of the column

Return value

Object, HmiDataGridColumnPartBase (Page 4350)

See also

HmiDataGridColumnCollection (Page 4348)

Process View Columns (Page 4350)

Process View Columns

ProcessColumn

Description

The "ProcessColumn" object represents a value column.

Object type

HmiProcessColumnPart

Properties

The "ProcessColumn" object has the following properties:

- **AllowSort**
  Specifies whether column sorting is allowed.
- **BackColor**
  Specifies the background color.
- **Content**
  Specifies the display options for text and graphics.
- **DataSource**
  Specifies the data source.
- **Enabled**
  Specifies whether the column can be operated in runtime.
- **ForeColor**
  Specifies the font color of the text.
- **Header**
  Specifies the properties of the column header.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumWidth**
  Specifies the minimum width.
- **Name**
  Returns the name of the column.
- **OutputFormat**
  Specifies the format for displaying values.
- **SortDirection**
  Specifies the sorting direction.
- **SortOrder**
  Specifies the sorting order.

- **Visible**
  Specifies whether the column is visible.
- **Width**
  Specifies the width.

Methods

--

See also

HmiDataGridColumnCollection (Page 4348)

ProcessColumn.AllowSort

Description

The "AllowSort" property specifies whether column sorting is permitted.

This property is ignored if the parent object has the "AllowSort" property set to "False".

Type

Bool

Access

Read-write

Syntax

```
ProcessColumn.AllowSort
```

See also

ProcessColumn (Page 4350)

ProcessColumn.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ProcessColumn.BackColor
```

See also

ProcessColumn (Page 4350)

ProcessColumn.Content

Description

The "Content" property specifies the display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ProcessColumn.Content
```

See also

ProcessColumn (Page 4350)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics

- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ProcessColumn.Content (Page 4352)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ProcessColumn.Content (Page 4352)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ProcessColumn.Content (Page 4352)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ProcessColumn.Content (Page 4352)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ProcessColumn.Content (Page 4352)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ProcessColumn.Content (Page 4352)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ProcessColumn.Content (Page 4352)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ProcessColumn.Content (Page 4352)

ProcessColumn.DataSource

Description

The "DataSource" property specifies the data source.

Type

Object, HmiDataSourcePart

Access

Read-write

Syntax

```
ProcessColumn.DataSource
```

See also

ProcessColumn (Page 4350)

DataSource.Source

Description

The "Source" property specifies the data source, e.g. a tag or logging tag.

Type

String

Access

Read-write

Syntax

```
DataSource.Source
```

See also

ProcessColumn.DataSource (Page 4357)

DataSource.VisualizeQuality

Description

The "VisualizeQuality" property specifies whether the connection quality of the process value is displayed.

Type

Bool

Access

Read-write

Syntax

```
DataSource.VisualizeQuality
```

See also

ProcessColumn.DataSource (Page 4357)

ProcessColumn.Enabled

Description

The "Enabled" property specifies whether the column can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ProcessColumn.Enabled
```

See also

ProcessColumn (Page 4350)

ProcessColumn.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ProcessColumn.ForeColor
```

See also

ProcessColumn (Page 4350)

ProcessColumn.Header

Description

The "Header" property specifies the properties of the column header.

Type

Object, HmiDataGridColumnHeaderPart

Access

Read-write

Syntax

```
ProcessColumn.Header
```

See also

ProcessColumn (Page 4350)

DataGridColumnHeader.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
DataGridColumnHeader.Content
```

See also

ProcessColumn.Header (Page 4360)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

DataGridColumnHeader.Content (Page 4360)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

DataGridColumnHeader.Content (Page 4360)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

DataGridColumnHeader.Content (Page 4360)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

DataGridColumnHeader.Content (Page 4360)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

DataGridColumnHeader.Content (Page 4360)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

DataGridColumnHeader.Content (Page 4360)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

DataGridColumnHeader.Content (Page 4360)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

DataGridColumnHeader.Content (Page 4360)

DataGridColumnHeader.Graphic

Description

The "Graphic" property specifies the graphic of the column header.

Type

String

Access

Read-write

Syntax

```
DataGridColumnHeader.Graphic
```

See also

ProcessColumn.Header (Page 4360)

DataGridColumnHeader.Text

Description

The "Text" property specifies the label of the column header.

Type

String

Access

Read-write

Syntax

```
DataGridColumnHeader.Text
```

See also

ProcessColumn.Header (Page 4360)

ProcessColumn.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ProcessColumn.MaximumWidth
```

See also

ProcessColumn (Page 4350)

ProcessColumn.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ProcessColumn.MinimumWidth
```

See also

ProcessColumn (Page 4350)

ProcessColumn.Name

Description

The "Name" property returns the name of the column.

Type

String

Access

Read-only

Syntax

```
ProcessColumn.Name
```

See also

ProcessColumn (Page 4350)

ProcessColumn.OutputFormat

Description

The "OutputFormat" property specifies the format for displaying values.

Type

String

Access

Read-write

Syntax

```
ProcessColumn.OutputFormat
```

See also

ProcessColumn (Page 4350)

ProcessColumn.SortDirection

Description

The "SortDirection" property specifies the sorting direction.

Type

Int32, HmiSortDirection

Specifies the sorting order:

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

Access

Read-write

Syntax

```
ProcessColumn.SortDirection
```

See also

ProcessColumn (Page 4350)

ProcessColumn.SortOrder

Description

The "SortOrder" property specifies the sorting order.

The sorting index starts at "1" (highest priority) in ascending order. Zero is ignored.

Type

UInt16

Access

Read-write

Syntax

```
ProcessColumn.SortOrder
```

See also

ProcessColumn (Page 4350)

ProcessColumn.Visible

Description

The "Visible" property specifies whether the column is visible.

Type

Bool

Access

Read-write

Syntax

```
ProcessColumn.Visible
```

See also

ProcessColumn (Page 4350)

ProcessColumn.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ProcessColumn.Width
```

See also

ProcessColumn (Page 4350)

TimeRangeColumn

Description

The "TimeRangeColumn" object represents a value column.

Object type

HmiTimeRangeColumnPart

Properties

The "TimeRangeColumn" object has the following properties:

- **AllowSort**
  Specifies whether column sorting is allowed.
- **BackColor**
  Specifies the background color.
- **BeginTime**
  Specifies the date and time for the start time of the time range.
- **Content**
  Specifies the display options for text and graphics.
- **Enabled**
  Specifies whether the column can be operated in runtime.
- **EndTime**
  Specifies the date and time for the end time of the time range.
- **ForeColor**
  Specifies the font color of the text.
- **Header**
  Specifies the properties of the column header.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumWidth**
  Specifies the minimum width.
- **Name**
  Returns the name of the column.
- **OutputFormat**
  Specifies the format for displaying values.
- **PointCount**
  Specifies the number of measurement points from the start time.
- **RangeType**
  Specifies the type of time range.
- **SortDirection**
  Specifies the sorting direction.
- **SortOrder**
  Specifies the sorting order.
- **TimeRangeBase**
  Specifies the basis of the time range.
- **TimeRangeFactor**
  Specifies the factor of the time base for defining the time range.
- **Visible**
  Specifies whether the column is visible.
- **Width**
  Specifies the width.

Methods

--

See also

HmiDataGridColumnCollection (Page 4348)

TimeRangeColumn.AllowSort

Description

The "AllowSort" property specifies whether column sorting is permitted.

This property is ignored if the parent object has the "AllowSort" property set to "False".

Type

Bool

Access

Read-write

Syntax

```
TimeRangeColumn.AllowSort
```

See also

TimeRangeColumn (Page 4370)

TimeRangeColumn.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
TimeRangeColumn.BackColor
```

See also

TimeRangeColumn (Page 4370)

TimeRangeColumn.BeginTime

Description

The "BeginTime" property specifies the date and time for the start time of the time range.

Type

DateTime

Access

Read-write

Syntax

```
TimeRangeColumn.BeginTime
```

See also

TimeRangeColumn (Page 4370)

TimeRangeColumn.Content

Description

The "Content" property specifies the display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
TimeRangeColumn.Content
```

See also

TimeRangeColumn (Page 4370)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

TimeRangeColumn.Content (Page 4373)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.

- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

TimeRangeColumn.Content (Page 4373)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

TimeRangeColumn.Content (Page 4373)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

TimeRangeColumn.Content (Page 4373)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

TimeRangeColumn.Content (Page 4373)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

TimeRangeColumn.Content (Page 4373)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

TimeRangeColumn.Content (Page 4373)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

TimeRangeColumn.Content (Page 4373)

TimeRangeColumn.Enabled

Description

The "Enabled" property specifies whether the column can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
TimeRangeColumn.Enabled
```

See also

TimeRangeColumn (Page 4370)

TimeRangeColumn.EndTime

Description

The "EndTime" property specifies the date and time for the end time of the time range.

Type

DateTime

Access

Read-write

Syntax

```
TimeRangeColumn.EndTime
```

See also

TimeRangeColumn (Page 4370)

TimeRangeColumn.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
TimeRangeColumn.ForeColor
```

See also

TimeRangeColumn (Page 4370)

TimeRangeColumn.Header

Description

The "Header" property specifies the properties of the column header.

Type

Object, HmiDataGridColumnHeaderPart

Access

Read-write

Syntax

```
TimeRangeColumn.Header
```

See also

TimeRangeColumn (Page 4370)

DataGridColumnHeader.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
DataGridColumnHeader.Content
```

See also

TimeRangeColumn.Header (Page 4380)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

DataGridColumnHeader.Content (Page 4380)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

DataGridColumnHeader.Content (Page 4380)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

DataGridColumnHeader.Content (Page 4380)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

DataGridColumnHeader.Content (Page 4380)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

DataGridColumnHeader.Content (Page 4380)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

DataGridColumnHeader.Content (Page 4380)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

DataGridColumnHeader.Content (Page 4380)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

DataGridColumnHeader.Content (Page 4380)

DataGridColumnHeader.Graphic

Description

The "Graphic" property specifies the graphic of the column header.

Type

String

Access

Read-write

Syntax

```
DataGridColumnHeader.Graphic
```

See also

TimeRangeColumn.Header (Page 4380)

DataGridColumnHeader.Text

Description

The "Text" property specifies the label of the column header.

Type

String

Access

Read-write

Syntax

```
DataGridColumnHeader.Text
```

See also

TimeRangeColumn.Header (Page 4380)

TimeRangeColumn.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
TimeRangeColumn.MaximumWidth
```

See also

TimeRangeColumn (Page 4370)

TimeRangeColumn.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
TimeRangeColumn.MinimumWidth
```

See also

TimeRangeColumn (Page 4370)

TimeRangeColumn.Name

Description

The "Name" property returns the name of the column.

Type

String

Access

Read-only

Syntax

```
TimeRangeColumn.Name
```

See also

TimeRangeColumn (Page 4370)

TimeRangeColumn.OutputFormat

Description

The "OutputFormat" property specifies the format for displaying values.

Type

String

Access

Read-write

Syntax

```
TimeRangeColumn.OutputFormat
```

See also

TimeRangeColumn (Page 4370)

TimeRangeColumn.PointCount

Description

The "PointCount" property specifies the number of measurement points from the start time.

Type

Int32

Access

Read-write

Syntax

```
TimeRangeColumn.PointCount
```

See also

TimeRangeColumn (Page 4370)

TimeRangeColumn.RangeType

Description

The "RangeType" property specifies the type of time range.

Type

Int32, HmiTimeRangeType

Specifies the time range:

- TimeRange (0): Any time range
- FromBeginToEnd (1): Total time range
- PointCount (2): Number of measurement points

Access

Read-write

Syntax

```
TimeRangeColumn.RangeType
```

See also

TimeRangeColumn (Page 4370)

TimeRangeColumn.SortDirection

Description

The "SortDirection" property specifies the sorting direction.

Type

Int32, HmiSortDirection

Specifies the sorting order:

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

Access

Read-write

Syntax

```
TimeRangeColumn.SortDirection
```

See also

TimeRangeColumn (Page 4370)

TimeRangeColumn.SortOrder

Description

The "SortOrder" property specifies the sorting order.

The sorting index starts at "1" (highest priority) in ascending order. Zero is ignored.

Type

UInt16

Access

Read-write

Syntax

```
TimeRangeColumn.SortOrder
```

See also

TimeRangeColumn (Page 4370)

TimeRangeColumn.TimeRangeBase

Description

The "TimeRangeBase" property specifies the base of the time range.

Type

Int32, HmiTimeRangeBase

Specifies the time range:

- Undefined (0): Not defined
- Millisecond (1): Millisecond
- Second (2): Second
- Minute (3): Minute
- Hour (4): Hour
- Day (5): Day
- Month (6): Month
- Year (7): Year

Access

Read-write

Syntax

```
TimeRangeColumn.TimeRangeBase
```

See also

TimeRangeColumn (Page 4370)

TimeRangeColumn.TimeRangeFactor

Description

The "TimeRangeFactor" property specifies the factor of the time base for defining the time range.

Type

Int32

Access

Read-write

Syntax

```
TimeRangeColumn.TimeRangeFactor
```

See also

TimeRangeColumn (Page 4370)

TimeRangeColumn.Visible

Description

The "Visible" property specifies whether the column is visible.

Type

Bool

Access

Read-write

Syntax

```
TimeRangeColumn.Visible
```

See also

TimeRangeColumn (Page 4370)

TimeRangeColumn.Width

Description

The "Width" property specifies the width in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
TimeRangeColumn.Width
```

See also

TimeRangeColumn (Page 4370)

DataGridView.Font

Description

The "Font" property specifies the font of the cells.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
DataGridView.Font
```

See also

ProcessControl.ProcessView (Page 4341)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

DataGridView.Font (Page 4393)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

DataGridView.Font (Page 4393)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

DataGridView.Font (Page 4393)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

DataGridView.Font (Page 4393)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

DataGridView.Font (Page 4393)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

DataGridView.Font (Page 4393)

DataGridView.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.ForeColor
```

See also

ProcessControl.ProcessView (Page 4341)

DataGridView.GridLineColor

Description

The "GridLineColor" property specifies the color of grid lines.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.GridLineColor
```

See also

ProcessControl.ProcessView (Page 4341)

DataGridView.GridLineVisibility

Description

The "GridLineVisibility" property specifies the visibility of the grid lines.

Type

Int32, HmiSimpleGridLine

Specifies the grid lines:

- None (0): None
- Vertikal (1): Vertical
- Horizontal (2): Horizontal

Access

Read-write

Syntax

```
DataGridView.GridLineVisibility
```

See also

ProcessControl.ProcessView (Page 4341)

DataGridView.GridLineWidth

Description

The "GridLineWidth" property specifies the thickness of the grid lines in pixels.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.GridLineWidth
```

See also

ProcessControl.ProcessView (Page 4341)

DataGridView.GridSelectionMode

Description

The "GridSelectionMode" property specifies whether multiple selection is enabled in the table content.

Type

Int32, HmiGridSelectionMode

Specifies the type of the selection:

- None (0): None
- Single (1): Only single selection
- Multi (2): Multiple selection

Access

Read-write

Syntax

```
DataGridView.GridSelectionMode
```

See also

ProcessControl.ProcessView (Page 4341)

DataGridView.HeaderSettings

Description

The "HeaderSettings" property specifies the settings for all column headers in the table.

Type

Object, HmiDataGridHeaderSettingsPart

Access

Read-write

Syntax

```
DataGridView.HeaderSettings
```

See also

ProcessControl.ProcessView (Page 4341)

DataGridHeaderSettings.AllowColumnReorder

Description

The "AllowColumnReorder" property specifies whether the order of the columns can be changed.

Type

Bool

Access

Read-write

Syntax

```
DataGridHeaderSettings.AllowColumnReorder
```

See also

DataGridView.HeaderSettings (Page 4399)

DataGridHeaderSettings.AllowColumnResize

Description

The "AllowColumnResize" property specifies whether the width of the columns can be changed.

Type

Bool

Access

Read-write

Syntax

```
DataGridHeaderSettings.AllowColumnResize
```

See also

DataGridView.HeaderSettings (Page 4399)

DataGridHeaderSettings.ColumnHeaderType

Description

The "ColumnHeaderType" property specifies the type of content of a column header.

Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

Access

Read-write

Syntax

```
DataGridHeaderSettings.ColumnHeaderType
```

See also

DataGridView.HeaderSettings (Page 4399)

DataGridHeaderSettings.Font

Description

The "Font" property specifies the font of the headers.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
DataGridHeaderSettings.Font
```

See also

DataGridView.HeaderSettings (Page 4399)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

DataGridHeaderSettings.Font (Page 4401)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

DataGridHeaderSettings.Font (Page 4401)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

DataGridHeaderSettings.Font (Page 4401)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

DataGridHeaderSettings.Font (Page 4401)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

DataGridHeaderSettings.Font (Page 4401)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

DataGridHeaderSettings.Font (Page 4401)

DataGridHeaderSettings.HeaderBackColor

Description

The "HeaderBackColor" property specifies the background color of the header.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderBackColor
```

See also

DataGridView.HeaderSettings (Page 4399)

DataGridHeaderSettings.HeaderForeColor

Description

The "HeaderForeColor" property specifies the font color of the headers.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderForeColor
```

See also

DataGridView.HeaderSettings (Page 4399)

DataGridHeaderSettings.HeaderGridLineColor

Description

The "HeaderGridLineColor" property specifies the color of the separation line between column headers.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderGridLineColor
```

See also

DataGridView.HeaderSettings (Page 4399)

DataGridHeaderSettings.HeaderSelectionBackColor

Description

The "HeaderSelectionBackColor" property specifies the background color of the header of a selected line or column.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderSelectionBackColor
```

See also

DataGridView.HeaderSettings (Page 4399)

DataGridHeaderSettings.HeaderSelectionForeColor

Description

The "HeaderSelectionForeColor" property specifies the font color of the header of a selected line or column.

Type

UInt32

Access

Read-write

Syntax

```
Object.HeaderSelectionForeColor
```

`Object`

Required. An object from the "Availability" section.

See also

DataGridView.HeaderSettings (Page 4399)

DataGridHeaderSettings.RowHeaderType

Description

The "RowHeaderType" property specifies the type of content of a row header.

Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

Access

Read-write

Syntax

```
DataGridHeaderSettings.RowHeaderType
```

See also

DataGridView.HeaderSettings (Page 4399)

DataGridView.HorizontalScrollBarVisibility

Description

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar of the display.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
DataGridView.HorizontalScrollBarVisibility
```

See also

ProcessControl.ProcessView (Page 4341)

DataGridView.RowHeight

Description

The "RowHeight" property specifies the height of all rows in the table in DIU (Device Independent Unit).

"0" corresponds to a automatic mechanism, which adjusts the height of each line according to the font size and number of paragraphs.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.RowHeight
```

See also

ProcessControl.ProcessView (Page 4341)

DataGridView.SelectFullRow

Description

The "SelectFullRow" property specifies whether only the cell or the entire row is included in the selection.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.SelectFullRow
```

See also

ProcessControl.ProcessView (Page 4341)

DataGridView.SelectionBackColor

Description

The "SelectionBackColor" property specifies the background color of the selected cells.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.SelectionBackColor
```

See also

ProcessControl.ProcessView (Page 4341)

DataGridView.SelectionBorderColor

Description

The "SelectionBorderColor" property specifies the border color of the selected cells.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.SelectionBorderColor
```

See also

ProcessControl.ProcessView (Page 4341)

DataGridView.SelectionForeColor

Description

The "SelectionForeColor" property specifies the font color of the selected cells.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.SelectionForeColor
```

See also

ProcessControl.ProcessView (Page 4341)

DataGridView.VerticalScrollBarVisibility

Description

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the display.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
DataGridView.VerticalScrollBarVisibility
```

See also

ProcessControl.ProcessView (Page 4341)

ProcessControl.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the process control was created.

Type

String

Access

Read-only

Syntax

```
ProcessControl.RenderingTemplate
```

See also

ProcessControl (Page 4322)

ProcessControl.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the process control is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
ProcessControl.ShowFocusVisual
```

See also

ProcessControl (Page 4322)

ProcessControl.StatusBar

Description

The "StatusBar" property specifies the information bar of the process control.

Type

Object, HmiStatusBarPart

Access

Read-write

Syntax

```
ProcessControl.StatusBar
```

See also

ProcessControl (Page 4322)

StatusBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
StatusBar.BackColor
```

See also

ProcessControl.StatusBar (Page 4413)

StatusBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

Type

Object, HmiControlBarElementCollection (Page 4415)

Access

Read-only

Syntax

```
StatusBar.Elements
```

See also

ProcessControl.StatusBar (Page 4413)

HmiControlBarElementCollection (Page 4415)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

StatusBar.Elements (Page 4414)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 4415)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 4433)

See also

HmiControlBarElementCollection (Page 4415)

Control Bar Elements (Page 4433)

Control Bar Elements

Description

Control Bar Elements (Page 4433)

StatusBar.Enabled

Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Enabled
```

See also

ProcessControl.StatusBar (Page 4413)

StatusBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
StatusBar.Font
```

See also

ProcessControl.StatusBar (Page 4413)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

StatusBar.Font (Page 4417)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

StatusBar.Font (Page 4417)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

StatusBar.Font (Page 4417)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

StatusBar.Font (Page 4417)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

StatusBar.Font (Page 4417)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

StatusBar.Font (Page 4417)

StatusBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
StatusBar.Margin
```

See also

ProcessControl.StatusBar (Page 4413)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

StatusBar.Margin (Page 4421)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

StatusBar.Margin (Page 4421)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

StatusBar.Margin (Page 4421)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

StatusBar.Margin (Page 4421)

StatusBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
StatusBar.Padding
```

See also

ProcessControl.StatusBar (Page 4413)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

StatusBar.Padding (Page 4424)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

StatusBar.Padding (Page 4424)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

StatusBar.Padding (Page 4424)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

StatusBar.Padding (Page 4424)

StatusBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.ShowToolTips
```

See also

ProcessControl.StatusBar (Page 4413)

StatusBar.Visible

Description

The "Visible" property specifies whether the information bar is visible.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Visible
```

See also

ProcessControl.StatusBar (Page 4413)

ProcessControl.StyleItemClass

Description

The "StyleItemClass" property returns the style that is applied to the process control.

Type

String

Access

Read-only

Syntax

```
ProcessControl.StyleItemClass
```

See also

ProcessControl (Page 4322)

ProcessControl.TabIndex

Description

The "TabIndex" property returns the position of the process control in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
ProcessControl.TabIndex
```

See also

ProcessControl (Page 4322)

ProcessControl.TimeStepSmoothingBase

Description

The "TimeStepSmoothingBase" property specifies the base of the time range for smoothing the values/times.

Type

Int32, HmiTimeRangeBase

Specifies the time range:

- Undefined (0): Not defined
- Millisecond (1): Millisecond
- Second (2): Second
- Minute (3): Minute
- Hour (4): Hour
- Day (5): Day
- Month (6): Month
- Year (7): Year

Access

Read-write

Syntax

```
ProcessControl.TimeStepSmoothingBase
```

See also

ProcessControl (Page 4322)

ProcessControl.TimeStepSmoothingFactor

Description

The "TimeStepSmoothingFactor" property specifies the factor for smoothing the time base.

Type

Int32

Access

Read-write

Syntax

```
ProcessControl.TimeStepSmoothingFactor
```

See also

ProcessControl (Page 4322)

ProcessControl.TimeZone

Description

The "TimeZone" property specifies the time zone.

Type

Int32, HmiTimeZone

Access

Read-write

Syntax

```
ProcessControl.TimeZone
```

See also

ProcessControl (Page 4322)

ProcessControl.ToolBar

Description

The "ToolBar" property specifies the toolbar of the table display.

Type

Object, HmiToolBarPart

Access

Read-write

Syntax

```
ProcessControl.ToolBar
```

See also

ProcessControl (Page 4322)

ToolBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ToolBar.BackColor
```

See also

ProcessControl.ToolBar (Page 4430)

ToolBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

Type

Object, HmiControlBarElementCollection (Page 4431)

Access

Read-only

Syntax

```
ToolBar.Elements
```

See also

HmiControlBarElementCollection (Page 4431)

ProcessControl.ToolBar (Page 4430)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

ToolBar.Elements (Page 4431)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 4431)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 4433)

See also

HmiControlBarElementCollection (Page 4431)

Control Bar Elements (Page 4433)

Control Bar Elements

ControlBarButton

Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarButtonPart

Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the label of the button.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the button can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the button.
- **Mapping**
  Returns the function of the button.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.

- **Operability**
  Returns whether the button is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the button is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarButton.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBackColor
```

See also

ControlBarButton (Page 4433)

ControlBarButton.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBorderColor
```

See also

ControlBarButton (Page 4433)

ControlBarButton.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarButton.Authorization
```

See also

ControlBarButton (Page 4433)

ControlBarButton.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BackColor
```

See also

ControlBarButton (Page 4433)

ControlBarButton.Badge

Description

The "Badge" property specifies the label of the button.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarButton.Badge
```

See also

ControlBarButton (Page 4433)

ControlBarButton.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BorderColor
```

See also

ControlBarButton (Page 4433)

ControlBarButton.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarButton.BorderWidth
```

See also

ControlBarButton (Page 4433)

ControlBarButton.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarButton.Content
```

See also

ControlBarButton (Page 4433)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarButton.Content (Page 4439)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarButton.Content (Page 4439)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarButton.Content (Page 4439)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarButton.Content (Page 4439)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarButton.Content (Page 4439)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarButton.Content (Page 4439)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarButton.Content (Page 4439)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarButton.Content (Page 4439)

ControlBarButton.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarButton.CustomID
```

See also

ControlBarButton (Page 4433)

ControlBarButton.Enabled

Description

The "Enabled" property specifies whether the button can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Enabled
```

See also

ControlBarButton (Page 4433)

ControlBarButton.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.ForeColor
```

See also

ControlBarButton (Page 4433)

ControlBarButton.Graphic

Description

The "Graphic" property specifies the graphic of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Graphic
```

See also

ControlBarButton (Page 4433)

ControlBarButton.Height

Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Height
```

See also

ControlBarButton (Page 4433)

ControlBarButton.HotKey

Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
ControlBarButton.HotKey
```

See also

ControlBarButton (Page 4433)

ControlBarButton.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent

- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms

- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarButton.Mapping
```

See also

ControlBarButton (Page 4433)

ControlBarButton.Margin

Description

The "Margin" property specifies the surrounded outer distance of the button.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarButton.Margin
```

See also

ControlBarButton (Page 4433)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarButton.Margin (Page 4449)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarButton.Margin (Page 4449)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarButton.Margin (Page 4449)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarButton.Margin (Page 4449)

ControlBarButton.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumHeight
```

See also

ControlBarButton (Page 4433)

ControlBarButton.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumWidth
```

See also

ControlBarButton (Page 4433)

ControlBarButton.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumHeight
```

See also

ControlBarButton (Page 4433)

ControlBarButton.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumWidth
```

See also

ControlBarButton (Page 4433)

ControlBarButton.Operability

Description

The "Operability" property returns whether the button is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarButton.Operability
```

See also

ControlBarButton (Page 4433)

ControlBarButton.Padding

Description

The "Padding" property specifies the distance of the content from the border of the button.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarButton.Padding
```

See also

ControlBarButton (Page 4433)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarButton.Padding (Page 4454)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarButton.Padding (Page 4454)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarButton.Padding (Page 4454)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarButton.Padding (Page 4454)

ControlBarButton.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarButton.RequireExplicitUnlock
```

See also

ControlBarButton (Page 4433)

ControlBarButton.Text

Description

The "Text" property specifies the label of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Text
```

See also

ControlBarButton (Page 4433)

ControlBarButton.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.ToolTipText
```

See also

ControlBarButton (Page 4433)

ControlBarButton.Visible

Description

The "Visible" property specifies whether the button is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Visible
```

See also

ControlBarButton (Page 4433)

ControlBarButton.Width

Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Width
```

See also

ControlBarButton (Page 4433)

ControlBarDisplay

Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarDisplayPart

Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the display area is enabled in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the display area.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the display area is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.

- **Visible**
  Specifies whether the display area is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarDisplay.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarDislay.Authorization
```

See also

ControlBarDisplay (Page 4459)

ControlBarDisplay.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarDislay.Content
```

See also

ControlBarDisplay (Page 4459)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarDisplay.Content (Page 4461)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarDisplay.Content (Page 4461)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarDisplay.Content (Page 4461)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarDisplay.Content (Page 4461)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarDisplay.Content (Page 4461)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarDisplay.Content (Page 4461)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarDisplay.Content (Page 4461)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarDisplay.Content (Page 4461)

ControlBarDisplay.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarDislay.CustomID
```

See also

ControlBarDisplay (Page 4459)

ControlBarDisplay.Enabled

Description

The "Enabled" property specifies whether the display is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Enabled
```

See also

ControlBarDisplay (Page 4459)

ControlBarDisplay.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.ForeColor
```

See also

ControlBarDisplay (Page 4459)

ControlBarDisplay.Graphic

Description

The "Graphic" property specifies the graphic of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Graphic
```

See also

ControlBarDisplay (Page 4459)

ControlBarDisplay.Height

Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Height
```

See also

ControlBarDisplay (Page 4459)

ControlBarDisplay.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarDislay.Mapping
```

See also

ControlBarDisplay (Page 4459)

ControlBarDisplay.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the display.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarDislay.Margin
```

See also

ControlBarDisplay (Page 4459)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarDisplay.Margin (Page 4471)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarDisplay.Margin (Page 4471)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarDisplay.Margin (Page 4471)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarDisplay.Margin (Page 4471)

ControlBarDisplay.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumHeight
```

See also

ControlBarDisplay (Page 4459)

ControlBarDisplay.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumWidth
```

See also

ControlBarDisplay (Page 4459)

ControlBarDisplay.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumHeight
```

See also

ControlBarDisplay (Page 4459)

ControlBarDisplay.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumWidth
```

See also

ControlBarDisplay (Page 4459)

ControlBarDisplay.Operability

Description

The "Operability" property returns whether the display is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarDislay.Operability
```

See also

ControlBarDisplay (Page 4459)

ControlBarDisplay.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the display.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarDislay.Padding
```

See also

ControlBarDisplay (Page 4459)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarDisplay.Padding (Page 4476)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarDisplay.Padding (Page 4476)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarDisplay.Padding (Page 4476)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarDisplay.Padding (Page 4476)

ControlBarDisplay.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarDislay.RequireExplicitUnlock
```

See also

ControlBarDisplay (Page 4459)

ControlBarDisplay.Text

Description

The "Text" property specifies the label of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Text
```

See also

ControlBarDisplay (Page 4459)

ControlBarDisplay.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.ToolTipText
```

See also

ControlBarDisplay (Page 4459)

ControlBarDisplay.Visible

Description

The "Visible" property specifies whether the display is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Visible
```

See also

ControlBarDisplay (Page 4459)

ControlBarDisplay.Width

Description

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Width
```

See also

ControlBarDisplay (Page 4459)

ControlBarLabel

Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar.

You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarLabelPart

Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the identifier can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the identifier.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the identifier is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.

- **Visible**
  Specifies whether the identifier is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarLabel.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarLabel.Authorization
```

See also

ControlBarLabel (Page 4481)

ControlBarLabel.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarLabel.CustomID
```

See also

ControlBarLabel (Page 4481)

ControlBarLabel.Enabled

Description

The "Enabled" property specifies whether the identifier is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Enabled
```

See also

ControlBarLabel (Page 4481)

ControlBarLabel.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.ForeColor
```

See also

ControlBarLabel (Page 4481)

ControlBarLabel.Height

Description

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Height
```

See also

ControlBarLabel (Page 4481)

ControlBarLabel.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

See also

ControlBarLabel (Page 4481)

ControlBarLabel.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms

- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export

- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarLabel.Mapping
```

See also

ControlBarLabel (Page 4481)

ControlBarLabel.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarLabel.Margin
```

See also

ControlBarLabel (Page 4481)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarLabel.Margin (Page 4488)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarLabel.Margin (Page 4488)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarLabel.Margin (Page 4488)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarLabel.Margin (Page 4488)

ControlBarLabel.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumHeight
```

See also

ControlBarLabel (Page 4481)

ControlBarLabel.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumWidth
```

See also

ControlBarLabel (Page 4481)

ControlBarLabel.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumHeight
```

See also

ControlBarLabel (Page 4481)

ControlBarLabel.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumWidth
```

See also

ControlBarLabel (Page 4481)

ControlBarLabel.Operability

Description

The "Operability" property returns whether the identifier is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarLabel.Operability
```

See also

ControlBarLabel (Page 4481)

ControlBarLabel.Padding

Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarLabel.Padding
```

See also

ControlBarLabel (Page 4481)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarLabel.Padding (Page 4493)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarLabel.Padding (Page 4493)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarLabel.Padding (Page 4493)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarLabel.Padding (Page 4493)

ControlBarLabel.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarLabel.RequireExplicitUnlock
```

See also

ControlBarLabel (Page 4481)

ControlBarLabel.Text

Description

The "Text" property specifies the label of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.Text
```

See also

ControlBarLabel (Page 4481)

ControlBarLabel.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.ToolTipText
```

See also

ControlBarLabel (Page 4481)

ControlBarLabel.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.VerticalTextAlignment
```

See also

ControlBarLabel (Page 4481)

ControlBarLabel.Visible

Description

The "Visible" property specifies whether the identifier is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Visible
```

See also

ControlBarLabel (Page 4481)

ControlBarLabel.Width

Description

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Width
```

See also

ControlBarLabel (Page 4481)

ControlBarSeparator

Description

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarSeparatorPart

Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the disconnector can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the separator.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.

- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the separator is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the disconnector is only operable while the associated button is being pressed.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the disconnector is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarSeparator.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarSeparator.Authorization
```

See also

ControlBarSeparator (Page 4499)

ControlBarSeparator.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarSeparator.CustomID
```

See also

ControlBarSeparator (Page 4499)

ControlBarSeparator.Enabled

Description

The "Enabled" property specifies whether the separator is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Enabled
```

See also

ControlBarSeparator (Page 4499)

ControlBarSeparator.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.ForeColor
```

See also

ControlBarSeparator (Page 4499)

ControlBarSeparator.Height

Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Height
```

See also

ControlBarSeparator (Page 4499)

ControlBarSeparator.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarSeparator.Mapping
```

See also

ControlBarSeparator (Page 4499)

ControlBarSeparator.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the separator.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarSeparator.Margin
```

See also

ControlBarSeparator (Page 4499)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarSeparator.Margin (Page 4505)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarSeparator.Margin (Page 4505)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarSeparator.Margin (Page 4505)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarSeparator.Margin (Page 4505)

ControlBarSeparator.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumHeight
```

See also

ControlBarSeparator (Page 4499)

ControlBarSeparator.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumWidth
```

See also

ControlBarSeparator (Page 4499)

ControlBarSeparator.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumHeight
```

See also

ControlBarSeparator (Page 4499)

ControlBarSeparator.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumWidth
```

See also

ControlBarSeparator (Page 4499)

ControlBarSeparator.Operability

Description

The "Operability" property returns whether the separator is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarSeparator.Operability
```

See also

ControlBarSeparator (Page 4499)

ControlBarSeparator.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the separator.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarSeparator.Padding
```

See also

ControlBarSeparator (Page 4499)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarSeparator.Padding (Page 4510)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarSeparator.Padding (Page 4510)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarSeparator.Padding (Page 4510)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarSeparator.Padding (Page 4510)

ControlBarSeparator.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the disconnector can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarSeparator.RequireExplicitUnlock
```

See also

ControlBarSeparator (Page 4499)

ControlBarSeparator.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

Type

String

Access

Read-write

Syntax

```
ControlBarSeparator.ToolTipText
```

See also

ControlBarSeparator (Page 4499)

ControlBarSeparator.Visible

Description

The "Visible" property specifies whether the separator is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Visible
```

See also

ControlBarSeparator (Page 4499)

ControlBarSeparator.Width

Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Width
```

See also

ControlBarSeparator (Page 4499)

ControlBarTextBox

Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarTextBoxPart

Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the text box can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Mapping**
  Returns the function of the text box.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.

- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the text box is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **Readonly**
  Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**
  Returns whether the text box is only operable while the associated button is being pressed.
- **Text**
  Specifies the labeling.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the text box is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarTextBox.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.AlternateBorderColor
```

See also

ControlBarTextBox (Page 4515)

ControlBarTextBox.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarTextBox.Authorization
```

See also

ControlBarTextBox (Page 4515)

ControlBarTextBox.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BackColor
```

See also

ControlBarTextBox (Page 4515)

ControlBarTextBox.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BorderColor
```

See also

ControlBarTextBox (Page 4515)

ControlBarTextBox.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarTextBox.BorderWidth
```

See also

ControlBarTextBox (Page 4515)

ControlBarTextBox.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarTextBox.CustomID
```

See also

ControlBarTextBox (Page 4515)

ControlBarTextBox.Enabled

Description

The "Enabled" property specifies whether the text box can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Enabled
```

See also

ControlBarTextBox (Page 4515)

ControlBarTextBox.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.ForeColor
```

See also

ControlBarTextBox (Page 4515)

ControlBarTextBox.Height

Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Height
```

See also

ControlBarTextBox (Page 4515)

ControlBarTextBox.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

See also

ControlBarTextBox (Page 4515)

ControlBarTextBox.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarTextBox.Mapping
```

See also

ControlBarTextBox (Page 4515)

ControlBarTextBox.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the text box.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarTextBox.Margin
```

See also

ControlBarTextBox (Page 4515)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarTextBox.Margin (Page 4524)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarTextBox.Margin (Page 4524)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarTextBox.Margin (Page 4524)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarTextBox.Margin (Page 4524)

ControlBarTextBox.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumHeight
```

See also

ControlBarTextBox (Page 4515)

ControlBarTextBox.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumWidth
```

See also

ControlBarTextBox (Page 4515)

ControlBarTextBox.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumHeight
```

See also

ControlBarTextBox (Page 4515)

ControlBarTextBox.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumWidth
```

See also

ControlBarTextBox (Page 4515)

ControlBarTextBox.Operability

Description

The "Operability" property returns whether the text box is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarTextBox.Operability
```

See also

ControlBarTextBox (Page 4515)

ControlBarTextBox.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the text box.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarTextBox.Padding
```

See also

ControlBarTextBox (Page 4515)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarTextBox.Padding (Page 4529)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarTextBox.Padding (Page 4529)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarTextBox.Padding (Page 4529)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarTextBox.Padding (Page 4529)

ControlBarTextBox.ReadOnly

Description

The "ReadOnly" property specifies whether the text box is read-only.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.ReadOnly
```

See also

ControlBarTextBox (Page 4515)

ControlBarTextBox.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

See also

ControlBarTextBox (Page 4515)

ControlBarTextBox.Text

Description

The "Text" property specifies the label of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.Text
```

See also

ControlBarTextBox (Page 4515)

ControlBarTextBox.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.ToolTipText
```

See also

ControlBarTextBox (Page 4515)

ControlBarTextBox.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

See also

ControlBarTextBox (Page 4515)

ControlBarTextBox.Visible

Description

The "Visible" property specifies whether the text box is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Visible
```

See also

ControlBarTextBox (Page 4515)

ControlBarTextBox.Width

Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Width
```

See also

ControlBarTextBox (Page 4515)

ControlBarToggleSwitch

Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar.

You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarToggleSwitchPart

Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **AlternateGraphic**
  Specifies the graphic for the "pressed" state.
- **AlternateText**
  Specifies the text for the "pressed" state.
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the identifier of the switch.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.

- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the switch can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the switch.
- **IsAlternateState**
  Specifies the current state of the switch.
- **Mapping**
  Returns the function of the switch.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the switch is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the switch is only operable while the associated button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the switch is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarToggleSwitch.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.AlternateGraphic

Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateGraphic
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.AlternateText

Description

The "AlternateText" property specifies the text of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateText
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Authorization
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BackColor
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.Badge

Description

The "Badge" property specifies the identifier of the switch.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Badge
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderColor
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderWidth
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Content
```

See also

ControlBarToggleSwitch (Page 4535)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarToggleSwitch.Content (Page 4541)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.

- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarToggleSwitch.Content (Page 4541)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 4541)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarToggleSwitch.Content (Page 4541)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarToggleSwitch.Content (Page 4541)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarToggleSwitch.Content (Page 4541)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarToggleSwitch.Content (Page 4541)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 4541)

ControlBarToggleSwitch.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarToggleSwitch.CustomID
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.Enabled

Description

The "Enabled" property specifies whether the switch can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Enabled
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ForeColor
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.Graphic

Description

The "Graphic" property specifies the graphic of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Graphic
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.Height

Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Height
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.HotKey

Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
Button.HotKey
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.IsAlternateState

Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment

- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms

- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Mapping
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the switch.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Margin
```

See also

ControlBarToggleSwitch (Page 4535)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarToggleSwitch.Margin (Page 4552)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarToggleSwitch.Margin (Page 4552)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarToggleSwitch.Margin (Page 4552)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarToggleSwitch.Margin (Page 4552)

ControlBarToggleSwitch.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumHeight
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumWidth
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumHeight
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumWidth
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.Operability

Description

The property "Operability" returns whether the switch is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Operability
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the switch.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Padding
```

See also

ControlBarToggleSwitch (Page 4535)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarToggleSwitch.Padding (Page 4557)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarToggleSwitch.Padding (Page 4557)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarToggleSwitch.Padding (Page 4557)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarToggleSwitch.Padding (Page 4557)

ControlBarToggleSwitch.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.Text

Description

The "Text" property specifies the label of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Text
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ToolTipText
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.Visible

Description

The "Visible" property specifies whether the switch is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Visible
```

See also

ControlBarToggleSwitch (Page 4535)

ControlBarToggleSwitch.Width

Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Width
```

See also

ControlBarToggleSwitch (Page 4535)

ToolBar.Enabled

Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Enabled
```

See also

ProcessControl.ToolBar (Page 4430)

ToolBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ToolBar.Font
```

See also

ProcessControl.ToolBar (Page 4430)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ToolBar.Font (Page 4563)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ToolBar.Font (Page 4563)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ToolBar.Font (Page 4563)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ToolBar.Font (Page 4563)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ToolBar.Font (Page 4563)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ToolBar.Font (Page 4563)

ToolBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the toolbar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ToolBar.Margin
```

See also

ProcessControl.ToolBar (Page 4430)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ToolBar.Margin (Page 4567)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ToolBar.Margin (Page 4567)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ToolBar.Margin (Page 4567)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ToolBar.Margin (Page 4567)

ToolBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ToolBar.Padding
```

See also

ProcessControl.ToolBar (Page 4430)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ToolBar.Padding (Page 4569)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ToolBar.Padding (Page 4569)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ToolBar.Padding (Page 4569)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ToolBar.Padding (Page 4569)

ToolBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.ShowToolTips
```

See also

ProcessControl.ToolBar (Page 4430)

ToolBar.UseHotKeys

Description

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.UseHotKeys
```

See also

ProcessControl.ToolBar (Page 4430)

ToolBar.Visible

Description

The "Visible" property specifies whether the toolbar is visible.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Visible
```

See also

ProcessControl.ToolBar (Page 4430)

ProcessControl.Top

Description

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
ProcessControl.Top
```

See also

ProcessControl (Page 4322)

ProcessControl.Visible

Description

The "Visible" property specifies whether the process control is visible.

Type

Bool

Access

Read-write

Syntax

```
ProcessControl.Visible
```

See also

ProcessControl (Page 4322)

ProcessControl.Width

Description

The "Width" property specifies the width in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ProcessControl.Width
```

See also

ProcessControl (Page 4322)

ProcessControl.WindowFlags

Description

The "WindowFlags" property specifies the window configuration of the process control display.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title
- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be moved
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

You can enable multiple properties by adding integer values or bit operators.

Access

Read-write

Syntax

```
ProcessControl.WindowFlags
```

See also

ProcessControl (Page 4322)

ProcessControl.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the table view.

Syntax

```
ProcessControl.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

ProcessControl (Page 4322)

ProcessControl.FireCommand()

Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the table view.

Syntax

```
ProcessControl.FireCommand(commandId, custom)
```

Parameters

commandId

Type: Int32

ID of the element of the toolbar or information bar

custom

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

Return value

--

See also

ProcessControl (Page 4322)

ProcessControl.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
ProcessControl.PropertyFlashing(propertyName, enable[, value][,
alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

ProcessControl (Page 4322)

ProcessControl_OnActivated()

Description

The "OnActivated" event occurs when a table view receives focus:

- A table display is selected via the configured tab sequence.
- A table display that had no focus is clicked/touched.

The "OnActivated" event is only used to detect whether an object has been selected and is receiving focus. The event is not triggered if the object already had the focus.

The event does not trigger a password prompt. For this reason, do not use the "OnActivated" event if you want to configure access protection on the function call of the object.

Syntax

```
ProcessControl_OnActivated(item)
```

Context

item

Type: Object

Table view where the event occurs.

See also

ProcessControl (Page 4322)

ProcessControl_OnCommandFired()

Description

The "OnCommandFired" event occurs when the operator has operated an element in the toolbar or information bar (control bar element, e.g. a button) of the table view.

Syntax

```
ProcessControl_OnCommandFired(item, commandId, custom)
```

Context

item

Type: Object

Table view where the event occurs.

commandId

Type: DInt

ID of the element of the toolbar or information bar that was operated.

custom

Type: Bool

Specifies the type of the ID of the operated element:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

See also

ProcessControl (Page 4322)

ProcessControl_OnDeactivated()

Description

The "OnDeactivated" event occurs when the table view loses focus because the operator presses the <TAB> key or executes another action with the mouse.

The "OnDeactivated" event is only used to detect whether an object was deselected.

The event does not trigger a password prompt. For this reason, do not use the "OnDeactivated" event if you want to configure access protection on the function call of the object.

System functions or user-defined functions on the "OnDeactivated" event are not executed when a screen is closed.

Syntax

```
ProcessControl_OnDeactivated(item)
```

Context

item

Type: Object

Table view where the event occurs.

See also

ProcessControl (Page 4322)

ProcessControl_OnInitialized()

Description

The "OnInitialized" event occurs when a table view has been successfully initialized and the data connection to the PLC has been established.

Syntax

```
ProcessControl_OnInitialized(item)
```

Context

item

Type: Object

Table view where the event occurs.

See also

ProcessControl (Page 4322)

ProcessDiagnosisCriteriaAnalysisControl

Description

The "ProcessDiagnosisCriteriaAnalysisControl" object represents a process diagnostics view for criteria analysis in runtime.

Object type

HmiProcessDiagnosisCriteriaAnalysisControl

Properties

The "ProcessDiagnosisCriteriaAnalysisControl" object has the following properties:

- **BackColor**
  Specifies the background color.
- **Caption**
  Specifies the text that is displayed in the title bar.
- **CaptionColor**
  Specifies the background color of the title bar.
- **CriteriaAnalysisView**
  Defines the appearance of the process diagnostics view.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the process diagnostics view.
- **Enabled**
  Specifies whether the process diagnostics view can be operated in runtime.
- **ForeColor**
  Specifies the font color of the text.
- **Height**
  Specifies the height.
- **Icon**
  Specifies the icon of the process diagnostics view.
- **Layer**
  Returns the screen layer in which the process diagnostics view is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the process diagnostics view.

- **Parent**
  Returns the higher-level screen object.
- **RenderingTemplate**
  Returns the name of the template from which the process diagnostics view was created.
- **ShowFocusVisual**
  Specifies whether the process diagnostics view is highlighted when in focus.
- **SnapToSourceControl**
  Specifies whether the process diagnostics overview snaps to the window of the associated data source.
- **SourceControl**
  Specifies the data source.
- **StatusBar**
  Specifies the information bar of the process diagnostics view.
- **StyleItemClass**
  Returns the style which is applied to the process diagnostics view.
- **TabIndex**
  Returns the position of the process diagnostics view in the tab sequence.
- **ToolBar**
  Specifies the toolbar of the process diagnostics view.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the process diagnostics view is visible.
- **Width**
  Specifies the width.
- **WindowFlags**
  Specifies the window configuration of the process diagnostics view.

Methods

The "ProcessDiagnosisCriteriaAnalysisControl" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the process diagnostics view.
- **FireCommand()**
  Configures the occurrence of an event for an element.
- **PropertyFlashing()**
  Configures flashing of a property.

ProcessDiagnosisCriteriaAnalysisControl.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.BackColor
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

ProcessDiagnosisCriteriaAnalysisControl.Caption

Description

The "Caption" property specifies the text that is displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.Caption
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

ProcessDiagnosisCriteriaAnalysisControl.Caption (Page 4583)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 4583)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 4583)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 4583)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 4583)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 4583)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 4583)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

ProcessDiagnosisCriteriaAnalysisControl.Caption (Page 4583)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

ProcessDiagnosisCriteriaAnalysisControl.Caption (Page 4583)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

ProcessDiagnosisCriteriaAnalysisControl.Caption (Page 4583)

ProcessDiagnosisCriteriaAnalysisControl.CaptionColor

Description

The "CaptionColor" property specifies the color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.CaptionColor
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView

Description

The "CriteriaAnalysisView" property specifies the appearance of the process diagnostics view.

Type

Object, HmiDataGridViewPart (Page 4590)

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

DataGridView (Page 4590)

DataGridView

DataGridView.AllowFilter

Description

The "AllowFilter" property specifies whether filtering of columns is permitted.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.AllowFilter
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

DataGridView.AllowSort

Description

The "AllowSort" property specifies whether the sorting of columns is permitted.

- True: Activates the sorting and sets the "AllowSort" property of all columns to "true".
- False: Disables the sorting for all columns. The individual column properties remain unchanged.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.AllowSort
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

DataGridView.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.AlternateBackColor
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

DataGridView.AlternateForeColor

Description

The "AlternateForeColor" property specifies the flashing color for the text.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.AlternateForeColor
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

DataGridView.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.BackColor
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

DataGridView.CellPadding

Description

The "CellPadding" property specifies the inner spacing of the content from the cell border.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
DataGridView.CellPadding
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

DataGridView.CellPadding (Page 4592)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

DataGridView.CellPadding (Page 4592)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

DataGridView.CellPadding (Page 4592)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

DataGridView.CellPadding (Page 4592)

DataGridView.ColoringMode

Description

The "ColoringMode" property specifies whether alternate coloring of every other row or column is enabled.

Type

Int32, HmiGridColoringMode

Specifies the type of the coloring:

- None (0): None
- Columns (1): Color the columns alternately.
- Rows (2): Color the rows alternately.

Access

Read-write

Syntax

```
DataGridView.ColoringMode
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

DataGridView.Columns

Description

The "Columns" property represents the quantity of columns.

Type

Object, HmiDataGridColumnCollection (Page 4596)

Access

Read-only

Syntax

```
DataGridView.Columns
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

HmiDataGridColumnCollection (Page 4596)

HmiDataGridColumnCollection

Description

The "HmiDataGridColumnCollection" object is a list of all columns ("DataGridColumn" objects) of the table.

You reference a "HmiDataGridColumnCollection" object via the `DataGridView.Columns` property.

Use

The "HmiDataGridColumnCollection" object is a list and can be counted and enumerated. You can access the "HmiDataGridColumnCollection" list using the index or the tag name.

Object type

HmiDataGridColumnCollection

Properties

The "HmiDataGridColumnCollection" object has the following properties:

- **Count**
  Returns the number of columns in the "HmiDataGridColumnCollection" list.

Methods

The "HmiDataGridColumnCollection" object has the following methods:

- **Item()**
  Returns a column of the "HmiDataGridColumnCollection" list.

See also

DataGridView.Columns (Page 4595)

HmiDataGridColumnCollection.Count

Description

The "Count" property returns the number of columns in the "HmiDataGridColumnCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiDataGridColumnCollection.Count
```

See also

HmiDataGridColumnCollection (Page 4596)

HmiDataGridColumnCollection.Item()

Description

The "Item" method returns a column of the "HmiDataGridColumnCollection" list.

Syntax

```
HmiDataGridColumnCollection[.Item](HmiDataGridColumnName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiDataGridColumnCollection" object.

Parameters

`HmiDataGridColumnName`

Type: String

Name of the column

Return value

Object, HmiDataGridColumnPartBase (Page 4598)

See also

HmiDataGridColumnCollection (Page 4596)

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4598)

ProcessDiagnosisCriteriaAnalysisControlColumn

Description

The "ProcessDiagnosisCriteriaAnalysisControlColumn" object represents a value column.

Object type

HmiProcessDiagnosisCriteriaAnalysisControlColumnPart

Properties

The "ProcessDiagnosisCriteriaAnalysisControlColumn" object has the following properties:

- **AllowSort**
  Specifies whether column sorting is allowed.
- **BackColor**
  Specifies the background color.
- **Content**
  Specifies display options for text and graphics.
- **CriteriaAnalysisBlock**
  Returns the criteria analysis block.
- **Enabled**
  Specifies whether the column can be operated in runtime.
- **ForeColor**
  Specifies the font color of the text.
- **Header**
  Specifies the properties of the column header.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumWidth**
  Specifies the minimum width.
- **Name**
  Returns the name of the column.
- **OutputFormat**
  Specifies the format for displaying values.

- **SortDirection**
  Specifies the sorting direction.
- **SortOrder**
  Specifies the sorting order.
- **Visible**
  Specifies whether the column is visible.
- **Width**
  Specifies the width.

Methods

--

See also

HmiDataGridColumnCollection (Page 4596)

ProcessDiagnosisCriteriaAnalysisControlColumn.AllowSort

Description

The "AllowSort" property specifies whether column sorting is permitted.

This property is ignored if the parent object has the "AllowSort" property set to "False".

Type

Bool

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControlColumn.AllowSort
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4598)

ProcessDiagnosisCriteriaAnalysisControlColumn.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControlColumn.BackColor
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4598)

ProcessDiagnosisCriteriaAnalysisControlColumn.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControlColumn.Content
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4598)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn.Content (Page 4600)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn.Content (Page 4600)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn.Content (Page 4600)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn.Content (Page 4600)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn.Content (Page 4600)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above

- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn.Content (Page 4600)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn.Content (Page 4600)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn.Content (Page 4600)

ProcessDiagnosisCriteriaAnalysisControlColumn.CriteriaAnalysisBlock

Description

The "CriteriaAnalysisBlock" property returns the criteria analysis block.

Type

Int32, HmiProcessDiagnosisCriteriaAnalysisBlock

Returns the criteria analysis block:

- SymbolName (0): Symbol name
- Address (1): Address
- Value (2): Value
- Comment (3): Comment

Access

Read-only

Syntax

```
ProcessDiagnosisCriteriaAnalysisControlColumn.CriteriaAnalysisBlock
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4598)

ProcessDiagnosisCriteriaAnalysisControlColumn.Enabled

Description

The "Enabled" property specifies whether the column can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControlColumn.Enabled
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4598)

ProcessDiagnosisCriteriaAnalysisControlColumn.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControlColumn.ForeColor
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4598)

ProcessDiagnosisCriteriaAnalysisControlColumn.Header

Description

The "Header" property specifies the properties of the column header.

Type

Object, HmiDataGridColumnHeaderPart

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControlColumn.Header
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4598)

DataGridColumnHeader.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
DataGridColumnHeader.Content
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn.Header (Page 4607)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

DataGridColumnHeader.Content (Page 4607)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.

- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

DataGridColumnHeader.Content (Page 4607)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

DataGridColumnHeader.Content (Page 4607)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

DataGridColumnHeader.Content (Page 4607)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

DataGridColumnHeader.Content (Page 4607)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

DataGridColumnHeader.Content (Page 4607)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

DataGridColumnHeader.Content (Page 4607)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

DataGridColumnHeader.Content (Page 4607)

DataGridColumnHeader.Graphic

Description

The "Graphic" property specifies the graphic of the column header.

Type

String

Access

Read-write

Syntax

```
DataGridColumnHeader.Graphic
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn.Header (Page 4607)

DataGridColumnHeader.Text

Description

The "Text" property specifies the label of the column header.

Type

String

Access

Read-write

Syntax

```
DataGridColumnHeader.Text
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn.Header (Page 4607)

ProcessDiagnosisCriteriaAnalysisControlColumn.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControlColumn.MaximumWidth
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4598)

ProcessDiagnosisCriteriaAnalysisControlColumn.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControlColumn.MinimumWidth
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4598)

ProcessDiagnosisCriteriaAnalysisControlColumn.Name

Description

The "Name" property returns the name of the column.

Type

String

Access

Read-only

Syntax

```
ProcessDiagnosisCriteriaAnalysisControlColumn.Name
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4598)

ProcessDiagnosisCriteriaAnalysisControlColumn.OutputFormat

Description

The "OutputFormat" property specifies the format for displaying values.

Type

String

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControlColumn.OutputFormat
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4598)

ProcessDiagnosisCriteriaAnalysisControlColumn.SortDirection

Description

The "SortDirection" property specifies the sorting direction.

Type

Int32, HmiSortDirection

Specifies the sorting order:

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControlColumn.SortDirection
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4598)

ProcessDiagnosisCriteriaAnalysisControlColumn.SortOrder

Description

The "SortOrder" property specifies the order of the sorting.

The sorting index starts at "1" (highest priority) in ascending order. Zero is ignored.

Type

UInt16

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControlColumn.SortOrder
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4598)

ProcessDiagnosisCriteriaAnalysisControlColumn.Visible

Description

The "Visible" property specifies whether the column is visible.

Type

Bool

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControlColumn.Visible
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4598)

ProcessDiagnosisCriteriaAnalysisControlColumn.Width

Description

The "Width" property specifies the width in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControlColumn.Width
```

See also

ProcessDiagnosisCriteriaAnalysisControlColumn (Page 4598)

DataGridView.Font

Description

The "Font" property specifies the font of the cells.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
DataGridView.Font
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

DataGridView.Font (Page 4617)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

DataGridView.Font (Page 4617)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

DataGridView.Font (Page 4617)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

DataGridView.Font (Page 4617)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

DataGridView.Font (Page 4617)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

DataGridView.Font (Page 4617)

DataGridView.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.ForeColor
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

DataGridView.GridLineColor

Description

The "GridLineColor" property specifies the color of grid lines.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.GridLineColor
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

DataGridView.GridLineVisibility

Description

The "GridLineVisibility" property specifies the visibility of the grid lines.

Type

Int32, HmiSimpleGridLine

Specifies the grid lines:

- None (0): None
- Vertikal (1): Vertical
- Horizontal (2): Horizontal

Access

Read-write

Syntax

```
DataGridView.GridLineVisibility
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

DataGridView.GridLineWidth

Description

The "GridLineWidth" property specifies the thickness of the grid lines in pixels.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.GridLineWidth
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

DataGridView.GridSelectionMode

Description

The "GridSelectionMode" property specifies whether multiple selection is enabled in the table content.

Type

Int32, HmiGridSelectionMode

Specifies the type of the selection:

- None (0): None
- Single (1): Only single selection
- Multi (2): Multiple selection

Access

Read-write

Syntax

```
DataGridView.GridSelectionMode
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

DataGridView.HeaderSettings

Description

The "HeaderSettings" property specifies the settings for all column headers in the table.

Type

Object, HmiDataGridHeaderSettingsPart

Access

Read-write

Syntax

```
DataGridView.HeaderSettings
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

DataGridHeaderSettings.AllowColumnReorder

Description

The "AllowColumnReorder" property specifies whether the order of the columns can be changed.

Type

Bool

Access

Read-write

Syntax

```
DataGridHeaderSettings.AllowColumnReorder
```

See also

DataGridView.HeaderSettings (Page 4624)

DataGridHeaderSettings.AllowColumnResize

Description

The "AllowColumnResize" property specifies whether the width of the columns can be changed.

Type

Bool

Access

Read-write

Syntax

```
DataGridHeaderSettings.AllowColumnResize
```

See also

DataGridView.HeaderSettings (Page 4624)

DataGridHeaderSettings.ColumnHeaderType

Description

The "ColumnHeaderType" property specifies the type of content of a column header.

Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

Access

Read-write

Syntax

```
DataGridHeaderSettings.ColumnHeaderType
```

See also

DataGridView.HeaderSettings (Page 4624)

DataGridHeaderSettings.Font

Description

The "Font" property specifies the font of the headers.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
DataGridHeaderSettings.Font
```

See also

DataGridView.HeaderSettings (Page 4624)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

DataGridHeaderSettings.Font (Page 4626)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

DataGridHeaderSettings.Font (Page 4626)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

DataGridHeaderSettings.Font (Page 4626)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

DataGridHeaderSettings.Font (Page 4626)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

DataGridHeaderSettings.Font (Page 4626)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

DataGridHeaderSettings.Font (Page 4626)

DataGridHeaderSettings.HeaderBackColor

Description

The "HeaderBackColor" property specifies the background color of the header.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderBackColor
```

See also

DataGridView.HeaderSettings (Page 4624)

DataGridHeaderSettings.HeaderForeColor

Description

The "HeaderForeColor" property specifies the font color of the headers.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderForeColor
```

See also

DataGridView.HeaderSettings (Page 4624)

DataGridHeaderSettings.HeaderGridLineColor

Description

The "HeaderGridLineColor" property specifies the color of the separation line between column headers.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderGridLineColor
```

See also

DataGridView.HeaderSettings (Page 4624)

DataGridHeaderSettings.HeaderSelectionBackColor

Description

The "HeaderSelectionBackColor" property specifies the background color of the header of a selected line or column.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderSelectionBackColor
```

See also

DataGridView.HeaderSettings (Page 4624)

DataGridHeaderSettings.HeaderSelectionForeColor

Description

The "HeaderSelectionForeColor" property specifies the font color of the header of a selected line or column.

Type

UInt32

Access

Read-write

Syntax

```
Object.HeaderSelectionForeColor
```

`Object`

Required. An object from the "Availability" section.

See also

DataGridView.HeaderSettings (Page 4624)

DataGridHeaderSettings.RowHeaderType

Description

The "RowHeaderType" property specifies the type of content of a row header.

Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

Access

Read-write

Syntax

```
DataGridHeaderSettings.RowHeaderType
```

See also

DataGridView.HeaderSettings (Page 4624)

DataGridView.HorizontalScrollBarVisibility

Description

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar of the display.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
DataGridView.HorizontalScrollBarVisibility
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

DataGridView.RowHeight

Description

The "RowHeight" property specifies the height of all rows in the table in DIU (Device Independent Unit).

"0" corresponds to a automatic mechanism, which adjusts the height of each line according to the font size and number of paragraphs.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.RowHeight
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

DataGridView.SelectFullRow

Description

The "SelectFullRow" property specifies whether only the cell or the entire row is included in the selection.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.SelectFullRow
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

DataGridView.SelectionBackColor

Description

The "SelectionBackColor" property specifies the background color of the selected cells.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.SelectionBackColor
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

DataGridView.SelectionBorderColor

Description

The "SelectionBorderColor" property specifies the border color of the selected cells.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.SelectionBorderColor
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

DataGridView.SelectionBorderWidth

Description

The "SelectionBorderWidth" property specifies the border width of the selected cells.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.SelectionBorderWidth
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

DataGridView.SelectionForeColor

Description

The "SelectionForeColor" property specifies the font color of the selected cells.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.SelectionForeColor
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

DataGridView.VerticalScrollBarVisibility

Description

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the display.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
DataGridView.VerticalScrollBarVisibility
```

See also

ProcessDiagnosisCriteriaAnalysisControl.CriteriaAnalysisView (Page 4589)

ProcessDiagnosisCriteriaAnalysisControl.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the process diagnostics view.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.CurrentQuality
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

ProcessDiagnosisCriteriaAnalysisControl.Enabled

Description

The "Enabled" property specifies whether the process diagnostics view can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.Enabled
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

ProcessDiagnosisCriteriaAnalysisControl.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.ForeColor
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

ProcessDiagnosisCriteriaAnalysisControl.Height

Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.Height
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

ProcessDiagnosisCriteriaAnalysisControl.Icon

Description

The "Icon" property specifies the icon of the process diagnostics view.

Type

String

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.Icon
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

ProcessDiagnosisCriteriaAnalysisControl.Layer

Description

The "Layer" property returns the screen layer in which the process diagnostics view is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.Layer
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

ProcessDiagnosisCriteriaAnalysisControl.Layer (Page 4640)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

ProcessDiagnosisCriteriaAnalysisControl.Layer (Page 4640)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

ProcessDiagnosisCriteriaAnalysisControl.Layer (Page 4640)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

ProcessDiagnosisCriteriaAnalysisControl.Layer (Page 4640)

ProcessDiagnosisCriteriaAnalysisControl.Left

Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.Left
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

ProcessDiagnosisCriteriaAnalysisControl.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.Margin
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ProcessDiagnosisCriteriaAnalysisControl.Margin (Page 4643)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ProcessDiagnosisCriteriaAnalysisControl.Margin (Page 4643)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ProcessDiagnosisCriteriaAnalysisControl.Margin (Page 4643)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ProcessDiagnosisCriteriaAnalysisControl.Margin (Page 4643)

ProcessDiagnosisCriteriaAnalysisControl.Name

Description

The "Name" property returns the name of the process diagnostics view.

Type

String

Access

Read-only

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.Name
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

ProcessDiagnosisCriteriaAnalysisControl.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.Parent
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

ProcessDiagnosisCriteriaAnalysisControl.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the process diagnostics view was created.

Type

String

Access

Read-only

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.RenderingTemplate
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

ProcessDiagnosisCriteriaAnalysisControl.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the process diagnostics view is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.ShowFocusVisual
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

ProcessDiagnosisCriteriaAnalysisControl.SnapToSourceControl

Description

The "SnapToSourceControl" property specifies whether the process diagnostics overview snaps to the window of the associated data source.

Type

Bool

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.SnapToSourceControl
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

ProcessDiagnosisCriteriaAnalysisControl.SourceControl

Description

The "SourceControl" property specifies the data source.

Type

Object, HmiAlarmControl (Page 1571)

Access

Read-only

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.SourceControl
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

AlarmControl (Page 1571)

AlarmControl

Description

AlarmControl (Page 1571)

ProcessDiagnosisCriteriaAnalysisControl.StatusBar

Description

The "StatusBar" property specifies the information bar of the process diagnostics view.

Type

Object, HmiStatusBarPart

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.StatusBar
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

StatusBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
StatusBar.BackColor
```

See also

ProcessDiagnosisCriteriaAnalysisControl.StatusBar (Page 4648)

StatusBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

Type

Object, HmiControlBarElementCollection (Page 4650)

Access

Read-only

Syntax

```
StatusBar.Elements
```

See also

ProcessDiagnosisCriteriaAnalysisControl.StatusBar (Page 4648)

HmiControlBarElementCollection (Page 4650)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

StatusBar.Elements (Page 4649)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 4650)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 4667)

See also

HmiControlBarElementCollection (Page 4650)

Control Bar Elements (Page 4667)

Control Bar Elements

Description

Control Bar Elements (Page 4667)

StatusBar.Enabled

Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Enabled
```

See also

ProcessDiagnosisCriteriaAnalysisControl.StatusBar (Page 4648)

StatusBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
StatusBar.Font
```

See also

ProcessDiagnosisCriteriaAnalysisControl.StatusBar (Page 4648)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

StatusBar.Font (Page 4653)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

StatusBar.Font (Page 4653)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

StatusBar.Font (Page 4653)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

StatusBar.Font (Page 4653)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

StatusBar.Font (Page 4653)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

StatusBar.Font (Page 4653)

StatusBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
StatusBar.Margin
```

See also

ProcessDiagnosisCriteriaAnalysisControl.StatusBar (Page 4648)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

StatusBar.Margin (Page 4656)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

StatusBar.Margin (Page 4656)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

StatusBar.Margin (Page 4656)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

StatusBar.Margin (Page 4656)

StatusBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
StatusBar.Padding
```

See also

ProcessDiagnosisCriteriaAnalysisControl.StatusBar (Page 4648)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

StatusBar.Padding (Page 4659)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

StatusBar.Padding (Page 4659)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

StatusBar.Padding (Page 4659)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

StatusBar.Padding (Page 4659)

StatusBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.ShowToolTips
```

See also

ProcessDiagnosisCriteriaAnalysisControl.StatusBar (Page 4648)

StatusBar.Visible

Description

The "Visible" property specifies whether the information bar is visible.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Visible
```

See also

ProcessDiagnosisCriteriaAnalysisControl.StatusBar (Page 4648)

ProcessDiagnosisCriteriaAnalysisControl.StyleItemClass

Description

The "StyleItemClass" property returns the style that is applied to the process diagnostics view.

Type

String

Access

Read-only

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.StyleItemClass
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

ProcessDiagnosisCriteriaAnalysisControl.TabIndex

Description

The "TabIndex" property returns the position of the process diagnostics view in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.TabIndex
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

ProcessDiagnosisCriteriaAnalysisControl.ToolBar

Description

The "ToolBar" property specifies the toolbar of the process diagnostics view.

Type

Object, HmiToolBarPart

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.ToolBar
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

ToolBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ToolBar.BackColor
```

See also

ProcessDiagnosisCriteriaAnalysisControl.ToolBar (Page 4663)

ToolBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

Type

Object, HmiControlBarElementCollection (Page 4665)

Access

Read-only

Syntax

```
ToolBar.Elements
```

See also

ProcessDiagnosisCriteriaAnalysisControl.ToolBar (Page 4663)

HmiControlBarElementCollection (Page 4665)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

ToolBar.Elements (Page 4664)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 4665)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 4667)

See also

HmiControlBarElementCollection (Page 4665)

Control Bar Elements (Page 4667)

Control Bar Elements

ControlBarButton

Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarButtonPart

Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the label of the button.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.

- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the button can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the button.
- **Mapping**
  Returns the function of the button.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the button is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the button is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarButton.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBackColor
```

See also

ControlBarButton (Page 4667)

ControlBarButton.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.AlternateBorderColor
```

See also

ControlBarButton (Page 4667)

ControlBarButton.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the button of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarButton.Authorization
```

See also

ControlBarButton (Page 4667)

ControlBarButton.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BackColor
```

See also

ControlBarButton (Page 4667)

ControlBarButton.Badge

Description

The "Badge" property specifies the label of the button.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarButton.Badge
```

See also

ControlBarButton (Page 4667)

ControlBarButton.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.BorderColor
```

See also

ControlBarButton (Page 4667)

ControlBarButton.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarButton.BorderWidth
```

See also

ControlBarButton (Page 4667)

ControlBarButton.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarButton.Content
```

See also

ControlBarButton (Page 4667)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarButton.Content (Page 4672)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.

- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarButton.Content (Page 4672)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarButton.Content (Page 4672)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarButton.Content (Page 4672)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarButton.Content (Page 4672)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarButton.Content (Page 4672)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarButton.Content (Page 4672)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarButton.Content (Page 4672)

ControlBarButton.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarButton.CustomID
```

See also

ControlBarButton (Page 4667)

ControlBarButton.Enabled

Description

The "Enabled" property specifies whether the button can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Enabled
```

See also

ControlBarButton (Page 4667)

ControlBarButton.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.ForeColor
```

See also

ControlBarButton (Page 4667)

ControlBarButton.Graphic

Description

The "Graphic" property specifies the graphic of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Graphic
```

See also

ControlBarButton (Page 4667)

ControlBarButton.Height

Description

The "Height" property specifies the height of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Height
```

See also

ControlBarButton (Page 4667)

ControlBarButton.HotKey

Description

The "HotKey" property returns the hotkey specified for the button. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
ControlBarButton.HotKey
```

See also

ControlBarButton (Page 4667)

ControlBarButton.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarButton.Mapping
```

See also

ControlBarButton (Page 4667)

ControlBarButton.Margin

Description

The "Margin" property specifies the surrounded outer distance of the button.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarButton.Margin
```

See also

ControlBarButton (Page 4667)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarButton.Margin (Page 4683)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarButton.Margin (Page 4683)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarButton.Margin (Page 4683)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarButton.Margin (Page 4683)

ControlBarButton.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumHeight
```

See also

ControlBarButton (Page 4667)

ControlBarButton.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MaximumWidth
```

See also

ControlBarButton (Page 4667)

ControlBarButton.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumHeight
```

See also

ControlBarButton (Page 4667)

ControlBarButton.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.MinimumWidth
```

See also

ControlBarButton (Page 4667)

ControlBarButton.Operability

Description

The "Operability" property returns whether the button is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarButton.Operability
```

See also

ControlBarButton (Page 4667)

ControlBarButton.Padding

Description

The "Padding" property specifies the distance of the content from the border of the button.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarButton.Padding
```

See also

ControlBarButton (Page 4667)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarButton.Padding (Page 4688)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarButton.Padding (Page 4688)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarButton.Padding (Page 4688)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarButton.Padding (Page 4688)

ControlBarButton.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the button can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarButton.RequireExplicitUnlock
```

See also

ControlBarButton (Page 4667)

ControlBarButton.Text

Description

The "Text" property specifies the label of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.Text
```

See also

ControlBarButton (Page 4667)

ControlBarButton.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the button.

Type

String

Access

Read-write

Syntax

```
ControlBarButton.ToolTipText
```

See also

ControlBarButton (Page 4667)

ControlBarButton.Visible

Description

The "Visible" property specifies whether the button is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarButton.Visible
```

See also

ControlBarButton (Page 4667)

ControlBarButton.Width

Description

The "Width" property specifies the width of the button in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarButton.Width
```

See also

ControlBarButton (Page 4667)

ControlBarDisplay

Description

The "ControlBarDisplay" object represents a display area for text and graphics of an information bar or toolbar.

You can reference the "ControlBarDisplay" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarDisplayPart

Properties

The "ControlBarDisplay" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the display area is enabled in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the display area.

- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the display area is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the display area is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the display area is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarDisplay.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the display.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarDislay.Authorization
```

See also

ControlBarDisplay (Page 4693)

ControlBarDisplay.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarDislay.Content
```

See also

ControlBarDisplay (Page 4693)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarDisplay.Content (Page 4695)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarDisplay.Content (Page 4695)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarDisplay.Content (Page 4695)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarDisplay.Content (Page 4695)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarDisplay.Content (Page 4695)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarDisplay.Content (Page 4695)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarDisplay.Content (Page 4695)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarDisplay.Content (Page 4695)

ControlBarDisplay.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarDislay.CustomID
```

See also

ControlBarDisplay (Page 4693)

ControlBarDisplay.Enabled

Description

The "Enabled" property specifies whether the display is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Enabled
```

See also

ControlBarDisplay (Page 4693)

ControlBarDisplay.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.ForeColor
```

See also

ControlBarDisplay (Page 4693)

ControlBarDisplay.Graphic

Description

The "Graphic" property specifies the graphic of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Graphic
```

See also

ControlBarDisplay (Page 4693)

ControlBarDisplay.Height

Description

The "Height" property specifies the height of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Height
```

See also

ControlBarDisplay (Page 4693)

ControlBarDisplay.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page

- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarDislay.Mapping
```

See also

ControlBarDisplay (Page 4693)

ControlBarDisplay.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the display.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarDislay.Margin
```

See also

ControlBarDisplay (Page 4693)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarDisplay.Margin (Page 4705)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarDisplay.Margin (Page 4705)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarDisplay.Margin (Page 4705)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarDisplay.Margin (Page 4705)

ControlBarDisplay.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumHeight
```

See also

ControlBarDisplay (Page 4693)

ControlBarDisplay.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MaximumWidth
```

See also

ControlBarDisplay (Page 4693)

ControlBarDisplay.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumHeight
```

See also

ControlBarDisplay (Page 4693)

ControlBarDisplay.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.MinimumWidth
```

See also

ControlBarDisplay (Page 4693)

ControlBarDisplay.Operability

Description

The "Operability" property returns whether the display is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarDislay.Operability
```

See also

ControlBarDisplay (Page 4693)

ControlBarDisplay.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the display.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarDislay.Padding
```

See also

ControlBarDisplay (Page 4693)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarDisplay.Padding (Page 4710)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarDisplay.Padding (Page 4710)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarDisplay.Padding (Page 4710)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarDisplay.Padding (Page 4710)

ControlBarDisplay.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the display can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarDislay.RequireExplicitUnlock
```

See also

ControlBarDisplay (Page 4693)

ControlBarDisplay.Text

Description

The "Text" property specifies the label of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.Text
```

See also

ControlBarDisplay (Page 4693)

ControlBarDisplay.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the display.

Type

String

Access

Read-write

Syntax

```
ControlBarDislay.ToolTipText
```

See also

ControlBarDisplay (Page 4693)

ControlBarDisplay.Visible

Description

The "Visible" property specifies whether the display is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarDislay.Visible
```

See also

ControlBarDisplay (Page 4693)

ControlBarDisplay.Width

Description

The "Width" property specifies the width of the display in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarDislay.Width
```

See also

ControlBarDisplay (Page 4693)

ControlBarLabel

Description

The "ControlBarLabel" object represents an identifier of an information bar or toolbar.

You can reference the "ControlBarLabel" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarLabelPart

Properties

The "ControlBarLabel" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the identifier can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the identifier.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.

- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the identifier is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the identifier is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the identifier is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarLabel.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the identifier.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarLabel.Authorization
```

See also

ControlBarLabel (Page 4715)

ControlBarLabel.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarLabel.CustomID
```

See also

ControlBarLabel (Page 4715)

ControlBarLabel.Enabled

Description

The "Enabled" property specifies whether the identifier is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Enabled
```

See also

ControlBarLabel (Page 4715)

ControlBarLabel.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.ForeColor
```

See also

ControlBarLabel (Page 4715)

ControlBarLabel.Height

Description

The "Height" property specifies the height of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Height
```

See also

ControlBarLabel (Page 4715)

ControlBarLabel.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.HorizontalTextAlignment
```

See also

ControlBarLabel (Page 4715)

ControlBarLabel.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms

- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarLabel.Mapping
```

See also

ControlBarLabel (Page 4715)

ControlBarLabel.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the identifier.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarLabel.Margin
```

See also

ControlBarLabel (Page 4715)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarLabel.Margin (Page 4722)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarLabel.Margin (Page 4722)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarLabel.Margin (Page 4722)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarLabel.Margin (Page 4722)

ControlBarLabel.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumHeight
```

See also

ControlBarLabel (Page 4715)

ControlBarLabel.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MaximumWidth
```

See also

ControlBarLabel (Page 4715)

ControlBarLabel.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumHeight
```

See also

ControlBarLabel (Page 4715)

ControlBarLabel.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.MinimumWidth
```

See also

ControlBarLabel (Page 4715)

ControlBarLabel.Operability

Description

The "Operability" property returns whether the identifier is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarLabel.Operability
```

See also

ControlBarLabel (Page 4715)

ControlBarLabel.Padding

Description

The "Padding" property specifies the spacing of the content from the frame of the identifier.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarLabel.Padding
```

See also

ControlBarLabel (Page 4715)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarLabel.Padding (Page 4727)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarLabel.Padding (Page 4727)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarLabel.Padding (Page 4727)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarLabel.Padding (Page 4727)

ControlBarLabel.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the identifier can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarLabel.RequireExplicitUnlock
```

See also

ControlBarLabel (Page 4715)

ControlBarLabel.Text

Description

The "Text" property specifies the label of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.Text
```

See also

ControlBarLabel (Page 4715)

ControlBarLabel.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the identifier.

Type

String

Access

Read-write

Syntax

```
ControlBarLabel.ToolTipText
```

See also

ControlBarLabel (Page 4715)

ControlBarLabel.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarLabel.VerticalTextAlignment
```

See also

ControlBarLabel (Page 4715)

ControlBarLabel.Visible

Description

The "Visible" property specifies whether the identifier is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarLabel.Visible
```

See also

ControlBarLabel (Page 4715)

ControlBarLabel.Width

Description

The "Width" property specifies the width of the identifier in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarLabel.Width
```

See also

ControlBarLabel (Page 4715)

ControlBarSeparator

Description

The "ControlBarSeparator" object represents a separator of an information bar or toolbar.

You can reference the "ControlBarSeparator" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarSeparatorPart

Properties

The "ControlBarSeparator" object has the following properties:

- **Authorization**
  Returns the operator authorization.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the disconnector can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Height**
  Specifies the height.
- **Mapping**
  Returns the function of the separator.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the separator is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the disconnector is only operable while the associated button is being pressed.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the disconnector is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarSeparator.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the separator.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarSeparator.Authorization
```

See also

ControlBarSeparator (Page 4732)

ControlBarSeparator.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarSeparator.CustomID
```

See also

ControlBarSeparator (Page 4732)

ControlBarSeparator.Enabled

Description

The "Enabled" property specifies whether the separator is active in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Enabled
```

See also

ControlBarSeparator (Page 4732)

ControlBarSeparator.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.ForeColor
```

See also

ControlBarSeparator (Page 4732)

ControlBarSeparator.Height

Description

The "Height" property specifies the height of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Height
```

See also

ControlBarSeparator (Page 4732)

ControlBarSeparator.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display

- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup
- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms

- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarSeparator.Mapping
```

See also

ControlBarSeparator (Page 4732)

ControlBarSeparator.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the separator.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarSeparator.Margin
```

See also

ControlBarSeparator (Page 4732)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarSeparator.Margin (Page 4738)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarSeparator.Margin (Page 4738)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarSeparator.Margin (Page 4738)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarSeparator.Margin (Page 4738)

ControlBarSeparator.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumHeight
```

See also

ControlBarSeparator (Page 4732)

ControlBarSeparator.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MaximumWidth
```

See also

ControlBarSeparator (Page 4732)

ControlBarSeparator.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumHeight
```

See also

ControlBarSeparator (Page 4732)

ControlBarSeparator.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.MinimumWidth
```

See also

ControlBarSeparator (Page 4732)

ControlBarSeparator.Operability

Description

The "Operability" property returns whether the separator is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarSeparator.Operability
```

See also

ControlBarSeparator (Page 4732)

ControlBarSeparator.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the separator.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarSeparator.Padding
```

See also

ControlBarSeparator (Page 4732)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarSeparator.Padding (Page 4743)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarSeparator.Padding (Page 4743)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarSeparator.Padding (Page 4743)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarSeparator.Padding (Page 4743)

ControlBarSeparator.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the disconnector can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarSeparator.RequireExplicitUnlock
```

See also

ControlBarSeparator (Page 4732)

ControlBarSeparator.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the separator.

Type

String

Access

Read-write

Syntax

```
ControlBarSeparator.ToolTipText
```

See also

ControlBarSeparator (Page 4732)

ControlBarSeparator.Visible

Description

The "Visible" property specifies whether the separator is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarSeparator.Visible
```

See also

ControlBarSeparator (Page 4732)

ControlBarSeparator.Width

Description

The "Width" property specifies the width of the separator in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarSeparator.Width
```

See also

ControlBarSeparator (Page 4732)

ControlBarTextBox

Description

The "ControlBarTextBox" object represents a text box of an information bar or toolbar.

You can reference the "ControlBarTextBox" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarTextBoxPart

Properties

The "ControlBarTextBox" object has the following properties:

- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the text box can be operated in runtime.
- **ForeColor**
  Specifies the font color.

- **Height**
  Specifies the height.
- **HorizontalTextAlignment**
  Specifies the horizontal alignment of the text.
- **Mapping**
  Returns the function of the text box.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.
- **Operability**
  Returns whether the text box is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **Readonly**
  Specifies whether the text box is write-protected.
- **RequireExplicitUnlock**
  Returns whether the text box is only operable while the associated button is being pressed.
- **Text**
  Specifies the labeling.
- **ToolTipText**
  Specifies the tooltip text.
- **VerticalTextAlignment**
  Specifies the vertical alignment of the text.
- **Visible**
  Specifies whether the text box is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarTextBox.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.AlternateBorderColor
```

See also

ControlBarTextBox (Page 4748)

ControlBarTextBox.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the text box of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarTextBox.Authorization
```

See also

ControlBarTextBox (Page 4748)

ControlBarTextBox.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BackColor
```

See also

ControlBarTextBox (Page 4748)

ControlBarTextBox.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.BorderColor
```

See also

ControlBarTextBox (Page 4748)

ControlBarTextBox.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarTextBox.BorderWidth
```

See also

ControlBarTextBox (Page 4748)

ControlBarTextBox.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarTextBox.CustomID
```

See also

ControlBarTextBox (Page 4748)

ControlBarTextBox.Enabled

Description

The "Enabled" property specifies whether the text box can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Enabled
```

See also

ControlBarTextBox (Page 4748)

ControlBarTextBox.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.ForeColor
```

See also

ControlBarTextBox (Page 4748)

ControlBarTextBox.Height

Description

The "Height" property specifies the height of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Height
```

See also

ControlBarTextBox (Page 4748)

ControlBarTextBox.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.HorizontalTextAlignment
```

See also

ControlBarTextBox (Page 4748)

ControlBarTextBox.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarTextBox.Mapping
```

See also

ControlBarTextBox (Page 4748)

ControlBarTextBox.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the text box.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarTextBox.Margin
```

See also

ControlBarTextBox (Page 4748)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarTextBox.Margin (Page 4757)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarTextBox.Margin (Page 4757)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarTextBox.Margin (Page 4757)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarTextBox.Margin (Page 4757)

ControlBarTextBox.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumHeight
```

See also

ControlBarTextBox (Page 4748)

ControlBarTextBox.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MaximumWidth
```

See also

ControlBarTextBox (Page 4748)

ControlBarTextBox.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumHeight
```

See also

ControlBarTextBox (Page 4748)

ControlBarTextBox.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.MinimumWidth
```

See also

ControlBarTextBox (Page 4748)

ControlBarTextBox.Operability

Description

The "Operability" property returns whether the text box is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarTextBox.Operability
```

See also

ControlBarTextBox (Page 4748)

ControlBarTextBox.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the text box.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarTextBox.Padding
```

See also

ControlBarTextBox (Page 4748)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarTextBox.Padding (Page 4762)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarTextBox.Padding (Page 4762)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarTextBox.Padding (Page 4762)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarTextBox.Padding (Page 4762)

ControlBarTextBox.ReadOnly

Description

The "ReadOnly" property specifies whether the text box is read-only.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.ReadOnly
```

See also

ControlBarTextBox (Page 4748)

ControlBarTextBox.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the text box can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarTextBox.RequireExplicitUnlock
```

See also

ControlBarTextBox (Page 4748)

ControlBarTextBox.Text

Description

The "Text" property specifies the label of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.Text
```

See also

ControlBarTextBox (Page 4748)

ControlBarTextBox.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the text box.

Type

String

Access

Read-write

Syntax

```
ControlBarTextBox.ToolTipText
```

See also

ControlBarTextBox (Page 4748)

ControlBarTextBox.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
ControlBarTextBox.VerticalTextAlignment
```

See also

ControlBarTextBox (Page 4748)

ControlBarTextBox.Visible

Description

The "Visible" property specifies whether the text box is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarTextBox.Visible
```

See also

ControlBarTextBox (Page 4748)

ControlBarTextBox.Width

Description

The "Width" property specifies the width of the text box in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarTextBox.Width
```

See also

ControlBarTextBox (Page 4748)

ControlBarToggleSwitch

Description

The "ControlBarToggleSwitch" object represents a switch of an information bar or toolbar.

You can reference the "ControlBarToggleSwitch" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarToggleSwitchPart

Properties

The "ControlBarToggleSwitch" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".

- **AlternateGraphic**
  Specifies the graphic for the "pressed" state.
- **AlternateText**
  Specifies the text for the "pressed" state.
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the identifier of the switch.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the switch can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the switch.
- **IsAlternateState**
  Specifies the current state of the switch.
- **Mapping**
  Returns the function of the switch.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.

- **Operability**
  Returns whether the switch is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the switch is only operable while the associated button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
  Specifies the tooltip text.
- **Visible**
  Specifies whether the switch is visible.
- **Width**
  Specifies the width.

Methods

--

ControlBarToggleSwitch.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBackColor
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.AlternateBorderColor

Description

The "AlternateBorderColor" property specifies the second border color used with line styles such as "Dash".

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateBorderColor
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.AlternateGraphic

Description

The "AlternateGraphic" property specifies the graphic of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateGraphic
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.AlternateText

Description

The "AlternateText" property specifies the text of the switch for the "On" state.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.AlternateText
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.Authorization

Description

The "Authorization" property returns the operator authorization (HmiFunctionRight) that the logged-in operator must have to use the switch of an information bar or toolbar.

Type

Object, HmiFunctionRight

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Authorization
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BackColor
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.Badge

Description

The "Badge" property specifies the identifier of the switch.

Type

Object, HmiBadgePart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Badge
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.BorderColor

Description

The "BorderColor" property specifies the border color.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderColor
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.BorderWidth

Description

The "BorderWidth" property specifies the border thickness.

Type

UInt8

Access

Read-write

Syntax

```
ControlBarToggleSwitch.BorderWidth
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Content
```

See also

ControlBarToggleSwitch (Page 4768)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

ControlBarToggleSwitch.Content (Page 4775)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

ControlBarToggleSwitch.Content (Page 4775)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 4775)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

ControlBarToggleSwitch.Content (Page 4775)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

ControlBarToggleSwitch.Content (Page 4775)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

ControlBarToggleSwitch.Content (Page 4775)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

ControlBarToggleSwitch.Content (Page 4775)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

ControlBarToggleSwitch.Content (Page 4775)

ControlBarToggleSwitch.CustomID

Description

The "CustomID" property returns the custom ID for identification of an element of an information bar or toolbar.

Type

Int32

Access

Read-only

Syntax

```
ControlBarToggleSwitch.CustomID
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.Enabled

Description

The "Enabled" property specifies whether the switch can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Enabled
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ForeColor
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.Graphic

Description

The "Graphic" property specifies the graphic of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Graphic
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.Height

Description

The "Height" property specifies the height of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Height
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.HotKey

Description

The "HotKey" property returns the hotkey specified for the switch. Hotkeys are unique within a screen. The hotkeys are activated from the active (local) screen window down to the top level screen window.

Type

UInt16

Access

Read-only

Syntax

```
Button.HotKey
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.IsAlternateState

Description

The "IsAlternateState" property specifies the current state of the switch.

- True: Switch is in "On" state.
- False: Switch is in "Off" state.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.IsAlternateState
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.Mapping

Description

The "Mapping" property returns the function of an element of an information bar or toolbar.

Type

Int32, HmiAlarmControlID

Function of an element of the alarm control:

- None (0): None
- Help (1): Show help
- Configuration (2): Configuration dialog
- AlarmView (3): Alarm control
- AlarmStatisticsView (5): Alarm statistics display
- AlarmAnnunciator (7): Alarm annunciator
- SingleAcknowledgment (8): Single-mode acknowledgment
- GroupAcknowledgment (9): Group acknowledgment
- AlwaysShowRecent (10): Show recent
- SelectionDisplay (11): Selection display
- DisplayOptionsSetup (12): Display options setup
- DisabledAlarmsSetup (13): Configuration of the locked alarms
- FirstLine (14): First row
- PreviousLine (15): Previous line
- NextLine (16): Next line
- LastLine (17): Last line
- InfoTextSetup (18): Info text setup
- CommentsSetup (19): Comments setup
- LoopInAlarm (20): Loop-in-alarm
- DisableAlarm (21): Lock alarm
- EnableAlarm (22): Release alarm
- ShelveAlarm (23): Shelve alarm
- UnshelveAlarm (24): Unshelve alarm
- SortSetup (25): Sorting setup

- TimeBaseSetup (26): Time base setup
- CopyLines (27): Copy lines
- PreviousPage (28): Previous page
- NextPage (29): Next page
- TimeBase (256): Timebase
- Date (257): Date
- Time (258): Time
- PendingAlarms (259): Pending alarms
- Alarms (260): Alarms
- PendingAcknowledgeableAlarms (261): Pending acknowledgeable alarms
- PendingShelvedAlarms (262): Pending shelved alarms
- Selection (263): Selection
- DisplayOption (264): Display options
- Disabled (265): Disabled
- HasPendingShelvedAlarms (272): Pending shelved alarms available
- ConnectionStatus (273): Connection status
- Print (30): Print
- ShowActiveAlarms (31): Show active alarms
- ShowLoggedAlarms (32): Show logged alarms
- ShowLoggedAlarmsUpdated (33): Show and update logged alarms
- ShowDefinedAlarms (34): Show defined alarms
- SingleReset (35): Single confirm
- Export (36): Export
- MoveToNextAcknowledgeableAlarm (37): Skip to the next alarm that requires acknowledgment
- StartTime (274): Start time
- EndTime (275): End time
- CurrentContextHint (276): Note on current context
- SelectContext (38): Select context
- StatusText (277): Status text
- Custom (65536): Reserved for user-defined functions. The "CustomID" property can be used for identification.
- PendingResettableAlarms (278): Pending engaged alarms
- StatisticsSetup (39): Show alarm statistics settings
- MaximumRecordsExceeded (279): Number of logged alarms exceeds the value of AlarmStatisticsSettings.MaximumRecords.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Mapping
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the switch.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Margin
```

See also

ControlBarToggleSwitch (Page 4768)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ControlBarToggleSwitch.Margin (Page 4786)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ControlBarToggleSwitch.Margin (Page 4786)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ControlBarToggleSwitch.Margin (Page 4786)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ControlBarToggleSwitch.Margin (Page 4786)

ControlBarToggleSwitch.MaximumHeight

Description

The "MaximumHeight" property specifies the maximum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumHeight
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MaximumWidth
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.MinimumHeight

Description

The "MinimumHeight" property specifies the minimum height.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumHeight
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.MinimumWidth
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.Operability

Description

The property "Operability" returns whether the switch is operable.

Type

Int32, HmiOperability

Returns the operability:

- Operable (0): Operable
- DisabledProgrammatically (1): Not operable because disabled.
- NoAuthorization (2): Not operable because operator authorization is missing.
- NoExplicitUnlock (4): Not operable because unlock button is not pressed.

Access

Read-only

Syntax

```
ControlBarToggleSwitch.Operability
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the switch.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Padding
```

See also

ControlBarToggleSwitch (Page 4768)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ControlBarToggleSwitch.Padding (Page 4791)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ControlBarToggleSwitch.Padding (Page 4791)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ControlBarToggleSwitch.Padding (Page 4791)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ControlBarToggleSwitch.Padding (Page 4791)

ControlBarToggleSwitch.RequireExplicitUnlock

Description

The "RequireExplicitUnlock" property returns whether the switch can only be operated while the associated button is being pressed.

Type

Bool

Access

Read-only

Syntax

```
ControlBarToggleSwitch.RequireExplicitUnlock
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.Text

Description

The "Text" property specifies the label of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Text
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.ToolTipText

Description

The "ToolTipText" property specifies the text of the tooltip of the switch.

Type

String

Access

Read-write

Syntax

```
ControlBarToggleSwitch.ToolTipText
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.Visible

Description

The "Visible" property specifies whether the switch is visible.

Type

Bool

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Visible
```

See also

ControlBarToggleSwitch (Page 4768)

ControlBarToggleSwitch.Width

Description

The "Width" property specifies the width of the switch in DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ControlBarToggleSwitch.Width
```

See also

ControlBarToggleSwitch (Page 4768)

ToolBar.Enabled

Description

The "Enabled" property specifies whether the toolbar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Enabled
```

See also

ProcessDiagnosisCriteriaAnalysisControl.ToolBar (Page 4663)

ToolBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ToolBar.Font
```

See also

ProcessDiagnosisCriteriaAnalysisControl.ToolBar (Page 4663)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ToolBar.Font (Page 4797)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ToolBar.Font (Page 4797)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ToolBar.Font (Page 4797)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ToolBar.Font (Page 4797)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ToolBar.Font (Page 4797)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ToolBar.Font (Page 4797)

ToolBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the toolbar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ToolBar.Margin
```

See also

ProcessDiagnosisCriteriaAnalysisControl.ToolBar (Page 4663)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ToolBar.Margin (Page 4800)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ToolBar.Margin (Page 4800)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ToolBar.Margin (Page 4800)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ToolBar.Margin (Page 4800)

ToolBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the toolbar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
ToolBar.Padding
```

See also

ProcessDiagnosisCriteriaAnalysisControl.ToolBar (Page 4663)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

ToolBar.Padding (Page 4803)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

ToolBar.Padding (Page 4803)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

ToolBar.Padding (Page 4803)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

ToolBar.Padding (Page 4803)

ToolBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.ShowToolTips
```

See also

ProcessDiagnosisCriteriaAnalysisControl.ToolBar (Page 4663)

ToolBar.UseHotKeys

Description

The "UseHotKeys" property specifies whether the shortcut keys for the buttons in the toolbar are activated.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.UseHotKeys
```

See also

ProcessDiagnosisCriteriaAnalysisControl.ToolBar (Page 4663)

ToolBar.Visible

Description

The "Visible" property specifies whether the toolbar is visible.

Type

Bool

Access

Read-write

Syntax

```
ToolBar.Visible
```

See also

ProcessDiagnosisCriteriaAnalysisControl.ToolBar (Page 4663)

ProcessDiagnosisCriteriaAnalysisControl.Top

Description

The "Top" property sets the value of the Y coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.Top
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

ProcessDiagnosisCriteriaAnalysisControl.Visible

Description

The "Visible" property specifies whether the process diagnostics view is visible.

Type

Bool

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.Visible
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

ProcessDiagnosisCriteriaAnalysisControl.Width

Description

The "Width" property specifies the width in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.Width
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

ProcessDiagnosisCriteriaAnalysisControl.WindowFlags

Description

The "WindowFlags" property specifies the window configuration of the process diagnostics view.

Type

Int32, HmiWindowFlag

Specifies the window configuration:

- None (0): Use default setting of the object
- ShowCaption (1): Show title

- ShowBorder (2): Show border
- AlwaysOnTop (4): Always on top
- CanSize (8): Can be sized
- CanMove (16): Can be positioned
- CanMaximize (32): Can be maximized
- CanClose (64): Can be closed
- AlwaysInParent (128): Position always inside the surrounding object

Note

You can enable multiple properties by adding integer values or bit operators.

Access

Read-write

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.WindowFlags
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

ProcessDiagnosisCriteriaAnalysisControl.CheckAuthorization()

Description

The "CheckAuthorization" method returns whether the current user is authorized to operate the process diagnostics view.

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.CheckAuthorization()
```

Parameters

--

Return value

Bool

Example

Set the background of all screen objects that start with "btn" and cannot be operated to light gray:

Copy code

```
for (const screenItem of Screen.Items) {
    if (screenItem.Name.startsWith('btn') && !screenItem.CheckAuthorization()) {
        screenItem.BackColor = 0xFFAAAAAA; // light grey
    }
}
```

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

ProcessDiagnosisCriteriaAnalysisControl.FireCommand()

Description

The "FireCommand" method executes the command of an element in the toolbar or information bar (control bar element, e.g. a button) of the process diagnostics view for criteria analysis.

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.FireCommand(commandId,
custom)
```

Parameters

commandId

Type: Int32

ID of the element of the toolbar or information bar

custom

Type: Bool

Type of element ID:

- True: Custom ID
- False: ID of a standard function of an element (ControlID)

Return value

--

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

ProcessDiagnosisCriteriaAnalysisControl.PropertyFlashing()

Description

The "PropertyFlashing" method configures the flashing of a property. Flashing refers to the change between two values of a property.

Syntax

```
ProcessDiagnosisCriteriaAnalysisControl.PropertyFlashing(propertyNam
e, enable[, value][, alternateValue][, rate])
```

Parameters

propertyName

Type: String

Name of the property for which flashing is configured.

enable

Type: Bool

Specifies that flashing is activated.

value

Optional, type: Variant

Value of the property for which flashing is configured.

alternateValue

Optional, type: Variant

Specifies the second value for flashing.

rate

Optional, type: Int32, HmiFlashingRate

Specifies the flash rate:

- Slow (0): Slow, 2 s
- Medium (1): Medium, 1 s
- Fast (2): Fast, 500 ms

Note

If the parameter is missing, "Medium" is used.

Return value

Bool

See also

ProcessDiagnosisCriteriaAnalysisControl (Page 4581)

ProcessDiagnosisGraphOverviewControl

Description

The "ProcessDiagnosisGraphOverviewControl" object represents a process diagnostics view for graphic overview in runtime.

Object type

HmiProcessDiagnosisGraphOverviewControl

Properties

The "ProcessDiagnosisGraphOverviewControl" object has the following properties:

- **BackColor**
  Specifies the background color.
- **Caption**
  Specifies the text that is displayed in the title bar.
- **CaptionColor**
  Specifies the background color of the title bar.
- **CurrentQuality**
  Returns the poorest quality code of all tags which influence the process diagnostics view.
- **Enabled**
  Specifies whether the process diagnostics view can be operated in runtime.
- **Font**
  Specifies the font of the text.
- **ForeColor**
  Specifies the font color of the text.
- **GraphOverview**
  Defines the appearance of the process diagnostics view.
- **GridLineColor**
  Specifies the color of the grid lines.
- **Height**
  Specifies the height.
- **Icon**
  Specifies the icon of the process diagnostics view.

- **Layer**
  Returns the screen layer in which the process diagnostics view is located.
- **Left**
  Specifies the value of the X coordinate.
- **Margin**
  Specifies the margin.
- **Name**
  Returns the name of the process diagnostics view.
- **OperationMode**
  Specifies the operating mode.
- **Parent**
  Returns the higher-level screen object.
- **PlcSource**
  Specifies the PLC source.
- **RenderingTemplate**
  Returns the name of the template from which the process diagnostics view was created.
- **SelectedStep**
  Specifies which step is selected.
- **ShowFocusVisual**
  Specifies whether the process diagnostics view is highlighted when in focus.
- **ShowOperationMode**
  Specifies whether to display the operating mode.
- **StatusBar**
  Specifies the information bar of the process diagnostics view.
- **StyleItemClass**
  Returns the style which is applied to the process diagnostics view.
- **TabIndex**
  Returns the position of the process diagnostics view in the tab sequence.
- **ToolBar**
  Specifies the toolbar of the process diagnostics view.
- **Top**
  Specifies the value of the Y coordinate.
- **Visible**
  Specifies whether the process diagnostics view is visible.
- **Width**
  Specifies the width.
- **WindowFlags**
  Specifies the window configuration of the process diagnostics view.

Methods

The "ProcessDiagnosisGraphOverviewControl" object has the following methods:

- **CheckAuthorization()**
  Returns whether the current user is authorized to operate the process diagnostics view.
- **FireCommand()**
  Configures the occurrence of an event for an element.
- **PropertyFlashing()**
  Configures flashing of a property.

Events

The "ProcessDiagnosisGraphOverviewControl" object has the following events:

- **AlarmViewButtonTapped()**
  Occurs when the "AlarmView" button is pressed.
- **PlcCodeViewerButtonTapped()**
  Occurs when the "PlcCodeViewer" button is pressed.
- **TIAPortalButtonTapped()**
  Occurs when the "TIAPortal" button is pressed.

ProcessDiagnosisGraphOverviewControl.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.BackColor
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl.Caption

Description

The "Caption" property specifies the text that is displayed in the title bar.

Type

Object, HmiTextPart

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.Caption
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

Text.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
Text.Font
```

See also

ProcessDiagnosisGraphOverviewControl.Caption (Page 4815)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

Text.Font (Page 4815)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

Text.Font (Page 4815)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

Text.Font (Page 4815)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

Text.Font (Page 4815)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

Text.Font (Page 4815)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

Text.Font (Page 4815)

Text.ForeColor

Description

The "ForeColor" property sets the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
Text.ForeColor
```

See also

ProcessDiagnosisGraphOverviewControl.Caption (Page 4815)

Text.Text

Description

The "Text" property specifies the label.

Type

String

Access

Read-write

Syntax

```
Text.Text
```

See also

ProcessDiagnosisGraphOverviewControl.Caption (Page 4815)

Text.Visible

Description

The "Visible" property specifies whether the text is visible.

Type

Bool

Access

Read-write

Syntax

```
Text.Visible
```

See also

ProcessDiagnosisGraphOverviewControl.Caption (Page 4815)

ProcessDiagnosisGraphOverviewControl.CaptionColor

Description

The "CaptionColor" property specifies the color of the title bar.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.CaptionColor
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl.CurrentQuality

Description

The "CurrentQuality" property returns the poorest quality code of all tags which influence the process diagnostics view.

Type

Int32, HmiQuality

Returns the current quality code:

- None (0): Undefined or not initialized.
- Bad (1): Value cannot be used.
- Uncertain (2): Usable, but the value quality is worse than usual.
- Good (4): Usable, value quality is good.
- UpperLimitViolation (64): Value has exceeded the high limit.
- LowerLimitViolation (128): Value has fallen below the low limit.

Access

Read-only

Syntax

```
ProcessDiagnosisGraphOverviewControl.CurrentQuality
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl.Enabled

Description

The "Enabled" property specifies whether the process diagnostics view can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.Enabled
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.Font
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

ProcessDiagnosisGraphOverviewControl.Font (Page 4822)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

ProcessDiagnosisGraphOverviewControl.Font (Page 4822)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

ProcessDiagnosisGraphOverviewControl.Font (Page 4822)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

ProcessDiagnosisGraphOverviewControl.Font (Page 4822)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

ProcessDiagnosisGraphOverviewControl.Font (Page 4822)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

ProcessDiagnosisGraphOverviewControl.Font (Page 4822)

ProcessDiagnosisGraphOverviewControl.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.ForeColor
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl.GraphOverview

Description

The "GraphOverview" property specifies the appearance of the process diagnostics view.

Type

Object, HmiDataGridViewPart (Page 4827)

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.GraphOverview
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

DataGridView (Page 4827)

DataGridView

DataGridView.AllowFilter

Description

The "AllowFilter" property specifies whether filtering of columns is permitted.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.AllowFilter
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

DataGridView.AllowSort

Description

The "AllowSort" property specifies whether the sorting of columns is permitted.

- True: Activates the sorting and sets the "AllowSort" property of all columns to "true".
- False: Disables the sorting for all columns. The individual column properties remain unchanged.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.AllowSort
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

DataGridView.AlternateBackColor

Description

The "AlternateBackColor" property specifies the second background color for a color gradient.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.AlternateBackColor
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

DataGridView.AlternateForeColor

Description

The "AlternateForeColor" property specifies the flashing color for the text.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.AlternateForeColor
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

DataGridView.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.BackColor
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

DataGridView.CellPadding

Description

The "CellPadding" property specifies the inner spacing of the content from the cell border.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
DataGridView.CellPadding
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

DataGridView.CellPadding (Page 4829)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

DataGridView.CellPadding (Page 4829)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

DataGridView.CellPadding (Page 4829)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

DataGridView.CellPadding (Page 4829)

DataGridView.ColoringMode

Description

The "ColoringMode" property specifies whether alternate coloring of every other row or column is enabled.

Type

Int32, HmiGridColoringMode

Specifies the type of the coloring:

- None (0): None
- Columns (1): Color the columns alternately.
- Rows (2): Color the rows alternately.

Access

Read-write

Syntax

```
DataGridView.ColoringMode
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

DataGridView.Columns

Description

The "Columns" property represents the quantity of columns.

Type

Object, HmiDataGridColumnCollection (Page 4833)

Access

Read-only

Syntax

```
DataGridView.Columns
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

HmiDataGridColumnCollection (Page 4833)

HmiDataGridColumnCollection

Description

The "HmiDataGridColumnCollection" object is a list of all columns ("DataGridColumn" objects) of the table.

You reference a "HmiDataGridColumnCollection" object via the `DataGridView.Columns` property.

Use

The "HmiDataGridColumnCollection" object is a list and can be counted and enumerated. You can access the "HmiDataGridColumnCollection" list using the index or the tag name.

Object type

HmiDataGridColumnCollection

Properties

The "HmiDataGridColumnCollection" object has the following properties:

- **Count**
  Returns the number of columns in the "HmiDataGridColumnCollection" list.

Methods

The "HmiDataGridColumnCollection" object has the following methods:

- **Item()**
  Returns a column of the "HmiDataGridColumnCollection" list.

See also

DataGridView.Columns (Page 4833)

HmiDataGridColumnCollection.Count

Description

The "Count" property returns the number of columns in the "HmiDataGridColumnCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiDataGridColumnCollection.Count
```

See also

HmiDataGridColumnCollection (Page 4833)

HmiDataGridColumnCollection.Item()

Description

The "Item" method returns a column of the "HmiDataGridColumnCollection" list.

Syntax

```
HmiDataGridColumnCollection[.Item](HmiDataGridColumnName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiDataGridColumnCollection" object.

Parameters

`HmiDataGridColumnName`

Type: String

Name of the column

Return value

Object, HmiDataGridColumnPartBase (Page 4835)

See also

HmiDataGridColumnCollection (Page 4833)

GraphOverviewControlColumn (Page 4835)

GraphOverviewControlColumn

Description

The "GraphOverviewControlColumn" object represents a value column.

Object type

HmiGraphOverviewControlColumnPart

Properties

The "GraphOverviewControlColumn" object has the following properties:

- **AllowSort**
  Specifies whether column sorting is allowed.
- **BackColor**
  Specifies the background color.
- **Content**
  Specifies display options for text and graphics.

- **Enabled**
  Specifies whether the column can be operated in runtime.
- **ForeColor**
  Specifies the font color of the text.
- **GraphOverviewControlBlock**
  Specifies the graphic overview block.
- **Header**
  Specifies the properties of the column header.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumWidth**
  Specifies the minimum width.
- **Name**
  Returns the name of the column.
- **OutputFormat**
  Specifies the format for displaying values.
- **SortDirection**
  Specifies the sorting direction.
- **SortOrder**
  Specifies the sorting order.
- **Visible**
  Specifies whether the column is visible.
- **Width**
  Specifies the width.

Methods

--

See also

HmiDataGridColumnCollection.Item() (Page 4834)

GraphOverviewControlColumn.AllowSort

Description

The "AllowSort" property specifies whether column sorting is permitted.

This property is ignored if the parent object has the "AllowSort" property set to "False".

Type

Bool

Access

Read-write

Syntax

```
GraphOverviewControlColumn.AllowSort
```

See also

GraphOverviewControlColumn (Page 4835)

GraphOverviewControlColumn.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
GraphOverviewControlColumn.BackColor
```

See also

GraphOverviewControlColumn (Page 4835)

GraphOverviewControlColumn.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
GraphOverviewControlColumn.Content
```

See also

GraphOverviewControlColumn (Page 4835)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

GraphOverviewControlColumn.Content (Page 4837)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

GraphOverviewControlColumn.Content (Page 4837)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

GraphOverviewControlColumn.Content (Page 4837)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

GraphOverviewControlColumn.Content (Page 4837)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

GraphOverviewControlColumn.Content (Page 4837)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

GraphOverviewControlColumn.Content (Page 4837)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

GraphOverviewControlColumn.Content (Page 4837)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

GraphOverviewControlColumn.Content (Page 4837)

GraphOverviewControlColumn.Enabled

Description

The "Enabled" property specifies whether the column can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
GraphOverviewControlColumn.Enabled
```

See also

GraphOverviewControlColumn (Page 4835)

GraphOverviewControlColumn.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
GraphOverviewControlColumn.ForeColor
```

See also

GraphOverviewControlColumn (Page 4835)

GraphOverviewControlColumn.GraphOverviewControlBlock

Description

The "GraphOverviewControlBlock" property specifies the graphic overview block.

Type

Int32, HmiGraphOverviewBlock

Specifies the graphic overview block:

- Undefined (0): Not defined
- Step (1): Step
- StepName (2): Step name

Access

Read-write

Syntax

```
GraphOverviewControlColumn.GraphOverviewControlBlock
```

See also

GraphOverviewControlColumn (Page 4835)

GraphOverviewControlColumn.Header

Description

The "Header" property specifies the properties of the column header.

Type

Object, HmiDataGridColumnHeaderPart

Access

Read-write

Syntax

```
GraphOverviewControlColumn.Header
```

See also

GraphOverviewControlColumn (Page 4835)

DataGridColumnHeader.Content

Description

The "Content" property specifies display options for text and graphics.

Type

Object, HmiContentPart

Access

Read-write

Syntax

```
DataGridColumnHeader.Content
```

See also

GraphOverviewControlColumn.Header (Page 4844)

Content.ContentMode

Description

The "ContentMode" property specifies whether text, graphics, or both are used for the display.

Type

Int32, HmiContentMode

Specifies the appearance of text and graphics:

- GraphicOrText (0): Graphic has priority. If no graphic is available, text is used.
- GraphicAndText (1): Text and graphics
- Text (2): Text only
- Graphic (3): Graphic only

Access

Read-write

Syntax

```
Content.ContentMode
```

See also

DataGridColumnHeader.Content (Page 4845)

Content.GraphicStretchMode

Description

The "GraphicStretchMode" property defines the type of scaling of the graphic.

Type

Int32, HmiGraphicStretchMode

Specifies the scaling of the graphic:

- None (0): The graphic is shown in the original size and centered.
- Fill (1): Graphic is displayed in the available space. Aspect ratio is adjusted, but not scaled.
- Uniform (2): Graphic is displayed in the available space. Aspect ratio is not changed.
- UniformToFill (3): Graphic is displayed in the available space. The rest is truncated. Aspect ratio is not changed.
- Tiled (4): The graphic is shown in the original size and repeated in tiles.

Access

Read-write

Syntax

```
Content.GraphicStretchMode
```

See also

DataGridColumnHeader.Content (Page 4845)

Content.HorizontalTextAlignment

Description

The "HorizontalTextAlignment" property specifies the horizontal alignment of the text.

Type

Int32, HmiHorizontalAlignment

Specifies the horizontal alignment:

- Left (0): Left
- Center (1): Centered
- Right (2): Right
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.HorizontalTextAlignment
```

See also

DataGridColumnHeader.Content (Page 4845)

Content.Spacing

Description

The "Spacing" property specifies the spacing between graphics and text.

Type

UInt32

Access

Read-write

Syntax

```
Content.Spacing
```

See also

DataGridColumnHeader.Content (Page 4845)

Content.SplitRatio

Description

The "SplitRatio" property specifies how much space the graphic takes up in relation to the text. A split ratio of 0.7 means that the graphic takes up 70% of the space.

Type

Float

Access

Read-write

Syntax

```
Content.SplitRatio
```

See also

DataGridColumnHeader.Content (Page 4845)

Content.TextPosition

Description

The "TextPosition" property specifies the position of the text in comparison to the graphic.

Type

Int32, HmiTextPosition

Specifies the position of the text:

- Left (0): Left
- Right (1): Right
- Top (2): Above
- Bottom (3): Below
- Behind (4): Behind
- InFront (5): In front

Access

Read-write

Syntax

```
Content.TextPosition
```

See also

DataGridColumnHeader.Content (Page 4845)

Content.TextTrimming

Description

The "TextTrimming" property specifies the type of text trimming if space is not sufficient.

Type

Int32, HmiTextTrimming

Specifies the text trimming:

- None (0): No trimming
- CharacterEllipsis (1): Trimming of the text end with character ellipsis ("...")

Access

Read-write

Syntax

```
Content.TextTrimming
```

See also

DataGridColumnHeader.Content (Page 4845)

Content.VerticalTextAlignment

Description

The "VerticalTextAlignment" property specifies the vertical alignment of the text.

Type

Int32, HmiVerticalAlignment

Specifies the vertical alignment:

- Top (0): Top
- Center (1): Centered
- Bottom (2): Bottom
- Stretch (3): Stretched

Access

Read-write

Syntax

```
Content.VerticalTextAlignment
```

See also

DataGridColumnHeader.Content (Page 4845)

DataGridColumnHeader.Graphic

Description

The "Graphic" property specifies the graphic of the column header.

Type

String

Access

Read-write

Syntax

```
DataGridColumnHeader.Graphic
```

See also

GraphOverviewControlColumn.Header (Page 4844)

DataGridColumnHeader.Text

Description

The "Text" property specifies the label of the column header.

Type

String

Access

Read-write

Syntax

```
DataGridColumnHeader.Text
```

See also

GraphOverviewControlColumn.Header (Page 4844)

GraphOverviewControlColumn.MaximumWidth

Description

The "MaximumWidth" property specifies the maximum width.

Type

UInt32

Access

Read-write

Syntax

```
GraphOverviewControlColumn.MaximumWidth
```

See also

GraphOverviewControlColumn (Page 4835)

GraphOverviewControlColumn.MinimumWidth

Description

The "MinimumWidth" property specifies the minimum width.

Type

UInt32

Access

Read-write

Syntax

```
GraphOverviewControlColumn.MinimumWidth
```

See also

GraphOverviewControlColumn (Page 4835)

GraphOverviewControlColumn.Name

Description

The "Name" property returns the name of the column.

Type

String

Access

Read-only

Syntax

```
GraphOverviewControlColumn.Name
```

See also

GraphOverviewControlColumn (Page 4835)

GraphOverviewControlColumn.OutputFormat

Description

The "OutputFormat" property specifies the format for displaying values.

Type

String

Access

Read-write

Syntax

```
GraphOverviewControlColumn.OutputFormat
```

See also

GraphOverviewControlColumn (Page 4835)

GraphOverviewControlColumn.SortDirection

Description

The "SortDirection" property specifies the sorting direction.

Type

Int32, HmiSortDirection

Specifies the sorting order:

- None (0): None
- Ascending (1): Ascending
- Descending (2): Descending

Access

Read-write

Syntax

```
GraphOverviewControlColumn.SortDirection
```

See also

GraphOverviewControlColumn (Page 4835)

GraphOverviewControlColumn.SortOrder

Description

The "SortOrder" property specifies the order of the sorting.

The sorting index starts at "1" (highest priority) in ascending order. Zero is ignored.

Type

UInt16

Access

Read-write

Syntax

```
GraphOverviewControlColumn.SortOrder
```

See also

GraphOverviewControlColumn (Page 4835)

GraphOverviewControlColumn.Visible

Description

The "Visible" property specifies whether the column is visible.

Type

Bool

Access

Read-write

Syntax

```
GraphOverviewControlColumn.Visible
```

See also

GraphOverviewControlColumn (Page 4835)

GraphOverviewControlColumn.Width

Description

The "Width" property specifies the width in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
GraphOverviewControlColumn.Width
```

See also

GraphOverviewControlColumn (Page 4835)

DataGridView.Font

Description

The "Font" property specifies the font of the cells.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
DataGridView.Font
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

DataGridView.Font (Page 4855)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

DataGridView.Font (Page 4855)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

DataGridView.Font (Page 4855)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

DataGridView.Font (Page 4855)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

DataGridView.Font (Page 4855)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal

- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

DataGridView.Font (Page 4855)

DataGridView.ForeColor

Description

The "ForeColor" property specifies the font color of the text.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.ForeColor
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

DataGridView.GridLineColor

Description

The "GridLineColor" property specifies the color of grid lines.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.GridLineColor
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

DataGridView.GridLineVisibility

Description

The "GridLineVisibility" property specifies the visibility of the grid lines.

Type

Int32, HmiSimpleGridLine

Specifies the grid lines:

- None (0): None
- Vertikal (1): Vertical
- Horizontal (2): Horizontal

Access

Read-write

Syntax

```
DataGridView.GridLineVisibility
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

DataGridView.GridLineWidth

Description

The "GridLineWidth" property specifies the thickness of the grid lines in pixels.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.GridLineWidth
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

DataGridView.GridSelectionMode

Description

The "GridSelectionMode" property specifies whether multiple selection is enabled in the table content.

Type

Int32, HmiGridSelectionMode

Specifies the type of the selection:

- None (0): None
- Single (1): Only single selection
- Multi (2): Multiple selection

Access

Read-write

Syntax

```
DataGridView.GridSelectionMode
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

DataGridView.HeaderSettings

Description

The "HeaderSettings" property specifies the settings for all column headers in the table.

Type

Object, HmiDataGridHeaderSettingsPart

Access

Read-write

Syntax

```
DataGridView.HeaderSettings
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

DataGridHeaderSettings.AllowColumnReorder

Description

The "AllowColumnReorder" property specifies whether the order of the columns can be changed.

Type

Bool

Access

Read-write

Syntax

```
DataGridHeaderSettings.AllowColumnReorder
```

See also

DataGridView.HeaderSettings (Page 4862)

DataGridHeaderSettings.AllowColumnResize

Description

The "AllowColumnResize" property specifies whether the width of the columns can be changed.

Type

Bool

Access

Read-write

Syntax

```
DataGridHeaderSettings.AllowColumnResize
```

See also

DataGridView.HeaderSettings (Page 4862)

DataGridHeaderSettings.ColumnHeaderType

Description

The "ColumnHeaderType" property specifies the type of content of a column header.

Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

Access

Read-write

Syntax

```
DataGridHeaderSettings.ColumnHeaderType
```

See also

DataGridView.HeaderSettings (Page 4862)

DataGridHeaderSettings.Font

Description

The "Font" property specifies the font of the headers.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
DataGridHeaderSettings.Font
```

See also

DataGridView.HeaderSettings (Page 4862)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

DataGridHeaderSettings.Font (Page 4864)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

DataGridHeaderSettings.Font (Page 4864)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

DataGridHeaderSettings.Font (Page 4864)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

DataGridHeaderSettings.Font (Page 4864)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

DataGridHeaderSettings.Font (Page 4864)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

DataGridHeaderSettings.Font (Page 4864)

DataGridHeaderSettings.HeaderBackColor

Description

The "HeaderBackColor" property specifies the background color of the header.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderBackColor
```

See also

DataGridView.HeaderSettings (Page 4862)

DataGridHeaderSettings.HeaderForeColor

Description

The "HeaderForeColor" property specifies the font color of the headers.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderForeColor
```

See also

DataGridView.HeaderSettings (Page 4862)

DataGridHeaderSettings.HeaderGridLineColor

Description

The "HeaderGridLineColor" property specifies the color of the separation line between column headers.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderGridLineColor
```

See also

DataGridView.HeaderSettings (Page 4862)

DataGridHeaderSettings.HeaderSelectionBackColor

Description

The "HeaderSelectionBackColor" property specifies the background color of the header of a selected line or column.

Type

UInt32

Access

Read-write

Syntax

```
DataGridHeaderSettings.HeaderSelectionBackColor
```

See also

DataGridView.HeaderSettings (Page 4862)

DataGridHeaderSettings.HeaderSelectionForeColor

Description

The "HeaderSelectionForeColor" property specifies the font color of the header of a selected line or column.

Type

UInt32

Access

Read-write

Syntax

```
Object.HeaderSelectionForeColor
```

`Object`

Required. An object from the "Availability" section.

See also

DataGridView.HeaderSettings (Page 4862)

DataGridHeaderSettings.RowHeaderType

Description

The "RowHeaderType" property specifies the type of content of a row header.

Type

Int32, HmiDataGridHeaderType

Specifies the type of headers:

- None (0): No column header
- Index (1): Consecutive number
- Content (2): Text and graphic

Access

Read-write

Syntax

```
DataGridHeaderSettings.RowHeaderType
```

See also

DataGridView.HeaderSettings (Page 4862)

DataGridView.HorizontalScrollBarVisibility

Description

The "HorizontalScrollBarVisibility" property specifies the visibility of the horizontal scroll bar of the display.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
DataGridView.HorizontalScrollBarVisibility
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

DataGridView.RowHeight

Description

The "RowHeight" property specifies the height of all rows in the table in DIU (Device Independent Unit).

"0" corresponds to a automatic mechanism, which adjusts the height of each line according to the font size and number of paragraphs.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.RowHeight
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

DataGridView.SelectFullRow

Description

The "SelectFullRow" property specifies whether only the cell or the entire row is included in the selection.

Type

Bool

Access

Read-write

Syntax

```
DataGridView.SelectFullRow
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

DataGridView.SelectionBackColor

Description

The "SelectionBackColor" property specifies the background color of the selected cells.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.SelectionBackColor
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

DataGridView.SelectionBorderColor

Description

The "SelectionBorderColor" property specifies the border color of the selected cells.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.SelectionBorderColor
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

DataGridView.SelectionBorderWidth

Description

The "SelectionBorderWidth" property specifies the border width of the selected cells.

Type

UInt8

Access

Read-write

Syntax

```
DataGridView.SelectionBorderWidth
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

DataGridView.SelectionForeColor

Description

The "SelectionForeColor" property specifies the font color of the selected cells.

Type

UInt32

Access

Read-write

Syntax

```
DataGridView.SelectionForeColor
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

DataGridView.VerticalScrollBarVisibility

Description

The "VerticalScrollBarVisibility" property specifies the visibility of the vertical scroll bar of the display.

Type

Int32, HmiScrollBarVisibility

Specifies the visibility of the scroll bar:

- Automatic (0): Only visible if required
- Visible (1): Always visible
- Collapsed (2): Never visible

Access

Read-write

Syntax

```
DataGridView.VerticalScrollBarVisibility
```

See also

ProcessDiagnosisGraphOverviewControl.GraphOverview (Page 4826)

ProcessDiagnosisGraphOverviewControl.GridLineColor

Description

The "GridLineColor" property specifies the color of grid lines.

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.GridLineColor
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl.Height

Description

The "Height" property specifies the height in the DIU (Device Independent Unit).

Type

UInt32

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.Height
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl.Icon

Description

The "Icon" property specifies the icon of the process diagnostics view.

Type

String

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.Icon
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl.Layer

Description

The "Layer" property returns the screen layer in which the process diagnostics view is located.

Type

Object, HmiLayerPart

Access

Read-only

Syntax

```
ProcessDiagnosisGraphOverviewControl.Layer
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

Layer.MaximumZoom

Description

The "MaximumZoom" property specifies the maximum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MaximumZoom
```

See also

ProcessDiagnosisGraphOverviewControl.Layer (Page 4877)

Layer.MinimumZoom

Description

The "MinimumZoom" specifies the minimum zoom up to which the layer can be seen.

Type

Float

Access

Read-write

Syntax

```
Layer.MinimumZoom
```

See also

ProcessDiagnosisGraphOverviewControl.Layer (Page 4877)

Layer.Name

Description

The "Name" property returns the name of the screen layer.

Type

String

Access

Read-only

Syntax

```
Layer.Name
```

See also

ProcessDiagnosisGraphOverviewControl.Layer (Page 4877)

Layer.Visible

Description

The "Visible" property specifies whether the screen layer and contained objects are visible.

Type

Bool

Access

Read-write

Syntax

```
Layer.Visible
```

See also

ProcessDiagnosisGraphOverviewControl.Layer (Page 4877)

ProcessDiagnosisGraphOverviewControl.Left

Description

The "Left" property sets the value of the X coordinate in the DIU (Device Independent Unit).

Type

Int32

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.Left
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl.Margin

Description

The "Margin" property specifies the margin.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.Margin
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

ProcessDiagnosisGraphOverviewControl.Margin (Page 4880)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

ProcessDiagnosisGraphOverviewControl.Margin (Page 4880)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

ProcessDiagnosisGraphOverviewControl.Margin (Page 4880)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

ProcessDiagnosisGraphOverviewControl.Margin (Page 4880)

ProcessDiagnosisGraphOverviewControl.Name

Description

The "Name" property returns the name of the process diagnostics view.

Type

String

Access

Read-only

Syntax

```
ProcessDiagnosisGraphOverviewControl.Name
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl.OperationMode

Description

The "OperationMode" property specifies the operating mode.

Type

Object, HmiProcessDiagnosisOperationModePart

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.OperationMode
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisOperationMode.OpModeAutoText

Description

The "OpModeAutoText" property specifies the automatic text.

Type

String

Access

Read-write

Syntax

```
ProcessDiagnosisOperationMode.OpModeAutoText
```

See also

ProcessDiagnosisGraphOverviewControl.OperationMode (Page 4883)

ProcessDiagnosisOperationMode.OpModeManText

Description

The "OpModeManText" property specifies the manual text.

Type

String

Access

Read-only

Syntax

```
ProcessDiagnosisOperationMode.OpModeManText
```

See also

ProcessDiagnosisGraphOverviewControl.OperationMode (Page 4883)

ProcessDiagnosisOperationMode.OpModeTapText

Description

The "OpModeTapText" property specifies the text on clicking.

Type

String

Access

Read-write

Syntax

```
ProcessDiagnosisOperationMode.OpModeTapText
```

See also

ProcessDiagnosisGraphOverviewControl.OperationMode (Page 4883)

ProcessDiagnosisOperationMode.OpModeTopText

Description

The "OpModeTopText" property specifies the title text.

Type

String

Access

Read-only

Syntax

```
ProcessDiagnosisOperationMode.OpModeTopText
```

See also

ProcessDiagnosisGraphOverviewControl.OperationMode (Page 4883)

ProcessDiagnosisGraphOverviewControl.Parent

Description

The "Parent" property returns the higher-level screen object (Parent container).

Type

Object, HmiScreenObjectBase (Page 1571)

Access

Read-only

Syntax

```
ProcessDiagnosisGraphOverviewControl.Parent
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

Screen Items (Page 1571)

Screen Items

Description

Screen Items (Page 1571)

ProcessDiagnosisGraphOverviewControl.PlcSource

Description

The "PlcSource" property specifies the PLC source.

Type

Object, HmiPlcDataSourcePart

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.PlcSource
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

PlcDataSource.Connection

Description

The "Connection" property returns the connection.

Type

Object, HmiConnection (Page 1148)

Access

Read-only

Syntax

```
PlcDataSource.Connection
```

See also

ProcessDiagnosisGraphOverviewControl.PlcSource (Page 4886)

Connection (Page 1148)

Connection

Description

Connection (Page 1148)

PlcDataSource.DB_Name

Description

The "DB_Name" property returns the name of the database.

Type

String

Access

Read-only

Syntax

```
PlcDataSource.DB_Name
```

See also

ProcessDiagnosisGraphOverviewControl.PlcSource (Page 4886)

PlcDataSource.HmiConnectionName

Description

The "HmiConnectionName" property specifies the connection name.

Type

String

Access

Read-write

Syntax

```
PlcDataSource.HmiConnectionName
```

See also

ProcessDiagnosisGraphOverviewControl.PlcSource (Page 4886)

PlcDataSource.Tag

Description

The "Tag" property returns the tag.

Type

String, HMITag (Page 1338)

Access

Read-only

Syntax

```
PlcDataSource.Tag
```

See also

ProcessDiagnosisGraphOverviewControl.PlcSource (Page 4886)

Tag (Page 1338)

Tag

Description

Tag (Page 1338)

ProcessDiagnosisGraphOverviewControl.RenderingTemplate

Description

The "RenderingTemplate" property returns the name of the template from which the process diagnostics view was created.

Type

String

Access

Read-only

Syntax

```
ProcessDiagnosisGraphOverviewControl.RenderingTemplate
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl.SelectedStep

Description

The "SelectedStep" property specifies which step is selected.

Type

UInt16

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.SelectedStep
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl.ShowFocusVisual

Description

The "ShowFocusVisual" property specifies whether the process diagnostics view is highlighted when in focus.

Type

Bool

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.ShowFocusVisual
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl.ShowOperationMode

Description

The "ShowOperationMode" property specifies whether to display the operating mode.

Type

Bool

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.ShowOperationMode
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl.StatusBar

Description

The "StatusBar" property specifies the information bar of the process diagnostics view.

Type

Object, HmiStatusBarPart

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.StatusBar
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

StatusBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
StatusBar.BackColor
```

See also

ProcessDiagnosisGraphOverviewControl.StatusBar (Page 4891)

StatusBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the information bar.

Type

Object, HmiControlBarElementCollection (Page 4892)

Access

Read-only

Syntax

```
StatusBar.Elements
```

See also

ProcessDiagnosisGraphOverviewControl.StatusBar (Page 4891)

HmiControlBarElementCollection (Page 4892)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

StatusBar.Elements (Page 4892)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 4892)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 4909)

See also

HmiControlBarElementCollection (Page 4892)

Control Bar Elements (Page 4909)

Control Bar Elements

Description

Control Bar Elements (Page 4909)

StatusBar.Enabled

Description

The "Enabled" property specifies whether the information bar can be operated in runtime.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Enabled
```

See also

ProcessDiagnosisGraphOverviewControl.StatusBar (Page 4891)

StatusBar.Font

Description

The "Font" property specifies the font of the text.

Type

Object, HmiFontPart

Access

Read-write

Syntax

```
StatusBar.Font
```

See also

ProcessDiagnosisGraphOverviewControl.StatusBar (Page 4891)

Font.Italic

Description

The "Italic" property specifies whether the text is displayed in italics.

Type

Bool

Access

Read-write

Syntax

```
Font.Italic
```

See also

StatusBar.Font (Page 4895)

Font.Name

Description

The "Name" property specifies the name of the character set used.

Type

String

Access

Read-write

Syntax

```
Font.Name
```

See also

StatusBar.Font (Page 4895)

Font.Size

Description

The "Size" property specifies the font size in DIU (Device Independent Unit).

Type

Float

Access

Read-write

Syntax

```
Font.Size
```

See also

StatusBar.Font (Page 4895)

Font.StrikeOut

Description

The "StrikeOut" property specifies whether font is struck through.

Type

Int32, HmiFontStrikeOut

Specifies the type of strikethrough font:

- None (0): None
- Single (1): Single

Access

Read-write

Syntax

```
Font.StrikeOut
```

See also

StatusBar.Font (Page 4895)

Font.Underline

Description

The "Underline" property specifies whether the font is underlined.

Type

Bool

Access

Read-write

Syntax

```
Font.Underline
```

See also

StatusBar.Font (Page 4895)

Font.Weight

Description

The "Weight" property specifies the font thickness.

Type

Int32, HmiFontWeight

Specifies the font weight:

- None (0): None
- Light (300): Light
- Normal (400): Normal
- SemiBold (600): Semi-bold
- Bold (700): Bold

Access

Read-write

Syntax

```
Font.Weight
```

See also

StatusBar.Font (Page 4895)

StatusBar.Margin

Description

The "Margin" property specifies the surrounded outer spacing of the information bar.

Type

Object, HmiMarginPart

Access

Read-write

Syntax

```
StatusBar.Margin
```

See also

ProcessDiagnosisGraphOverviewControl.StatusBar (Page 4891)

Margin.Bottom

Description

The "Bottom" property specifies the spacing to the bottom.

Type

Int32

Access

Read-write

Syntax

```
Margin.Bottom
```

See also

StatusBar.Margin (Page 4899)

Margin.Left

Description

The "Left" property specifies the spacing to the left.

Type

Int32

Access

Read-write

Syntax

```
Margin.Left
```

See also

StatusBar.Margin (Page 4899)

Margin.Right

Description

The "Right" property specifies the spacing to the right.

Type

Int32

Access

Read-write

Syntax

```
Margin.Right
```

See also

StatusBar.Margin (Page 4899)

Margin.Top

Description

The "Top" property specifies the spacing to the top.

Type

Int32

Access

Read-write

Syntax

```
Margin.Top
```

See also

StatusBar.Margin (Page 4899)

StatusBar.Padding

Description

The "Padding" property specifies the spacing of the content from the border of the information bar.

Type

Object, HmiPaddingPart

Access

Read-write

Syntax

```
StatusBar.Padding
```

See also

ProcessDiagnosisGraphOverviewControl.StatusBar (Page 4891)

Padding.Bottom

Description

The "Bottom" property specifies the bottom distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Bottom
```

See also

StatusBar.Padding (Page 4901)

Padding.Left

Description

The "Left" property specifies the left distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Left
```

See also

StatusBar.Padding (Page 4901)

Padding.Right

Description

The "Right" property specifies the right distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Right
```

See also

StatusBar.Padding (Page 4901)

Padding.Top

Description

The "Top" property specifies the top distance of the content from the border.

Type

Int32

Access

Read-write

Syntax

```
Padding.Top
```

See also

StatusBar.Padding (Page 4901)

StatusBar.ShowToolTips

Description

The "ShowToolTips" property specifies whether tooltips are displayed.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.ShowToolTips
```

See also

ProcessDiagnosisGraphOverviewControl.StatusBar (Page 4891)

StatusBar.Visible

Description

The "Visible" property specifies whether the information bar is visible.

Type

Bool

Access

Read-write

Syntax

```
StatusBar.Visible
```

See also

ProcessDiagnosisGraphOverviewControl.StatusBar (Page 4891)

ProcessDiagnosisGraphOverviewControl.StyleItemClass

Description

The "StyleItemClass" property returns the style that is applied to the process diagnostics view.

Type

String

Access

Read-only

Syntax

```
ProcessDiagnosisGraphOverviewControl.StyleItemClass
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl.TabIndex

Description

The "TabIndex" property returns the position of the process diagnostics view in the tab sequence.

Type

UInt16

Access

Read-only

Syntax

```
ProcessDiagnosisGraphOverviewControl.TabIndex
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ProcessDiagnosisGraphOverviewControl.ToolBar

Description

The "ToolBar" property specifies the toolbar of the process diagnostics view.

Type

Object, HmiToolBarPart

Access

Read-write

Syntax

```
ProcessDiagnosisGraphOverviewControl.ToolBar
```

See also

ProcessDiagnosisGraphOverviewControl (Page 4812)

ToolBar.BackColor

Description

The "BackColor" property specifies the background color.

Type

UInt32

Access

Read-write

Syntax

```
ToolBar.BackColor
```

See also

ProcessDiagnosisGraphOverviewControl.ToolBar (Page 4906)

ToolBar.Elements

Description

The "Elements" property returns a list of the basic elements (e.g., buttons or labels) of the toolbar.

Type

Object, HmiControlBarElementCollection (Page 4907)

Access

Read-only

Syntax

```
ToolBar.Elements
```

See also

ProcessDiagnosisGraphOverviewControl.ToolBar (Page 4906)

HmiControlBarElementCollection (Page 4907)

HmiControlBarElementCollection

Description

The "HmiControlBarElementCollection" object is a list of all the basic elements (e.g. buttons or labels) of an information bar or toolbar.

You reference a "HmiControlBarElementCollection" object via the property `StatusBar.Elements` or `ToolBar.Elements`

Use

The "HmiControlBarElementCollection" object is a list which can be counted and enumerated. You can access the "HmiControlBarElementCollection" list using the index or the tag names.

Object type

HmiControlBarElementCollection

Properties

The "HmiControlBarElementCollection" object has the following properties:

- **Count**
  Returns the number of basic elements of the "HmiControlBarElementCollection" list.

Methods

The "HmiControlBarElementCollection" object has the following methods:

- **Item()**
  Returns a basic element of the "HmiControlBarElementCollection" list.

See also

ToolBar.Elements (Page 4907)

HmiControlBarElementCollection.Count

Description

The "Count" property returns the number of basic elements (e.g., buttons or labels) of the "HmiControlBarElementCollection" list.

Type

UInt32

Access

Read-only

Syntax

```
HmiControlBarElementCollection.Count
```

See also

HmiControlBarElementCollection (Page 4907)

HmiControlBarElementCollection.Item()

Description

The "Item" method returns a basic element (e.g., button or label) of the "HmiControlBarElementCollection" list.

Syntax

```
HmiControlBarElementCollection[.Item](HmiControlBarElementName)
```

Note

The `.Item` part of the expression is not required. The "Item" method is the standard method of the "HmiControlBarElementCollection" object.

Parameters

`HmiControlBarElementName`

Type: String

Name of the element

Return value

Object, HmiControlBarElementPartBase (Page 4909)

See also

HmiControlBarElementCollection (Page 4907)

Control Bar Elements (Page 4909)

Control Bar Elements

ControlBarButton

Description

The "ControlBarButton" object represents a button of an information bar or toolbar.

You can reference the "ControlBarButton" object via the "HmiControlBarElementCollection" list.

Object type

HmiControlBarButtonPart

Properties

The "ControlBarButton" object has the following properties:

- **AlternateBackColor**
  Specifies the second color for a color gradient.
- **AlternateBorderColor**
  Specifies the second border color which is displayed for line styles such as "Dash".
- **Authorization**
  Returns the operator authorization.
- **BackColor**
  Specifies the background color.
- **Badge**
  Specifies the label of the button.
- **BorderColor**
  Specifies the line color.
- **BorderWidth**
  Specifies the line thickness.
- **Content**
  Specifies display options for text and graphics.
- **CustomID**
  Returns the custom ID.
- **Enabled**
  Specifies whether the button can be operated in runtime.
- **ForeColor**
  Specifies the font color.
- **Graphic**
  Specifies the graphic.
- **Height**
  Specifies the height.
- **HotKey**
  Returns the hotkey specified for the button.
- **Mapping**
  Returns the function of the button.
- **Margin**
  Specifies the margin.
- **MaximumHeight**
  Specifies the maximum height.
- **MaximumWidth**
  Specifies the maximum width.
- **MinimumHeight**
  Specifies the minimum height.
- **MinimumWidth**
  Specifies the minimum width.

- **Operability**
  Returns whether the button is operable.
- **Padding**
  Specifies the distance of the content from the border.
- **RequireExplicitUnlock**
  Returns whether the button is only operable while the corresponding button is being pressed.
- **Text**
  Specifies the label.
- **ToolTipText**
