## Legal information

### Warning notice system

This Manual contains information which you must observe to ensure your own personal safety as well as to avoid material damage. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to equipment damage have no safety alert symbol. Depending on the hazard level, warnings are indicated in a descending order as follows:

|  |
|--|
|  <b>DANGER</b>  |
| indicates that death or serious injury <b>will</b> result if proper precautions are not taken.   |
|  <b>WARNING</b> |
| indicates that death or serious injury <b>could</b> result if proper precautions are not taken.  |
|  <b>CAUTION</b> |
| indicates that minor personal injury can result if proper precautions are not taken.             |
| <b>NOTICE</b>  |
| indicates that property damage can result if proper precautions are not taken.                   |

If more than one level of danger is simultaneously applicable, the warning notice for the highest level is used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified personnel

The product/system described in this documentation may only be operated by **personnel qualified** for the specific task in accordance with the relevant documentation for the specific task, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

|  |
|--|
|  <b>WARNING</b>   |
| Siemens products are only permitted to be used for the applications listed in the catalog and in the associated technical documentation. If third-party products and components are used, then they must be recommended or approved by Siemens. These products can only function correctly and safely if they are transported, stored, set up, mounted, installed, commissioned, operated and maintained correctly. The permissible ambient conditions must be adhered to. Notices in the relevant documentation must be observed. |

### Trademarks

All names identified with ® are registered trademarks of Siemens AG. Any other names used in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of liability

We have checked the contents of this publication for consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. The information given in this document is reviewed at regular intervals and any corrections that might be necessary are made in the subsequent editions.

# Preface

## SINAMICS documentation

The SINAMICS documentation is structured according to the following categories:

- General documentation/catalogs
- Manufacturer/service documentation

## Additional information

Information on the following topics is available under the link:

- Ordering documentation/overview of documentation
- Additional links to download documents
- Using documentation online (find and search in manuals/information).

<http://www.siemens.com/motioncontrol/docu>

Please send any questions about the technical documentation (e. g. suggestions for improvement, corrections) to the following e-mail address:

[docu.motioncontrol@siemens.com](mailto:docu.motioncontrol@siemens.com)

## My Documentation Manager

Information on how to produce individual contents for your own machine documentation based on Siemens contents is available under the link:

<http://www.siemens.com/mdm>

## Training

Information about SITRAIN (Siemens Training on products, systems and solutions for automation) is available under the following link:

<http://www.siemens.com/sitrain>

## FAQs

You can find Frequently Asked Questions in the Service&Support pages under Product Support:

<http://support.automation.siemens.com>

## SINAMICS

You can find information on SINAMICS at:

<http://www.siemens.com/sinamics>

## Usage phases and their tools/documents (as an example)

Table V-1 Usage phases and the available tools/documents

| Usage phase            | Tools/documents   |

## Target group

This documentation is intended for machine manufacturers, commissioning engineers, and service personnel who use the SINAMICS drive system.

## Benefits

This documentation contains the comprehensive information about parameters, function diagrams and faults and alarms required to commission and service the system.

This manual should be used in addition to the other manuals and tools provided for the product.

## Standard scope

The scope of the functionality described in this document can differ from that of the drive system that is actually supplied.

- It may be possible for other functions not described in this documentation to be executed in the drive system. However, no claim can be made regarding the availability of these functions when the equipment is first supplied or in the event of servicing.
- Functions that are not available in a particular product version of the drive system may be described in the documentation. The functionality of the supplied drive system should only be taken from the ordering documentation.
- Extensions or changes made by the machine manufacturer must be documented by the machine manufacturer.

For reasons of clarity, this documentation does not contain all of the detailed information on all of the product types, and cannot take into consideration every conceivable type of installation, operation and service/maintenance.

## Search guides

The following guides are provided to help you locate information in this manual:

1. Table of contents
  - Table of contents for the complete manual (Page 9)
  - Table of contents for function diagrams (Page 2067)
2. List of abbreviations (Page 3307)
3. References (Page 3316)
4. Index (Page 3319)

## Technical Support

Country-specific telephone numbers for technical support are provided at the following Internet address:

<http://www.siemens.com/automation/service&support>

## **EC Declaration of Conformity**

The EC Declaration of Conformity for the EMC Directive can be found on the Internet at:

<http://support.automation.siemens.com/WW/view/de/21901735/134200>

Alternatively, you can contact the Siemens office in your region in order to obtain the EC Declaration of Conformity.

## **Compliance with the General Data Protection Regulation**

Siemens respects the principles of data protection, in particular the data minimization rules (privacy by design).

For this product, this means:

The product does not process neither store any person-related data, only technical function data (e.g. time stamps). If the user links these data with other data (e.g. shift plans) or if he stores person-related data on the same data medium (e.g. hard disk), thus personalizing these data, he has to ensure compliance with the applicable data protection stipulations.

# Table of contents

|          |   |      |
|----------|---|------|
| <b>1</b> | <b>Fundamental safety instructions</b> .....                  | 13   |
| 1.1      | General safety instructions .....                             | 14   |
| 1.2      | Warranty and liability for application examples .....         | 14   |
| 1.3      | Security information .....                                    | 15   |
| <b>2</b> | <b>Parameters</b> .....                                       | 17   |
| 2.1      | Overview of parameters .....                                  | 18   |
| 2.1.1    | Explanation of the list of parameters .....                   | 18   |
| 2.1.2    | Number ranges of parameters .....                             | 36   |
| 2.2      | List of parameters .....                                      | 39   |
| 2.3      | Parameters for data sets .....                                | 2031 |
| 2.3.1    | Parameters for command data sets (CDS) .....                  | 2031 |
| 2.3.2    | Parameters for drive data sets (DDS) .....                    | 2034 |
| 2.3.3    | Parameters for encoder data sets (EDS) .....                  | 2050 |
| 2.3.4    | Parameters for motor data sets (MDS) .....                    | 2052 |
| 2.3.5    | Parameters for power unit data sets (PDS) .....               | 2057 |
| 2.4      | Parameters for write protection and know-how protection ..... | 2059 |
| 2.4.1    | Parameters with "WRITE_NO_LOCK" .....                         | 2059 |
| 2.4.2    | Parameters with "KHP_WRITE_NO_LOCK" .....                     | 2061 |
| 2.4.3    | Parameters with "KHP_ACTIVE_READ" .....                       | 2062 |
| <b>3</b> | <b>Function diagrams</b> .....                                | 2065 |

## Fundamental safety instructions

### Content

|     |   |    |
|-----|---|----|
| 1.1 | General safety instructions                     | 14 |
| 1.2 | Warranty and liability for application examples | 14 |
| 1.3 | Security information                            | 15 |

## 1.1 General safety instructions

|   |
|---|
|  <b>WARNING</b>  |
| <b>Danger to life if the safety instructions and residual risks are not observed</b>  |
| If the safety instructions and residual risks in the associated hardware documentation are not observed, accidents involving severe injuries or death can occur.                      |
| <ul style="list-style-type: none"><li>• Observe the safety instructions given in the hardware documentation.</li><li>• Consider the residual risks for the risk evaluation.</li></ul> |

|   |
|---|
|  <b>WARNING</b>  |
| <b>Malfunctions of the machine as a result of incorrect or changed parameter settings</b>   |
| As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.  |
| <ul style="list-style-type: none"><li>• Protect the parameterization against unauthorized access.</li><li>• Handle possible malfunctions by taking suitable measures, e.g. emergency stop or emergency off.</li></ul> |

## 1.2 Warranty and liability for application examples

Application examples are not binding and do not claim to be complete regarding configuration, equipment or any eventuality which may arise. Application examples do not represent specific customer solutions, but are only intended to provide support for typical tasks.

As the user you yourself are responsible for ensuring that the products described are operated correctly. Application examples do not relieve you of your responsibility for safe handling when using, installing, operating and maintaining the equipment.

## 1.3 Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that can be implemented, please visit:

Industrial security (<https://www.siemens.com/industrialsecurity>)

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed at:

Industrial security  
(<https://new.siemens.com/global/en/products/services/cert.html#Subscriptions>).

Further information is provided on the Internet:

Industrial Security Configuration Manual  
(<https://support.industry.siemens.com/cs/ww/en/view/108862708>)

### WARNING

#### Unsafe operating states resulting from software manipulation

Software manipulations (e.g. viruses, trojans, malware or worms) can cause unsafe operating states in your system that may lead to death, serious injury, and property damage.

- Keep the software up to date.
- Incorporate the automation and drive components into a holistic, state-of-the-art industrial security concept for the installation or machine.
- Make sure that you include all installed products into the holistic industrial security concept.
- Protect files stored on exchangeable storage media from malicious software by with suitable protection measures, e.g. virus scanners.
- On completion of commissioning, check all security-related settings.

# Parameters

## Content

|     |   |      |
|-----|---|------|
| 2.1 | Overview of parameters                                  | 18   |
| 2.2 | List of parameters                                      | 39   |
| 2.3 | Parameters for data sets                                | 2031 |
| 2.4 | Parameters for write protection and know-how protection | 2059 |

## 2.1 Overview of parameters

### 2.1.1 Explanation of the list of parameters

#### Basic structure of the parameter descriptions

The data in the following example have been chosen at random. The description of a parameter includes as a maximum the information listed below. Some of the information is optional.

The "List of parameters (Page 39)" has the following structure:

----- **Start of example** -----

| <b>pxxxx[0...n]</b>   | <b>BICO: Full parameter name / abbreviated name</b>   |   |  |                   |
|---|---|---|--|-------------------|
| Drive object<br>(function module)   | <b>Can be changed:</b> C1(x), C2(x), U, T   | <b>Calculated:</b> CALC_MOD_REG   | <b>Access level:</b> 2                 |                   |
|   | <b>Data type:</b> Unsigned32 / Integer16  | <b>Dyn. index:</b> CDS, p0170   | <b>Func. diagram:</b> 8070             |                   |
|   | <b>P-Group:</b> Closed-loop control   | <b>Unit group:</b> 7_1  | <b>Unit selection:</b> p0505           |                   |

----- **End of example** -----

The individual pieces of information are described in detail below.

**pxxxx[0...n]      Parameter number**

The parameter number is made up of a "p" or "r", followed by the parameter number and the index or bit array (optional).

Examples of representation in the parameter list:

- p...                      Adjustable parameters (read and write parameters)
- r...                      Display parameters (read only)
- p0918                    Adjustable parameter 918
- p0099[0...3]          Adjustable parameter 99, indices 0 to 3
- p1001[0...n]          Adjustable parameter 1001, indices 0 to n (n = configurable)
- r0944                    Display parameter 944
- r2129.0...15          Display parameter 2129 with bit array from bit 0 (smallest bit) to bit 15 (largest bit)

Other examples of the notation in the documentation:

- p1070[1]                Adjustable parameter 1070, index 1
- p2098[1].3             Adjustable parameter 2098, index 1 bit 3
- r0945[2](3)            Display parameter 945, index 2 of drive object 3
- p0795.4                Adjustable parameter 795, bit 4

The following applies to adjustable parameters:

The parameter value "when shipped" is specified under "Factory setting" with the relevant unit in square parentheses. The value can be adjusted within the range defined by "Min" and "Max".

The term "linked parameterization" is used in cases where changes to adjustable parameters affect the settings of other parameters.

Linked parameterization can occur, for example, as a result of the following actions and parameters:

- Executing macros  
p0015, p0700, p1000, p1500
- Setting the PROFIBUS telegram (BICO interconnection)  
p0922
- Setting component lists  
p0230, p0300, p0301, p0400
- Automatically calculating and pre-assigning  
p0112, p0340, p0578, p3900
- Restoring the factory settings  
p0970

The following applies to display parameters:

The fields "Min", "Max" and "Factory setting" are specified with a dash "-" and the relevant unit in square parentheses.

---

#### Note

The parameter list can contain parameters that are not visible in the expert lists of the particular commissioning software (e. g. parameters for trace functions).

---

#### BICO: Full parameter name / abbreviated name

The following abbreviations can appear in front of the BICO parameter name:

- BI: Binector Input  
This parameter is used for selecting the source of a digital signal.
- BO: Binector output  
This parameter is available as a digital signal for interconnection with other parameters.
- CI: Connector Input  
This parameter is used for selecting the source of an "analog" signal.
- CO: Connector output  
This parameter is available as an "analog" signal for interconnection with other parameters.
- CO/BO: Connector/Binector Output  
This parameter is available as an "analog" and digital signal for interconnection with other parameters.

---

#### Note

A BICO input (BI/CI) cannot be interconnected with just any BICO output (BO/CO, signal source).

When interconnecting a BICO input using the commissioning software, only the corresponding possible signal sources are listed.

Function diagrams 1020 ... 1030 explain the symbols for BICO parameters and how to deal with BICO technology.

---

#### Drive object (function module)

A drive object (DO) is an independent, "self-contained" functional unit that has its own parameters and, in some cases, faults and alarms.

When carrying out commissioning using the commissioning software, you can select/deselect additional functions and their parameters by activating/deactivating function modules accordingly.

---

#### Note

References: SINAMICS S120 Function Manual Drive Functions

---

The parameter list specifies the associated drive object and function module for each individual parameter.

Examples:

- p1070 CI: Main setpoint  
SERVO (extended setpoint), VECTOR  
The parameter is available only in association with drive object SERVO with the "Extended setpoint channel" function module or with drive object VECTOR irrespective of activated function modules.
- p1055 BI: Jog bit 0  
SERVO, VECTOR  
The parameter is available in association with drive objects SERVO and VECTOR irrespective of activated function modules, i.e. it is also available with every activated function module belonging to the respective drive object.

A parameter can belong to one, several, or all drive objects.

The following information relating to "Drive object" and "Function module" can be displayed under the parameter number:

Table 2-1 Data in the "Drive object (function module)" field

| Drive object (function module) | Type | Significance   |
|--------------------------------|------|--|
| All objects                    | -    | This parameter is used by all drive objects.   |
| A_INF                          | 10   | Active Infeed closed-loop control<br>Closed-loop controlled, self-commutated infeed/regenerative feedback unit for generating a constant DC-link voltage |
| A_INF (supplementary control)  | -    | Active Infeed with "Additional controls" function module (r0108.3)   |
| A_INF (line transformer)       | -    | Active Infeed with "Line transformer" function module (r0108.4).   |
| A_INF (rec)                    | -    | Active Infeed with "Recorder" function module (r0108.5).   |
| A_INF (dynamic line buffering) | -    | Active Infeed with "Dynamic line buffering" function module (r0108.7).   |
| A_INF (cos phi)                |      | Active Infeed with "cosine phi" function module (r0108.10).  |
| A_INF (line droop control)     | -    | Active Infeed with "Line droop control" function module (r0108.12).  |
| A_INF (parallel)               | -    | Active Infeed with "Parallel connection" function module (r0108.15).   |

| A_INF (Brk Mod Ext)            | -    | Active Infeed with "Braking Module external" function module (r0108.26).   |
| A_INF (Cooling unit)           | -    | Active Infeed with "Cooling unit" function module (r0108.28)   |
| A_INF (PN CBE20)               | -    | Active Infeed with "PROFINET CBE20" function module (r0108.31).  |
| B_INF                          | 30   | Basic Infeed closed loop control<br>Unregulated line infeed unit (without regenerative feedback) for rectifying the line voltage of the DC link.         |
| B_INF (rec)                    | -    | Basic Infeed with "Recorder" function module (r0108.5).  |
| B_INF (parallel)               | -    | Basic Infeed with "Parallel connection" function module (r0108.15).  |
| B_INF (Brk Mod Ext)            | -    | Basic Infeed with "Braking Module external" function module (r0108.26).  |
| B_INF (Cooling unit)           | -    | Basic Infeed with "Cooling unit" function module (r0108.28)  |

## 2 Parameters

### 2.1 Overview of parameters

Table 2-1 Data in the "Drive object (function module)" field, continued

| Drive object (function module) | Type | Significance  |
|--------------------------------|------|---|
| B_INF (PN CBE20)               | -    | Basic Infeed with "PROFINET CBE20" function module (r0108.31).                                      |
| CU_I                           | 3    | Control Unit SINAMICS Integrated (only SIMOTION D4x5-2).  |
| CU_I_D410                      | 201  | Control Unit SINAMICS Integrated for SIMOTION D410-2.   |
| CU_LINK                        | 254  | Object for Controller Extension 32 (CX32)   |
| CU_NX_CX                       | 4    | Controller Extension for boosting the processing performance  |
| CU_S_AC_DP                     | 2    | Control Unit SINAMICS S120 AC Drive with PROFIBUS interface.  |
| CU_S_AC_PN                     | 3    | Control Unit SINAMICS S120 AC Drive with PROFINET interface.  |
| CU_S120_DP                     | 6    | Control Unit SINAMICS S120 with PROFIBUS interface.   |
| CU_S120_DP (CAN)               | -    | Control Unit SINAMICS S120 with PROFIBUS interface and function module "CAN" (p0108.29).            |
| CU_S120_DP (COMM BOARD)        | -    | Control Unit SINAMICS S120 with PROFIBUS interface and "COMM BOARD" function module (p0108.30).     |
| CU_S120_DP (PN CBE20)          | -    | Control Unit SINAMICS S120 with PROFIBUS interface and "PROFINET CBE20" function module (p0108.31). |
| CU_S120_PN                     | 4    | Control Unit SINAMICS S120 with PROFINET interface.   |
| CU_S120_PN (CAN)               | -    | Control Unit SINAMICS S120 with PROFINET interface and function module "CAN" (p0108.29).            |
| CU_S120_PN (COMM BOARD)        | -    | Control Unit SINAMICS S120 with PROFINET interface and "COMM BOARD" function module (p0108.30).     |
| CU_S120_PN (PN CBE20)          | -    | Control Unit SINAMICS S120 with PROFINET interface and "PROFINET CBE20" function module (p0108.31). |
| CU_S150_DP                     | 7    | Control Unit SINAMICS S150 with PROFIBUS interface.   |
| CU_S150_DP (CAN)               | -    | Control Unit SINAMICS S150 with PROFIBUS interface and function module "CAN" (p0108.29).            |
| CU_S150_DP (COMM BOARD)        | -    | Control Unit SINAMICS S150 with PROFIBUS interface and "COMM BOARD" function module (p0108.30).     |
| CU_S150_DP (PN CBE20)          | -    | Control Unit SINAMICS S150 with PROFIBUS interface and "PROFINET CBE20" function module (p0108.31). |
| CU_S150_PN                     | 5    | Control Unit SINAMICS S150 with PROFINET interface.   |
| CU_S150_PN (CAN)               | -    | Control Unit SINAMICS S150 with PROFINET interface and function module "CAN" (p0108.29).            |
| CU_S150_PN (COMM BOARD)        | -    | Control Unit SINAMICS S150 with PROFINET interface and "COMM BOARD" function module (p0108.30).     |
| CU_S150_PN (PN CBE20)          | -    | Control Unit SINAMICS S150 with PROFINET interface and "PROFINET CBE20" function module (p0108.31). |
| ENC                            | 300  | Object for a DRIVE-CLiQ encoder.  |
| ENC (lin_encoder)              | 300  | Object for a DRIVE-CLiQ encoder with "Linear encoder" function module (r0108.12).                   |
| ENC (PN CBE20)                 | 300  | Object for a DRIVE-CLiQ encoder with function module "PROFINET CBE20" (r0108.31).                   |
| HLA                            | 70   | Hydraulic linear drive.   |

Table 2-1 Data in the "Drive object (function module)" field, continued

| Drive object (function module) | Type | Significance  |
|--------------------------------|------|---|
| HLA (ESR)                      | -    | Hydraulic linear drive with "Extended Stop and Retract" function module (r0108.9).  |
| HLA (PN CBE20)                 | -    | Hydraulic linear drive with function module "PROFINET CBE20" (r0108.31).  |
| HUB                            | 150  | DRIVE-CLiQ Hub Module.  |
| R_INF                          | 21   | Renewable Infeed Control<br>Closed-loop controlled, self-commutated infeed/regenerative feedback unit for generating a constant DC-link voltage |
| R_INF (additional ctrl)        | -    | Renewable Infeed with "Additional controls" function module (r0108.3)   |
| R_INF (line transformer)       | -    | Renewable Infeed with "Line transformer" function module (r0108.4).   |
| R_INF (rec)                    | -    | Renewable Infeed with "Recorder" function module (r0108.5).   |
| R_INF (dynamic line buffering) | -    | Renewable Infeed with "Dynamic line buffering" function module (r0108.7).   |
| R_INF (cos phi)                | -    | Renewable Infeed with "cosine phi" function module (r0108.10).  |
| R_INF (line droop control)     | -    | Renewable Infeed with "Line droop control" function module (r0108.12).  |
| R_INF (parallel)               | -    | Renewable Infeed with "Parallel connection" function module (r0108.15).   |
| R_INF (master/slave)           | -    | Renewable Infeed with "Master/Slave" function module (r0108.19).  |
| R_INF (SW_sts)                 | -    | Renewable Infeed with "Software gating unit" function module (r0108.20).  |
| R_INF (Brk Mod Ext)            | -    | Renewable Infeed with "Braking Module external" function module (r0108.26).   |
| R_INF (Cooling unit)           | -    | Renewable Infeed with "Cooling unit" function module (r0108.28)   |
| R_INF (PN CBE20)               | -    | Renewable Infeed with "PROFINET CBE20" function module (r0108.31).  |
| S_INF                          | 20   | Smart Infeed control<br>Unregulated line infeed/feedback unit for generating the DC-link voltage.   |
| S_INF (rec)                    | -    | Smart Infeed with "Recorder" function module (r0108.5).   |
| S_INF (parallel)               | -    | Smart Infeed with "Parallel connection" function module (r0108.15).   |
| S_INF (Brk Mod Ext)            | -    | Smart Infeed with "Braking Module external" function module (r0108.26).   |
| S_INF (Cooling unit)           | -    | Smart Infeed with "Cooling unit" function module (r0108.28).  |
| S_INF (PN CBE20)               | -    | Smart Infeed with "PROFINET CBE20" function module (r0108.31).  |
| SERVO                          | 11   | Servo drive.  |
| SERVO (ext M_reg)              | -    | Servo drive with "Extended torque control" function module (r0108.1).   |
| SERVO (pos ctrl)               | -    | Servo drive with "Closed-loop position control" function module (r0108.3).  |
| SERVO (EPOS)                   | -    | Servo drive with "Basic positioner" function module (r0108.4).  |
| SERVO (rec)                    | -    | Servo drive with "Recorder" function module (r0108.5).  |
| SERVO (DSC spline)             | -    | Servo drive with function module "DSC with Spline" (r0108.6).   |
| SERVO (APC)                    | -    | Servo drive with "Advanced Positioning Control (APC)" function module (r0108.7).  |
| SERVO (ext setp)               | -    | Servo drive with "Extended setpoint channel" function module (r0108.8).   |
| SERVO (ESR)                    | -    | Servo drive with "Extended Stop and Retract" function module (r0108.9).   |
| SERVO (J_estimator/OBT)        | -    | Servo drive with function module "Moment of inertia estimator/OBT" (r0108.10).  |

## 2 Parameters

### 2.1 Overview of parameters

Table 2-1 Data in the "Drive object (function module)" field, continued

| Drive object (function module) | Type | Significance   |
|--------------------------------|------|--|
| SERVO (Spin_diag)              | -    | Servo drive with "Spindle diagnostics" function module (r0108.11).<br>This function module can only be used in conjunction with a Sensor Module Integrated 24 (SMI24). |
| SERVO (Lin)                    | -    | Servo drive with "Linear motor" function module (r0108.12).  |
| SERVO (Safety rot)             | -    | Servo drive with "Safety rotary axis" function module (r0108.13).  |
| SERVO (ext brake)              | -    | Servo drive with "Extended brake control" function module (r0108.14)   |
| SERVO (Tech_ctrl)              | -    | Servo drive with "Technology controller" function module (r0108.16).   |
| SERVO (ext msg)                | -    | Servo drive with "Extended messages/monitoring functions" function module (r0108.17).  |
| SERVO (AVS/APC-ECO)            | -    | Servo drive with function module "Active Vibration Suppression (AVS/APC-ECO)" (r0108.19).  |
| SERVO (ext I_set_filt)         | -    | Servo drive with "Extended current setpoint filter" function module (r0108.21).  |
| SERVO (cogging_M_comp)         | -    | Servo drive with "cogging torque compensation" function module (r0108.22).   |
| SERVO (Dig IO)                 | -    | Servo drive for SINAMICS S120M with "Digital inputs-/outputs" function module (r0108.23)   |
| SERVO (Cooling unit)           | -    | Servo drive with "Cooling unit" function module (r0108.28).  |
| SERVO (CAN)                    | -    | Servo drive with "CAN" function module (r0108.29).   |
| SERVO (J_estimator)            | -    | Servo drive with "Moment of inertia estimator" function module (r0108.30).   |
| SERVO (PN CBE20)               | -    | Servo drive with "PROFINET CBE20" function module (r0108.31).  |
| SERVO (ctrl_par adapt)         | -    | Servo drive with "Controller parameter adaptation" function module (r0171.29).   |
| SERVO_AC                       | -    | Servo drive for SINAMICS S120 AC Drive.  |
| SERVO_I_AC                     | -    | Servo drive for SINAMICS Integrated in SIMOTION D410-2.  |
| TB30                           | 100  | Terminal Board 30.   |
| TM120                          | 207  | Terminal Module 120.   |
| TM15                           | 203  | Terminal Module 15 (SIMOTION D4xx-2 only).   |
| TM150                          | 208  | Terminal Module 150.   |
| TM15DI_DO                      | 204  | Terminal Module 15 (for SINAMICS).   |
| TM17                           | 202  | Terminal Module 17 (SIMOTION D4xx-2 only).   |

| VECTOR_AC                      | -    | Vector drive for SINAMICS S120 AC Drive.  |
| VECTOR_I_AC                    | -    | Vector drive for SINAMICS Integrated in SIMOTION D410-2.  |

**Note**

The drive object type is used to identify the drive objects in the drive system (e. g. r0107, r0975[1]).

### Can be changed

The "-" sign indicates that the parameter can be changed in any object state and that the change will be effective immediately.

The information "C1(x), C2(x), T, U" ((x): optional) means that the parameter can be changed only in the specified drive unit state and that the change will not take effect until the unit switches to another state. This can be a single state or multiple states.

The following states are available:

- C1(x) Device commissioning C1: **Commissioning 1**  
Device is being commissioned (p0009 > 0).  
Pulses cannot be enabled.  
The parameter can only be changed for the following device commissioning settings (p0009 > 0):
  - C1: Can be changed for all settings p0009 > 0.
  - C1(x): Can be changed only when p0009 = x.A modified parameter value does not take effect until the device commissioning mode is exited with p0009 = 0.
  
- C2(x) Drive object commissioning C2: **Commissioning 2**  
Drive commissioning is in progress (p0009 = 0 and p0010 > 0).  
Pulses cannot be enabled.  
The parameter can only be changed in the following drive commissioning settings (p0010 > 0):
  - C2: Can be changed for all settings p0010 > 0.
  - C2(x): Can only be changed for the settings p0010 = x.A modified parameter value does not take effect until drive commissioning mode is exited with p0010 = 0.
  
- U Operation U: **Run**  
Pulses are enabled.
  
- T Ready T: **Ready to run**  
The pulses are not enabled and the state "C1(x)" or "C2(x)" is not active.

---

#### Note

Parameter p0009 is CU-specific (belongs to the Control Unit).

Parameter p0010 is drive-specific (belongs to each drive object).

The operating state of individual drive objects is displayed in r0002.

---

## Calculated

Specifies whether the parameter is influenced by automatic calculations.

The calculation attribute defines which activities influence the parameter.

The following attributes exist:

- CALC\_MOD\_ALL
  - p0340 = 1
  - Project download with commissioning software and send from p0340 = 3
- CALC\_MOD\_CON
  - p0340 = 1, 3, 4
- CALC\_MOD\_EQU
  - p0340 = 1, 2
- CALC\_MOD\_LIM\_REF
  - p0340 = 1, 3, 5
  - p0578 = 1
- CALC\_MOD\_REG
  - p0340 = 1, 3

---

### Note

For p3900 > 0, p0340 = 1 is also called automatically.

After p1910 = 1, p0340 = 3 is also called automatically.

---

## Access level

Specifies the minimum access level required to be able to display and change the relevant parameter. The required access level can be set using p0003.

The system uses the following access levels:

- 1: Standard
- 2: Extended
- 3: Expert
- 4: Service

---

### Note

Parameter p0003 is CU-specific (belongs to the Control Unit).

A higher access level will also include the functions of the lower levels.

---

**Data type**

The information on the data type can consist of the following two items (separated by a slash):

- First item  
Data type of the parameter.
- Second item (for binector or connector input only)  
Data type of the signal source to be interconnected (binector/connector output).

Parameters can have the following data types:

- Integer8                I8        8-bit integer number
- Integer16             I16       16-bit integer number
- Integer32             I32       32-bit integer number
- Unsigned8             U8        8 bits without sign
- Unsigned16            U16       16 bits without sign
- Unsigned32            U32       32 bits without sign
- FloatingPoint32      Float     32-bit floating point number

Depending on the data type of the BICO input parameter (signal sink) and BICO output parameter (signal source), the following combinations are possible when creating BICO interconnections:

Table 2-2 Possible combinations of BICO interconnections

| BICO output parameter   | BICO input parameter   |                        |                              |                     |
|---|------------------------|------------------------|------------------------------|---------------------|
|   | CI parameter           |                        |                              | BI parameter        |
|   | Unsigned32 / Integer16 | Unsigned32 / Integer32 | Unsigned32 / FloatingPoint32 | Unsigned32 / Binary |
| CO: Unsigned8   | x                      | x                      | –                            | –                   |
| CO: Unsigned16  | x                      | x                      | –                            | –                   |
| CO: Integer16   | x                      | x                      | r2050, r8850                 | –                   |
| CO: Unsigned32  | x                      | x                      | –                            | –                   |
| CO: Integer32   | x                      | x                      | r2060, r8860                 | –                   |
| CO: FloatingPoint32   | x                      | x                      | x                            | –                   |
| BO: Unsigned8   | –                      | –                      | –                            | x                   |
| BO: Unsigned16  | –                      | –                      | –                            | x                   |
| BO: Integer16   | –                      | –                      | –                            | x                   |
| BO: Unsigned32  | –                      | –                      | –                            | x                   |
| BO: Integer32   | –                      | –                      | –                            | x                   |
| BO: FloatingPoint32   | –                      | –                      | –                            | –                   |
| Legend:                    x : BICO interconnection permitted<br>–: BICO interconnection not permitted<br>rxxxx: BICO interconnection is only permitted for the specified CO parameters |                        |                        |                              |                     |

## Dynamic index

For parameters with a dynamic index [0...n], the following information is specified here:

- Data set (if available).
- Parameter for the number of indices (n = number - 1).

The following information can be contained in this field:

- "CDS, p0170" (Command Data Set, CDS count)

Example:

p1070[0] → main setpoint [command data set 0]

p1070[1] → main setpoint [command data set 1], etc.

- "DDS, p0180" (Drive Data Set, DDS count)
- "EDS, p0140" (Encoder Data Set, EDS count)
- "MDS, p0130" (Motor Data Set, MDS count)
- "PDS, p0120" (Power unit Data Set, PDS count)
- "p2615" (traversing blocks count)

Data sets can only be created and deleted when p0010 = 15.

---

### Note

Information on the data sets can be taken from the following references:

References: SINAMICS S120 Function Manual Drive Functions  
Chapter "Data sets"

---

## Function diagram

The parameter is included in this function diagram. The structure of the parameter function and its relationship with other parameters is shown in the specified function diagram.

## P group (only when accessing via BOP (Basic Operator Panel))

Specifies the functional group to which this parameter belongs. The required parameter group can be set via p0004.

---

### Note

Parameter p0004 is CU-specific (belongs to the Control Unit).

---

### Unit, unit group and unit selection

The standard unit of a parameter is specified in square brackets after the values for "Min", "Max", and "Factory setting".

For parameters where the unit can be switched over, the specifications for "Unit group" and "Unit selection" determine the group to which this parameter belongs and with which parameter the unit can be changed over.

#### Example:

Unit group: 7\_1, unit selection: p0505

The parameter belongs to unit group 7\_1 and the unit can be changed over using p0505.

#### Note

Detailed information on changing over units can be found in the following references:

References: /FH1/ SINAMICS S120 Function Manual Drive Functions

References: /BA3/ SINAMICS S150 Operating Instructions

All the potential unit groups and possible unit selections are listed below.

Table 2-3 Unit groups (p0100)

| Unit group | Unit selection for p0100 =              |  | Reference variable for % |
|------------|---|--|--------------------------|
|            | 0                                       | 1  |                          |

## 2 Parameters

### 2.1 Overview of parameters

Table 2-5 Unit groups (p0505), continued

| Unit group | Unit selection for p0505 = |                  |                   |                   | Reference variable for % |
|------------|----------------------------|------------------|-------------------|-------------------|--------------------------|
|            | 1                          | 2                | 3                 | 4                 |                          |
| 14_11      | var                        | %                | var               | %                 | r2004                    |
| 14_12      | kvar                       | %                | kvar              | %                 | r2004                    |
| 17_1       | Nms/rad                    | %                | lbf ft s/rad      | %                 | p2003/p2000              |
| 18_1       | V/A                        | %                | V/A               | %                 | p2001/p2002              |
| 19_1       | A/V                        | %                | A/V               | %                 | p2002/p2001              |
| 21_1       | °C                         | °C               | °F                | °F                | -                        |
| 21_2       | K                          | K                | °F                | °F                | -                        |
| 22_1       | m/s <sup>2</sup>           | m/s <sup>2</sup> | ft/s <sup>2</sup> | ft/s <sup>2</sup> | -                        |
| 22_2       | m/s <sup>2</sup>           | %                | ft/s <sup>2</sup> | %                 | p2007                    |
| 23_1       | Vrms s/m                   | Vrms s/m         | Vrms s/ft         | Vrms s/ft         | -                        |
| 24_1       | Ns/m                       | Ns/m             | lbf s/ft          | lbf s/ft          | -                        |
| 24_2       | Ns/m                       | %                | lbf s/ft          | %                 | p2003/p2000              |
| 26_1       | m/s <sup>3</sup>           | m/s <sup>3</sup> | ft/s <sup>3</sup> | ft/s <sup>3</sup> | -                        |
| 39_1       | 1/s <sup>2</sup>           | %                | 1/s <sup>2</sup>  | %                 | p2007                    |
| 49_1       | Nm/rad                     | %                | lbf ft/rad        | %                 | p2003                    |

Table 2-6 Unit group (p0595)

| Unit group | Unit selection for p0595 =   |      | Reference variable for % |
|------------|--|------|--------------------------|
|            | Value  | Unit |                          |
| 9_1        | The values that can be set and the technological units are shown in p0595. |      |                          |

## Parameter values

|                 |  |
|-----------------|--|
| Min             | Minimum value of the parameter [unit]  |
| Max             | Maximum value of the parameter [unit]  |
| Factory setting | Value when delivered [unit]  |
|                 | In the case of a binector/connector input, the signal source of the default BICO interconnection is specified. A non-indexed connector output is assigned the index [0]. |
|                 | A different value may be displayed for certain parameters (e.g. p1800) at the initial commissioning stage or when establishing the factory settings.                     |
|                 | Reason:  |
|                 | The setting of these parameters is determined by the operating environment of the Control Unit (e. g. depending on converter type, macro, power unit).                   |

---

### Note

For SINAMICS G150/G130/S150, the macros and their settings are provided in the following documentation:

References: SINAMICS G150/G130/S150 Operating Instructions

---

## Not for motor type

Specifies for which motor type this parameter has no significance

|      |  |
|------|--|
| ASM  | : Induction motor                            |
| PMSM | : Permanent-magnet synchronous motor         |
| REL  | : Reluctance motor textiles / SIEMOSYN motor |
| RESM | : Synchronous reluctance motor               |
| SESM | : Separately-excited synchronous motor       |

## Normalization

Specification of the reference variable with which a signal value is automatically converted for a BICO interconnection.

The following reference variables are available:

- p2000 ... p2007: Reference speed, reference voltage, etc.
- PERCENT: 1.0 = 100 %
- 4000H: 4000 hex = 100 % (wort) or 4000 0000 hex = 100 % (double word)
- p0514: specific normalization

Refer to the description for p0514[0...9] and p0515[0...19] to p0524[0...19]

#### Expert list

Specifies whether this parameter is available in the expert list of the specified drive objects in the commissioning software.

1. Parameter exists in the expert list.
- 0: Parameter does not exist in the expert list.

| NOTICE  |
|---|
| Users assume full responsibility for using parameters marked "Expert list: 0" (parameter does not exist in the expert list).<br><br>These parameters and their functionalities have not been tested and no further user documentation is available for them (e. g. description of functions). Moreover, no support is provided for these parameters by "Technical Support" (hotline). |

#### Description

Explanation of the function of a parameter.

#### Values

Lists the possible values of a parameter.

#### Recommendation

Information about recommended settings.

#### Index

The name and meaning of each individual index is specified for indexed parameters.

The following applies to the values (Min, Max, Factory setting) of indexed adjustable parameters:

- Min, Max:  
The adjustment range and unit apply to all indices.
- Factory setting:  
When all indices have the same factory setting, index 0 is specified with the unit to represent all indices.  
When the indices have different factory settings, they are all listed individually with the unit.

#### Bit array

For parameters with bit arrays, the following information is provided about each bit:

- Bit number and signal name
- Meaning for signal states 1 and 0
- Function diagram (optional)  
The signal is shown in this function diagram.

## Dependency

Conditions that must be fulfilled in conjunction with this parameter. Also includes special effects that can occur between this parameter and others.

Where necessary, "See also:" indicates the following information:

- List of other relevant parameters to be considered.
- List of faults and alarms to be considered.

## Safety instructions

Important information that must be observed to avoid the risk of physical injury or material damage.

Information that must be observed to avoid any problems.

Information that the user may find useful.

### **Danger**

The description of this safety notice can be found at the beginning of this manual, see "Legal information (Page 4)".

### **Warning**

The description of this safety notice can be found at the beginning of this manual, see "Legal information (Page 4)".

### **Caution**

The description of this safety notice can be found at the beginning of this manual, see "Legal information (Page 4)".

### **Notice**

The description of this safety notice can be found at the beginning of this manual, see "Legal information (Page 4)".

### **Note**

Information that the user may find useful.

## 2.1.2 Number ranges of parameters

### Note

The following number ranges represent an overview for all of the parameters available for the SINAMICS drive family.

The parameters for the product described in this List Manual are described in detail in "List of parameters (Page 39)".

Parameters are grouped into the following number ranges:

Table 2-7 Number ranges for SINAMICS

| Range |      | Description   |
|-------|------|---|
| From  | To   |   |
| 0000  | 0099 | Display and operation   |
| 0100  | 0199 | Commissioning   |
| 0200  | 0299 | Power section   |
| 0300  | 0399 | Motor   |
| 0400  | 0499 | Encoder   |
| 0500  | 0599 | Technology and units, motor-specific data, probes                               |
| 0600  | 0699 | Thermal monitoring, maximum current, operating hours, motor data, central probe |
| 0700  | 0799 | Control Unit terminals, measuring sockets                                       |
| 0800  | 0839 | CDS, DDS data sets, motor changeover  |
| 0840  | 0879 | Sequence control (e.g. signal source for ON/OFF1)                               |
| 0880  | 0899 | ESR, parking, control and status words  |
| 0900  | 0999 | PROFIBUS/PROFIdrive   |
| 1000  | 1199 | Setpoint channel (e.g. ramp-function generator)                                 |
| 1200  | 1299 | Functions (e.g. motor holding brake)  |
| 1300  | 1399 | U/f control   |
| 1400  | 1799 | Closed-loop control   |
| 1800  | 1899 | Gating unit   |
| 1900  | 1999 | Power unit and motor identification   |
| 2000  | 2009 | Reference values  |
| 2010  | 2099 | Communication (fieldbus)  |
| 2100  | 2139 | Faults and alarms   |
| 2140  | 2199 | Signals and monitoring  |
| 2200  | 2359 | Technology controller   |
| 2360  | 2399 | Staging, hibernation  |
| 2500  | 2699 | Position control (LR) and basic positioning (EPOS)                              |
| 2700  | 2719 | Reference values, display   |

Table 2-7 Number ranges for SINAMICS, continued

| Range |      | Description   |
|-------|------|---|
| From  | To   |   |
| 2720  | 2729 | Load gearbox  |
| 2800  | 2819 | Logic operations                                      |
| 2900  | 2930 | Fixed values (e. g. percentage, torque)               |
| 3000  | 3099 | Motor identification results                          |
| 3100  | 3109 | Real-time clock (RTC)                                 |
| 3110  | 3199 | Faults and alarms                                     |
| 3200  | 3299 | Signals and monitoring                                |
| 3400  | 3659 | Infeed closed-loop control                            |
| 3660  | 3699 | Voltage Sensing Module (VSM), Braking Module internal |
| 3700  | 3779 | Advanced Positioning Control (APC)                    |
| 3780  | 3819 | Synchronization                                       |
| 3820  | 3849 | Friction characteristic                               |
| 3850  | 3899 | Functions (e. g. long stator)                         |
| 3900  | 3999 | Management  |
| 4000  | 4599 | Terminal Board, Terminal Module (e. g. TB30, TM31)    |
| 4600  | 4699 | Sensor Module   |
| 4700  | 4799 | Trace   |
| 4800  | 4849 | Function generator                                    |
| 4950  | 4999 | OA application  |
| 5000  | 5169 | Spindle diagnostics                                   |
| 5200  | 5230 | Current setpoint filter 5 ... 10 (r0108.21)           |
| 5400  | 5499 | System droop control (e. g. shaft generator)          |
| 5500  | 5599 | Dynamic grid support (solar)                          |
| 5600  | 5614 | PROFenergy  |
| 5900  | 6999 | SINAMICS GM/SM/GL/SL                                  |
| 7000  | 7499 | Parallel connection of power units                    |
| 7500  | 7599 | SINAMICS SM120  |
| 7700  | 7729 | External messages                                     |
| 7770  | 7789 | NVRAM, system parameters                              |
| 7800  | 7839 | EEPROM read/write parameters                          |
| 7840  | 8399 | Internal system parameters                            |
| 8400  | 8449 | Real-time clock (RTC)                                 |
| 8500  | 8599 | Data and macro management                             |
| 8600  | 8799 | CAN bus   |
| 8800  | 8899 | Communication Board Ethernet (CBE), PROFIdrive        |

Table 2-7 Number ranges for SINAMICS, continued

| Range |       | Description   |
|-------|-------|---|
| From  | To    |   |
| 8900  | 8999  | Industrial Ethernet, PROFINET, CBE20                |
| 9000  | 9299  | topology  |
| 9300  | 9399  | Safety Integrated                                   |
| 9400  | 9499  | Parameter consistency and storage                   |
| 9500  | 9899  | Safety Integrated                                   |
| 9900  | 9949  | topology  |
| 9950  | 9999  | Diagnostics, internal                               |
| 10000 | 10199 | Safety Integrated                                   |
| 11000 | 11299 | Free technology controller 0, 1, 2                  |
| 20000 | 20999 | Free function blocks (FBLOCKS)                      |
| 21000 | 25999 | Drive Control Chart (DCC)                           |
| 50000 | 53999 | SINAMICS DC MASTER (closed-loop DC current control) |
| 61000 | 61001 | PROFINET  |

## 2.2 List of parameters

Product: SINAMICS S120/S150, Version: 5206900, Language: eng  
 Objects: CU\_I, CU\_NX\_CX, CU\_S\_AC\_DP, CU\_S\_AC\_PN, CU\_S120\_PN, CU\_S150\_PN, CU\_S120\_DP, CU\_S150\_DP, CU\_I\_D410, SERVO, VECTOR, HLA, SERVO\_AC, VECTOR\_AC, SERVO\_I\_AC, VECTOR\_I\_AC, A\_INF, S\_INF, R\_INF, B\_INF, TM31, TM41, TM17, TM15, TM15DI\_DO, TM120, TM150, TB30, TM54F\_MA, TM54F\_SL, ENC, HUB, CU\_LINK

## 2 Parameters

### 2.2 List of parameters

60: Drive object deactivated/not operational  
 70: Initialization  
 200: Wait for booting/partial booting  
 250: Device signals a topology error

**Dependency:**

Refer to: r0046

**Notice:**

For several missing enable signals, the corresponding value with the highest number is displayed.

**Note:**

OC: Operating condition  
 EP: Enable Pulses (pulse enable)  
 RFG: Ramp-function generator  
 COMM: Commissioning  
 MotID: Motor data identification  
 SS2: Safe Stop 2  
 STO: Safe Torque Off

#### r0002

 SERVO\_AC,  
 VECTOR\_AC,  
 SERVO\_I\_AC,  
 VECTOR\_I\_AC

**Can be changed:** -

**Calculated:** -

**Access level:** 1

**Data type:** Integer16

**Dyn. index:** -

**Func. diagram:** -

**P-Group:** -

**Unit group:** -

**Unit selection:** -

**Not for motor type:** -

**Scaling:** -

**Expert list:** 1

**Min**

**Max**

**Factory setting**

0

250

-

**Description:**

Operating display for the drive.

**Value:**

0: Operation - everything enabled  
 10: Operation - set "enable setpoint" = "1" (p1142, p1152)  
 11: Operation - set "enable speed controller" = "1" (p0856)  
 12: Operation - RFG frozen, set "RFG start" = "1" (p1141)  
 13: Operation - set "enable RFG" = "1" (p1140)  
 14: Oper. - MotID, excit. running and/or brake opens, SS2, STOP C  
 15: Operation - open brake (p1215)  
 16: Operation - withdraw braking with OFF1 using "ON/OFF1" = "1"  
 17: Operation - braking with OFF3 can only be interrupted with OFF2  
 18: Operation - brake on fault, remove fault, acknowledge  
 19: Operation - armature short-circ./DC brake act. (p1230, p1231)  
 21: Ready for operation - set "Enable operation" = "1" (p0852)  
 22: Ready for operation - de-magnetizing running (p0347)  
 23: Ready for operation - set "Infeed operation" = "1" (p0864)  
 31: Ready for switching on - set "ON/OFF1" = "0/1" (p0840)  
 35: Switching on inhibited - carry out first commissioning (p0010)  
 41: Switching on inhibited - set "ON/OFF1" = "0" (p0840)  
 42: Switching on inhibited - set "OC/OFF2" = "1" (p0844, p0845)  
 43: Switching on inhibited - set "OC/OFF3" = "1" (p0848, p0849)  
 44: Switching on inhibited - supply STO terminal w/ 24 V (hardware)  
 45: Switching on inhibited - rectify fault, acknowledge fault, STO  
 46: Switching on inhibited - exit commissioning mode (p0009, p0010)  
 60: Drive object deactivated/not operational  
 70: Initialization  
 200: Wait for booting/partial booting  
 250: Device signals a topology error

**Dependency:**

Refer to: r0046

**Notice:**

For several missing enable signals, the corresponding value with the highest number is displayed.

**Note:**

OC: Operating condition  
 EP: Enable Pulses (pulse enable)  
 RFG: Ramp-function generator  
 COMM: Commissioning  
 MotID: Motor data identification  
 SS2: Safe Stop 2  
 STO: Safe Torque Off

|  |   |  |   |
|--|---|--|---|
| <b>p0003</b>   | <b>BOP access level / BOP acc_level</b>   |  |   |
| CU_I, CU_NX_CX,<br>CU_S_AC_DP,<br>CU_S_AC_PN,<br>CU_S120_PN,<br>CU_S150_PN,<br>CU_S120_DP,<br>CU_S150_DP,<br>CU_I_D410 | <b>Can be changed:</b> C1, U, T<br><b>Data type:</b> Integer16<br><b>P-Group:</b> All groups<br><b>Not for motor type:</b> -<br><b>Min</b><br>1 | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>4 | <b>Access level:</b> 1<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>1 |

**Description:** Sets the access level for reading and writing parameters via the Basic Operator Panel (BOP).

**Value:**

- 1: Standard
- 2: Extended
- 3: Expert
- 4: Service

**Note:** A higher set access level also includes the lower one.

Access level 1 (standard):  
Parameters for simplest possible operations.

Access level 2 (extended):  
Parameters to operate the basic functions of the drive unit.

Access level 3 (experts):  
Expert know-how is required for these parameters (e.g. BICO parameterization).

Access level 4 (service):  
For these parameters, it is necessary that authorized service personnel enter the appropriate password (p3950).

**Description:** Sets the display filter for parameters with the Basic Operator Panel (BOP).

**Value:**

- 0: All parameters
- 1: Displays, signals
- 2: Power unit
- 3: Motor
- 4: Encoder/position encoder
- 5: Technology/units
- 7: Digital inputs/outputs, commands, sequence control
- 8: Analog inputs/outputs
- 10: Setpoint channel/ramp-fct generator
- 12: Functions
- 13: U/f control
- 14: Control
- 15: Data sets
- 17: Basic positioner
- 18: Gating unit
- 19: Motor identification
- 20: Communication
- 21: Faults, alarms, monitoring functions
- 25: Position control
- 28: Free function blocks
- 47: Trace and function generator
- 50: Technology Extensions
- 90: Topology
- 95: Safety Integrated
- 98: Command Data Sets (CDS)
- 99: Drive Data Sets (DDS)

**Dependency:** Refer to: p0003

**Notice:** The display filter via p0004 provides precise filtering and displays the corresponding parameters only when p0009 and p0010 = 0.

**Note:** The set access level via p0003 is also relevant for the display filter via p0004.

Examples (assumption: p0009 = p0010 = 0):

p0003 = 1, p0004 = 3

--> Only the parameters for the motor with access level 1 are displayed.

p0003 = 2, p0004 = 3

--> Only the parameters for the motor with access levels 1 and 2 are displayed.

| <b>Description:</b>  | Sets the device and basic drive commissioning.<br>By appropriately setting this parameter, those parameters are filtered that can be written into in the various commissioning steps. |  |   |

|                |   |
|----------------|---|
| <b>Value:</b>  | <p>0: Ready</p> <p>1: Device configuration</p> <p>2: Defining the drive type/function module</p> <p>3: Drive base configuration</p> <p>4: Data set base configuration</p> <p>29: Device download</p> <p>30: Parameter reset</p> <p>50: Install Technology Extension</p> <p>55: Install Technology Extension</p> <p>101: Topology input</p> <p>111: Insert drive object</p> <p>112: Delete drive object</p> <p>113: Change drive object number</p> <p>114: Change component number</p> <p>115: Parameter download</p> <p>117: Delete component</p> <p>10000: Ready (asynchronous)</p>  |
| <b>Notice:</b> | <p>For p0009 = 0:</p> <p>The check and the calculation can take a longer period of time, so that in the worst case scenario, communication with the commissioning tool is interrupted. As a consequence, alternatively p0009 = 10000 can be used.</p> <p>For p0009 = 10000:</p> <p>After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.</p>  |
| <b>Note:</b>   | <p>The drives can only be switched on outside the device commissioning (the inverter enabled). In this case, p0009 must be 0 (Ready) and the individual drive objects must have already gone into operation (p0010).</p> <p>p0009 = 0: ready</p> <p>When changing into this state, the device configuration is checked and commissioning completed (a new start can be initiated).</p> <p>p0009 = 1: Device configuration</p> <p>At the first commissioning of the device, after booting, the device is in the "device configuration" state. To start the internal automatic first commissioning of the drive unit, p0009 should be set to 0 (Ready) after the ID for the actual topology (r0098) was transferred into the ID for the target topology (p0099). To do this, it is sufficient to set a single index value of p0099[x] the same as r0098[x]. Before the device has been completely commissioned, no other parameter can be changed. After the first commissioning was carried out, in this state, when required, other basic device configuration parameters can be adapted (e.g. the basic sampling time in p0110).</p> <p>p0009 = 2: Defines the drive type / function module</p> <p>In this state, the drive object types and/or the function modules can be changed or selected for the individual drive objects. To do this, the drive object type can be set using p0107[0...15] and the function can be set using p0108[0...15] (refer to p0101[0...15]).</p> <p>p0009 = 3: Drive basic configuration</p> <p>In this state, after the device has been commissioned for the first time, basic changes can be made for the individual drive objects (e.g. sampling times in p0111, p0112, p0115 and the number of data sets in p0120, p0130, p0140, p0170, p0180).</p> <p>p0009 = 4: Data set basic configuration</p> <p>In this state, after the device has been commissioned for the first time, for the individual drive objects changes can be made regarding the assignment of the components (p0121, p0131, p0141, p0151, p0161) to the individual data sets and the assignment of the power unit, motor and encoder to the drive data sets (p0185, ...).</p> <p>p0009 = 29: Device download</p> <p>In the case of a download via the commissioning tool, the device is automatically brought into this state. After the download has been completed, p0009 is automatically set to 0 (ready). It is not possible to manually set p0009 to this value.</p> <p>p0009 = 30: Parameter reset</p> <p>In order to bring the complete unit into the "first commissioning" state or to load the parameters saved using p0977, to start, p0009 must be set to this value. p0976 can then be changed to the required value.</p> <p>p0009 = 50: configure Technology Extension</p> <p>After the device has been commissioned for the first time, in this state, Technology Extensions can be activated/deactivated for the individual drive objects (p4956).</p> <p>p0009 = 55: install Technology Extension</p> <p>Technology Extensions can be installed/uninstalled in this state.</p> <p>p0009 = 101: Topology input</p> <p>In this state, the DRIVE-CLiQ target topology can be entered using p9902 and p9903.</p> |

## 2 Parameters

### 2.2 List of parameters

p0009 = 111: Insert drive object

This state allows a new drive object to be inserted using p9911.

p0009 = 112: Delete drive object

This state allows existing drive objects to be deleted using p9912 after the device has been commissioned for the first time.

p0009 = 113: Change drive object number

This state allows the drive object number of existing drive objects to be changed using p9913 after the device has been commissioned for the first time.

p0009 = 114: Change component number

This state allows the component number of existing components to be changed using p9914 after the device has been commissioned for the first time.

p0009 = 115: Parameter download

This state allows the complete device and drive commissioning using the parameter services.

p0009 = 117: Delete component

This state allows components to be deleted using p9917 after the device has been commissioned for the first time.

p0009 = 10000: ready (asynchronous)

When changing into this state, internally p0009 is set = 0. Additional calculations and checks are carried out in the background (asynchronously).

## 2 Parameters

### 2.2 List of parameters

**Note:** The following parameters can be read and written on the Control Unit drive object:

- p0003 (access stage)
- p0009 (device commissioning, parameter filter)
- p0012 (BOP password acknowledgment (p0013))

The following applies for the user-defined list:

- password protection is only available on the drive object Control Unit and is valid for all of the drive objects.
- p0013 cannot be included in the user-defined list for all drive objects.
- p0003, p0009, p0011, p0012, p0976 cannot, for the drive object Control Unit, be included in the user-defined list.
- the user-defined list can be cleared and deactivated "restore factory setting".

A value of 0 means: Entry is empty.

**Description:** Display and connector output for the smoothed actual value of the piston velocity.

**Dependency:** Refer to: r0022, r0063

**Note:** Smoothing time constant = 100 ms  
 The signal is not suitable as a process quantity and may only be used as a display quantity.  
 The velocity actual value is available smoothed (r0021, r0022) and unsmoothed (r0063).

---

## 2 Parameters

### 2.2 List of parameters

**Note:** Smoothing time constant = 300 ms  
 The signal is not suitable as a process quantity and may only be used as a display quantity.  
 The line frequency is available smoothed (r0024) and unsmoothed (r0066).  
 A positive sign of the frequency is obtained when the line supply phases U, V and W are connected with the correct phase sequence.  
 A negative sign of the frequency is obtained when the 3 line phases are interchanged therefore designating a negative direction of the rotating field of the 3-phase line supply voltage.

 [4] = Line voltage source strongly smoothed (model)  
**Dependency:** Refer to: r0072  
**Note:** Smoothing time constant = 300 ms  
 The signals are not suitable as process quantity and may only be used as display quantities.  
 The input voltages are available smoothed (r0025) and unsmoothed (r0072).  
 For r0025[0]:  
 Pulsed voltage at the line supply input terminals of the power unit.  
 The value is calculated from the modulation depth r0074, and is therefore only correct in the closed-loop controlled mode and when the pulses are enabled.  
 For r0025[1]:  
 Absolute voltage value at the input terminals of the line filter or the connection point of a Voltage Sensing Module (VSM).  
 If a VSM is not connected, then the value is calculated from the VSM measured values r3661 and r3662 and is therefore equal to 0.  
 For r0025[2]:  
 Estimated value for the voltage of the voltage source that is calculated in the voltage model of the line supply PLL.  
 For r0025[3]:  
 Smoothed display value of the filtered source voltage from r0072[3].  
 For r0025[4]:  
 Smoothed display value of the filtered source voltage from r0072[4].

|   | - [%]   | - [%]                   | - [%]                      |

**Description:** Displays the smoothed force utilization as a percentage.  
The force utilization is obtained from the required smoothed force referred to the force limit.

**Note:** Smoothing time constant = 100 ms  
The signal is not suitable as a process quantity and may only be used as a display quantity.  
The force utilization is available smoothed (r0033) and unsmoothed (r0081).  
For  $F_{set\ total} (r0079) > F_{max\ offset} (p1532)$ , the following applies:  
- demanded torque =  $F_{set\ total} - F_{max\ offset}$   
- actual force limit =  $F_{max\ upper\ effective} (r1538) - F_{max\ offset}$   
For  $F_{set\ total} (r0079) \leq F_{max\ offset} (p1532)$ , the following applies:  
- demanded force =  $F_{max\ offset} - F_{set\ total}$   
- actual force limit =  $F_{max\ offset} - F_{max\ lower\ effective} (r1539)$   
For the actual force limit = 0, the following applies: r0033 = 100 %  
For the actual force limit < 0, the following applies: r0033 = 0 %

**Description:** Displays the smoothed torque utilization as a percentage.  
The torque utilization is obtained from the required smoothed torque in reference to the torque limit, scaled using p2196.

**Note:** Smoothing time constant = 100 ms  
The signal is not suitable as a process quantity and may only be used as a display quantity.  
The torque utilization is available smoothed (r0033) and unsmoothed (r0081).  
For  $M_{set\ total} (r0079) > 0$ , the following applies:  
- Required torque =  $M_{set\ total}$   
- Actual torque limit =  $M_{max\ upper\ effective} (r1538)$   
For  $M_{set\ total} (r0079) \leq 0$ , the following applies:  
- Required torque =  $- M_{set\ total}$   
- Actual torque limit =  $- M_{max\ lower\ effective} (r1539)$   
For the actual torque limit = 0, the following applies: r0033 = 100 %  
For the actual torque limit < 0, the following applies: r0033 = 0 %

| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Displays, signals<br><b>Not for motor type:</b> ASM, SESM, REL<br><b>Min</b><br>- [%]  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> PERCENT<br><b>Max</b><br>- [%]   | <b>Access level:</b> 2<br><b>Func. diagram:</b> 8017, 8019<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- [%]      |
| <b>Description:</b>   | Display and connector output for the motor utilization from motor temperature model 1 (I2t) or 3.<br>For motor temperature model 1 (I2t) (p0612.0 = 1), the following applies:<br>For firmware version < 4.7 SP6:<br>- r0034 = (motor model temperature - 40 °C) / (p0605 - 40 °C) * 100 %<br>From firmware version 4.7 SP6:<br>- p0612.12 = 0 and p0612.8 = 0: r0034 = (motor model temperature - 40 °C) / (p0605 - 40 °C) * 100 %<br>- p0612.12 = 0 and p0612.8 = 1: r0034 = (motor model temperature - 40 °C) / p0627 * 100 %<br>- p0612.12 = 1 and p0612.8 = 0: r0034 = (motor model temperature - p0613) / (p0605 - p0613) * 100 %<br>- p0612.12 = 1 and p0612.8 = 1: r0034 = (motor model temperature - p0613) / p0627 * 100 %<br>For motor temperature model 3 (p0612.2 = 1), the following applies:<br>- r0034 = (motor model temperature - r5397) / (r5398 - r5397) * 100 %  |  |   |
| <b>Dependency:</b>  | The thermal motor utilization is only determined when the motor temperature model 1 (I2t) or 3 is activated.<br>The following conditions are a prerequisite for additional information.<br>- a temperature sensor has not been parameterized (p0600, p0601).<br>- the current corresponds to the stall current (p0318).<br>- speed n > 1 [rpm].<br>For firmware version < 4.7 SP6 or p0612.12 = 0, the following applies:<br>- the temperature model operates with an ambient temperature of 20 °C.<br>A motor utilization of 100% is displayed (r0034 = 100 %) when the following conditions are permanently fulfilled:<br>- the ambient temperature is 40 °C (model 1: p0625 = 40 °C, model 3: p0613 = 40 °C).<br>From firmware version 4.7 SP6 and p0612.12 = 1, the following applies:<br>- the ambient temperature can be adapted to the conditions using p0613.<br>Refer to: p0605, p0611, p0612, p0613, p0627, r0632<br>Refer to: F07011, A07012 |  |   |
| <b>Notice:</b>  | After the drive is switched on, the system starts to determine the motor temperature with an assumed model value.<br>This means that the value for the motor utilization is only valid after a stabilization time.  |  |   |
| <b>Note:</b>  | Smoothing time constant = 100 ms<br>The signal is not suitable as a process quantity and may only be used as a display quantity.<br>For r0034 = -200.0 %, the following applies:<br>The value is invalid (e.g. the motor temperature model is not activated or has been incorrectly parameterized).   |  |   |
| <b>r0035</b>  | <b>CO: Motor temperature / Mot temp</b>   |  |   |
| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Displays, signals<br><b>Not for motor type:</b> -<br><b>Min</b><br>- [°C]  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> 21_1<br><b>Scaling:</b> p2006<br><b>Max</b><br>- [°C] | <b>Access level:</b> 2<br><b>Func. diagram:</b> 8016, 8017<br><b>Unit selection:</b> p0505<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- [°C] |
| <b>Description:</b>   | Display and connector output for the actual temperature in the motor.   |  |   |
| <b>Note:</b>  | For r0035 not equal to -200.0 °C, the following applies:<br>- this temperature display is valid.<br>- a KTY/PT1000 temperature sensor is connected.<br>- the thermal model for the induction motor is activated (p0612 bit 1 = 1 and temperature sensor deactivated: p0600 = 0 or p0601 = 0).   |  |   |

For r0035 equal to -200.0 °C, the following applies:

- this temperature display is not valid (temperature sensor error).
- a PTC sensor or bimetallic NC contact is connected.
- the temperature sensor of the synchronous motor is deactivated (p0600 = 0 or p0601 = 0).

- Note:** The value r0046 = 0 indicates that all enable signals for this drive are present.
- Bit 00 = 1 (enable signal missing), if:
- the signal source in p0840 is a 0 signal.
  - there is a "switching on inhibited".
- Bit 01 = 1 (enable signal missing), if:
- the signal source in p0844 or p0845 is a 0 signal.
- Bit 02 = 1 (enable signal missing), if:
- the signal source in p0848 or p0849 is a 0 signal.
- Bit 03 = 1 (enable signal missing), if:
- the signal source in p0852 is a 0 signal.
- Bit 07 = 1 (enable signal missing), if:
- the 26.5 V supply voltage is missing (X271).
- Bit 08 = 1 (enable signal missing), if:
- safety functions have been enabled and STO is active.
  - a safety-relevant signal is present with a STOP A response.
- STO enabled via terminals:
- the pulse enable via STO terminal is missing or the signal source in p9620 has a 0 signal.
- STO enabled via PROFIsafe or TM54F:
- STO is selected via PROFIsafe or TM54F.
- Bit 09 = 1 (enable signal missing), if:
- the signal source in p0864 is a 0 signal.
- Bit 10 = 1 (enable signal missing), if:
- the signal source in p1140 is a 0 signal.
- Bit 11 = 1 (enable signal missing) if the velocity setpoint is frozen, because:
- the signal source in p1141 is a 0 signal.
- Bit 12 = 1 (enable signal missing), if:
- the signal source in p1142 is a 0 signal.
- Bit 16 = 1 (enable signal missing), if:
- there is an OFF1 fault response. The system is only enabled if the fault is removed and was acknowledged and the "switching on inhibited" withdrawn with OFF1 = 0.
- Bit 17 = 1 (enable signal missing), if:
- commissioning mode is selected (p0009 > 0 or p0010 > 0).
  - there is an OFF2 fault response.
  - the drive is inactive (p0105 = 0) or is not operational (r7850[DO-Index]=0).
- Bit 18 = 1 (enable signal missing), if:
- OFF3 has still not been completed or an OFF3 fault response is present.
- Bit 19 = 1 (internal power enable missing), if:
- synchronization is running between the basic clock cycle, DRIVE-CLiQ clock cycle and application clock cycle.
- Bit 21 = 1 (enable signal missing), if:
- the power has been enabled and the velocity setpoint has still not been enabled.
- Bit 26 = 1 (enable signal missing), if:
- the drive is inactive (p0105 = 0) or is not operational (r7850[DO-Index]=0).
  - the function "parking axis" is selected (BI: p0897 = 1 signal)..
  - the drive device is in the "PROFenergy energy-saving mode" (r5600, CU-specific).
- Bit 30 = 1 (velocity controller inhibited), if:
- the function generator with deactivated velocity controller is active.
  - the measuring function with deactivated velocity controller is active.

**Dependency:** Refer to: r0002

**Note:** The value r0046 = 0 indicates that all enable signals for this drive are present.

Bit 00 = 1 (enable signal missing), if:

- the signal source in p0840 is a 0 signal.
- there is a "switching on inhibited".

Bit 01 = 1 (enable signal missing), if:

- the signal source in p0844 or p0845 is a 0 signal.

Bit 02 = 1 (enable signal missing), if:

- the signal source in p0848 or p0849 is a 0 signal.

Bit 03 = 1 (enable signal missing), if:

- the signal source in p0852 is a 0 signal.

Bit 04 = 1 (armature short-circuit active), if:

- the signal source in p1230 has a 1 signal

Bit 05, Bit 06: Being prepared

Bit 08 = 1 (enable signal missing), if:

- safety functions have been enabled and STO is active.
- a safety-relevant signal is present with a STOP A response.

STO enabled via terminals:

- the pulse enable via terminal EP is missing (booksize: X21, chassis: X41), or the signal source in p9620 is for a 0 signal.

STO enabled via PROFIsafe or TM54F:

- STO is selected via PROFIsafe or TM54F.

- Bit 09 = 1 (enable signal missing), if:
- the signal source in p0864 is a 0 signal.
- Bit 10 = 1 (enable signal missing), if:
- the signal source in p1140 is a 0 signal.
- Bit 11 = 1 (enable signal missing) if the speed setpoint is frozen, because:
- the signal source in p1141 is a 0 signal.
  - the speed setpoint is entered from jogging and the two signal sources for jogging, bit 0 (p1055) and bit 1 (p1056) have a 1 signal.
- Bit 12 = 1 (enable signal missing), if:
- the signal source in p1142 is a 0 signal.
  - When activating the function module "basic positioner" (r0108.4 = 1), the signal source in p1142 is set to a 0 signal.
- Bit 16 = 1 (enable signal missing), if:
- there is an OFF1 fault response. The system is only enabled if the fault is removed and was acknowledged and the "switching on inhibited" withdrawn with OFF1 = 0.
- Bit 17 = 1 (enable signal missing), if:
- commissioning mode is selected (p0009 > 0 or p0010 > 0).
  - there is an OFF2 fault response.
  - the drive is inactive (p0105 = 0) or is not operational (r7850[DO-Index]=0).
- Bit 18 = 1 (enable signal missing), if:
- OFF3 has still not been completed or an OFF3 fault response is present.
- Bit 19 = 1 (internal pulse enable missing), if:
- synchronization is running between the basic clock cycle, DRIVE-CLiQ clock cycle and application clock cycle.
- Bit 20 = 1 (internal armature short-circuit active), if:
- the drive is not in the state "S4: Operation" or "S5x" (refer to function diagram 2610).
  - the internal pulse enable is missing (r0046.19 = 0).
- Bit 21 = 1 (enable signal missing), if:
- The pulses have been enabled and the speed setpoint has still not been enabled, because:
- the holding brake opening time (p1216) has still not expired.
  - the motor has still not been magnetized (induction motor).
  - the encoder has not been calibrated (U/f vector and synchronous motor)
- Bit 22: Being prepared
- Bit 26 = 1 (enable signal missing), if:
- the drive is inactive (p0105 = 0) or is not operational (r7850[DO-Index]=0).
  - the function "parking axis" is selected (BI: p0897 = 1 signal)..
  - all power units of a parallel connection are deactivated (p0125, p0895).
  - the drive device is in the "PROFInergy energy-saving mode" (r5600, CU-specific).
- Bit 27 = 1 (enable signal missing), if:
- de-magnetizing has still not been completed (only for vector).
- Bit 28 = 1 (enable signal missing), if:
- the holding brake is closed or has still not been opened.
- Bit 29 = 1 (enable signal missing), if:
- the cooling unit ready signal via binector input p0266[1] missing.
- Bit 30 = 1 (speed controller inhibited), if one of the following reasons is present:
- a 0 signal is available via binector input p0856.
  - the function generator with current input is active.
  - the measuring function "current controller reference frequency characteristic" is active.
  - the pole position identification is active.
  - motor data identification is active (only certain steps).
- Bit 31 = 1 (enable signal missing), if:
- the speed setpoint from jog 1 or 2 is entered.

- Bit 09 = 1 (enable signal missing), if:
- the signal source in p0864 is a 0 signal.
- Bit 10 = 1 (enable signal missing), if:
- the signal source in p1140 is a 0 signal.
- Bit 11 = 1 (enable signal missing) if the velocity setpoint is frozen, because:
- the signal source in p1141 is a 0 signal.
  - the velocity setpoint is entered from jogging and the two signal sources for jogging, bit 0 (p1055) and bit 1 (p1056) have a 1 signal.
- Bit 12 = 1 (enable signal missing), if:
- the signal source in p1142 is a 0 signal.
  - When activating the function module "basic positioner" (r0108.4 = 1), the signal source in p1142 is set to a 0 signal.
- Bit 16 = 1 (enable signal missing), if:
- there is an OFF1 fault response. The system is only enabled if the fault is removed and was acknowledged and the "switching on inhibited" withdrawn with OFF1 = 0.
- Bit 17 = 1 (enable signal missing), if:
- commissioning mode is selected (p0009 > 0 or p0010 > 0).
  - there is an OFF2 fault response.
  - the drive is inactive (p0105 = 0) or is not operational (r7850[DO-Index]=0).
- Bit 18 = 1 (enable signal missing), if:
- OFF3 has still not been completed or an OFF3 fault response is present.
- Bit 19 = 1 (internal pulse enable missing), if:
- synchronization is running between the basic clock cycle, DRIVE-CLiQ clock cycle and application clock cycle.
- Bit 20 = 1 (internal armature short-circuit active), if:
- the drive is not in the state "S4: Operation" or "S5x" (refer to function diagram 2610).
  - the internal pulse enable is missing (r0046.19 = 0).
- Bit 21 = 1 (enable signal missing), if:
- The pulses have been enabled and the velocity setpoint has still not been enabled, because:
- the holding brake opening time (p1216) has still not expired.
  - the motor has still not been magnetized (induction motor).
- Bit 22: Being prepared
- Bit 26 = 1 (enable signal missing), if:
- the drive is inactive (p0105 = 0) or is not operational (r7850[DO-Index]=0).
  - the function "parking axis" is selected (BI: p0897 = 1 signal)..
  - all power units of a parallel connection are deactivated (p0125, p0895).
  - the drive device is in the "PROFenergy energy-saving mode" (r5600, CU-specific).
- Bit 27 = 1 (enable signal missing), if:
- de-magnetizing has still not been completed (only for vector).
- Bit 28 = 1 (enable signal missing), if:
- the holding brake is closed or has still not been opened.
- Bit 29 = 1 (enable signal missing), if:
- the cooling unit ready signal via binector input p0266[1] missing.
- Bit 30 = 1 (velocity controller inhibited), if one of the following reasons is present:
- a 0 signal is available via binector input p0856.
  - the function generator with current input is active.
  - the measuring function "current controller reference frequency characteristic" is active.
  - the pole position identification is active.
  - motor data identification is active (only certain steps).
- Bit 31 = 1 (enable signal missing), if:
- the velocity setpoint from jog 1 or 2 is entered.

**Dependency:** Refer to: r0002

**Note:** The value r0046 = 0 indicates that all enable signals for this drive are present.

- Bit 00 = 1 (enable signal missing), if:
  - the signal source in p0840 is a 0 signal.
  - there is a "switching on inhibited".
- Bit 01 = 1 (enable signal missing), if:
  - the signal source in p0844 or p0845 is a 0 signal.
- Bit 02 = 1 (enable signal missing), if:
  - the signal source in p0848 or p0849 is a 0 signal.
- Bit 03 = 1 (enable signal missing), if:
  - the signal source in p0852 is a 0 signal.
- Bit 04 = 1 (armature short-circuit active), if:
  - the signal source in p1230 has a 1 signal
- Bit 05, Bit 06: Being prepared

Bit 08 = 1 (enable signal missing), if:

- safety functions have been enabled and STO is active.
- a safety-relevant signal is present with a STOP A response.

STO enabled via terminals:

- the pulse enable via terminal EP is missing (booksize: X21, chassis: X41), or the signal source in p9620 is for a 0 signal.

STO enabled via PROFIsafe or TM54F:

- STO is selected via PROFIsafe or TM54F.

Bit 09 = 1 (enable signal missing), if:

- the signal source in p0864 is a 0 signal.

Bit 10 = 1 (enable signal missing), if:

- the signal source in p1140 is a 0 signal.

Bit 11 = 1 (enable signal missing) if the speed setpoint is frozen, because:

- the signal source in p1141 is a 0 signal.
- the speed setpoint is entered from jogging and the two signal sources for jogging, bit 0 (p1055) and bit 1 (p1056) have a 1 signal.

Bit 12 = 1 (enable signal missing), if:

- the signal source in p1142 is a 0 signal.
- When activating the function module "basic positioner" (r0108.4 = 1), the signal source in p1142 is set to a 0 signal.

Bit 16 = 1 (enable signal missing), if:

- there is an OFF1 fault response. The system is only enabled if the fault is removed and was acknowledged and the "switching on inhibited" withdrawn with OFF1 = 0.

Bit 17 = 1 (enable signal missing), if:

- commissioning mode is selected (p0009 > 0 or p0010 > 0).
- there is an OFF2 fault response.
- the drive is inactive (p0105 = 0) or is not operational (r7850[DO-Index]=0).

Bit 18 = 1 (enable signal missing), if:

- OFF3 has still not been completed or an OFF3 fault response is present.

Bit 19 = 1 (internal pulse enable missing), if:

- synchronization is running between the basic clock cycle, DRIVE-CLiQ clock cycle and application clock cycle.

Bit 20 = 1 (internal armature short-circuit active), if:

- the drive is not in the state "S4: Operation" or "S5x" (refer to function diagram 2610).
- the internal pulse enable is missing (r0046.19 = 0).

Bit 21 = 1 (enable signal missing), if:

The pulses have been enabled and the speed setpoint has still not been enabled, because:

- the holding brake opening time (p1216) has still not expired.
- the motor has still not been magnetized (induction motor).
- the encoder has not been calibrated (U/f vector and synchronous motor)

Bit 22: Being prepared

Bit 26 = 1 (enable signal missing), if:

- the drive is inactive (p0105 = 0) or is not operational (r7850[DO-Index]=0).
- the function "parking axis" is selected (BI: p0897 = 1 signal)..
- all power units of a parallel connection are deactivated (p0125, p0895).
- the drive device is in the "PROFInergy energy-saving mode" (r5600, CU-specific).

Bit 27 = 1 (enable signal missing), if:

- de-magnetizing has still not been completed (only for vector).

Bit 28 = 1 (enable signal missing), if:

- the holding brake is closed or has still not been opened.

Bit 29 = 1 (enable signal missing), if:

- the cooling unit ready signal via binector input p0266[1] missing.

## 2 Parameters

### 2.2 List of parameters

Bit 30 = 1 (speed controller inhibited), if one of the following reasons is present:

- a 0 signal is available via binector input p0856.
- the function generator with current input is active.
- the measuring function "current controller reference frequency characteristic" is active.
- the pole position identification is active.
- motor data identification is active (only certain steps).

Bit 31 = 1 (enable signal missing), if:

- the speed setpoint from jog 1 or 2 is entered.

#### Description:

Display and BICO output for missing enable signals that are preventing the closed-loop infeed control from being commissioned.

#### Bit field:

| Bit | Signal name                        | 1 signal | 0 signal | FP |
|-----|------------------------------------|----------|----------|----|
| 00  | OFF1 enable missing                | Yes      | No       | -  |
| 01  | OFF2 enable missing                | Yes      | No       | -  |
| 03  | Operation enable missing           | Yes      | No       | -  |
| 08  | EP terminals enable missing        | Yes      | No       | -  |
| 16  | OFF1 enable internal missing       | Yes      | No       | -  |
| 17  | OFF2 enable internal missing       | Yes      | No       | -  |
| 19  | Pulse enable internal missing      | Yes      | No       | -  |
| 26  | Infeed inactive or not operational | Yes      | No       | -  |
| 29  | Cooling unit ready signal missing  | Yes      | No       | -  |

#### Dependency:

Refer to: r0002

#### Note:

The value r0046 = 0 indicates that all enable signals for the infeed are present.

Bit 00 = 1 (enable signal missing), if:

- the signal source in p0840 is a 0 signal.
- there is a "switching on inhibited".

Bit 01 = 1 (enable signal missing), if:

- the signal source in p0844 or p0845 is a 0 signal.

Bit 03 = 1 (enable signal missing), if:

- the signal source in p0852 is a 0 signal.

Bit 08 = 1 (enable signal missing), if:

- the pulse enable via terminal EP is missing (booksize: X21, chassis: X41).

Bit 16 = 1 (enable signal missing), if:

- there is an OFF1 fault response. The system is only enabled if the fault is removed and was acknowledged and the "switching on inhibited" withdrawn with OFF1 = 0.

Bit 17 = 1 (enable signal missing), if:

- the commissioning mode is selected (p0009 > 0 or p0010 > 0) or there is an OFF2 fault response or the OFF1 signal source (p0840) is changed.

Bit 19 = 1 (internal pulse enable missing), if:

- synchronization is running between the basic clock cycle, DRIVE-CLiQ clock cycle and application clock cycle.

Bit 26 = 1 (enable signal missing), if:

- the infeed is inactive (p0105 = 0) or is not operational (r7850[DO-Index]=0).
- the infeed is in the "PROFenergy energy-saving mode" (r5600, CU-specific).

Bit 29 = 1 (enable signal missing), if:

- the cooling unit ready signal via binector input p0266[1] missing.

#### r0047

#### Identification status / ID status

SERVO, SERVO\_AC,  
SERVO\_I\_AC

**Can be changed:** -

**Calculated:** -

**Access level:** 1

**Data type:** Integer16

**Dyn. index:** -

**Func. diagram:** -

**P-Group:** Displays, signals

**Unit group:** -

**Unit selection:** -

**Not for motor type:** -

**Scaling:** -

**Expert list:** 1

**Min**

**Max**

**Factory setting**

0

104

-

#### Description:

Displays the currently executed steps or the first step after the enable for the motor identification and pole position identification routines.

#### Value:

- 0: No measurement
- 1: PolID: Wait for brake closing time
- 2: PolID: Measurement step 1
- 3: PolID: Measurement step 2
- 4: PolID: Measurement step 3
- 5: PolID: Measurement step 4
- 6: PolID: Measurement stage 2
- 7: PolID: Measurement evaluation
- 8: PolID: Measurement end
- 11: MotID: Inductance measurement, step 1
- 12: MotID: Inductance measurement, step 2
- 13: MotID: Inductance measurement evaluation
- 14: MotID: Resistance measurement evaluation
- 15: MotID: Fine synchronization step 1
- 16: MotID: Fine synchronization step 2
- 17: MotID: Fine synchronization step 3
- 18: MotID: Fine synchronization end
- 20: MotID: Rotating inductance measurement step 1
- 21: MotID: Rotating inductance measurement step 2
- 22: MotID: Rotating inductance measurement step 3
- 23: MotID: Rotating inductance measurement step 4
- 24: MotID: Rotating Inductance measurement evaluation
- 25: MotID: Rotating Inductance measurement end
- 30: MotID: Induction motor measurement step 1
- 31: MotID: Induction motor measurement step 2
- 32: MotID: Induction motor measurement step 3
- 33: MotID: Induction motor measurement step 4

## 2 Parameters

### 2.2 List of parameters

**Note:** In encoderless operation, the speed actual value is calculated and can be smoothed using p1451.  
For operation with encoder, r0063 is smoothed with p1441.  
The speed actual value is available smoothed (r0021, r0022) and unsmoothed (r0061).

|                                      | - [rpm]                                | - [rpm]                | - [rpm]                                   |

**Description:** Display and connector output for the speed actual value.

Frequency components from the slip compensation (for induction motors) are not included.

For U/f control and when slip compensation is deactivated (see p1335), the synchronous speed to the output frequency is shown in r0063[0].

**Index:**  
[0] = Unsmoothed  
[1] = Smoothed with p0045  
[2] = Calculated from f\_set - f\_slip (unsmoothed)

**Dependency:** Refer to: r0021, r0022

**Note:** The speed actual value is calculated in encoderless operation and for U/f control.  
For operation with encoder, r0063[0] is smoothed with p1441.  
The speed actual value r0063[0] – smoothed with p0045 – is additionally displayed in r0063[1]. r0063[1] can be used as process variable for the appropriate smoothing time constant p0045.  
The speed (r0063[2]) calculated from the output frequency and slip can only be compared with the speed actual value (r0063[0]) in the steady-state.  
The actual speed (r0063[0]) is available as a display quantity with additional smoothing in r0021.  
For U/f control, the mechanical speed calculated from the output frequency and the slip is shown in r0063[2] even if slip compensation is deactivated.

**Description:** Display and connector output for the smoothed speed actual value.

**Note:** For Terminal Module 41 (TM41), this value is used to interconnect with standard telegram 3 and is always zero.

## 2 Parameters

### 2.2 List of parameters

**Note:** The input voltages are available smoothed (r0025) and unsmoothed (r0072).  
 For r0072[0]:  
 Displays the pulsed voltage at the line supply input terminals of the power unit.  
 The value is calculated from the modulation depth (r0074) and is therefore only correct in the closed-loop controlled mode and when the pulses are enabled.  
 For r0072[1]:  
 Displays the absolute voltage at the input terminals of the line filter or the connection point of a Voltage Sensing Module (VSM).  
 If a VSM is not connected, then the value is calculated from the VSM measured values r3661 and r3662 and is therefore equal to 0.  
 For r0072[2]:  
 Displays the estimated value for the voltage of the voltage source that is calculated in the voltage model of the line supply PLL.  
 Input quantities of the model are the measured values of the line currents and the DC link voltage as well as the characteristics of the line filter p0225, p0226 as well as the line inductance p3424.  
 For r0072[3]:  
 Displays the smoothed value for the source voltage in r0072[2].  
 The PT1 smoothing time constant is set in p3472[0, 1].  
 For r0072[4]:  
 Displays the strongly smoothed value for the source voltage in r0072[2].  
 The PT1 smoothing time constant is set in p3472[2].

| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC,<br>A_INF, R_INF | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><br><b>P-Group:</b> Displays, signals<br><b>Not for motor type:</b> -<br><b>Min</b><br>- [%]  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><br><b>Unit group:</b> -<br><b>Scaling:</b> PERCENT<br><b>Max</b><br>- [%]    | <b>Access level:</b> 3<br><b>Func. diagram:</b> 5730, 6730,<br>6731, 6799, 8940, 8950<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- [%] |
| <b>Description:</b>  | Display and connector output for the actual modulation depth.  |   |   |
| <b>Dependency:</b>   | Refer to: r0028  |   |   |
| <b>Note:</b>   | For space vector modulation, 100% corresponds to the maximum output voltage without overcontrol. Values above 100% indicate an overcontrol condition - values below 100% have no overcontrol. The phase voltage (phase-to-phase, rms) is calculated as follows: $(r0074 \times r0070) / (\sqrt{2} \times 100 \%)$ . The modulation depth is available smoothed (r0028) and unsmoothed (r0074).   |   |   |
| <b>r0075</b>   | <b>CO: Current setpoint field-generating / Id_set</b>  |   |   |
| SERVO, SERVO_AC,<br>SERVO_I_AC   | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><br><b>P-Group:</b> Displays, signals<br><b>Not for motor type:</b> REL<br><b>Min</b><br>- [Arms]   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><br><b>Unit group:</b> 6_2<br><b>Scaling:</b> p2002<br><b>Max</b><br>- [Arms] | <b>Access level:</b> 3<br><b>Func. diagram:</b> 5700, 5714,<br>5722<br><b>Unit selection:</b> p0505<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- [Arms]            |
| <b>Description:</b>  | Display and connector output for the field-generating current setpoint (Id_set).   |   |   |
| <b>Note:</b>   | This value is irrelevant for the U/f control mode.   |   |   |
| <b>r0075</b>   | <b>CO: Current setpoint field-generating / Id_set</b>  |   |   |
| VECTOR,<br>VECTOR_AC,<br>VECTOR_I_AC   | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><br><b>P-Group:</b> Displays, signals<br><b>Not for motor type:</b> REL<br><b>Min</b><br>- [Arms]   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><br><b>Unit group:</b> 6_2<br><b>Scaling:</b> p2002<br><b>Max</b><br>- [Arms] | <b>Access level:</b> 3<br><b>Func. diagram:</b> 6700, 6714,<br>6725<br><b>Unit selection:</b> p0505<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- [Arms]            |
| <b>Description:</b>  | Display and connector output for the field-generating current setpoint (Id_set).   |   |   |
| <b>Note:</b>   | This value is irrelevant for the U/f control mode.   |   |   |
| <b>r0075</b>   | <b>CO: Reactive current setpoint / I_react_set</b>   |   |   |
| A_INF, R_INF   | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><br><b>P-Group:</b> Displays, signals<br><b>Not for motor type:</b> -<br><b>Min</b><br>- [Arms]   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><br><b>Unit group:</b> 6_2<br><b>Scaling:</b> p2002<br><b>Max</b><br>- [Arms] | <b>Access level:</b> 3<br><b>Func. diagram:</b> 7997, 8945,<br>8946<br><b>Unit selection:</b> p0505<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- [Arms]            |
| <b>Description:</b>  | Display and connector output for the reactive current setpoint.  |   |   |
| <b>Dependency:</b>   | Refer to: r3471, p3610   |   |   |
| <b>Note:</b>   | The reactive current requirement of a line filter should be covered by the controlled infeed/regenerative feedback so that the converter always operates with a power factor of 1 compared to the line. Setpoint r0075 includes the reactive current for a line filter that depends on the actual operating point (r3471).<br>If the line phases are reversed and the line voltage therefore has a negative orientation ( $r0066 < 0$ ), it should be noted that the sign of the reactive current is reversed. |   |   |

## 2 Parameters

### 2.2 List of parameters

**Note:** The flux actual value (index 1) smoothed with p1585 is only displayed for separately excited synchronous motors. In the following cases, the unsmoothed flux actual value is also displayed:

- in the range of the current model.
- during the pole position identification.
- for I/f control.
- for a stalled drive.

**Description:** Setting to pre-assign/check the sampling times for the internal controller clock cycles for isochronous PROFIdrive operation.  
 For p0092 = 0:  
 The controller clock cycles are set without any restrictions by the isochronous PROFIdrive operation (same as for up to V2.3).  
 When calculating the drive unit utilization (r9976), when using the fixed DCC runtime groups "Receive AFTER IF1 PROFIdrive PZD", "Send BEFORE IF1 PROFIdrive PZD", "Receive AFTER IF2 PZD" (from V4.4) and "Send BEFORE IF2 PZD" (from V4.4), then its maximum computing time load has already been calculated during ramp-up for isochronous operation and taken into account in r9976 (from V4.3).  
 For p0092 = 1:  
 The controller clock cycles are set so that isochronous PROFIdrive operation is possible. If it is not possible to change the controller clock cycles of the isochronous PROFIdrive operation, then an appropriate message is output. The pre-setting of the controller clock cycles can result in a derating of the Motor Module (e.g. p0115[0] = 400 µs --> 375 µs).  
 When calculating the drive unit utilization (r9976), when using the fixed DCC runtime groups "Receive AFTER IF1 PROFIdrive PZD", "Send BEFORE IF1 PROFIdrive PZD", "Receive AFTER IF2 PZD" (from V4.4) and "Send BEFORE IF2 PZD" (from V4.4), then its maximum computing time load has already been calculated during ramp-up for isochronous operation and taken into account in r9976 (from V4.3).

**Value:**  
 0: No isochronous PROFIBUS  
 1: Isochronous PROFIBUS

**Dependency:**  
 Refer to: r0110, p0115  
 Refer to: A01223, A01224

**Caution:**  Only current controller sampling times (p0115[0]) which are integers of 125 µs are permitted for isochronous mode. For SERVO the following current controller sampling times are also possible:  
 187.5, 150, 100, 93.75, 75, 62.5, 50, 37.5, 31.25 µs  
 For VECTOR the following current controller sampling times are also possible:  
 312.5, 218.75, 200, 187.5, 175, 156.25, 150, 137.5 µs  
 The additional current controller sampling times must be taken into account when parameterizing the bus for Ti, To and Tdp.

**Notice:** p0092 only has an influence on the automatic default for the sampling times (p0115) in the drive. If the sampling times are modified subsequently in expert mode (p0112 = 0), p0092 = 0 should be set so that the new values are not overwritten again by the automatic default when the parameters are downloaded. The conditions for current controller sampling time for isochronous operation must still be carefully ensured (refer under Caution!).

|                                | - [°]  | - [°]                 | - [°]                      |

**Description:** Displays the scaled electrical pole position angle.  
**Dependency:** Refer to: r0094, p0431, r1778

**Notice:** When the pole position angle (r0093) is output via test socket Tx (x = 0, 1, 2) to adjust the encoder (to determine the angular commutation offset) the test socket being used must be parameterized as follows:

p0771[x] = r0093  
 p0777[x] = 0 %  
 p0778[x] = 0 V  
 p0779[x] = 400 %  
 p0780[x] = 4 V  
 p0783[x] = 0 V  
 p0784[x] = 0

For p1821 = 1 (counter-clockwise direction of rotation) the following applies:

In order to adjust the encoder using the EMF method, the value, determined using the oscilloscope, must be inverted and then entered in p0431.

**Note:** For operation with encoder and pulse suppression, the following applies:

- the value is generated from r0094 + 180 °.

- this angle can be used to adjust the encoders of synchronous motors.

For pulse enable, the following applies:

- the value indicates the transformation angle used by the control + 180 °.

- this value is, contrary to r0094, also applicable (provides information) for encoderless operation and after a pole position identification routine.

**Description:**

Display and connector output of the piston position.

**Note:**

The piston position should be calibrated, so that when the cylinder is completely retracted, zero is displayed and the value increases as it extends.

For piston calibration, p1960 (automatic) or p1909 (manual) can be used.

**Description:**

Displays the transformation angle.

**Dependency:**

Refer to: r0093, p0431, r1778

**Note:**

The transformation angle corresponds to the electrical commutation angle.

If no pole position identification is carried out (p1982), and the encoder is adjusted, the following applies:

The encoder supplies the value and indicates the electrical angle of the flux position (d axis).

## 2 Parameters

### 2.2 List of parameters

**Dependency:** If p0100 is changed, all of the rated motor parameters are reset. Only then are possible unit changeovers made. The units of all motor parameters are changed that are involved in the selection of IEC or NEMA (e.g. r0206, p0307, p0316, r0333, r0334, p0341, p0344, r1493, r1969). Refer to: p0206, p0210, p0300, p0304, p0305, p0307, p0308, p0309, p0310, p0311, p0312, p0314, p0320, p0322, p0323, p0335, r0336, r0337, p0338, p1800

**Note:** The parameter can only be changed for vector control (p0107). The parameter value is not reset when the factory setting is restored (p0010 = 30, p0970).

## 2 Parameters

### 2.2 List of parameters

**Note:** For value = 0, 2:  
When a drive object is deactivated it no longer outputs any errors.  
If value = 0:  
All components of the drive object were completely commissioned and are deactivated using this value. They can be removed from the DRIVE-CLiQ without any error.  
If a component has been deactivated, only the component with the correct serial number may be inserted, or none at all.  
If value = 1:  
All components of the drive object must be available for error-free operation.  
If value = 2:  
Components of a drive object in a project generated offline and set to this value must never be inserted in the actual topology from the very start. This means that the components are marked to be bypassed in the DRIVE-CLiQ line.  
For components that comprise several individual components (e.g. Double Motor Modules), it is not permissible to set just one subset to this value.

 208: TM150 (Terminal Module)  
 300: ENCODER

**Dependency:**

Refer to: p0103

**Caution:**

If you change this parameter and exit the device commissioning mode, then the complete software will be set up again and all of the previous drive parameter settings are deleted.

**Note:**

The number (p0101) and the associated drive object type are in the same index.

For SINAMICS S a drive object type can only be changed between SERVO and VECTOR. If you change the parameter and exit drive commissioning (p0009 from 2 to 0) the drive parameters are set up again.

**Dependency:** Refer to: r0171, r0172, r0173

**Note:** A "function module" is a functional expansion of a drive object that can be activated when commissioning.

DO: Drive Object

The following bits are only automatically set, if the power units are detected with the appropriate properties.

Bit 15: Parallel connection of identical power units (only automatically set for G130/G150).

Bit 20: Software gating unit (only automatically set when power units are connected in parallel).

Bit 24: Type PM330 power units are presently not supported.

Bit 26: Type PM250 power units with F3E energy recovery are only supported for S120 CRANES.

Bit 28: Power units with liquid cooling.

**Description:** Pre-assignment of the sampling times in p0115.  
The clock cycles for the current controller / speed controller / flux controller / setpoint channel / position controller / positioning / technology controller are pre-assigned as follows:  
SINAMICS S, servo drive:  
p0112 = 1: 250 / 250 / 250 / 4000 / 2000 / 8000 / 4000 µs (for chassis units)  
p0112 = 2: 125 / 250 / 250 / 4000 / 2000 / 8000 / 4000 µs  
p0112 = 3: 125 / 125 / 125 / 4000 / 1000 / 4000 / 4000 µs  
p0112 = 4: 62.5 / 62.5 / 62.5 / 1000 / 1000 / 2000 / 1000 µs (for S210)  
p0112 = 5: 31.25 / 31.25 / 31.25 / 1000 / 1000 / 2000 / 1000 µs  
SINAMICS S, Active Infeed (p0112 = 1 not for p0092 = 1):  
p0112 = 1: 400 / - / - / 1600 µs (pre-setting for the rated pulse frequency = 2.5 kHz)  
p0112 = 2: 250 / - / - / 2000 µs (pre-setting for rated pulse frequency = 4.0 kHz, 8.0 kHz)  
p0112 = 3: 125 / - / - / 2000 µs  
p0112 = 4: 125 / - / - / 1000 µs  
p0112 = 5: 125 / - / - / 500 µs  
SINAMICS S, Smart Infeed (p0112 = 1 not for p0092 = 1):  
p0112 = 1: 400 / - / - / 1600 µs (pre-setting for the rated pulse frequency = 2.5 kHz)  
p0112 = 2: 250 / - / - / 2000 µs (pre-setting for rated pulse frequency = 4.0 kHz, 8.0 kHz)  
p0112 = 3: 250 / - / - / 2000 µs  
p0112 = 4: 250 / - / - / 1000 µs  
p0112 = 5: Not possible  
SINAMICS S, Basic Infeed, booksize:  
p0112 = 4: 250 / - / - / 2000 µs  
SINAMICS S, Basic Infeed, chassis:  
p0112 = 1: 2000 / - / - / 2000 µs  
p0112 = 2: 2000 / - / - / 2000 µs (pre-setting)  
p0112 = 3: 2000 / - / - / 2000 µs  
p0112 = 4: Not possible  
p0112 = 5: Not possible

SINAMICS S/G, vector drive (p0112 = 1 not for p0092 = 1 and not for PM340):

p0112 = 1: 400 / 1600 / 1600 / 1600 / 3200 / 3200 / 3200  $\mu$ s (for rated pulse frequency = 1.25, 2.5 kHz)

p0112 = 2: 250 / 1000 / 2000 / 1000 / 2000 / 4000 / 4000  $\mu$ s

p0112 = 3: 250 / 1000 / 1000 / 1000 / 2000 / 4000 / 4000  $\mu$ s (for rated pulse frequency = 2.0, 4.0 kHz)

SINAMICS S, vector drive:

p0112 = 4: 250 / 500 / 1000 / 500 / 1000 / 2000 / 2000  $\mu$ s

p0112 = 5: 250 / 250 / 1000 / 500 / 1000 / 2000 / 1000  $\mu$ s

**Value:**  
 0: Expert  
 1: xLow  
 2: Low  
 3: Standard  
 4: High  
 5: xHigh

**Recommendation:** When changing the sampling times of the current and speed controllers (also refer to p0115), then we recommend that after exiting commissioning (p0009 = 0) the controller settings are re-calculated using p0340 = 4.

**Dependency:** It is prohibited to select a parameter value from p0112 if the associated current controller clock cycle cannot set (e.g. p0112 = 1 is not possible for a vector drive and PM340 power unit).

If, for a servo drive, p112 = 5 is set, then the pulse frequency p1800 is pre-assigned 8 kHz. For D410-2 and vector drive, the current controller sampling time can only be permanently changed for p0112 = 0.

Refer to: p0092

**Note:** For p0112 = 0 (expert) the individual sampling times in p0115 can be adjusted.

The setting p0112 = 1 cannot be set for a vector drive with power unit type PM340 (refer to r0203).

---

### p0113 Minimum pulse frequency, selection / f\_puls min sel

|                                |                                     |                      |                          |
|--------------------------------|-------------------------------------|----------------------|--------------------------|
| SERVO, SERVO_AC,<br>SERVO_I_AC | <b>Can be changed:</b> C1(3)        | <b>Calculated:</b> - | <b>Access level:</b> 3   |
|                                | <b>Data type:</b> FloatingPoint32   | <b>Dyn. index:</b> - | <b>Func. diagram:</b> -  |
|                                | <b>P-Group:</b> Closed-loop control | <b>Unit group:</b> - | <b>Unit selection:</b> - |
|                                | <b>Not for motor type:</b> -        | <b>Scaling:</b> -    | <b>Expert list:</b> 1    |
|                                | <b>Min</b>                          | <b>Max</b>           | <b>Factory setting</b>   |
|                                | 2.000 [kHz]                         | 4.000 [kHz]          | 4.000 [kHz]              |

**Description:** The current controller sampling time (p0115[0]) is pre-assigned by selecting the minimum pulse frequency.

**Dependency:** The parameter can only be changed with p0112 = 0 (expert). For isochronous operation (p0092 = 1) the parameter can only be set so that a current controller sampling time of 125  $\mu$ s is obtained as an integer number.

The required pulse frequency can be set in p1800 after commissioning (p0009 = p0010 = 0), assuming that this has not been restricted by other conditions (e.g. as a result of p1082, p0310).

Refer to: p0112, r0114, p0115, p1800

**Note:** The current controller sampling time (p0115[0]) is set to the inverse value of twice the minimum pulse frequency. For p0113 = 2.0 kHz, p0115[0] = 250  $\mu$ s is set, for p0113 = 4.0 kHz, p0115[0] = 125  $\mu$ s is set. The current controller sampling time (p0115[0]), calculated from the pulse frequency, is set in a grid of 1.25  $\mu$ s.

For a power unit type PM340 (refer to r0203), only the values 2.0 and 4.0 kHz can be set.

---

**Description:** The current controller sampling time (p0115[0]) is pre-assigned by selecting the minimum pulse frequency.

**Dependency:** The parameter can only be changed with p0112 = 0 (expert). For isochronous operation (p0092 = 1) the parameter can only be set so that a current controller sampling time of 125  $\mu$ s is obtained as an integer number.

The required pulse frequency can be set in p1800 after commissioning (p0009 = p0010 = 0), assuming that this has not been restricted by other conditions (e.g. as a result of p1082, p0310).

Refer to: p0112, r0114, p0115, p1800

## 2 Parameters

### 2.2 List of parameters

**Note:** The current controller sampling time (p0115[0]) is set to the inverse value of twice the minimum pulse frequency. For p0113 = 2.0 kHz, p0115[0] = 250 µs is set, for p0113 = 4.0 kHz, p0115[0] = 125 µs is set. The current controller sampling time (p0115[0]), calculated from the pulse frequency, is set in a grid of 1.25 µs.  
For a power unit type PM340 (refer to r0203), only the values 2.0 and 4.0 kHz can be set.

| <b>Description:</b>  | Sets the mode for the computing dead time of the current controller.<br>0: Offset (shifted) clocking, minimum computing dead time of each drive, automatic setting<br>1: Clocking at the same time, the dead time aligns itself to the dead time of the latest drive, automatic setting<br>2: Manual setting of the computing dead time, early transfer<br>3: Manual setting of the computing dead time, late transfer<br>4-6: As for 0-2, however, no early transfers are set for vectors |  |   |  |
| <b>Dependency:</b>   | Refer to: p0118<br>Refer to: A02100  |  |   |  |

**Note:** The mode change is not effective until the drive unit is switched on again.

For p0117 = 0:  
The times when the setpoints become effective for the individual controls is automatically and individually determined. Another computing dead time is set for each control (closed-loop) (p0118). Current is impressed for the individual controls without any offset with respect to time (improved EMC compatibility).

For p0117 = 1:  
The latest closed-loop control determines when the setpoints for each of the individual controls become active. The same computing dead time is set for each control (p0118). Current is impressed (flows) for the individual controls without any offset with respect to time.

For p0117 = 2:  
The computing dead time is manually set. The user must optimize the value in p0118.

For p0117 = 3:  
The computing dead time is manually set. The user must optimize the value in p0118.

For p0117 = 4 ... 6:  
Behavior as for p0117 = 0 ... 2, however for vectors, the earliest times are not determined.

| <b>Description:</b>  | Setting to activate/deactivate a power unit component.   |   |   |
| <b>Value:</b>  | 0: Deactivate component<br>1: Activate component<br>2: Component deactivate and not present  |   |   |
| <b>Recommendation:</b>   | After inserting a component, before activating, first wait for Alarm A01317.   |   |   |
| <b>Dependency:</b>   | Refer to: r0126<br>Refer to: A01314, A01317  |   |   |

**Caution:**

For a parallel connection, the following applies:

When deactivating individual power units using this parameter, it is not permissible that the power units of the parallel connection involved are connected. Infeed units should be disconnected from the line supply (for example, using a contactor). Motor feeder cables should be disconnected. In addition, defective power units should be disconnected from the DC link.

**Notice:**

It is not permissible to deactivate drive objects with safety functions enabled.

**Note:**

The activation of a component can be rejected if the component was inserted for the first time. In this case, it is only possible to activate the component when the pulses for all of the drive objects are inhibited.

For units connected in parallel, when one of the power units is deactivated, then the enable in p7001 is withdrawn.

For value = 0, 2:

When a component is deactivated it no longer outputs any errors.

If value = 0:

The component was completely commissioned and is deactivated using this value. It can be removed from the DRIVE-CLiQ without any error.

If value = 1:

The component must be available for error-free operation.

If value = 2:

A component in a project generated offline and set to this value must never be inserted in the actual topology from the very start. This means that the component is marked to be bypassed in the DRIVE-CLiQ line.

For components that comprise several individual components (e.g. Double Motor Modules), it is not permissible to set just one subset to this value.

## 2 Parameters

| <b>Description:</b>  | Copying a Motor Data Set (MDS) into another.   |   |  |                 |
| <b>Index:</b>  | [0] = Source motor data set<br>[1] = Target motor data set<br>[2] = Start copying procedure  |   |  |                 |

## 2 Parameters

### 2.2 List of parameters

**Note:** Procedure:  
 1. In Index 0, enter which motor data set should be copied.  
 2. In Index 1, enter the motor data set data that is to be copied into.  
 3. Start copying: set index 2 from 0 to 1.  
 p0139[2] is automatically set to 0 when copying is completed.  
 When copying, p0131 is not taken into account.

**Description:** This parameter is used to assign the encoder data set to an encoder evaluation (e.g. SMC).  
 This unique component number is assigned when parameterizing the topology.  
 Only a component number can be entered that corresponds to an encoder evaluation.

**Note:** If the encoder evaluation and encoder are integrated (motor with DRIVE-CLiQ), then their component numbers are identical.  
 For an SMC, different component numbers are assigned for the SMC (p0141) and the (actual) encoder (p0142).  
 SMC: Sensor Module Cabinet

|                     | <b>Min</b>   | <b>Max</b>               | <b>Factory setting</b>   |
|                     | -  | -                        | -                        |
| <b>Description:</b> | Displays the version of the EEPROM data of the Voltage Sensing Module (VSM). |                          |                          |
| <b>Note:</b>        | Example:<br>The value 1010100 should be interpreted as V01.01.01.00.         |                          |                          |

## 2 Parameters

### 2.2 List of parameters

|   |   |   |   |
|---|---|---|---|
| <b>r0148[0...n]</b>   | <b>Sensor Module firmware version / SM FW version</b>   |   |   |
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC, ENC | <b>Can be changed:</b> -<br><b>Data type:</b> Unsigned32<br><b>P-Group:</b> Encoder<br><b>Not for motor type:</b> -<br><b>Min</b><br>-  | <b>Calculated:</b> -<br><b>Dyn. index:</b> EDS, p0140<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- |
| <b>Description:</b>   | Displays the firmware version of the Sensor Module.   |   |   |
| <b>Dependency:</b>  | Refer to: r0018, r0128, r0158, r0197, r0198   |   |   |
| <b>Note:</b>  | Example:<br>The value 1010100 should be interpreted as V01.01.01.00.  |   |   |
| <b>r0148[0...n]</b>   | <b>Voltage Sensing Module firmware version / VSM FW version</b>   |   |   |
| A_INF, S_INF, R_INF   | <b>Can be changed:</b> -<br><b>Data type:</b> Unsigned32<br><b>P-Group:</b> Encoder<br><b>Not for motor type:</b> -<br><b>Min</b><br>-  | <b>Calculated:</b> -<br><b>Dyn. index:</b> p0140<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>-      | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- |
| <b>Description:</b>   | Displays the firmware version of the Voltage Sensing Module (VSM).  |   |   |
| <b>Dependency:</b>  | Refer to: r0018, r0128, r0158, r0197, r0198   |   |   |
| <b>Note:</b>  | Example:<br>The value 1010100 should be interpreted as V01.01.01.00.  |   |   |
| <b>p0150</b>  | <b>Number of VSM data sets / VSM dat_sets qty</b>   |   |   |
| VECTOR,<br>VECTOR_AC,<br>VECTOR_I_AC  | <b>Can be changed:</b> C1(3), C2(15)<br><b>Data type:</b> Unsigned8<br><b>P-Group:</b> Data sets<br><b>Not for motor type:</b> -<br><b>Min</b><br>1   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>2          | <b>Access level:</b> 4<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>1 |
| <b>Description:</b>   | Sets the number of VSM data sets.   |   |   |
| <b>p0150</b>  | <b>VSM2 data sets selection / VSM2 dat_sets qty</b>   |   |   |
| A_INF, S_INF, R_INF   | <b>Can be changed:</b> C1(3), C2(15)<br><b>Data type:</b> Unsigned8<br><b>P-Group:</b> Data sets<br><b>Not for motor type:</b> -<br><b>Min</b><br>1   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>2          | <b>Access level:</b> 4<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>1 |
| <b>Description:</b>   | Sets the number of VSM2 data sets.  |   |   |
| <b>Dependency:</b>  | The Voltage Sensing Module 2 (VSM2) can only be used if the "line transformer" function module has been activated (r0108.4 = 1).<br>For the VSM2, parameters p5460 and following are significant. |   |   |
| <b>Note:</b>  | The Voltage Sensing Module 2 (VSM2) should always be connected to the primary side of the line transformer if at all possible.  |   |   |

---

|                                      |   |                          |                          |
|--------------------------------------|---|--------------------------|--------------------------|
| <b>p0151[0...n]</b>                  | <b>Voltage Sensing Module component number / VSM comp_no</b>  |                          |                          |
| VECTOR,<br>VECTOR_AC,<br>VECTOR_I_AC | <b>Can be changed:</b> C1(4), C2(15)  | <b>Calculated:</b> -     | <b>Access level:</b> 3   |
|                                      | <b>Data type:</b> Unsigned8   | <b>Dyn. index:</b> p0150 | <b>Func. diagram:</b> -  |
|                                      | <b>P-Group:</b> Data sets   | <b>Unit group:</b> -     | <b>Unit selection:</b> - |
|                                      | <b>Not for motor type:</b> -  | <b>Scaling:</b> -        | <b>Expert list:</b> 1    |
|                                      | <b>Min</b>  | <b>Max</b>               | <b>Factory setting</b>   |
|                                      | 0   | 199                      | 0                        |
| <b>Description:</b>                  | The VSM data set is assigned to a VSM evaluation using this parameter.  |                          |                          |
| <b>Note:</b>                         | If two VSM are connected at the Motor Module, then the first (p0151[0]) is assigned to the line voltage measurement (see p3801) and the second, to the motor voltage measurement (see p1200). |                          |                          |

**Description:** The function module of an existing drive object is entered into each index (see p0101, p0107).  
 The following bits are available in p0171 for the Control Unit (Index 0):  
 Bit 00: PZD extension  
 For all other drive objects (Index > 0), the significance of the bits should be taken from the display parameters r0171 of the drive object.

| Bit field: | Bit | Signal name | 1 signal | 0 signal | FP |
|------------|-----|-------------|----------|----------|----|
|            | 00  | Bit 0       | ON       | OFF      | -  |
|            | 01  | Bit 1       | ON       | OFF      | -  |
|            | 02  | Bit 2       | ON       | OFF      | -  |
|            | 03  | Bit 3       | ON       | OFF      | -  |
|            | 04  | Bit 4       | ON       | OFF      | -  |
|            | 05  | Bit 5       | ON       | OFF      | -  |
|            | 06  | Bit 6       | ON       | OFF      | -  |
|            | 07  | Bit 7       | ON       | OFF      | -  |
|            | 08  | Bit 8       | ON       | OFF      | -  |
|            | 09  | Bit 9       | ON       | OFF      | -  |

| <b>Description:</b>  | Sets the number of Drive Data Sets (DDS).   |  |   |  |
| <b>p0186[0...n]</b>  | <b>Motor Data Sets (MDS) number / MDS number</b>  |  |   |  |
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC   | <b>Can be changed:</b> C1(4), C2(15)<br><b>Data type:</b> Unsigned8<br><b>P-Group:</b> Data sets<br><b>Not for motor type:</b> -<br><b>Min</b><br>0   | <b>Calculated:</b> -<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>15 | <b>Access level:</b> 3<br><b>Func. diagram:</b> 8575<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0        |  |
| <b>Description:</b>  | Using the parameter, each Drive Data Set (= index) is assigned the associated Motor Data Set (MDS).<br>The parameter value therefore corresponds to the number of the assigned motor data set.  |  |   |  |
| <b>p0187[0...n]</b>  | <b>Encoder 1 encoder data set number / Enc 1 EDS number</b>   |  |   |  |
| SERVO, SERVO_AC,<br>SERVO_I_AC   | <b>Can be changed:</b> C1(4), C2(15)<br><b>Data type:</b> Unsigned8<br><b>P-Group:</b> Data sets<br><b>Not for motor type:</b> -<br><b>Min</b><br>0   | <b>Calculated:</b> -<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>99 | <b>Access level:</b> 3<br><b>Func. diagram:</b> 4700, 8570<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>99 |  |
| <b>Description:</b>  | Assign a drive data set (= index) the corresponding encoder data set (EDS) for encoder 1.<br>The value corresponds to the number of the assigned encoder data set.<br>Example:<br>Encoder 1 in drive data set 2 should be assigned encoder data set 0.<br>--> p0187[2] = 0  |  |   |  |
| <b>Notice:</b>   | Writing to p0187 is rejected if the pole position identification is selected (p1982 = 1) and additional data sets with the same MDS data set (p0186) are available, which however have a different encoder data set number in p0187.<br>If all data sets with this MDS p0187 are to be changed, then the pole position identification of the data sets involved should be temporarily deselected (p1982 = 0), p0187 changed for all MDS data sets and then the pole position identification reselected (p1982 = 1).<br>If a motor with pole position identification is to be operated with two different encoders, then for this motor, two motor data sets should be introduced. |  |   |  |
| <b>Note:</b>   | A value of 99 means that no encoder has been assigned to this drive data set (not configured).  |  |   |  |

|   |   |                               |                                  |
|---|---|-------------------------------|----------------------------------|
| <b>p0187[0...n]</b>                       | <b>Encoder 1 encoder data set number / Enc 1 EDS number</b> |                               |                                  |
| VECTOR, HLA,<br>VECTOR_AC,<br>VECTOR_I_AC | <b>Can be changed:</b> C1(4), C2(15)                        | <b>Calculated:</b> -          | <b>Access level:</b> 3           |
|   | <b>Data type:</b> Unsigned8                                 | <b>Dyn. index:</b> DDS, p0180 | <b>Func. diagram:</b> 4700, 8570 |
|   | <b>P-Group:</b> Data sets                                   | <b>Unit group:</b> -          | <b>Unit selection:</b> -         |
|   | <b>Not for motor type:</b> -                                | <b>Scaling:</b> -             | <b>Expert list:</b> 1            |
|   | <b>Min</b>  | <b>Max</b>                    | <b>Factory setting</b>           |
|   | 0   | 99                            | 99                               |

**Description:** Assign a drive data set (= index) the corresponding encoder data set (EDS) for encoder 1.  
The value corresponds to the number of the assigned encoder data set.  
Example:

Encoder 1 in drive data set 2 should be assigned encoder data set 0.  
--> p0187[2] = 0

**Note:** A value of 99 means that no encoder has been assigned to this drive data set (not configured).

|  |   |                               |                                  |
|--|---|-------------------------------|----------------------------------|
| <b>p0188[0...n]</b>  | <b>Encoder 2 encoder data set number / Enc 2 EDS number</b> |                               |                                  |

## 2 Parameters

### 2.2 List of parameters

|    |   |     |    |   |
|----|---|-----|----|---|
| 06 | Liquid cooling  | Yes | No | - |
| 07 | SERVO pulse frequency changeover DDS-dependent                  | Yes | No | - |
| 08 | Simulation mode possible  | Yes | No | - |
| 09 | Internal armature short-circuit possible                        | Yes | No | - |
| 10 | Autonomous internal armature short-circuit possible             | Yes | No | - |
| 11 | Infeed temperature inputs X21.1/2                               | Yes | No | - |
| 12 | Integral scaled to half the gating unit clock cycle freq.       | Yes | No | - |
| 13 | Filtering thermal power unit current limit possible             | Yes | No | - |
| 14 | Reserved  | Yes | No | - |
| 15 | PT100 temperature evaluation possible                           | Yes | No | - |
| 16 | Gating unit with pulse frequency wobble possible                | Yes | No | - |
| 17 | Compound braking possible                                       | Yes | No | - |
| 18 | Extended voltage range possible                                 | Yes | No | - |
| 19 | Gating unit available with current limitation control           | Yes | No | - |
| 20 | Component status possible                                       | Yes | No | - |
| 21 | Temperature evaluation via Motor Module / CU terminals possible | Yes | No | - |
| 22 | Reduced device supply voltage possible                          | Yes | No | - |
| 23 | Current measurement oversampling available                      | Yes | No | - |
| 24 | Parking keeping the relevant data is available                  | Yes | No | - |
| 25 | Internal fan operating hours counter available                  | Yes | No | - |
| 26 | Software gating unit supported in the Control Unit              | Yes | No | - |
| 27 | Current controller dynamics higher                              | Yes | No | - |
| 28 | DC link voltage compensation in the power unit.                 | Yes | No | - |
| 29 | Voltage measurement   | Yes | No | - |
| 30 | Gating unit with all-phase current limiting                     | Yes | No | - |

**Dependency:**

Refer to: r0193

**Notice:**

This information represents the characteristics/features of the power unit firmware. It does not provide information/data about the characteristics/features of the hardware (e.g. bit 06 = 1 means that although the firmware supports "liquid cooling", a power unit with liquid cooling does not have to be used).

**Note:**

For bit 09:

The Motor Module supports the internal armature short-circuit. The function is internally required for voltage protection (p1231 = 3).

For bit 10:

The Motor Module supports the autonomous internal voltage protection.

If the "internal voltage protection" function is activated (p1231 = 3) the Motor Module decides autonomously - using the DC link voltage - as to whether the short-circuit is activated.

For bit 23:

The component supports the detection of current actual values (and the detection of valve close durations) with double clocking and phase shift.

**Note:**

For bit 03 ... 00:  
 Bit 3, 2, 1, 0 = 0, 0, 0, 0 --> component not available.  
 Bit 3, 2, 1, 0 = 0, 0, 0, 1 --> power up, non-cyclic DRIVE-CLiQ communication (LED = orange).  
 Bit 3, 2, 1, 0 = 0, 0, 1, 0 --> operating mode, cyclic DRIVE-CLiQ communication (LED = green).  
 Bit 3, 2, 1, 0 = 0, 0, 1, 1 --> alarm (LED = green).  
 Bit 3, 2, 1, 0 = 0, 1, 0, 0 --> fault (LED = red).  
 Bit 3, 2, 1, 0 = 0, 1, 0, 1 --> detection via LED and operating mode (LED = green/orange).  
 Bit 3, 2, 1, 0 = 0, 1, 1, 0 --> detection via LED and alarm (LED = green/orange).  
 Bit 3, 2, 1, 0 = 0, 1, 1, 1 --> detection via LED and fault (LED = red/orange).  
 Bit 3, 2, 1, 0 = 1, 0, 0, 0 --> firmware being downloaded (LED = green/red with 0.5 Hz).  
 Bit 3, 2, 1, 0 = 1, 0, 0, 1 --> firmware download completed, wait for POWER ON (LED = green/red with 2.0 Hz).

For bits 12 ... 11:  
 These status bits are used for the classification of internal alarm classes and are intended for diagnostic purposes only on certain automation systems with integrated SINAMICS functionality.

**Description:** Displays the name of the firmware package on the memory card/device memory.

r0203[0]: Name character 1

...

r0203[15]: Name character 16

For the commissioning tool, the ASCII characters are displayed uncoded.

**Notice:** An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.

## 2 Parameters

### 2.2 List of parameters

**Notice:** If, in the switched-off state (pulse inhibit), the supply voltage is higher than the entered value, the Vdc controller may be automatically deactivated in some cases to prevent the motor from accelerating the next time the system is switched on. In this case, an appropriate alarm A07401 is output.

**Note:** Setting ranges for p0210 as a function of the rated power unit voltage:

U<sub>rated</sub> = 400 V:

- p0210 = 380 ... 480 V (AC/AC), 510 ... 720 V (DC/AC)

U<sub>rated</sub> = 500 V:

- p0210 = 500 ... 600 V (AC/AC), 675 ... 900 V (DC/AC)

U<sub>rated</sub> = 660 ... 690 V:

- p0210 = 660 ... 690 V (AC/AC), 890 ... 1035 V (DC/AC)

U<sub>rated</sub> = 500 ... 690 V:

- p0210 = 500 ... 690 V (AC/AC), 675 ... 1035 V (DC/AC)

The precharging switch-in threshold for the DC link voltage (Vdc) is calculated from p0210:

Vdc<sub>pre</sub> = p0210 \* 0.82 \* 1.35 (AC/AC)

Vdc<sub>pre</sub> = p0210 \* 0.82 (DC/AC)

The undervoltage thresholds for the DC link voltage (Vdc) are calculated from p0210 as a function of the rated power unit voltage:

U<sub>rated</sub> = 400 V:

- U<sub>min</sub> = p0210 \* 0.78 (AC/AC) > 330 V, p0210 \* 0.60 (DC/AC) > 380 V

U<sub>rated</sub> = 500 V:

- U<sub>min</sub> = p0210 \* 0.76 (AC/AC) > 410 V

U<sub>rated</sub> = 660 ... 690 V:

- U<sub>min</sub> = p0210 \* 0.82 (AC/AC) > 565 V, p0210 \* 0.63 (DC/AC) > 650 V

U<sub>rated</sub> = 500 ... 690 V:

- U<sub>min</sub> = p0210 \* 0.82 (AC/AC) > 420 V, p0210 \* 0.63 (DC/AC) > 480 V

#### p0210

**Max**

**Factory setting**

1 [V]

63000 [V]

600 [V]

#### Description:

Sets the drive unit supply voltage.

AC/AC unit: The rms value of the phase-to-phase line supply voltage should be entered.

DC/AC unit: The rated DC voltage of the connection busbar should be entered.

#### Dependency:

Set p1254, p1294 (automatic detection of the Vdc switch-on levels) = 0.

The switch-in thresholds of the Vdc<sub>max</sub> controller (r1242, r1282) are then directly determined using p0210.

The parameter can be reduced to p0210 = 100 V if p0212.0 = 1 has been set.

Refer to: p0212

#### Notice:

If, in the switched-off state (pulse inhibit), the supply voltage is higher than the entered value, the Vdc controller may be automatically deactivated in some cases to prevent the motor from accelerating the next time the system is switched on. In this case, an appropriate alarm is output (A07401).

For SINAMICS S150 devices, the supply voltage is calculated from the line supply voltage (p0210 of the infeed), and is overwritten each time that the line supply voltage changes.

**Note:** Setting ranges for p0210 as a function of the rated power unit voltage:

U<sub>rated</sub> = 400 V:  
 - p0210 = 380 ... 480 V (AC/AC), 510 ... 720 V (DC/AC)

U<sub>rated</sub> = 500 V:  
 - p0210 = 500 ... 600 V (AC/AC), 675 ... 900 V (DC/AC)

U<sub>rated</sub> = 660 ... 690 V:  
 - p0210 = 660 ... 690 V (AC/AC), 890 ... 1035 V (DC/AC)

U<sub>rated</sub> = 500 ... 690 V:  
 - p0210 = 500 ... 690 V (AC/AC), 675 ... 1035 V (DC/AC)

The precharging switch-in threshold for the DC link voltage (V<sub>dc</sub>) is calculated from p0210:  
 V<sub>dc\_pre</sub> = p0210 \* 0.82 \* 1.35 (AC/AC)  
 V<sub>dc\_pre</sub> = p0210 \* 0.82 (DC/AC)

The undervoltage thresholds for the DC link voltage (V<sub>dc</sub>) are calculated from p0210 as a function of the rated power unit voltage:

U<sub>rated</sub> = 400 V:  
 - U<sub>min</sub> = p0210 \* 0.78 (AC/AC) > 330 V, p0210 \* 0.60 (DC/AC) > 380 V

U<sub>rated</sub> = 500 V:  
 - U<sub>min</sub> = p0210 \* 0.76 (AC/AC) > 410 V

U<sub>rated</sub> = 660 ... 690 V:  
 - U<sub>min</sub> = p0210 \* 0.82 (AC/AC) > 565 V, p0210 \* 0.63 (DC/AC) > 650 V

U<sub>rated</sub> = 500 ... 690 V:  
 - U<sub>min</sub> = p0210 \* 0.82 (AC/AC) > 420 V, p0210 \* 0.63 (DC/AC) > 480 V

|                     | <b>Not for motor type:</b> -      | <b>Scaling:</b> -   | <b>Expert list:</b> 1            |
|                     | <b>Min</b>                        | <b>Max</b>  | <b>Factory setting</b>           |
|                     | 70 [Vrms]                         | 1000 [Vrms]   | 400 [Vrms]                       |

**Description:** Sets the drive unit supply voltage (3-ph. AC).  
 The value corresponds to the rms value of the phase-to-phase rated line supply voltage.

**Dependency:** Refer to: p3400

**Warning:**

If the infeed is continually in the controlled mode with high DC link voltages (p3510 > 660 V), depending on the particular application, this can damage the connected motors that have not been specified for these high voltages. Before an active infeed with a line supply voltage p0210 > 415 V goes into pulsed operation it must be ensured that all of the components connected to the DC link can be permanently operated with DC link voltages exceeding 660 V. Controlled operation of booksize power units for p0210 > 415 V is possible if the maximum steady-state DC link voltage (p0280) is increased as follows:  
 p0280 >= 1.5 x p0210 and p0280 > 660 V  
 In this case, the setpoint of the DC link voltage p3510 is not automatically adapted. We recommend p3510 = 1.5 x p0210.

Closed-loop voltage controlled operation is active with p3400.0 = 0 and p3400.3 = 1.

**Notice:** For p0210 > 415 V for booksize power units with a supply voltage of 3-ph. 380 ... 480 V, the Smart Mode is automatically activated (p3400.0 = 1); this is because in the voltage-controlled mode, the maximum permissible steady-state DC link voltage (p0280) would otherwise be exceeded.

For booksize power units with supply voltage of 3-ph. 380 ... 480 V AC, the following applies:

380 V <= p0210 <= 400 V --> Pre-assignment, setpoint for the DC link voltage: p3510 = 600 V

401 V <= p0210 <= 415 V --> Pre-assignment, setpoint for the DC link voltage: p3510 = 625 V

416 V <= p0210 <= 480 V --> Smart Mode with non-regulated DC link voltage: p3510 = 1.35 x p0210

## 2 Parameters

### 2.2 List of parameters

**Note:** When pre-assigning the setpoint for the DC link voltage (p3510), the following is generally valid:  
 $p3510 = 1.5 \times p0210$   
 The voltage range for the supply voltage depends on the type and the voltage class of the power unit.  
 The following applies for the normal range of the supply voltage:  
 400 V devices:  $380 \text{ V} \leq p0210 \leq 480 \text{ V}$   
 690 V devices:  $660 \text{ V} \leq p0210 \leq 690 \text{ V}$   
 500/690 V devices:  $500 \text{ V} \leq p0210 \leq 690 \text{ V}$   
 Further, for the following devices an extended voltage range downwards can be set:  
 Booksize devices:  
 ALM, 400 V device:  $180 \text{ V} \leq p0210$   
 SLM, 400 V device:  $180 \text{ V} \leq p0210$   
 80 kW / 120 kW ALM with internal and external cooling are excluded.  
 For ALM with 6SL3130-7TE28-0Axx, 6SL3130-7TE31-2Axx, 6SL3131-7TE28-0Axx, 6SL3131-7TE31-2Axx, the following applies:  
 $380 \text{ V} \leq p0210$   
 Chassis devices:  
 ALM, 400 V device:  $180 \text{ V} \leq p0210 \leq 480 \text{ V}$   
 ALM, 500/690 V device:  $380 \text{ V} \leq p0210 \leq 690 \text{ V}$

| <b>p0210</b> | <b>Drive unit line supply voltage / U_connect</b> |                      |                            |
|--------------|---|----------------------|----------------------------|
| B_INF        | <b>Can be changed:</b> C2(1, 2)                   | <b>Calculated:</b> - | <b>Access level:</b> 1     |
|              | <b>Data type:</b> FloatingPoint32                 | <b>Dyn. index:</b> - | <b>Func. diagram:</b> 8760 |
|              | <b>P-Group:</b> Converter                         | <b>Unit group:</b> - | <b>Unit selection:</b> -   |
|              | <b>Not for motor type:</b> -                      | <b>Scaling:</b> -    | <b>Expert list:</b> 1      |
|              | <b>Min</b>  | <b>Max</b>           | <b>Factory setting</b>     |
|              | 70 [Vrms]   | 1000 [Vrms]          | 400 [Vrms]                 |

**Description:** Sets the drive unit supply voltage (3-ph. AC).

The value corresponds to the rms value of the phase-to-phase rated line supply voltage.

**Dependency:** The parameter can be reduced to  $p0210 = 70 \text{ V}$  if  $p0212.0$  is set.

**Notice:** When connected to 3-ph. 230 V AC (only booksize units) the following must be observed:

- the undervoltage and overvoltage limits change (r0296, r0297).
- when using the internal braking chopper of Basic Line Modules (20 or 40 kW) the threshold when the braking chopper becomes active is reduced to 385 V. When using an external braking chopper, it must be ensured that a suitable activation threshold is used.
- all of the components connected to this DC link must also be adapted to the low line supply voltage. It is especially important that the rated DC voltage of all of the drives connected to this DC link is set with  $p0210$  (e.g.  $p0210(\text{SERVO}) = 1.35 \times p0210(\text{B\_INF}) = 310 \text{ V}$ ).
- it is not possible to use a Control Supply Module (CSM) to generate a 24 V supply from the DC link, as the minimum continuous DC link voltage should not be below 430 V.

**Note:** The supply voltage range depends on the voltage class of the power unit.

400 V chassis units:  $380 \text{ V} \leq p0210 \leq 480 \text{ V}$

690 V chassis units:  $500 \text{ V} \leq p0210 \leq 690 \text{ V}$

400 V booksize units can also be connected to 3-ph. 230 V AC:

400 V booksize units:  $180 \text{ V} \leq p0210 \leq 480 \text{ V}$

A reduced supply voltage up to 70 V is possible if  $p0212.0 = 1$  has been set.

## 2 Parameters

### 2.2 List of parameters

**Caution:**

For bit 00:  
Working with reduced input voltages deactivates undervoltage detection.

**Note:**

For bit 00 = 0:  
It is not possible to reduce the supply voltage in p0210.  
For bit 00 = 1:  
With this setting the supply voltage in p0210 can be reduced to 100 V.  
For bit 01 = 0:  
There is no external precharging of the DC/AC Motor Modules. The precharging monitoring is bypassed.  
For bit 01 = 1:  
There is external precharging of the DC/AC Motor Modules. The precharging monitoring is calculated.

| 05  | Contactor display inputs/outputs status | Yes      | No       | 9814 |

**Dependency:**

For bit 00:  
Reduced supply voltages are only possible for booksize and chassis power units (DC/AC).  
Bit 0 = 1 can only be set if r0192.22 = 1.  
For bit 01 = 1:  
The external precharging setting only affects the DC/AC power units.  
For bit 03 = 1:  
The automatic adaptation (reduction) of the Vdc max limit is deactivated (only for chassis power units). Bit 3 only has an effect, if bit 0 is simultaneously set.  
Refer to: r0192, p0210

**Caution:**

For bit 00:  
Working with reduced input voltages deactivates undervoltage detection.  
For bit 03:  
If the automatic setting of the Vdc max limit is deactivated, then all of the components connected to the DC link must be suitable for the maximum DC link voltage of the power unit (e.g. 820 V for 400 V units).

**Note:**

For bit 00 = 0:  
It is not possible to reduce the supply voltage in p0210.  
For bit 00 = 1:  
With this setting the supply voltage in p0210 can be reduced to 100 V.  
Booksize PU: only for operating mode p1300 = 19  
Chassis PU: only for operating mode p1300 > 19 and closed-loop DC voltage control  
For bit 01 = 0:  
There is no external precharging of the DC/AC Motor Modules. The precharging monitoring is bypassed.  
For bit 01 = 1:  
There is external precharging of the DC/AC Motor Modules. The precharging monitoring is calculated.  
For bit 03 = 0:  
The DC link voltage limit is calculated from p0210.  
For bit 03 = 1:  
The DC link voltage limit is set to the maximum value of the power unit.

For bit 05 = 1:

The status of the inputs/outputs for the power unit contactors is displayed in r0256.

This only applies to chassis power units with 3 AC line connection and line contactors.

The status display is only effective after parameter save and POWER ON.

**Bit field:**

| Bit | Signal name   | 1 signal | 0 signal | FP   |
|-----|---|----------|----------|------|
| 00  | Drive unit line supply voltage reduced                          | Yes      | No       | -    |
| 01  | External precharging present                                    | Yes      | No       | -    |
| 03  | Automatically adapt Vdc_max limit                               | No       | Yes      | -    |
| 05  | Contactors display inputs/outputs status                        | Yes      | No       | 9814 |
| 06  | Reduction of the permissible minimum voltage during precharging | Yes      | No       | -    |

**Dependency:**

For bit 00:

Reduced supply voltages are only possible for booksize and chassis power units (DC/AC).

Bit 0 = 1 can only be set if r0192.22 = 1.

For bit 01 = 1:

The external precharging setting only affects the DC/AC power units.

For bit 03 = 1:

The automatic adaptation (reduction) of the Vdc max limit is deactivated (only for chassis power units). Bit 3 only has an effect, if bit 0 is simultaneously set.

Refer to: r0192, p0210

**Caution:**

For bit 00:

Working with reduced input voltages deactivates undervoltage detection.

For bit 03:

If the automatic setting of the Vdc max limit is deactivated, then all of the components connected to the DC link must be suitable for the maximum DC link voltage of the power unit (e.g. 820 V for 400 V units).

**Note:**

For bit 00 = 0:

It is not possible to reduce the supply voltage in p0210.

For bit 00 = 1:

With this setting the supply voltage in p0210 can be reduced to 100 V.

Booksize PU: only for operating mode p1300 = 19

Chassis PU: only for operating mode p1300 > 19 and closed-loop DC voltage control

For bit 01 = 0:

There is no external precharging of the DC/AC Motor Modules. The precharging monitoring is bypassed.

For bit 01 = 1:

There is external precharging of the DC/AC Motor Modules. The precharging monitoring is calculated.

For bit 03 = 0:

The DC link voltage limit is calculated from p0210.

For bit 03 = 1:

The DC link voltage limit is set to the maximum value of the power unit.

For bit 05 = 1:

The status of the inputs/outputs for the power unit contactors is displayed in r0256.

This only applies to chassis power units with 3 AC line connection and line contactors.

The status display is only effective after parameter save and POWER ON.

## 2 Parameters

### 2.2 List of parameters

For bit 06:

Precharging via the Motor Module is activated using this bit. To do this, while precharging, the undervoltage threshold for the pulse enable is reduced.

Precharging via the Motor Module can only be activated for S120 devices for separately excited synchronous generators where the DC link voltage control has been preselected (technology controller function module).

**Caution:**

For bit 00:

Working with reduced input voltages correspondingly reduces undervoltage detection.

This function may only be used by personnel with expert knowledge!

**Note:**

For bit 00 = 0:

It is not possible to reduce the supply voltage in p0210 to below 180 V.

For bit 00 = 1:

With this setting the supply voltage in p0210 can be reduced to 70 V.

Bit 0 = 1 can only be set for booksize power units with a rated power of up to 40 kW.

The activation of this function is retentively saved in the unit and for incorrect design of the application can result in loss of warranty!

For bit 02:

Reserved. It is not permissible to set to 1.

For bit 05 = 1:

The status of the inputs/outputs for the power unit contactors is displayed in r0256.

This only applies to chassis power units with 3 AC line connection and line contactors.

The status display is only effective after parameter save and POWER ON.

**Description:**

Sets the configuration for the cylinder safety circuit.

**Bit field:**

| Bit | Signal name  | 1 signal | 0 signal | FP   |
|-----|--|----------|----------|------|
| 00  | Close shutoff valve for power inhibit (PI)           | Yes      | No       | -    |
| 01  | Shutdown control valve supply for power inhibit (PI) | Yes      | No       | 4990 |
| 02  | Valve feedback signal available                      | Yes      | No       | -    |
| 03  | Invert valve feedback signal                         | Yes      | No       | -    |

**Note:**

PI: power inhibit

For bit 01 = 0 and power inhibit:

When the control valve is switched in, the valve setpoint is interlocked to 0. If bit 0 = 0 (shutoff valve for power inhibit does not close) the drive can drift.

**Description:** Sets the line filter type for the Active Line Module (ALM).  
 For an Active Line Module (ALM), a line filter (Active Interface Module, AIM) with the appropriate rating is automatically selected and the line filter type (p0220) preset as follows:  
 - "booksize" format: p0220 = 41 ... 45  
 - "Chassis" format: p0220 = 10 ... 29 or 78 ... 105  
 - "Chassis-2" format: p0220 = 110 ... 140  
 Based on the line filter type, filter capacitance (p0221), filter resistance (p0222), line-side filter reactor (p0228) as well as inductance (p0223) and the resistance (p0224) of the commutation reactor are preassigned. Further, the setting of the pulse frequency wobulation is also preassigned (p1810.2, p1810.4, p1811) for which the AIM is dimensioned.  
 For the selected filter, controller settings (p3421, p3422, p3424) are newly preassigned suitable values. As a consequence, a subsequent line supply and DC link identification with automatic controller setting is recommended (p3410 >= 4).

**Value:**

| 119: | AIM FS4+ 400 V 900 kW (6SL3301-7TE41-4AA0)                   |

**Index:** [0] = Line filter  
[1] = Line filter optional

**Dependency:** Refer to: p3665

**Caution:** "Booksize" format:

When using an Active Interface Module (AIM), it is absolutely necessary that the terminals for the temperature switch between the Active Interface Module (X121.1/2) and the Active Line Module (X21.1/2) are connected.

"Chassis" format:

When connecting AIMS in parallel, if the last position of the Article number (MLFB) is different, then the temperature sensor type must be manually set (p3665).

**Notice:** After changing the filter selection, it may be necessary to again make special settings regarding the modulation type (p1810, p1811).

For p0220 = 110 ... 140, the following applies:

These line filter types have been designed for operation with pulse frequency wobulation (p1810.2 = 1, p1810.4 = 0, p1811 = 10%), and they only satisfy operation in compliance with the standard under this precondition. Further, the pulse frequency (p1800) can be increased - depending on the power unit - to additionally reduce the line harmonics.

**Note:** The maximum filter current is indicated in r3534, and acts as apparent current limit for the closed-loop control.

For booksize units, when using an Active Interface Module in p0220[0] it is also possible to use a Basic Filter that is parameterized in p0220[1].

The setting of the filter capacitance (p0221) and filter resistance (p0222) - derived from p0220[0, 1] - are required in the closed-loop voltage controlled mode to automatically compensate the filter reactive current.

For two power ratings, the same line filter is used for both power ratings.

---

## p0221 System pressure / p\_system

**Description:** Sets the cooling type for booksize compact power units.  
This therefore defines whether for these power units, the internal air cooling is shut down and instead, the "Cold-Plate" cooling type is used.

**Value:**  
0: Air cooling int  
1: Cold-Plate

**Note:** For booksize compact power units, there is a 4 at the 5th position of the Article number.  
The parameter is irrelevant for all other power unit types.

**Description:** Displays the operating hours of the heat sink fan in the power unit.  
The number of hours operated can only be reset to 0 in this parameter (e.g. after a fan has been replaced).

**Dependency:** Refer to: p0252, r0277  
Refer to: A30042

**Note:** For r0193.13 = 0, the following applies:  
For liquid-cooled chassis power units, the operating hours of the inner fan are displayed in p0251 and not in p0254.

|   |   |   |   |
|---|---|---|---|
| <b>p0252</b>  | <b>Power unit heat sink fan operating time maximum / PU fan t_op max</b>  |   |   |
| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC,<br>A_INF, S_INF, R_INF,<br>B_INF | <b>Can be changed:</b> T<br><b>Data type:</b> Unsigned32<br><b>P-Group:</b> Modulation<br><b>Not for motor type:</b> -<br><b>Min</b><br>0 [h] | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>500000 [h] | <b>Access level:</b> 4<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>40000 [h] |

**Description:** Sets the maximum operating time of the heat sink fan in the power unit.  
The monitoring is deactivated with p0252 = 0.

**Dependency:** Refer to: p0251, r0277  
Refer to: A30042

**Notice:** For firmware version < 5.1 of the power unit, the value is limited to 65535 hours.  
For multi-axis power units, the same value must be entered for all axes.

**Note:** For power units with a model for the fan service life, the shortest conceivable service life is permanently saved. If p0252 is set to a value not equal to 0, then this saved value is always indicated in p0252.

|--|--|---|--|

**Description:**

Sets starting time 1 to monitor the cooling unit after switch-on command.  
After switching on, the following signals must be present within starting time 1:  
- "RKA switched on"  
- "RKA liquid flow OK"  
When a fault occurs, an appropriate message is output.

**Dependency:**

Refer to: F49152, F49153

**Note:**

|                               | 0 [V]                             | 500 [V]              | 0 [V]                                     |

**Description:** Sets the voltage threshold to initiate alarm A06810.

The value represents an offset so that the alarm threshold is obtained from the total of r0296 and p0279.

**Dependency:** Refer to: p0210, r0296

Refer to: A06810

**Note:** The absolute value of the undervoltage threshold r0296 depends on the selected unit supply voltage (p0210).

|              | <b>Data type:</b> FloatingPoint32 | <b>Dyn. index:</b> - | <b>Func. diagram:</b> 8940, 8964 |
|              | <b>P-Group:</b> Converter         | <b>Unit group:</b> - | <b>Unit selection:</b> -         |
|              | <b>Not for motor type:</b> -      | <b>Scaling:</b> -    | <b>Expert list:</b> 1            |
|              | <b>Min</b>                        | <b>Max</b>           | <b>Factory setting</b>           |
|              | 50 [V]                            | 1500 [V]             | 660 [V]                          |

**Description:** Sets the maximum steady-state DC link voltage. When the DC link voltage setpoint reaches the threshold, alarm A06800 is output.

The setpoint for the DC link voltage in p3510 is limited to the value in p0280.

The voltage can be increased (boosted) using the modulation depth reserve controller. The modulation depth reserve (p3480) can be too low if p0210 (drive unit supply voltage) was incorrectly parameterized, a line overvoltage condition is present or a high reactive current is required.

**Dependency:** Refer to: p0210

Refer to: A06800

**Warning:** Before increasing the voltage limit for pulsed operation of a controlled booksize infeed with line supply voltages p0210 > 415 V it should be checked whether the motors connected to the DC link are specified for the higher motor voltages.

The warning information associated with p0210 must be carefully observed.

**Caution:** All motors connected to the DC link must be rated for the maximum DC link voltage set in this parameter.

**Notice:** For chassis power units, for the extended line supply voltage range from 500 V to 690 V, the value in p0280 is automatically adapted if the line supply voltage in p0210 is changed. The individual parameter setting for p0280 is then lost and if necessary must be re-entered.

**Note:** A brief dynamic increase of the DC link voltage does not result in an alarm.

Pre-setting values:

380 ... 480 V booksize devices: 660 V

380 ... 480 V chassis devices: 750 V

500 ... 690 V chassis devices:  $0.875 * p0210 + 502$  V

Maximum values:

380 ... 480 V booksize devices: 785 V

380 ... 480 V chassis devices: 785 V

500 ... 690 V chassis devices: 1130 V

## 2 Parameters

When a temperature threshold is exceeded, the output current is reduced - and in turn, the output frequency.<br/>                     This overload response is activated as default setting for Booksize devices with a pulse frequency higher than or equal to 16 kHz.</p> <p>For p0290 = 12:<br/>                     In this particular case, the chip temperature is evaluated based on the actual load. If the temperature exceeds this alarm threshold, then the pulse frequency is reduced to a permissible minimum. The output current is only reduced if the actual chip temperature increases above a certain temperature threshold.<br/>                     Application:<br/>                     Drives that are frequently started and accelerated - and which manifest a significantly fluctuating torque profile (e.g. centrifuges, flywheel presses, cranes).</p> |   |  |

For p0290 = 13:

In this particular case, the chip temperature is evaluated based on the actual load. If the temperature exceeds this alarm threshold, then the pulse frequency is reduced to a permissible minimum.

Application:

Drives that are frequently started and accelerated - and which manifest a significantly fluctuating torque profile, and where the output current is not to be reduced (e.g. centrifuges, flywheel presses, cranes).

**Value:**

- 0: Reduce output current
- 1: No reduction shutdown when overload threshold is reached
- 2: Reduce the pulse frequency and output current
- 3: Reduce the pulse frequency
- 10: Automatic output current reduction
- 12: Automatic pulse frequency and output current reduction
- 13: Automatic pulse frequency reduction

**Dependency:**

For a thermal power unit overload, an appropriate alarm or fault is output, and r2135.15 or r2135.13 set.

Settings, where the pulse frequency is reduced, are not possible if the "Extended torque control" function module (r0108.1) is activated.

For p0290 = 2, 3:

These responses are only applicable for blocksize power units.

For p0290 = 10:

This response is only applicable for booksize power units.

Refer to: r0036, r0037, r0108, p0230, r2135

Refer to: A05000, A05001, A07805

**Notice:**

If the thermal overload of the power unit is not sufficiently reduced by the actions taken, the drive is always shut down. This means that the power unit is always protected irrespective of the setting of this parameter.

**Note:**

Under overload conditions, the current and torque limit are reduced, and therefore the motor is braked and forbidden speed ranges (e.g. minimum speed p1080 and suppression [skip] speeds p1091 ... p1094) can be passed through.

When the motor data identification routine is selected, parameter p0290 cannot be changed.

For p0290 = 0, 2, 12:

This setting is only practical if the load decreases with decreasing speed (e.g. for applications with variable torque such as for pumps and fans).

For p0290 = 2, 3, 12, 13:

The I2t overload detection of the power unit does not influence the response "Reduce pulse frequency".

For p0290 = 10, 12, 13:

The possible load duty cycles, calculated based on the previous model (p0290 = 0, 1, 2, 3) for booksize power units cannot be transferred in every case. This is the reason that we recommend that you contact our application support department if you are uncertain about dimensioning the device.

**Description:** Selects the motor type or start to read in the motor parameters for a motor with DRIVE-CLiQ (p0300 = 10000).  
For p0300 < 10000 the following applies:  
The first digit of the parameter value always defines the general motor type and corresponds to the third-party motor belonging to a motor list:  
1 = rotating induction motor  
2 = rotating synchronous motor  
3 = linear induction motor (reserved)  
4 = linear synchronous motor  
The type information must be entered to filter motor-specific parameters and to optimize the operating characteristics and behavior. For example, for synchronous motors, power factor (p0308) is neither used nor displayed (in the BOP/AOP).  
The following applies for values < 100:  
Motor data must be manually entered.  
The following applies for values >= 100:  
Motor data are automatically loaded from an internal list.

## 2 Parameters

### 2.2 List of parameters

|               |        |   |

|               | 401:   | 1FN1 synchronous motor linear                   |
|               | 403:   | 1FN3 synchronous motor linear                   |
|               | 406:   | 1FN6 synchronous motor linear                   |
|               | 444:   | xxxx synchronous motor linear OEM               |
|               | 10000: | Motor with DRIVE-CLiQ                           |
|               | 10001: | Motor with DRIVE-CLiQ 2nd data set              |
|               | 10100: | Motor with DRIVE-CLiQ (only read in motor data) |

**Dependency:** When the motor type is changed, the code number in p0301 may be reset to 0.  
If p0300 is changed during quick commissioning (p0010 = 1), then the matching technological application (p0500) is automatically pre-assigned. This does not occur when commissioning the motor (p0010 = 3). If p0300 = 10000 is written for a parameter download, p0500 is pre-assigned with DRIVE-CLiQ corresponding to the motor type.  
Refer to: p0301

**Notice:** If a catalog motor is selected (p0300 >= 100) and an associated motor code number (p0301), then the parameters that are associated with this list cannot be changed (write protection). The write protection is canceled if the motor type p0300 is set to a non-Siemens motor that matches p0301 (e.g. p0300 = 2 for p0301 = 2xxxx). Write protection is automatically canceled when the results of motor data identification are copied to the motor parameters.

The motor type of a catalog motor corresponds to the upper three digits of the code number or the following assignment (if the particular motor type is listed):

Type/code number ranges

102 / 102xx, 122xx  
103 / 103xx  
104 / 104xx, 114xx, 124xx  
107 / 107xx, 117xx, 127xx  
108 / 108xx, 118xx, 128xx, 138xx, 148xx, 158xx  
132 / 132xx, 142xx  
134 / 134xx, 144xx, 154xx  
136 / 136xx, 146xx, 156xx  
166 / 166xx, 176xx, 186xx  
191 / 191xx  
200 / 200xx, 210xx, 220xx  
203 / 203xx, 213xx, 233xx, 243xx, 253xx, 273xx

206 / 206xx, 216xx, 226xx  
 207 / 207xx, 217xx, 227xx  
 231 / 231xx, 241xx, 251xx  
 232 / 232xx, 242xx, 252xx  
 235 / 235xx, 245xx, 255xx  
 237 / 237xx, 247xx, 257xx  
 261 / 261xx, 262xx, 263xx  
 272 / 272xx, 282xx, 292xx  
 283 / 283xx, 293xx  
 286 / 286xx, 296xx  
 403 / 403xx, 413xx  
 406 / 406xx, 416xx, 426xx  
 For OEM motors:  
 111 / 111xx, 112xx, 113xx  
 222 / 222xx, 223xx, 224xx  
 444 / 444xx, 445xx, 446xx

**Note:** With p0300 = 10000, for a motor with DRIVE-CLiQ, the motor parameters are automatically downloaded, with p0300 = 10001, the motor parameters of a second data set (if available).

If a motor type has not been selected (p0300 = 0), then the drive commissioning routine cannot be exited.

A motor type with a value above p0300 >= 100 describes motors for which a motor parameter list exists.

Motor types with a value below p0300 < 100 correspond to the selection of a third-party motor. When appropriately selected, this means that the motor parameters are pre-assigned the settings for a third-party motor.

This also applies for parameters for a motor with DRIVE-CLiQ. In this case p0300 can only be set to p0300 = 10000 or 10001 (read motor parameters) or to the corresponding non-Siemens motor (first digit of the motor code number) in order to be able to cancel the write protection.

With p0300 = 10100, when the system powers up, for a motor with DRIVE-CLiQ, the motor data are loaded, without subsequently newly calculating the control parameters. This means that control parameters that are already optimized are kept. To load the data, motor code number p0301 must match the code number of the connected encoder r0302.

This is the reason that after exiting commissioning, all parameters must be saved and a warm restart must be initiated (e.g. p0009 = 30, p0976 = 3).</p> <p>Refer to: p0301</p>  |
| <b>Caution:</b>   | <p>A permanent-magnet synchronous motor cannot be operated with an SSI encoder without HTL/TTL track.</p>  |
|  | <p>A separately excited synchronous motor can only be operated with an SSI encoder if this is used as the second encoder and an HTL/TTL encoder is used as the first encoder.</p>  |
| <b>Notice:</b>  | <p>If a catalog motor is selected (p0300 &gt;= 100) and an associated motor code number (p0301), then the parameters that are associated with this list cannot be changed (write protection). The write protection is canceled if the motor type p0300 is set to a non-Siemens motor that matches p0301 (e.g. p0300 = 2 for p0301 = 2xxxx). Write protection is automatically canceled when the results of motor data identification are copied to the motor parameters.</p> <p>The motor type of a catalog motor corresponds to the upper three digits of the code number or the following assignment (if the particular motor type is listed):</p> <p>Type/code number ranges</p> <p>100 / 100xx, 110xx, 120xx, 130xx, 140xx, 150xx, 160xx, 170xx, 180xx, 190xx</p> <p>101 / 101xx</p> <p>102 / 102xx, 122xx</p> <p>104 / 104xx, 114xx, 124xx</p>  |

105 / 105xx  
 107 / 107xx, 117xx, 127xx  
 108 / 108xx, 118xx, 128xx, 138xx, 148xx, 158xx  
 134 / 134xx, 144xx, 154xx  
 136 / 136xx, 146xx, 156xx  
 166 / 166xx, 176xx, 186xx  
 271 / 271xx, 281xx  
 264 / 264xx, 274xx, 284xx, 294xx  
 283 / 283xx, 293xx  
 600 / 600xx, 610xx, 620xx  
 603 / 603xx, 613xx, 623xx  
 608 / 608xx, 618xx, 628xx  
 For OEM motors:  
 111 / 111xx, 112xx, 113xx  
 222 / 222xx, 223xx, 224xx

For 1PQ8 motors (p0300 = 18) the fan type p0335 should be set to 5.

**Note:** With p0300 = 10000, for a motor with DRIVE-CLiQ, the motor parameters are automatically downloaded, with p0300 = 10001, the motor parameters of a second data set (if available).

If a motor type has not been selected (p0300 = 0), then the drive commissioning routine cannot be exited.

A motor type with a value above p0300 >= 100 describes motors for which a motor parameter list exists.

Motor types with a value below p0300 < 100 correspond to the selection of a third-party motor. When appropriately selected, this means that the motor parameters are pre-assigned the settings for a third-party motor.

This also applies for parameters for a motor with DRIVE-CLiQ. In this case p0300 can only be set to p0300 = 10000 or 10001 (read motor parameters) or to the corresponding non-Siemens motor (first digit of the motor code number) in order to be able to cancel the write protection.

| <b>Description:</b>            | The parameter is used to select a motor from a motor parameter list.<br>When changing the code number (with the exception to the value 0), all of the motor parameters are pre-assigned from the internally available parameter lists.   |   |   |
| <b>Dependency:</b>             | Code numbers can only be selected for motor types that correspond to the motor type selected in p0300. For 1PH2, 1PH4, 1PH7, 1PM4, 1PM6, 1FT6 motors, code numbers are also possible, whose fourth decimal position is greater by a value of 1 or 2 than the matching motor type in p0300. For 1FE1 motors, the third decimal position can be higher by a value of 1.<br>Refer to: p0300   |   |   |
| <b>Note:</b>                   | The motor code number can only be changed if the matching catalog motor was first selected in p0300.<br>For a motor with DRIVE-CLiQ, p0301 cannot be changed. In this case, p0301 is automatically written to the code number of the motor parameter read in (r0302) if p0300 is set to 10000.<br>When selecting a catalog motor (p0300 >= 100), drive commissioning can only be exited if a code number is selected.<br>If, for direct drives, the motor code number (p0301) is changed, this does not automatically result in the angular commutation offset being determined (p0431). |   |   |

## 2 Parameters

| <b>Recommendation:</b>         | For motors connected in parallel, external thermal protection should be provided for each individual motor.   |                               |                            |
| <b>Dependency:</b>             | Refer to: r0331, r0370, r0373, r0374, r0376, r0377, r0382   |                               |                            |

**Caution:**

The motors to be connected up in parallel must be of the same type and the same size (power rating) (identical Article No. [MLFB]).

The mounting regulations when connecting motors in parallel must be carefully maintained! Especially for synchronous motors, the pole position of motors that are rigidly coupled with one another (mechanically) must be identical.

The number of motors set must correspond to the number of motors that are actually connected in parallel.

After changing p0306, it is imperative that the control parameters are adapted (e.g. using automatic calculation with p0340 = 1).

For synchronous motors connected in parallel with p1300 >= 20, the following applies:

- the individual motors must be mechanically coupled with one another and the EMF must be aligned to one another.

For induction motors that are connected in parallel, but which are not mechanically coupled with one another, then the following applies:

- an individual motor must not be loaded beyond its stall point.

**Notice:**

If p0306 is changed during quick commissioning (p0010 = 1), then the maximum current p0640 is appropriately pre-assigned. This is not the case when commissioning the motor (p0010 = 3).

**Description:**

Number of motors that can be operated in parallel using one motor data set.

Depending on the motor number entered, internally an equivalent motor is calculated.

The following should be carefully observed for motors connected in series:

The following rating plate data should only be entered for one motor:

- resistances and inductances: p0350 ... p0361
- currents: p0305, p0320, p0323, p0325, p0329, p0389, p0390, p0391, p0392
- power ratings: p0307
- masses/moments of inertia: p0341, p0344

All other parameters take into account the replacement/equivalent motor (e.g. r0331, r0333).

**Recommendation:**

For motors connected in parallel, external thermal protection should be provided for each individual motor.

**Dependency:**

Refer to: r0331

**Caution:**

The motors to be connected up in parallel must be of the same type and the same size (power rating) (identical Article No. [MLFB]).

The mounting regulations when connecting motors in parallel must be carefully maintained! Especially for synchronous motors, the pole position of motors that are rigidly coupled with one another (mechanically) must be identical.

The number of motors set must correspond to the number of motors that are actually connected in parallel.

After changing p0306, it is imperative that the control parameters are adapted (e.g. using automatic calculation with p0340 = 1).

For synchronous motors connected in parallel with p1300 >= 20, the following applies:

- the individual motors must be mechanically coupled with one another and the EMF must be aligned to one another.

For induction motors that are connected in parallel, but which are not mechanically coupled with one another, then the following applies:

- an individual motor must not be loaded beyond its stall point.

**Notice:**

If p0306 is changed during quick commissioning (p0010 = 1), then the maximum current p0640 is appropriately pre-assigned. This is not the case when commissioning the motor (p0010 = 3).

**Note:**

Only operation with U/f characteristic makes sense if more than 10 identical motors are connected in parallel.

Separately excited synchronous motors must not be connected in parallel.

Synchronous and reluctance motors that are not coupled with one another align themselves when the pulses are switched in. If the motors have different load levels, then equalization currents flow between the motors.

## 2 Parameters

### 2.2 List of parameters

**Notice:** The following parameters are influenced using p0340:  
 p0340.0 = 1:  
 - p2000 ... p2003  
 p0340.1 = 1:  
 - p0350 ... p0354, p1475, p1570 ... p1572, p1700, p1830, p1831, p3998  
 p0340.2 = 1:  
 - p1833, p1834, p1836, p1837, p1839 ... p1848  
 p0340.3 = 1:  
 - p1400.5, p1433, p1434, p1460 ... p1467, p1715 ... p1719, p1820  
 p0340.4 = 1:  
 - p1082, p1083, p1086, p1520, p1521, p1532, p1850, p1851, p2162, p2177

**Note:** When quick commissioning is exited using p3900 = 3, p0340 is automatically called = 1 1111 bin.  
 At the end of the calculations, p0340 is automatically set to 0.

**Description:** Setting to automatically calculate motor parameters and U/f open-loop and closed-loop control parameters from the rating plate data.

**Value:**  
 0: No calculation  
 1: Complete calculation  
 2: Calculation of equivalent circuit diagram parameters  
 3: Calculation of closed-loop control parameters  
 4: Calculation of controller parameters  
 5: Calculation of technological limits and threshold values

**Notice:** After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

The following parameters are influenced using p0340:  
 The parameters designated with (\*) are not overwritten for catalog motors (p0300 > 100).

SERVO:  
 p0340 = 1:  
 -> All of the parameters influenced for p0340 = 2, 3, 4, 5  
 -> p0341 (\*)

p0340 = 4:

--&gt; p1290, p1292, p1293, p1299, p1338, p1339, p1340, p1341, p1345, p1346, p1460, p1461, p1462, p1463, p1464, p1465, p1470, p1472, p1590, p1592, p1600, p1628, p1629, p1630, p1643, p1703, p1715, p1717, p1740, p1756, p1757, p1760, p1761, p1764, p1767, p1780, p1781, p1783, p1785, p1786, p1795, p7036, p7037, p7038

p0340 = 5:

--&gt; p0260 ... p0264, p1037, p1038, p1520, p1521, p1530, p1531, p1574, p1750, p1802, p1803, p2140, p2141, p2142, p2148, p2150, p2155, p2161 ... p2164, p2175, p2177, p2194, p3207, p3208, p3236, p3237, p3806, p3815, p3820 ... p3829

**Note:**

The calculation is not performed, if the power unit is deactivated.

p0340 = 1 contains the calculations of p0340 = 2, 3, 4, 5 without overwriting the motor parameters from the Siemens motor lists (p0301 &gt; 0).

p0340 = 2 calculates the motor parameters (p0350 ... p0360), but only if it does not involve a Siemens catalog motor (p0301 = 0).

p0340 = 3 contains the calculations of p0340 = 4, 5.

p0340 = 4 only calculates the controller parameters.

p0340 = 5 only calculates the controller limits.

When quick commissioning is exited using p3900 &gt; 0, p0340 is automatically set to 1.

At the end of the calculations, p0340 is automatically set to 0.

If the STARTER commissioning tool writes a 3 into p0340 when "Downloading to target device", then this corresponds to a "Complete calculation of the motor/control parameters without equivalent circuit diagram data". The same calculations are carried out as for p0340 = 1, however, without the equivalent circuit diagram parameters of the motor (p0340 = 2), the motor moment of inertia (p0341) and the motor mass (p0344).

For third-party linear synchronous motors (p0300 = 4) equivalent circuit diagram data are not calculated (p0340 = 2).

0

2

0

**Description:**

Setting to reset and automatically calculate filter and control (closed-loop) parameters.

**Value:**

0: No calculation

1: Complete re-calculation of control parameters with COMM data

2: Reset control parameters

## 2 Parameters

### 2.2 List of parameters

- Notice:** After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.  
The following parameters are influenced using p0340:  
p0340 = 1:  
--> All of the parameters influenced for p0340 = 2  
--> p3421 = p0223, p0225  
--> p3422 = p0227  
--> p3424 = p0225  
--> p3415, p3425, p3555, p3614, p3620, p3622 are reset to the factory settings dependent on the particular unit.  
p0340 = 2:  
--> p3560, p3562, p3564, p3603, p3615 and p3617 are reset to the factory setting.  
For S\_INF, these control parameters are not available.
- Note:** When quick commissioning is exited using p3900 > 0, p0340 is automatically set to 1.  
At the end of the calculations, p0340 is automatically set to 0.

**Description:** Sets the excitation build-up time of the motor.  
This involves the delay time between enabling the pulses and enabling the ramp-function generator. The induction motor is magnetized during this time.

**Caution:**  If there is insufficient magnetization under load or if the acceleration rate is too high, then an induction motor can stall (refer to the note). This is especially true for sensorless vector control or U/f control.

**Notice:** If the parameter is set to 0 s for separately excited synchronous motors (p0300 = 5), then an excitation current setpoint is generated even if the drive is switched off. In the base speed range, this is the no-load excitation current (p0389). In the field-weakening range, the value is reduced with the inverse value of the actual speed. An excitation current setpoint is not generated during de-magnetizing (p0347) and if an encoder fault is detected.

When starting or executing a flying restart for a separately excited synchronous motor without encoder or with incremental encoder, then the voltage induced in the stator by the excitation current pulse is used to determine the rotor position.

The length of the ramp is pre-assigned from the motor data for p0346 = 0 s. If it crystallizes out that this time is too short, then it can be extended by entering a negative value in p0346, whereby otherwise, the excitation behavior corresponds with that for p0346 = 0 s.

For all other motor types, p0346 is internally limited downwards to 0 s.

**Note:** The parameter is calculated using p0340 = 1, 3.

For induction motors, the result depends on the rotor time constant (r0384). If this time is excessively reduced, this can result in an inadequate magnetizing of the induction motor. This is the case if the current limit is reached while building up magnetizing. For induction motors, the parameter cannot be set to 0 s (internal limit: 0.1 \* r0384).

For permanent-magnet synchronous motors and vector control, the value depends on the stator time constant (r0386). Here, it defines the time to establish the current for encoderless operation immediately after the pulses have been enabled.

The current to excite the induction motor can be limited in p0644.

---

| <b>Description:</b>         | Resistance of the power cable between the Motor Module and motor. |                               |                              |

**Caution:** The cable resistance should be entered prior to motor data identification. If it is used subsequently, the difference by which p0352 was changed must be subtracted from the stator resistance p0350 or motor data identification must be repeated.

**Note:** The parameter influences the temperature adaptation of the stator resistance.

The motor identification routine does not change the cable resistance. This is subtracted from the total measured stator resistance in order to calculate the stator resistance (p0350, p0352).

The cable resistance is reset when quick commissioning is exited with p3900 > 0.

| <b>Description:</b>            | Resistance of the power cable between the Motor Module and motor. |                               |                              |

**Dependency:** Refer to: p7003

**Caution:** The cable resistance should be entered prior to motor data identification. If it is used subsequently, the difference by which p0352 was changed must be subtracted from the stator resistance p0350 or motor data identification must be repeated.

**Notice:** Parallel circuits with one winding system (p7003 = 0):

p0352 includes the feeder cable resistance of an individual Motor Module. The total feeder cable resistance is obtained from p0352 divided by the number of activated Motor Modules (refer to r0395).

Parallel circuits with multi-winding system (p7003 = 1):

p0352 includes the complete feeder cable resistance and is directly added to the stator resistance (refer to r0395).

## 2 Parameters

### 2.2 List of parameters

**Note:** The parameter influences the temperature adaptation of the stator resistance.  
 The motor identification sets the cable resistance to 20% of the measured total resistance if p0352 is zero at the time that the measurement is made. If p0352 is not zero, then the value is subtracted from the measured total stator resistance to calculate stator resistance p0350. In this case, p0350 is a minimum of 10% of the measured value.  
 Exception:  
 For parallel circuit configurations with one winding system (p07003 = 0), the cable resistance is directly measured. It is important to note that only the component of an individual Motor Module is entered into p0352.  
 The cable resistance is reset when quick commissioning is exited with p3900 > 0.

## 2 Parameters

### 2.2 List of parameters

- Dependency:** The following applies for the magnetizing currents:  
p0366 < p0367 < p0368 < p0369  
The following applies for the stator quadrature axis current values (PMSM):  
20 % < p0366 < p0367 < p0368 < p0369  
Refer to: p0362
- Notice:** For permanent magnet synchronous motors (PMSM), the following applies:  
If the parameters are not set as specified, i.e. not in ascending order and to more than 20 %, the unsaturated quadrature inductance (p0356) is always used for quadrature axis flux calculation purposes.
- Note:** When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (p0300).

9010: Simulated motor encoder  
 9999: User defined  
 10000: Identify encoder  
 10050: Encoder with EnDat2.x interface identified  
 10051: DRIVE-CLiQ encoder identified  
 10058: Digital encoder (absolute) identified  
 10059: Digital encoder (incremental) identified  
 10100: Identify encoder (waiting)

**Notice:** An encoder type with p0400 < 9999 defines an encoder for which there is an encoder parameter list. When selecting a catalog encoder (p0400 < 9999) the parameters from the encoder parameter list cannot be changed (write protection). To remove write protection, the encoder type should be set to a third-party encoder (p0400 = 9999).

**Note:** The connected encoder can be identified by setting p0400 to 10000 or 10100. This means that the encoder must support this, and is possible in the following cases:

- motor with DRIVE-CLiQ
- encoder with EnDat interface
- DRIVE-CLiQ encoder
- encoder with SSI interface (only 10100)

The encoder data (e.g. pulse number p0408) can only be changed when p0400 = 9999.

When using an encoder with track A/B and zero pulse, as standard, fine synchronization is not set using a zero mark. If, for a synchronous motor, fine synchronization is to be realized using a zero mark, then the following must be executed:

- set p0400 to 9999
- set p0404.15 to 1

Prerequisite:

Coarse synchronization must be selected (e.g. pole position identification) and the zero pulse of the encoder must be either mechanically or electronically (p0431) adjusted to the pole position.

For p0400 = 9010 the following applies:

Further, for encoderless operation, the position actual value (r0482) is supplied from the motor model. This means that encoderless positioning/position control is possible.

For p0400 = 10000 the following applies:

The connected encoder is identified. If an identification is not possible, then p0400 is set to 0.

For p0400 = 10100 the following applies:

The connected encoder is identified. If identification is not possible, then p0400 remains set = 10100, and the system waits until identification is possible.

### p0402[0...n]

### Gearbox type selection / Gearbox type sel

|   |  |   |  |
|---|--|---|--|
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC, ENC | <b>Can be changed:</b> C2(1, 4)<br><b>Data type:</b> Integer16<br><b>P-Group:</b> Encoder<br><b>Not for motor type:</b> -<br><b>Min</b><br>1 | <b>Calculated:</b> -<br><b>Dyn. index:</b> EDS, p0140<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>10100 | <b>Access level:</b> 1<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>9999 |
|---|--|---|--|

**Description:** Selects the gearbox type to pre-set the inversion and the gearbox factor. Measuring gear factor = motor or load revolutions / encoder revolutions.

**Value:**

- 1: Gearbox 1:1 not inverted
- 2: Gearbox 2:7 inverted
- 3: Gearbox 4:17 inverted
- 4: Gearbox 2:10 inverted
- 9999: Gearbox user-defined
- 10000: Identify gearbox
- 10100: Identify gearbox

**Dependency:** Refer to: p0410, p0432, p0433

## 2 Parameters

### 2.2 List of parameters

**Note:**

For p0402 = 1:  
Automatic setting of p0410 = 0000 bin, p0432 = 1, p0433 = 1.

For p0402 = 2:  
Automatic setting of p0410 = 0011 bin, p0432 = 7, p0433 = 2.

For p0402 = 3:  
Automatic setting of p0410 = 0011 bin, p0432 = 17, p0433 = 4.

For p0402 = 4:  
Automatic setting of p0410 = 0011 bin, p0432 = 10, p0433 = 2.

For p0402 = 9999:  
No automatic setting of p0410, p0432, p0433. The parameters should be manually set.

For p0402 = 10000:  
It is only possible to identify the gearbox type for a motor with DRIVE-CLiQ. Parameters p0410, p0432 and p0433 are set corresponding to the identified gearbox. If an identification is not possible, then p0402 is set to 9999.

**Notice:** This parameter is automatically preassigned for encoders from the encoder list and for identify encoder (p0400).  
When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.

**Note:** ZM: Zero mark  
 SMC: Sensor Module Cabinet

If a technique to determine the commutation information/data has not been selected (e.g. track C/D, Hall sensor), and the encoder pulse number is an integer multiple of the pole number, then the following applies:  
 The track A/B is adjusted to match the magnetic position of the motor.  
 For bit 01, 02 (absolute encoder, multiturn encoder):  
 These bits can only be selected for EnDat encoders, SSI encoders or DRIVE-CLiQ encoders.  
 For bit 10 (DRIVE-CLiQ encoder):  
 This bit is only used for the large-scale integrated DRIVE-CLiQ encoders that provide their encoder data directly in DRIVE-CLiQ format without converting this data. This bit is not, therefore, set for first-generation DRIVE-CLiQ encoders.  
 For bit 12 (equidistant zero mark):  
 The zero marks occur at regular intervals (e.g. rotary encoder with 1 zero mark per revolution or linear encoder with constant zero mark distance).  
 The bit activates monitoring of the zero mark distance (p0424/p0425, linear/rotary) or in the case of the linear encoder with 1 zero mark and p0424 = 0 zero mark monitoring is activated.  
 For bit 13 (irregular zero mark):  
 The zero marks occur at irregular intervals (e.g. a linear scale with only 1 zero mark in the traversing range). The zero mark distance is not monitored.  
 For bit 14 (distance-coded zero mark):  
 The distance (clearance) between two or several consecutive zero marks allows the absolute position to be calculated.  
 For bit 15 (commutation with zero mark):  
 Only applicable for synchronous motors.  
 The function can be deselected by priority via p0430.23.  
 For distance-coded zero marks, the following applies:  
 The phase sequence of the C/D track (if available) must be the same as the phase sequence of the encoder (A/B track).  
 The phase sequence of the Hall signal (if available) must be the same as the phase sequence of the motor. Further, the position of the Hall sensor must be mechanically adjusted to the motor EMF.  
 The fine synchronization is only started after two zero marks have been passed.

## 2 Parameters

### 2.2 List of parameters

|    |                           |     |    |   |
|----|---------------------------|-----|----|---|
| 20 | Voltage level 5 V         | Yes | No | - |
| 21 | Voltage level 24 V        | Yes | No | - |
| 22 | Remote sense (only SMC30) | Yes | No | - |
| 23 | Resolver excitation       | Yes | No | - |

**Notice:** This parameter is automatically preassigned for encoders from the encoder list and for identify encoder (p0400). When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.

If an SSI encoder (bit 9 = 1) is used as motor encoder for permanent-magnet synchronous motors, then this is only permissible in conjunction with an additional A/B track (bit 3 = 1 or bit 4 = 1).

**Note:**

ZM: Zero mark

SMC: Sensor Module Cabinet

If a technique to determine the commutation information/data has not been selected (e.g. track C/D, Hall sensor), and the encoder pulse number is an integer multiple of the pole number, then the following applies:

The track A/B is adjusted to match the magnetic position of the motor.

For bit 01, 02 (absolute encoder, multiturn encoder):

These bits can only be selected for EnDat encoders, SSI encoders or DRIVE-CLiQ encoders.

For bit 10 (DRIVE-CLiQ encoder):

This bit is only used for the large-scale integrated DRIVE-CLiQ encoders that provide their encoder data directly in DRIVE-CLiQ format without converting this data. This bit is not, therefore, set for first-generation DRIVE-CLiQ encoders.

For bit 12 (equidistant zero mark):

The zero marks occur at regular intervals (e.g. rotary encoder with 1 zero mark per revolution or linear encoder with constant zero mark distance).

The bit activates monitoring of the zero mark distance (p0424/p0425, linear/rotary) or in the case of the linear encoder with 1 zero mark and p0424 = 0 zero mark monitoring is activated.

For bit 13 (irregular zero mark):

The zero marks occur at irregular intervals (e.g. a linear scale with only 1 zero mark in the traversing range). The zero mark distance is not monitored.

For bit 14 (distance-coded zero mark):

The distance (clearance) between two or several consecutive zero marks allows the absolute position to be calculated.

For bit 15 (commutation with zero mark):

Only applicable for synchronous motors.

The function can be deselected by priority via p0430.23.

For distance-coded zero marks, the following applies:

The phase sequence of the C/D track (if available) must be the same as the phase sequence of the encoder (A/B track).

The phase sequence of the Hall signal (if available) must be the same as the phase sequence of the motor. Further, the position of the Hall sensor must be mechanically adjusted to the motor EMF.

The fine synchronization is only started after two zero marks have been passed.

#### Square-wave encoder track A/B / Sq-wave enc A/B

SERVO, VECTOR,  
HLA, SERVO\_AC,  
VECTOR\_AC,  
SERVO\_I\_AC,  
VECTOR\_I\_AC, ENC

**Can be changed:** C2(4)

**Data type:** Unsigned32

**P-Group:** Encoder

**Not for motor type:** -

**Min**

-

**Calculated:** -

**Dyn. index:** EDS, p0140

**Unit group:** -

**Scaling:** -

**Max**

-

**Access level:** 3

**Func. diagram:** 4704

**Unit selection:** -

**Expert list:** 1

**Factory setting**

0000 1111 bin

**Description:**

Settings for the track A/B in a square-wave encoder.

For square-wave encoders, p0404.3 must also be 1.

**Bit field:**

| Bit | Signal name         | 1 signal          | 0 signal      | FP |
|-----|---------------------|-------------------|---------------|----|
| 00  | Signal              | Bipolar           | Unipolar      | -  |
| 01  | Level               | TTL               | HTL           | -  |
| 02  | Track monitoring    | A/B <> -A/B       | None          | -  |
| 03  | Zero pulse          | Same as A/B track | 24 V unipolar | -  |
| 04  | Switching threshold | High              | Low           | -  |
| 05  | Pulse/direction     | Active            | Inactive      | -  |

**Notice:** This parameter is automatically preassigned for encoders from the encoder list and for identify encoder (p0400).  
When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.

**Note:** For bit 02:  
When the function is activated, track monitoring can be deactivated by setting p0437.26.

For bit 05:  
When the function is activated, a frequency setpoint and a direction for traveling can be entered via an encoder interface.

### p0407[0...n] Linear encoder grid division / Enc grid div

|   |                              |                               |                                  |
|---|------------------------------|-------------------------------|----------------------------------|
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC, ENC | <b>Can be changed:</b> C2(4) | <b>Calculated:</b> -          | <b>Access level:</b> 3           |
|   | <b>Data type:</b> Unsigned32 | <b>Dyn. index:</b> EDS, p0140 | <b>Func. diagram:</b> 4010, 4704 |
|   | <b>P-Group:</b> Encoder      | <b>Unit group:</b> -          | <b>Unit selection:</b> -         |
|   | <b>Not for motor type:</b> - | <b>Scaling:</b> -             | <b>Expert list:</b> 1            |
|   | <b>Min</b>                   | <b>Max</b>                    | <b>Factory setting</b>           |
|   | 0 [nm]                       | 250000000 [nm]                | 16000 [nm]                       |

**Description:** Sets the grid division for a linear encoder.

In conjunction with the values in p0418/p0419, the grid division defines the transfer format for position actual values Gn\_XIST1 (r0482) and Gn\_XIST2 (r0483).

**Notice:** This parameter is automatically preassigned for encoders from the encoder list and for identify encoder (p0400).  
When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.

**Note:** The lowest permissible value is 250 nm.

This value does not always correspond to the grid division of the measuring device. For a DRIVE-CLiQ encoder, a value is entered here that facilitates optimum transfer of the resolution (p0422).

---

### p0408[0...n] Rotary encoder pulse number / Rot enc pulse no

|   |                              |                               |                                  |
|---|------------------------------|-------------------------------|----------------------------------|
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC, ENC | <b>Can be changed:</b> C2(4) | <b>Calculated:</b> -          | <b>Access level:</b> 3           |
|   | <b>Data type:</b> Unsigned32 | <b>Dyn. index:</b> EDS, p0140 | <b>Func. diagram:</b> 4010, 4704 |
|   | <b>P-Group:</b> Encoder      | <b>Unit group:</b> -          | <b>Unit selection:</b> -         |
|   | <b>Not for motor type:</b> - | <b>Scaling:</b> -             | <b>Expert list:</b> 1            |
|   | <b>Min</b>                   | <b>Max</b>                    | <b>Factory setting</b>           |
|   | 0                            | 16777215                      | 2048                             |

**Description:** Sets the number of pulses for a rotary encoder.

In conjunction with the values in p0418/p0419, the pulse number defines the transfer format for position actual values Gn\_XIST1 (r0482) and Gn\_XIST2 (r0483).

**Notice:** This parameter is automatically preassigned for encoders from the encoder list and for identify encoder (p0400).  
When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.

**Note:** The smallest permissible value is 1 pulse.

The number of pole pairs for a resolver is entered here.

This value does not always correspond to the pulse number of the measuring device. For a DRIVE-CLiQ encoder, a value is entered here that facilitates optimum transfer of the resolution (p0423).

| <b>Description:</b>   | Sets the number of rotations that can be resolved for a rotary encoder with activated position tracking of the measuring gear.  |   |  |                 |
| <b>Dependency:</b>  | This parameter is only of significance for an absolute encoder (p0404.1 = 1) with activated position tracking (p0411.0 = 1) and for an incremental encoder with activated position tracking (p0411.3 = 1).  |   |  |                 |

## 2 Parameters

### 2.2 List of parameters

**Note:** The resolution that is set must be able to be represented using r0483.  
 For rotary axes/modulo axes, the following applies:  
 p0411.0 = 1:  
 This parameter is pre-set with p0421 and can be changed.  
 p0411.3 = 1:  
 The parameter value is pre-set to the highest possible value. The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).  
 For linear axes, the following applies:  
 p0411.0 = 1:  
 This parameter is pre-assigned with p0421, expanded by 6 bits for multiturn information (maximum number of overflows) and cannot be changed.  
 p0411.3 = 1:  
 The parameter value is pre-set to the highest possible value. The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).

| p0413[0...n]  | Measuring gear position tracking tolerance window / Pos track window |                               |                          |
|---|--|-------------------------------|--------------------------|

|   | <b>Min</b>   | <b>Max</b>                    | <b>Factory setting</b>   |
|   | 0.00   | 4294967300.00                 | 0.00                     |

**Description:** Sets a tolerance window for position tracking.  
 After the system is switched on, the difference between the saved position and the actual position is determined, and depending on this, the following is initiated:  
 Difference within the tolerance window --> The position is reproduced as a result of the encoder actual value.  
 Difference outside the tolerance window --> An appropriate message is output.

**Dependency:** Refer to: F31501, F32501, F33501

**Caution:** Rotation, for example through a complete encoder range is not detected.

**Note:** The value is entered in integer (complete) encoder pulses.  
 For p0411.0 = 1, the value is automatically pre-assigned quarter of the encoder range.  
 Example:  
 $\text{Quarter of the encoder range} = (\text{p0408} * \text{p0421}) / 4$   
 It is possible that the tolerance window may not be able to be precisely set due to the data type (floating point number with 23 bit mantissa).

| <b>Description:</b>   | Sets the fine resolution in bits of the incremental position actual values.  |  |   |
| <b>Note:</b>  | The parameter applies for the following process data:<br>- Gx_XIST1<br>- Gx_XIST2 for reference mark or flying measurement<br>The fine resolution specifies the fraction between encoder pulses. Depending on the physical measurement principle, an encoder pulse can be broken down into a different number of fractions (e.g. square-wave encoder: 2 bit = resolution 4, sin/cos encoder: Typical 11 bit = resolution 2048).<br>For a square-wave encoder, with the factory setting, the least significant bits have the value zero, i.e. they do not supply any useful information.<br>For especially high quality measuring systems, the fine resolution must be increased corresponding to the available accuracy. |  |   |

## 2 Parameters

### 2.2 List of parameters

|   |  |                               |                                  |                 |

## 2 Parameters

### 2.2 List of parameters

**Notice:** This parameter is automatically preassigned for encoders from the encoder list and for identify encoder (p0400).  
When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.

**Note:** For distance-coded zero marks this parameter signifies the basic distance.

|   | 27   | Extrapolate position values   | Yes  | No              |
|   | 28   | Cubic correction  | Yes  | No              |
|   | 29   | Phase correction  | Yes  | No              |
|   | 30   | Amplitude correction  | Yes  | No              |
|   | 31   | Offset correction   | Yes  | No              |
| <b>Notice:</b>  | A bit-wise configuration is only possible if the corresponding property is also present in r0458.  |   |  |                 |
| <b>Note:</b>  | For bit 17 (burst oversampling):<br>- if bit = 1, burst oversampling is switched on.<br>For bit 18 (continuous oversampling):<br>- if bit = 1, continuous oversampling is switched on.<br>For bit 19 (Safety position actual value sensing):<br>- if bit = 1, the Safety position actual value is transferred in the cyclic telegram.<br>For bit 20 (speed calculation mode):<br>- if bit = 1, the speed is calculated via incremental difference without extrapolation.<br>- if bit = 0, the speed is calculated via edge time measurement with extrapolation. p0453 is effective in this mode.<br>For bit 21 (zero mark tolerance):<br>- if bit = 1, a one-off zero mark distance error is tolerated. In the event of a defect, the fault F3x100/F3x101 does not appear, but alarm A3x400/A3x401 does. |   |  |                 |

For bit 22 (rotor position adaptation):

- if bit = 1, the rotor position is corrected automatically. The correction speed is +/-1/4 encoder pulse per zero mark distance.

For bit 23 (deselect commutation with zero mark):

- the bit should only be set for encoders that have not been adjusted.

For bit 24 (commutation with selected zero mark):

- if bit = 1, the commutation position is corrected via a selected zero mark.

For bit 25 (disconnect the encoder power supply on parking):

- if bit = 1, the encoder power supply is switched off on parking (0 V).

- if bit = 0, the encoder power supply is not switched off on parking, it is reduced from 24 V to 5 V.

For bit 27 (extrapolate position values):

- if bit = 1, the extrapolation of the position values is activated.

For bit 28 (cubic correction):

- if bit = 1, the cubic correction for track A/B sine is activated.

For bit 29 (phase correction):

- if bit = 1, the phase correction for track A/B sine is activated.

For bit 30 (amplitude correction):

- if bit = 1, the amplitude correction for track A/B sine is activated.

For bit 31 (offset correction):

- if bit = 1, the offset correction for track A/B sine is activated.

**Notice:**

A bit-wise configuration is only possible if the corresponding property is also present in r0458.

**Note:**

For bit 17 (burst oversampling):

- if bit = 1, burst oversampling is switched on.

For bit 18 (continuous oversampling):

- if bit = 1, continuous oversampling is switched on.

For bit 19 (Safety position actual value sensing):

- if bit = 1, the Safety position actual value is transferred in the cyclic telegram.

For bit 20 (speed calculation mode):

- if bit = 1, the speed is calculated via incremental difference without extrapolation.

- if bit = 0, the speed is calculated via edge time measurement with extrapolation. p0453 is effective in this mode.

For bit 21 (zero mark tolerance):

- if bit = 1, a one-off zero mark distance error is tolerated. In the event of a defect, the fault F3x100/F3x101 does not appear, but alarm A3x400/A3x401 does.

For bit 22 (rotor position adaptation):

- if bit = 1, the rotor position is corrected automatically. The correction speed is +/-1/4 encoder pulse per zero mark distance.

For bit 23 (deselect commutation with zero mark):

- the bit should only be set for encoders that have not been adjusted.

For bit 24 (commutation with selected zero mark):

- if bit = 1, the commutation position is corrected via a selected zero mark.

For bit 25 (disconnect the encoder power supply on parking):

- if bit = 1, the encoder power supply is switched off on parking (0 V).

- if bit = 0, the encoder power supply is not switched off on parking, it is reduced from 24 V to 5 V.

For bit 27 (extrapolate position values):

- if bit = 1, the extrapolation of the position values is activated.

For bit 28 (cubic correction):

- if bit = 1, the cubic correction for track A/B sine is activated.

For bit 29 (phase correction):

- if bit = 1, the phase correction for track A/B sine is activated.

For bit 30 (amplitude correction):

- if bit = 1, the amplitude correction for track A/B sine is activated.

For bit 31 (offset correction):

- if bit = 1, the offset correction for track A/B sine is activated.

### p0431[0...n]

### Angular commutation offset / Ang\_com offset

SERVO, HLA,  
SERVO\_AC,  
SERVO\_I\_AC

**Can be changed:** C2(4)

**Calculated:** -

**Access level:** 3

**Data type:** FloatingPoint32

**Dyn. index:** EDS, p0140

**Func. diagram:** -

**P-Group:** Encoder

**Unit group:** -

**Unit selection:** -

**Not for motor type:** -

**Scaling:** -

**Expert list:** 1

**Min**

**Max**

**Factory setting**

-180.00 [°]

180.00 [°]

0.00 [°]

**Description:**

Sets the angular commutation offset.

**Dependency:**

The value is taken into account in r0094.

Refer to: r0094, r1778

**Notice:**

When the firmware is upgraded from V2.3 to V2.4 or higher, the value must be reduced by 60° if all the following conditions are fulfilled:

- the motor is a synchronous motor (p0300 = 2, 2xx, 4, 4xx).
- the encoder is a resolver (p0404.23 = 1).
- the actual speed value is inverted (p0410.0 = 1).

The angular commutation offset cannot be generally taken from other drive systems. As a minimum - the sign of the offset determined for SIMODRIVE 611 digital and SIMODRIVE 611 universal must be reversed for SINAMICS (p0431 (SINAMICS) = -p1016 (SIMODRIVE)).

**Note:**

Angular commutation offset, angular difference between electrical position of encoder and flux position.

For p0404.5 = 1 (track C/D) the following applies:

The angular offset in p0431 acts on track A/B, the zero mark on track C/D.

For p0404.6 = 1 (Hall sensor) the following applies:

The angular offset in p0431 acts on track A/B and the zero mark.

|   | 29   | EnDat encoder initialization with high accuracy   | Yes  | No              | -         |
|   | 31   | Analog unipolar track monitoring  | Yes  | No              | -         |
| <b>Dependency:</b>  | Refer to: p0430, r0459   |   |  |                 |           |

- Note:** A value of zero is displayed if an encoder is not present.
- For bit 00:  
When the data logger (trace) is activated, in the case of a fault, data before and after the event are recorded (traced) and saved in files on the non-volatile memory medium. Experts can then evaluate this data.
- For bit 01:  
If bit = 0, the zero mark is evaluated by ANDing tracks A and B and the zero mark.  
For bit = 1, the zero mark is evaluated depending on the direction of rotation detected. For a positive direction of rotation, the positive edge of the zero mark is considered and for a negative direction of rotation, the negative edge of the zero mark.
- For bit 02:  
When the bit is set, for a deviation less than the tolerance window for the zero mark (p4681, p4682), the pulse number is corrected. If the bit is not set, encoder fault F3x131 is triggered.
- For bits 05, 04:  
The actual hardware only supports 1x or 4x signal evaluation.  
Bit 5/4 = 0/0: Signal evaluation per period, 4x.  
Bit 5/4 = 1/0: signal evaluation per period, 4x with speed calculation over the complete pulse.  
Bit 5/4 = 0/1: Signal evaluation per period, 1x.  
Bit 5/4 = 1/1: Illegal setting.
- For bit 06:  
If the function is active, when dn/dt monitoring responds, the speed actual value is internally frozen for a time equivalent to two current controller sampling times. The rotor position continues to be integrated. The actual value is then re-enabled after this time has expired.
- For bit 07:  
When the bit is not set, the incorrect pulses that have occurred up until now are accumulated in p4688.  
When the bit is not set, p4688 indicates the incorrect pulses that have still not been corrected.
- For bit 11:  
If the bit is set, the Sensor Module checks within a certain time grid whether the fault cause is still present. This enables the Sensor Module to switch from the fault state to the operating state and provide valid actual values automatically. The faults are displayed until the user acknowledges them.
- For bit 12:  
Additional fault messages can be activated for extended fault diagnostics.
- For bit 13:  
When the bit is set, for an incremental encoder with zero mark, the absolute value in Gn\_XIST2 can be requested via Gn\_STW.13. The absolute value is only valid after passing the zero mark.
- For bit 22:  
When the bit is set, the resolution of the absolute position in the serial protocol is set using distribution factor in p4630. The resolution for the absolute position is then calculated using p0407/p4630.
- For bit 26:  
Track monitoring is deactivated for the square-wave encoders when the bit is set, even if the monitoring function is selected in p0405.2.
- For bit 28:  
Monitoring of the difference between incremental and absolute position in the case of linear encoders.
- For bit 29:  
When the bit is set, the EnDat encoder is initialized under a certain speed and, therefore, with high accuracy. If initialization at a higher speed is requested, fault F31151, F32151, or F33151 is output.
- For bit 31:  
When monitoring is active, the levels of the individual track signals and the corresponding inverted track signals are monitored separately.

|   | 28   | EnDat linear encoder monitoring incremental/absolute        | Yes  | No              | -         |
|   | 29   | EnDat encoder initialization with high accuracy             | Yes  | No              | -         |
|   | 31   | Analog unipolar track monitoring                            | Yes  | No              | -         |
| <b>Dependency:</b>  | Refer to: p0430, r0459   |   |  |                 |           |
| <b>Note:</b>  | A value of zero is displayed if an encoder is not present.   |   |  |                 |           |
|   | For bit 00:<br>When the data logger (trace) is activated, in the case of a fault, data before and after the event are recorded (traced) and saved in files on the non-volatile memory medium. Experts can then evaluate this data.   |   |  |                 |           |
|   | For bit 01:<br>If bit = 0, the zero mark is evaluated by ANDing tracks A and B and the zero mark.<br>For bit = 1, the zero mark is evaluated depending on the direction detected. For a positive direction, the positive edge of the zero mark is considered and for a negative direction, the negative edge of the zero mark. |   |  |                 |           |
|   | For bit 02:<br>When the bit is set, for a deviation less than the tolerance window for the zero mark (p4681, p4682), the pulse number is corrected. If the bit is not set, encoder fault F3x131 is triggered.  |   |  |                 |           |
|   | For bits 05, 04:<br>Bit 5/4 = 0/0: Signal evaluation per period, 4x.<br>Bit 5/4 = 1/0: Signal evaluation per period, 4x.<br>Bit 5/4 = 0/1: Signal evaluation per period, 1x.<br>Bit 5/4 = 1/1: Illegal setting.  |   |  |                 |           |
|   | For bit 06:<br>If the function is active, when dn/dt monitoring responds, the velocity actual value is internally frozen - for a time equivalent to two current controller sampling times. The rotor position continues to be integrated. The actual value is then re-enabled after this time has expired.                     |   |  |                 |           |
|   | For bit 07:<br>When the bit is not set, the incorrect pulses that have occurred up until now are accumulated in p4688.<br>When the bit is not set, p4688 indicates the incorrect pulses that have still not been corrected.  |   |  |                 |           |

For bit 29:

When the bit is set, the EnDat encoder is initialized under a certain velocity and, therefore, with high accuracy. If initialization at a higher velocity is requested, fault F31151, F32151, or F33151 is output.

For bit 31:

When monitoring is active, the levels of the individual track signals and the corresponding inverted track signals are monitored separately.

## 2 Parameters

### 2.2 List of parameters

**Note:** For encoders with serial number, encoder replacement is monitored in order to request angular commutation calibration (adjustment) for motor encoders and absolute calibration for direct measuring systems with absolute value data. The serial number, which from then onwards is used for monitoring purposes, can be transferred using p0440. Copying is automatically started in the following cases:

- 1.) When commissioning 1FT6, 1FK6, 1FK7 motors.
- 2.) When writing into p0431.
- 3.) For p1990 = 1.

p0440 is automatically set to 0 when the copying has been completed.  
In order to permanently accept the copied values, it is necessary to save in a non-volatile fashion (p0977).

|            | 05  | Track C/D                            | Yes      | No       | -  |
|            | 06  | Hall sensor                          | Yes      | No       | -  |
|            | 08  | EnDat encoder                        | Yes      | No       | -  |
|            | 09  | SSI encoder                          | Yes      | No       | -  |
|            | 10  | DRIVE-CLiQ encoder                   | Yes      | No       | -  |
|            | 11  | Digital encoder                      | Yes      | No       | -  |
|            | 12  | Equidistant zero mark                | Yes      | No       | -  |
|            | 13  | Irregular zero mark                  | Yes      | No       | -  |
|            | 14  | Distance-coded zero mark             | Yes      | No       | -  |
|            | 15  | Commutation with zero mark (not ASM) | Yes      | No       | -  |
|            | 16  | Acceleration                         | Yes      | No       | -  |
|            | 17  | Track A/B analog                     | Yes      | No       | -  |
|            | 20  | Voltage level 5 V                    | Yes      | No       | -  |
|            | 21  | Voltage level 24 V                   | Yes      | No       | -  |
|            | 22  | Remote sense (only SMC30)            | Yes      | No       | -  |
|            | 23  | Resolver excitation                  | Yes      | No       | -  |

**Dependency:** Refer to: p0404

**Note:** ZM: Zero mark

This parameter is only used for diagnostics.

A value of zero is displayed if an encoder is not present.

For bit 20, 21 (voltage level 5 V, voltage level 24 V):

The voltage level cannot be detected. Therefore, these bits are always set to 0.

---

#### r0455 Encoder configuration recognized / Enc\_config recog

**Dependency:**

Refer to: p0404

**Note:**

ZM: Zero mark

This parameter is only used for diagnostics.

A value of zero is displayed if an encoder is not present.

## 2 Parameters

### 2.2 List of parameters

|    |  |     |    |   |
|----|--|-----|----|---|
| 23 | Commutation with zero mark can be deselected               | Yes | No | - |
| 24 | Commutation with selected zero mark                        | Yes | No | - |
| 25 | Disconnection of encoder power supply on parking supported | Yes | No | - |
| 26 | Parking with temperature evaluation                        | Yes | No | - |
| 27 | SSI position value extrapolation                           | Yes | No | - |
| 28 | Cubic correction   | Yes | No | - |
| 29 | Phase correction   | Yes | No | - |
| 30 | Amplitude correction                                       | Yes | No | - |
| 31 | Offset correction  | Yes | No | - |

**Dependency:**

Refer to: p0437, p0600, p0601

**Note:**

A value of zero is displayed if an encoder is not present.

For bit 11:

When the property is set, the following parameters can be changed without the actual value in the encoder interface becoming invalid (state r0481.14 = 1 "parking encoder active"):

p0314, p0315, p0430, p0431, p0441, p0442, p0443, p0444, p0445

For bit 12:

The extended functions can be configured using p0437.

For bit 13:

Encoder faults can be acknowledged via Gn\_STW.15.

For bit 14:

Only for internal Siemens use.

For bit 23:

When the property is set, commutation with zero mark can be deselected using p0430.23.

For bit 24:

If the property is set, commutation to the selected zero mark can be carried out.

**Dependency:**

Refer to: p0437, p0600, p0601

**Note:**

A value of zero is displayed if an encoder is not present.

For bit 11:

When the property is set, the following parameters can be changed without the actual value in the encoder interface becoming invalid (state r0481.14 = 1 "parking encoder active"):

p0314, p0315, p0430, p0431, p0441, p0442, p0443, p0444, p0445

For bit 12:

The extended functions can be configured using p0437.

For bit 13:

Encoder faults can be acknowledged via Gn\_STW.15.

For bit 14:

Only for internal Siemens use.

For bit 23:

When the property is set, commutation with zero mark can be deselected using p0430.23.

For bit 24:

If the property is set, commutation to the selected zero mark can be carried out.

## 2 Parameters

### 2.2 List of parameters

|    |  |     |    |   |
|----|--|-----|----|---|
| 17 | Extended multiturn resolution                            | Yes | No | - |
| 18 | PT1000 temperature sensor evaluation                     | Yes | No | - |
| 22 | Resolution absolute position as factor                   | Yes | No | - |
| 23 | Commutation with 180°                                    | Yes | No | - |
| 24 | Multiturn via battery                                    | Yes | No | - |
| 25 | Deselect monitoring multiturn representation in Gx_XIST2 | Yes | No | - |
| 26 | Track monitoring deselection                             | Yes | No | - |
| 28 | EnDat linear encoder monitoring incremental/absolute     | Yes | No | - |
| 29 | EnDat encoder initialization with high accuracy          | Yes | No | - |
| 30 | Extended functions available                             | Yes | No | - |
| 31 | Analog unipolar track monitoring                         | Yes | No | - |

**Dependency:**

Refer to: p0437

**Note:**

A value of zero is displayed if an encoder is not present.

For bit 09:

Parameter p0426 or p0439 has been modified. These functions are not supported by the connected Sensor Module.

#### r0459

#### Sensor Module properties extended / SM prop ext

ENC (Lin\_enc)

**Caution:**

Following ramping-up or after a data set changeover, the new value is present at connector inputs which are interconnected to connector output r0479 and under certain circumstances take 100 ms to become available.

Reason:

These interconnections are updated in the background, unlike interconnections involving other connector outputs (e.g. CO: r0482).

The value is immediately available when non-cyclically reading r0479 (e.g. via the expert list).

**Notice:** Information on Gn\_STW/Gn\_ZSW can, e.g. be found in the following literature:  
SINAMICS S120 Function Manual Drive Functions

**Note:** For bit 14:  
Displays the acknowledgment for "activate parking encoder" (Gn\_STW.14 = 1) or encoder position actual value (Gn\_XIST1) invalid.  
For bit 14, 15:  
r0481.14 = 1 and r0481.15 = 0 can have one of the following causes:  
- the encoder is parked.  
- the encoder is deactivated.  
- the encoder is being commissioned.  
- no parameterized encoder available.  
- encoder data set is being changed over.  
r0481.14 = 1 and r0481.15 = 1 has the following significance:  
An encoder error has occurred and the encoder position actual value (Gn\_XIST1) is invalid.

**Notice:** Information on Gn\_STW/Gn\_ZSW can, e.g. be found in the following literature:  
SINAMICS S120 Function Manual Drive Functions

## 2 Parameters

### 2.2 List of parameters

**Note:** For p4401 = 0, the following applies:  
 For Terminal Module 41 (TM41), this value is used to interconnect with standard telegram 3 and is always zero.  
 For p4401 = 1, the following applies:  
 r0481.0 indicates as to whether the zero mark synchronization is active.  
 r0481.4 indicates whether the zero mark of the incremental encoder was found.  
 r0481.14 indicates whether the output of track A/B is activated.

**Notice:** Information on Gn\_STW/Gn\_ZSW can, e.g. be found in the following literature:  
 SINAMICS S120 Function Manual Drive Functions

**Note:** For bit 14:  
 Displays the acknowledgment for "activate parking encoder" (Gn\_STW.14 = 1) or encoder position actual value (Gn\_XIST1) invalid.  
 For bit 14, 15:  
 r0481.14 = 1 and r0481.15 = 0 can have one of the following causes:  
 - the encoder is parked.  
 - the encoder is deactivated.  
 - the encoder is being commissioned.  
 - no parameterized encoder available.  
 - encoder data set is being changed over.  
 r0481.14 = 1 and r0481.15 = 1 has the following significance:  
 An encoder error has occurred and the encoder position actual value (Gn\_XIST1) is invalid.

|              | -  | -                    | -  |

**Description:**

Display and connector output for the encoder actual position value Gn\_XIST1 according to PROFIdrive.

**Note:**

- this value is reset if necessary when the "parking encoder" (r0481.14) function is deselected.
- in this value, the measuring gear (p0432, p0433) is only taken into account when the position tracking is activated (p0411.0 = 1).
- the update time for the position control (EPOS) corresponds to the position controller clock cycle (p0115[4]).
- the update time in isochronous operation corresponds to the bus cycle time r2064[1].
- the update time in isochronous operation and with position control (EPOS) corresponds to the position controller sampling time (p0115[4]).
- the update time in non-isochronous operation or without position control (EPOS) must be determined from the default bus cycle time and the minimum cycle time:  
The default bus cycle time is the lowest common multiple (LCM) of all current controller sampling times (p0115[0]) in the drive group (infeed + drives).  
The minimum cycle time is four times the maximum of all current controller sampling times (p0115[0]) in the drive group (infeed + drives).  
If the minimum cycle time is greater than the default bus cycle time, then the update time corresponds to the minimum cycle time; otherwise, the update time corresponds to the default bus cycle time.  
The minimum update time is 1 ms.  
Example 1: infeed, servo  
Default bus cycle time = KGV(250 µs, 125 µs) = 250 µs  
Minimum cycle time = 4 \* MAX(250 µs, 125 µs) = 4 \* 250 µs = 1 ms  
-> update time = 1 ms  
Example 2: infeed, servo, vector  
Default bus cycle time = KGV(250 µs, 125 µs, 400 µs) = 2 ms  
Minimum cycle time = 4 \* MAX(250 µs, 125 µs, 400 µs) = 4 \* 400 µs = 1.6 ms  
-> update time = 2 ms

|  | -  | -                    | -                                |

**Description:**

Displays the encoder actual position value Gn\_XIST2 according to PROFIdrive.

**Index:**

- [0] = Encoder 1
- [1] = Encoder 2
- [2] = Encoder 3

**Notice:**

The encoder position actual value must be requested using the encoder control word Gn\_STW.13.

**Note:**

- in this value, the measuring gear (p0432, p0433) is only taken into account when the position tracking is activated (p0411.0 = 1).
- if GxZSW.15 = 1 (r0481), then an error code with the following significance is located in Gx\_XIST2 (r0483):  
1: Encoder fault.  
2: Possible position shift in Gx\_XIST1.  
3: Encoder parking not possible.  
4: Cancellation, reference block search (e.g. reference mark not available or input terminal for external zero mark not set). Zero mark is requested, however according to p0404.12/13/14 there is no zero mark (alarm A07565).  
5: Cancellation, fetch reference value (e.g. illegal change from reference mark search to flying measurement).

6: cancellation, flying measurement (e.g. input terminal for probe not set).  
 7: Cancellation, fetch measured value (e.g. illegal change from flying measurement to reference mark search).  
 8: Abort, absolute value transfer.  
 3841: Function not supported.  
 4097: Abort, reference mark search due to an initialization error. Possible cause: defective Control Unit hardware.  
 4098: Abort, flying measurement due to an initialization error. Possible cause: defective Control Unit hardware.  
 4099: Abort, reference mark search due to a measuring error. Possible cause: too many measuring pulses have occurred.  
 4100: Abort, flying measurement due to a measuring error. Possible cause: too many measuring pulses have occurred.

**Description:** Displays the encoder actual position value Gn\_XIST2 according to PROFIdrive.

**Notice:** The encoder position actual value must be requested using the encoder control word Gn\_STW.13.

**Note:** SIMOTION (p4400 = 0) operating mode:

This value is used for interconnection with standard telegram 3 and is always zero.

SINAMICS (p4400 = 1) operating mode:

Once automatic zero mark synchronization is complete, the position of the zero mark of the leading encoder is displayed in this parameter. The leading encoder is interconnected via connector input p4420.

#### p0488[0...2] Measuring probe 1 input terminal / Meas probe 1 inp

|  |                              |                      |                            |
|--|------------------------------|----------------------|----------------------------|
| SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC | <b>Can be changed:</b> U, T  | <b>Calculated:</b> - | <b>Access level:</b> 3     |
|  | <b>Data type:</b> Integer16  | <b>Dyn. index:</b> - | <b>Func. diagram:</b> 4740 |
|  | <b>P-Group:</b> Encoder      | <b>Unit group:</b> - | <b>Unit selection:</b> -   |
|  | <b>Not for motor type:</b> - | <b>Scaling:</b> -    | <b>Expert list:</b> 1      |
|  | <b>Min</b>                   | <b>Max</b>           | <b>Factory setting</b>     |
|  | 0                            | 8                    | 0                          |

**Description:** Sets the input terminal to connect probe 1.

**Value:**

|    |                            |
|----|----------------------------|
| 0: | No measuring probe         |
| 1: | DI/DO 9 (X122.10/X121.8)   |
| 2: | DI/DO 10 (X122.12/X121.10) |
| 3: | DI/DO 11 (X122.13/X121.11) |
| 4: | DI/DO 13 (X132.10/X131.2)  |
| 5: | DI/DO 14 (X132.12/X131.4)  |
| 6: | DI/DO 15 (X132.13/X131.5)  |
| 7: | DI/DO 8 (X122.9/X121.7)    |
| 8: | DI/DO 12 (X132.9/X131.1)   |

**Index:** [0] = Encoder 1  
[1] = Encoder 2  
[2] = Encoder 3

**Dependency:** Refer to: p0489, p0490, p0728

**Caution:** In order to prevent incorrect measurement values, these parameters may not be written during an active measurement.

**Notice:** Regarding the terminal designation:  
The first designation is valid for CU320-2, the second for CU310-2.  
To select the values:  
For CX32, NX10 and NX15, only DI/DO 8, 9, 10, 11 can be selected as fast inputs (refer to the Equipment Manual).

**Note:** DI/DO: Bidirectional Digital Input/Output  
 The terminal must be set as input (p0728).  
 Refer to the encoder interface for PROFIdrive.  
 If parameterization is rejected, check whether the terminal is already being used in p0580, p0680, p2517 or p2518.

## 2 Parameters

### 2.2 List of parameters

**Caution:**

In order to prevent incorrect measurement values, these parameters may not be written during an active measurement.

**Notice:**

Regarding the terminal designation:

The first designation is valid for CU320-2, the second for CU310-2.

To select the values:

For CX32, NX10 and NX15, only DI/DO 8, 9, 10, 11 can be selected as fast inputs (refer to the Equipment Manual).

**Note:**

DI/DO: Bidirectional Digital Input/Output

The terminal must be set as input (p0728).

Refer to the encoder interface for PROFIdrive.

If parameterization is rejected, check whether the terminal is already being used in p0580, p0680, p2517 or p2518.

| <b>Dependency:</b>  | The following parameters are relevant for encoderless operation.<br>Refer to: p0341, p0342, p1470, p1472, p1517, p1612, p1755<br>Refer to: F07575  |  |   |  |
| <b>Caution:</b>     | For a value = 1, 2, 3, 5, 6 the following applies:<br>- encoderless operation must have been started.<br>- if, for synchronous motors, an encoder fault occurs below the switchover speed p1755, when switching over to encoderless operation, the motor can stall.<br>For a value = 1, 5, 6, the following applies:<br>- in spite of the motor encoder fault that has occurred, the motor continues to operate.                       |  |   |  |

- Note:** For a value = 1, 2, 3, 5, 6 the following applies:
- Refer to the status signal "encoderless operation due to a fault" (BO: r1407.13).
  - if, with r1407.13 = 1, a different drive data set is selected (e.g. interconnection from p0820), then the open-loop/closed-loop control mode p1300 of this data set must match that of the original data set (e.g. p1300 = 21). Encoderless closed-loop controlled operation is kept when changing over.
- For a value = 4, the following applies:
- the value can only be set for all motor data sets when p1231 = 3, 4.
  - For synchronous motors, an armature short circuit is initiated on an encoder fault.
  - For induction motors, DC braking is initiated on an encoder fault. DC braking must be commissioned (p1232, p1233, p1234).
- For a value = 5, 6 the following applies:
- Same function as for value = 1.
- However, faults are output as alarm and the message bit "Fault active" (r2139.3) is not set. The encoder fault has to be acknowledged via the encoder interface in order to resume operation with encoder.
- For a value 6, the following applies:
- The drive can be switched on again even with encoder malfunction - except for a topology error.

|                                | <b>Not for motor type:</b> -                                     | <b>Scaling:</b> -    | <b>Expert list:</b> 1    |
|                                | <b>Min</b>   | <b>Max</b>           | <b>Factory setting</b>   |
|                                | 0  | 6                    | 0                        |

**Description:** Sets the behavior for the ENCODER fault response (motor encoder).  
This means, for example, if an encoder fault occurs, encoderless operation can be automatically selected with a shutdown behavior that can be selected.

**Value:**

- 0: Encoder fault results in OFF2
- 1: Enc fault results in encoderless oper. and oper. continues
- 2: Encoder fault results in encoderless operation and OFF1
- 3: Encoder fault results in encoderless operation and OFF3
- 4: Encoder fault results in an armature short-cct int/DC braking
- 5: Enc fault results in encoderless op, operation continues, alarm
- 6: An encoder fault results in encoderless operation, alarm

**Dependency:** The following parameters are relevant for encoderless operation.  
Refer to: p0341, p0342, p1470, p1472, p1517, p1612, p1755  
Refer to: A07532, F07575

**Caution:**  For a value = 1, 2, 3, 5, 6 the following applies:

- encoderless operation must have been started. When doing this, the following parameters must be set: p1612, p1498, p1451, p1470, p1472, p0642.
- if, for synchronous motors, an encoder fault occurs below the switchover speed p1755, when switching over to encoderless operation, the motor can stall.

For a value = 1, 5, 6, the following applies:

- in spite of the motor encoder fault that has occurred, the motor continues to operate.

**Note:** For a value = 1, 2, 3, 5, 6 the following applies:

- for encoderless operation the following condition must be fulfilled:  $p1800 \geq 1 / (4 * p0115[0])$
- Refer to the status signal "encoderless operation due to a fault" (BO: r1407.13).
- if, with  $r1407.13 = 1$ , a different drive data set is selected (e.g. interconnection from p0820), then the open-loop/closed-loop control mode p1300 of this data set must match that of the original data set (e.g.  $p1300 = 21$ ). Encoderless closed-loop controlled operation is kept when changing over.

For a value = 4, the following applies:

- the value can only be set for all motor data sets when  $p1231 = 3, 4$ .
- For synchronous motors, an armature short circuit is initiated on an encoder fault.
- For induction motors, DC braking is initiated on an encoder fault. DC braking must be commissioned ( $p1232, p1233, p1234$ ).

For a value = 5, 6 the following applies:

Same function as for value = 1.

However, faults are output as alarm and the message bit "Fault active" (r2139.3) is not set. The encoder fault has to be acknowledged via the encoder interface in order to resume operation with encoder.

For a value 6, the following applies:

The drive can be switched on again even with encoder malfunction - except for a topology error.

| <b>p0491</b>                         | <b>Motor encoder fault response ENCODER / Fault resp ENCODER</b> |                      |                          |
|--------------------------------------|--|----------------------|--------------------------|

|                                      | 0  | 6                    | 0                        |

**Description:** Sets the behavior for the ENCODER fault response (motor encoder).  
This means, for example, if an encoder fault occurs, encoderless operation can be automatically selected with a shutdown behavior that can be selected.

**Value:**

- 0: Encoder fault results in OFF2
- 1: Enc fault results in encoderless oper. and oper. continues
- 2: Encoder fault results in encoderless operation and OFF1
- 3: Encoder fault results in encoderless operation and OFF3
- 4: Encoder fault results in an armature short-cct int/DC braking
- 5: Enc fault results in encoderless op, operation continues, alarm
- 6: An encoder fault results in encoderless operation, alarm

**Dependency:** The following parameters are relevant for encoderless operation.  
Refer to: p0341, p0342, p1470, p1472, p1517, p1612, p1755  
Refer to: F07575

**Caution:**  For a value = 1, 2, 3, 5, 6 the following applies:  
- encoderless operation must have been started.  
For a value = 1, 5, 6, the following applies:  
- the motor continues to operate in spite of the incorrect motor encoder function.

**Note:** For a value = 1, 2, 3, 5, 6 the following applies:

- Refer to the status signal "encoderless operation due to a fault" (BO: r1407.13).
- if, with  $r1407.13 = 1$ , a different drive data set is selected (e.g. interconnection from p0820), then the open-loop/closed-loop control mode p1300 of this data set must match that of the original data set (e.g.  $p1300 = 21$ ). Encoderless closed-loop controlled operation is kept when changing over.

For a value = 4, the following applies:

- the value can only be set for all motor data sets when  $p1231 = 3, 4$ .
- for permanent magnet synchronous motors, an armature short circuit is initiated when an encoder fault occurs.
- For induction motors, DC braking is initiated on an encoder fault. DC braking must be commissioned ( $p1232, p1233, p1234$ ).

For a value = 5, the following applies:

Same function as for value = 1.

However, in operation, encoder malfunctions that occur are only output as alarm and the message bit "Fault active" (r2139.3) is not set. Fault F07575 is set after the drive axis has been shut down.

The active malfunction of the encoder must be acknowledged via the encoder interface before the system can be switched on again.

For a value = 6, the following applies:

Same function as for value = 1.

Encoder malfunctions that occur are only output as alarm and the message bit "Fault active" (r2139.3) is not set.

After shutting down the drive axis, in spite of an active encoder malfunction, the drive can restart without switching over to encoderless operation (except if an active topology error is involved).

The active encoder malfunction must be acknowledged via the encoder interface before operation can be resumed for operation with the encoder.

---

|               | 4: DI/DO 13 (X132.10/X131.2)  |
|               | 5: DI/DO 14 (X132.12/X131.4)  |
|               | 6: DI/DO 15 (X132.13/X131.5)  |
|               | 7: DI/DO 8 (X122.9/X121.7)    |
|               | 8: DI/DO 12 (X132.9/X131.1)   |
|               | 210: DI 0 (X130 / 1.2)        |
|               | 211: DI 1 (X130 / 1.5)        |

**Dependency:** Refer to: p0490

**Caution:** In order to prevent incorrect measurement values, these parameters may not be written during an active measurement.

**Notice:** For CX32, NX10 and NX15, only DI/DO 8, 9, 10, 11 can be selected as fast inputs (refer to the Equipment Manual).  
Regarding the terminal designation:

The first designation is valid for CU320-2, the second for CU310-2.

**Note:** Refer to the encoder interface for PROFIdrive.

The terminal must be set as input (p0728).

For p0493 = 0 (factory setting) the following applies:

- there is no logic operation between the reference mark search and an input signal.

For p0493 > 0, the following applies:

- the positive edge of the input signal is evaluated. If the negative edge is to be evaluated, signal inversion must be parameterized via p0490.

- if a parameter change is rejected, a check should be performed as to whether the input terminal is already being used in p0580, p0680, p2517, or p2518.

### Equivalent zero mark input terminal / ZM\_equiv inp\_term

**Can be changed:** U, T

**Calculated:** -

**Access level:** 3

**Data type:** Integer16

**Dyn. index:** EDS, p0140

**Func. diagram:** -

**P-Group:** Encoder

**Unit group:** -

**Unit selection:** -

**Not for motor type:** -

**Scaling:** -

**Expert list:** 1

**Min**

**Max**

**Factory setting**

0

8

0

**Description:**

Selects the input terminal for connecting an equivalent zero mark (external encoder zero mark).

**Value:**

|    |   |
|----|---|
| 0: | No equivalent zero mark (evaluation of the encoder zero mark) |
| 1: | DI/DO 9 (X122.10/X121.8)                                      |
| 2: | DI/DO 10 (X122.12/X121.10)                                    |
| 3: | DI/DO 11 (X122.13/X121.11)                                    |
| 4: | DI/DO 13 (X132.10/X131.2)                                     |
| 5: | DI/DO 14 (X132.12/X131.4)                                     |
| 6: | DI/DO 15 (X132.13/X131.5)                                     |
| 7: | DI/DO 8 (X122.9/X121.7)                                       |
| 8: | DI/DO 12 (X132.9/X131.1)                                      |

**Dependency:** Refer to: p0490

**Caution:** In order to prevent incorrect measurement values, these parameters may not be written during an active measurement.

**Notice:** For CX32, NX10 and NX15, only DI/DO 8, 9, 10, 11 can be selected as fast inputs (refer to the Equipment Manual).

For p0494 = 0 (factory setting), the setting in p0495 is effective.

Regarding the terminal designation:

The first designation is valid for CU320-2, the second for CU310-2.

**Note:**

Refer to the encoder interface for PROFIdrive.

The terminal must be set as input.

  - 5: DI/DO 14 (X132.12/X131.4)
  - 6: DI/DO 15 (X132.13/X131.5)
  - 7: DI/DO 8 (X122.9/X121.7)
  - 8: DI/DO 12 (X132.9/X131.1)

**Index:** [0] = Encoder 1  
[1] = Encoder 2  
[2] = Encoder 3

**Dependency:** Refer to: p0490, p0494

**Caution:** In order to prevent incorrect measurement values, these parameters may not be written during an active measurement.

- Notice:** For CX32, NX10 and NX15, only DI/DO 8, 9, 10, 11 can be selected as fast inputs (refer to the Equipment Manual).  
For p0494 > 0, the setting in p0494 is effective and p0495 is invalid.  
Regarding the terminal designation:  
The first designation is valid for CU320-2, the second for CU310-2.
- Note:** Refer to the encoder interface for PROFIdrive.  
The terminal must be set as input.  
For p0495 = 0 (factory setting), the encoder zero mark is evaluated as zero mark.  
For p0495 > 0, the following applies:  
Depending on the direction of motion, the positive or negative edge at the appropriate input is evaluated.  
- increasing position actual values (r0482) --> the 0/1 edge is evaluated.  
- decreasing position actual values (r0482) --> the 1/0 edge is evaluated.  
Only one zero mark is supported. If function 2, 3 or 4 is selected, this results in a fault message in Gn\_ZSW.  
The inversion of the inputs via p0490 affects the function "referencing with equivalent zero mark". This is the reason that the edge evaluation is interchanged as a function of the direction of motion.  
An input can only be assigned to one encoder as measuring probe 1, 2 or equivalent zero mark.  
Exception:  
Simultaneous use as measuring probe and equivalent zero mark is possible for the same encoder, as both functions cannot be simultaneously requested.

**Description:** Selects the trace signal to be output in r0497, r0498 and r0499 for encoder diagnostics.

**Value:**

- 0: Inactive
- 1: r0497: Mechanical revolution
- 7: r0498: oversampling channel A with fault trigger
- 8: r0498: oversampling channel A with fault trigger
- 9: r0497: sum of the squares AB in 0.1 mV
- 10: r0498: Raw value track A, r0499: Raw value track B
- 11: r0498: Fine position X (-A/2), r0499: Fine position Y (-B/2)
- 12: r0498: Fine position Phi, r0499: -
- 13: r0498: Offset correction X, r0499: Offset correction Y

|     |   |
|-----|---|
| 14: | r0498: Phase correction X, r0499: Amplitude correction Y          |
| 15: | r0498: Cubic correction X, r0499: Fine position X                 |
| 16: | r0498: oversampling channel A, r0499: oversampling channel B      |
| 17: | r0498: fan-out amount, r0499: fan-out number                      |
| 18: | r0498: Oversampling angle, r0499: Oversampling amount             |
| 19: | r0498: Fault counter AB, r0499: raw value track A                 |
| 20: | r0498: Raw value track C, r0499: Raw value track D                |
| 21: | r0498: CD position X (-D/2), r0499: CD position Y (C/2)           |
| 22: | r0498: CD position Phi, r0499: CD pos. Phi - mech. revolution     |
| 23: | r0497: Zero mark status   |
| 24: | r0498: Raw value track R, r0499: Zero mark status                 |
| 25: | r0498: Raw value track A, r0499: Raw value track R                |
| 26: | r0498: Sum of squares AB, r0499: sector number                    |
| 30: | r0497: Absolute position serial                                   |
| 31: | r0497: Absolute position incremental                              |
| 32: | r0497: Zero mark position   |
| 33: | r0497: Correction absolute position difference                    |
| 40: | r0498: Raw temperature, r0499: Temperature in 0.1 °C              |
| 41: | r0498: Resistance in 0.1 Ohm, r0499: Temperature in 0.1 °C        |
| 42: | r0497: Resistance 2500 Ohm  |
| 51: | r0497: Absolute speed difference (dn/dt)                          |
| 52: | r0497: Xact1 corrected quadrants                                  |
| 60: | Analog sensor: r0498: raw val chann. A, r0499: raw val chann. B   |
| 61: | Analog sensor: r0498: fine pos chann. A, r0499: fine pos chann. B |
| 62: | Analog sensor: r0498: Fine pos before characteristic, r0499: -    |
| 70: | Resolver: r0498: Transformation ratio, r0499: phase               |
| 80: | Spindle: r0498: Sensor S1 (raw), r0499: Sensor S4 (raw)           |
| 81: | Spindle: r0498: Sensor S5 (raw), r0499: -                         |
| 85: | Spindle: r0498: Sensor S1 (cal), r0499: Sensor S4 (cal)           |
| 86: | Spindle: r0498: Sensor S5 (cal), r0499: -                         |

**Dependency:**

Refer to: r0497, r0498, r0499

**Notice:**

The setting option depends on the following properties:

Sensor Module type, hardware version, firmware version (Sensor Module and Control Units), Article number (last digit).

Not all combinations are supported.

**Note:**

For p0496 = 1: 360 ° <--> 2<sup>32</sup>

For p0496 = 7, 8: input voltage in mV

For p0496 = 10 (resolver): 2900 mV <--> 26214 dec

For p0496 = 10, 20 (sin/cos 1 Vpp, EnDat): 500 mV <--> 21299 dec

For p0496 = 11 (resolver): 2900 mV <--> 13107 dec, internal processor offset is corrected

For p0496 = 11, 21 (sin/cos 1 Vpp, EnDat): 500 mV <--> 10650 dec, internal processor offset is corrected

For p0496 = 12: 180 ° fine position <--> 32768 dec

For p0496 = 13 (resolver): 2900 mV <--> 13107 dec

For p0496 = 13 (sin/cos 1 Vpp, EnDat): 500 mV <--> 10650 dec

For p0496 = 14: 1 ° <--> 286 dec, 100 % <--> 16384 dec

For p0496 = 15: 100 % <--> 16384 dec

For p0496 = 16 (resolver): channel A: 2900 mV <--> 26214 dec, channel B: 2900 mV <--> 26214 dec, channel A and channel B can be shifted by one sample (in time)

For p0496 = 16: (sin/cos 1 Vpp, EnDat) channel A: 500 mV <--> 21299 dec, channel B: 500 mV <--> 21299 dec, channel A and channel B can be shifted by one sample (in time)

For p0496 = 17 (resolver): absolute value: 2900 mV <--> 13107 dec, number: 1 ... 8

For p0496 = 17 (sin/cos 1 Vpp, EnDat): absolute value 500 mV <--> 10650 dec, number: 1 ... 8

For p0496 = 18 (resolver): angle: signal period <--> 2<sup>16</sup>, absolute value: 2900 mV <--> 13107 dec

For p0496 = 18 (sin/cos 1 Vpp, EnDat): angle: signal period <--> 2<sup>16</sup>, absolute value: 500 mV <--> 10650 dec

For p0496 = 19 (resolver): counter: dec, channel A: 2900 mV <--> 26214 dec

For p0496 = 19 (sin/cos 1 Vpp, EnDat): counter: dec, channel A: 500 mV <--> 21299 dec

For p0496 = 22: 180 ° <--> 32768 dec

For p0496 = 23, 24: r0497.31 (r0499.15) set for at least 1 current controller sampling time when encoder zero mark detected

For p0496 = 24, 25: 500 mV <--> 21299 dec

## 2 Parameters

### 2.2 List of parameters

**Caution:**

After changing over the technological application and then calculating the open-loop and closed-loop parameters, the behavior of the motor can have changed very significantly (e.g. the same setpoint results in a higher speed due to a different reference speed). For this reason extreme caution must be taken when the motor is started for the first time.

**Note:**

The calculation of parameters dependent on the technology application can be called up as follows:

- when exiting quick commissioning using p3900 > 0
- when writing p0340 = 1, 3, 5
- when writing p0578 = 1

For p0500 = 100 and when the calculation is initiated, the following parameters are set:

- p1520/p1521 = rated motor torque (r0333)
- p1530/p1531 =  $2 * \pi * r0333 * p0311$  (rotary) or  $r0333 * p0311$  (linear)
- p2000 = rated motor speed (p0311) (only for p0340 = 1, p3900 > 0)
- p2175 = factory setting
- p2177 = factory setting

For p0500 = 101 and when the calculation is initiated, the following parameters are set:

- p1520/p1521 = torque at the maximum motor current (p0323)
- p1530/p1531 = power at the maximum motor current (p0323) and rated motor speed (p0311)
- p2000 = rated motor speed (p0311) (only for p0340 = 1, p3900 > 0)
- p2175 = maximum value
- p2177 = 0.2 s

For p0500 = 102 and when the calculation is initiated, the following parameters are set:

- p1520/p1521 = rated motor torque (r0333)
- p1530/p1531 =  $2 * \pi * r0333 * p0311$  (rotary) or  $r0333 * p0311$  (linear)
- p2000 = maximum motor speed (p0322) if p0322 not equal to 0, otherwise rated motor speed (p0311) (only for p0340 = 1, p3900 > 0)
- p2175 = factory setting
- p2177 = factory setting

For p0500 = 103 and when the calculation is initiated, the following parameters are set:

- p1520/p1521 = torque at the maximum motor current (p0323)
- p1530/p1531 = power at the maximum motor current (p0323) and rated motor speed (p0311)
- p2000 = maximum motor speed (p0322) if p0322 not equal to 0, otherwise rated motor speed (p0311) (only for p0340 = 1, p3900 > 0)
- p2175 = factory setting
- p2177 = factory setting

#### p0500

#### Technology application / Tec application

VECTOR,

**P-Group:** Applications

**Unit group:** -

**Unit selection:** -

**Not for motor type:** -

**Scaling:** -

**Expert list:** 1

**Min**

**Max**

**Factory setting**

0

6

1

**Description:**

Sets the technology application.

The parameter influences the calculation of open-loop and closed-loop control parameters that is initiated using p0578, for example.

**Value:**

- 0: Standard drive (VECTOR)
- 1: Pumps and fans
- 2: Sensorless closed-loop control down to  $f = 0$  (passive loads)
- 4: Dynamic in the field weakening range
- 5: Starting with a high break loose torque
- 6: High load moment of inertia

**Dependency:**

Refer to: p2175, p2177

**Note:**

The calculation of parameters dependent on the technology application can be called up as follows:

- when exiting quick commissioning using p3900 > 0
- when writing p0340 = 1, 3, 5 (for p0500 = 6: p0340 = 1, 3, 4)
- when writing p0578 = 1

For p0500 = 0 and when the calculation is initiated, the following parameters are set:

- p1574 = 10 V (separately excited synchronous motor: 20 V)
- p1750.2 = 0
- p1802 = 4 (SVM/FLB without overcontrol)
- p1803 = 106 %
- p1610 = 50 %
- p1611 = 30 %
- p1310 = 50 %
- p1311 = 0 %
- p1381 = 0 %

For p0500 = 1 and when the calculation is initiated, the following parameters are set:

- p1574 = 2 V (separately excited synchronous motor: 4 V)
- p1750.2 = 0
- p1802 = 9 (edge modulation), if r0192.0 = 1
- p1802 = 4, if r0192.0 = 0
- p1803 = 106 %
- p1310, p1311, p1381, p1611, p1610 the same as for p0500 = 0

For p0500 = 2 and when the calculation is initiated, the following parameters are set:

- p1574 = 2 V (separately excited synchronous motor: 4 V)
- p1750.2 = 1: Encoderless control of the induction motor is effective down to zero frequency.

This operating mode is possible for passive loads. These include applications where the load does not generate regenerative torque when breaking away and the motor comes to a standstill (zero speed) itself when the pulses are inhibited.

- p1802, p1803, p1310, p1311, p1381, p1610, p1611 the same as for p0500 = 0

The setting of p1750 is only relevant for induction motors.

p1802 and p1803 are only changed, in all cases, if a sine-wave output filter (p0230 = 3, 4) has not been selected.

For p0500 = 4: (presetting for VECTOR with PM250 power unit)

- p1574 = 30 V
- p1750.2 = 0
- p1802 = 2 (SVM with overcontrol)
- p1803 = 106 %
- p1381 = 6 % (to avoid overcontrol)
- p1654 = p0115[1]
- p1402.11 = 1
- p1310, p1311, p1610, p1611 the same as for p0500 = 0

For p0500 = 5: (for speed-controlled starting for vector control without encoder)

- p1574, p1750.2, p1802, p1803, p1381 the same as for p0500 = 0
- p1610 = 80 % (separately excited synchronous motor: 50 %)
- p1611 = 80 % (separately excited synchronous motor: 50 %)
- p1310 minimum 80%
- p1311 at least 30 %

For p0500 = 6: (for high moments of inertia with/without gearbox coupling)

- p1574, p1750.2, p1802, p1803, p1610, p1611, p1310, p1311 the same as for p0500 = 0

The following settings change the speed control for p0340 = 1, 3, 4

They are only reset using p0340 = 1 or p3900 > 0.

- p0342 = 10 (motor moment of inertia factor, if previously p0342 = 1)

The real factor can be entered in the commissioning tool.

- p1400.20 = 1 (acceleration model)
- p1441, p1442, p1452 calculated
- p1496 = 100 %
- p1959.14 = 1 (speed actual value smoothing is calculated)
- p1967 = 80 %

## 2 Parameters

### 2.2 List of parameters

The following settings are only reset again using p3900 = 1.

- p1115 = 1

- p1130, p1131 ramp-function generator rounding calculated from p1120, p1121 and r0345.

The moment of inertia estimator (p1400.18, p5310) can be activated, depending on the specific application, to adaptively determine the load moment of inertia in operation.

## 2 Parameters

### 2.2 List of parameters

**Notice:** This parameter is pre-assigned in the case of motors from the motor list (p0301) if a bearing version (p0530) is selected.

When selecting a catalog motor, this parameter cannot be changed (write protection). The information in p0530 should be observed when removing write protection.

If p0532 is changed during quick commissioning (p0010 = 1), then the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned appropriately. This is not the case when commissioning the motor (p0010 = 3).

**Description:** This parameter is used to calculate all parameters that depend on the technology of the application (p0500). All of the parameters are calculated that can also be determined using p0340 = 5.

**Value:** 0: No calculation  
1: Complete calculation

**Note:** At the end of the calculations, p0578 is automatically set to 0.

**p0580 Measuring probe input terminal / MT input terminal**

|  |                              |                      |                          |

|  | <b>Data type:</b> Integer16  | <b>Dyn. index:</b> - | <b>Func. diagram:</b> -  |
|  | <b>P-Group:</b> Encoder      | <b>Unit group:</b> - | <b>Unit selection:</b> - |
|  | <b>Not for motor type:</b> - | <b>Scaling:</b> -    | <b>Expert list:</b> 1    |
|  | <b>Min</b>                   | <b>Max</b>           | <b>Factory setting</b>   |
|  | 0                            | 8                    | 0                        |

**Description:** Sets the input terminal for the measuring probe for speed actual value measurement.

**Value:** 0: No measuring probe  
1: DI/DO 9 (X122.10/X121.8)  
2: DI/DO 10 (X122.12/X121.10)  
3: DI/DO 11 (X122.13/X121.11)  
4: DI/DO 13 (X132.10/X131.2)  
5: DI/DO 14 (X132.12/X131.4)  
6: DI/DO 15 (X132.13/X131.5)  
7: DI/DO 8 (X122.9/X121.7)  
8: DI/DO 12 (X132.9/X131.1)

**Dependency:** Refer to: p0581, p0728

Refer to: A07498

**Caution:** In order to prevent incorrect measurement values, these parameters may not be written during an active measurement.

**Notice:** Regarding the terminal designation:  
The first designation is valid for CU320-2, the second for CU310-2.  
To select the values:  
For CX32, NX10 and NX15, only DI/DO 8, 9, 10, 11 can be selected as fast inputs (refer to the Equipment Manual).  
The terminal must be set as input (p0728).

**Note:** If a parameter change is rejected, a check should be performed as to whether the input terminal is already being used in p0488, p0489, p0493, p0494, p0495, p0680, p2517 or p2518.  
DI/DO: Bidirectional Digital Input/Output

## 2 Parameters

| <b>Dependency:</b>  | A thermal motor model is calculated corresponding to p0612.<br>Refer to: r0458, p0600, p0612   |                               |                            |

**Note:** The temperature sensor for the temperature evaluation is set in p0600.  
 For p0600 = 10 (temperature sensor via a BICO interconnection), the setting in p0601 has no significance.  
 Information on using temperature sensors is provided in the following literature:  
 - hardware description of the appropriate components  
 - SINAMICS S120 Commissioning Manual  
 For p0601 = 1:  
 Tripping resistance = 1650 Ohm.  
 After the tripping resistance has been exceeded, an appropriate alarm is output and after the delay time set in p0606 has expired, an appropriate fault is output.  
 For p0601 = 3, 7:  
 For motors with DRIVE-CLiQ and two temperature sensors, the value is automatically set.  
 For p0601 = 4:  
 Tripping resistance = 100 Ohm.  
 After tripping, an appropriate alarm is output and after the delay time set in p0606 has expired, an appropriate fault is output.  
 For p0601 = 5:  
 It is only possible to evaluate a PT100 for p0600 = 11 and r0192.15 = 1.  
 For p0601 = 10:  
 Not permitted for p0600 = 0, 10, 11.  
 Associated parameters: p4600 ... p4603 (can be switched via EDS)  
 For r0458.8 = 1, a temperature evaluation is supported through several temperature channels.  
 Examples:  
 When evaluating using SME120 or SME125, 4 temperature channels are available (parameterized using p4600, p4601, p4602, p4603).  
 When evaluating using CU310 and CUA32, 2 temperature channels are available (encoder interface: parameterization via p4600, terminal block: parameterization via p4601).  
 For p0601 = 11:  
 Not permitted for p0600 = 0, 10, 11.  
 Associated parameters: p4610 ... p4613 (can be switched via MDS)

## 2 Parameters

### 2.2 List of parameters

**Note:** The measured value display depends on the selected sensor type.  
 For p0601 = 0:  
 --> r0035 = -200 °C  
 For p0601 = 1:  
 Tripping resistance = 1650 Ohm (lower resistance --> r0035 = -50 °C, higher resistance --> r0035 = 250 °C).  
 For p0601 = 2, 6:  
 Displays the temperature in °C.  
 For p0601 = 4:  
 r0035 = -50 °C  
 --> The tripping resistance is less than 100 Ohm (bimetallic NC contact is closed or has a short-circuit).  
 r0035 = 250 °C  
 --> The tripping resistance is greater than 100 Ohm (bimetallic NC contact is open, not connected or has a wire breakage).  
 When using the following components, a value of 4 is set as the factory setting and can no longer be changed:  
 - Basic Line Module (BLM) with internal Braking Module.  
 - Active Line Module (ALM) with line filter Active Interface Module (AIM, p0220[0] = 41 ... 45).  
 In these cases, in addition to the temperature display, the temperature is also monitored.

**Description:** Sets the signal source to evaluate the motor temperature via a BICO interconnection.

**Dependency:** Refer to: p0600

**Note:** Temperature sensor KTY/PT1000: Valid temperature range -48 °C ... 248 °C.  
 Temperature sensor PTC/bimetallic switch with NC contact:  
 For a value of -50 °C, the following applies: Motor temperature < nominal response temperature of the PTC/bimetal contact closed.  
 For a value of 250 °C, the following applies: Motor temperature >= nominal response temperature of the PTC/bimetal contact open.  
 Note:  
 When using a Terminal Module 31 (TM31), the following applies:  
 - the sensor type used is set using p4100.  
 - the temperature signal is interconnected using CO: r4105.

| <b>Note:</b>  | The relevant alarm threshold (p0604, p0605, p5390) depends on the setting in p0600, p0601 and p0612. If the temperature measurement and temperature model are simultaneously active, then the temperature provided by the temperature model is used.<br>If value = 0:<br>An alarm is output and I_max is not reduced.<br>If value = 1:<br>An alarm is output and a timer is started. A fault is output if the alarm is still active after this timer has expired.<br>The I_max reduction can result in a lower output frequency.<br>- for KTY/PT1000/PT100, the following applies: reduction of I_max.<br>- for PTC (p0601 = 1) or bimetallic NC contact (p0601 = 4) the following applies: I_max is not reduced. |                               |   |

If value = 2:

An alarm is output and a timer is started. A fault is output if the alarm is still active after this timer has expired.

If value = 12:

Behavior is always the same as for value 2.

For motor temperature monitoring without temperature sensor, when switching off, the model temperature is saved in a non-volatile fashion. When switching on, the same value (reduced by p0614) is taken into account in the model calculation. As a consequence, the UL508C specification is fulfilled.

## 2 Parameters

### 2.2 List of parameters

- Notice:** For bit 00:  
This bit is only automatically activated for permanent-magnet 1FT7 synchronous motors and synchronous reluctance motors. For other permanent-magnet synchronous motors, the user himself must activate motor temperature model 1 (I2t).  
It is only possible to activate this motor temperature model (I2t) for a time constant greater than zero ( $p0611 > 0$ ).
- Note:** Mot\_temp\_mod: motor temperature model
- For bit 00 (see also bit 8):  
This bit is used to activate/deactivate the motor temperature model for permanent-magnet synchronous motors and synchronous reluctance motors.
- For bit 01 (see also bit 9):  
This bit is used to activate/deactivate the motor temperature model for induction motors.
- For bit 02:  
This bit is used to activate/deactivate the motor temperature model for 1FK7/1FG1 motors without encoder, 1FK2 and 1FL6.  
Motor temperature model 3 cannot be simultaneously activated with another motor temperature model.
- For bit 08:  
This bit is used to extend the motor temperature model 1 (I2t).  
The following applies for firmware version < 4.7 SP6 (only bit 0):  
- this bit has no function. Temperature model 1 operates in the standard mode.  
Overtemperature at rated load: p0605 - 40 °C  
Alarm threshold: p0605  
Fault threshold: p0615  
The following applies from firmware version 4.7 SP6 (bits 0 and 8):  
- temperature model 1 operates in the extended mode.  
Overtemperature at rated load: p0627  
Alarm threshold: p5390  
Fault threshold: p5391
- For bit 09:  
This bit is used to extend the motor temperature model 2.  
For firmware version < 4.7 following applies (only bit 1):  
- this bit has no function. Temperature model 2 operates in the standard mode.  
From firmware version 4.7 the following applies (bits 1 and 9):  
- this bit should be set. Temperature model 2 then operates in the extended mode and the result of the model is more precise.
- For bit 12 (only effective if a temperature sensor has not been parameterized):  
This bit is used to set the ambient temperature for the motor temperature model 1 (I2t).  
The following applies for firmware version < 4.7 SP6 (only bit 0):  
- this bit has no function. Temperature model 1 operates with an ambient temperature of 20 °C.  
The following applies from firmware version 4.7 SP6 (bits 0 and 12):  
- the ambient temperature can be adapted to the conditions using p0613.

## 2 Parameters

### 2.2 List of parameters

**Note:** For p0620 = 1, the following applies:  
The stator resistance is adapted using the temperature in r0035 and the rotor resistance together with the model temperature in r0633.  
For p0620 = 2, the following applies:  
The stator resistance is adapted using the temperature in r0035. If applicable, the rotor temperature for adapting the rotor resistance is calculated from the stator temperature (r0035) as follows:  
$$\theta_R = (r0628 + r0625) / (r0627 + r0625) * r0035$$

| p0620[0...n]                         | Thermal adaptation, stator and rotor resistance / Mot therm_adpt R  |                                 |                          |

|  | 0   | 2                             | 0                        |
| <b>Description:</b>                                    | Selects the identification of the stator resistance after booting the Control Unit (only for vector control).<br>The identification is used to measure the actual stator resistance and from the ratio of the result of motor data identification (p0350) to the matching ambient temperature (p0625) the actual mean temperature of the stator winding is calculated. The result is used to initialize the thermal motor model.<br>p0621 = 1:<br>Identification of the stator resistance only when switching on the drive for the first time (pulse enable) after the Control Unit powers up.<br>p0621 = 2:<br>Identification of the stator resistance every time the drive is switched on (pulse enable).<br>p0621 = 3:<br>One-time identification of the cable resistance p0352 without making a change in the thermal motor model (also suitable for synchronous motors). |                               |                          |
| <b>Value:</b>  | 0: No Rs identification<br>1: Rs identification after switching-on again<br>2: Rs identification after switching-on each time   |                               |                          |
| <b>Dependency:</b>                                     | - perform motor data identification (see p1910) with cold motor.<br>- enter ambient temperature at time of motor data identification in p0625.<br>Refer to: p0622, r0623  |                               |                          |

- Notice:** The calculated stator temperature can only be compared with the measured value of a temperature sensor (KTY/PT1000) to a certain extent, as the sensor is usually the warmest point of the stator winding, whereas the measured value of identification reflects the average value of the stator winding.
- Furthermore this is a short-time measurement with limited accuracy that is performed during the magnetizing phase of the induction motor.
- Note:** The measurement is performed in the following cases:
- an induction motor is being used.
  - vector control is active (see p1300).
  - temperature sensor (KTY/PT1000) is not connected.
  - when switching on, the motor remains at standstill.
- When a flying restart is performed on a rotating motor, the temperatures of the thermal motor model are set to a third of the overtemperatures. However, this occurs only once when the Control Unit has powered up (e.g. after a power failure).
- If identification is activated, the magnetizing time is determined via p0622 and not via p0346. Quick magnetizing (p1401.6) is internally deactivated and alarm A07416 is output. The speed is enabled after completion of the measurement.

| <b>p0622[0...n]</b>                                    | <b>Motor excitation time for Rs_ident after switching on again / t_excit Rs_id</b>  |                                 |                          |

## 2 Parameters

### 2.2 List of parameters

|   |   |  |   |
|---|---|--|---|
| <b>p0629[0...n]</b>   | <b>Stator resistance reference / R_stator ref</b>   |  |   |
| VECTOR (n/M),<br>VECTOR_AC (n/M),<br>VECTOR_I_AC (n/M)                  | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Motor<br><b>Not for motor type:</b> PMSM, SESM, REL, RESM<br><b>Min</b><br>0.00000 [ohm]  | <b>Calculated:</b> CALC_MOD_EQU<br><b>Dyn. index:</b> MDS, p0130<br><b>Unit group:</b> 16_1<br><b>Scaling:</b> -<br><b>Max</b><br>2000.00000 [ohm] | <b>Access level:</b> 4<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> p0349<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0.00000 [ohm]         |
| <b>Description:</b>   | Reference value for the identification of the stator resistance every time the drive is switched on.  |  |   |
| <b>Dependency:</b>  | The measurement of the reference value is activated by the automatic calculation (p0340 = 1, 2), if the following conditions apply:<br>- the motor temperature is at this instant in time less than 30 °C (r0035).<br>- a temperature sensor is not being used (p0601).<br>Refer to: p0621, r0623   |  |   |
| <b>Note:</b>  | The reference value to identify the stator resistance should be manually entered after the first identification (p0629 = r0623). The identification must be realized when the motor is in a cold state, as the value refers to the ambient temperature p0625. The feeder cable resistance should be entered into p0352 before the measurement.<br>The result must be saved after the first measurement so that the reference is available after the CU has powered up. When changing p0350 or p0352, the reference value p0629 should be re-determined. |  |   |
| <b>r0630[0...n]</b>   | <b>Mot_temp_mod ambient temperature / Mod T_ambient</b>   |  |   |

## 2 Parameters

### 2.2 List of parameters

**Note:** In the field-weakening range, synchronous motors can, when a fault condition exists, generate high DC link voltages. The following possibilities exist to protect the drive system from being destroyed due to overvoltage:

- limit the maximum speed (p1082) without any additional protection.

The maximum speed without protection is calculated as follows:  
 $p1082 \text{ [rpm]} \leq 11.695 * r0297 / p0316 \text{ (or } r0334) \text{ [Nm/A]}$

- use a Voltage Protection Module (VPM) in conjunction with the function "Safe Torque Off" (p9601, p9801).

When a fault condition exists, the VPM short-circuits the motors. During the short-circuit, the pulses must be suppressed - this means that the terminals for the function "Safe Torque Off" must be connected to the VPM.

- activating the internal voltage protection (IVP) with p1231 = 3.

|               | 8: DI/DO 12 (X132.9/X131.1)   |

**Dependency:** Refer to: p0728

**Caution:** In order to prevent incorrect measurement values, these parameters may not be written during an active measurement.

**Notice:** Regarding the terminal designation:  
The first designation is valid for CU320-2, the second for CU310-2.

To select the values:

For CX32, NX10 and NX15, only DI/DO 8, 9, 10, 11 can be selected as fast inputs (refer to the Equipment Manual).

**Note:** DI/DO: Bidirectional Digital Input/Output

Prerequisite: The DI/DO must be set as input (p0728.x = 0).

If a parameter change is rejected, a check should be performed as to whether the input terminal is already being used in p0488, p0489, p0493, p0494, p0495, p0580, p2517 or p2518.

---

**Description:** Sets the signal source for the synchronizing signal (SYN) of the function "central measuring probe evaluation".  
The signal is used to synchronize the common system time between the master and slave.

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

---

### p0682 **CI: Central measuring probe control word signal source / Cen meas STW s\_s**

**Description:** Sets the signal source for the control word of the function "central measuring probe evaluation".

---

### p0684 **Central measuring probe evaluation technique / Cen meas eval\_tech**

|  |                              |                      |                          |
|--|------------------------------|----------------------|--------------------------|
| CU_I, CU_NX_CX,<br>CU_S_AC_DP,<br>CU_S_AC_PN,<br>CU_S120_PN,<br>CU_S150_PN,<br>CU_S120_DP,<br>CU_S150_DP,<br>CU_I_D410 | <b>Can be changed:</b> U, T  | <b>Calculated:</b> - | <b>Access level:</b> 3   |
|  | <b>Data type:</b> Integer16  | <b>Dyn. index:</b> - | <b>Func. diagram:</b> -  |
|  | <b>P-Group:</b> Encoder      | <b>Unit group:</b> - | <b>Unit selection:</b> - |
|  | <b>Not for motor type:</b> - | <b>Scaling:</b> -    | <b>Expert list:</b> 1    |
|  | <b>Min</b>                   | <b>Max</b>           | <b>Factory setting</b>   |
|  | 0                            | 16                   | 0                        |

**Description:** Sets the evaluation technique for the "central measuring probe evaluation" function.

**Value:**  
0: Measurement with handshake  
1: Measurement without handshake 2 edges  
16: Measurement without handshake more than 2 edges

**Notice:** For p0684 = 16:  
This evaluation procedure is only activated after parameter save and POWER ON.

## 2 Parameters

### 2.2 List of parameters

**Note:** During measurement without a handshake, the probe may have a higher evaluation frequency.  
 The setting "Measurement without handshake" must be supported by the higher-level control. This setting cannot be used for SIMOTION D with integrated SINAMICS or with CX32.

For p0684 = 0:  
 Changing this evaluation procedure to p0684 = 1 is possible in the RUN state.  
 Changing this evaluation procedure to p0684 = 16 is only activated after parameter save and POWER ON.  
 Permissible combinations in p0922 are:  
 p0922 = 391, 392, 393, 394

For p0684 = 1:  
 Changing this evaluation procedure to p0684 = 0 is possible in the RUN state.  
 Changing this evaluation procedure to p0684 = 16 is only activated after parameter save and POWER ON.  
 Permissible combinations in p0922 are:  
 p0922 = 391, 392, 393, 394

For p0684 = 16:  
 Changing this evaluation procedure to p0684 = 0 or to p0684 = 1 is only activated after parameter save and POWER ON.  
 Permissible combinations in p0922 are:  
 p0922 = 395

**Description:** Sets the correction factor for the calculated excitation current setpoint of the reverse field exciter for reverse field excitation.

**Dependency:** Refer to: p0311, p0390, p0690, p0699

Refer to: A49205

**Note:** The correction factor specifies the ratio between the rated excitation current and the rated current of the exciter (p0690). The rated excitation current is the current that flows at the rated operating point of the main machine as stamped on the rating plate.

## 2 Parameters

### 2.2 List of parameters

**Dependency:** Refer to: r8571

**Notice:** No errors were issued during quick commissioning (p3900 = 1) when writing to parameters of the QUICK\_IBN group! When executing a specific macro, the corresponding programmed settings are made and become active.

**Note:** The macros in the specified directory are displayed in r8571. r8571 is not in the expert list of the commissioning tool. Macros available as standard are described in the technical documentation of the particular product.

## 2 Parameters

### 2.2 List of parameters

| Bit field: | Bit | Signal name         | 1 signal | 0 signal | FP |
|------------|-----|---------------------|----------|----------|----|
|            | 00  | Cam_0 output signal | High     | Low      | -  |
|            | 01  | Cam_1 output signal | High     | Low      | -  |
|            | 02  | Cam_2 output signal | High     | Low      | -  |
|            | 03  | Cam_3 output signal | High     | Low      | -  |
|            | 04  | Cam_4 output signal | High     | Low      | -  |
|            | 05  | Cam_5 output signal | High     | Low      | -  |
|            | 06  | Cam_6 output signal | High     | Low      | -  |
|            | 07  | Cam_7 output signal | High     | Low      | -  |

**Note:** The cam sequencer is only calculated if the output-side binector (r0716) is interconnected.

#### r0721

#### CU digital inputs terminal actual value / CU DI term ActV

|   |                              |                      |   |
|---|------------------------------|----------------------|---|
| CU_I, CU_S120_PN,<br>CU_S150_PN,<br>CU_S120_DP,<br>CU_S150_DP | <b>Can be changed:</b> -     | <b>Calculated:</b> - | <b>Access level:</b> 2  |
|   | <b>Data type:</b> Unsigned32 | <b>Dyn. index:</b> - | <b>Func. diagram:</b> 2119, 2120,<br>2121, 2130, 2131, 2132, 2133 |
|   | <b>P-Group:</b> Commands     | <b>Unit group:</b> - | <b>Unit selection:</b> -  |
|   | <b>Not for motor type:</b> - | <b>Scaling:</b> -    | <b>Expert list:</b> 1   |
|   | <b>Min</b>                   | <b>Max</b>           | <b>Factory setting</b>  |
|   | -                            | -                    | -   |

**Description:** Displays the actual value at the digital inputs.

This means that the actual input signal can be checked at terminal DI x or DI/DO x prior to switching from the simulation mode (p0795.x = 1) to terminal mode (p0795.x = 0).

| Bit field: | Bit | Signal name                | 1 signal | 0 signal | FP |
|------------|-----|----------------------------|----------|----------|----|
|            | 00  | DI 0 (X122.1/X121.1)       | High     | Low      | -  |
|            | 01  | DI 1 (X122.2/X121.2)       | High     | Low      | -  |

|   | -                            | -                    | -  |

**Description:** Display and BICO output for the inverted status of the digital inputs.

| Bit field: | Bit | Signal name          | 1 signal | 0 signal | FP |
|------------|-----|----------------------|----------|----------|----|
|            | 00  | DI 0 (X122.1/X121.1) | High     | Low      | -  |
|            | 01  | DI 1 (X122.2/X121.2) | High     | Low      | -  |
|            | 02  | DI 2 (X122.3/X121.3) | High     | Low      | -  |

|    |                            |      |     |   |
|----|----------------------------|------|-----|---|
| 03 | DI 3 (X122.4/X121.4)       | High | Low | - |
| 08 | DI/DO 8 (X122.9/X121.7)    | High | Low | - |
| 09 | DI/DO 9 (X122.10/X121.8)   | High | Low | - |
| 10 | DI/DO 10 (X122.12/X121.10) | High | Low | - |
| 11 | DI/DO 11 (X122.13/X121.11) | High | Low | - |
| 12 | DI/DO 12 (X132.9/X131.1)   | High | Low | - |
| 13 | DI/DO 13 (X132.10/X131.2)  | High | Low | - |
| 14 | DI/DO 14 (X132.12/X131.4)  | High | Low | - |
| 15 | DI/DO 15 (X132.13/X131.5)  | High | Low | - |
| 16 | DI 16 (X122.5/X120.3)      | High | Low | - |
| 17 | DI 17 (X122.6/X120.4)      | High | Low | - |
| 18 | DI 18 (- / X120.6)         | High | Low | - |
| 19 | DI 19 (- / X120.7)         | High | Low | - |
| 20 | DI 20 (X132.5/X120.9)      | High | Low | - |
| 21 | DI 21 (X132.6/X120.10)     | High | Low | - |
| 22 | DI 22 (- / X130.1)         | High | Low | - |

**Dependency:** Refer to: r0722

**Notice:** Regarding the terminal designation:  
The first designation is valid for CU320-2, the second for CU310-2.

**Note:** DI: Digital Input  
DI/DO: Bidirectional Digital Input/Output

|   | -   | -                    | -   |

**Description:** Displays the access authority at the digital outputs.

Bit = 1:

The control has access authority to the digital output via PROFIBUS or direct access.

Bit = 0:

The drive has access authority to the digital output or the digital input/output is not set as digital output or is not available.

| Bit field: | Bit | Signal name                | 1 signal | 0 signal | FP |
|------------|-----|----------------------------|----------|----------|----|
|            | 08  | DI/DO 8 (X122.9/X121.7)    | High     | Low      | -  |

|   | <b>Not for motor type:</b> -             | <b>Scaling:</b> -    | <b>Expert list:</b> 1      |
|   | <b>Min</b>                               | <b>Max</b>           | <b>Factory setting</b>     |
|   | 0  | 5                    | 4                          |

**Description:** Sets the type of analog inputs of the CU310-2.

p0756[x] = 0, 4 corresponds to a voltage input (r0752, p0757, p0759 are displayed in V).

p0756[x] = 2, 3, 5 corresponds to a current input (r0752, p0757, p0759 are displayed in mA).

In addition, the associated DIP switch S1200 must be set.

For a voltage input, S1200.1 must be switched to setting "BL".

For a current input, S1200.1 must be switched to the "ON" setting (load resistor = 250 Ohm is switched in).

**Value:**

- 0: Unipolar voltage input (0 V ... +10 V)
- 2: Unipolar current input (0 mA ... +20 mA)
- 3: Unipolar current input monitored (+4 mA to +20 mA)
- 4: Bipolar voltage input (-10 V ... +10 V)
- 5: Bipolar current input (-20 mA to +20 mA)

**Index:** [0] = AI0 (X131.7, 8)

**Warning:** The maximum voltage difference between analog input terminals AI+, AI-, and the ground must not exceed 35 V (X131.3, X131.6).

For operation with the load resistor switched in, the voltage between the differential inputs AI+ and AI- may not exceed 12.50 V or the impressed current of 60 mA; if this is not carefully observed, the input will be damaged.

**Notice:** For use as voltage input, DIP switch S1200 must be set to 0 for the input involved (0).

DIP switch S1200 is located on the front panel, below the BOP cover.

## 2 Parameters

### 2.2 List of parameters

**Note:** When changing p0756, the parameters of the scaling characteristic (p0757, p0758, p0759, p0760) are overwritten with the following default values:  
For p0756 = 0, 4, p0757 is set to 0.0 V, p0758 = 0.0 %, p0759 = 10.0 V and p0760 = 100.0 %.  
For p0756 = 2, 5, p0757 is set to 0.0 mA, p0758 = 0.0 %, p0759 = 20.0 mA and p0760 = 100.0 %.  
For p0756 = 3, p0757 is set to 4.0 mA, p0758 = 0.0 %, p0759 = 20.0 mA and p0760 = 100.0 %.

**Description:** Sets the scaling characteristic for the analog input of the CU310-2.  
The scaling characteristic for the analog input is defined using 2 points.  
This parameter specifies the x coordinate (input voltage in V or input current in mA) of the 1st value pair of the characteristic.

**Index:** [0] = AI0 (X131.7, 8)

**Dependency:** The unit of this parameter (V or mA) depends on the analog input type.  
Refer to: p0756

**Notice:** This parameter is automatically overwritten when the analog input type (p756) is modified.

**Note:** The parameters for the characteristic do not have a limiting effect.

**Description:** Sets the scaling characteristic for the analog input of the CU310-2.  
The scaling characteristic for the analog inputs is defined using 2 points.  
This parameter specifies the y coordinate (percentage) of the 1st value pair of the characteristic.

**Index:** [0] = AI0 (X131.7, 8)

**Notice:** This parameter is automatically overwritten when the analog input type (p756) is modified.

**Note:** The parameters for the characteristic do not have a limiting effect.

---

**Description:** Sets the scaling characteristic for the analog input of the CU310-2.  
The scaling characteristic for the analog inputs is defined using 2 points.  
This parameter specifies the x coordinate (input voltage in V or input current in mA) of the 2nd value pair of the characteristic.

**Index:** [0] = AI0 (X131.7, 8)

**Dependency:** The unit of this parameter (V or mA) depends on the analog input type.  
Refer to: p0756

**Notice:** This parameter is automatically overwritten when the analog input type (p0756) is modified.

**Note:** The parameters for the characteristic do not have a limiting effect.

**Dependency:** The simulation of a digital input is selected using p0795.  
Refer to: p0795

**Notice:** Regarding the terminal designation:  
The first designation is valid for CU320-2, the second for CU310-2.

**Note:** This parameter is not saved when data is backed-up (p0971, p0977).  
DI: Digital Input  
DI/DO: Bidirectional Digital Input/Output

## 2 Parameters

### 2.2 List of parameters

**Dependency:** Refer to: p0826, r0830  
**Note:** A motor is only changed over (a new motor selected) after the pulses have been suppressed.  
 When the motor data sets are changed over, the following applies:  
 Bit numbers that are not identical, signify that the motor must be changed over.

---

**p0828[0...n]**      **BI: Motor changeover feedback signal / Mot\_chgov fdbk sig**

|   |                                       |                               |                            |

|   | -                                     | -                             | 0                          |

**Description:** Sets the signal source for the feedback signal when changing over the motor.  
 For p0833.0 = 1 the following applies:  
 This feedback signal (0/1 edge) is required after a motor changeover to enable the pulses.

**Dependency:** Refer to: p0833  
**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

0000 bin

**Description:**

Sets the configuration for the motor and encoder changeover.

**Bit field:**

| Bit | Signal name                                     | 1 signal    | 0 signal | FP |
|-----|---|-------------|----------|----|
| 00  | Contactor changeover from the application/drive | Application | Drive    | -  |
| 01  | Pulse suppression by application/drive          | Application | Drive    | -  |
| 02  | Suppress drive parking for EDS changeover       | Yes         | No       | -  |

**Note:**

For bit 00:

When the bit is set and the motor has to be changed over, then p0827 must be set differently in the appropriate motor data sets.

For bit 02:

The bit defines whether, for an EDS changeover, the status signal Gn\_ZSW.14 is suppressed (parking encoder active).

#### p0833

#### Data set changeover configuration / DS\_chgov config

**Description:**

Sets the configuration for the motor and encoder changeover.

**Bit field:**

| Bit | Signal name                                     | 1 signal    | 0 signal | FP |
|-----|---|-------------|----------|----|
| 00  | Contactor changeover from the application/drive | Application | Drive    | -  |
| 01  | Pulse suppression by application/drive          | Application | Drive    | -  |
| 02  | Suppress drive parking for EDS changeover       | Yes         | No       | -  |

**Note:**

For bit 00:

When the bit is set and the motor has to be changed over, then p0827 must be set differently in the appropriate motor data sets.

For bit 02:

The bit defines whether, for an EDS changeover, the status signal Gn\_ZSW.14 is suppressed (parking encoder active).

For motor changeover to running motor:

The "flying restart" function should also be activated (p1200) when changing over to a motor that is already running.

| <b>Description:</b>   | Sets the delay time for the contactor control for the motor changeover.   |   |  |
| <b>Note:</b>  | The delay time is taken into account in the following cases:<br>- for feedback signal, previous contactor "Open". The new motor contactor is controlled (energized) after the delay time has expired.<br>- for the feedback signal, new motor contactor "Closed". The pulses are enabled after the delay time has expired.  |   |  |
| <b>p0840[0...n]</b>   | <b>BI: ON / OFF (OFF1) / ON / OFF (OFF1)</b>  |   |  |
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC        | <b>Can be changed:</b> T<br><b>Data type:</b> Unsigned32 / Binary<br><b>P-Group:</b> Commands<br><b>Not for motor type:</b> -<br><b>Min</b><br>-  | <b>Calculated:</b> -<br><b>Dyn. index:</b> CDS, p0170<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- | <b>Access level:</b> 3<br><b>Func. diagram:</b> 2501<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0   |
| <b>Description:</b>   | Sets the signal source for the command "ON/OFF (OFF1)".<br>For the PROFIdrive profile, this command corresponds to control word 1 bit 0 (STW1.0).   |   |  |
| <b>Recommendation:</b>  | When the setting for this binector input is changed, the motor can only be switched on by means of an appropriate signal change of the source.  |   |  |
| <b>Dependency:</b>  | Refer to: p1055, p1056  |   |  |
| <b>Caution:</b>   | When "master control from PC" is activated, this binector input is ineffective.   |   |  |
|  |   |   |  |
| <b>Notice:</b>  | For binector input p0840 = 0 signal, the motor can be moved, jogging using binector input p1055 or p1056.<br>The command "ON/OFF (OFF1)" can be issued using binector input p0840 or p1055/p1056.<br>For binector input p0840 = 0 signal, the switching on inhibited is acknowledged.<br>Only the signal source that originally switched on can also switch off again.<br>The parameter may be protected as a result of p0922 or p2079 and cannot be changed. |   |  |

## 2 Parameters

### 2.2 List of parameters

**Note:** For drives with closed-loop speed control (p1300 = 20, 21), the following applies:  
 - BI: p0840 = 0 signal: OFF1 (braking with the ramp-function generator, then pulse suppression)  
 For drives with closed-loop torque control (p1300 = 22, 23), the following applies:  
 - BI: p0840 = 0 signal: immediate pulse suppression  
 For drives with closed-loop torque control (activated using p1501), the following applies:  
 - BI: p0840 = 0 signal: No dedicated braking response, but pulse cancelation when standstill is detected (p1226, p1227)  
 For drives with closed-loop speed/torque control, the following applies:  
 - BI: p0840 = 0/1 signal: ON (pulses can be enabled)  
 r0863.1 of a drive can also be selected as signal source.

|   | -   | -                    | 0                          |
| <b>Description:</b>   | Sets the signal source for the command "ON/OFF (OFF1)".<br>For the PROFIdrive profile, this command corresponds to control word 1 bit 0 (STW1.0). |                      |                            |
| <b>Recommendation:</b>  | When the setting for this binector input is changed, the motor can only be switched on by means of an appropriate signal change of the source.    |                      |                            |
| <b>Dependency:</b>  | Refer to: p1055, p1056  |                      |                            |
| <b>Caution:</b>   | When "master control from PC" is activated, this binector input is ineffective.   |                      |                            |
|  |   |                      |                            |

- Notice:** Only the signal source that originally switched on can also switch off again.  
The parameter may be protected as a result of p0922 or p2079 and cannot be changed.
- Note:** BI: p0840 = 0 signal: OFF1 (pulse suppression and switching on inhibited)  
BI: p0840 = 0/1 signal: ON (pulses can be enabled)  
This parameter has no function in the "SINAMICS" (p4400 = 1) operating mode.

| p0844[0...n]   | BI: No coast-down / coast-down (OFF2) signal source 1 / OFF2 s_s 1 |                               |   |
|--|--|-------------------------------|---|
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC | <b>Can be changed:</b> T   | <b>Calculated:</b> -          | <b>Access level:</b> 3                          |
|  | <b>Data type:</b> Unsigned32 / Binary                              | <b>Dyn. index:</b> CDS, p0170 | <b>Func. diagram:</b> 2501, 8720,<br>8820, 8920 |
|  | <b>P-Group:</b> Commands   | <b>Unit group:</b> -          | <b>Unit selection:</b> -                        |
|  | <b>Not for motor type:</b> -                                       | <b>Scaling:</b> -             | <b>Expert list:</b> 1                           |
|  | <b>Min</b>   | <b>Max</b>                    | <b>Factory setting</b>                          |
|  | -  | -                             | 1   |

- Description:** Sets the first signal source for the command "No coast down/coast down (OFF2)".  
The following signals are AND'ed:  
- BI: p0844 "No coast-down / coast-down (OFF2) signal source 1"  
- BI: p0845 "No coast-down / coast-down (OFF2) signal source 2"  
For the PROFIdrive profile, the result of the AND logic operation corresponds to control word 1 bit 1 (STW1.1).  
BI: p0844 = 0 signal or BI: p0845 = 0 signal  
- OFF2 (immediate pulse suppression and switching on inhibited)  
BI: p0844 = 1 signal and BI: p0845 = 1 signal  
- no OFF2 (enable is possible)

**Caution:** When "master control from PC" is activated, this binector input is ineffective.

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

| p0844[0...n]                  | BI: No coast-down / coast-down (OFF2) signal source 1 / OFF2 s_s 1 |                               |   |

|                               | <b>Data type:</b> Unsigned32 / Binary                              | <b>Dyn. index:</b> CDS, p0170 | <b>Func. diagram:</b> 8720, 8820,<br>8920 |
|                               | <b>P-Group:</b> Commands   | <b>Unit group:</b> -          | <b>Unit selection:</b> -                  |
|                               | <b>Not for motor type:</b> -                                       | <b>Scaling:</b> -             | <b>Expert list:</b> 1                     |
|                               | <b>Min</b>   | <b>Max</b>                    | <b>Factory setting</b>                    |
|                               | -  | -                             | 1   |

- Description:** Sets the first signal source for the command to instantaneously switch off the drive.  
This corresponds to command "No coast down/coast down (OFF2)" for drives.  
The following signals are AND'ed:  
- BI: p0844 "No coast-down / coast-down (OFF2) signal source 1"  
- BI: p0845 "No coast-down / coast-down (OFF2) signal source 2"  
For the PROFIdrive profile, the result of the AND logic operation corresponds to control word 1 bit 1 (STW1.1).  
BI: p0844 = 0 signal or BI: p0845 = 0 signal  
- OFF2 (immediate pulse suppression and switching on inhibited)  
BI: p0844 = 1 signal and BI: p0845 = 1 signal  
- no OFF2 (enable is possible)

**Caution:** When "master control from PC" is activated, this binector input is ineffective.

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:** For binector input p0844 = 0 signal or p0845 = 0 signal, the following applies:  
- precharging contactor/line contactor is additionally opened.

**Description:** Sets the second signal source for the command to instantaneously switch off the drive. This corresponds to command "No coast down/coast down (OFF2)" for drives. The following signals are AND'ed:

- BI: p0844 "No coast-down / coast-down (OFF2) signal source 1"
- BI: p0845 "No coast-down / coast-down (OFF2) signal source 2"

For the PROFIdrive profile, the result of the AND logic operation corresponds to control word 1 bit 1 (STW1.1).

BI: p0844 = 0 signal or BI: p0845 = 0 signal

- OFF2 (immediate pulse suppression and switching on inhibited)

BI: p0844 = 1 signal and BI: p0845 = 1 signal

- no OFF2 (enable is possible)

**Caution:** When "master control from PC" is activated, this binector input is effective.

**Note:** For binector input p0844 = 0 signal or p0845 = 0 signal, the following applies:  
- precharging contactor/line contactor is additionally opened.

| <b>p0848[0...n]</b>  | <b>BI: No Quick Stop / Quick Stop (OFF3) signal source 1 / OFF3 s_s 1</b> |                               |                            |
|--|---|-------------------------------|----------------------------|
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC | <b>Can be changed:</b> T  | <b>Calculated:</b> -          | <b>Access level:</b> 3     |
|  | <b>Data type:</b> Unsigned32 / Binary                                     | <b>Dyn. index:</b> CDS, p0170 | <b>Func. diagram:</b> 2501 |
|  | <b>P-Group:</b> Commands  | <b>Unit group:</b> -          | <b>Unit selection:</b> -   |

|  | <b>Min</b>  | <b>Max</b>                    | <b>Factory setting</b>     |
|  | -   | -                             | 1                          |

**Description:** Sets the first signal source for the command "No quick stop/quick stop (OFF3)". The following signals are AND'ed:

- BI: p0848 "No quick stop / quick stop (OFF3) signal source 1"
- BI: p0849 "No quick stop / quick stop (OFF3) signal source 2"

For the PROFIdrive profile, the result of the AND logic operation corresponds to control word 1 bit 2 (STW1.2).

BI: p0848 = 0 signal or BI: p0849 = 0 signal

- OFF3 (braking along the OFF3 ramp (p1135), then pulse suppression and switching on inhibited)

BI: p0848 = 1 signal and BI: p0849 = 1 signal

- no OFF3 (enable is possible)

**Caution:** When "master control from PC" is activated, this binector input is ineffective.

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:** For drives with closed-loop torque control (activated using p1501), the following applies:  
BI: p0848 = 0 signal:  
- no dedicated braking response, but pulse suppression when standstill is detected (p1226, p1227).

|              |   |                      |                            |

BI: p0852 = 0 signal  
Inhibit operation (suppress pulses).  
BI: p0852 = 1 signal  
Enable operation (pulses can be enabled).

**Caution:** When "master control from PC" is activated, this binector input is ineffective.

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:** This parameter has no function in the "SINAMICS" (p4400 = 1) operating mode.

|  |  |   |   |
|--|--|---|---|
| <b>p0854[0...n]</b>  | <b>BI: Control by PLC/no control by PLC / Master ctrl by PLC</b>   |   |   |
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC,<br>A_INF, S_INF, R_INF,<br>B_INF | <b>Can be changed:</b> T<br><b>Data type:</b> Unsigned32 / Binary<br><b>P-Group:</b> Commands<br><b>Not for motor type:</b> -<br><b>Min</b><br>- | <b>Calculated:</b> -<br><b>Dyn. index:</b> CDS, p0170<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- | <b>Access level:</b> 3<br><b>Func. diagram:</b> 2501, 8720,<br>8820, 8920<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>1 |

**Description:** Sets the signal source for the command "control by PLC/no control by PLC".  
For the PROFIdrive profile, this command corresponds to control word 1 bit 10 (STW1.10).  
BI: p0854 = 0 signal  
No control by PLC  
BI: p0854 = 1 signal  
Master control by PLC.

**Caution:** When "master control from PC" is activated, this binector input is ineffective.

## 2 Parameters

### 2.2 List of parameters

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:** This bit is used to initiate a response for the drives when the control fails (F07220). If there is no control available, then binector input p0854 should be set to 1.  
If a control is available, then STW1.10 must be set to 1 (PZD1) so that the received data is updated. This applies regardless of the setting in p0854 and even in the case of free telegram configuration (p0922 = 999).

---

|              | <b>P-Group:</b> Commands   | <b>Unit group:</b> - | <b>Unit selection:</b> -         |
|              | <b>Not for motor type:</b> -                                     | <b>Scaling:</b> -    | <b>Expert list:</b> 1            |
|              | <b>Min</b>   | <b>Max</b>           | <b>Factory setting</b>           |
|              | -  | -                    | 1                                |

**Description:** Sets the signal source for the command "control by PLC/no control by PLC".  
For the PROFIdrive profile, this command corresponds to control word 1 bit 10 (STW1.10).  
BI: p0854 = 0 signal  
No control by PLC  
BI: p0854 = 1 signal  
Master control by PLC.

**Dependency:**

Refer to: p1155

**Caution:**

When "master control from PC" is activated, this binector input is ineffective.

**Notice:**

The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:**

For the TM41, a response can be initiated using this bit if the control fails.

The parameter is only effective in the "SIMOTION" operating mode (p4400 = 0).

In the "SINAMICS" operating mode, the setpoints at connector input p4420 are evaluated independently of p0854.

Further, the setting of p2037 should be observed.

|--|--|---|---|
| <b>p0857</b>   | <b>Power unit monitoring time / PU t_mon</b>   |   |   |
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC,<br>A_INF, S_INF, R_INF,<br>B_INF | <b>Can be changed:</b> T<br><b>Data type:</b> FloatingPoint32<br><br><b>P-Group:</b> Commands<br><b>Not for motor type:</b> -<br><b>Min</b><br>100.0 [ms]  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>60000.0 [ms] | <b>Access level:</b> 2<br><b>Func. diagram:</b> 8760, 8864,<br>8964<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>6000.0 [ms] |
| <b>Description:</b>  | Sets the monitoring time for the power unit.<br>The following applies for infeeds and drives:<br>The monitoring time is started after an 0/1 edge of the ON/OFF1 command. If the power unit does not return a READY signal within the monitoring time, then fault F06000 (infeeds) or F07802 (drives) is output.<br>For drives, the following also applies:<br>After the pulse enable (operation enabled, p0852), the monitoring time is re-started. If the infeed does not signal ready to the drive within the monitoring time (using binector input p0864 of the drive), fault F07840 is initiated. |   |   |
| <b>Dependency:</b>   | Refer to: F06000, F07802, F07840, F30027   |   |   |
| <b>Notice:</b>   | The maximum time to precharge the DC link is monitored in the power unit and cannot be changed. The maximum duration of the precharging depends on the power class and the power unit design.<br>The monitoring time for the precharging is started after the ON command (BI: p0840 = 0/1 signal). Fault F30027 is output when the maximum precharging duration is exceeded.   |   |   |
| <b>Note:</b>   | The factory setting for p0857 depends on the power class and the design of the power unit.<br>The monitoring time for the ready signal of the power unit includes the time to precharge the DC link and, if relevant, the de-bounce time of the contactors.<br>If an excessively low value is entered into p0857, then after enable, this results in the corresponding fault.  |   |   |
| <b>p0858[0...n]</b>  | <b>BI: Unconditionally close holding brake / Uncond close brake</b>  |   |   |
| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC  | <b>Can be changed:</b> T<br><b>Data type:</b> Unsigned32 / Binary<br><br><b>P-Group:</b> Commands<br><b>Not for motor type:</b> -<br><b>Min</b><br>-   | <b>Calculated:</b> -<br><b>Dyn. index:</b> CDS, p0170<br><br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>-   | <b>Access level:</b> 2<br><b>Func. diagram:</b> 2501, 2701,<br>2707<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>10251.13    |
| <b>Description:</b>  | Sets the signal source for the command "unconditionally close holding brake".  |   |   |
| <b>Dependency:</b>   | Refer to: p0855  |   |   |
| <b>Note:</b>   | The signal via binector input p0858 "Unconditionally close holding brake" has a higher priority than via binector input p0855 "Unconditionally open holding brake".<br>For a 1 signal via binector input p0858, the command "unconditionally close the holding brake" is executed and internally a zero setpoint is entered.   |   |   |
| <b>p0860</b>   | <b>BI: Line contactor feedback signal / Line contact fdbk</b>  |   |   |
| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC,<br>A_INF, S_INF, R_INF,<br>B_INF      | <b>Can be changed:</b> T<br><b>Data type:</b> Unsigned32 / Binary<br><br><b>P-Group:</b> Commands<br><b>Not for motor type:</b> -<br><b>Min</b><br>-   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>-            | <b>Access level:</b> 3<br><b>Func. diagram:</b> 2634, 8734,<br>8834, 8934<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>863.1 |
| <b>Description:</b>  | Sets the signal source for the feedback signal from the line contactor.  |   |   |
| <b>Recommendation:</b>   | When the monitoring is activated (BI: p0860 not equal to r0863.1), then to control the line contactor, signal BO: r0863.1 of its own drive object should be used.  |   |   |
| <b>Dependency:</b>   | Refer to: p0861, r0863<br>Refer to: F07300   |   |   |

- Notice:** The line contactor monitoring is deactivated if the control signal of the particular drive object is set as the signal source for the feedback signal of the line contactor (BI: p0860 = r0863.1).
- Note:** The state of the line contactor is monitored depending on signal BO: r0863.1.  
When the monitoring is activated (BI: p0860 not equal to r0863.1), fault F07300 is then also output if the contactor is closed before it is controlled using r0863.1.

## 2 Parameters

### 2.2 List of parameters

**Recommendation:** When operating a drive connected to SINUMERIK, which only closes the main contactor with the OFF1 command (blocksize, chassis), p0867 should be set as a minimum to 50 ms.

**Dependency:** Refer to: p0869

**Note:** For p0869 = 1 (keep main contactor closed for STO), after withdrawing STO, the switching on inhibited must be acknowledged via the signal source of p0840 = 0 (OFF1) – and before the main contactor holding time expires, should go back to 1, otherwise the main contactor will open.

| p0868   | Power unit debounce time/wait time / PU t_debnc/t_wait |                      |                          |
|---|--|----------------------|--------------------------|
| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC | <b>Can be changed:</b> T                               | <b>Calculated:</b> - | <b>Access level:</b> 3   |

|   | 0 [ms]   | 65000 [ms]           | 65000 [ms]               |

**Description:** Sets the debounce time or wait time for the power unit.  
The following applies for "Chassis" format Motor Modules:  
- sets the debounce time for the DC circuit breaker.  
The following applies for "Chassis" format AC/AC converters:  
- sets the wait time for the thyristor rectifier.

**Note:** The following applies if p0868 = 65000 ms:  
The debounce time defined internally in the power unit's EEPROM is implemented.

| p0869   | Sequence control configuration / Seq_ctrl config |                      |                          |

|   | -  | -                    | 0000 bin                 |

**Description:** Sets the configuration for the sequence control.

| Bit field: | Bit | Signal name                        | 1 signal | 0 signal | FP |
|------------|-----|------------------------------------|----------|----------|----|
|            | 00  | Keep main contactor closed for STO | Yes      | No       | -  |

**Dependency:** Refer to: p0867

**Note:** STO: Safe Torque Off

For bit 00:

After withdrawing the OFF1 enable (signal source of p0840), the main contactor is opened after the main contactor holding time has elapsed.

For p0869.0 = 1, after withdrawing STO, the switching on inhibited must be acknowledged via the signal source of p0840 = 0 (OFF1) – and before the main contactor holding time expires (p0867), should go back to 1, otherwise the main contactor will open.

**Description:** Sets the configuration for the sequence control.

| Bit field: | Bit | Signal name   | 1 signal | 0 signal | FP                     |
|------------|-----|---|----------|----------|------------------------|
|            | 01  | Wait for the feedback signal from the external main contactor | Yes      | No       | 8732,<br>8832,<br>8932 |

- Notice:** For chassis units, the following applies:  
Setting p0869.1 = 1 is not permissible, if, using p0860 the internal circuit breaker is monitored (this is not controlled with r0863.1).
- Note:** For bit 01:
