### p4095 TM41 digital inputs simulation mode / TM41 DI sim\_mode

|      |                              |                      |                          |
|------|------------------------------|----------------------|--------------------------|
| TM41 | <b>Can be changed:</b> U, T  | <b>Calculated:</b> - | <b>Access level:</b> 2   |
|      | <b>Data type:</b> Unsigned32 | <b>Dyn. index:</b> - | <b>Func. diagram:</b> -  |
|      | <b>P-Group:</b> Terminals    | <b>Unit group:</b> - | <b>Unit selection:</b> - |
|      | <b>Not for motor type:</b> - | <b>Scaling:</b> -    | <b>Expert list:</b> 1    |
|      | <b>Min</b>                   | <b>Max</b>           | <b>Factory setting</b>   |
|      | -                            | -                    | 0000 0000 0000 0000 bin  |

**Description:** Sets the simulation mode for the digital inputs of Terminal Module 41 (TM41).

| Bit field: | Bit | Signal name      | 1 signal   | 0 signal      | FP   |
|------------|-----|------------------|------------|---------------|------|
|            | 00  | DI 0 (X522.1)    | Simulation | Terminal eval | 9660 |
|            | 01  | DI 1 (X522.2)    | Simulation | Terminal eval | 9660 |
|            | 02  | DI 2 (X522.3)    | Simulation | Terminal eval | 9660 |
|            | 03  | DI 3 (X522.4)    | Simulation | Terminal eval | 9660 |
|            | 08  | DI/DO 0 (X521.1) | Simulation | Terminal eval | 9661 |
|            | 09  | DI/DO 1 (X521.2) | Simulation | Terminal eval | 9661 |
|            | 10  | DI/DO 2 (X521.3) | Simulation | Terminal eval | 9662 |
|            | 11  | DI/DO 3 (X521.4) | Simulation | Terminal eval | 9662 |

**Dependency:** The setpoint for the input signals is specified using p4096.  
Refer to: p4096

**Warning:** A drive that is moved by simulating the inputs of a Terminal Module is brought to a standstill while the Terminal Module is being activated or deactivated.

## 2 Parameters

### 2.2 List of parameters

**Note:** This parameter is not saved when data is backed-up (p0971, p0977).  
 DI: Digital Input  
 DI/DO: Bidirectional Digital Input/Output

---

#### p4095 TB30 digital inputs simulation mode / TB30 DI sim\_mode

|      |                              |                      |                                  |
|------|------------------------------|----------------------|----------------------------------|
| TB30 | <b>Can be changed:</b> U, T  | <b>Calculated:</b> - | <b>Access level:</b> 2           |
|      | <b>Data type:</b> Unsigned32 | <b>Dyn. index:</b> - | <b>Func. diagram:</b> 9099, 9100 |
|      | <b>P-Group:</b> Commands     | <b>Unit group:</b> - | <b>Unit selection:</b> -         |
|      | <b>Not for motor type:</b> - | <b>Scaling:</b> -    | <b>Expert list:</b> 1            |
|      | <b>Min</b>                   | <b>Max</b>           | <b>Factory setting</b>           |
|      | -                            | -                    | 0000 bin                         |

**Description:** Sets the simulation mode for the digital inputs of the Terminal Board 30 (TB30).

| Bit field: | Bit | Signal name   | 1 signal   | 0 signal      | FP |
|------------|-----|---------------|------------|---------------|----|
|            | 00  | DI 0 (X481.1) | Simulation | Terminal eval | -  |
|            | 01  | DI 1 (X481.2) | Simulation | Terminal eval | -  |
|            | 02  | DI 2 (X481.3) | Simulation | Terminal eval | -  |
|            | 03  | DI 3 (X481.4) | Simulation | Terminal eval | -  |

**Dependency:** The setpoint for the input signals is specified using p4096.  
 Refer to: p4096

**Warning:** A drive that is moved by simulating the inputs of a Terminal Board is brought to a standstill while the Terminal Module is being activated or deactivated.

**Note:** This parameter is not saved when data is backed-up (p0971, p0977).  
 DI: Digital Input

**Description:** Sets the setpoint for the input signals in the simulation mode of the digital inputs of Terminal Module 41 (TM41).

**Bit field:**

| Bit | Signal name      | 1 signal | 0 signal | FP   |
|-----|------------------|----------|----------|------|
| 00  | DI 0 (X522.1)    | High     | Low      | 9660 |
| 01  | DI 1 (X522.2)    | High     | Low      | 9660 |
| 02  | DI 2 (X522.3)    | High     | Low      | 9660 |
| 03  | DI 3 (X522.4)    | High     | Low      | 9660 |
| 08  | DI/DO 0 (X521.1) | High     | Low      | 9661 |
| 09  | DI/DO 1 (X521.2) | High     | Low      | 9661 |
| 10  | DI/DO 2 (X521.3) | High     | Low      | 9662 |
| 11  | DI/DO 3 (X521.4) | High     | Low      | 9662 |

**Dependency:** The simulation of a digital input is selected using p4095.  
Refer to: p4095

**Note:** This parameter is not saved when data is backed-up (p0971, p0977).  
DI: Digital Input  
DI/DO: Bidirectional Digital Input/Output

## 2 Parameters

### 2.2 List of parameters

- Dependency:** The parameter can only be modified for p0009 = 3, 29.  
The following applies for the sampling time:  
The sampling times at a DRIVE-CLiQ line must be integral multiples of one another.  
The sampling times of this TM must be an integral multiple of a servo or vector drive that exists in the system.  
The minimum permissible sampling time for index 0 (digital inputs/outputs) is 125 µs.  
The minimum permissible sampling time for index 1 (analog inputs) and index 2 (analog outputs) is 62.5 µs.  
The sampling times entered in index 0 (digital inputs/outputs) and index 2 (analog outputs) must always be greater than or equal to the sampling time in index 1 (analog inputs).  
Refer to: p0009, r0110, r0111
- Notice:** The sampling times entered in index 0 (digital inputs/outputs) and index 2 (analog outputs) must always be greater than or equal to the sampling time in index 1 (analog inputs).
- Note:** The changed sampling time is immediately effective after a completed sub-boot (p0009 → 0).  
Parameter p4099[0] must never be equal to zero.

| <b>Note:</b>        | The value of the sampling time of the incremental encoder emulation p4099[3] can be pre-set in both operating modes (p4400). The next time that the system boots, the validity of the value is checked. For an invalid value, message F35228 and/or A01223 is output.<br>The changed sampling time is immediately effective after a completed sub-boot (p0009 → 0).<br>The sampling time of a TM41 in the SINAMICS mode (p4400 = 1) must be the same as that of the emulated encoder.<br>The sampling time of a TM41 in the SIMOTION mode (p4400 = 0) is determined by the topology used |   |   |

---

| p4099[0...2]        | TB30 inputs/outputs sampling time / TB30 I/O t <sub>samp</sub>   |   |   |
|---------------------|--|---|---|
| TB30                | <b>Can be changed:</b> C1(3)<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Commands<br><b>Not for motor type:</b> -<br><b>Min</b><br>0.00 [µs] | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>5000.00 [µs] | <b>Access level:</b> 3<br><b>Func. diagram:</b> 9099, 9100<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>[0] 4000.00 [µs]<br>[1] 4000.00 [µs]<br>[2] 4000.00 [µs] |
| <b>Description:</b> | Sets the sampling time for the inputs and outputs of Terminal Board 30 (TB30).   |   |   |
| <b>Index:</b>       | [0] = Digital inputs/outputs (DI/DO)<br>[1] = Analog inputs (AI)<br>[2] = Analog outputs (AO)  |   |   |

**Dependency:** The parameter can only be modified for p0009 = 3, 29.  
The sampling times can only be set as an integer multiple of the lowest basic sampling time (r0110[0]).  
Refer to: p0009, r0110, r0111

**Note:** The changed sampling time is immediately effective after a completed sub-boot (p0009 -> 0).  
For clock cycle synchronous PROFIBUS operation, the TB30 hardware (e.g. analog/digital converter) is operated with the PROFIBUS clock cycle (r2064[1]). This clock cycle is also kept after the PROFIBUS connection has been exited up to the next time that the Control Unit is switched off. In this case, a faster sampling time than the PROFIBUS clock cycle is not practical in p4099[0...2].

0.000 [ms]

**Description:**

Sets the delay time for the output of the fault for the Terminal Module 31 (TM31).  
 The timer is started when the alarm threshold (p4102[0]) is exceeded.  
 If the delay time has expired and the alarm threshold has, in the meantime, not been fallen below, then fault F35207 is output.  
 The fault can be acknowledged, if, after the delay time has expired, the alarm threshold is again fallen below.  
 For sensor type "KTY84" "PT1000" (p4100 = 2, 6), the following applies:  
 If the fault threshold (p4102[1]) is exceeded before the delay time has expired, then fault F35207 is immediately output.  
 For sensor type "PTC thermistor" (p4100 = 1), the following applies:  
 - Alarm and fault threshold simultaneously respond. The fault is only issued after the delay time has expired.

**Dependency:**

Refer to: r4104

**Warning:**

Fault F35207 only causes the drive to be shut down if there is at least one BICO interconnection between the drive and TM31.

**Note:**

With p4103 = 0, the timer is deactivated and only the fault threshold is effective.

## 2 Parameters

### 2.2 List of parameters

**Note:** The temperature sensors are connected to the following terminals:  
X531 = channel 0 (for 2x2 wire evaluation, additionally channel 6)  
X532 = channel 1 (for 2x2 wire evaluation, additionally channel 7)  
X533 = channel 2 (for 2x2 wire evaluation, additionally channel 8)  
X534 = channel 3 (for 2x2 wire evaluation, additionally channel 9)  
X535 = channel 4 (for 2x2 wire evaluation, additionally channel 10)  
X536 = channel 5 (for 2x2 wire evaluation, additionally channel 11)  
For p4108[0...5] = 0, 2, 3 (1x2, 3, 4 wire evaluation):  
The temperature channel belonging to the terminal block with the higher number is automatically deactivated (e.g. for X531 with 3-wire evaluation, channel 6 is deactivated).

**Description:** Setting to start the measurement of the wire resistance for a channel for the Terminal Module 150 (TM150).  
For a 2 wire evaluation, the total wire resistance is measured and saved. During the temperature evaluation, the temperature actual value is automatically calibrated using the measured wire resistance.

Procedure:

1. Select the measuring method (1x2/2x2) for the corresponding terminal block (p4108[0...5] = 0, 1).
2. Set the required sensor type for the corresponding channel (p4100[x] = 1 ... 6, x = 0...5 or 0...11).
3. Jumper the sensor to be connected (short-circuit the sensor cable close to the sensor).
4. Connect the sensor conductors to the appropriate terminals 1(+), 2(-) or 3(+), 4(-).
5. For the corresponding channel, start the measurement of the wire resistance (p4109[x] = 1).
6. After p4109[x] = 0, check the measured resistance value in p4110[x].
7. Remove the jumper across the temperature sensor.

**Value:**  
0: Inactive  
1: Start

**Index:**  
[0] = Temperature channel 0  
[1] = Temperature channel 1  
[2] = Temperature channel 2  
[3] = Temperature channel 3  
[4] = Temperature channel 4  
[5] = Temperature channel 5  
[6] = Temperature channel 6  
[7] = Temperature channel 7  
[8] = Temperature channel 8  
[9] = Temperature channel 9  
[10] = Temperature channel 10  
[11] = Temperature channel 11

**Dependency:** Refer to: p4100, p4108, p4110

**Notice:** Wire resistance measurement is only possible for 1x2 or 2x2 wire evaluation (p4108[0...5] = 0, 1).

**Note:** The wire resistance value can be also directly entered into p4110[0...11].  
The automatic conductor calibration for 1x2 and 2x2 wire evaluation is always performed with the value in p4110[0...11].

## 2 Parameters

### 2.2 List of parameters

- Notice:** When forming groups, it must be ensured that in one particular group, only temperature channels with the following sensor types are included:  
- "KTY84", "PT100", "PT1000" (p4100[0...11] = 2, 5, 6), real temperature actual value  
or alternatively  
- "PTC thermistor", "bimetallic NC contact" (p4100[0...11] = 1, 4), fictitious temperature actual value (-50 °C, 250 °C)  
If these sensor types are combined within one group, then the calculated values for maximum, minimum and average value will be falsified.
- Note:** Active and inactive temperature channels can be included in one group. However, when calculating the values (r4112, r4113, r4114) only the active temperature channels with valid actual value are taken into account (r4105[0...11] not equal to -300 °C).

---

#### **r4112[0...2] CO: TM150 group temperature actual value maximum value / TM150 grp temp max**

**Description:** Display and connector output for the maximum value of each group for the Terminal Module 150 (TM150). This value is calculated from the actual temperature values (r4105[0...11]) of each group.

**Recommendation:** The following connector inputs can use these connector outputs for interconnection:  
- CI: p0603  
- CI: p0608[0...3]  
- CI: p0609[0...3]  
- CI: p2051

**Index:**  
[0] = Group 0  
[1] = Group 1  
[2] = Group 2

**Dependency:** Refer to: r4105, p4111, r4113, r4114

 [11] = Temperature channel 11

**Dependency:**

Refer to: p4102, p4103, r4104, r4105

**Note:**

The following applies for a corresponding alarm:

- Remains until the temperature actual value (r4105[x]) reaches or falls below the threshold value (p4102[2x]) - hysteresis (p4118[x]).

The following applies for a corresponding fault:

- Remains until the temperature actual value (r4105[x]) reaches or falls below the threshold value (p4102[2x+1]) - hysteresis (p4118[x]) and the fault has been acknowledged.

**Description:** Sets the smoothing time constant for the 1st order lowpass filter of the temperature channels.  
 The effective smoothing time constant depends on the number of channels that are simultaneously active and is displayed in r4120.

In order that the value becomes effective, p4122 must be set  $\geq 2 \cdot \text{channel sampling time}$ .

The following applies:

Channel sampling time = active number of channels \* 50ms

For lower values, a smoothing of  $2 \cdot \text{channel sampling time}$ .

**Index:**  
 [0] = Temperature channel 0  
 [1] = Temperature channel 1  
 [2] = Temperature channel 2  
 [3] = Temperature channel 3

| <b>Description:</b> | Is used to synchronize the timer of Terminal Module 17 (TM17) with the system time of the DP master. To do this, the sign-of-life of the DP master is transferred in the form of a counter in bits 12 to 15. At each cycle of the system of the DP master, bit 0 (SYN signal) is set for the duration of a DP master clock cycle. |                      |                            |                 |           |

**Description:** Displays the edge mode for digital input 16 ... 23 of Terminal Module 15 (TM15).

Assignment of the digital inputs to the bits:

- DI 16: r4213.1 ... 0
- DI 17: r4213.3 ... 2
- DI 18: r4213.5 ... 4
- DI 19: r4213.7 ... 6
- DI 20: r4213.9 ... 8
- DI 21: r4213.11 ... 10
- DI 22: r4213.13 ... 12
- DI 23: r4213.15 ... 14

Possible edge modes:

- Bit x, y = 0, 0 --> no edge detection
- Bit x, y = 0, 1 --> rising - rising edge
- Bit x, y = 1, 0 --> falling - falling edge
- Bit x, y = 1, 1 --> rising - falling edge or falling - rising edge

**Note:** DI: Digital Input

**p4220 TM17 enable DI/DO 0 ... 5 / TM17 enable 0-5**

**Description:** Sets the enable signal with bits 0 ... 5 for DI/DO 0 ... 5 of Terminal Module 17 (TM17).

Sets the triggering of the enable signal with bits 8 ... 13.

The following assignment applies:

Enable signal for DI/DO 0, 1, 2, 3, 4 or 5 via DI/DO 10, 11, 12, 13, 14 or 15.

**Description:** Displays the edge status for digital input 8 ... 15 of Terminal Module 15 (TM15).

Assignment of the digital inputs to the bits:

DI 8: r4312.1 ... 0

DI 9: r4312.3 ... 2

DI 10: r4312.5 ... 4

DI 11: r4312.7 ... 6

DI 12: r4312.9 ... 8

DI 13: r4312.11 ... 10

DI 14: r4312.13 ... 12

DI 15: r4312.15 ... 14

Possible edge states:

Bit x, y = 0, 0 --> no edge detection

Bit x, y = 0, 1 --> 1st edge detected

Bit x, y = 1, 0 --> 2nd edge detected

Bit x, y = 1, 1 --> both edges detected

**Note:** DI: Digital Input

| 05 | Activate higher setpoint resolution                        | Yes | No | - |
| 06 | Deactivate residual value handling in the setpoint channel | Yes | No | - |
| 07 | Activate output frequencies greater than 750 kHz           | Yes | No | - |

**Note:**

For bit 00, 01:

This bit is used to configure the zero mark via X520.

When the TM41 is operated in the SINAMICS mode (p4400 = 1), the following applies:

A new zero mark search is initiated by switching in the zero mark at the TM41 (p4401.0 = 1). The zero mark is output at the TM41 as soon as it was synchronized with the zero position/zero mark of the leading encoder.

For p4401.1 = 1, the following applies:

The zero pulse is only output via X520 when the absolute encoder passes the zero position of the absolute position (modulo converted).

For p4401.1 = 0, the following applies:

The zero pulse is output via X520 compatible with previous firmware versions (< V4.3). The zero pulse is output when the TM41 (modulo converted) passes the position it was in when the 24 V supply was switched on.

For bit 07:

For hardware versions A and B, this bit has no significance (output frequency = 512 kHz).

For p4401.7 = 0, the following applies:

The maximum output frequency is 750 kHz (from hardware version C).

For p4401.7 = 1, the following applies:

The maximum output frequency is 1024 kHz (from hardware version C).

## 2 Parameters

### 2.2 List of parameters

**Note:** This parameter is effective only when p0601 = 10.  
Terminals for KTY84/PT1000: X200.1, X200.2  
PTC thermistor: Tripping resistance = 1650 Ohm  
Information on using temperature sensors is provided in the following literature:  
- hardware description of the appropriate components  
- SINAMICS S120 Commissioning Manual

---

| <b>p4602[0...n]</b>   | <b>Motor temperature sensor 3 sensor type / Temp_sens 3 type</b> |                               |                            |
|---|--|-------------------------------|----------------------------|
| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC | <b>Can be changed:</b> U, T                                      | <b>Calculated:</b> -          | <b>Access level:</b> 2     |
|   | <b>Data type:</b> Integer16                                      | <b>Dyn. index:</b> EDS, p0140 | <b>Func. diagram:</b> 8016 |
|   | <b>P-Group:</b> Motor  | <b>Unit group:</b> -          | <b>Unit selection:</b> -   |
|   | <b>Not for motor type:</b> -                                     | <b>Scaling:</b> -             | <b>Expert list:</b> 1      |
|   | <b>Min</b>   | <b>Max</b>                    | <b>Factory setting</b>     |
|   | 0  | 60                            | 0                          |

**Description:** Sets the sensor type of the third temperature sensor for the motor temperature monitoring.

**Value:**

- 0: No sensor
- 10: PTC fault
- 11: PTC alarm
- 12: PTC alarm & timer
- 20: KTY84
- 30: Bimetallic NC contact fault
- 31: Bimetallic NC contact alarm
- 32: Bimetallic NC contact alarm & timer
- 60: PT1000

**Dependency:** Refer to: r0458, p0600, p0601

**Note:** This parameter is effective only when p0601 = 10.  
Terminals for PTC triplet and bimetallic: X200.3, X200.4  
PTC thermistor: Tripping resistance = 1650 Ohm  
Information on using temperature sensors is provided in the following literature:  
- hardware description of the appropriate components  
- SINAMICS S120 Commissioning Manual

---

| <b>p4603[0...n]</b>   | <b>Motor temperature sensor 4 sensor type / Temp_sens 4 type</b> |                               |                            |
|---|--|-------------------------------|----------------------------|
| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC | <b>Can be changed:</b> U, T                                      | <b>Calculated:</b> -          | <b>Access level:</b> 2     |
|   | <b>Data type:</b> Integer16                                      | <b>Dyn. index:</b> EDS, p0140 | <b>Func. diagram:</b> 8016 |
|   | <b>P-Group:</b> Motor  | <b>Unit group:</b> -          | <b>Unit selection:</b> -   |
|   | <b>Not for motor type:</b> -                                     | <b>Scaling:</b> -             | <b>Expert list:</b> 1      |
|   | <b>Min</b>   | <b>Max</b>                    | <b>Factory setting</b>     |
|   | 0  | 60                            | 0                          |

**Description:** Sets the sensor type of the fourth temperature sensor for the motor temperature monitoring.

**Value:**

- 0: No sensor
- 10: PTC fault
- 11: PTC alarm
- 12: PTC alarm & timer
- 20: KTY84
- 30: Bimetallic NC contact fault
- 31: Bimetallic NC contact alarm
- 32: Bimetallic NC contact alarm & timer
- 60: PT1000

**Dependency:** Refer to: r0458, p0600, p0601

**Note:** This parameter is effective only when p0601 = 10.  
Terminals for PTC triplet: X200.5, X200.6  
PTC thermistor: Tripping resistance = 1650 Ohm  
Information on using temperature sensors is provided in the following literature:  
- hardware description of the appropriate components  
- SINAMICS S120 Commissioning Manual

**p4644****Simulated motor encoder configuration / Sim mot\_enc config**

SERVO, VECTOR (n/M), SERVO\_AC, VECTOR\_AC (n/M), SERVO\_I\_AC

**Can be changed:** T**Calculated:** -**Access level:** 4**Data type:** Unsigned16**Dyn. index:** -**Func. diagram:** -**P-Group:** -**Unit group:** -**Unit selection:** -**Not for motor type:** -**Scaling:** -**Expert list:** 1**Min****Max****Factory setting**

-

-

0010 bin

**Description:**

Sets the configuration for the simulated motor encoder.

Using these configuration bits, the response of the encoder status bit "Parking encoder active" (r0481.14) can be set for a pulse inhibit.

For bit 00:

When the bit is set, after a pulse inhibit, encoder status bit "Parking encoder active" (r0481.14) is temporarily set and then withdrawn. When r0481.14 = 1 is set, the higher-level control system is signaled that the position must be re-referenced. When r0481.14 = 0 is reset, then the higher-level control system can switch the system on again.

For bit 01:

When the bit is set, a brake is being used (p1215 = 1, 3) and the pulses are canceled for absolute speeds less than the standstill speed (SERVO: p1226, VECTOR: 2 \* p1226), then the encoder status bit "Parking encoder active" (r0481.14) is not set. This means that the position is not re-referenced after switching on again.

For bit 02:

This bit can be used for diagnostics.

When the bit is set, encoder status bit "Parking encoder active" (r0481.14) is not set as a result of the pulse inhibit.

**Bit field:**

| Bit | Signal name   | 1 signal | 0 signal | FP |
|-----|---|----------|----------|----|
| 00  | For a pulse inhibit, temporarily set bit r0481.14           | Yes      | No       | -  |
| 01  | Bit r0481.14 = 0 for pulse inhibit at standstill with brake | Yes      | No       | -  |
| 02  | For a pulse inhibit, do not set bit r0481.14                | Yes      | No       | -  |

**Dependency:**

Refer to: r0481

**Danger:**

For bit 02 = 1:

If it cannot be excluded that the motor shaft turns while the pulses are inhibited, then after the pulse enable, the position calculated by the simulated motor encoder can be offset and not detected using encoder status bit "Parking encoder active" (r0481.14). Hazardous operating states can subsequently occur.

**Note:**

Function "Simulated motor encoder" is activated using p0400 = 9010.

For bit 00, 01, 02 = 0, the following applies:

For a pulse inhibit, encoder status bit "Parking encoder active" (r0481.14) is set. The system must be referenced after switching on again.

For bit 02 = 1, the following applies:

This bit has priority over the other bits.

| <b>Description:</b>   | <p>Sets the configuration for the simulated motor encoder.</p> <p>Using these configuration bits, the response of the encoder status bit "Parking encoder active" (r0481.14) can be set for a pulse inhibit.</p> <p>For bit 00:</p> <p>When the bit is set, after a pulse inhibit, encoder status bit "Parking encoder active" (r0481.14) is temporarily set and then withdrawn. When r0481.14 = 1 is set, the higher-level control system is signaled that the position must be re-referenced. When r0481.14 = 0 is reset, then the higher-level control system can switch the system on again.</p> <p>For bit 01:</p> <p>When the bit is set, a brake is being used (p1215 = 1, 3) and the pulses are canceled for absolute speeds less than the standstill speed (SERVO: p1226, VECTOR: 2 * p1226), then the encoder status bit "Parking encoder active" (r0481.14) is not set. This means that the position is not re-referenced after switching on again.</p> <p>For bit 02:</p> <p>This bit can be used for diagnostics.</p> <p>When the bit is set, encoder status bit "Parking encoder active" (r0481.14) is not set as a result of the pulse inhibit.</p> |   |                          |                 |           |
| <b>Bit field:</b>   | <b>Bit</b>   | <b>Signal name</b>  | <b>1 signal</b>          | <b>0 signal</b> | <b>FP</b> |
|   | 00   | For a pulse inhibit, temporarily set bit r0481.14           | Yes                      | No              | -         |
|   | 01   | Bit r0481.14 = 0 for pulse inhibit at standstill with brake | Yes                      | No              | -         |
|   | 02   | For a pulse inhibit, do not set bit r0481.14                | Yes                      | No              | -         |
| <b>Dependency:</b>  | Refer to: r0481  |   |                          |                 |           |
| <b>Danger:</b>  | For bit 02 = 1:  |   |                          |                 |           |
|  | If it cannot be excluded that the motor shaft turns while the pulses are inhibited, then after the pulse enable, the position calculated by the simulated motor encoder can be offset and not detected using encoder status bit "Parking encoder active" (r0481.14). Hazardous operating states can subsequently occur.  |   |                          |                 |           |
| <b>Note:</b>  | Function "Simulated motor encoder" is activated using p0400 = 9010.  |   |                          |                 |           |
|   | For bit 00, 01, 02 = 0, the following applies:   |   |                          |                 |           |
|   | For a pulse inhibit, encoder status bit "Parking encoder active" (r0481.14) is set. The system must be referenced after switching on again.  |   |                          |                 |           |
|   | For bit 02 = 1, the following applies:   |   |                          |                 |           |
|   | This bit has priority over the other bits.   |   |                          |                 |           |

**Description:** Amplitude threshold of the incremental signals for the function reserve.

If the set amplitude threshold on the incremental signals is fallen below, then alarm A3x407 "Encoder x; function limit reached " is output.

**Note:** An amplitude threshold of 230 mV can be used as default value.

---

|  | <b>Data type:</b> FloatingPoint32 | <b>Dyn. index:</b> - | <b>Func. diagram:</b> -  |
|  | <b>P-Group:</b> Displays, signals | <b>Unit group:</b> - | <b>Unit selection:</b> - |
|  | <b>Not for motor type:</b> -      | <b>Scaling:</b> -    | <b>Expert list:</b> 1    |
|  | <b>Min</b>                        | <b>Max</b>           | <b>Factory setting</b>   |
|  | - [%]                             | - [%]                | - [%]                    |

**Description:** Displays the functional reserve of the encoder selected via p4650.

0 ... 25 %:

The function limit has been reached. A service is recommended.

26 ... 100 %:

The encoder is working in the specified range.

**Index:**  
[0] = Function reserve 1  
[1] = Function reserve 2  
[2] = Function reserve 3  
[3] = Function reserve 4

**Dependency:** Refer to: p4650

**Note:** Value = 999 means:

- the component specified in p4650 is not connected

- the encoder does not support the display of the functional reserve

|                   | 09         | Fault/alarm messages       | Alarm           | Fault             | -         |
|                   | 10         | Channel B act              | Yes             | No                | -         |
|                   | 11         | Channel A act              | Yes             | No                | -         |
|                   | 13         | Commutation angle constant | Yes             | No                | -         |
|                   | 14         | Suppress faults            | Yes             | No                | -         |
|                   | 15         | Two-channel evaluation     | Yes             | No                | -         |
|                   | 31         | Extrapolation              | ON              | OFF               | -         |

**Notice:** For bit 06:  
Setting the bit sets the velocity actual value (r0061) permanently to 0.  
For bit 13:  
Setting the bit sets the commutation angle permanently to the commutation angle offset (p0431).

**Note:** For bit 09:  
A setting of bit = 0 will trigger a fault for the relevant channel if the actual value is invalid.  
A setting of bit = 1 will trigger an alarm for the relevant channel if the actual value is invalid.  
For bits 10, 11:  
If both channels are activated, the actual value is generated from the average value of both channels. If a channel fails (actual value invalid), it is not included when the average value is generated.  
For bit 14:  
The bit is only evaluated for encoder 1. Otherwise no effect.  
For bit 15:  
When the bit is set, both input signals are separately evaluated and transferred.  
Prerequisite:  
Function "Extended cyclic DRIVE-CLiQ telegram" is activated (p0454.4 = 1).

**Description:** Sets the output voltage range to be mapped for the connected analog sensor.  
The voltage range is determined by the following parameters:  
- p4674 (voltage at actual value 0)  
- p4675 (voltage per encoder period)

**Note:** The minimum actual value which can be mapped is equal to p4674 - p4675/2.  
The maximum actual value which can be mapped is equal to p4674 + p4675/2.

**Description:** Sets the threshold for limit monitoring of the absolute actual value on the analog sensor.  
If this threshold is overshoot by the actual value of a channel, a corresponding fault/alarm (p4670.9) is output.

**Dependency:** Refer to: p4673, p4675

**p4677[0...n] Analog sensor LVDT configuration / Ana\_sens LVDT conf**

|  | 0                                 | 29                   | 0                        |

**Description:**

Setting to back up the data of all SMIs and DQIs featured in the target topology.

**Value:**

- 0: Inactive  
1: Save data of all SMIs and DQIs  
10: Save all data successful  
13: Insufficient memory space for backup  
16: Transfer fault during data backup  
20: Component does not contain any data  
29: Not all components from target topology saved

**Note:**

- SMI: SINAMICS Sensor Module Integrated  
p4692 = 10: Automatic on successful completion of backup procedure.  
p4692 = 13, 16, 20, 29: Error values if the procedure could not be executed successfully.  
The procedure must be repeated if the data save operation was interrupted (e.g. if the power supply voltage failed).  
Help for error value = 13:  
- Use a memory card with more memory space.  
Remedy for fault value = 16:  
- check the DRIVE-CLiQ wiring.  
Remedy for fault value = 20:  
- Use an SMI that is not blank.  
Help for error value = 29:  
- check and correct the target and actual topologies for the SMIs.  
- Repeat the save procedure.

| <b>Description:</b>  | Displays the trace buffer (record buffer) for trace 0 and signal 0.<br>The trace (record) buffer is sub-divided into memory banks, each containing 16384 values. Parameter p4795 can be used to toggle between the individual banks.<br>Example A:<br>The first 16384 values of signal 0, trace 0 are to be read out.<br>In this case, memory bank 0 is set with p4795 = 0. The first 16384 values can now be read out using r4740[0] to r4740[16383].<br>Example B:<br>The values 16385 to 32768 from signal 0, trace 0 are to be read out.<br>In this case, memory bank 1 is set with p4795 = 1. The values can now be read out in r4740[0] to r4740[16383]. |  |   |
| <b>Dependency:</b>   | Refer to: p4795  |  |   |

| <b>Description:</b>  | Sets the signal source to control the function generator.<br>When the function generator is running, signal generation is stopped with binector p4819 = 0 signal and p4800 is set = 0. |  |   |
| <b>Dependency:</b>   | Refer to: p4800  |  |   |

| <b>p4820</b>   |   | <b>Function generator signal shape / FG signal shape</b>   |   |  |
|--|---|--|---|--|
| CU_I, CU_NX_CX,<br>CU_S_AC_DP,<br>CU_S_AC_PN,<br>CU_S120_PN,<br>CU_S150_PN,<br>CU_S120_DP,<br>CU_S150_DP,<br>CU_I_D410 | <b>Can be changed:</b> U, T<br><b>Data type:</b> Integer16<br><b>P-Group:</b> Trace and function generator<br><b>Not for motor type:</b> -<br><b>Min</b><br>1 | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>5 | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 0<br><b>Factory setting</b><br>1 |  |

**Description:** Sets the signal to be generated for the function generator.

- Value:**
- 1: Square-wave
  - 2: Staircase
  - 3: Delta
  - 4: Binary noise - PRBS (Pseudo Random Binary Signal)
  - 5: Sine-wave

| <b>p4821</b>   |   | <b>Function generator period / FG period duration</b>  |  |  |
|--|---|--|--|--|
| CU_I, CU_NX_CX,<br>CU_S_AC_DP,<br>CU_S_AC_PN,<br>CU_S120_PN,<br>CU_S150_PN,<br>CU_S120_DP,<br>CU_S150_DP,<br>CU_I_D410 | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Trace and function generator<br><b>Not for motor type:</b> -<br><b>Min</b><br>0.00 [ms] | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>60000.00 [ms] | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 0<br><b>Factory setting</b><br>1000.00 [ms] |  |

**Description:** Sets the period of the signal to be generated for the function generator.

**Dependency:** Ineffective when p4820 = 4 (PRBS).

| <b>p4822</b>   |   | <b>Function generator pulse width / FG pulse width</b>   |   |  |
|--|---|--|---|--|
| CU_I, CU_NX_CX,<br>CU_S_AC_DP,<br>CU_S_AC_PN,<br>CU_S120_PN,<br>CU_S150_PN,<br>CU_S120_DP,<br>CU_S150_DP,<br>CU_I_D410 | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Trace and function generator<br><b>Not for motor type:</b> -<br><b>Min</b><br>0.00 [ms] | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>60000.00 [ms] | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 0<br><b>Factory setting</b><br>500.00 [ms] |  |

**Description:** Sets the pulse width for the signal to be generated for the function generator.

**Dependency:** Only effective when p4820 = 1 (square-wave).

| <b>p4823</b>   |   | <b>Function generator bandwidth / FG bandwidth</b>   |  |  |
|--|---|--|--|--|
| CU_I, CU_NX_CX,<br>CU_S_AC_DP,<br>CU_S_AC_PN,<br>CU_S120_PN,<br>CU_S150_PN,<br>CU_S120_DP,<br>CU_S150_DP,<br>CU_I_D410 | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Trace and function generator<br><b>Not for motor type:</b> -<br><b>Min</b><br>0.0025 [Hz] | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>16000.0000 [Hz] | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 0<br><b>Factory setting</b><br>4000.0000 [Hz] |  |

**Description:** Sets the bandwidth for the signal to be generated for the function generator.

**Dependency:** Only effective when p4820 = 4 (PRBS).

## 2 Parameters

### 2.2 List of parameters

|  |   |  |   |  |
|--|---|--|---|--|
| <b>r4987</b>   | <b>TEC GUID total length / TEC GUID tot_lgth</b>  |  |   |  |
| CU_I, CU_NX_CX,<br>CU_S_AC_DP,<br>CU_S_AC_PN,<br>CU_S120_PN,<br>CU_S150_PN,<br>CU_S120_DP,<br>CU_S150_DP,<br>CU_I_D410 | <b>Can be changed:</b> -<br><b>Data type:</b> Unsigned16<br><b>P-Group:</b> OEM range<br><b>Not for motor type:</b> -<br><b>Min</b><br>0  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>576   | <b>Access level:</b> 4<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- |  |
| <b>Description:</b>  | Displays the total length of the GUIDs of all the Technology Extensions installed on the memory card/device memory.   |  |   |  |
| <b>Dependency:</b>   | Refer to: r4985, r4986, r4988, r4989, r4990, r4991, r4992, r4993, r4994   |  |   |  |
| <b>Note:</b>   | The GUID of a Technology Extension comprises 16 characters plus 1 character major information plus 1 character, minor information.<br>GUID: Globally Unique Identifier<br>TEC: Technology Extension             |  |   |  |
| <b>r4988[0...n]</b>  | <b>TEC identifier / TEC ident</b>   |  |   |  |
| CU_I, CU_NX_CX,<br>CU_S_AC_DP,<br>CU_S_AC_PN,<br>CU_S120_PN,<br>CU_S150_PN,<br>CU_S120_DP,<br>CU_S150_DP,<br>CU_I_D410 | <b>Can be changed:</b> -<br><b>Data type:</b> Unsigned8<br><b>P-Group:</b> OEM range<br><b>Not for motor type:</b> -<br><b>Min</b><br>-   | <b>Calculated:</b> -<br><b>Dyn. index:</b> r4986<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- | <b>Access level:</b> 4<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- |  |
| <b>Description:</b>  | Displays the IDs of all the Technology Extensions installed on the memory card/device memory.<br>r4988[0...8]: Identifier of Technology Extension 1<br>r4988[9...17]: Identifier of Technology Extension 2, ... |  |   |  |
| <b>Dependency:</b>   | Refer to: r4985, r4986, r4987, r4989, r4990, r4991, r4992, r4993, r4994   |  |   |  |
| <b>Notice:</b>   | This parameter is only indexed if at least one Technology Extension exists (p4985 > 0).   |  |   |  |
| <b>Note:</b>   | TEC: Technology Extension   |  |   |  |
| <b>r4989[0...n]</b>  | <b>TEC version / TEC version</b>  |  |   |  |
| CU_I, CU_NX_CX,<br>CU_S_AC_DP,<br>CU_S_AC_PN,<br>CU_S120_PN,<br>CU_S150_PN,<br>CU_S120_DP,<br>CU_S150_DP,<br>CU_I_D410 | <b>Can be changed:</b> -<br><b>Data type:</b> Unsigned32<br><b>P-Group:</b> OEM range<br><b>Not for motor type:</b> -<br><b>Min</b><br>-  | <b>Calculated:</b> -<br><b>Dyn. index:</b> r4985<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- | <b>Access level:</b> 4<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- |  |
| <b>Description:</b>  | Displays the version of all the Technology Extensions installed on the memory card/device memory.<br>r4989[0]: Version of Technology Extension 1<br>r4989[1]: Version of Technology Extension 2, ...            |  |   |  |
| <b>Dependency:</b>   | Refer to: r4985, r4986, r4987, r4988, r4990, r4991, r4992, r4993, r4994   |  |   |  |
| <b>Notice:</b>   | This parameter is only indexed if at least one Technology Extension exists (p4985 > 0).   |  |   |  |
| <b>Note:</b>   | TEC: Technology Extension<br>Example:<br>The value 1010100 should be interpreted as V01.01.01.00.   |  |   |  |

|  |   |  |   |
|--|---|--|---|
| <b>r4990[0...n]</b>  | <b>TEC interface version / TEC intf_vers</b>  |  |   |
| CU_I, CU_NX_CX,<br>CU_S_AC_DP,<br>CU_S_AC_PN,<br>CU_S120_PN,<br>CU_S150_PN,<br>CU_S120_DP,<br>CU_S150_DP,<br>CU_I_D410 | <b>Can be changed:</b> -<br><b>Data type:</b> Unsigned32<br><b>P-Group:</b> OEM range<br><b>Not for motor type:</b> -<br><b>Min</b><br>-  | <b>Calculated:</b> -<br><b>Dyn. index:</b> r4985<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- | <b>Access level:</b> 4<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- |
| <b>Description:</b>  | Displays the interface version of all the Technology Extensions installed on the memory card/device memory.<br>r4990[0]: Interface version of Technology Extension 1<br>r4990[1]: Interface version of Technology Extension 2, ...  |  |   |
| <b>Dependency:</b>   | Refer to: r4985, r4986, r4987, r4988, r4989, r4991, r4992, r4993, r4994   |  |   |
| <b>Notice:</b>   | This parameter is only indexed if at least one Technology Extension exists (p4985 > 0).   |  |   |
| <b>Note:</b>   | TEC: Technology Extension<br>Example:<br>The value 1010100 should be interpreted as V01.01.01.00.   |  |   |

**Description:** Display and connector output for the clamped state.  
Message A3x940 is output in states 2 and 11.  
The voltage threshold values for the states can be set using parameter p5041. The hysteresis is adapted using parameter p5040.  
The transition from state 4 to states 7, 8 or 10 can be influenced by the wait time p5042[0].  
A transition is made into state 10 if the analog value in p5002 falls below the voltage threshold value in p5041[4].  
However, if the analog value p5002 lies below the voltage threshold value in p5041[2] and the wait time in p5042[0] has expired, then a transition is made into state 7 or 8 - otherwise state 4 is kept.

**Value:**

- 0: System being initialized
- 1: State being initialized
- 2: Released with message
- 3: Released without message
- 4: Clamping
- 5: Releasing
- 6: Releasing without tool
- 7: Clamped with tool (S4 inactive)
- 8: Clamped with tool (S4 active)
- 9: Clamping without tool
- 10: Clamped without tool
- 11: Clamped with message

**Dependency:** Refer to: r5002, r5003, p5040, p5041, p5042

**Note:** This display value is contained in the manufacturer-specific telegram 139 (SP\_ZSW).

## 2 Parameters

### 2.2 List of parameters

|   |   |                      |                          |

**Note:** This parameter can only be used in conjunction with a Sensor Module Integrated 24 (SMI24).

The action to adapt the selected files is selected in p5009.

For bit 01:

The action selected in p5009 only becomes immediately effective for this bit.

For bit 02 ... 22:

Only for internal Siemens use.

For these bits, after setting p5009 a hardware reset is required.

## 2 Parameters

### 2.2 List of parameters

---

|   |   |  |   |  |
|---|---|--|---|--|
| <b>r5022[0...15]</b>  | <b>Spindle serial number / Serial_no</b>  |  |   |  |
| SERVO (Spin_diag),<br>SERVO_AC<br>(Spin_diag)   | <b>Can be changed:</b> -<br><b>Data type:</b> Unsigned8<br><b>P-Group:</b> -<br><b>Not for motor type:</b> -<br><b>Min</b><br>-               | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>-         | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>-         |  |
| <b>Description:</b>   | Displays the spindle serial number.   |  |   |  |
| <b>Note:</b>  | An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.   |  |   |  |
| <hr/>   |   |  |   |  |
| <b>r5023</b>  | <b>Spindle production date / Prod_date</b>  |  |   |  |
| SERVO (Spin_diag),<br>SERVO_AC<br>(Spin_diag)   | <b>Can be changed:</b> -<br><b>Data type:</b> Unsigned32<br><b>P-Group:</b> -<br><b>Not for motor type:</b> -<br><b>Min</b><br>-              | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>-         | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>-         |  |
| <b>Description:</b>   | Displays the production date of the spindle.  |  |   |  |
| <b>Note:</b>  | Format: yyyymmdd  |  |   |  |
| <hr/>   |   |  |   |  |
| <b>r5032</b>  | <b>Maximum spindle speed / n_max</b>  |  |   |  |
| SERVO (Lin,<br>Spin_diag),<br>SERVO_AC (Lin,<br>Spin_diag),<br>SERVO_I_AC (Lin,<br>Spin_diag) | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> -<br><b>Not for motor type:</b> -<br><b>Min</b><br>- [m/min] | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- [m/min] | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- [m/min] |  |
| <b>Description:</b>   | Displays the maximum spindle speed.   |  |   |  |
| <b>Note:</b>  | The highest possible (maximum) speed is set using p1082 (p1082 <= r5032).   |  |   |  |
| <hr/>   |   |  |   |  |
| <b>r5032</b>  | <b>Maximum spindle speed / n_max</b>  |  |   |  |
| SERVO (Spin_diag),<br>SERVO_AC<br>(Spin_diag),<br>SERVO_I_AC<br>(Spin_diag)                   | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> -<br><b>Not for motor type:</b> -<br><b>Min</b><br>- [rpm]   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- [rpm]   | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- [rpm]   |  |
| <b>Description:</b>   | Displays the maximum spindle speed.   |  |   |  |
| <b>Note:</b>  | The highest possible (maximum) speed is set using p1082 (p1082 <= r5032).   |  |   |  |
| <hr/>   |   |  |   |  |
| <b>r5033</b>  | <b>Spindle angular commutation offset / Commut_ang_offs</b>   |  |   |  |
| SERVO (Spin_diag),<br>SERVO_AC<br>(Spin_diag)   | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> -<br><b>Not for motor type:</b> -<br><b>Min</b><br>- [°]     | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- [°]     | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- [°]     |  |
| <b>Description:</b>   | Displays the angular commutation offset for the spindle encoder.  |  |   |  |
| <b>Note:</b>  | When exiting commissioning, the value is transferred into p0431.  |  |   |  |

|   |  |                      |                          |
|---|--|----------------------|--------------------------|
| <b>r5034</b>                                  | <b>Spindle current controller sampling time maximum / I_ctrl t_samp max</b>  |                      |                          |

## 2 Parameters

### 2.2 List of parameters

---

#### **p5202** Output voltage setpoint filter 5 denominator natural frequency / U\_set\_filt5 fn\_den

|  |                                     |                                 |                                       |
|--|-------------------------------------|---------------------------------|---------------------------------------|
| A_INF (Suppl cl-loop ctrl), R_INF (Suppl cl-loop ctrl) | <b>Can be changed:</b> U, T         | <b>Calculated:</b> CALC_MOD_CON | <b>Access level:</b> 3                |
|  | <b>Data type:</b> FloatingPoint32   | <b>Dyn. index:</b> -            | <b>Func. diagram:</b> 8946            |
|  | <b>P-Group:</b> Closed-loop control | <b>Unit group:</b> -            | <b>Unit selection:</b> -              |
|  | <b>Not for motor type:</b> -        | <b>Scaling:</b> -               | <b>Expert list:</b> 1                 |
|  | <b>Min</b><br>0.5 [Hz]              | <b>Max</b><br>16000.0 [Hz]      | <b>Factory setting</b><br>1000.0 [Hz] |

**Description:** Sets the denominator natural frequency for the output voltage setpoint filter 5.

**Dependency:** This parameter is active for the following filter type:  
- "PT2 lowpass" (p5201 = 1).  
- "general 2nd order filter" (p5201 = 2).  
Filter 5 is activated via p5200.0, and parameterized via p5202 ... p5205.

---

#### **p5203[0...n]** Current setpoint filter 5 denominator damping / I\_set\_filt 5 D\_den

|   |                                     |                                 |                                 |
|---|-------------------------------------|---------------------------------|---------------------------------|
| SERVO (Ext I_setp_filt), SERVO_AC (Ext I_setp_filt), SERVO_I_AC (Ext I_setp_filt) | <b>Can be changed:</b> U, T         | <b>Calculated:</b> CALC_MOD_CON | <b>Access level:</b> 3          |
|   | <b>Data type:</b> FloatingPoint32   | <b>Dyn. index:</b> DDS, p0180   | <b>Func. diagram:</b> 5711      |
|   | <b>P-Group:</b> Closed-loop control | <b>Unit group:</b> -            | <b>Unit selection:</b> -        |
|   | <b>Not for motor type:</b> REL      | <b>Scaling:</b> -               | <b>Expert list:</b> 1           |
|   | <b>Min</b><br>0.001                 | <b>Max</b><br>10.000            | <b>Factory setting</b><br>0.700 |

**Description:** Sets the denominator damping for current setpoint filter 5 (PT2, general filter).

**Dependency:** Current setpoint filter 5 is activated via p5200.0 and parameterized via p5202 ... p5205.

---

#### **p5203** Output voltage setpoint filter 5 denominator damping / U\_set\_filt 5 D\_den

|  |                                     |                                 |                                 |
|--|-------------------------------------|---------------------------------|---------------------------------|
| A_INF (Suppl cl-loop ctrl), R_INF (Suppl cl-loop ctrl) | <b>Can be changed:</b> U, T         | <b>Calculated:</b> CALC_MOD_CON | <b>Access level:</b> 3          |
|  | <b>Data type:</b> FloatingPoint32   | <b>Dyn. index:</b> -            | <b>Func. diagram:</b> 8946      |
|  | <b>P-Group:</b> Closed-loop control | <b>Unit group:</b> -            | <b>Unit selection:</b> -        |
|  | <b>Not for motor type:</b> -        | <b>Scaling:</b> -               | <b>Expert list:</b> 1           |
|  | <b>Min</b><br>0.001                 | <b>Max</b><br>10.000            | <b>Factory setting</b><br>0.700 |

**Description:** Sets the denominator damping for the output voltage setpoint filter 5.

**Dependency:** This parameter is active for the following filter type:  
- "PT2 lowpass" (p5201 = 1).  
- "general 2nd order filter" (p5201 = 2).  
Filter 5 is activated via p5200.0, and parameterized via p5202 ... p5205.

---

#### **p5204[0...n]** Current setpoint filter 5 numerator natural frequency / I\_set\_filt5 fn\_num

|   |                                     |                               |                                       |
|---|-------------------------------------|-------------------------------|---------------------------------------|
| SERVO (Ext I_setp_filt), SERVO_AC (Ext I_setp_filt), SERVO_I_AC (Ext I_setp_filt) | <b>Can be changed:</b> U, T         | <b>Calculated:</b> -          | <b>Access level:</b> 3                |
|   | <b>Data type:</b> FloatingPoint32   | <b>Dyn. index:</b> DDS, p0180 | <b>Func. diagram:</b> 5711            |
|   | <b>P-Group:</b> Closed-loop control | <b>Unit group:</b> -          | <b>Unit selection:</b> -              |
|   | <b>Not for motor type:</b> REL      | <b>Scaling:</b> -             | <b>Expert list:</b> 1                 |
|   | <b>Min</b><br>0.5 [Hz]              | <b>Max</b><br>16000.0 [Hz]    | <b>Factory setting</b><br>1999.0 [Hz] |

**Description:** Sets the numerator natural frequency for current setpoint filter 5 (general filter).

**Dependency:** Current setpoint filter 5 is activated via p5200.0 and parameterized via p5202 ... p5205.

**p5204 Output voltage setpoint filter 5 numerator natural frequency / U\_set\_filt5 fn\_num**

|  |                                     |                            |                                       |
|--|-------------------------------------|----------------------------|---------------------------------------|
| A_INF (Suppl cl-loop ctrl), R_INF (Suppl cl-loop ctrl) | <b>Can be changed:</b> U, T         | <b>Calculated:</b> -       | <b>Access level:</b> 3                |
|  | <b>Data type:</b> FloatingPoint32   | <b>Dyn. index:</b> -       | <b>Func. diagram:</b> 8946            |
|  | <b>P-Group:</b> Closed-loop control | <b>Unit group:</b> -       | <b>Unit selection:</b> -              |
|  | <b>Not for motor type:</b> -        | <b>Scaling:</b> -          | <b>Expert list:</b> 1                 |
|  | <b>Min</b><br>0.5 [Hz]              | <b>Max</b><br>16000.0 [Hz] | <b>Factory setting</b><br>1000.0 [Hz] |

**Description:** Sets the numerator natural frequency for the output voltage setpoint filter 5.

**Dependency:** This parameter is active for the following filter type:  
- "general 2nd order filter" (p5201 = 2).  
Filter 5 is activated via p5200.0, and parameterized via p5202 ... p5205.

**p5205[0...n] Current setpoint filter 5 numerator damping / I\_set\_filt 5 D\_num**

|   |                                     |                               |                                 |
|---|-------------------------------------|-------------------------------|---------------------------------|
| SERVO (Ext I_setp_filt), SERVO_AC (Ext I_setp_filt), SERVO_I_AC (Ext I_setp_filt) | <b>Can be changed:</b> U, T         | <b>Calculated:</b> -          | <b>Access level:</b> 3          |
|   | <b>Data type:</b> FloatingPoint32   | <b>Dyn. index:</b> DDS, p0180 | <b>Func. diagram:</b> 5711      |
|   | <b>P-Group:</b> Closed-loop control | <b>Unit group:</b> -          | <b>Unit selection:</b> -        |
|   | <b>Not for motor type:</b> REL      | <b>Scaling:</b> -             | <b>Expert list:</b> 1           |
|   | <b>Min</b><br>0.000                 | <b>Max</b><br>10.000          | <b>Factory setting</b><br>0.700 |

**Description:** Sets the numerator damping for current setpoint filter 5 (general filter).

**Dependency:** Current setpoint filter 5 is activated via p5200.0 and parameterized via p5202 ... p5205.

**p5205 Output voltage setpoint filter 5 numerator damping / U\_set\_filt 5 D\_num**

|  |                                     |                      |                                 |
|--|-------------------------------------|----------------------|---------------------------------|
| A_INF (Suppl cl-loop ctrl), R_INF (Suppl cl-loop ctrl) | <b>Can be changed:</b> U, T         | <b>Calculated:</b> - | <b>Access level:</b> 3          |
|  | <b>Data type:</b> FloatingPoint32   | <b>Dyn. index:</b> - | <b>Func. diagram:</b> 8946      |
|  | <b>P-Group:</b> Closed-loop control | <b>Unit group:</b> - | <b>Unit selection:</b> -        |
|  | <b>Not for motor type:</b> -        | <b>Scaling:</b> -    | <b>Expert list:</b> 1           |
|  | <b>Min</b><br>0.000                 | <b>Max</b><br>10.000 | <b>Factory setting</b><br>0.010 |

**Description:** Sets the numerator damping for the output voltage setpoint filter 5.

**Dependency:** This parameter is active for the following filter type:  
- "general 2nd order filter" (p5201 = 2).  
Filter 5 is activated via p5200.0, and parameterized via p5202 ... p5205.

**p5206[0...n] Current setpoint filter 6 type / I\_set\_filt 6 type**

**Description:** Sets current setpoint filter 6 as lowpass filter (PT2) or general 2nd order filter.

**Value:**  
1: PT2 low pass  
2: General 2nd order filter

**Dependency:** Current setpoint filter 6 is activated via p5200.1 and parameterized via p5207 ... p5210.

**Note:** For a general 2nd order filter, by inserting the same natural frequency in both the numerator and in the denominator, i.e. bandstop frequency, a bandstop filter is implemented. If the numerator damping of zero is selected, the bandstop frequency is completely suppressed.

The denominator damping can be determined from the equation for the 3 dB bandwidth:

$$f_{3dB} \text{ bandwidth} = 2 * D_{denominator} * f_{bandstop} \text{ frequency}$$

## 2 Parameters

### 2.2 List of parameters

**Description:** Sets the denominator natural frequency for current actual value filter 7.

**Dependency:** This parameter is active for the following filter type:

- "PT2 lowpass" (p5201 = 1).
- "general 2nd order filter" (p5211 = 2).

Filter 7 is activated via p5200.2, and parameterized via p5212 ... p5215.

## 2 Parameters

### 2.2 List of parameters

**Note:** For a general 2nd order filter, by inserting the same natural frequency in both the numerator and in the denominator, i.e. bandstop frequency, a bandstop filter is implemented. If the numerator damping of zero is selected, the bandstop frequency is completely suppressed.

The denominator damping can be determined from the equation for the 3 dB bandwidth:

$$f_{3dB} \text{ bandwidth} = 2 * D_{\text{denominator}} * f_{\text{bandstop frequency}}$$

**Description:** Amplitude to compensate periodic position errors in fine pulses for the error with one sinusoidal period per mechanical revolution.

The value is determined with the motor data identification routine (p1960).

**Dependency:** Refer to: p5250, p5266

**Note:** Prerequisites:  
 - "Cogging torque compensation" function module activated (r0108.22 = 1).  
 - motor data identification carried out with transfer (p1959.0 = 1, p1960 = 1).  
 - compensation periodic position errors activated (p5250.2 = 1).  
 - encoder with absolute position information (unique zero mark, distance-coded zero marks, absolute encoder, 1-pole resolver)

## 2 Parameters

### 2.2 List of parameters

**Note:** Prerequisites:  
 - "Cogging torque compensation" function module activated (r0108.22 = 1).  
 - motor data identification carried out with transfer (p1959.0 = 1, p1960 = 1).  
 - compensation periodic position errors activated (p5250.2 = 1).  
 - encoder with absolute position information (unique zero mark, distance-coded zero marks, absolute encoder, 1-pole resolver)

|            | 03  | Setting the speed precontrol                              | Yes      | No       | 5045 |
|            | 04  | Setting the torque precontrol                             | Yes      | No       | 5045 |
|            | 05  | Setting the maximum acceleration for the basic positioner | Yes      | No       | 5045 |
|            | 06  | Do not change Kp  | Yes      | No       | -    |
|            | 07  | Setting the voltage precontrol                            | Yes      | No       | -    |

**Dependency:** Refer to: p5272, p5273, r5274, p5275

**Note:** For bit 00:  
 For significant differences between the motor mass and load mass, or for low dynamic performance of the controller, then the P controller becomes a PD controller in the position control loop. As a consequence, the dynamic performance of the position controller is increased.  
 This function should only be set when the velocity precontrol (bit 3 = 1) or the force precontrol (bit 4 = 1) is active.

For bit 01:  
 At low velocities, the controller gain factors are automatically reduced in order to avoid noise and oscillation at standstill.

For bit 02:  
 The estimated load mass is taken into account for the velocity controller gain (see p5273).

For bit 03:  
 Activates the velocity precontrol for the basic positioner (EPOS).

For bit 04:  
 Activates the force precontrol for the basic positioner (EPOS).

For bit 05:  
 The maximum acceleration (p2572) and maximum deceleration (p5273) for the basic positioner (EPOS) are determined using the estimated mass. This is only realized once by setting the bit.

Prerequisite:  
 The drive pulses are inhibited and the mass was previously determined.

For bit 06:  
 The velocity controller gain set in p1460 is not changed when calculating the controller data.

For bit 07:  
 Activation of the voltage precontrol.

**Description:** Display and connector output for the estimated dynamic response of the speed control loop as PT1 time constant for online tuning/One Button Tuning.

This position controller setting is required if the closed-loop position control is in an external control system.

**Dependency:** Refer to: p5271, p5272, p5273, p5275

| <b>p5275[0...n]</b>   | <b>Online / One Button Tuning dynamic response time constant / Ot dyn Tc</b>  |   |  |
|---|---|---|--|
| SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT) | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> -<br><b>Not for motor type:</b> REL<br><b>Min</b><br>0.0 [ms] | <b>Calculated:</b> -<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>60.0 [ms] | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>7.5 [ms] |

**Description:** Sets the time constant for the precontrol symmetrization for online tuning / One Button Tuning. As a consequence, the drive is allocated a defined, dynamic response via its precontrol. For axes, which must interpolate with one another, the same value must be entered.

Examples:

0 ms = travel without following error (Kv factor is infinity)

5 ms = settling behavior as for PT1 with 5 ms (Kv factor = 12 [1000/min])

**Dependency:** Refer to: p5271, p5272, p5273, r5274

## 2 Parameters

### 2.2 List of parameters

**Note:** This time constant is only effective if p5302.7 is set = 1.  
Otherwise, the precontrol symmetrization is adapted to the estimated dynamic response, therefore setting positioning without any overshoot.

| r5276[0...n]  | Online / One Button Tuning maximum Kv factor estimated / Ot Kv estimated   |                               |                          |

The adaptation is deactivated and the assigned filter deactivated.

If p5280 = 0:  
The adaptation is inactive. The actual setting of the filter parameters is kept in a volatile memory. To permanently save the values that have been determined, the parameters must be saved in a non-volatile memory (p0977 = 1).

If p5280 = 1:  
The adaptation is active. When a mechanical resonant frequency is excited, the filter frequency is adapted. Adaptation is temporarily inactive while the function generator generates a noise signal (p4820 = 4).

|            | 16  | Torque in front of the current setpoint filter             | Yes      | No       | -  |

**Dependency:** Refer to: r5293, r5294, r5295, p5296, p5297

**Note:** HF: high frequency

LF: low frequency

For bit 00:

A PRBS signal (pseudo random binary signal) is superimposed on the current setpoint to be able to better identify the mechanical controlled system.

For bit 01:

The identified mechanical resonance points are suppressed using current setpoint filters.

For bit 02:

The maximum velocity controller gain is determined from the identified mechanical controlled system.

For bits 03, 04:

The measured value buffer length is set using these bits:

Bit 04 = 0 and bit 03 = 0 -> buffer length = 256

Bit 04 = 0 and bit 03 = 1 -> buffer length = 512

Bit 04 = 1 and bit 03 = 0 -> buffer length = 1024

Bit 04 = 1 and bit 03 = 1 -> buffer length = 2048

For bit 05:

A Hamming window is used to filter the measured time signals.

For bit 06:

The measurement checks the current controller frequency characteristic. For high amplitudes in p5298, it is possible that the check is unsuccessful, as the converter reaches its voltage limit.

For bits 07, 08:

An aliasing filter is used for the measured values.

Bit 08 = 0 and bit 07 = 0 -> filter frequency = 50 Hz

Bit 08 = 0 and bit 07 = 1 -> filter frequency = 100 Hz

Bit 08 = 1 and bit 07 = 0 -> filter frequency = 200 Hz

Bit 08 = 1 and bit 07 = 1 -> filter frequency = 400 Hz

For bit 09:

Evaluation can be switched over from correlation to differential filter.

For bits 10, 11:

Number of measuring periods.

Bit 11 = 0 and bit 10 = 0 -> number of measurements = 1

Bit 11 = 0 and bit 10 = 1 -> number of measurements = 2

Bit 11 = 1 and bit 10 = 0 -> number of measurements = 4

Bit 11 = 1 and bit 10 = 1 -> number of measurements = 8

For bit 12:

The PRBS signal is switched to the velocity setpoint (in front of the filter).

For bit 13:

The input signal for the force actual value is taken from in front of the current setpoints filters.

|            | 16  | Torque in front of the current setpoint filter             | Yes      | No       | -  |

**Dependency:** Refer to: r5293, r5294, r5295, p5296, p5297

**Note:** HF: high frequency  
LF: low frequency  
For bit 00:  
A PRBS signal (pseudo random binary signal) is superimposed on the current setpoint to be able to better identify the mechanical controlled system.  
For bit 01:  
The identified mechanical resonance points are suppressed using current setpoint filters.  
For bit 02:  
The maximum speed controller gain is determined from the identified mechanical controlled system.  
For bits 03, 04:  
The measured value buffer length is set using these bits:  
Bit 04 = 0 and bit 03 = 0 -> buffer length = 256  
Bit 04 = 0 and bit 03 = 1 -> buffer length = 512  
Bit 04 = 1 and bit 03 = 0 -> buffer length = 1024  
Bit 04 = 1 and bit 03 = 1 -> buffer length = 2048  
For bit 05:  
A Hamming window is used to filter the measured time signals.  
For bit 06:  
The measurement checks the current controller frequency response and this is taken into account in the speed controller loop. For high amplitudes in p5298, it is possible that the measurement is unsuccessful, as the converter reaches its voltage limit.

For bits 07, 08, 09:

The measurement bandwidth is set using these bits:

Bit 09 = 0, bit 08 = 0, bit 07 = 0 -> bandwidth = 50 Hz

Bit 09 = 0, bit 08 = 0, bit 07 = 1 -> bandwidth = 100 Hz

Bit 09 = 0, bit 08 = 1, bit 07 = 0 -> bandwidth = 200 Hz

Bit 09 = 0, bit 08 = 1, bit 07 = 1 -> bandwidth = 400 Hz

Bit 09 = 1, bit 08 = 0, bit 07 = 0 -> bandwidth = 800 Hz

Bit 09 = 1, bit 08 = 0, bit 07 = 1 -> bandwidth = 1600 Hz

For bits 10, 11:

Number of measuring periods.

Bit 11 = 0 and bit 10 = 0 -> number of measurements = 1

Bit 11 = 0 and bit 10 = 1 -> number of measurements = 2

Bit 11 = 1 and bit 10 = 0 -> number of measurements = 4

Bit 11 = 1 and bit 10 = 1 -> number of measurements = 8

For bit 12:

The PRBS signal is switched to the speed setpoint (in front of the filter).

For bit 13:

The input signal for the torque actual value is taken from in front of the current setpoints filters.

For bit 14:

When the bit is set, a current setpoint filter is used to partially compensate the mechanical system.

This is recommended for the following machine attributes:

- the load moment of inertia is significantly higher than the motor moment of inertia (e.g. > 6x).
- the coupling between the machine elements has almost no backlash (no play).
- the stiffness of the mechanical transmission elements does not change significantly in the traversing range.

| <b>Value:</b>  | <p>-1: Reset controller parameters<br/>0: Inactive<br/>1: One Button Tuning<br/>2: Online tuning</p>   |                               |                          |
| <b>Dependency:</b>   | <p>The prerequisite for the "auto tuning" function is that the "Moment of inertia estimator" function module is activated (r0108.10).</p> <p>The "Autotuning" function can only be selected for "Servo" control mode with position encoder.</p> <p>The motor must have already been commissioned so that autotuning functions error-free. A motor identification may be necessary beforehand (p1900 and following).</p> <p>One Button Tuning:<br/>p5301 configures the "One Button Tuning" function.<br/>p5292 if the required dynamic response of the control loops is set.<br/>p5308 is used to parameterize the traversing distance for the test signal.<br/>Other relevant parameters: p5309, p5296, p5297, p5275, r5274, r5393, r5394, r5395</p> <p>Online tuning:<br/>p5302 configures the "Online tuning" function.<br/>p5272 if the required dynamic response of the control loops is set.<br/>Other relevant parameters: p5271, p5275, r5274</p> <p>Refer to: p5271, p5272, p5273, r5274, p5275, p5292, r5293, r5294, r5295, p5296, p5297, p5301, p5302, p5308, p5309</p> |                               |                          |
| <b>Warning:</b>  | <p> Only the motor measuring system is taken into account when optimizing the position controller. If an external measuring system is used for the position control, then this can result in an unstable controller setting.</p> <p>The "One Button Tuning" function does not support different sampling times for current and velocity controllers. For p0112 =2, in some instances different stability criteria are obtained. It is recommended that "One Button Tuning" is not used for this configuration.</p>  |                               |                          |
| <b>Caution:</b>  | <p> For some drive trains, the "online tuning" function can result in unstable settings (motor makes a whistling sound). This is especially the case for large load masses that are connected to the motor through a low-frequency coupling/connection. In this case, parameter p5272 or p5273 must be reduced.</p>   |                               |                          |
| <b>Notice:</b>   | <p>When executing One Button Tuning, the motor can be accelerated with its rated torque if the torque limit (p1520, p1521) does not limit this to lower values. If the mechanical system is sensitive, then it is recommended that the torque limits are appropriately reduced before executing One Button Tuning.</p>   |                               |                          |
| <b>Note:</b>   | <p>If p5300 = -1:<br/>Autotuning is deactivated, and p5300 is automatically set to 0. In addition, the default setting values for the velocity and position controller are restored.</p> <p>If p5300 = 0:<br/>Online tuning is inactive.</p> <p>To permanently back up the values determined for the velocity controller and position controller, the parameters must be saved in a non-volatile fashion (p0977 = 1 or "Copy RAM to ROM").</p> <p>The results of the moment of inertia estimator can be reset using p5300 = 0. After p5300 &gt; 0, the parameters for moment of inertia and tuning must be determined again.</p>   |                               |                          |

## 2 Parameters

### 2.2 List of parameters

If p5300 = 1:

One Button Tuning is active.

The mass is determined once using a test signal. The controller parameters and current setpoint filters are additionally determined once using a noise signal as excitation source.

If p5300 = 2:

Online tuning is active.

The mass is estimated. The controller parameters are recalculated if the mass noticeably changes.

|      |  |   |   |
| <b>Caution:</b>   | For some drive trains, the "online tuning" function can result in unstable settings (motor makes a whistling sound). This is especially the case for high load moments of inertia, which are coupled to the motor through a low-frequency connection/coupling. In this case, the values in parameter p5272 or p5273 must be reduced.   |   |   |
|      |  |   |   |
| <b>Notice:</b>  | When executing One Button Tuning, the motor can be accelerated with its rated torque if the torque limit (p1520, p1521) does not limit this to lower values. If the mechanical system is sensitive, then it is recommended that the torque limits are appropriately reduced before executing One Button Tuning.  |   |   |

**Note:** If p5300 = -1:  
Autotuning is deactivated, and p5300 is automatically set to 0. In addition, the default setting values for the speed and position controller are restored.

If p5300 = 0:  
Online tuning is inactive.

To permanently save the values determined for the speed and position controllers, the parameters must be saved in a non-volatile manner (p0977 = 1 or "copy RAM to ROM").

If p5300 = 1:  
One Button Tuning is active.

The moment of inertia is determined once using a test signal. The controller parameters and current setpoint filters are additionally determined once using a noise signal as excitation source. The steps to be executed can be configured using p5301.

If p5300 = 2:  
Online tuning is active.

The moment of inertia is estimated. The controller parameters are recalculated if the moment of inertia noticeably changes. The steps to be executed can be configured using p5302.

|            | 08  | Moment of inertia determination from frequency response | Yes      | No       | -  |

**Dependency:** It is only possible to change the configuration if autotuning is not active (p5300 = 0).  
Refer to: p5292, r5293, r5294, r5295, p5296, p5297, p5300, p5308, p5309

**Note:** For bit 00:  
The velocity controller gain is determined and set using a noise signal.

For bit 01:  
Possibly required current setpoint filters are determined and set using a noise signal.  
As a consequence, a higher dynamic performance can be achieved in the velocity control loop.

For bit 02:  
Using this bit, the mass is determined using a test signal. If this bit is not set, then the load mass must be manually set using parameter p1498. The test signal must have been previously set using parameters p5308 and p5309.

For bit 07:  
With this function, these axes are adapted to the dynamic response set in p5275. This is necessary for interpolating axes. The time in p5275 should be set according to the axis with the lowest dynamic response.

## 2 Parameters

### 2.2 List of parameters

- Dependency:** It is only possible to change the configuration if autotuning is not active (p5300 = 0).  
Refer to: p5271, p5272, p5273, r5274, p5275, p5300
- Caution:** Please note the general conditions for the moment of inertia estimator, online tuning as well as adaptive resonance filter in the following reference:  
 SINAMICS S120 Function Manual Drive Functions
- Note:** For bit 02:  
When the bit is set, the moment of inertia is determined while traversing (moment of inertia estimator). If this bit is not set, then the load moment of inertia must be manually set using parameter p1498.
- For bit 03:  
If p5302.3 = 0, "Once" applies:  
After having successfully determined the moment of inertia (p1498), the moment of inertia estimator is deactivated.  
If p5302.3 = 1, "Cyclic" applies:  
The moment of inertia is continually determined and the control parameters adapted. After the moment of inertia has been successfully determined (r1407.26 = 1), we recommend that the parameters are saved in a non-volatile fashion. As a consequence, the controllers do not have to restabilize after the next switch on.
- For bit 06:  
The adaptation of a current setpoint filter can be set here (see p5280 - p5285).  
This adaptation may be necessary if a mechanical resonance frequency changes in operation. It can also be used to dampen a fixed resonance frequency. Once the control loop has stabilized, this bit should be deactivated and the determined parameters saved in a non-volatile fashion.
- For bit 07:  
When the function is activated, these axes are adapted to the dynamic response set in p5275. This is necessary for interpolating axes. The time in p5275 should be set according to the axis with the lowest dynamic response.

|   | <b>Min</b><br>0                | <b>Max</b><br>1      | <b>Factory setting</b><br>0 |

**Description:** A noise signal is injected into the drive to determine the moment of inertia.  
Activation of the moment of inertia determination  
For p5320 = 1:  
The moment of inertia determination is started.

**Value:** 0: Inactive  
1: Start moment of inertia measurement

**Dependency:** The prerequisite for the "Moment of inertia determination" function is that the "Moment of inertia estimator" function module is activated (r0108.10).  
The "Moment of inertia determination" function can only be selected for the "Servo" control mode with motor encoder.  
The motor must have already been commissioned so that "moment of inertia determination" functions error-free. A motor identification may be necessary beforehand (p1900 and following).

## 2 Parameters

### 2.2 List of parameters

**Note:** Temperature model 1 (I2t):  
 The following applies for firmware version < 4.7 SP6 or p0612.8 = 0:  
 - parameter p5350 is not active. Internally, a fixed boost factor of 1.333 is used as basis for the calculation.  
 The following applies from firmware version 4.7 SP6 and p0612.8 = 1:  
 - parameter p5350 becomes active as described above.

| p5350[0...n]  | Mot_temp_mod 1/3 boost factor at standstill / Standst boost_fact |                               |                            |

|   | 1.0000   | 2.0000                        | 2.0000                     |

**Description:** Sets the boost factor for the copper losses at standstill for motor temperature models 1 and 3.

The entered factor is active for velocity  $n = 0$  [m/min].

This factor is linearly reduced down to 1 between velocities  $n = 0 \dots 1$  [m/min].

The following values are required to calculate the boost factor:

- stall current (I\_0, p0318, catalog value)
- thermal stall current (I\_th0, catalog value)

The boost factor is calculated as follows:

$$- p5350 = (I_0 / I_{th0})^2$$

**Dependency:** Refer to: p0318, p0351, p0612, p5390, p5391

Refer to: F07011, A07012, F07013, A07014

**Notice:** When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

**Note:** Temperature model 1 (I2t):  
 The following applies for firmware version < 4.7 SP6 or p0612.8 = 0:  
 - parameter p5350 is not active. Internally, a fixed boost factor of 1.333 is used as basis for the calculation.  
 The following applies from firmware version 4.7 SP6 and p0612.8 = 1:  
 - parameter p5350 becomes active as described above.

**Description:** Display and connector output for the remaining time until a fault is output due to motor overtemperature.

With the motor load remaining the same, the values specify the time remaining until a fault is output.

For index [0]:

The value indicates the active remaining time until a fault is output.

This value is the minimum from indices [1] to [4]; whereby, value -1 is not taken into account.

For index [1]:

The value indicates the calculated time that remains until a fault is output for the model.

For index [2]:

The value indicates the time that remains until a fault is output after an alarm has occurred for the model (p0605, p5387).

For index [3]:

The value indicates the calculated time that remains until a fault is output for the measurement.

For index [4]:

The value indicates the time that remains until a fault is output after an alarm has occurred for the measurement (p0606).

**Index:** [0] = Active time  
 [1] = Thermal time according to the model-based calculation  
 [2] = Timer time after alarm from the model  
 [3] = Timer time after calculation for measurement  
 [4] = Timer time after alarm from the measurement

**Note:** Value = 120 s means that there is no thermal restriction.  
 Value = -1 s means that a prediction is not possible.

## 2 Parameters

### 2.2 List of parameters

**Note:** For bit 00, 04:  
The motor temperature is measured using a temperature sensor (p0600, p0601). When the bit is set, a high temperature is identified, and a corresponding signal is additionally output.  
For bit 01, 05:  
The motor temperature is monitored based on a temperature model (p0612). When the bit is set, a high temperature is identified, and a corresponding signal is additionally output.  
For bit 02:  
The encoder temperature is measured using a temperature sensor. When the bit is set, a high temperature is identified, and a corresponding signal is additionally output.  
For bit 08:  
When reaching the motor temperature alarm threshold, reduction of the maximum current is set as response (p0610 = 1). When the bit is set, reduction of the maximum current is active.

| <b>Dependency:</b>                               | For p5401[0], the following applies:<br>The Smart Mode must be deactivated (p3400.0 = 0) to set a signal source.<br>Refer to: r5402   |   |  |                 |

**Notice:** Line droop control can only be activated if the power units have a gating unit with current limitation control (r0192.19 = 1 or r0192.30 = 1).

We urgently recommend at least one measure to dampen power oscillations (p5413, p5476) if, in an island grid, several generating sources are simultaneously active – and power is exchanged via the frequency droop (p5405).

**Note:** For index [0]:

So that closed-loop DC link voltage control is activated by the VECTOR drive object's technology controller (due to closed-loop DC link voltage control for the infeed being deactivated) the following BICO interconnection must be set:

BI: p3513 (VECTOR) = r5402.0 (A\_INF)

For index [1]:

When the setpoints are deactivated, the smoothed actual values of these variables are used for the no-load values of frequency and voltage. As a consequence, the average power is controlled so that it approaches zero. However, when the line frequency or line voltage changes, brief peak powers can occur according to the current limits that have been set (r5479).

As the power is controlled to zero, in island grids continuous operation is only possible with p5401[1] = 0 if the grid is supplied by other generating units. Otherwise, line frequency and line voltage decreases to the shutdown limits.

However, brief exceptions with the appropriate low frequency and amplitude deviations are possible and make sense (e.g. for switchover transitions in hot standby applications).

### r5402.0...6 CO/BO: Line droop control status word / Ldrp ZSW

|                   | 05         | Wobulation modulation type active         | Yes             | No              | -         |
|                   | 06         | Line droop f-U setpoints active           | Yes             | No              | -         |

**Note:** For bit 00, 01:

The line droop control is activated via binector input p5401[0].

The grid and DC link parameter identification must be deselected (p3410 = 0) in order to do this.

For bit 02:

The operating mode of the current hysteresis controller is specified via binector input p5451.

For bit 04:

The status word of the sequence control is displayed in r5452.

For bit 05:

The pulse frequency wobulation is activated via p1810.2 = 1, and the wobulation amplitude p1811 is enabled via p5456[0...2].4 = 0.

For bit 06:

The no-load setpoints for frequency and voltage are activated using binector input p5401[1].

## 2 Parameters

### 2.2 List of parameters

**Note:** When the load changes, mechanical energy generation units induce a delayed change in frequency on account of their inertia. The converter tries to emulate this response with the assistance of the smoothing time.  
For the line to remain stable, all the energy generation units in a separate network have to respond in a similar manner during operation.

| <b>Description:</b>                              | Sets the gradient for the additional, fast frequency droop.<br>The reference quantity is the gradient for the regular frequency droop (p5407).<br>The settings for the regular frequency droop (p5405 onwards) apply to the other droop parameters.<br>As a result of the short smoothing time, the supplementary frequency droop acts similar to a D component – and therefore as damping factor for the closed-loop line control. |  |  |

**Recommendation:** Typical setting values lie between 50 % and 100 %.

**Dependency:** Refer to: p5414, p5476

**Note:** For example, a strong frequency dip can be generated when the load is connected with the additional frequency droop, and this can be used to emulate the behavior of a diesel generator.  
The frequency is initially changed with the smoothing time p5414 in accordance with the additional droop, reaching the stationary end value in accordance with the time constant p5409 for the regular frequency droop.  
The additional droop is deactivated with p5413 = 0.

---

**Description:** Sets the no-load voltage for the voltage droop and grid droop control.  
This value is entered as a % referred to the device supply voltage (p0210)  
Using the voltage droop, the currently required output voltage can be calculated for stable grid operation.  
The no-load voltage is defined as the setpoint output voltage for the case that the reactive current or the reactive power at the selected connection point (p5403, p5404) assumes a value of 0.

**Dependency:** Refer to: p5419

**Note:** For the reactive current voltage droop (p5400.0 = 0), the following applies:

The droop characteristic input variable is the reactive power r5421[0] at the selected connection point (p5403, p5404).

The following droop formula applies without taking into account smoothing:

$$r5420 = (p5415 + p5416 + p5417 * r5421[0] / r0207) * p0210$$

The voltage calculated according to this formula, after smoothing (p5419) is effective as output voltage and is indicated in r5420.

For the reactive power voltage droop (p5400.0 = 1), the following applies:

The input variable of the droop characteristic is the reactive power (r5422[0]) at the selected connection point (p5403, p5404).

The following droop formula applies without taking into account smoothing:

$$p5420 = (p5415 + p5416 - p5417 * r5422[0] / (1.732 * r0207 * p0210)) * p0210$$

The voltage calculated according to this formula, after smoothing (p5419) is effective as output voltage and is indicated in r5420.

## 2 Parameters

### 2.2 List of parameters

**Note:** For index [1]:  
The value is smoothed using a PT1 filter (smoothing time: p0045).

#### p5423

#### Line droop control supplementary inductance / Ldrp L\_suppl

A\_INF (Line droop ctrl), R\_INF (Line droop ctrl)

**Can be changed:** U, T

**Data type:** FloatingPoint32

**P-Group:** -

**Not for motor type:** -

**Min**

-10.000 [mH]

**Calculated:** -

**Dyn. index:** -

**Unit group:** -

**Scaling:** -

**Max**

10.000 [mH]

**Access level:** 4

**Func. diagram:** 7983

**Unit selection:** -

**Expert list:** 1

**Factory setting**

0.000 [mH]

**Description:**

Sets an imaginary supplementary inductance for the infeed.

The supplementary inductance supplements the effect of the voltage droop, in particular for transient operations.

**Dependency:**

Refer to: p5424

**Warning:**

Unsuitable supplementary inductance and smoothing time settings will make line droop control unstable.

**Note:**

The supplementary inductance is deactivated with p5423 = 0.

The converter's output voltage is calculated so that the converter behaves like a supplementary inductance and as such achieves an effect similar to a line reactor with higher/lower inductance.

The supplementary inductance can be used for damping in the event of resonance phenomena on the line.

This parameter can only be set to 0.

#### p5424

#### Line droop control supplementary inductance smoothing time / Ldrp L\_suppl t\_sm

A\_INF (Line droop ctrl), R\_INF (Line droop ctrl)

**Can be changed:** U, T

**Data type:** FloatingPoint32

**P-Group:** Closed-loop control

**Not for motor type:** -

**Min**

0.00 [ms]

**Calculated:** -

**Dyn. index:** -

**Unit group:** -

**Scaling:** -

**Max**

100.00 [ms]

**Access level:** 4

**Func. diagram:** 7983

**Unit selection:** -

**Expert list:** 1

**Factory setting**

0.00 [ms]

**Description:**

Sets the smoothing time for the effect of the supplementary inductance (p5423).

**Dependency:**

Refer to: p5423

**Note:**

The supplementary inductance causes current change to be fed back to the converter's output voltage.

This parameter can only be set to 0.

#### p5425[0...1]

#### CI: Line droop control voltage control signal source / Ldrp U\_ctrl s\_s

A\_INF (Line droop ctrl), R\_INF (Line droop ctrl)

**Can be changed:** T

**Data type:** Unsigned32 / FloatingPoint32

**P-Group:** Closed-loop control

**Not for motor type:** -

**Min**

-

**Calculated:** -

**Dyn. index:** -

**Unit group:** -

**Scaling:** p2001

**Max**

-

**Access level:** 3

**Func. diagram:** 7982

**Unit selection:** -

**Expert list:** 1

**Factory setting**

[0] 3468[0]

[1] 3468[1]

**Description:**

Sets the signal source for the voltage to be regulated at the connection point in alpha/beta coordinates.

**Recommendation:**

Set the same signal source for connector input p5404[0, 1] and p5425[0, 1].

**Index:**

[0] = Alpha

[1] = Beta

**Dependency:**

Refer to: p5404, p5427

**Note:**

The following BICO interconnections are recommended:

- Compensation of the internal voltage drop for connection point at line filter: BI: p5425 = r3468

- Compensation of the internal voltage drop for connection point at line transformer: BI: p5425 = r5488 or r5498

## 2 Parameters

### 2.2 List of parameters

**Note:** Rapid adaptation of the voltage setpoint to a reduced line voltage (e.g. in the event of a line short circuit) reduces the number of additional switching operations completed by the lower-level rapid current hysteresis controller.

For index [0]:  
Minimum value for the adaptation factor, must be complied with for the calculation of the reduced output voltage. The factory setting is appropriate if the inductance of the commutating reactor (p0223) has the value p3421 - p3424.  
Higher values for p5428[0] result in higher rms values of the currents in the case of a short circuit. However, current limiting also intervenes more – and more harmonics are generated.  
For excessively low values in p5428[0], the short-circuit displayed in r5479[1] is no longer reached.  
The function is deactivated with p5428[0] = 100 %.

For index [1]:  
When the current limit is reached, the adaptation factor is weighted with this factor in each sampling cycle. A value of 0 means that the adaptation factor will jump to the minimum value (p5428[0]) if the current limit is reached. The function is deactivated for a value of 100%.

For index [2]:  
If the voltage across the line reactor exceeds the minimum value (p5428[0]) for at least 2 current controller sampling times, the adaptation factor will be weighted with this factor (p5428[2]) in every sampling cycle.

For index [3]:  
If none of the above criteria for reducing the adaptation factor is met, the adaptation factor is increased by the percentage value p5428[3] in each current controller sampling time (the increase is additive). If the adaptation factor reaches the maximum value of 100%, the effect of precontrol by means of multiplication by the droop setpoint r5420 is cancelled out.

|  | <b>Data type:</b> FloatingPoint32 | <b>Dyn. index:</b> - | <b>Func. diagram:</b> -  |
|  | <b>P-Group:</b> Displays, signals | <b>Unit group:</b> - | <b>Unit selection:</b> - |
|  | <b>Not for motor type:</b> -      | <b>Scaling:</b> -    | <b>Expert list:</b> 1    |
|  | <b>Min</b>                        | <b>Max</b>           | <b>Factory setting</b>   |
|  | 15.0 [%]                          | 50.0 [%]             | 20.0 [%]                 |

**Description:** Sets the permissible current hysteresis in the event of an overload and short circuit for the modulator to intervene and apply limiting.

The effective current limits are calculated from the parameterized overcurrent (p5453) and the hysteresis width (p5454).

**Index:**  
[0] = No-load operation (p5451 = 1 signal)  
[1] = Normal operation (p5451 = 1 signal)  
[2] = Short-circuit operation (p5451 = 1 signal)  
[3] = No-load operation (p5451 = 0 signal)  
[4] = Normal operation (p5451 = 0 signal)  
[5] = Short-circuit operation (p5451 = 0 signal)

**Dependency:** The hysteresis width (p5454) cannot be set greater than or equal to the overcurrent limit (p5453).

Refer to: p5453, p5478

**Notice:** The setting values are automatically set. This manual setting is only possible for the case that p5478[0, 1] = 50 %, and it is critical that expert knowledge is available.

**Note:** The value is referred to the internal reference current.

---

### p5455[0...5] Current hysteresis controller overcurrent tolerance range / I\_hyst\_ctrl I\_tol

|  |                                   |                      |                          |
|--|-----------------------------------|----------------------|--------------------------|
| A_INF (Line droop ctrl), R_INF (Line droop ctrl) | <b>Can be changed:</b> U, T       | <b>Calculated:</b> - | <b>Access level:</b> 4   |
|  | <b>Data type:</b> FloatingPoint32 | <b>Dyn. index:</b> - | <b>Func. diagram:</b> -  |
|  | <b>P-Group:</b> Displays, signals | <b>Unit group:</b> - | <b>Unit selection:</b> - |
|  | <b>Not for motor type:</b> -      | <b>Scaling:</b> -    | <b>Expert list:</b> 1    |
|  | <b>Min</b>                        | <b>Max</b>           | <b>Factory setting</b>   |
|  | 10.0 [%]                          | 100.0 [%]            | 20.0 [%]                 |

**Description:** Sets the permissible tolerance range in the event of an overload and short circuit for the modulator to intervene and apply limiting.

The effective current limit is calculated from the overcurrent limit (p5453) plus the overcurrent tolerance range (p5455).

**Index:**  
[0] = No-load operation (p5451 = 1 signal)  
[1] = Normal operation (p5451 = 1 signal)  
[2] = Short-circuit operation (p5451 = 1 signal)  
[3] = No-load operation (p5451 = 0 signal)  
[4] = Normal operation (p5451 = 0 signal)  
[5] = Short-circuit operation (p5451 = 0 signal)

**Dependency:** Refer to: p5453, p5478

**Notice:** The setting values are automatically set. This manual setting is only possible for the case that p5478[0, 1] = 50 %, and it is critical that expert knowledge is available.

**Note:** The value is referred to the internal reference current.

## 2 Parameters

### 2.2 List of parameters

**Note:**  
For bit 04 = 0:  
The pulse frequency wobulation amplitude (p1811) is enabled. Only applies if p1810.2 = 1.  
For bit 04 = 1:  
The pulse frequency wobulation amplitude (p1811) is disabled. Only applies if p1810.2 = 1.  
For bit 10:  
The setting according to p1810.10 applies.

| <b>p5457[0...2] Current hysteresis controller pulse frequency changeover / I_hyst_ctrl f_puls</b> |   |  |   |
|---|---|--|---|
| A_INF (Line droop ctrl), R_INF (Line droop ctrl)  | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Closed-loop control<br><b>Not for motor type:</b> -<br><b>Min</b><br>50.0 [%] | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>200.0 [%] | <b>Access level:</b> 4<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>100.0 [%] |

**Description:** Sets the pulse frequency for the operating states of the current hysteresis controller.

**Index:**  
[0] = No load  
[1] = Normal operation  
[2] = Short-circuit operation

**Note:**  
The value refers to p1800.  
Only factors of the pulse frequency in p1800 are permitted.

|  | 0.00 [%]                            | 100000.00 [%]            | 0.00 [%]                 |

**Description:** Sets a voltage divider for the Voltage Sensing Module 2/3 (VSM2/3).

**Note:** When the 690 V input is used (X522) without voltage scaler, 0 % should be entered.  
When the 100 V input (X521) is used with voltage scaler to measure medium voltages, the dividing (scaling) factor multiplied by 100% should be entered.  
Example:  
1000 V line supply voltage, voltage scaling, 10:1  
--> voltage at the VSM input is 100 V  
--> p5460 = 10 \* 100 % = 1000 %

| A_INF (Line droop ctrl), R_INF (Line droop ctrl) | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> -<br><b>Not for motor type:</b> -<br><b>Min</b><br>0.0 [%]  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>1000.0 [%] | <b>Access level:</b> 4<br><b>Func. diagram:</b> 7982<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0.0 [%]                    |
| <b>Description:</b>                              | Sets the gain for the DT1 element of the frequency droop.<br>In addition or alternatively to fast droop (p5413, p5414), with this D component power oscillations in the island line can be dampened.<br>The reference quantity is the gain of the regular frequency droop (p5407).                    |   |   |
| <b>Recommendation:</b>                           | Typical setting values lie between 50 % and 100 %.  |   |   |
| <b>Dependency:</b>                               | Refer to: p5477   |   |   |
| <b>Note:</b>                                     | With p5476 = 100 %, a frequency change from the power-frequency droop, unscaled for the integration of the line angle becomes effective.<br>With p5476 = 0, damping of the line control via the DT1 element is deactivated.   |   |   |
| <b>p5477</b>                                     | <b>Line droop control damping smoothing time / Line droop damp T</b>  |   |   |
| A_INF (Line droop ctrl), R_INF (Line droop ctrl) | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> -<br><b>Not for motor type:</b> -<br><b>Min</b><br>5.0 [%]  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>2000.0 [%] | <b>Access level:</b> 4<br><b>Func. diagram:</b> 7982<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>200.0 [%]                  |
| <b>Description:</b>                              | Sets the smoothing time for the DT1 element of the frequency droop.<br>The reference quantity is the smoothing time for the regular frequency droop (p5409).  |   |   |
| <b>Recommendation:</b>                           | Typical setting values lie between 100 % and 200 %.   |   |   |
| <b>Dependency:</b>                               | Refer to: p5476   |   |   |
| <b>Note:</b>                                     | With a lower smoothing time, the corner frequency of the high pass filter formed by the DT1 element increases. To dampen resonance in the line, the corner frequency must lie below the resonant frequency, and the setting value for the smoothing time must be selected to be correspondingly high. |   |   |
| <b>p5478[0...1]</b>                              | <b>Line droop control current limits / Line droop I_lim</b>   |   |   |
| A_INF (Line droop ctrl)                          | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Displays, signals<br><b>Not for motor type:</b> -<br><b>Min</b><br>50.0 [%]   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>123.0 [%]  | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>[0] 90.0 [%]<br>[1] 123.0 [%] |
| <b>Description:</b>                              | Setting for the permissible maximum current in the event of an overload and short circuit with active line droop control (p5401[0] = 1 signal).   |   |   |
| <b>Index:</b>                                    | [0] = Normal operation<br>[1] = Short-circuit operation   |   |   |
| <b>Notice:</b>                                   | For devices with r0192.19 = 0 (e.g. Active Line Module Booksize), the maximum short-circuit current limit can be set to p5478[1] = 100 %.   |   |   |

## 2 Parameters

### 2.2 List of parameters

**Note:** The value is referred to r5479[5].  
 The current limits p5453, p5454 and p5455 for the gating unit are automatically set.  
 In the case of p5478[0] = 50 % and p5478[1] = 50 %, the current limits can be set manually (p5453, p5454, p5455).  
 The current limits resulting from the setting values are displayed in r5479[0, 1].  
 For index [0]:  
 Current limit for normal operation and for line short circuit in combined operation with a generator. Maximum value is 100 %.  
 For index [1]:  
 Current limit for short circuit with a main generator in isolated operation in the line.

| <b>p5478[0...1]</b>     | <b>Line droop control current limits / Line droop I_lim</b> |                      |                              |
|-------------------------|---|----------------------|------------------------------|
| R_INF (Line droop ctrl) | <b>Can be changed:</b> U, T                                 | <b>Calculated:</b> - | <b>Access level:</b> 3       |
|                         | <b>Data type:</b> FloatingPoint32                           | <b>Dyn. index:</b> - | <b>Func. diagram:</b> -      |
|                         | <b>P-Group:</b> Displays, signals                           | <b>Unit group:</b> - | <b>Unit selection:</b> -     |
|                         | <b>Not for motor type:</b> -                                | <b>Scaling:</b> -    | <b>Expert list:</b> 1        |
|                         | <b>Min</b>  | <b>Max</b>           | <b>Factory setting</b>       |
|                         | 50.0 [%]  | 123.0 [%]            | [0] 67.0 [%]<br>[1] 67.0 [%] |

**Description:** Setting for the permissible maximum current in the event of an overload and short circuit with active line droop control (p5401[0] = 1 signal).

**Index:** [0] = Normal operation  
[1] = Short-circuit operation

**Notice:** For devices with r0192.19 = 0 (e.g. Active Line Module Booksize), the maximum short-circuit current limit can be set to p5478[1] = 100 %.

The value range is restricted as follows without license option S02:

51 % <= p5478[0, 1] <= 67 %

**Note:** The value is referred to r5479[5].  
 The current limits p5453, p5454 and p5455 for the gating unit are automatically set.  
 In the case of p5478[0] = 50 % and p5478[1] = 50 %, the current limits can be set manually (p5453, p5454, p5455).  
 The current limits resulting from the setting values are displayed in r5479[0, 1].  
 For index [0]:  
 Current limit for normal operation and for line short circuit in combined operation with a generator. Maximum value is 100 %.  
 For index [1]:  
 Current limit for short circuit with a main generator in isolated operation in the line.

|  | - [Arms]  | - [Arms]             | - [Arms]                 |

**Description:** Displays the permissible converter line current with active line droop control (p5401[0] = 1 signal).

**Index:** [0] = Overload current limiting  
 [1] = Short-circuit current limiting  
 [2] = Continuous current permissible at an ambient 40 °C  
 [3] = Continuous current permissible at an ambient 45 °C  
 [4] = Continuous current permissible at an ambient 50 °C  
 [5] = Reference current

**Note:** For index [0]:  
Permissible overload current and permissible current during a line short circuit in combined operation (p5451). The converter current is limited to this current value.

For index [1]:  
Permissible current during a line short circuit in isolated operation (p5451). The converter current is limited to this current value.

For index [2, 3, 4]:  
Continuously permissible line current at  $\cos \phi = 1$  for I2t monitoring. The I2t numerator (r0036) is incremented above this current value with active line droop control (r5402.1 = 1).  
The current limit is dependent on the ambient temperature.  
Derating should be observed for  $\cos \phi < 1$  in order to avoid overtemperatures.

For index [5]:  
Reference value for setting the current limits with p5478[0, 1].  
The value lies above the maximum current (r0209) of the power unit.

**p5480****Transformer magnetization mode / Tr mag mode**

|   | 0                            | 102                  | 0                          |

**Description:** Sets the mode for the transformer magnetization.

Using this function, a transformer is magnetized using a voltage that is in synchronism with the external line supply; this means that no inrush currents flow when this transformer is connected to the line supply.

If value = 11:  
Automatic determination of the magnetizing inductance.  
The magnetizing inductance determined in r5491 must be transferred to p5492 in order to take effect.  
Observe notes regarding r5491.

If value = 12:  
Automatic determination of the transformer phase shift and the gain correction.  
The transformer phase shift determined in r6440 must be transferred to p6420 in order to take effect.  
The gain correction determined in r6441 must be transferred to p6421 in order to take effect.

If value = 13:  
Determination of the total leakage inductance of the transformer during line data identification. p3410 = 1 is set automatically and the inductance is measured on the next switch-on. Once the measurement has been completed the converter shuts down automatically and p3410 is set = 0 and p5480 is set = 1.  
The total leakage inductance of the transformer determined in r5489 must be transferred to p5490 in order to take effect.

If value = 101:  
The infeed goes into line droop control, however the main switch/circuit breaker is not closed, and the transformer magnetization remains in the state r5482 = 4.  
Test operation requires the "Line droop control" function module to be activated (r0108.12 = 1).

If value = 102:  
As for test operation 1.  
However, synchronization with the line is not realized (VSM2 measured data r5460 and following is not used); instead, the output voltage is generated corresponding to the rated data p0210, p0211, p5486.

**Value:**

- 0: Deactivated
- 1: Normal operation
- 11: Identification transformer magnetizing inductance
- 12: Identification transformer phase shift/gain correction
- 13: Identification total transformer leakage inductance
- 101: Test operation 1 (without activation of circuit breaker)
- 102: Test oper. 2 (w/o activation of circuit breaker, without VSM2)

**Dependency:** Refer to: r5482, p5486, r5493, p5494, r5499, p5580

## 2 Parameters

### 2.2 List of parameters

**Notice:** The feedback signal contact of the circuit breaker between the Active Interface Module and the island grid must be connected in parallel via binector input p0860.

For an active black start (p5580 > 0), a separate transformer magnetization is not performed.

**Note:** The transformer magnetizing function is used in order to magnetize a line transformer to which the Active Line Module (ALM) is connected.

The precondition is that the transformer can be isolated from the line supply on the primary side using a circuit breaker and that the DC link of the ALM is supplied from a separate power source before the circuit breaker is closed (e.g. with a separate precharging transformer or for photovoltaic applications).

The circuit breaker between the Active Interface Module and the island grid is controlled via binector output r0863.1

The status of the transformer magnetization, black start and island grid synchronization is displayed in r5499.

The status of the sequence control for transformer magnetization, black start and island grid synchronization is displayed in r5482.

If value = 13:

For weak line supplies, it is recommended to reduce the excitation current p3415 for identifying the inductance (e.g. p3415[0] = p3415[1] = 5 %).

**Description:** Sets the time values for the transformer magnetization.

**Index:**  
[0] = Voltage ramp ramp-up time  
[1] = Circuit breaker bounce time  
[2] = Line synchronization timeout

**Note:** For index [0]:

Sets the ramp duration for the transformer voltage.

For index [1]:

Sets the bounce time for the circuit breaker at the line side of the line transformer.

An interruption-free connection between the line supply and the transformer is only guaranteed after the bounce time has expired.

The feedback signal contact of the circuit breaker between the Active Interface Module and the island grid must be connected in parallel via binector input p0860.

The wait state until the debounce time has expired is canceled if the following conditions are fulfilled:

- feedback signal p0860 = 1.
- current rise or DC link voltage change identified.

For index [2]:

Sets the permissible maximum time.

If the maximum time elapses without the line being synchronized, alarm A06502 is output.

The minimum duration of line synchronization is 25 % of this maximum time, however, as a minimum 40 ms.

The voltages converted over to the transformer secondary side are displayed in r5488[0, 1, 2]. |                      |   |

For index [1]:

Setting the rated primary voltage of the line transformer; an island grid with ALM in the grid droop mode (p5401) is connected to the secondary of this transformer. Typically, the transformer primary is connected to the grid or to another island grid through a circuit breaker.

The setting of this primary voltage and setting the device supply voltage (p0210) defines the island grid transformer ratio.

To synchronize the island grid voltage with the external grid, the external grid voltage must be measured. To do this, an additional VSM must be connected and parameterized using p0150[1] and following. The voltage actual values of this VSM are displayed in r5461[1] and r5462[1]. The voltages converted over to the ALM connection point can be displayed in r5488[3, 4, 5]. To do this, the following BICO interconnections are acquired: p5487[2] = r5461[1], p5487[3] = r5462[1].

## 2 Parameters

### 2.2 List of parameters

**Note:** For index [0, 1, 2]:  
The signals from p5487[0, 1] are transformed for the transformer calculation.  
To do this, the ratio (p5486[0] / p0210), the phase angle of the transformer (p6420[0]) as well as a correction factor for the voltage ratio (p6421[0]) are taken into account.  
For index [3, 4, 5]:  
The signals from p5487[2, 3] are transformed for the transformer calculation.  
To do this, the ratio (p5486[1] / p0210), the phase angle of the transformer (p6420[1]) as well as a correction factor for the voltage ratio (p6421[1]) are taken into account.

## 2 Parameters

### 2.2 List of parameters

**Dependency:** Refer to: F06505

**Note:** For index [0]:  
If the precharging circuit of an application only creates a low DC link voltage, which is not sufficient to fully magnetize the transformer (modulation depth r0074 limited), then the target value for the magnetization can be reduced (p5494[0]).  
When closing the line contactor, the residual magnetization required only causes a relatively low recharging current surge that is generally within permissible limits.

For index [1]:  
If, during transformer magnetization, the current limit is exceeded ( $r0068 > p5494[1] * r0207$ ), then fault F06505 is output.

---

**p5495 Transformer operating mode configuration / Tr op config**

|   | -                                   | -                    | 0000 bin                 |

**Description:** Sets the operating mode for the grid PLL in conjunction with the grid transformer function module ( $r0108.4 = 1$ ).

| <b>Bit field:</b> | <b>Bit</b> | <b>Signal name</b>                | <b>1 signal</b> | <b>0 signal</b> | <b>FP</b> |
|-------------------|------------|-----------------------------------|-----------------|-----------------|-----------|
|                   | 00         | Line PLL with transformer voltage | Yes             | No              | -         |

**Note:** VSM: Voltage Sensing Module

For bit 00:

When the bit is set, voltages ( $r5488[0, 1]$ ) from the transformer model are used as input variable for the grid PLL ( $r3452$  and following), which otherwise operates with the measured values of VSM1 ( $r3661, r3662$ ).

This means, for example if the transformer properties are not known, a higher accuracy of the PLL can be achieved, and in turn the controller stability improved.

For booksize drive units, the following applies:

Before and during PLL synchronization ( $r3402 \leq 7$ ),  $p5495.0$  is only effective if operation with VSM is activated ( $p3400.5 = 1$ ).

---

**r5497[0...1] CO: Transformer secondary current / Tr I\_second**

|   |                                     |                       |                          |

**Dependency:** Refer to: p5507, r5510, p5520

**Note:** For bit 00:

If p5500.0 = 0 the output value of the grid support characteristic is added to the control's reactive current setpoint.  
 $r0075 = p3610 + p3611 + r3471 + r5510[0]$

For p5500.0 = 1, the dynamic reactive current setpoint p3611 is subtracted if dynamic grid support is active (r5502.1 = 1).

In this case, the following applies:

$r0075 = p3610 + r3471 + r5510[0]$

For bit 01:

Only active for  $p5500.3 = 0$ .

If  $p5500.1 = 0$  the alpha and beta amplitudes of the line voltage, which were smoothed with  $p5507[2]$ , are determined. The absolute value of the line voltage, calculated from these amplitudes, is used as input value for the characteristic for grid support. In the event of an asymmetrical line disturbance, oscillation of the reactive current setpoint ( $r5510$ ) is prevented.

If  $p5500.1 = 1$ , the smoothed absolute value of the measured line voltage is used as the input value for the grid support characteristic. Smoothing is set with  $p5507[3]$ .

For bit 02:

Only effective if  $p5500.1 = 0$  and  $p5500.3 = 0$ .

If  $p5500.2 = 0$ , the maximum value from the alpha and beta line voltage amplitudes is used as the input value for the grid support characteristic. The reactive current setpoint ( $r5510$ ) will, therefore, remain virtually constant even in the event of asymmetrical line disturbance. Power fluctuations in the DC link are reduced.

If  $p5500.2 = 1$ , the average value from the alpha and beta line voltage amplitudes is used as the input value for the grid support characteristic.

For bit 03:

For  $p5500.3 = 0$ , no negative phase-sequence system current setpoint according to the characteristic is calculated. This means that the setpoints for the negative phase-sequence system current controller are also equal to 0 if the line supply is not symmetrical.

For  $p5500.3 = 1$ , for an asymmetrical line supply voltage, a negative phase-sequence system current setpoint is calculated, which counteracts the voltage asymmetry and therefore supports the grid.

The negative phase-sequence system current is impressed using the negative phase-sequence system controller ( $p3636$  and following).

The negative phase-sequence system controller is automatically activated and deactivated (the following applies,  $p3640.0 = p5500.3$ ).

For bit 04:

Only active for  $p5500.3 = 1$ .

For  $p5500.4 = 0$ , a negative phase-sequence system current setpoint according to characteristic  $p5505/p5506$  is generated if the difference between two line phase voltage amplitudes is greater than  $p5509[9]$  - and the amplitude of at least one line phase voltage exceeds the line tolerance range according to the characteristic.

For  $p5500.4 = 1$ , an already supporting negative phase-sequence system current is impressed according to the characteristic, if only the difference between two line phase voltage amplitudes is greater than  $p5509[9]$ .

For bit 05:

For  $p5500.5 = 1$ , the limiting of the support reactive current is not active according to the characteristic  $p5505/p5506$ . Instead, the current limits  $p5506[1]$  and  $p5506[3]$  are effective after adding the supplementary reactive current setpoints  $p3610$  and  $p3611$ .

For bit 06:

For  $p5500.6 = 1$ , the apparent current is limited to the smoothed apparent current ( $r0027$ ) effective at the start of an FRT. During this line fault, this value of the apparent current limit is continually effective.

For bit 07:

Only effective for  $p5526.7 = 1$  and  $p192.19 = 1$

For  $p5500.7 = 1$ , for each phase, a tolerance band is generated around the current setpoint, which the current actual value does not leave.

For  $p5500.7 = 0$ , a tolerance band is generated based on the current setpoint amplitude. The current actual value for each phase can be within this tolerance band.

For bit 08:

Only active for  $p5500.3 = 1$ .

For  $p5500.8 = 1$ , during a line short-circuit ( $r5502.4 = 1$ ) the active line infeed current is reduced to zero.

For  $p5500.8 = 0$ , during a line short circuit ( $r5502.4 = 1$ ) the active line infeed current is increased within the effective current limits in order to achieve the highest possible active power. To support the line supply, the reactive current has priority over the active current.

For bit 09:

Only active for  $p5500.3 = 1$ .

For  $p5500.9 = 1$ , during a line short-circuit ( $r5502.4 = 1$ ) the active line infeed current and the supporting reactive current are reduced to zero.

For  $p5500.9 = 0$ , the standard response of dynamic line support applies corresponding to  $p5500.8 = 0$ .

For bit 10:

Only active for p5500.3 = 1.

For p5500.10 = 1, during an asymmetrical line short circuit (r5502.2 = 1) the active line infeed current is increased within the effective current limits in order to achieve the highest possible active power. To support the line supply, the reactive current has priority over the active current.

For p5500.10 = 0, during an asymmetrical line short-circuit (r5502.2 = 1) the active line infeed current is reduced to zero.

**p5501****BI: Dynamic grid support activation / Dyn grid act**

A\_INF (Dyn. grid support), R\_INF (Dyn. grid support)

**Can be changed:** U, T

**Calculated:** -

**Access level:** 3

**Data type:** Unsigned32 / Binary

**Description:**

Sets the signal source to activate dynamic grid support.

BI: p5501 = 1 signal:

Activates dynamic grid support.

BI: p5501 = 0 signal:

Deactivates dynamic grid support.

**Recommendation:**

The smoothing time for the line PLL (p3458[1]) should be set to values higher than 20 ms so as to ensure stable operation even with significant dips in supply voltage.

**Dependency:**

For p5501[0], the following applies:

The Smart Mode must be deactivated (p3400.0 = 0) to set a signal source.

**Notice:**

Dynamic grid support can only be activated if the power units have a gating unit with current limitation control (r0192.19 = 1 or r0192.30 = 1).

**Note:**

If grid support has been activated:

Line disturbance will trigger grid support in accordance with the set characteristic (p5505, p5506).

If grid support is deactivated:

Line disturbance will generate the standard response to phase failures on the part of the infeed for drive applications (see A06205).

**r5502.0...4****CO/BO: Dynamic grid support status word / Dyn grid ZSW**

### p5506[0...3] Dynamic grid support characteristic reactive current setpoint / Dyn grid char I

|  |  |  |   |
|--|--|--|---|
| A_INF (Dyn. grid support), R_INF (Dyn. grid support) | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Displays, signals<br><b>Not for motor type:</b> -<br><b>Min</b><br>0.0 [%] | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>500.0 [%] | <b>Access level:</b> 3<br><b>Func. diagram:</b> 7996, 7997<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>[0] 20.0 [%]<br>[1] 100.0 [%]<br>[2] 20.0 [%]<br>[3] 100.0 [%] |
|--|--|--|---|

**Description:** Sets the reactive current setpoints for the characteristic for dynamic grid support.  
For more information, see p5505.

**Index:** [0] = Characteristic positive starting point  
[1] = Characteristic positive finishing point  
[2] = Characteristic negative starting point  
[3] = Characteristic negative finishing point

**Dependency:** Refer to: p5505, p5509

**Notice:** If the grid is not symmetrical (r5502.2 = 1), then the reactive current setpoint is multiplied by factor p5509[12].

**Note:** The values are referred to r0207.

---

### p5507[0...4] Dynamic grid support times / Dyn grid times

|  |  |  |   |
|--|--|--|---|
| A_INF (Dyn. grid support), R_INF (Dyn. grid support) | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Closed-loop control<br><b>Not for motor type:</b> -<br><b>Min</b><br>0.00 [ms] | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>10000.00 [ms] | <b>Access level:</b> 3<br><b>Func. diagram:</b> 7996, 7998, 7999<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>[0] 500.00 [ms]<br>[1] 2.00 [ms]<br>[2] 20.00 [ms]<br>[3] 4.00 [ms]<br>[4] 8.00 [ms] |
|--|--|--|---|

**Description:** Sets the time values for dynamic grid support.

**Recommendation:** For index [0]:  
For the run-on time p5507[0], the current limits parameterized for the dynamic grid support remain valid (e.g. p5509[11]). If a grid standard specifies that the active power is re-established faster, then we recommend that the run-on time is reduced (e.g. p5507[0] = 20 ms).

**Index:** [0] = Minimum time dynamic grid support  
[1] = Minimum time line disturbance  
[2] = Smoothing time alpha/beta  
[3] = Smoothing time instantaneous value  
[4] = Minimum time non-symmetrical grid fault

## 2 Parameters

### 2.2 List of parameters

**Dependency:** Refer to: p5500, p5509, p5529

**Note:** For index [0]:  
Minimum time for continuing grid support in accordance with the characteristic once the line voltage has returned to the permissible tolerance range between the two starting points (p5505[0], p5505[2]).  
For index [1]:  
Minimum time for line disturbance for the start of grid support in accordance with the characteristic.  
If the tolerance band between the two characteristic starting points is violated for at least this period of time, voltage control in accordance with characteristic will start up.  
For index [2]:  
Smoothing time for the calculation of the alpha amplitude and the beta amplitude of the line voltage if p5500.1 = 0.  
An estimated value for the actual line voltage absolute value is calculated from the alpha and beta amplitudes and serves as the input value for the grid support characteristic.  
A smoothing time of less than a line period makes no sense.  
If the estimated absolute value deviates from the smoothed measured voltage absolute value by more than 25%, the smoothed measured value is used. This corresponds to a temporary automatic changeover from p5500.1 = 0 to p5500.1 = 1.  
For index [3]:  
Smoothing time for the measured absolute value of the line voltage if p5500.1 = 1.  
The smoothed absolute value of the line voltage is used as the input value for the grid support characteristic.  
Setting p5507[3] = 0 deactivates smoothing.  
For index [4]:  
Minimum time for a non-symmetrical line disturbance for the start of grid support in accordance with the characteristic p5506 and scaling factor p5509[12].  
If the tolerance band between the two characteristic starting points is violated for at least this period of time, voltage control in accordance with characteristic will start up.

-200 [V]

0 [V]

[0] -50 [V]

[1] 0 [V]

#### Description:

Sets the thresholds for the DC link voltage (Vdc) to reduce the reactive current setpoint from dynamic grid support. A value of 0 deactivates the particular intervention.

For index [0]:

The value represents an offset to the maximum DC link voltage.

For the intervention threshold, the following applies:  $r0297 + p5508[0]$

For index [1]:

The value represents an offset to the setpoint of the DC link voltage.

The following applies to the intervention threshold:  $p3510 + p3511 + p5508[1]$

#### Index:

[0] = Offset overvoltage

[1] = Offset setpoint voltage

#### Dependency:

Refer to: r0297

#### Note:

To avoid imminent shutdown due to a DC link overvoltage, the reactive current setpoint is reduced for dynamic grid support. Instead of this, the available converter current is used as the active current to reduce the DC link voltage.

| <b>Dependency:</b>   | Refer to: p5505, p5506, p5508  |  |  |
| <b>Notice:</b>   | For index [5]:<br>For devices with r0192.19 = 0 (e.g., Active Line Module Booksize), the maximum apparent current limit can be set to p5509[5] = 80 %.   |  |  |

**Note:**

For index [0]:

Change in the reactive current setpoint (% per ms) at the beginning and end of dynamic grid support.

This avoids sudden changes in the reactive current if the starting points for the line voltage (p5505[0], p5505[2]) are overshoot.

For index [1]:

Change in the reactive current setpoint (% per ms) when the maximum Vdc threshold (p5508) is overshoot.

To avoid beat phenomena, the following must apply: p5509[1] > p5509[2].

The reactive current ramp is deactivated with p5509[1] = 0.1 %. The reactive current required for dynamic support is also kept, even when the Vdc threshold is reached.

For index [2]:

Change in the reactive current setpoint (% per ms) when the maximum Vdc threshold (p5508) is undershoot.

To avoid beat phenomena, the following must apply: p5509[1] > p5509[2].

For index [3]:

Sets the hysteresis for the line voltage to exit grid support (as a percentage of the supply voltage p0210).

To exit grid support, the line voltage must be in the interval reduced by the hysteresis width (the interval is defined with the starting points p5505[0] and p5505[2] and the hysteresis width p5509[3]).

For index [4]:

Sets the scaling factor for the reference voltage for dynamic grid support (as a percentage of the supply voltage p0210).

As a result, the product of p0210 x p5509[4] is applied as the voltage zero.

For index [5]:

Sets the scaling factor for the maximum permissible absolute apparent current value when grid support is active (p5501 = 1 signal).

The value is referred to the maximum current r0209.

Values higher than 100% will not be applied.

Values greater than 80% can only be set if the duration that can be set is less than or equal to 3 seconds for the short-circuit state p5528.

For Active Line Module Booksize, the setting value is limited to 80 %.

For index [6]:

Only active for p5500.3 = 1.

Sets the percentage voltage change (as a percentage of p0210) from which value the calculated positive phase-sequence system and negative phase-sequence system amplitudes are quickly adapted. As a consequence, the grid is quickly supported when step-type faults occur.

For index [7]:

Only active for p5500.3 = 1.

Sets the maximum positive phase-sequence system reactive current absolute value to support the grid in the case of line asymmetry (r5502.2 = 1) as a percentage of r0207.

If a symmetrical support reactive current (positive phase-sequence system current), is also specified for non-symmetrical grid faults, then generally, p5509[7] should be set to = 100 %.

For index [8]:

Only active for p5500.3 = 1.

Sets the maximum negative phase-sequence system absolute current to support the grid in the case of line asymmetry (r5502.2 = 1) as a percentage of r0207.

For the case p5509[7] = 100 %, we recommend setting p5509[8] > 20 %.

For index [9]:

Only active for p5500.3 = 1.

Sets the minimum value of the voltage asymmetry to impress a negative phase-sequence system current for asymmetrical grid support.

For p5500.4 = 1, a negative phase-sequence system current is already impressed, if the voltage asymmetry exceeds the set value.

For p5500.4 = 0, in addition, for at least one of the phase voltages, the tolerance condition from the characteristic p5505 / p5506 must be exceeded.

For index [10]:

Only active for p5500.3 = 1.

Sets the maximum value of the voltage asymmetry to end asymmetrical grid support.

This means that parameters p5509[9] and p5509[10] define a hysteresis range.

For index [11]:

Only active for p5500.3 = 1.

Sets the scaling factor for the permissible negative active current value for grid voltage out of tolerance (r5502.1 = 1).

The value is referred to the permissible apparent current p5509[5] \* r0209.

For index [12]:

Only active for p5500.3 = 1.

Sets the scaling factor for dynamic grid support for 2-phase grid dips. The gradient of the support characteristic p5505/p5506 is scaled using this factor if asymmetry (r5502.2=1) is present. The setting of p5509[0] is applicable for the transition ramp

For index [13]:

Only active for p5500.3 = 1.

If the grid voltage dips by this voltage with respect to the value of p0210, then the voltage precontrol is quickly adapted based on the calculated positive phase-sequence system and negative phase-sequence system amplitudes.

For index [14]:

Sets the scaling factor for the maximum permissible reactive current absolute value when grid support is active (p5501 = 1 signal).

The value is referred to the rated current r0207.

Values greater than 150% cannot be set.

Values greater than 105% can only be set if the following applies - r0193.16 = 1 and p5509[8] <= 100%.

For Active Line Module Booksize devices, the setting value is limited to 105 %.

#### Description:

Display and connector output for the reactive current setpoint.

The value is calculated according to the characteristic for dynamic grid support (p5505, p5506).

#### Index:

[0] = Reactive current setpoint not limited

[1] = Reactive current setpoint Vdc threshold

[2] = Reactive current setpoint ramp

[3] = Reactive current setpoint characteristic

[4] = Negative phase-sequence system active current setpoint unlimited

[5] = Neg phase-sequence system active current setpoint characteristic

[6] = Neg phase-sequence system reactive current setpoint unlimited

[7] = Negative phase-sequence reactive current setpoint characteristic

[8] = Dynamic limiting current setpoint

#### Dependency:

Refer to: p5505, p5506

#### Notice:

For index [0]:

During the ramp-up for the reactive current (r3402 = 8) the signal is not valid.

#### Note:

For index [0]:

Output of characteristic following addition of reactive current setpoints prior to current limitation. The reactive current setpoint applied for current control including dynamic grid support is displayed in r0075.

For index [1]:

Output of characteristic following correction on the basis of the Vdc threshold (p5508).

For index [2]:

Output of characteristic after ramp function.

For index [3]:

Output of characteristic for dynamic grid support.

For index [4]:

Setpoint for the active current in the negative phase-sequence system before current limiting.

For index [5]:

Output of the characteristic for the active current in the negative phase-sequence system.

## 2 Parameters

### 2.2 List of parameters

For index [6]:  
Setpoint for the reactive current in the negative phase-sequence system before current limiting.

For index [7]:  
Output of the characteristic for the reactive current in the negative phase-sequence system.

For index [8]:  
Displays the dynamic current setpoint limiting.

**Description:** Display and connector output for the reactive power at the defined line connection point via p5503 and p5504.

**Index:** [0] = Unsmoothed  
[1] = Smoothed

**Note:** For index [1]:  
The value is smoothed using a PT1 filter (smoothing time: p0045).

## 2 Parameters

### 2.2 List of parameters

**Note:** The value refers to r0209.  
 If the current absolute value of a line phase exceeds the tolerance threshold (p5523 + p5525), then the pulses in all of the line phases are inhibited for one cycle.  
 If the current actual value increases in spite of this second current limiting stage, then the system fault trips (F30001).

**Dependency:**

Refer to: p5541  
Refer to: F06851

**Notice:**

For bit 00:

Fault F06851 is additionally displayed if, as a result of a line voltage fault, the current control was inhibited (alarm A06205, r03405.2 = 1) - and the inhibit is continuously active while the wait time is elapsing (p5545[0]). To make reference to the temporarily output alarm A06205, fault F06200 is subsequently output.

**Note:**

AISL: Anti Islanding

FRT: Fault Ride Through (riding through a grid fault)

HFRT: High Frequency Ride Through (riding through frequency increases)

HVRT: High Voltage Ride Through (riding through voltage increases)

LFRT: Low Frequency Ride Through (riding through frequency dips)

LVRT: Low Voltage Ride Through (riding through voltage dips)

For bit 00:

The monitoring thresholds of the voltage and frequency criterion are defined using p5543 and p5544. If these thresholds are violated, then this is flagged in status word r5542 bits 6 to 9. If the violation remains during wait time p5545[0], then fault F06851 is output.

For bit 01:

The frequency shift technique actively changes the frequency that is fed in. For islanding formation this results in the permissible frequency bandwidth being violated. Shut down is realized via fault F06851.

For bit 04:

It is only possible to activate the FRT voltage-time characteristic (HVRT, LVRT) when the voltage and frequency monitoring are activated (p5540.0 = 1). The monitoring thresholds p5543 are deactivated. The voltage-time monitoring to be set using p5550 to p5554 applies (display in r5542 bits 10 and 11).

For bit 05:

Sets the response after a voltage dip (LVRT).

0 = immediate shutdown.

1 = shutdown only after the time in p5545[2] has expired.

For bit 07:

It is only possible to activate the FRT frequency-time characteristic (HFRT, LFRT) when the voltage and frequency monitoring are activated (p5540.0 = 1). The monitoring thresholds p5544 are deactivated. The frequency-time monitoring to be set using p5555 to p5559 applies (display in r5542 bits 12 and 13).

For bit 09:

The additional voltage and frequency check is activated when switching on. To do this, before operation is enabled, a check is made against the limits p5543[2, 3] and p5544[2, 3], and the system waits until these limits are maintained (r3402 = 7 or r3402 = 12 when transformer magnetization is active (p5480 > 0)).

If the voltage and frequency limits are violated, then this is indicated in status word r5542 bits 6 to 9.

For bit 10 (only effective for p5540.4 = 1 or p5540.7 = 1):

0 = when the overvoltage or undervoltage limit is violated (p5550[0, 1]), both curves (overvoltage and undervoltage curve) always start at the same time. Correspondingly applies for the frequency-time characteristics.

1 = activation of separate initiation of FRT voltage-time characteristics for an overvoltage or undervoltage event. Correspondingly applies for the frequency-time characteristics.

**Note:**

AISL: Anti Islanding  
 FRT: Fault Ride Through (riding through a line fault)  
 For bits 06, 07:  
 These bits are set if the voltage limits are violated (p5543).  
 When these limits are no longer violated, then these bits are reset after the wait time in p5545[3] has expired.  
 For bits 08, 09:  
 These bits are set if the frequency limits are violated (p5544).  
 When these limits are no longer violated, then these bits are reset after the wait time in p5545[4] has expired.  
 For bits 10, 11:  
 These bits are set if the voltage characteristic thresholds (p5550) are violated.  
 If, taking into account hysteresis, the limits are no longer violated, then these bits are reset.  
 For bits 12, 13:  
 These bits are set if the frequency characteristic thresholds (p5555) are violated.  
 If, taking into account hysteresis, the limits are no longer violated, then these bits are reset.

|  | -20.0 [Hz]                        | 20.0 [Hz]            | [0] 0.5 [Hz]<br>[1] -0.7 [Hz]<br>[2] 0.2 [Hz] |

**Description:** Sets the frequency activation threshold for a line fault for the FRT line monitoring. The setting is realized as a difference to the rated frequency p0211.

**Index:** [0] = HFRT frequency  
[1] = LFRT frequency  
[2] = Hysteresis frequency

**Dependency:** This parameter is only effective for p5540.7 = 1.

**Note:** FRT: Fault Ride Through (riding through a line fault)  
HFRT: High Frequency Ride Through  
LFRT: Low Frequency Ride Through  
For index [0, 1]:  
The effective frequency thresholds, which when violated indicate a line fault, are obtained as follows:  
Threshold HFRT = p0211 + p5555[0]  
Threshold LFRT = p0211 - p5555[1]  
When these thresholds are violated, status bit r5542.12 is set = 1 or r5542.13 is set = 1.  
If, taking into account hysteresis, the limits are no longer violated, then these bits are reset.  
For index [2]:  
Only positive values are permitted when setting the hysteresis.

**Description:** Display and connector output for the status word of PLL2. The value 0 signals is valid values for frequency and voltage within the parameterized tolerance limits.

| <b>Bit field:</b> | <b>Bit</b> | <b>Signal name</b>                  | <b>1 signal</b> | <b>0 signal</b> | <b>FP</b> |
|-------------------|------------|-------------------------------------|-----------------|-----------------|-----------|
|                   | 00         | PLL deactivated                     | Yes             | No              | -         |
|                   | 01         | PLL not stabilized                  | Yes             | No              | -         |
|                   | 02         | PLL line frequency out of tolerance | Yes             | No              | -         |
|                   | 03         | PLL line voltage out of tolerance   | Yes             | No              | -         |

**Dependency:** Refer to: p0281, p0282, p0284, p0285, r6311, r6313, r6314, r6316

**Note:** For bit 00:  
It is recommended that the PLL2 should be deactivated if invalid voltage values are present (e.g. when the power supply is shutdown).  
After activation initially a PLL synchronization is carried out. An excessively low voltage prevents synchronization from starting and this is displayed using r5572.3...0 = 1011.

For bit 01:  
After PLL synchronization starts (r5572.0 = 0) and the settling time has expired, the actual values are valid for phase angle, frequency and amplitude (r5572.1 = 0).  
In operation, r5572.1 is set = 1 if the absolute value of the PLL angular error - smoothed over 50 ms - exceeds a value of 7.5°. The PLL actual values are then no longer valid.

For bit 02:  
The tolerance limits are set using p0284 and p0285.

For bit 03:  
The tolerance limits are set using p0281 and p0282.

**Description:** Sets the signal source for the voltage to be measured in alpha/beta coordinates.

**Index:**  
[0] = Alpha  
[1] = Beta

**Note:** PLL2 is deactivated with input signal 0.  
The following interconnection is practical for synchronizing an island grid to another grid (typically: public grid):  
- the voltage of the island grid is measured using a VSM (r5461[0] and r5462[0]), which is connected in front of the circuit breaker between the island grid and the ALM.  
- the voltage of the external grid is measured using another VSM (r5461[1] and r5462[1]), which is connected in front of the circuit breaker between the external grid and the island grid. The voltages (r5488[3, 4]) transformed to the ALM supply voltage are used as input variables for the PLL2.

|   | 0  | 3                    | 0                          |

**Description:** Sets the mode for the black start.  
An island grid, which at the start has no voltage, can be established using this function. In this case, the ALM acts as the grid voltage source or as grid generator for the connected island grid.  
Prerequisite:  
Activating function module "Line droop control" (r0108.12 = 1) and line droop operation (p5401).  
If value = 0:  
The black start is deactivated.  
If value = 2:  
At the next switch on, a black start is carried out. Here, the precondition is that the line voltage is close to zero (less than p5586[0]). Using the grid droop control, the grid voltage is increased up to the rated value using a ramp function.  
If value = 3:  
At the next switch on, a black start is carried out if the grid voltage is less than p5586[0]. If on the other hand, a grid is connected within the regular tolerances (p0281, p0282), then a regular switching-on operation is carried out with synchronization to the existing grid voltage.  
If, in so doing, transformer magnetization is activated (p5480 = 1), then this is performed.

## 2 Parameters

|----------------|---|
| <b>Value:</b>  | 0: Deactivated<br>2: Grid black start<br>3: Grid black start automatic  |
| <b>Notice:</b> | A black start is only possible when the grid droop control (p5401) is activated.<br>A black start is only possible when the transformer test operation mode is deactivated (p5480 <= 1).<br>The use of feedback signal contacts from the circuit breaker between the Active Interface Module and the island grid is urgently recommended (p0860).   |
| <b>Note:</b>   | Precondition for establishing a voltage in an island grid is that adequate power is supplied into the ALM DC link (e.g. generator, photovoltaic) as well as control of the DC link voltage using this power generation system. The power requirement of the Island grid must not exceed the power of the generating system - even briefly.<br>In order to avoid the high inrush currents, when the grid is being established, the voltage is ramped up to the rated value. At the end of the voltage ramp, the system changes over into regular grid droop operation. The ALM then operates as grid-generating voltage source using active and reactive power droop, also with other sources of power in the island grid, in a stable fashion. The other power units can then act as a current source to support the grid or as a voltage source to form a grid. As grid forming unit, then the other power units must also have a grid droop function.<br>The circuit breaker between the Active Interface Module and the island grid is controlled via binector output r0863.1 Before closing this switch, it is checked as to whether the island grid is in a non-voltage condition. A possibly existing residual voltage in the Active Interface Module is automatically controlled down to zero. |

For index [4]:

Sets the smoothing time constant for an additional PT1 filtering of the voltage ramp.

For index [5]:

Sets the bounce time for the circuit breaker at the line side of the line transformer.

An interruption-free connection between the line supply and the transformer is only guaranteed after the bounce time has expired.

For index [6]:

Sets the permissible maximum time.

If the maximum time elapses without the line being synchronized, fault F06504 is output.

For index [7]:

Sets of the test time for the outer line supply, to which the system should be synchronized (voltage signals r5488[3, 4]). This line supply must maintain the regular tolerance for voltage and frequency (see p0281 ... p0285). The test is realized before synchronizing starts.

For index [8]:

Sets the smoothing time constant for an additional PT1 filtering of the voltage and frequency ramp.

#### Description:

Display and connector output of the supplementary setpoints for the frequency and voltage control during island grid synchronization.

#### Index:

[0] = Setpoint ramp frequency  
[1] = Setpoint ramp voltage

#### Notice:

In order to avoid equalization operations, after island synchronization has been completed, it is not permissible that supplementary setpoints for frequency and voltage are suddenly set to zero (as step function). This is the reason that after ending synchronization, the setpoints are held constant and reset with the trigger signal p5583[2] = 1.

In the same controller cycle, the signals for smoothed frequency (p5406[0]) and voltage (p5416[0]) are corrected by the corresponding absolute values!

The supplementary setpoints (r5582) are automatically reset when synchronization is canceled and when the grid droop (p5401) is deactivated with a change into regular closed-loop current control operation (with adaptation to the grid frequency).

#### Note:

In the default setting, the setpoints are connected with the unfiltered setpoint inputs (no-load frequency p5406[1], no-load voltage p5416[1]) of the grid droop. While synchronizing the island grid to an external grid, the amplitude, phase angle as well as the frequency of the island grid are adapted in this fashion.

The setpoints for synchronizing can also be used for synchronous voltage and frequency adaptation of additional power generating systems in the island grid.

#### Description:

Sets the signal sources for island grid synchronization.

Using the island grid synchronization function, an island grid can be synchronized with an external grid regarding frequency, phase angle and voltage amplitude.

After synchronization has been performed, a circuit breaker between the two grids can be closed (r5493.1).

#### Index:

[0] = Start  
[1] = Circuit breaker feedback signal  
[2] = Reset setpoints

## 2 Parameters

### 2.2 List of parameters

**Notice:** For index [1]:  
The feedback signal contact of the circuit breaker between the external grid and the island grid (in front of the grid transformer) must be connected in parallel via binector input p5583[1].  
The feedback signal is required for a state change in the synchronization sequence control. This signal is not used to completely monitor the contactor (p0860 and following).

**Note:** In order to synchronize an island grid with an external grid, frequency, phase position and amplitude of the island grid must be changed in operation!  
This assumes that the components of the island grid are suitable for these parameter changes and that the ALM is the only grid generator in the island grid.  
For index [0]:  
Signal source for the start command to synchronize the island grid with an external grid.  
The target values for the synchronization, are the output values of the PLL2 (r6311[1], r6313, r6314).  
The PLL2 must be activated at the latest when synchronization starts (p5571, p5574).  
For index [1]:  
Signal source for the feedback signal of the circuit breaker between the island grid and the external grid.  
For index [2]:  
Signal source to reset the supplementary setpoints for voltage and frequency(r5582[0, 1]) after island grid synchronization has been completed.  
At the same time as the reset command, the external cyclic supplementary setpoints (p5406[0], p5416[0]) must be appropriately adapted.

|  | <b>Min</b>   | <b>Max</b>  | <b>Factory setting</b>   |  |
|  | -1.0 [°]   | 360.0 [°]   | -1.0 [°]                 |  |
| <b>Description:</b>                              | Sets the trigger angle for the asymmetrical voltage output.  |   |                          |  |
| <b>Dependency:</b>                               | Refer to: p5590, p5591   |   |                          |  |
| <b>Notice:</b>                                   | The set angular values cannot be precisely implemented, but only rounded off to interval limits corresponding to the current controller sampling time (p0115[0]).<br>Example:<br>With p0115[0] = 0.25 ms and a 50 Hz line frequency, an angular resolution of $0.25 \text{ ms} * 50 \text{ Hz} * 360^\circ = 4.5^\circ$ is obtained. |   |                          |  |

**Note:** The function is activated using binector input p5591 = 0/1 signal.  
 After this function is activated, the start of asymmetry is delayed until the phase angle (r5412) reaches the value of p5589. This means that asymmetrical voltage changes can be implemented, which can be synchronized with the basic fundamental of the grid voltage - and that are reproducible.  
 With  $p5589 < 0^\circ$ , asymmetry starts immediately with the 0/1 edge, and is therefore not synchronized with the grid voltage.

|  |  | [6] 5594[6]             |                          |
|  |  | [7] 5594[7]             |                          |
|  |  | [8] 5594[8]             |                          |

**Description:** Sets the signal sources for scaling the individual phase and line voltages.  
 This therefore allows asymmetrical voltage sources to be implemented (negative phase-sequence system voltage not equal to 0).  
 The scaling of phase and line voltages can be freely combined.  
 As a result of the 3-conductor connection, using the power unit, a zero system cannot be implemented as a result of the inherent operating principle. As a consequence, the sum of the output voltages is always 0.  
 We recommend that p5594 is used for simple handling based on fixed values.

**Index:**  
 [0] = Differential voltage factor RS  
 [1] = Differential voltage factor ST  
 [2] = Differential voltage factor TR  
 [3] = Phase voltage factor R  
 [4] = Phase voltage factor S  
 [5] = Phase voltage factor T  
 [6] = Zero system voltage factor R0  
 [7] = Zero system voltage factor S0  
 [8] = Zero system voltage factor T0

**Dependency:** Refer to: p5415, p5416, p5594

**Danger:** By scaling the phase voltages, phase short-circuits as well as overcontrol of the phase voltages (with overvoltages and high harmonic components) can be realized.

This means that special care must be taken when using this function.

The complete system with all of the connected components must be designed for the resulting current and voltage levels in order to rule out injury and material damage.

**Notice:** The voltage control of the grid droop (p5429) uses the symmetrical basic fundamental amplitude (positive phase-sequence system voltage) as control variable. Changing an individual phase voltage therefore results in an undesirable subsequent control of the positive phase sequences system voltage.  
 In the case of an asymmetrical setpoint voltage due to p5590, we therefore recommend that p5426 = p5427 are set = 0.  
 For the same reason, generally the modulation depth controller (r5433) must be deactivated.  
 The setting value of indices 6, 7 and 8 together must add up to 300% in order to ensure that the zero system is completely subdivided. Otherwise, a remaining zero system is automatically distributed internally and symmetrically across all 3 phases.

## 2 Parameters

### 2.2 List of parameters

**Note:** Using the grid droop function (p5415, p5416), depending on the reactive current actual value, a voltage amplitude is calculated for all 3 grid phases (positive phase-sequence system voltage, r5429). The amplitude of the individual grid phases is obtained by multiplying this positive phase-sequence system voltage by the associated scaling factors p5590[...]. The DC component control (p5436), the harmonic control (p5440) and the interventions when reaching the current limits (p5478) remain active, also for asymmetrical setpoint voltages.

The setting p5590[...] = 1 deactivates the corresponding scaling (as a consequence, internally a value of 100% is active).

For index [0, 1, 2]:

Virtual three-phase voltage source in a delta connection.

Internally, the values are limited to the range 0 ... 100%.

Setpoint voltage amplitude phase RS:  $U_{RS} = r5429 * \text{root}(2) * p5590[0]$

Setpoint voltage amplitude phase ST:  $U_{ST} = r5429 * \text{root}(2) * p5590[1]$

Setpoint voltage amplitude phase TR:  $U_{TR} = r5429 * \text{root}(2) * p5590[2]$

The instantaneous voltages are internally adapted using a transformation matrix so that a zero system-free three-phase voltage system is obtained. For example, a short circuit between phases R and S can be directly emulated using p5590[0].

For index [3, 4, 5]:

Virtual three-phase voltage source in a star connection.

Internally, the values are limited to the range 0 ... 150%.

Setpoint voltage amplitude phase R:  $U_R = r5429 * \text{root}(2/3) * p5590[3]$

Setpoint voltage amplitude phase S:  $U_S = r5429 * \text{root}(2/3) * p5590[4]$

Setpoint voltage amplitude phase T:  $U_T = r5429 * \text{root}(2/3) * p5590[5]$

As the sum of the 3 sinusoidal voltages must be 0 at any particular instant in time, the average value of the instantaneous voltages are subtracted in each phase (i.e. the zero system components are evenly distributed across the 3 branches). For example, this is the reason that p5590[3] = 0% does not result in a DC voltage of 0 in phase R.

For index [6, 7, 8]:

Zero system distribution of the virtual three-phase voltage source in a star connection.

Internally, the values are limited to the range -300 ... 300 %.

Using these factors, it is defined with which component an existing zero system (instantaneous value  $u_0 = (u_R + u_S + u_T)/3$ ) should be subtracted in the individual phases.

Zero system correction phase R:  $u1_R = u_R - u_0 * p5590[6]$

Zero system correction phase S:  $u1_S = u_S - u_0 * p5590[7]$

Zero system correction phase T:  $u1_T = u_T - u_0 * p5590[8]$

In order to obtain a zero system-free U1 system, p5590[6] + p5590[7] + p5590[8] must = 300%. If this condition is violated, then the remaining zero system component is evenly distributed across all 3 branches.

Example:

The combination of p5590[3] = 0% and p5590[6] = 0% results in a voltage 0 in phase R. The phase voltage  $U_{ST}$  keeps its rated value, the sinusoidal curves of the two other differential voltages lie one above the other.

#### Description:

Sets the signal source to activate asymmetrical phase voltages in the grid droop mode.

BI: p5591 = change, from a 0 signal to a 1 signal:

Activates asymmetry.

BI: p5591 = 0 signal:

Deactivates asymmetry.

#### Danger:

By scaling the phase voltages (p5590), phase short-circuits as well as overcontrol of the phase voltages (with overvoltages and high harmonic components) can be realized. This means that special care must be taken when using this function.

The complete system with all of the connected components must be designed for the resulting current and voltage levels in order to rule out injury and material damage.

- Notice:** The function is activated with a 0/1 edge.  
A fixed value saved in the ROM p5591 = 1 is therefore not sufficient to activate (for instance, after a POWER ON).
- Note:** The precondition to output asymmetrical voltages is that the grid droop control is activated (p5401 = 1 signal).  
Duration and start of the asymmetry can be set with p5588 or p5589.

## 2 Parameters

### 2.2 List of parameters

**Note:** The amount of the value entered in the parameter is dynamically limited to the rated speed of the motor.  
The value 0 is not permissible.  
The sign of the hysteresis defines the rotating field of the stator current for the reverse field exciter depending on the mechanical direction of rotation.  
The hysteresis is symmetrical around the value in parameter p6277.

## 2 Parameters

### 2.2 List of parameters

**Warning:**

Switching-in with a significantly incorrectly parameterized offset angle ( $> 5^\circ$ ) can cause a peak current intervention and / or triggering the crowbar thyristor.

**Caution:**

If this parameter is changed in the "ready for operation" state and if a synchronizing voltage is already available at the VSM, under certain circumstances, a line supply fault can be signaled. When this occurs for the first time after changing the parameter, the fault can be ignored and acknowledged.

**Note:**

This phase shift must be determined when commissioning the system.

Example:

If the converter input voltage (= secondary side voltage of the power transformer) lags the synchronizing voltage measured by the VSM by  $30^\circ$ , then p6420 should be set to  $-30^\circ$ .

**Expert list:** 1

**Min**

**Max**

**Factory setting**

50.000 [%]

200.000 [%]

100.000 [%]

**Description:**

Sets the gain factor identified in p6441 to finely calibrate the line voltage detection.

**Index:**

[0] = Supply transformer  
[1] = Island grid transformer

**Dependency:**

Refer to: r6441

#### p6422

#### Line supply voltage rotating field direction / U\_line field dir

A\_INF (Line transf),  
R\_INF (Line transf)

**Can be changed:** T

**Calculated:** -

**Access level:** 3

**Data type:** Integer16

**Dyn. index:** -

**Func. diagram:** -

**P-Group:** Converter

**Unit group:** -

**Unit selection:** -

**Not for motor type:** -

**Scaling:** -

**Expert list:** 1

**Min**

**Max**

**Factory setting**

0

1

0

**Description:**

Setting to reverse the rotating field direction of the synchronizing voltage system measured by the Voltage Sensing Module (VSM).

**Value:**

0: Rotating field direction positive  
1: Rotating field negative

**Warning:**

Only use in an emergency if it is not possible to correct the wiring. Extreme caution must be applied in this case when measuring the phase shift (p6420).

**Note:**

Allows the rotating field direction to be adapted if there is inconsistency in the wiring.

#### p6423

#### PLL dynamic / PLL dynamic

A\_INF (Line transf),  
R\_INF (Line transf)

**Can be changed:** T

**Calculated:** -

**Access level:** 4

**Data type:** FloatingPoint32

**Dyn. index:** -

**Func. diagram:** -

**P-Group:** Converter

**Unit group:** -

**Unit selection:** -

**Not for motor type:** -

**Scaling:** -

**Expert list:** 1

**Min**

**Max**

**Factory setting**

2.000 [%]

500.000 [%]

20.000 [%]

**Description:**

Sets the dynamic response for the line supply voltage PLL.

**Note:**

Higher values increase the dynamic response but also the tendency of the PLL to oscillate (instability).

**Description:** Sets the offset voltage between phases L1 and L2 for the Voltage Sensing Module (VSM).  
The value is automatically determined with the drive switched-off and stationary when the offset calculation is enabled. The last determined value is saved if the offset calculation is inhibited. If the offset calculation is inhibited, then a fixed value can also be entered here.

**Dependency:** Refer to: p6903

**Note:** Offset calibration is only automatically activated if the resulting motor voltage is less than 1% of the rated line voltage.

## 2 Parameters

| <b>Description:</b>   | Offset voltage between phases L2 and L3 for the Voltage Sensing Module (VSM).<br>The value is automatically determined with the drive switched-off and stationary when the offset calculation is enabled. The last determined value is saved if the offset calculation is inhibited. If the offset calculation is inhibited, then a fixed value can also be entered here.                                  |                          |                            |

## 2 Parameters

### 2.2 List of parameters

**Note:** For index [0]:  
 Enables or disables the function.  
 p6999[0] = 0  
 Inhibits the function.  
 p6999[0] = 1  
 Enables the function.

For index [1]:  
 Sets the recording time, [ms].  
 A maximum of 8000 measuring points can be recorded across all drive objects. 1 measuring point is created in one current controller sampling time.  
 Example:  
 The "Recorder" function module is activated on 4 drive objects. The current controller sampling time (p0115[0]) is 250 µs.  
 --> every drive object can record a maximum of  $8000/4 = 2000$  measuring points.  
 --> the recording time that can be realized is  $2000 * 0.250 \text{ ms} = 500 \text{ ms}$ .

**Note:**  
 - the recording time that can be realized is displayed in r6991[1].  
 - if the recording time is set too long, then it is automatically reduced to what can be realized.

For index [2]:  
 Sets the pretrigger time, [ms].  
 This time is included in the recording time and cannot be longer than the recording time p6999[1].

**Note:**  
 - when the recording time is automatically reduced, the pretrigger time is correspondingly reduced as well.  
 - the pretrigger time that can be realized is displayed in r6991[2].

For index [3]:  
 Enables or disables the output of message A4998 when the trigger event is triggered.

For index [4]:  
 p6999[4] = n, n = 0 ... 4  
 Recording with the factor, which extends the record time p6999[1] and the pre-trigger time p6999[2]  $2^n$  times, and reduces the number of signals  $2^n$  times.  
 Example:  
 Number of drive objects = 1, p0115[0] = 250 µs, p6999[1] = 2000, p6999[2] = 1000, p6999[4] = 4  
 --> recording time:  $2000 \text{ ms} * 2^4 = 32 \text{ s}$ , pre-trigger time:  $1000 \text{ ms} * 2^4 = 16 \text{ s}$ , number of signals  $64/16 = 4$ .  
 When setting p6999[4] to 0, the results are as follows:  
 --> recording time: 2000 ms, pre-trigger time: 1000 ms, number of signals: 64

| <b>Description:</b>   | Display and connector output for the status of the power units in a parallel connection.   |   |   |
| <b>Value:</b>   | 0: Pulses inhibited<br>1: Pulses enabled   |   |   |
| <b>Dependency:</b>  | Refer to: r7000, p7001   |   |   |
| <b>p7003</b>  | <b>Par_circuit winding system / Wind_sys</b>   |   |   |
| VECTOR (Parallel),<br>VECTOR_AC<br>(Parallel),<br>VECTOR_I_AC<br>(Parallel)   | <b>Can be changed:</b> C2(2)<br><b>Data type:</b> Integer16<br><b>P-Group:</b> Converter<br><b>Not for motor type:</b> -<br><b>Min</b><br>0  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>2          | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0 |
| <b>Description:</b>   | Specifies the motor winding system when power units are connected in parallel.   |   |   |
| <b>Value:</b>   | 0: One-winding system<br>1: Several separate winding systems or motors<br>2: Two separate offset winding systems   |   |   |
| <b>Dependency:</b>  | For p7003 = 2:<br>In order to permit separate, offset winding systems, wobulation must first be deactivated (p1810.2 = 0). The magnitude and direction of the offset is parameterized in p6397.<br>When exiting commissioning, the circulating current control is automatically deactivated (p7035 = 0), and the compensation of the valve interlocking times is replaced by the appropriate stator resistance adaptation (p1780.7 = 1).<br>Refer to: p1802, p6397   |   |   |
| <b>Notice:</b>  | If, for motors with multi-winding system, the individual winding is connected with several partial inverters, then a development system (p7003 = 0) must be parameterized. The cable resistance should be entered in p0352 - and then the motor data identification performed with configuration p1909.20 = 1 (estimate cable resistance).   |   |   |

## 2 Parameters

### 2.2 List of parameters

**Note:** For p7003 = 0:  
- the motor data identification routine (p1910) determines the stator resistance and the cable resistance. The cable resistance of an individual Motor Module is entered into p0352.  
- the current symmetrizing is activated as standard after the motor data identification routine (p7035 = 1).  
- individual Motor Modules can be activated and deactivated (p7001).  
For p7003 = 1, 2:  
- the motor data identification routine (p1910) determines the total (overall) resistance. The cable resistance is not measured, but instead, entered as a component of the total resistance (refer to p0352).  
- all Motor Modules are activated. It is not possible to deactivate a Motor Module.

## 2 Parameters

### 2.2 List of parameters

---

|  |   |  |   |
|--|---|--|---|
| <b>p7324</b>   | <b>Par_connection VSM voltage asymmetry alarm threshold / VSM volt asym thr</b>   |  |   |
| A_INF (Parallel),<br>S_INF (Parallel),<br>R_INF (Parallel) | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Modulation<br><b>Not for motor type:</b> -<br><b>Min</b><br>2 [%]   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> PERCENT<br><b>Max</b><br>100 [%] | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>10 [%]    |
| <b>Description:</b>  | Sets the alarm threshold to detect asymmetry of the VSM voltages in the parallel connection. The deviation between the measured values and average value is evaluated. The reference value for the alarm threshold depends on the device supply voltage and the number of active VSM. The following applies for the reference value: $\sqrt{2} * p0210 * (2 - 1/r7000)$ . |  |   |
| <b>Dependency:</b>   | Refer to: p0210<br>Refer to: A05066   |  |   |
| <b>Notice:</b>   | For the monitoring function, precisely those Voltage Sensing Modules that are assigned to active power units must be activated.   |  |   |
| <b>Note:</b>   | For p7324 = 100 %, the monitoring is deactivated.   |  |   |
| <hr/>  |   |  |   |
| <b>r7325</b>   | <b>CO: Par_connection VSM maximum deviation voltage u1 - u2 / VSM max dev U 12</b>  |  |   |
| A_INF (Parallel),<br>S_INF (Parallel),<br>R_INF (Parallel) | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Displays, signals<br><b>Not for motor type:</b> -<br><b>Min</b><br>- [V]   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> 5_3<br><b>Scaling:</b> p2001<br><b>Max</b><br>- [V]   | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> p0505<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- [V] |
| <b>Description:</b>  | Displays the maximum absolute difference between the measured voltage (u1 - u2) of a VSM, and the corresponding average (mean) value of all VSM (r3661).  |  |   |
| <b>Dependency:</b>   | Refer to: r3661, r7300<br>Refer to: A05066  |  |   |
| <b>Note:</b>   | The individual VSM voltages are indicated in r7300.<br>The measured average value across all active Voltage Sensing Modules (VSM) is displayed in r3661.  |  |   |
| <hr/>  |   |  |   |
| <b>r7326</b>   | <b>CO: Par_connection VSM maximum deviation voltage u2 - u3 / VSM max dev U 23</b>  |  |   |
| A_INF (Parallel),<br>S_INF (Parallel),<br>R_INF (Parallel) | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Displays, signals<br><b>Not for motor type:</b> -<br><b>Min</b><br>- [V]   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> 5_3<br><b>Scaling:</b> p2001<br><b>Max</b><br>- [V]   | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> p0505<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- [V] |
| <b>Description:</b>  | Displays the maximum absolute difference between the measured voltage (u2 - u3) of a VSM, and the corresponding average (mean) value of all VSM (r3662).  |  |   |
| <b>Dependency:</b>   | Refer to: r3662, r7301<br>Refer to: A05066  |  |   |
| <b>Note:</b>   | The individual VSM voltages are indicated in r7301.<br>The measured average value across all active Voltage Sensing Modules (VSM) is displayed in r3662.  |  |   |

---

| <b>r7740[0...n]</b>   | <b>IGBT power cycling counter valve 1 / IGBT load count 1</b>  |   |   |
|---|--|---|---|
| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC,<br>A_INF, S_INF, B_INF | <b>Can be changed:</b> -<br><b>Data type:</b> Unsigned16<br><b>P-Group:</b> -<br><b>Not for motor type:</b> -<br><b>Min</b><br>-   | <b>Calculated:</b> -<br><b>Dyn. index:</b> PDS, p0120<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- | <b>Access level:</b> 4<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- |
| <b>Description:</b>   | Displays the status of power cycling counter for valve 1.<br>For repairs, this parameter serves as internal documentation for service personnel.<br>The counter state corresponds to the valve wear.   |   |   |
| <b>Dependency:</b>  | Refer to: p7786  |   |   |
| <b>Notice:</b>  | After a valve has been replaced, the corresponding power cycling counter must be reset.  |   |   |
| <b>Note:</b>  | The IGBT power cycling counter can only be set to 0.<br>Procedure when replacing valve 1:<br>1. Switch off the system and replace valve 1.<br>2. Switch on the system and acknowledge that valve 1 has been replaced (p7786.1 = 1).<br>--> the power cycling counter of valve 1 is then reset (r7740 = 0).<br>3. Carry out a POWER ON (switch-off/switch-on).<br>--> as a consequence p7786.1 is automatically set to 0. |   |   |

## 2 Parameters

### 2.2 List of parameters

**Note:** The IGBT power cycling counter can only be set to 0.  
Procedure when replacing valve 3:  
1. Switch off the system and replace valve 3.  
2. Switch on the system and acknowledge that valve 3 has been replaced (p7786.3 = 1).  
--> the power cycling counter of valve 3 is reset (r7742 = 0).  
3. Carry out a POWER ON (switch-off/switch-on).  
--> as a consequence p7786.3 is automatically set to 0.

#### r7743[0...n] IGBT power cycling counter valve 4 / IGBT load count 4

|   |   |  |  |
|---|---|--|--|
| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC,<br>A_INF, S_INF, B_INF | <b>Can be changed:</b> -<br><b>Data type:</b> Unsigned16<br><b>P-Group:</b> -<br><b>Not for motor type:</b> -<br><b>Min</b> | <b>Calculated:</b> -<br><b>Dyn. index:</b> PDS, p0120<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b> | <b>Access level:</b> 4<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b> |
|---|---|--|--|

**Description:** Displays the status of power cycling counter for valve 4.  
For repairs, this parameter serves as internal documentation for service personnel.  
The counter state corresponds to the valve wear.

**Dependency:** Refer to: p7786

**Notice:** After a valve has been replaced, the corresponding power cycling counter must be reset.

**Note:** The IGBT power cycling counter can only be set to 0.  
Procedure when replacing valve 4:  
1. Switch off the system and replace valve 4.  
2. Switch on the system and acknowledge that valve 4 has been replaced (p7786.4 = 1).  
--> the power cycling counter of valve 4 is reset (r7743 = 0).  
3. Carry out a POWER ON (switch-off/switch-on).  
--> as a consequence p7786.4 is automatically set to 0.

---

#### r7744[0...n] IGBT power cycling counter valve 5 / IGBT load count 5

|   |   |  |  |
|---|---|--|--|
| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC,<br>A_INF, S_INF, B_INF | <b>Can be changed:</b> -<br><b>Data type:</b> Unsigned16<br><b>P-Group:</b> -<br><b>Not for motor type:</b> -<br><b>Min</b> | <b>Calculated:</b> -<br><b>Dyn. index:</b> PDS, p0120<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b> | <b>Access level:</b> 4<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b> |
|---|---|--|--|

**Description:** Displays the status of power cycling counter for valve 5.  
For repairs, this parameter serves as internal documentation for service personnel.  
The counter state corresponds to the valve wear.

**Dependency:** Refer to: p7786

**Notice:** After a valve has been replaced, the corresponding power cycling counter must be reset.

**Note:** The IGBT power cycling counter can only be set to 0.  
Procedure when replacing valve 5:  
1. Switch off the system and replace valve 5.  
2. Switch on the system and acknowledge that valve 5 has been replaced (p7786.5 = 1).  
--> the power cycling counter of valve 5 is reset (r7744 = 0).  
3. Carry out a POWER ON (switch-off/switch-on).  
--> as a consequence p7786.5 is automatically set to 0.

This bit is only set if know-how protection is active (bit 1 = 1) and p7766 has not been entered in the OEM exception list.<br>For bit 04:<br>When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards/Control Units. This bit is only set if know-how protection is active and in p7765.0 is set = 1. |  |   |                 |

For bit 05:

When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards. This bit is only set if know-how protection is active and p7765.1 is set = 1 and p7765.0 is set = 0.

For bit 06:

When know-how protection is activated, the drive data can be traced using the device trace function. This bit is only set if know-how protection is active and p7765.2 is set = 1.

For bit 12:

Together with p7755, the bit is used to monitor write protection.

Bit = 1, if p7755 is not equal to 0 and write protection is active (r7760.0 = 1).

Bit = 0, if write protection was deactivated. p7755 is set to 0, and when write protection is activated again, bit 12 remains at 0.

**Dependency:**

Refer to: p7761, p7765, p7766, p7767, p7768

**Note:**

KHP: Know-How Protection

For bit 00:

Write protection can be activated/deactivated via p7761 on the Control Unit.

For bit 01:

The know-how protection can be activated by entering a password (p7766 ... p7768).

For bit 02:

If it has already been activated, know-how protection can be temporarily deactivated by entering the valid password in p7766. In this case, bit 1 = 0 and bit 2 = 1 offset.

For bit 03:

Know-how protection cannot be deactivated, as p7766 is not entered in the OEM exception list (only the factory setting is possible). This bit is only set if know-how protection is active (bit 1 = 1) and p7766 has not been entered in the OEM exception list.

For bit 04:

When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards/Control Units. This bit is only set if know-how protection is active and in p7765.0 is set = 1.

For bit 05:

When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards. This bit is only set if know-how protection is active and p7765.1 is set = 1 and p7765.0 is set = 0.

## 2 Parameters

### 2.2 List of parameters

For bit 06:

When know-how protection is activated, the drive data can be traced using the device trace function. This bit is only set if know-how protection is active and p7765.2 is set = 1.

For bit 12:

Together with p7755, the bit is used to monitor write protection.

Bit = 1, if p7755 is not equal to 0 and write protection is active (r7760.0 = 1).

Bit = 0, if write protection was deactivated. p7755 is set to 0, and when write protection is activated again, bit 12 remains at 0.

## 2 Parameters

### 2.2 List of parameters

| Bit field: | Bit | Signal name  | 1 signal | 0 signal | FP |
|------------|-----|--|----------|----------|----|
|            | 00  | Extended copy protection - linked to the memory card and CU  | Yes      | No       | -  |
|            | 01  | Basic copy protection - linked to the memory card            | Yes      | No       | -  |
|            | 02  | Permit trace and measuring functions for diagnostic purposes | Yes      | No       | -  |

**Dependency:** Refer to: p7766, p7767, p7768

**Note:** KHP: Know-How Protection

For copy protection, the serial numbers of the memory card and/or Control Unit are checked.

The memory card copy protection and preventing data to be traced are only effective when the know-how protection has been activated.

For bit 00, 01:

If both bits are inadvertently set to 1 (e.g. at the BOP), then the setting of bit 0 applies.

There is no copy protection if both bits are set to 0.

|  | -                            | -                    | -                        |

**Description:** Sets the password for know-how protection.

Example of a password:

123aBc = 49 50 51 97 66 99 dec (ASCII characters)

[0] = character 1 (e.g. 49 dec)

[1] = character 2 (e.g. 50 dec)

...

[5] = character 6 (e.g. 99 dec)

[29] = 0 dec (completes the entry)

**Dependency:** Refer to: p7767, p7768

**Notice:** An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.

When using the STARTER commissioning tool, the password should be entered using the associated dialogs.

The following rules apply when entering the password:

- password entry must start with p7766[0].

- no gaps are permissible in the password.

- entering a password is completed when writing to p7766[29] (p7766[29] = 0 for passwords less than 30 characters).

**Note:** KHP: Know-How Protection

When reading, p7766[0...29] = 42 dec (ASCII character = "\*\*\*") is displayed.

Parameters with the "KHP\_WRITE\_NO\_LOCK" attribute are not involved in the know-how protection.

Parameters with the "KHP\_ACTIVE\_READ" attribute can be read even when know-how protection is activated.

A product-specific list of these parameters is also available in the corresponding List Manual.

| <b>Notice:</b>   | After action p7770 = 1 no more pulses may be enabled.<br>After action p7770 = 2, it is essential that parameters are backed up (p0977 = 1) and that a warm restart is then performed (p0009 = 30, p0976 = 2, 3). This will apply the values written. |  |   |

## 2 Parameters

### 2.2 List of parameters

**Note:** If value = 1:  
This action loads the NVRAM data to the parameters.  
If value = 2:  
This action loads the parameters to the NVRAM.  
If value = 3:  
This action sets parameters p7771 ... p7774 to the factory setting.  
It is recommended to avoid placing unnecessary load on the subsequent upload/download operation.

---

|  |   |   |   |
|--|---|---|---|
| <b>p7775</b>   | <b>NVRAM data backup/import/delete / NVRAM backup</b>   |   |   |
| CU_I, CU_NX_CX,<br>CU_S_AC_DP,<br>CU_S_AC_PN,<br>CU_S120_PN,<br>CU_S150_PN,<br>CU_S120_DP,<br>CU_S150_DP,<br>CU_I_D410 | <b>Can be changed:</b> C1, U, T<br><b>Data type:</b> Integer16<br><b>P-Group:</b> All groups<br><b>Not for motor type:</b> -<br><b>Min</b><br>0 | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>17 | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0 |

**Description:** Setting to backup/import/delete NVRAM data.  
NVRAM data are non-volatile data in the device (e.g. fault buffer).  
For NVRAM data actions, the following data are excluded:  
- crash diagnostics  
- CU operating hours counter  
- CU temperature  
- safety logbook

**Value:** 0: Inactive  
1: NVRAM data backup to memory card  
2: Import NVRAM data from the memory card  
3: Delete NVRAM data in the device  
10: Error when clearing  
11: Error when backing up, memory card not available  
12: Error when backing up, insufficient memory space  
13: Error when backing up  
14: Error when importing, memory card not available  
15: Error when importing, checksum error  
16: Error when importing, no NVRAM data available  
17: Error when importing

**Notice:** For value = 2, 3:

These actions are only possible when pulses are inhibited.

**Note:** After the action has been successfully completed, the parameter is automatically set to zero.

The actions importing and deleting NVRAM data immediately initiate a warm restart.

If the procedure was not successfully completed, then an appropriate fault value is displayed (p7775 >= 10).

---

|   |   |   |   |
|---|---|---|---|
| <b>p7786[0...n]</b>   | <b>Service report / Service report</b>  |   |   |
| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC,<br>A_INF, S_INF, B_INF | <b>Can be changed:</b> U, T<br><b>Data type:</b> Unsigned16<br><b>P-Group:</b> -<br><b>Not for motor type:</b> -<br><b>Min</b><br>- | <b>Calculated:</b> -<br><b>Dyn. index:</b> PDS, p0120<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- | <b>Access level:</b> 4<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0000 0000 0000 0000 bin |

**Description:** Service parameter to internally document repairs.  
After a component has been replaced, this must be confirmed using p7786[PDS].x = 0/1. The "Generate report" function is then automatically executed.  
After the procedure has been completed, p7786[PDS] is automatically set = 0.

| Bit field: | Bit | Signal name                             | 1 signal | 0 signal | FP |
|------------|-----|---|----------|----------|----|
|            | 00  | Control Interface Module (CIM) replaced | Yes      | No       | -  |
|            | 01  | Valve 1 replaced                        | Yes      | No       | -  |
|            | 02  | Valve 2 replaced                        | Yes      | No       | -  |
|            | 03  | Valve 3 replaced                        | Yes      | No       | -  |
|            | 04  | Valve 4 replaced                        | Yes      | No       | -  |
|            | 05  | Valve 5 replaced                        | Yes      | No       | -  |
|            | 06  | Valve 6 replaced                        | Yes      | No       | -  |
|            | 15  | Generate report                         | Yes      | No       | -  |

**Notice:** The write process can take several minutes (p7786[PDS].x = 1). It is not permissible that the device is switched off during the procedure (only when p7786 = 0).

**Note:** The power unit involved can be assigned the correct P index using p0124 (power unit detection via LED).

---

| p7788   | Power unit sign-of-life monitoring tolerance window / PU SoL mon tol |                      |                          |  |

|   | 1  | 1000                 | 10                       |  |

**Description:** Sets the tolerance window for the sign of life monitoring for communication to the power unit.

**Dependency:** Refer to: A30853

**Note:** An active window is generated by means of DRIVE-CLiQ telegrams.  
If more than one sign-of-life error appears in the window, then A30853 is output.  
The lower the value in p7788, the greater the monitoring tolerance.

---

| p7789   | Power unit sign-of-life monitoring fault threshold / PU SoL mon F_thr |                      |                          |  |

**Description:** Sets the individual signals for the component trace.  
 For p7790[0...15] = 0, the component trace is deactivated.  
 For index [0...7]:  
 The signals are set in p7790[0...7], whose characteristic is to be recorded over time.  
 If "No signal" is set for a trace channel, then the recording duration of the other time characteristics is increased.  
 For index [8...15]:  
 The signals are set in p7790[8...15], whose instantaneous value is to be recorded.

**Value:**

- 0: No signal
- 1: Pulse frequency
- 2: Phase current U
- 3: Phase current V
- 4: Phase current W
- 5: IGBT chip temperature
- 6: Heat sink temperature
- 7: DC link voltage
- 8: Modulation depth
- 9: Angle
- 10: Status word
- 11: Control word

**Index:**

- [0] = Trace channel 0
- [1] = Trace channel 1
- [2] = Trace channel 2
- [3] = Trace channel 3
- [4] = Trace channel 4
- [5] = Trace channel 5
- [6] = Trace channel 6
- [7] = Trace channel 7
- [8] = Trace channel 8
- [9] = Trace channel 9
- [10] = Trace channel 10
- [11] = Trace channel 11
- [12] = Trace channel 12
- [13] = Trace channel 13
- [14] = Trace channel 14
- [15] = Trace channel 15

**Dependency:** Refer to: p7791, p7792  
 Refer to: A01302

**Note:** In the operation state, when a trigger event occurs, the trace data of the signals are saved in the component. The oldest trace data is overwritten after more than 5 trigger events.  
The trigger event can be set in p7791.  
By activating p7792, the trace data of the component is written to files on the non-volatile storage medium (memory card). Experts can then evaluate this data.

**Description:** Sets the individual signals for the component trace.  
For p7790[0...15] = 0, the component trace is deactivated.  
For index [0...7]:  
The signals are set in p7790[0...7], whose characteristic is to be recorded over time.  
If "No signal" is set for a trace channel, then the recording duration of the other time characteristics is increased.  
For index [8...15]:  
The signals are set in p7790[8...15], whose instantaneous value is to be recorded.

**Value:**

- 0: No signal
- 1: Pulse frequency
- 2: Phase current U
- 3: Phase current V
- 4: Phase current W
- 5: IGBT chip temperature
- 6: Heat sink temperature
- 7: DC link voltage
- 8: Modulation depth
- 9: Angle
- 10: Status word
- 11: Control word

**Index:**

**Dependency:** Refer to: p7791, p7792  
Refer to: A01302

## 2 Parameters

### 2.2 List of parameters

**Note:** In the operation state, when a trigger event occurs, the trace data of the signals are saved in the component. The oldest trace data is overwritten after more than 5 trigger events.  
The trigger event can be set in p7791.  
By activating p7792, the trace data of the component is written to files on the non-volatile storage medium (memory card). Experts can then evaluate this data.

| <b>Notice:</b>   | If this parameter is changed, it only becomes effective the next time that the drive system boots.   |  |   |

## 2 Parameters

### 2.2 List of parameters

**Note:** The firmware is automatically updated when the system boots. The boot can take several minutes. After the update has been completed, it is necessary to carry out a new POWER ON (switch-off/switch-on) for the components involved.

The firmware update procedure is displayed as follows:  
Control Unit (LED RDY):  
Flashes yellow with 0.5 Hz --> firmware is being updated.  
Flashing yellow with 2 Hz --> POWER ON is required for the components involved.  
Components involved:  
Flashing red/green with 0.5 Hz --> firmware is being updated.  
Flashing red/green with 2 Hz --> POWER ON of the components is required.  
Only components from firmware version 2.5 support the red/green flashing at 2 Hz.

|   | -  | -                    | -                        |

**Description:** Displays the actual serial number of the memory card.  
 The individual characters of the serial number are displayed in the ASCII code in the indices.

**Dependency:** Refer to: p9920, p9921

**Notice:** An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.

**Note:** Example: displaying the serial number for a memory card:

```
r7843[0] = 49 dec --> ASCII characters = "1" --> serial number, character 1
r7843[1] = 49 dec --> ASCII characters = "1" --> serial number, character 2
r7843[2] = 49 dec --> ASCII characters = "1" --> serial number, character 3
r7843[3] = 57 dec --> ASCII characters = "9" --> serial number, character 4
r7843[4] = 50 dec --> ASCII characters = "2" --> serial number, character 5
r7843[5] = 51 dec --> ASCII characters = "3" --> serial number, character 6
r7843[6] = 69 dec --> ASCII characters = "E" --> serial number, character 7
r7843[7] = 0 dec --> ASCII characters = " " --> serial number, character 8
...
r7843[19] = 0 dec --> ASCII characters = " " --> serial number, character 20
r7843[20] = 0 dec
Serial number = 111923E
```

|   | -  | -                    | -                        |

**Description:** Displays the version of the firmware stored on the memory medium of the converter.  
 Depending on the converter being used, the memory medium is a memory card (e.g. SINAMICS S120) - or the internal, non-volatile device memory (e.g. SINAMICS G120).

**Index:** [0] = Internal  
 [1] = External  
 [2] = Parameter backup  
 [3] = Motor data addon

**Note:** For index [0]:

Displays the internal firmware version (e.g. 04402315).

This firmware version is the version of the memory card/device memory and not the CU firmware (r0018), however, normally they have the same versions.

For index [1]:

Displays the external firmware version (e.g. 04040000 -> 4.4).

For automation systems with SINAMICS Integrated this is the runtime version of the automation system.

For index [2]:

Displays the internal firmware version of the parameter backup.

With this CU firmware version, the parameter backup was saved, which was used when powering up.

## 2 Parameters

### 2.2 List of parameters

For index [3]:

Displays the version of the subsequently loaded motor database.

If there is no motor data available, then this index has a value of 0.

**Dependency:**

Refer to: r7867, r7871

**Note:**

For index [0]:  
 When changing one of the following indices, then the value in this index is incremented.

For index [1]:  
 Drive object configuration. When changing r7871[0] on a drive object, the value in this index is incremented.

For index [2]:  
 Drive object, configuration unit. When changing either p0101 or r0102, the value in this index is incremented.

For index [3]:  
 PROFIBUS configuration unit. When changing p0978, the value in this index is incremented.

For index [4]:  
 DRIVE-CLiQ actual topology. When changing either r9900 or r9901, the value in this index is incremented.

For index [5]:  
 DRIVE-CLiQ target topology. When changing either p9902 or p9903, the value in this index is incremented.

For index [6]:  
 DRIVE-CLiQ sockets. When changing p0109, the value in this index is incremented.

For index [7]:  
 Technology Extensions When changing Technology Extensions, the value in this index is incremented.

For index [8]:  
 Topology comparison result. When changing the topology comparison result, the value in this index is incremented.

**Can be changed:** -

**Data type:** FloatingPoint32

**P-Group:** -

**Not for motor type:** -

**Min**

- [µs]

**Calculated:** -

**Dyn. index:** -

**Unit group:** -

**Scaling:** -

**Max**

- [µs]

**Access level:** 4

**Func. diagram:** -

**Unit selection:** -

**Expert list:** 1

**Factory setting**

- [µs]

**Description:**

Displays the sampling times currently present on the drive unit.

r7901[0...63]: sampling times of hardware time slices.

r7901[64...82]: sampling times of software time slices.

r7901[x] = 0, means the following:

No methods have been registered in the time slice involved.

**Note:**

The basis for the software time slices is T\_NRK = p7901[15].

### r7903

#### Hardware sampling times still assignable / HW t\_samp free

CU\_I, CU\_NX\_CX,  
 CU\_S\_AC\_DP,  
 CU\_S\_AC\_PN,  
 CU\_S120\_PN,  
 CU\_S150\_PN,  
 CU\_S120\_DP,  
 CU\_S150\_DP,  
 CU\_I\_D410

**Can be changed:** -

**Data type:** Unsigned16

**P-Group:** -

**Not for motor type:** -

**Min**

-

**Calculated:** -

**Dyn. index:** -

**Unit group:** -

**Scaling:** -

**Max**

-

**Access level:** 3

**Func. diagram:** -

**Unit selection:** -

**Expert list:** 1

**Factory setting**

-

**Description:**

Displays the number of hardware sampling times that can still be assigned.

These free sampling times can be used by technology functions such as TEC, DCC or FBLOCKS.

**Note:**

TEC: Technology Extension

DCC: Drive Control Chart

FBLOCKS: free blocks

The displayed value depends on the following:

The specific CU version (Sinamics S provides more sampling times than Sinamics G/DCM);

The sampling times that existed in the system up until now;

The internally reserved sampling times.

Additional application and system-dependent criteria must be taken into consideration for the possibility of registering an OA runtime group or a clock cycle change.

## 2 Parameters

| <b>Index:</b>   | [0] = Vendor ID<br>[1] = Product code<br>[2] = Revision number<br>[3] = Serial number  |                      |                          |

## 2 Parameters

### 2.2 List of parameters

**Note:** Corresponds to the CANopen object 1018 hex.  
For index [3]:  
The SINAMICS serial number comprises 60 bits.  
Of these bits, the following are displayed in this index:  
Bits 0 ... 19: Consecutive number  
Bits 20 ... 23: Production ID  
- 0 hex: Development  
- 1 hex: P1 unique number  
- 2 hex: P2 unique number  
- 3 hex: WA unique number  
- 9 hex: Pattern  
- F hex: All others  
Bits 24 ... 27: Month of manufacture (0 means January, B means December)  
Bits 28 ... 31: Year of manufacture (0 means 2002)

---

| <b>p8608[0...1]</b>   | <b>CAN Clear Bus Off Error / Clear bus off err</b> |                      |                          |
|---|--|----------------------|--------------------------|
| CU_S120_PN (CAN),<br>CU_S150_PN (CAN),<br>CU_S120_DP (CAN),<br>CU_S150_DP (CAN) | <b>Can be changed:</b> U, T                        | <b>Calculated:</b> - | <b>Access level:</b> 3   |
|   | <b>Data type:</b> Integer16                        | <b>Dyn. index:</b> - | <b>Func. diagram:</b> -  |
|   | <b>P-Group:</b> -                                  | <b>Unit group:</b> - | <b>Unit selection:</b> - |
|   | <b>Not for motor type:</b> -                       | <b>Scaling:</b> -    | <b>Expert list:</b> 1    |
|   | <b>Min</b>   | <b>Max</b>           | <b>Factory setting</b>   |
|   | 0  | 1                    | 0                        |

**Description:** As a result of a Bus Off error, the CAN controller is set into the initialization state.  
For index [0]:  
The CAN controller is manually started after resolving the cause of the error with p8608[0] = 1  
For index [1]:  
The automatic CAN bus start function is activated using p8608[1] = 1.  
At 2 second intervals, the CAN controller is automatically restarted until the cause of the error has been resolved and a CAN connection has been established.

**Value:** 0: Inactive  
1: Start CAN controller

**Index:** [0] = Manual controller start function  
[1] = Activating the automatic controller start function

**Note:** For index [0]:  
This parameter is automatically reset to 0 after start.

|   | 0  | 2                    | 1                        |

**Description:** Sets the behavior of the CAN node referred to the communications error or equipment fault.

**Value:** 0: Pre-operational  
1: No change  
2: Stopped

**Index:** [0] = Behavior for communication errors  
[1] = Behavior for device faults

**Note:** Corresponds to the CANopen object 1029 hex.

| <b>r8610[0...1]</b>   |  | <b>CAN First Server SDO / First server SDO</b>         |                          |  |

[80] = Fault 6/Control Unit  
[81] = Fault 7/Control Unit  
[82] = Fault 8/Control Unit

**Dependency:** Refer to: r8743

**Note:** Corresponds to the CANopen object 1003 hex.  
Parameter r8743 is used to display the assignment of the drive object (drive object number) to the CANopen device module.

**Description:** Sets the bit timing for the C\_CAN controller to the associated and selected bit rate (p8622).

Bits are distributed to the following parameters of the C\_CAN controller in p8623[0...7]:

Bit 0 ... 5: BRP (Baud Rate Prescaler)

Bit 6 ... 7: SJW (Synchronization Jump Width)

Bit 8 ... 11: TSEG1 (Time Segment 1, before the sampling point)

Bit 12 ... 14: TSEG2 (Time Segment 2, after the sampling point)

Bit 15: Reserved

Bit 16 ... 19: BRPE (Baud Rate Prescaler Extension)

Bit 20 ... 31: Reserved

Example:

Bit rate = 20 kbit/s --> p8622 = 6 --> associated bit timing is in p8623[6] --> 0001 2FB6

**Recommendation:** Use the factory setting when setting the bit timing.

**Index:**

- [0] = 1 Mbit/s
- [1] = 800 kbit/s
- [2] = 500 kbit/s
- [3] = 250 kbit/s
- [4] = 125 kbit/s
- [5] = 50 kbit/s
- [6] = 20 kbit/s
- [7] = 10 kbit/s

**Dependency:** Refer to: p8622

**Note:** The parameter is not influenced by setting the factory setting.

**Description:** Sets the CANopen NMT state that is effective after booting.

**Value:**

- 4: Stopped
- 5: Operational
- 127: Pre-operational

## 2 Parameters

### 2.2 List of parameters

**Dependency:** Refer to: p8685  
**Note:** Booting in the NMT state pre-operational corresponds to the CANopen standard

#### p8699

#### CAN: RPDO monitoring time / RPDO t\_mon

|   |  |  |  |
|---|--|--|--|
| CU_S120_PN (CAN),<br>CU_S150_PN (CAN),<br>CU_S120_DP (CAN),<br>CU_S150_DP (CAN) | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Communications<br><b>Not for motor type:</b> -<br><b>Min</b><br>0 [ms] | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>65535000 [ms] | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0 [ms] |
|---|--|--|--|

**Description:** Sets the monitoring time for the process data received via the CAN bus.  
A value that is not a multiple integer of the CANopen sampling time is rounded-off.  
If no process data is received within this time, then fault F08702 is output.

**Dependency:** Refer to: r8843, p8848  
Refer to: F08702

**Note:** Monitoring is deactivated for setting p8699 = 0.  
RPDO monitoring is deactivated in the first commissioning (as no RPDOs are configured).  
The activated and started RPDO monitoring is displayed using PROFIdrive PZD status "Fieldbus running" (r8843.2).  
RPDO: Receive Process Data Object

**Description:** Sets the communication parameters for CANopen Receive Process Data Object 1 (RPDO 1).

**Index:** [0] = PDO COB-ID  
[1] = PDO transmission type

**Dependency:** A valid COB-ID can only be set for the available (existing) channel.

**Note:** Corresponds to the CANopen object 1400 hex + 40 hex \* x (x: Drive number 0 ... 7).  
Transmission types 0, 1, FE and FF can be set.

|                   | 15         | Can be freely interconnected (BI: p8787) | Yes             | No              | -         |

**Note:** Corresponds to the CANopen object 6041 hex + 800 hex \* x (x: Drive number 0 ... 7).

For bit 10:

When the ramp-function generator is activated, the interconnection from CI: p2151 = r1119 can be changed, so that to evaluate bit 10, the setpoint can be retrieved (taken) from in front of the ramp-function generator.

For bit 10, 12:

When braking, the two bits must indicate the same state. This is the reason that the following parameters must be set the same:

p2161 (speed threshold value 3, for r2199.0) = p2163 (speed threshold value 4, for r2197.7)

p2150 (hysteresis speed 3, for r2199.0) = p2164 (hysteresis speed 4, for r2197.7)

**Max**

**Factory setting**

-

-

-

**Description:**

Display and connector output of the standardized CANopen I32 setpoint objects of the profile velocity mode for SDO transfer.

An index does not contain a sensible value if the corresponding object is mapped in one of the 8 possible RPDO (p8710 ... p8717). In this case, the interconnection and the SDO transfer must be realized via PZD interface 2 (r8860[x]).

**Index:**

[0] = Target velocity

**Dependency:**

Refer to: p2000, p8710, p8711, p8712, p8713, p8714, p8715, p8716, p8717, r8760, r8860

**Note:**

RPDO: Receive Process Data Object

SDO: Service Data Object

For index [0]:

Corresponds to the CANopen object 60FF hex + 800 hex \* x (x: Drive number 0 ... 7).

The displayed parameter value is scaled via the reference speed p2000:

4000 0000 hex corresponds to p2000.

#### r8797[0]

#### CO: CAN profile torque mode I16 setpoints / Pr Tq mod I16 set

**Min**

**Max**

**Factory setting**

-

-

-

**Description:**

Display and connector output of the standardized CANopen I16 setpoint objects of the profile torque mode for SDO transfer.

An index does not contain a sensible value if the corresponding object is mapped in one of the 8 possible RPDO (p8710 ... p8717). In this case, the interconnection and the SDO transfer must be realized via PZD interface 2 (r8850[x]).

**Index:**

[0] = Target torque

**Dependency:**

Refer to: p8710, p8711, p8712, p8713, p8714, p8715, p8716, p8717, r8750, r8850

**Note:**

RPDO: Receive Process Data Object

SDO: Service Data Object

For index [0]:

Corresponds to the CANopen object 6071 hex + 800 hex \* x (x: Drive number 0 ... 7).

The displayed parameter value is scaled using the reference torque p2003:

4000 hex corresponds to p2003.

## 2 Parameters

### 2.2 List of parameters

**Note:** An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.  
For p8807[0...15]:  
Dates of installation or first commissioning of the device with the following format options (ASCII):  
YYYY-MM-DD  
or  
YYYY-MM-DD hh:mm  
- YYYY: year  
- MM: month 01 ... 12  
- DD: day 01 ... 31  
- hh: hours 00 ... 23  
- mm: minutes 00 ... 59  
The separators between the individual data - i.e. hyphen '-', space ' ' and colon ':' - must be entered.

| <b>Description:</b>   | Selects the node address for the SINAMICS Link on the Communication Board Ethernet 20 (CBE20).<br>p8836 = 0: SINAMICS Link deactivated<br>p8836 = 1 ... 64: SINAMICS Link node address   |   |   |
| <b>Dependency:</b>  | Refer to: p8811, p8835   |   |   |
| <b>Note:</b>  | The maximum number of permitted participant addresses is limited by the project selection p8811.<br>SINAMICS Link requires that the appropriate CBE20 firmware version is selected (p8835 = 3).<br>A change only becomes effective after a POWER ON.<br>The parameter is not influenced by setting the factory setting.  |   |   |
| <b>p8837</b>  | <b>IF2 STW1.10 = 0 mode / IF2 STW1.10=0</b>  |   |   |
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC,<br>A_INF, S_INF, R_INF,<br>B_INF, TM41, ENC | <b>Can be changed:</b> T<br><b>Data type:</b> Integer16<br><b>P-Group:</b> Communications<br><b>Not for motor type:</b> -<br><b>Min</b><br>0   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>2  | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>2           |
| <b>Description:</b>   | Sets the processing mode for PROFIdrive STW1.10 "master control by PLC".<br>Generally, control world 1 is received with the first receive word (PZD1) (this is in conformance to the PROFIdrive profile). The behavior of STW1.10 = 0 corresponds to that of the PROFIdrive profile. For other applications that deviate from this, the behavior can be adapted using this particular parameter. |   |   |
| <b>Value:</b>   | 0: Freeze setpoints and continue to process sign-of-life<br>1: Freeze setpoints and sign-of-life<br>2: Do not freeze setpoints   |   |   |
| <b>Recommendation:</b>  | Do not change the setting p2037 = 0.   |   |   |
| <b>Note:</b>  | If the STW1 is not transferred according to the PROFIdrive with PZD1 (with bit 10 "master control by PLC"), then p2037 should be set to 2.   |   |   |
| <b>p8839[0...1]</b>   | <b>PZD interface hardware assignment / PZD intf HW assign</b>  |   |   |
| CU_S120_PN,<br>CU_S150_PN,<br>CU_S120_DP,<br>CU_S150_DP   | <b>Can be changed:</b> C1(1)<br><b>Data type:</b> Integer16<br><b>P-Group:</b> Communications<br><b>Not for motor type:</b> -<br><b>Min</b><br>0   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>99 | <b>Access level:</b> 3<br><b>Func. diagram:</b> 2197, 2198<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>99 |
| <b>Description:</b>   | Assignment of the hardware for cyclic communications via PZD interface 1 (IF1) and interface 2 (IF2).  |   |   |
| <b>Value:</b>   | 0: Inactive<br>1: Control Unit onboard<br>2: COMM BOARD<br>99: Automatic   |   |   |
| <b>Index:</b>   | [0] = Interface 1<br>[1] = Interface 2   |   |   |
| <b>Dependency:</b>  | Refer to: p2030, p8815   |   |   |

## 2 Parameters

### 2.2 List of parameters

**Note:** For value = 99 (automatic) the following applies:  
- if a COMM BOARD is not inserted, then the onboard interface (PROFIBUS/PROFINET/USS) communicates via IF1.  
- if a CBE20 is inserted, then the following applies:  
-- CU320-2 DP: PROFINET CBE20 communicates via IF1 and PROFIBUS/USS via IF2.  
-- CU320-2 PN: PROFINET onboard communicates via IF1 and PROFINET CBE20 via IF2.  
- CAN CBC10 always communicates via IF2.  
For a value not equal to 99 (automatic) the following applies:  
- both indices must be set to a number not equal to 99 (automatic).  
A change only becomes effective after POWER ON, reset or download.

**Dependency:** Refer to: p8851, p8861

**Note:** IF2: Interface 2

**r8854 COMM BOARD state / CB state**

|   |  |  |   |
|---|--|--|---|
| CU_S120_PN (COMM BOARD, PN CBE20),<br>CU_S150_PN (COMM BOARD, PN CBE20),<br>CU_S120_DP (COMM BOARD, PN CBE20),<br>CU_S150_DP (COMM BOARD, PN CBE20) | <b>Can be changed:</b> -<br><b>Data type:</b> Integer16<br><b>P-Group:</b> Communications<br><b>Not for motor type:</b> -<br><b>Min</b><br>0 | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>255 | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- |
|---|--|--|---|

**Description:** Status display for COMM BOARD.

|               |   |
|---------------|---|
| <b>Value:</b> | 0: No initialization<br>1: Fatal fault<br>2: Initialization<br>3: Send configuration<br>4: Receive configuration<br>5: Non-cyclic communication<br>6: Cyclic communications but no setpoints (stop/no clock cycle)<br>255: Cyclic communication |
|---------------|---|

**Note:** For CBE20, the parameter is only active for firmware version "SINAMICS Link" (p8835 = 3).  
For firmware version "PROFINET Device" or "EtherNet/IP" (p8835 = 1, 4), parameter p8956 should be observed.

**r8858[0...39] COMM BOARD read diagnostics channel / CB diag\_chan read**

|   |   |  |   |
|---|---|--|---|
| CU_S120_PN (COMM BOARD, PN CBE20),<br>CU_S150_PN (COMM BOARD, PN CBE20),<br>CU_S120_DP (COMM BOARD, PN CBE20),<br>CU_S150_DP (COMM BOARD, PN CBE20) | <b>Can be changed:</b> -<br><b>Data type:</b> Unsigned16<br><b>P-Group:</b> Communications<br><b>Not for motor type:</b> -<br><b>Min</b><br>- | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- |
|---|---|--|---|

**Description:** Displays the COMM BOARD diagnostics data.

**Note:** The display depends on the COMM BOARD being used.  
For CBE20, the parameter is only active for firmware version "SINAMICS Link" or "EtherNet/IP" (p8835 = 3, 4).  
Example for CBE20:  
r8858[0] = 4201 --> Siemens CBE20  
r8858[1] = 3 --> firmware version = SINAMICS Link (see p8835)  
r8858[2 ... 39] --> only for internal Siemens diagnostics.

**r8859[0...7] COMM BOARD identification data / CB ID\_data**

|   |   |  |   |
|---|---|--|---|
| CU_S120_PN (COMM BOARD, PN CBE20),<br>CU_S150_PN (COMM BOARD, PN CBE20),<br>CU_S120_DP (COMM BOARD, PN CBE20),<br>CU_S150_DP (COMM BOARD, PN CBE20) | <b>Can be changed:</b> -<br><b>Data type:</b> Unsigned16<br><b>P-Group:</b> Communications<br><b>Not for motor type:</b> -<br><b>Min</b><br>0 | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>65535 | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- |
|---|---|--|---|

**Description:** Displays the COMM BOARD identification data

|               |   |
|---------------|---|
| <b>Index:</b> | [0] = Version interface structure<br>[1] = Version interface driver<br>[2] = Company (Siemens = 42)<br>[3] = CB type<br>[4] = Firmware version<br>[5] = Firmware date (year)<br>[6] = Firmware date (day/month)<br>[7] = Firmware patch/hot fix |
|---------------|---|

## 2 Parameters

### 2.2 List of parameters

**Note:** Example for CBE20:  
r8859[0] = 100 --> version of the interface structure V1.00  
r8859[1] = 111 --> version of the interface driver V1.11  
r8859[2] = 42 --> SIEMENS  
r8859[3] = 0 --> CBE20  
r8859[4] = 1200 --> first part, firmware version V12.00 (second part, see index 7)  
r8859[5] = 2010 --> year 2010  
r8859[6] = 2306 --> 23rd June  
r8859[7] = 1300 --> second part, firmware version (complete version: V12.00.13.00)

|  | <b>P-Group:</b> Communications                          | <b>Unit group:</b> -  | <b>Unit selection:</b> -                  |
|  | <b>Not for motor type:</b> -                            | <b>Scaling:</b> 4000H | <b>Expert list:</b> 1                     |
|  | <b>Min</b>  | <b>Max</b>            | <b>Factory setting</b>                    |
|  | -   | -                     | -   |

**Description:** Connector output for interconnecting the PZD (setpoints) received via interface 2 in the double word format.

**Index:**  
[0] = PZD 1 + 2  
[1] = PZD 2 + 3  
[2] = PZD 3 + 4  
[3] = PZD 4 + 5  
[4] = PZD 5 + 6  
[5] = PZD 6 + 7  
[6] = PZD 7 + 8  
[7] = PZD 8 + 9  
[8] = PZD 9 + 10  
[9] = PZD 10 + 11  
[10] = PZD 11 + 12  
[11] = PZD 12 + 13  
[12] = PZD 13 + 14  
[13] = PZD 14 + 15  
[14] = PZD 15 + 16  
[15] = PZD 16 + 17  
[16] = PZD 17 + 18  
[17] = PZD 18 + 19  
[18] = PZD 19 + 20  
[19] = PZD 20 + 21  
[20] = PZD 21 + 22

**Dependency:** Refer to: r8850

**Notice:** Where there is a multiple interconnection of a connector output, all the connector inputs must either have Integer or FloatingPoint data types.

A BICO interconnection for a single PZD can only take place either on r8850 or r8860.

A maximum of 4 indices of the "trace" function can be used.

**Note:** IF2: Interface 2

| <b>Index:</b>       | [0] = PZD 1 + 2<br>[1] = PZD 2 + 3<br>[2] = PZD 3 + 4  |                       |   |

## 2 Parameters

### 2.2 List of parameters

**Dependency:** Refer to: r8850  
**Notice:** Where there is a multiple interconnection of a connector output, all the connector inputs must either have Integer or FloatingPoint data types.  
A BICO interconnection for a single PZD can only take place either on r8850 or r8860.  
**Note:** IF2: Interface 2

|  |                                 |                      |                            |
|--|---------------------------------|----------------------|----------------------------|
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC | <b>Can be changed:</b> C2(1), T | <b>Calculated:</b> - | <b>Access level:</b> 3     |
|  | <b>Data type:</b> Unsigned16    | <b>Dyn. index:</b> - | <b>Func. diagram:</b> 2423 |
|  | <b>P-Group:</b> Communications  | <b>Unit group:</b> - | <b>Unit selection:</b> -   |
|  | <b>Not for motor type:</b> -    | <b>Scaling:</b> -    | <b>Expert list:</b> 1      |
|  | <b>Min</b>                      | <b>Max</b>           | <b>Factory setting</b>     |
|  | 700                             | 999                  | 999                        |

**Description:** Sets the first supplementary telegram.

**Value:**  
700: Suppl. telegram 700, PZD-0/3  
701: Supplementary telegram 701, PZD-2/5  
750: Supplementary telegram 750, PZD-3/1  
999: Free telegram configuration with BICO

**Dependency:** For p0922 equal to p2079 equal to 999, then p8864 is locked.

Refer to: p0922, p2070, p2071, p2079, p8865, p60122

**Note:** The clearance to the PZD telegram can be increased using p2070/p2071.

After changing p0922/p2079 or p2070/p2071, then p8864 must be set again.

---

### p8865 IF1 PROFIdrive second supplementary telegram selection / IF1 Pd 2. sup\_tel

|  |                                 |                      |                            |

|  | 700                             | 999                  | 999                        |

**Description:** Sets the second supplementary telegram.

**Value:**  
700: Suppl. telegram 700, PZD-0/3  
701: Supplementary telegram 701, PZD-2/5  
750: Supplementary telegram 750, PZD-3/1  
999: Free telegram configuration with BICO

**Dependency:** For p8864 equal to 999, then p8865 is locked.

Refer to: p0922, p2079, p8864, p60122

**Note:** The second supplementary telegram is attached directly to the first supplementary telegram.

After changing p0922/p2079, p2070/p2071 or p8864, then p8865 must be set again.

| <b>Description:</b>  | Sets the signal source for the connector-binector converter.<br>A PZD receive word can be selected as signal source. The signals are available to be serially passed-on (interconnection). |  |  |  |  |
| <b>Dependency:</b>   | Refer to: r8850, r8894, r8895, p8898   |  |  |  |  |

## 2 Parameters

### 2.2 List of parameters

**Note:** From the signal source set via the connector input, the corresponding lower 16 bits are converted. p8899[0...1] together with r8894.0...15 and r8895.0...15 forms two connector-binector converters:  
Connector input p8899[0] to binector output in r8894.0...15  
Connector input p8899[1] to binector output in r8895.0...15

## 2 Parameters

### 2.2 List of parameters

---

|   |   |                      |                          |
|---|---|----------------------|--------------------------|
| <b>p8906</b>  | <b>Commissioning tool maximum telegram length / Com tel max</b> |                      |                          |
| CU_S_AC_DP,<br>CU_S_AC_PN,<br>CU_S120_PN,<br>CU_S150_PN,<br>CU_S120_DP,<br>CU_S150_DP | <b>Can be changed:</b> T  | <b>Calculated:</b> - | <b>Access level:</b> 3   |
|   | <b>Data type:</b> Integer16                                     | <b>Dyn. index:</b> - | <b>Func. diagram:</b> -  |
|   | <b>P-Group:</b> -   | <b>Unit group:</b> - | <b>Unit selection:</b> - |
|   | <b>Not for motor type:</b> -                                    | <b>Scaling:</b> -    | <b>Expert list:</b> 1    |
|   | <b>Min</b>  | <b>Max</b>           | <b>Factory setting</b>   |
|   | 0   | 2                    | 2                        |

**Description:** Sets the maximum telegram length for the Ethernet connection to a commissioning tool (e.g. STARTER, Startdrive, HMI).

**Value:**  
0: 240 bytes  
1: 480 bytes  
2: 960 bytes

**Note:** The parameter is effective for Ethernet interfaces (Ethernet X127, PROFINET X150, PROFINET CBE20 X1400).  
The telegram length actually used is negotiated between the participants.  
We recommend that the telegram length is reduced to 240 bytes in the following cases:  
- problems when operating with routed connections.  
- operation with a SINUMERIK 840D.  
A change only becomes effective after a POWER ON or reset.  
The parameter is not influenced by setting the factory setting.

|   | <b>Not for motor type:</b> -  | <b>Scaling:</b> -    | <b>Expert list:</b> 1    |
|   | <b>Min</b>                    | <b>Max</b>           | <b>Factory setting</b>   |
|   | 0                             | 1                    | 0                        |

**Description:** Activation of the FTP server.  
Permits the FTP access to the /INSTALL/SINAMICS directory of the memory card.

**Value:**  
0: No  
1: Yes

**Note:** Activation of the FTP server becomes effective immediately.  
Deactivation only becomes effective after a POWER ON of the Control Unit.  
Before the first commissioning, the FTP server is activated irrespective of the parameter setting.

|  | -   | -                    | -                        |
| <b>Description:</b>                      | Display for the cyclic connection diagnostics.  |                      |                          |
| <b>Index:</b>                            | [0] = Number of cyclic connections<br>[1] = Number of send subslots of all connections<br>[2] = Number of send net data (bytes) of all connections<br>[3] = Number of receive subslots of all connections<br>[4] = Number of receive net data (bytes) of all connections<br>[5] = Connection type (RT, IRT) |                      |                          |

**Note:** The parameter is active when the "PROFINET Device" and "EtherNet/IP" protocols are selected (p2030 = 7, 10).  
 For PROFINET, the following applies:  
 For index [5]:  
 Bit 0 = 1: there is at least one RT connection.  
 Bit 1 = 1: there is an IRT connection.  
 For EtherNet/IP, the following applies:  
 For index [1, 3, 5]:  
 These indices are not relevant.

**Description:** Sets the station name for the Communication Board Ethernet 20/25/41 (CBE20/CBE25/CBE41).

**Dependency:** Refer to: p8945, r8950

## 2 Parameters

### 2.2 List of parameters

**Note:** An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.  
The interface configuration (p8940 and following) is activated with p8945.  
The parameter is not influenced by setting the factory setting.

|   | <b>Data type:</b> Integer16    | <b>Dyn. index:</b> - | <b>Func. diagram:</b> -  |
|   | <b>P-Group:</b> Communications | <b>Unit group:</b> - | <b>Unit selection:</b> - |
|   | <b>Not for motor type:</b> -   | <b>Scaling:</b> -    | <b>Expert list:</b> 1    |
|   | <b>Min</b>                     | <b>Max</b>           | <b>Factory setting</b>   |
|   | 0                              | 1                    | 1                        |

**Description:** The setting to activate/deactivate SNMP for the Industrial Ethernet interface (X127) and the onboard PROFINET interface (X150).  
Facilitates SNMP access for network diagnostic tools (e.g. PRONETA).

**Value:**  
0: No  
1: Yes

**Notice:** When SNMP is activated, carefully note the impact relating to Industrial Security.

**Note:** SNMP: Simple Network Management Protocol  
A change only becomes effective after a POWER ON or reset.  
The setting is only active on onboard interfaces (X127/X150).  
For PROFINET CBExx, SNMP is always activated.

---

### p8984[0...1] BI: Web server interface enable signal source / Web serv enab s\_s

|  |                                       |                      |                          |

|  | -                                     | -                    | [0] 1<br>[1] 0           |

**Description:** Sets the signal source to enable the interface to access the web server.

**Index:**  
[0] = Reserved  
[1] = PROFINET X150

**Dependency:** The web server must be activated using p8986.0 = 1 before it can be used.  
Refer to: p8986

**Note:** BI:p8984[1] = 1 signal:  
PROFINET interface X150 is enabled for access to the web server.  
BI:p8984[1] = 0 signal:  
PROFINET interface X150 is blocked for access to the web server.

| CU_I, CU_NX_CX,<br>CU_S_AC_DP,<br>CU_S_AC_PN,<br>CU_S120_PN,<br>CU_S150_PN,<br>CU_S120_DP,<br>CU_S150_DP,<br>CU_I_D410 | <b>Can be changed:</b> -<br><b>Data type:</b> Unsigned32<br><b>P-Group:</b> Topology<br><b>Not for motor type:</b> -<br><b>Min</b><br>-  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>-   | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>-  |
| <b>Description:</b>  | Displays the value for the property set in p9206.<br>A value is only displayed for integer type properties.  |  |  |
| <b>Dependency:</b>   | Refer to: p9206, r9208   |  |  |
| <hr/>  |  |  |  |
| <b>r9208[0...50]</b>   | <b>Topology direct access string / Topo access string</b>  |  |  |
| CU_I, CU_NX_CX,<br>CU_S_AC_DP,<br>CU_S_AC_PN,<br>CU_S120_PN,<br>CU_S150_PN,<br>CU_S120_DP,<br>CU_S150_DP,<br>CU_I_D410 | <b>Can be changed:</b> -<br><b>Data type:</b> Unsigned8<br><b>P-Group:</b> Topology<br><b>Not for motor type:</b> -<br><b>Min</b><br>-   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>-   | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>-  |
| <b>Description:</b>  | Displays the value for the property set in p9206.<br>A value is only displayed for string type properties.   |  |  |
| <b>Dependency:</b>   | Refer to: p9206, r9207   |  |  |
| <b>Note:</b>   | An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.  |  |  |
| <hr/>  |  |  |  |
| <b>p9210</b>   | <b>Flashing component number / Flash comp_no</b>   |  |  |
| CU_I, CU_NX_CX,<br>CU_S_AC_DP,<br>CU_S_AC_PN,<br>CU_S120_PN,<br>CU_S150_PN,<br>CU_S120_DP,<br>CU_S150_DP,<br>CU_I_D410 | <b>Can be changed:</b> U, T<br><b>Data type:</b> Unsigned16<br><b>P-Group:</b> Topology<br><b>Not for motor type:</b> -<br><b>Min</b><br>0   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>499 | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0  |
| <b>Description:</b>  | Sets the component number for a component to get its status LED to flash.  |  |  |
| <b>Dependency:</b>   | Refer to: p9211  |  |  |
| <hr/>  |  |  |  |
| <b>p9211</b>   | <b>Flash function / Flash fct</b>  |  |  |
| CU_I, CU_NX_CX,<br>CU_S_AC_DP,<br>CU_S_AC_PN,<br>CU_S120_PN,<br>CU_S150_PN,<br>CU_S120_DP,<br>CU_S150_DP,<br>CU_I_D410 | <b>Can be changed:</b> U, T<br><b>Data type:</b> Integer16<br><b>P-Group:</b> Topology<br><b>Not for motor type:</b> -<br><b>Min</b><br>-1   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>1   | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>-1 |
| <b>Description:</b>  | Sets the function for the components selected in p9210.<br>After initiating a function, the parameter is automatically reset again.<br>Example:<br>- set the component number (p9210).<br>- select the "flashing on" function (set p9211 = 1). |  |  |
| <b>Value:</b>  | -1: Select function<br>0: Flashing off<br>1: Flashing on   |  |  |
| <b>Dependency:</b>   | Refer to: p9210  |  |  |

**Notice:** If a task cannot be executed (e.g. the component number in p9210 does not exist), the following applies:

- there is no negative feedback signal.
- the value is reset anyway.

| <b>r9220</b>   | <b>Statistics number of entries / Stat entries qty</b>   |  |   |
|--|--|--|---|
| CU_I, CU_NX_CX,<br>CU_S_AC_DP,<br>CU_S_AC_PN,<br>CU_S120_PN,<br>CU_S150_PN,<br>CU_S120_DP,<br>CU_S150_DP,<br>CU_I_D410 | <b>Can be changed:</b> -<br><b>Data type:</b> Unsigned16<br><b>P-Group:</b> -<br><b>Not for motor type:</b> -<br><b>Min</b><br>- | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- | <b>Access level:</b> 4<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- |
| <b>Description:</b>  | Displays the number of statistic entries in r9222.   |  |   |
| <b>Dependency:</b>   | In p9221, the component Id is set whose statistical entries are to be displayed.<br>Refer to: p9221, r9222                       |  |   |

| <b>p9221</b>   | <b>Statistic components Id / Stat comp Id</b>  |   |  |
|--|--|---|--|
| CU_I, CU_NX_CX,<br>CU_S_AC_DP,<br>CU_S_AC_PN,<br>CU_S120_PN,<br>CU_S150_PN,<br>CU_S120_DP,<br>CU_S150_DP,<br>CU_I_D410 | <b>Can be changed:</b> T<br><b>Data type:</b> Unsigned8<br><b>P-Group:</b> -<br><b>Not for motor type:</b> -<br><b>Min</b><br>0000 hex | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>00FF hex | <b>Access level:</b> 4<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0002 hex |
| <b>Description:</b>  | Selects the component Id whose statistics are to be displayed in r9222.  |   |  |
| <b>Dependency:</b>   | Refer to: r9220, r9222   |   |  |

| <b>r9222[0...n]</b>  | <b>Statistic DRIVE-CLiQ acyclic communication / Stat DQ acycl comm</b>  |  |   |
|--|---|--|---|
| CU_I, CU_NX_CX,<br>CU_S_AC_DP,<br>CU_S_AC_PN,<br>CU_S120_PN,<br>CU_S150_PN,<br>CU_S120_DP,<br>CU_S150_DP,<br>CU_I_D410 | <b>Can be changed:</b> -<br><b>Data type:</b> Unsigned32<br><b>P-Group:</b> -<br><b>Not for motor type:</b> -<br><b>Min</b><br>-  | <b>Calculated:</b> -<br><b>Dyn. index:</b> r9220<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- | <b>Access level:</b> 4<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- |
| <b>Description:</b>  | Displays the statistics for the acyclic DRIVE-CLiQ communication of a component.<br>The component is preset in p9221.<br>The entry comprises the following elements:<br>Index 0: Parameter Id.<br>Index 1: Number of messages sent.<br>Index 2: Minimum time of all acyclic tasks referred to parameter Id (index 0).<br>Index 3: Maximum time of all acyclic requests referred to the parameter Id (index 0).<br>Index 4: Average of all acyclic requests referred to the parameter Id (index 0).<br>The time unit is 10 µs. |  |   |
| <b>Dependency:</b>   | The number of statistic entries is displayed in p9220.<br>In p9221, the component Id can be set whose statistic is to be displayed.<br>Refer to: r9220, p9221   |  |   |
| <b>Note:</b>   | As a statistic entry comprises 5 data, when calling the entries via the terminal, a size that represents a multiple of 5 must be specified.<br>Example:<br>The 2nd entry should be called:<br>rdp 1 9222 5 5<br>or<br>rdpa 1 9222 5 5   |  |   |

## 2 Parameters

### 2.2 List of parameters

| <b>p9300</b>   |   | <b>SI Motion monitoring clock cycle (Motor Module) / SI Mtn clock MM</b> |                          |  |
|--|---|--|--------------------------|--|
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC | <b>Can be changed:</b> C2(95)   | <b>Calculated:</b> -   | <b>Access level:</b> 3   |  |
|  | <b>Data type:</b> FloatingPoint32   | <b>Dyn. index:</b> -   | <b>Func. diagram:</b> -  |  |

**Description:**

Sets the function configuration for the safe motion monitoring functions.

**Bit field:**

| Bit | Signal name   | 1 signal           | 0 signal      | FP |
|-----|---|--------------------|---------------|----|
| 00  | Extended message acknowledgment                     | Yes                | No            | -  |
| 01  | Setpoint velocity limit for STOP F                  | No                 | Yes           | -  |
| 02  | Actual value sensing encoderless motor type         | Synchronous motor  | ASM/RESM      | -  |
| 03  | SS1 with OFF3 (brake response)                      | SS1E external stop | SS1 with OFF3 | -  |
| 05  | Actual value sensing sensorless edge modulation     | Yes                | No            | -  |
| 06  | Configuration test stop motion monitoring functions | Test automatic     | Test manual   | -  |

**Dependency:**

Refer to: C01711

**Notice:**

This parameter is overwritten by the copy function of the safety functions integrated in the drive.

**Note:**

For bit 00:

When the function is activated, a safety-relevant acknowledgment (internal event acknowledge) can be performed by selecting/deselecting STO.

For bit 01:

When the function is activated, the active setpoint velocity limit (CO: r9733) is set to zero when STOP F is active.

For bit 02:

This bit defines the type of motor, which the sensorless actual value sensing evaluates.

For bit = 0, the actual speed is calculated for an induction/re reluctance motor.

For bit = 1, the actual speed is calculated for a synchronous motor. This value depends on the setting in p0300.

Bit = 0 should be set if no motor is defined (p0300 = 0).

For bit 03:

When the bit is activated – when selecting function SS1 or activating a STOP B – an SS1E or a STOP B with stop, which should be externally initiated, is triggered instead of SS1 with a drive-based braking response. As a consequence, brake monitoring (SBR, SAM) is deactivated.

SS1E: Safe Stop 1 external (Safe Stop 1 with external stop)

For bit 05:

This bit defines the type of modulation, which the sensorless actual value sensing evaluates.

For bit = 0, the actual velocity is calculated for space vector modulation.

For bit = 1, the actual velocity is calculated for edge modulation. This value depends on the setting in p1802.

For bit 06:

When the bit is active, the test stop of the Extended Functions and the test stop of the onboard F-DO is carried out. The onboard F-DO can be deactivated via p10146.

ASM: Induction motor

RESM: reluctance synchronous motor (synchronous reluctance motor)

**Description:** Sets the behavior of safety functions and their feedback during pulse suppression in encoderless operation.

| <b>Bit field:</b> | <b>Bit</b> | <b>Signal name</b>                           | <b>1 signal</b>  | <b>0 signal</b> | <b>FP</b> |
|-------------------|------------|--|------------------|-----------------|-----------|
|                   | 00         | SSM during pulse suppression and encoderless | Becomes inactive | Remains active  | -         |
|                   | 08         | SDI during pulse suppression and encoderless | Becomes inactive | Remains active  | -         |

**Dependency:** Refer to: C01711

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.

For bit 00:

If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.

**Note:** SDI: Safe Direction (safe motion direction)

SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring)

For bit 00:

For bit = 1 and with the SSM safety function activated, the following applies:

- During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level.

For bit = 0 and with the SSM safety function activated, the following applies:

- Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state.

For bit 08:

For bit = 1 and with the SDI safety function activated, the following applies:

- During pulse suppression, monitoring is switched off and the status signal indicates inactive.

For bit = 0 and with the SDI safety function activated, the following applies:

- Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

| <b>p9311</b> | <b>SI Motion actual value sensing clock cycle (Motor Module) / SI Mtn act clk MM</b>   |  |   |
| HLA          | <b>Can be changed:</b> C2(95)<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Safety Integrated<br><b>Not for motor type:</b> -<br><b>Min</b><br>0.0000 [µs] | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>25000.0000 [µs] | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0.0000 [µs] |

**Description:** Sets the clock cycle time of the actual value sensing for safe motion monitoring. Setting criteria if the motion monitoring functions are executed with an encoder.  
- a slower clock cycle time reduces the maximum permissible velocity - however, it ensures a lower load of the Control Unit for safe actual value sensing.  
- the maximum permissible velocity which, when exceeded, can mean that errors occur during safe actual value sensing, is displayed in r9730.  
- the isochronous PROFIBUS clock cycle is used as a clock cycle time for actual value sensing with a setting of 0 ms; the setting is 1 ms if isochronous operation is not being used.

**Dependency:** Refer to: p0115, p9300, p9511

Refer to: F01652

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.

**Note:** The parameter is only active for drive-based motion monitoring functions (p9801.2 = 1).  
 The monitoring clock cycle from p9300 must be an integer multiple of this parameter.  
 In the case of motion monitoring functions with encoder, the clock cycle time for actual value sensing must be an integer multiple of the current controller clock cycle and at least 4 times slower than the current controller clock cycle. A factor of at least 8 is recommended.  
 The clock cycle time of the actual value sensing should not be set to more than 8 ms.  
 A change only becomes effective after a POWER ON.

---

|-------------|-----------------|-------------|

**Description:** Sets the clock cycle time of the actual value sensing for safe motion monitoring.  
 Setting criteria if the motion monitoring functions are executed with an encoder.  
 - a slower clock cycle time reduces the maximum permissible velocity - however, it ensures a lower load of the Control Unit for safe actual value sensing.  
 - the maximum permissible velocity which, when exceeded, can mean that errors occur during safe actual value sensing, is displayed in r9730.  
 - the isochronous PROFIBUS clock cycle is used as a clock cycle time for actual value sensing with a setting of 0 ms; the setting is 1 ms if isochronous operation is not being used.  
 Setting criteria if the motion monitoring functions are executed without an encoder:  
 - the actual value sensing clock cycle must be set to the same value as the current controller clock cycle (p0115[0]).  
 For SINAMICS S120M, the following applies:  
 Only setting p9311 = 0 or 2 ms is possible (a value of 0 is internally assumed to be 2).

**Dependency:** Refer to: p0115, p9300, p9511  
 Refer to: F01652

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.

**Note:** The parameter is only active for drive-based motion monitoring functions (p9801.2 = 1).  
 The monitoring clock cycle from p9300 must be an integer multiple of this parameter.  
 In the case of motion monitoring functions with encoder, the clock cycle time for actual value sensing must be an integer multiple of the current controller clock cycle and at least 4 times slower than the current controller clock cycle. A factor of at least 8 is recommended.  
 The clock cycle time of the actual value sensing should not be set to more than 8 ms.  
 A change only becomes effective after a POWER ON.

## 2 Parameters

### 2.2 List of parameters

**Dependency:** Refer to: r9881

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.

---

#### **p9329 SI Motion Gx\_XIST1 coarse pos safe most significant bit (MM) / Gx\_XIST1 MSB MM**

|  |                                   |                      |                          |
|--|-----------------------------------|----------------------|--------------------------|
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC | <b>Can be changed:</b> C2(95)     | <b>Calculated:</b> - | <b>Access level:</b> 3   |
|  | <b>Data type:</b> Unsigned16      | <b>Dyn. index:</b> - | <b>Func. diagram:</b> -  |
|  | <b>P-Group:</b> Safety Integrated | <b>Unit group:</b> - | <b>Unit selection:</b> - |
|  | <b>Not for motor type:</b> -      | <b>Scaling:</b> -    | <b>Expert list:</b> 1    |
|  | <b>Min</b>                        | <b>Max</b>           | <b>Factory setting</b>   |
|  | 0                                 | 31                   | 14                       |

**Description:** Sets the bit number for the safe most significant bit (MSB) of the Gx\_XIST1 coarse position.  
The encoder that is used for the safe motion monitoring functions on the Motor Module/Hydraulic Module must be parameterized in this parameter.

**Dependency:** Refer to: p0415, r0475, p9529

**Note:** MSB: Most Significant Bit

---

#### **p9330 SI Motion standstill tolerance (Motor Module) / SI Mtn SOS Tol MM**

|  |                                   |                      |                          |
|--|-----------------------------------|----------------------|--------------------------|
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC | <b>Can be changed:</b> C2(95)     | <b>Calculated:</b> - | <b>Access level:</b> 3   |
|  | <b>Data type:</b> FloatingPoint32 | <b>Dyn. index:</b> - | <b>Func. diagram:</b> -  |
|  | <b>P-Group:</b> Safety Integrated | <b>Unit group:</b> - | <b>Unit selection:</b> - |
|  | <b>Not for motor type:</b> -      | <b>Scaling:</b> -    | <b>Expert list:</b> 1    |
|  | <b>Min</b>                        | <b>Max</b>           | <b>Factory setting</b>   |
|  | 0.000 [mm]                        | 100.000 [mm]         | 1.000 [mm]               |

**Description:** Sets the tolerance for the function "Safe Operating Stop" (SOS).

**Dependency:** Refer to: p9530

Refer to: C01707

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.

**Note:** SOS: Safe Operating Stop

---

#### **p9330 SI Motion standstill tolerance (Motor Module) / SI Mtn SOS Tol MM**

|  |                                   |                      |                          |

|     | 0.0010 [mm]                       | 360.0000 [mm]        | 0.1000 [mm]              |

**Description:** Sets the tolerance for the data cross-check of the actual position between the two monitoring channels.

**Dependency:** Refer to: p9542

Refer to: C01711

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.

**Note:** For a linear axis, the tolerance is internally limited to 10 mm.

For a "linear axis with rotating motor" and factory setting of p9320, p9321 and p9322, the factory setting of p9342 corresponds to a position tolerance of 36 ° on the motor side.

---

**p9342 SI Motion act val comparison tol (cross-check) (Motor Module) / SI Mtn ActV tol MM**

|   |                                   |                      |                          |

|  | <b>Min</b>                        | <b>Max</b>           | <b>Factory setting</b>   |

0.00 [µs] 600000000.00 [µs] 100000.00 [µs]

**Description:** Sets the transition time from STOP E to "Safe Operating Stop" (SOS).

**Dependency:** Refer to: p9554

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.

**Note:** The set time is rounded internally to an integer multiple of the monitoring clock cycle.  
SOS: Safe Operating Stop

---

#### p9355 SI Motion transition time STOP F to STOP B (Motor Module) / SI Mtn t F->B MM

|  |                                   |                      |                            |

## 2 Parameters

### 2.2 List of parameters

|  |  |  |  |
|--|--|--|--|
| <b>p9380</b>   | <b>SI Motion stop response delay bus failure (Motor Module) / SI Mtn t to IL MM</b>  |  |  |
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC   | <b>Can be changed:</b> C2(95)<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Safety Integrated<br><b>Not for motor type:</b> -<br><b>Min</b><br>0.00 [µs]   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>800000.00 [µs]        | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0.00 [µs]          |
| <b>Description:</b>  | Sets the delay time, after which the stop response parameterized in p9612 for bus failure is executed.   |  |  |
| <b>Dependency:</b>   | Refer to: p9363  |  |  |
| <b>Notice:</b>   | This parameter is overwritten by the copy function of the safety functions integrated in the drive.  |  |  |
| <b>Note:</b>   | In the extended sense, a bus failure should be seen here as a communication error in the control signals of the safety functions (e.g. via PROFIsafe or TM54F).<br>The main use of the wait time is the function "Extended stopping and retraction" (ESR).<br>The set time is rounded internally to an integer multiple of the monitoring clock cycle. |  |  |
| <b>p9381</b>   | <b>SI Motion brake ramp reference value (Motor Module) / SI Mtn ramp ref MM</b>  |  |  |
| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC  | <b>Can be changed:</b> C2(95)<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Safety Integrated<br><b>Not for motor type:</b> -<br><b>Min</b><br>600.0000 [mm/min]   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>1000000.0000 [mm/min] | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>1500.0000 [mm/min] |
| <b>Description:</b>  | Sets the reference value to define the brake ramp.<br>The rate of rise of the brake ramp depends upon p9381 (reference value) and p9383 (monitoring time).   |  |  |
| <b>Dependency:</b>   | Refer to: p9382, p9383   |  |  |
| <b>Notice:</b>   | This parameter is overwritten by the copy function of the safety functions integrated in the drive.  |  |  |

## 2 Parameters

### 2.2 List of parameters

**Note:** This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).  
For synchronous motors, the value 4 must be set.  
If value = -1:  
- for synchronous motors, the calculation is automatically made with the value 4.  
- for induction/re reluctance motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2).

---

#### p9386 SI Motion actual value sensing sensorless delay time (MM) / ActV sl t\_del MM

|   |                                   |                      |                          |

|   | <b>Not for motor type:</b> -      | <b>Scaling:</b> -    | <b>Expert list:</b> 1    |
|   | <b>Min</b>                        | <b>Max</b>           | <b>Factory setting</b>   |
|   | 5.00 [ms]                         | 1000.00 [ms]         | 100.00 [ms]              |

**Description:** Sets the delay time to evaluate the encoderless actual value sensing after the pulses have been enabled.  
The value must be greater than or equal to the motor magnetizing time (p0346).

**Dependency:** Refer to: C30711

**Caution:** The safety functionality is only completely guaranteed after this time has expired.

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.  
If this value is reduced, this can have a negative impact on the actual value acquisition and plausibility check – and result in Safety message C30711 with the message value 1041 or 1042.

**Note:** This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).  
The set time is rounded internally to an integer multiple of the monitoring clock cycle.

---

#### p9387 SI Motion actual value sensing sensorless filter time (MM) / ActV sl t\_filt MM

|   |                                   |                      |                          |
|---|-----------------------------------|----------------------|--------------------------|
| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC | <b>Can be changed:</b> C2(95)     | <b>Calculated:</b> - | <b>Access level:</b> 3   |
|   | <b>Data type:</b> FloatingPoint32 | <b>Dyn. index:</b> - | <b>Func. diagram:</b> -  |
|   | <b>P-Group:</b> Safety Integrated | <b>Unit group:</b> - | <b>Unit selection:</b> - |
|   | <b>Not for motor type:</b> -      | <b>Scaling:</b> -    | <b>Expert list:</b> 1    |
|   | <b>Min</b>                        | <b>Max</b>           | <b>Factory setting</b>   |
|   | 0.00 [µs]                         | 100000.00 [µs]       | 25000.00 [µs]            |

**Description:** Sets the filter time for smoothing the actual value with sensorless actual value sensing.

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.  
A longer filter time results in a longer response time.

**Note:** This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).  
The smoothing is realized with a 1st order lowpass filter  
For p9387 = minimum value, the filter is deactivated.  
The set time is rounded internally to an integer multiple of the monitoring clock cycle.

---

#### p9388 SI Motion actual value sensing sensorless minimum current (MM) / ActV sl I\_min MM

|   |                                   |                      |                          |
|---|-----------------------------------|----------------------|--------------------------|
| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC | <b>Can be changed:</b> C2(95)     | <b>Calculated:</b> - | <b>Access level:</b> 3   |
|   | <b>Data type:</b> FloatingPoint32 | <b>Dyn. index:</b> - | <b>Func. diagram:</b> -  |
|   | <b>P-Group:</b> Safety Integrated | <b>Unit group:</b> - | <b>Unit selection:</b> - |
|   | <b>Not for motor type:</b> -      | <b>Scaling:</b> -    | <b>Expert list:</b> 1    |
|   | <b>Min</b>                        | <b>Max</b>           | <b>Factory setting</b>   |
|   | 0.00 [%]                          | 1000.00 [%]          | 10.00 [%]                |

**Description:** Sets the minimum current for encoderless actual value sensing referred to 1 A (i.e. 1 % = 10 mA).  
- the value must be increased if C30711 has occurred with message value 1042.  
- the value must be decreased if C30711 has occurred with message value 1041.

For synchronous motors, the following condition must be fulfilled:  
 $|p0305 \times p9783| \geq p9388 \times 1.2$

**Recommendation:** If required, the correct value of the motor minimum current should be determined by making the appropriate measurements.

|                    |  |
|--------------------|--|
| <b>Dependency:</b> | Refer to: r9785<br>Refer to: C30711  |
| <b>Notice:</b>     | This parameter is overwritten by the copy function of the safety functions integrated in the drive.<br>If this percentage value is reduced excessively, then this can result in a safety message and an inaccurate actual value. |
| <b>Note:</b>       | This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).  |

---

**p9389 SI Motion actual value sensing sensorless accel. limit (MM) / ActV sl a\_lim MM**

|   |  |  |  |
|---|--|--|--|
| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC | <b>Can be changed:</b> C2(95)<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Safety Integrated<br><b>Not for motor type:</b> -<br><b>Min</b><br>10.00 [%] | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>3300.00 [%] | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>100.00 [%] |
|---|--|--|--|

**Description:** Sets the acceleration limit to filter velocity fluctuations.  
If this percentage value is increased, when accelerating, velocity peaks that do not reflect the real velocity characteristic can occur.

If this value is decreased, and this dampens the velocity peaks when accelerating.

- the value must be increased if C30711 with message value 1043 has occurred.

- the value must be lowered if acceleration procedures have led to an excessive Safety actual velocity.

**Recommendation:** The setting of this parameter depends on the motor and closed-loop control, and must be newly determined for each configuration.

To do this, a measurement should be performed while the actual value jumps, and the limit in r9785[0] must be set so low using p9389, so that it is exceeded by the value in r9785[1] a maximum of four times per second. The actual value correction filter intervenes at this instant in time. The step is no longer so drastic.

**Dependency:** Refer to: r9784

Refer to: C30711

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.

**Note:** This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

For p9389 = maximum value, the filter is deactivated.

Diagnostics parameter p9784 must be used to correctly set this parameter.

---

**r9390[0...3] SI Motion version safety motion monitoring (Motor Module) / SI Mtn version MM**

|  |  |  |   |
|--|--|--|---|
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC | <b>Can be changed:</b> -<br><b>Data type:</b> Unsigned16<br><b>P-Group:</b> Safety Integrated<br><b>Not for motor type:</b> -<br><b>Min</b><br>- | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- |
|--|--|--|---|

**Description:** Displays the Safety Integrated version for the safe monitoring functions.

**Index:** [0] = Safety Version (major release)  
[1] = Safety Version (minor release)  
[2] = Safety Version (baselevel or patch)  
[3] = Safety Version (hotfix)

**Dependency:** Refer to: r9590, r9770, r9870, r9890

**Note:** Example:

r9390[0] = 2, r9390[1] = 60, r9390[2] = 1, r9390[3] = 0 --> SI Motion version V02.60.01.00
