| <b>Dependency:</b>             | Refer to: p0325, p0329, p0431, p1980, p1981, p1982, p1983, r1984, r1985, r1986, r1987, p1999<br>Refer to: A07971  |                      |                          |
| <b>Danger:</b>                 | For recommendation 3:<br> When performing this measurement there is a danger of coming into contact with system parts that are at a high (hazardous) electrical voltage.<br>This measurement may only be performed by authorized service personnel.  |                      |                          |
| <b>Warning:</b>                |  The motor can move in an uncontrolled fashion.<br>To determine the angular commutation offset, pulses must be immediately enabled after p1990 = 1. For commutation with a zero mark - or with distance-coded zero marks - the drive must also be traversed over the zero mark or over two zero marks. If a POWER ON is carried out before activating the pulse enable and where relevant before passing the zero mark, then after powering up p1990 = 0, and the commutation angle is not determined. |                      |                          |

**Notice:** When the pulses are enabled, the function is immediately executed with p1990 = 1; otherwise, the next time that the pulses are enabled.

In order to prevent an incorrect orientation of the electrical pole position (uncontrolled motor movement), the automatically determined angular commutation offset (p0431) should, for reasons of safety, be checked using one of the following recommendations:

Recommendation 1:

Set encoderless operation (p1300 = 20 or p1404 = 0), deselect pole position identification (p1982 = 0), operate under no-load conditions with a speed > p1755, correct the actual value inversion (p0410.0) (e.g. r0061 = r0063), read the angular error in r1778; the result in r1778 should be approximately 0, for  $|r1778| > 2$  degrees, add the value to p0431 - taking into account the sign - and enter in p0431.

Recommendation 2:

Set current limit to 0 (p0640 = 0), activate travel to fixed stop (p1545 = 1); record r0089[0] (phase voltage) and r0093 (pole position, electrically scaled), (e.g. trace) while the motor is being externally moved.

When doing this, the rising zero crossing of the phase voltage must coincide with the step 360 ° --> 0 ° from r0093.

Recommendation 3:

Measure phase voltage U (measure phase U with respect to a virtual neutral point created using 3 resistors) and r0093 (pole position, electrically scaled).

When doing this, the rising zero crossing of the phase voltage must coincide with the step 360 ° --> 0 ° from r0093.

Recommendation 4:

Determine the average value from several results of a pole position identification routine executed as test (p1983) at various electrical angles and add the value to p0431 - taking into account the sign and enter into p0431.

**Note:** If fault F07414 is present, the following applies:

First set p1990 to 1, then acknowledge the fault and then issue the enable signals.

| <b>Min</b>                           | <b>Max</b>           | <b>Factory setting</b>   |
| 0                                    | 3                    | 0                        |

**Description:** This function is only required for synchronous motors and can be started when commissioning for the first time or after replacing an encoder.

The function acts on the active motor data set.

Alarm A07971 is output while the angular commutation offset is being determined.

p1990 is automatically set to 0 after the angular commutation offset has been determined.

For p1990 = 1 (encoder adjustment with transfer), the following applies:

The angular commutation offset is determined and transferred into p0431.

For p1990 = 2 (encoder adjustment for checking), the following applies:

The angular commutation offset is determined and is not transferred into p0431. For a deviation of more than 6 ° electrical, fault F07413 is output.

For p1990 = 3 (encoder adjustment in operation), the following applies:

PolID procedure runs before the zero mark detection. The angular commutation offset is determined and transferred into p0431. A fine adjustment (p1905) is then optionally possible.

**Value:**  
0: Deactivated  
1: Activated with transfer  
2: Activated for checking  
3: Activates encoder adjustment in operation

**Dependency:** In the simulation mode, the parameter cannot be written into.  
When selecting the encoder adjustment, the changeover of the drive data sets is suppressed.  
Encoder adjustment is only carried out if the function module for "speed/torque control" is activated (r0108.2 = 1).  
Refer to: p0325, p0329, p0431, p1272, p1900

**Caution:** When the encoder is being adjusted, the motor must be operated without a load - and if a motor holding brake is being used, this must be opened.

| <b>Note:</b>  | RESM: reluctance synchronous motor (synchronous reluctance motor)   |                                 |                          |
| <b>p1999[0...n]</b>   | <b>Ang. commutation offset calibr. and PolID scaling / Com_ang_offs scal</b>  |                                 |                          |
| VECTOR (n/M),<br>VECTOR_AC (n/M),<br>VECTOR_I_AC (n/M)                              | <b>Can be changed:</b> U, T   | <b>Calculated:</b> -            | <b>Access level:</b> 3   |
|   | <b>Data type:</b> FloatingPoint32   | <b>Dyn. index:</b> MDS, p0130   | <b>Func. diagram:</b> -  |
|   | <b>P-Group:</b> Closed-loop control   | <b>Unit group:</b> -            | <b>Unit selection:</b> - |
|   | <b>Not for motor type:</b> ASM, REL   | <b>Scaling:</b> -               | <b>Expert list:</b> 1    |
|   | <b>Min</b>  | <b>Max</b>                      | <b>Factory setting</b>   |
|   | 10 [%]  | 5000 [%]                        | 100 [%]                  |
| <b>Description:</b>   | Sets the scaling for the runtime of the automatic encoder calibration and of the pole position identification technique in which the current is injected.   |                                 |                          |
| <b>Dependency:</b>  | Refer to: p0341, p0342  |                                 |                          |
| <b>Caution:</b>   | For p1999 > 100 % (setting large moments of inertia) the following applies:<br>There is no locked rotor monitoring (F07970 fault value 2).<br>The plausibility check of the encoder signal (F07970 fault value 4) only checks the sign.   |                                 |                          |
|  |   |                                 |                          |
| <b>Note:</b>  | For high moments of inertia, it is practical to scale the runtime of the calibration higher.  |                                 |                          |

| <b>Dependency:</b>   | Refer to: p2001, p2002, p2003, r2004  |                      |                          |

**Note:** For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1.

If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.

Example 1:

The signal of an analog input (e.g. r4055[0]) is connected to a speed setpoint (e.g. p1070[0]). The actual percentage input value is cyclically converted into the absolute speed setpoint using the reference speed (p2000).

Example 2:

The setpoint from PROFIBUS (r2050[1]) is connected to a speed setpoint (e.g. p1070[0]). The actual input value is cyclically converted into a percentage value via the pre-specified scaling 4000 hex. This percentage value is converted to the absolute speed setpoint via reference speed (p2000).

## 2 Parameters

### 2.2 List of parameters

|   |  |  |   |
|---|--|--|---|
| <b>p2001</b>  | <b>Reference voltage / Reference voltage</b>   |  |   |
| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC,<br>A_INF, S_INF, R_INF,<br>B_INF, TM41 | <b>Can be changed:</b> T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Communications<br><b>Not for motor type:</b> -<br><b>Min</b><br>10 [Vrms]   | <b>Calculated:</b> CALC_MOD_ALL<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>100000 [Vrms]    | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>1000 [Vrms]   |
| <b>Description:</b>   | Sets the reference quantity for voltages.<br>All voltages specified as relative value are referred to this reference quantity. This also applies for direct voltage values (= rms value) like the DC link voltage.<br>The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).<br>Note:<br>This reference quantity also applies to direct voltage values. It is not interpreted as rms value, but as DC voltage value.  |  |   |
| <b>Note:</b>  | For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1.<br>If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.<br>For infeed units, the parameterized device supply voltage (p0210) is pre-assigned as the reference quantity.<br>Example:<br>The actual value of the DC link voltage (r0070) is connected to a test socket (e.g. p0771[0]). The actual voltage value is cyclically converted into a percentage of the reference voltage (p2001) and output according to the parameterized scaling. |  |   |
| <b>p2002</b>  | <b>Reference pressure / p_ref</b>  |  |   |
| HLA   | <b>Can be changed:</b> T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Communications<br><b>Not for motor type:</b> -<br><b>Min</b><br>0.10 [bar]  | <b>Calculated:</b> CALC_MOD_ALL<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>5000.00 [bar]    | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>100.00 [bar]  |
| <b>Description:</b>   | Sets the reference quantity for pressures.<br>All pressures specified as relative value are referred to this reference quantity.<br>The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).  |  |   |
| <b>Notice:</b>  | If various DDS are used with different valve/cylinder data, then the reference quantities remain the same as these are not changed over with the DDS. The resulting conversion factor should be taken into account (e.g. for BICO interconnections).   |  |   |
| <b>Note:</b>  | If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.   |  |   |
| <b>p2002</b>  | <b>Reference current / I_ref</b>   |  |   |
| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC,<br>A_INF, S_INF, R_INF,<br>B_INF, TM41 | <b>Can be changed:</b> T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Communications<br><b>Not for motor type:</b> -<br><b>Min</b><br>0.10 [Arms]   | <b>Calculated:</b> CALC_MOD_ALL<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>100000.00 [Arms] | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>100.00 [Arms] |
| <b>Description:</b>   | Sets the reference quantity for currents.<br>All currents specified as relative value are referred to this reference quantity.<br>The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).  |  |   |

**Notice:** If various DDS are used with different motor data, then the reference quantities remain the same as these are not changed over with the DDS. The resulting conversion factor should be taken into account (e.g. for trace records).  
 Example:  
 p2002 = 100 A  
 Reference quantity 100 A corresponds to 100 %  
 p0305[0] = 100 A  
 Rated motor current 100 A for MDS0 in DDS0 --> 100 % corresponds to 100 % of the rated motor current  
 p0305[1] = 50 A  
 Rated motor current 50 A for MDS1 in DDS1 --> 100 % corresponds to 200 % of the rated motor current

**Note:** For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1.  
 SERVO:  
 Pre-assigned value for p0338 > 0.001 is p0338, otherwise 2 \* p0305.  
 VECTOR:  
 Pre-assigned value is p0640.  
 If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.  
 For infeed units, the rated line current, which is obtained from the rated power and parameterized rated line supply voltage (p2002 = r0206 / p0210 / 1.73) is pre-assigned as the reference quantity.  
 Example:  
 The actual value of a phase current (r0069[0]) is connected to a test socket (e.g. p0771[0]). The current actual value is cyclically converted into a percentage of the reference current (p2002) and output according to the parameterized scaling.

**Description:** Sets the reference quantity for forces.

All forces specified as relative value are referred to this reference quantity.

The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).

**Note:** For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is at the factory setting.

If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.

Example:

The actual value of the total force (r0079[0]) is connected to a test socket (e.g. p0771[0]). The actual force is cyclically converted into a percentage of the reference force (p2003) and output according to the parameterized scaling.

**Description:** Sets the reference quantity for torque.

All torques specified as relative value are referred to this reference quantity.

The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).

## 2 Parameters

### 2.2 List of parameters

**Note:** For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1.

SERVO:

Pre-assigned value for p0338 and p0334 > 0.001 is p0338 \* p0334, otherwise 2 \* p0333.

VECTOR:

Pre-assigned value is 2 \* p0333.

If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.

Example:

The actual value of the total torque (r0079) is connected to a test socket (e.g. p0771[0]). The actual torque is cyclically converted into a percentage of the reference torque (p2003) and output according to the parameterized scaling.

**Description:** Displays the reference quantity for power.

All power ratings specified as relative value are referred to this reference quantity.

The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).

**Dependency:** This value is calculated as follows:

Calculated from the torque x speed (rotating) or from the force x velocity (linear).

Refer to: p2000, p2001, p2002, p2003

**Note:** If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.

The reference power is calculated as follows:

- 2 \* Pi \* reference speed / 60 \* reference torque (rotating)

- reference velocity / 60 \* reference force (linear)

**Description:** Displays the receive errors on the field bus interface (USS).

**Index:**  
 [0] = Number of error-free telegrams  
 [1] = Number of rejected telegrams  
 [2] = Number of framing errors  
 [3] = Number of overrun errors  
 [4] = Number of parity errors  
 [5] = Number of starting character errors  
 [6] = Number of checksum errors  
 [7] = Number of length errors

**Description:** Sets the communication protocol for the field bus interface.

**Value:**  
 3: PROFIBUS  
 6: USS (X140)

**Note:**  
 Changes only become effective after POWER ON.  
 The parameter is not influenced by setting the factory setting.

| <b>Description:</b>           | Displays the effective control word 1 (STW1) of the drive for the master control. |   |                          |  |

| Bit field: | Bit | Signal name           | 1 signal | 0 signal | FP |
|------------|-----|-----------------------|----------|----------|----|
|            | 00  | ON/OFF1               | Yes      | No       | -  |
|            | 01  | OC / OFF2             | Yes      | No       | -  |
|            | 03  | Enable operation      | Yes      | No       | -  |
|            | 07  | Acknowledge fault     | Yes      | No       | -  |
|            | 10  | Master control by PLC | Yes      | No       | -  |

**Notice:** The master control only influences control word 1 and speed setpoint 1. Other control word/setpoints can be transferred from another automation device.

**Note:** OC: Operating condition

|  | 1   | 62                   | 2                        |

**Description:** Sets the drive object number for communication via the field bus interface (USS).

**Dependency:** Refer to: p0978

**Note:** p2035 defines the destination for USS parameter requests (PIV).  
p0978[0] defines the destination for USS process data (PZD).  
The parameter is available globally on all drive objects.  
The parameter is not influenced by setting the factory setting.

|   | 0  | 2                    | 0                        |

**Description:** Sets the processing mode for PROFIdrive STW1.10 "master control by PLC".

Generally, control word 1 is received with the first receive word (PZD1) (this is in conformance to the PROFIdrive profile). The behavior of STW1.10 = 0 corresponds to that of the PROFIdrive profile. For other applications that deviate from this, the behavior can be adapted using this particular parameter.

**Value:** 0: Freeze setpoints and continue to process sign-of-life  
1: Freeze setpoints and sign-of-life  
2: Do not freeze setpoints

**Recommendation:** Do not change the setting p2037 = 0.

**Note:** If the STW1 is not transferred according to the PROFIdrive with PZD1 (with bit 10 "master control by PLC"), then p2037 should be set to 2.

**Description:** Displays the interface mode of the PROFIdrive control words and status words.

**Value:** 0: SINAMICS  
1: SIMODRIVE 611 universal  
2: VIK-NAMUR

**Dependency:** Refer to: p0922, p2079

**Notice:** The parameter is protected and cannot be changed.

## 2 Parameters

### 2.2 List of parameters

**Note:** For telegram selection p0922 (p2079) = 102, 103, 105, 106, 116, 118, 125, 126, 136, 138, 139, then p2038 is automatically set = 1.  
When another telegram is selected, then p2038 is automatically set = 0.

## 2 Parameters

### 2.2 List of parameters

**Note:** The parameter is only relevant for the setting of the following fieldbus protocols.  
 - USS (X140) (p2030 = 6)  
 - Modbus TCP (p2030 = 13)  
 Value = 0: Monitoring is deactivated.

 [31] = PZD 32

**Dependency:** Refer to: r2060

**Notice:** Where there is a multiple interconnection of a connector output, all the connector inputs must either have Integer or FloatingPoint data types.

A BICO interconnection for a single PZD can only take place either on r2050 or r2060.

**Note:** IF1: Interface 1

### r2054 PROFIBUS status / PB status

|  |                                |                      |                            |
|--|--------------------------------|----------------------|----------------------------|
| CU_S_AC_DP,<br>CU_S120_DP,<br>CU_S150_DP | <b>Can be changed:</b> -       | <b>Calculated:</b> - | <b>Access level:</b> 3     |
|  | <b>Data type:</b> Integer16    | <b>Dyn. index:</b> - | <b>Func. diagram:</b> 2410 |
|  | <b>P-Group:</b> Communications | <b>Unit group:</b> - | <b>Unit selection:</b> -   |
|  | <b>Not for motor type:</b> -   | <b>Scaling:</b> -    | <b>Expert list:</b> 1      |
|  | <b>Min</b>                     | <b>Max</b>           | <b>Factory setting</b>     |
|  | 0                              | 4                    | -                          |

**Description:** Status display for the PROFIBUS interface.

**Value:**

|    |   |
|----|---|
| 0: | OFF   |
| 1: | No connection (search for baud rate)          |
| 2: | Connection OK (baud rate found)               |
| 3: | Cyclic connection with master (data exchange) |
| 4: | Cyclic data OK                                |

**Note:** For r2054 = 2:

If the state is not exited, then set or check the PROFIBUS address in p0918.

For r2054 = 3:

In state 3 (the LED flashes green), a cyclic connection has been established to the PROFIBUS master; however, one of the following prerequisites is missing for cyclic operation:

- no setpoints are being received as the PROFIBUS master is in the STOP condition.

Only for isochronous operation, the following applies:

- the drive is not in synchronism as the global control (GC) has an error.

For r2054 = 4:

In the status 4 (LED green), the cyclic connection to the PROFIBUS master has been established and setpoints are being received. The clock cycle synchronization is OK, the global control (GC) is error-free.

This state does not provide any statement regarding the quality of the clock cycle synchronous sign-of-life characters on the drive objects.

 [29] = PZD 30 + 31  
 [30] = PZD 31 + 32

**Dependency:**

Refer to: r2050

**Notice:**

Where there is a multiple interconnection of a connector output, all the connector inputs must either have Integer or FloatingPoint data types.

A BICO interconnection for a single PZD can only take place either on r2050 or r2060.

A maximum of 4 indices of the "trace" function can be used.

**Description:** Sets the signal source for the connector-binector converter.  
A PZD receive word can be selected as signal source. The signals are available to be serially passed-on (interconnection).

**Dependency:** Refer to: r2094, r2095

## 2 Parameters

### 2.2 List of parameters

**Note:** From the signal source set via the connector input, the corresponding lower 16 bits are converted. p2099[0...1] together with r2094.0...15 and r2095.0...15 forms two connector-binector converters:  
Connector input p2099[0] to binector output in r2094.0...15  
Connector input p2099[1] to binector output in r2095.0...15

## 2 Parameters

### 2.2 List of parameters

- Notice:** It is not possible to re-parameterize the acknowledge mode for a fault in the following cases:
- fault number does not exist (exception value = 0).
  - Message type is not "fault" (F).
  - Acknowledge mode is not permissible for the set fault number.
- Note:** Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.
- The acknowledge mode can only be changed for faults with the appropriate identification.
- Example:  
 F12345 and acknowledge mode = IMMEDIATELY (POWER ON)  
 --> The acknowledge mode can be changed from IMMEDIATELY to POWER ON.

|            | 07  | Alarm present                  | Yes      | No       | 8065 |
|            | 08  | Internal message 2 present     | Yes      | No       | -    |
|            | 11  | Alarm class bit 0              | High     | Low      | -    |
|            | 12  | Alarm class bit 1              | High     | Low      | -    |
|            | 13  | Maintenance required           | Yes      | No       | -    |
|            | 14  | Maintenance urgently required  | Yes      | No       | -    |
|            | 15  | Fault gone/can be acknowledged | Yes      | No       | -    |

**Note:** For bit 03, 05, 07:

These bits are set if at least one fault/alarm occurs. Data is entered into the fault/alarm buffer with delay. For this reason, the fault/alarm buffer should only be read if, after "Fault active" or "Alarm active" occurs, a change is also identified in the buffer (r0944, r9744, r2121).

For bit 06, 08:

These status bits are used for internal diagnostic purposes only.

For bit 12, 11:

These status bits are used for the classification of internal alarm classes and are intended for diagnostic purposes only on certain automation systems with integrated SINAMICS functionality.

**Description:** Sets the hysteresis speed (bandwidth) for the following signals:

"|n\_act| <= speed threshold value 2" (BO: r2197.1)

"|n\_act| > speed threshold value 2" (BO: r2197.2)

**Dependency:** Refer to: p2155, r2197

| <b>Dependency:</b>             | Refer to: r2197<br>Refer to: A07903  |   |   |                 |           |

**Note:** For bit 00:  
Alarm A07903 is output when the bit is set with  $r2197.7 = 0$  ( $n\_set \neq n\_act$ ).  
For bit 01:  
When the bit is set, the load monitoring is only executed in the 1st quadrant as a result of the positive characteristic parameters (p2182 ... p2190).  
For bit 03:  
When the bit is set, r2197.1 and r2197.2 are determined using separate hysteresis functions.  
For bit 15:  
The bit indicates whether the automatic parameterization (p0340 = 1, p3900 > 0) for the parameters of the extended monitoring functions was carried out.  
If the bit is not set (e.g. when the configuration is activated (p0108.15)), the parameterization is automatically carried out during booting even if r3925.0 is already 1.

-

0000 0000 0000 0001 bin

**Description:** Sets the configuration for messages and monitoring functions.**Bit field:**

| Bit | Signal name  | 1 signal | 0 signal | FP   |
|-----|--|----------|----------|------|
| 00  | Enable alarm A07903  | Yes      | No       | 8011 |
| 01  | Load monitoring only in the 1st quadrant                         | Yes      | No       | 8013 |
| 03  | Reserved   | -        | -        | -    |
| 06  | Enable underspeed monitoring                                     | Yes      | No       | 8010 |
| 15  | Automatic parameterization carried out<br>(p0340 = 1, p3900 > 0) | Yes      | No       | -    |

**Dependency:**

Refer to: r2197

Refer to: A07903

**Note:**

For bit 00:

Alarm A07903 is output when the bit is set with  $r2197.7 = 0$  ( $n\_set \neq n\_act$ ).  
For bit 01:When the bit is set, the load monitoring is only executed in the 1st quadrant as a result of the positive characteristic parameters (p2182 ... p2190).  
For bit 03:When the bit is set, r2197.1 and r2197.2 are determined using separate hysteresis functions.  
For bit 06:When the bit is set, with  $r2197.1 = 1$  ( $n\_act < p2155$  speed threshold value 2), then alarm A08721 is output, and with  $r2199.0 = 1$  ( $n\_act < p2161$  speed threshold value 3), then fault F07822 is output.

For separately excited synchronous motors (without encoder) in torque control (p1501 set), the underspeed speed monitoring is automatically activated if conditions (p0300 = 5, p1300 = 20) for the automatic pre-assignment of the threshold values during commissioning (p0340 = 1) are fulfilled.

The alarm threshold p2155 is preassigned with  $1.5 * p1755$  - and the fault threshold p2161, with p1755.

For bit 15:

The bit indicates whether the automatic parameterization (p0340 = 1, p3900 &gt; 0) for the parameters of the extended monitoring functions was carried out.

If the bit is not set (e.g. when the configuration is activated (p0108.15)), the parameterization is automatically carried out during booting even if r3925.0 is already 1.

|   | <b>Data type:</b> FloatingPoint32   | <b>Dyn. index:</b> DDS, p0180          | <b>Func. diagram:</b> 8010             |
|   | <b>P-Group:</b> Messages  | <b>Unit group:</b> 3_1                 | <b>Unit selection:</b> p0505           |
|   | <b>Not for motor type:</b> -  | <b>Scaling:</b> -                      | <b>Expert list:</b> 1                  |
|   | <b>Min</b><br>0.00 [rpm]  | <b>Max</b><br>60000.00 [rpm]           | <b>Factory setting</b><br>0.00 [rpm]   |
| <b>Description:</b>   | Sets the hysteresis speed (bandwidth) for the signal "n_act > n_max" (BO: r2197.6).   |  |  |
| <b>Dependency:</b>  | Refer to: r1084, r1087, r2197   |  |  |

**Notice:** For  $p0322 = 0$ , the following applies:  $p2162 \leq 0.1 * p0311$   
 For  $p0322 > 0$ , the following applies:  $p2162 \leq 1.02 * p0322 - p1082$   
 If one of the conditions is violated,  $p2162$  is appropriately and automatically reduced when exiting the commissioning mode.

**Note:** For a negative speed limit ( $r1087$ ) the hysteresis is effective below the limit value and for a positive speed limit ( $r1084$ ) above the limit value.  
 If significant overshoot occurs in the maximum speed range (e.g. due to load shedding), you are advised to increase the dynamic response of the speed controller (if possible). If this is insufficient, the hysteresis  $p2162$  can only be increased by more than 10% of the rated speed when the maximum speed ( $p0322$ ) of the motor is sufficiently greater than the speed limit  $p1082$ .

---

**Note:** The following applies for sensorless vector control:  
 At low speeds a locked motor can only be detected if no change is made to open-loop speed controlled operation. If this is the case, the value in p2177 must be reduced accordingly (p2177 < p1758) before time p2177 has elapsed in order to detect the locked state reliably.  
 As countermeasure, it is generally also possible to set p1750.6. This is only not permitted if the drive is slowly reversed by the load at the torque limit (speed below p1755 for longer than p1758).

## 2 Parameters

### 2.2 List of parameters

**Note:** For bit 10:  
The torque threshold value 1 is set in p2174.  
For bit 12:  
This bit is reset after the fault cause disappears, even if the fault itself is still present.

For bit 12:  
This bit is reset after the fault cause disappears, even if the fault itself is still present.

|  | 00   | Data save active                              | Yes                        | No              | -         |
|  | 02   | Initial rounding-off active                   | Yes                        | No              | -         |
|  | 03   | Non-volatile data save active for p2230.0 = 1 | Yes                        | No              | -         |
|  | 04   | Ramp-function generator always active         | Yes                        | No              | -         |
| <b>Dependency:</b>   | Refer to: r2231, p2240   |   |                            |                 |           |
| <b>Notice:</b>   | The following prerequisites must be fulfilled in order to be able to save the setpoint in a non-volatile fashion:  |   |                            |                 |           |
|  | - Firmware with V2.3 or higher.  |   |                            |                 |           |
|  | - Control Unit 320 (CU320) with hardware version C or higher (module with NVRAM).  |   |                            |                 |           |
| <b>Note:</b>   | For bit 00:  |   |                            |                 |           |
|  | 0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p2240.  |   |                            |                 |           |
|  | 1: The setpoint for the motorized potentiometer is saved and after ON is entered using r2231. In order to save in a non-volatile fashion, bit 03 should be set to 1.   |   |                            |                 |           |
|  | For bit 02:  |   |                            |                 |           |
|  | 0: Without initial rounding-off  |   |                            |                 |           |
|  | 1: With initial rounding-off.  |   |                            |                 |           |
|  | The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed). The jerk for initial rounding is independent of the ramp-up time and only depends on the selected maximum value (p2237). |   |                            |                 |           |
|  | It is calculated as follows:   |   |                            |                 |           |
|  | $r = 0.0001 \times \max(p2237,  p2238 ) [\%] / 0.13^2 [s^2]$   |   |                            |                 |           |
|  | The jerk is active until maximum acceleration is reached ( $a_{max} = p2237 [\%] / p2247 [s]$ or $a_{max} = p2238 [\%] / p2248 [s]$ ); after this, the drive continues to operate with constant, linear acceleration.  |   |                            |                 |           |
|  | The higher the maximum acceleration (the lower that p2247 is), the longer the ramp-up time increases with respect to the set ramp-up time.   |   |                            |                 |           |
|  | For bit 03:  |   |                            |                 |           |
|  | 0: Non-volatile data save deactivated.   |   |                            |                 |           |
|  | 1. The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for p2230.0 = 1).  |   |                            |                 |           |
|  | For bit 04:  |   |                            |                 |           |
|  | When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r2250.   |   |                            |                 |           |

| <b>Description:</b>  | Setting to invert the system deviation of the technology controller.<br>The setting depends on the type of control loop.                                       |   |  |
| <b>Value:</b>  | 0: No inversion<br>1: Inversion  |   |  |
| <b>Caution:</b>  | If the actual value inversion is incorrectly selected, then the closed-loop control with the technology controller can become unstable and can oscillate!      |   |  |
|   |  |   |  |

**Note:** The correct setting can be determined as follows:

- inhibit the technology controller (p2200 = 0).
- increase the motor speed and in so doing, measure the actual value signal (of the technology controller).
- if the actual value increases with increasing motor speed, then the inversion should be switched out.
- if the actual value decreases with increasing motor speed, then the inversion should be set.

If value = 0:  
The drive reduces the output speed when the actual value rises (e.g. for heating fans, intake pump, compressor).

If value = 1:  
The drive increases the output speed when the actual value increases (e.g. for cooling fans, discharge pumps).

---

|--|--|--|---|

**Description:** Sets the signal source for the selection of the "Switch in motor" function.

When the function is selected, monitoring of the switches is deactivated with the "bypass" function. This means that the power unit can be connected to other motors via an external control without switch monitoring responding.

**p2502[0...n] LR encoder assignment / Encoder assignment**

|   |   |   |  |
|---|---|---|--|
| SERVO (Pos ctrl),<br>VECTOR (Pos ctrl),<br>SERVO_AC (Pos ctrl),<br>VECTOR_AC (Pos ctrl) | <b>Can be changed:</b> C2(25)<br><b>Data type:</b> Integer16<br><b>P-Group:</b> Closed-loop position control<br><b>Not for motor type:</b> -<br><b>Min</b><br>0 | <b>Calculated:</b> -<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>3 | <b>Access level:</b> 1<br><b>Func. diagram:</b> 4010<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>1 |
|---|---|---|--|

**Description:** Setting to assign the encoder.

The actual value preprocessing and the closed-loop position control are carried out using the assigned encoder.

## 2 Parameters

### 2.2 List of parameters

**Value:**  
 0: No encoder  
 1: Encoder 1  
 2: Encoder 2  
 3: Encoder 3

**Dependency:** Refer to: p0187, p0188, p0189

**Notice:** For the setting p2502 = 0 (no encoder), closed-loop position control is not possible. This setting is only practical as supportive measure to implement encoderless closed-loop speed control (e.g. if the motor encoder is defective).

**Note:** The assigned encoder (p2502 = 1, 2, 3) must be allocated an encoder data set (p0187, p0188, p0189).

**Description:** Sets the neutral length units LU per 10 mm.  
 Therefore, for a linear scale, a reference is established between the physical arrangement and the neutral length units LU used in the drive.

Example:

Linear scale, 10 mm should be broken down to units of  $\mu\text{m}$  (i.e. 1 LU = 1  $\mu\text{m}$ ).

--> p2503 = 10000

**Note:** The assignment to the grid spacing can be achieved using this for a rotary axis with linear encoder.  
 LU: Length Unit

## 2 Parameters

### 2.2 List of parameters

| <b>p2507[0...n]</b>  | <b>LR absolute encoder adjustment status / Abs_enc_adj stat</b>  |   |  |
|--|--|---|--|
| SERVO (EPOS, Pos ctrl), VECTOR (EPOS, Pos ctrl), SERVO_AC (EPOS, Pos ctrl), VECTOR_AC (EPOS, Pos ctrl) | <b>Can be changed:</b> U, T<br><b>Data type:</b> Integer16<br><b>P-Group:</b> Closed-loop position control<br><b>Not for motor type:</b> -<br><b>Min</b><br>0  | <b>Calculated:</b> -<br><b>Dyn. index:</b> EDS, p0140<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>4 | <b>Access level:</b> 1<br><b>Func. diagram:</b> 4010<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>1 |
| <b>Description:</b>  | Activates the adjustment and display of the status of the adjustment for absolute encoders.<br>For p2507 = 2:<br>This initiates encoder adjustment. The status is displayed using the other values.<br>For p2507 = 4:<br>This means that the encoder adjustment offset (p2525) can be directly accepted after new commissioning, without having to approach the adjustment point.  |   |  |
| <b>Value:</b>  | 0: Error occurred while adjusting<br>1: Absolute encoder not adjusted<br>2: Absolute encoder not adjusted and encoder adjustment initiated<br>3: Absolute encoder adjusted<br>4: Absolute encoder adjustment by accepting the offset   |   |  |
| <b>Dependency:</b>   | Refer to: p2525, p2598, p2599, p2733   |   |  |
| <b>Caution:</b>  | For rotating absolute encoders, when adjusting, a range is set up symmetrically around zero with half of the encoder range, within which the position must be re-established after switch-off/switch-on. In this range, it is only permissible that the encoder overflows.<br>After the adjustment has been completed, it must be guaranteed that the range is not exited. The reason for this is that outside the range, there is no clear reference any longer between the encoder actual value and mechanical system.<br>If the reference point (CI: p2598) lies in this range, then the position actual value is set when adjusting to the reference point. Otherwise, adjustment is canceled with F07443.<br>There is no overflow for linear absolute encoders. This means that after the adjustment, the position can be re-established in the complete traversing range after switch-off/switch-on. When adjusting, the position actual value is set to the reference point.<br>For p2507 = 4:<br>For an adjustment where the offset is accepted, the position actual value manifests a step. |   |  |
| <b>Note:</b>   | In order to permanently save the determined position offset (p2525) and the DDS number (p2733), they must be saved in a non-volatile fashion (p0971, p0977).<br>This adjustment can only be initiated for an absolute encoder.   |   |  |
| <b>p2508[0...3]</b>  | <b>BI: LR activate reference mark search / Ref_mark act</b>  |   |  |
| SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)                         | <b>Can be changed:</b> T<br><b>Data type:</b> Unsigned32 / Binary<br><b>P-Group:</b> Closed-loop position control<br><b>Not for motor type:</b> -<br><b>Min</b><br>-   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>-          | <b>Access level:</b> 1<br><b>Func. diagram:</b> 4010<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0 |

| <b>Dependency:</b>   | Refer to: p0490, p0728, p2509, p2510, p2511  |   |  |

**Caution:**

In order to prevent incorrect measurement values, these parameters may not be written during an active measurement.

**Notice:**

To select the values:

For CX32, NX10 and NX15, only DI/DO 8, 9, 10, 11 can be selected as fast inputs (refer to the Equipment Manual).

Regarding the terminal designation:

The first designation is valid for CU320-2, the second for CU310-2.

**Note:**

DI/DO: Bidirectional Digital Input/Output

The terminal must be set as input (p0728).

If a parameter change is rejected, a check should be performed as to whether the input terminal is already being used in p0488, p0489, p0493, p0494, p0495, p0580 or p0680.

Direct measurement via p2517 has a higher priority than measurements via p0488.

For the direct measuring probe evaluation, the DP clock cycle must be integer multiple of the position controller clock cycle.

**Description:**

Sets the input terminal for direct measuring probe 1.

The direct measuring probe can either be parameterized as a non-cyclic (value 1 ... 8) or a cyclic (value 11 ... 18) measuring probe.

After it has been activated via binector input: p2509 = 0/1 signal, the non-cyclic measuring probe measures once and can be used with EPOS.

After it has been activated via the p2509 = 1 signal, the cyclic measuring probe measures cyclically and cannot be used with EPOS.

In order to process signals faster, the direct measuring probe bypasses the handshake technique via the encoder control word and encoder status word.

**Value:**

0: No measuring probe

**Description:** Sets the behavior of the position actual value preprocessing for the position controller for a DDS changeover.  
 For p2519 = 1:  
 In the following cases, for a DDS changeover, the actual position actual value becomes invalid and the reference point is reset:  
 - the EDS effective for the closed-loop position control changes.  
 - the encoder assignment changes (p2502).  
 - the mechanical relationships change (p2503 ... p2506).  
 - the direction of rotation changes (p1821).  
 For absolute encoders, the status of the adjustment (p2507) is also reset if the same absolute encoder remains selected for the closed-loop position control, but the mechanical relationships or the direction of rotation have changed.  
 In the operation state, in addition, a fault (F07494) is generated.

**Notice:** The remaining setting values are intended for expanded functionality.

**Note:** The behavior for a DDS changeover is determined using the value of p2519 in the target data set.

## 2 Parameters

### 2.2 List of parameters

**Notice:** When speed precontrol is active (p2534 > 0 %), the following applies:  
 In addition to the set dead time (p2535), internally two position controller sampling times are effective.  
 When speed precontrol is inactive (p2534 = 0 %), the following applies:  
 No dead time is effective (p2535 and internal).

**Note:** Together with p2536, the timing behavior of the closed-loop control loop can be emulated.

---

#### p2536[0...n] LR velocity precontrol symmetrizing filter PT1 / v\_prectrl filt PT1

|  |  |                               |                                     |
|--|--|-------------------------------|-------------------------------------|

|  | <b>Min</b><br>0.00 [ms]                      | <b>Max</b><br>100.00 [ms]     | <b>Factory setting</b><br>0.00 [ms] |

**Description:** Sets a PT1 filter to emulate the timing behavior of the velocity control loop.

**Dependency:** Refer to: p2535

**Notice:** When velocity precontrol is inactive (p2534 = 0 %), the following applies:  
 If a PT1 filter has been set, it is not effective.

**Note:** Together with p2535, the timing behavior of the velocity control loop can be emulated.

---

#### p2536[0...n] LR speed precontrol symmetrizing filter PT1 / n\_prectrl filt PT1

|   |  |                               |                                     |
|---|--|-------------------------------|-------------------------------------|

|   | <b>Min</b><br>-                                | <b>Max</b><br>-         | <b>Factory setting</b><br>1 |

**Description:** Sets the signal source for the adaptation of the proportional gain of the position controller.

**Dependency:** Refer to: p2538

---

#### p2538[0...n] LR proportional gain / Kp

|   |  |                                  |  |
|---|--|----------------------------------|--|
| SERVO (Pos ctrl),<br>VECTOR (Pos ctrl),<br>SERVO_AC (Pos ctrl),<br>VECTOR_AC (Pos ctrl) | <b>Can be changed:</b> U, T                  | <b>Calculated:</b> -             | <b>Access level:</b> 1                     |
|   | <b>Data type:</b> FloatingPoint32            | <b>Dyn. index:</b> DDS, p0180    | <b>Func. diagram:</b> 4015                 |
|   | <b>P-Group:</b> Closed-loop position control | <b>Unit group:</b> -             | <b>Unit selection:</b> -                   |
|   | <b>Not for motor type:</b> -                 | <b>Scaling:</b> -                | <b>Expert list:</b> 1                      |
|   | <b>Min</b><br>0.000 [1000 rpm]               | <b>Max</b><br>300.000 [1000 rpm] | <b>Factory setting</b><br>1.000 [1000 rpm] |

**Description:** Sets the proportional gain (P gain, position loop gain, Kv factor) of the position controller.

**Dependency:** Refer to: p2537, p2539, p2555, r2557, r2558

**Note:** The proportional gain is used define at which traversing velocity which following error is obtained (without precontrol)  
 Low proportional gain:  
 Slow response to a setpoint - actual value difference, the following error becomes large.  
 High proportional gain:  
 Fast response to the setpoint - actual value difference, the following error becomes small.

|  | <b>Min</b>                                   | <b>Max</b>                    | <b>Factory setting</b>     |
|  | 0 [LU]                                       | 2147483647 [LU]               | 1000 [LU]                  |

**Description:** Sets the tolerance for the dynamic following error monitoring.  
If the dynamic following error (r2563) exceeds the selected tolerance, then an appropriate fault is output.  
Value = 0 --> The dynamic following error monitoring is deactivated.

**Dependency:** Refer to: r2563, r2684  
Refer to: F07452

**Note:** The tolerance bandwidth is intended to prevent the dynamic following error monitoring incorrectly responding due to operational control sequences (e.g. during load surges).

|  | -2147483648 [LU]                             | 2147483647 [LU]      | 0 [LU]                     |

**Description:** Sets the cam switching position 1.

**Dependency:** Refer to: p2548, r2683

**Caution:** Only after the axis has been referenced can it be guaranteed that the cam switching signals when output have a "true" position reference.

**Note:** Position actual value <= cam switching position 1 --> r2683.8 = 1 signal  
Position actual value > cam switching position 1 --> r2683.8 = 0 signal

---

|  |  |   |   |
|--|--|---|---|
| <b>r2563</b>   | <b>CO: LR following error dynamic model / Follow error dyn</b>   |   |   |
| SERVO (Pos ctrl),<br>VECTOR (Pos ctrl),<br>SERVO_AC (Pos ctrl),<br>VECTOR_AC (Pos<br>ctrl) | <b>Can be changed:</b> -<br><b>Data type:</b> Integer32<br><b>P-Group:</b> Closed-loop position control<br><b>Not for motor type:</b> -<br><b>Min</b><br>- [LU]  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- [LU]       | <b>Access level:</b> 1<br><b>Func. diagram:</b> 4025<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- [LU]     |
| <b>Description:</b>  | Display and connector output for the dynamic following error.<br>This value is the deviation, corrected by the velocity-dependent component, between the position setpoint and the position actual value.  |   |   |
| <b>Note:</b>   | For $p2534 \geq 100\%$ (precontrol activated) the following applies:<br>The dynamic following error (r2563) corresponds to the system deviation (r2557) at the position controller input.<br>For $0\% < p2534 < 100\%$ (precontrol activated) or $p2534 = 0\%$ (precontrol deactivated) the following applies:<br>The dynamic following error (r2563) is the deviation between the measured position actual value and a value that is calculated from the position setpoint via a PT1 model. This compensates the system-related velocity-dependent system deviation for a P controller. |   |   |
| <b>r2564</b>   | <b>CO: LR force precontrol value / F_prectrl val</b>   |   |   |
| SERVO (Lin, Pos ctrl),<br>SERVO_AC (Lin, Pos<br>ctrl)                                      | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Closed-loop position control<br><b>Not for motor type:</b> -<br><b>Min</b><br>- [N]   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> 8_1<br><b>Scaling:</b> p2003<br><b>Max</b><br>- [N]  | <b>Access level:</b> 1<br><b>Func. diagram:</b> 4015<br><b>Unit selection:</b> p0505<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- [N]  |
| <b>Description:</b>  | Display and connector output for the force setpoint.   |   |   |
| <b>Dependency:</b>   | Refer to: p1511, p1512   |   |   |
| <b>Note:</b>   | The force precontrol value is the derivation over time of the velocity precontrol value and is referred to a high inertia mass of 1000.0 kg. When using the precontrol, then this should be evaluated corresponding to the actual mass.  |   |   |
| <b>r2564</b>   | <b>CO: LR torque precontrol value / M_prectrl val</b>  |   |   |
| SERVO (Pos ctrl),<br>VECTOR (Pos ctrl),<br>SERVO_AC (Pos ctrl),<br>VECTOR_AC (Pos<br>ctrl) | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Closed-loop position control<br><b>Not for motor type:</b> -<br><b>Min</b><br>- [Nm]  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> 7_1<br><b>Scaling:</b> p2003<br><b>Max</b><br>- [Nm] | <b>Access level:</b> 1<br><b>Func. diagram:</b> 4015<br><b>Unit selection:</b> p0505<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- [Nm] |
| <b>Description:</b>  | Display and connector output for the torque precontrol value.  |   |   |
| <b>Dependency:</b>   | Refer to: p1511, p1512   |   |   |
| <b>Note:</b>   | The torque precontrol value is the derivation over time of the speed precontrol value and is referred to a moment of inertia of 1 kgm <sup>2</sup> /2 PI. When using the precontrol, then this should be evaluated corresponding to the actual moment of inertia.  |   |   |
| <b>r2565</b>   | <b>CO: LR following error actual / Following err act</b>   |   |   |
| SERVO (Pos ctrl),<br>VECTOR (Pos ctrl),<br>SERVO_AC (Pos ctrl),<br>VECTOR_AC (Pos<br>ctrl) | <b>Can be changed:</b> -<br><b>Data type:</b> Integer32<br><b>P-Group:</b> Closed-loop position control<br><b>Not for motor type:</b> -<br><b>Min</b><br>- [LU]  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- [LU]       | <b>Access level:</b> 1<br><b>Func. diagram:</b> 4015<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- [LU]     |
| <b>Description:</b>  | Display and connector output for the actual following error.<br>This value is the deviation between the position setpoint - after fine interpolation - and the position actual value.  |   |   |

## 2 Parameters

### 2.2 List of parameters

**Notice:** When speed precontrol is active (p2534 > 0 %), the following applies:  
To calculate this value, the position setpoint is delayed by two position controller sampling times.  
When speed precontrol is inactive (p2534 = 0 %), the following applies:  
To calculate this value, the position setpoint is delayed by two position controller clock cycles.

|   | 0.000000 [kgm <sup>2</sup> ]                                      | 100000.000000 [kgm <sup>2</sup> ] | 0.159155 [kgm <sup>2</sup> ] |
| <b>Description:</b>   | Sets the moment of inertia for the torque precontrol.             |                                   |                              |
| <b>Dependency:</b>  | Refer to: p2534, r2564  |                                   |                              |

**Note:** When calculating the torque precontrol value (r2654), the time derivation of the speed precontrol value is multiplied by  $2 \text{ PI} * \text{p2567}$ .

For reasons associated with the compatibility to earlier firmware versions, the factory setting for p2567 =  $1 \text{ kgm}^2/2 \text{ PI}$ . This means that CO: r2564 remains as standard the derivation over time of the speed precontrol value and is referred, as before, to a moment of inertia of  $1 \text{ kgm}^2/2 \text{ PI}$ . For torque precontrol, the moment of inertia can now be directly entered into p2567 (instead of subsequently evaluating the precontrol value).

**Description:** Sets the jerk limiting  
**Dependency:** Refer to: p2572, p2573, p2575  
**Note:** The jerk limiting is internally converted into a jerk time as follows:  

$$\text{Jerk time } T_r = \max(p2572, p2573) / p2574$$
 The jerk time is internally limited to 1000 ms and is rounded-off to an integer multiple of the sampling time positioning (p0115[5]).  
 The jerk time is valid for the acceleration and deceleration phases also for unequal maximum acceleration (p2572) and maximum deceleration (p2573).  
 For unequal maximum acceleration and maximum deceleration, the motion is not optimal from a time perspective as the jerk limit cannot be used for the lower of the two values.  
 If, in the traversing profile, the acceleration time without jerk limiting is shorter than jerk time  $T_r$ , then motion with jerk limiting is not time-optimized.  
 For traversing motion with a direct transition between acceleration and deceleration (i.e. jerk time is greater than the constant velocity phase), jerk can increase up to twice the parameterized jerk.  
 CONTINUE\_FLYING with direction reversal acts internally just like a CONTINUE\_WITH\_STOP without the "position reached" being set. Without jerk limiting, this behavior can hardly be noticed as, when reversing, the position setpoint is only kept at zero for one interpolator clock cycle.  
 For block change enable CONTINUE\_WITH\_STOP, jerk limiting results in a longer delay time.

## 2 Parameters

|   | -  | -                    | 0                          |

**Description:** Sets the signal source to activate the "software limit switch".

**Dependency:** Refer to: p2578, p2579, p2580, p2581

**Caution:** Software limit switch effective:  
- axis is referenced (r2684.11 = 1) and BI: p2582 = 1 signal.  
Software limit switch ineffective:  
- modulo correction active (BI: p2577 = 1 signal).  
- search for reference is executed.

## 2 Parameters

### 2.2 List of parameters

**Notice:** Target position for relative positioning outside software limit switch:  
 The traversing block is started and the axis comes to a standstill at the software limit switch. An appropriate alarm is output and the traversing block is interrupted. Traversing blocks with valid position can be activated.  
 Target position for absolute positioning outside software limit switch:  
 In the "traversing blocks" mode, the traversing block is not started and an appropriate fault is output.  
 Axis outside the valid traversing range:  
 If the axis is already outside the valid traversing range, then an appropriate fault is output. The fault can be acknowledged at standstill. Traversing blocks with valid position can be activated.

**Note:** The traversing range can also be limited using STOP cams.

|   | -   | -                    | 0   |

**Description:** Sets the signal source to start the "search for reference" or "flying referencing".

BI: p2595 = 0/1 signal  
 Referencing is started.  
 BI: p2595 = 1/0 signal  
 Referencing is interrupted.

**Dependency:** Refer to: p2597, p2598, p2599, r2684

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:** Search for reference (BI: p2597 = 0 signal):

The reference point approach can only be activated (0/1 edge) after traversing motion that is being processed has been completed.

With the start, where relevant, the state signal "reference point set" (r2684.11) is reset.

Flying referencing (BI: p2597 = 1 signal):

With the start, the state signal "reference point set" (r2684.11) is not reset.

|   | -  | -                    | 0                          |

**Description:** Sets the signal source for the "set reference point".

**Dependency:** Refer to: p2598, p2599, r2684

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

## 2 Parameters

### 2.2 List of parameters

**Note:** Reference point setting is effective in the following operating states:

- in the basic state.
- for FIXED STOP with progress condition END (corresponds to the initial state).
- for traversing block interrupted via BI: p2640 = 0 signal (intermediate stop).
- for EPOS not enabled (BI: p2656 = 0 signal) and position actual value valid (BI: p2658 = 1 signal).

|   | -  | -                    | 0   |

**Description:** Sets the signal source to select referencing type.  
1 signal: Flying referencing  
0 signal: Search for reference

**Dependency:** Refer to: p2595

**Note:** Referencing is activated as follows:  
- Select the referencing type (BI: p2597)  
- Start referencing (BI: p2595 = 0/1 signal)

|   | -   | -                    | [0] 2599[0]<br>[1] 0<br>[2] 0<br>[3] 0 |

**Description:** Sets the signal source for the reference point coordinate.  
This value is used as reference for the following referencing operations:

- search for reference
- set reference point
- flying referencing
- absolute value adjustment

**Index:** [0] = Position control  
[1] = Encoder 1  
[2] = Encoder 2  
[3] = Encoder 3

**Dependency:** Refer to: p2502, p2507, p2595, p2596, p2597, p2599

**Note:** When the function module "basic positioner" (r0108.4 = 1) is activated, the following applies:

Incremental measuring system:

After the reference point is reached, the drive accepts the actual axis position from the position received via the connector input p2598[0].

Absolute encoder:

When adjusting the encoder, the position received via the connector input is set as the actual axis position. The position offset to the actual encoder value is displayed in p2525.

**Description:** Sets the relative positioning mode for flying referencing.  
Value = 1:  
The corrected setpoint is not calculated into the traversing distance.  
Value = 0:  
The corrected setpoint is calculated into the traversing distance.

**Dependency:** Refer to: p2597, p2623, p2648  
**Notice:** For p2603 = 0 the direction can change.

**Description:** Sets the approach velocity to the reference cam for the search for reference.

**Dependency:** The search for reference only starts with the approach velocity to the reference cam when there is a reference cam (p2607 = 1).  
Refer to: p2595, p2597, p2604, p2606, p2607

**Note:** When traversing to the reference cam, the velocity override is effective.  
If, at the start of the search for reference, the axis is already at the reference cam, then the axis immediately starts to traverse to the zero mark.

| <b>Notice:</b>  | The parameter may be protected as a result of p0922 or p2079 and cannot be changed.  |                      |                                  |

## 2 Parameters

### 2.2 List of parameters

**Note:** To start a traversing block, the axis must be referenced (r2684.11 = 1).  
 The status signal r2684.12 = 0/1 signal is used for acknowledgment.  
 A traversing task can be influenced using the following signals:  
 - intermediate stop via BI: p2640.  
 - reject traversing task via BI: p2641.

| <b>p2632</b>  |   | <b>EPOS external block change evaluation / Ext blk chg eval</b> |                                  |  |
|---|---|---|----------------------------------|--|
| SERVO (EPOS),<br>VECTOR (EPOS),<br>SERVO_AC (EPOS),<br>VECTOR_AC (EPOS) | <b>Can be changed:</b> T  | <b>Calculated:</b> -  | <b>Access level:</b> 1           |  |

## 2 Parameters

### 2.2 List of parameters

**Dependency:** Refer to: p2640, p2641, p2642, p2643, p2644, p2645, p2648, p2649, p2651, p2652, r2684  
**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.  
**Note:** The status signal r2684.12 = 0/1 signal is used for acknowledgment.  
The operating mode "direct setpoint input/MDI" can be influenced via the following signals:  
- intermediate stop via BI: p2640.  
- reject traversing task via BI: p2641.

---

**p2651** **BI: EPOS direct setpoint input/MDI direction selection, positive / MDI dir\_sel pos**

|   |                                       |                      |                            |
|---|---------------------------------------|----------------------|----------------------------|
| SERVO (EPOS),<br>VECTOR (EPOS),<br>SERVO_AC (EPOS),<br>VECTOR_AC (EPOS) | <b>Can be changed:</b> T              | <b>Calculated:</b> - | <b>Access level:</b> 1     |
|   | <b>Data type:</b> Unsigned32 / Binary | <b>Dyn. index:</b> - | <b>Func. diagram:</b> 3620 |
|   | <b>P-Group:</b> Basic positioner      | <b>Unit group:</b> - | <b>Unit selection:</b> -   |
|   | <b>Not for motor type:</b> -          | <b>Scaling:</b> -    | <b>Expert list:</b> 1      |
|   | <b>Min</b>                            | <b>Max</b>           | <b>Factory setting</b>     |
|   | -                                     | -                    | 0                          |

**Description:** Sets the signal source for the positive direction selection in the operating mode "direct setpoint input/MDI".

**Dependency:** Refer to: p2576, p2648, p2649, p2650, p2652, p2653, p2654

**Note:** The following applies for "setting-up":

- the traversing direction can be entered using this binector input.
- if both directions (p2651, p2652) are selected, then the axis remains stationary (zero speed).
- if both directions (p2651, p2652) are deselected, then the axis remains stationary (zero speed).

The following applies for "positioning":

Using binector inputs p2651 and p2652, when the modulo correction (BI: p2577 = 1 signal) is activated and for absolute positioning (BI: p2648 = 1 signal), the traversing direction is specified as follows:

BI: p2651 / BI: p2652

0 signal / 0 signal: Absolute positioning through the shortest distance.

1 signal / 0 signal: Absolute positioning in the positive direction.

0 signal / 1 signal: Absolute positioning in the negative direction.

1 signal / 1 signal: Absolute positioning through the shortest distance.

---

**p2652** **BI: EPOS direct setpoint input/MDI direction selection negative / MDI dir\_sel neg**

## 2 Parameters

### 2.2 List of parameters

**Note:** The following is displayed depending on the task:  
FIXED STOP: Clamping torque (0 ... 65536 [0.01 Nm]) or clamping force (0 ... 65536 [N])  
WAIT: Delay time [ms]  
GOTO: Block number  
SET\_O: 1, 2, 3 --> direct output 1, 2 or 3 (both) is set  
RESET\_O: 1, 2, 3 --> direct output 1, 2 or 3 (both) is reset  
JERK: 0 --> deactivate, 1 --> activate

---

|  | 06  | Jerk limiting active   | Yes  | No              |
|  | 07  | Activate correction  | Yes  | No              |
|  | 08  | Following error in tolerance   | Yes  | No              |
|  | 09  | Modulo correction active   | Yes  | No              |
|  | 10  | Target position reached  | Yes  | No              |

|    |   |     |    |                        |
|----|---|-----|----|------------------------|
| 11 | Reference point set                       | Yes | No | 3612,<br>3614,<br>3630 |
| 12 | Acknowledgment traversing block activated | Yes | No | 3616,<br>3620          |
| 13 | STOP cam minus active                     | Yes | No | 3630                   |
| 14 | STOP cam plus active                      | Yes | No | 3630                   |
| 15 | Traversing command active                 | Yes | No | 3635                   |

**Note:**

For bit 02:

The "referencing active" signal is an OR logic operation of "search for reference active" and "flying referencing active".

For bit 00 ... 07 and 11 ... 14:

These signals are generated in the function module "basic positioner".

For bit 08:

The signal is generated in the "closed-loop position control" function module.

Displays the effective force limiting.

r2686[0]:

Displays the effective upper force limiting when traversing to fixed stop (referred to CI: p1522, CI: p1523).

r2686[1]:

Displays the effective lower force limiting when traversing to fixed stop (referred to CI: p1522, CI: p1523).

**Index:**

[0] = Upper

[1] = Lower

**Dependency:**

Refer to: p1520, p1521, p1522, p1523, r2676

**Note:**

As standard, the following BICO interconnections are established:

CI: p1528 = r2686[0]

CI: p1529 = r2686[1]

| <b>Dependency:</b>   | Refer to: p2000  |  |   |  |

## 2 Parameters

### 2.2 List of parameters

**Note:** This parameter represents the numerical value of the reference quantity in the currently selected units and is only available for interconnection with Drive Control Chart (DCC).  
If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.  
Example 1:  
The signal of an analog input (e.g. r4055[0]) is connected to a velocity setpoint (e.g. p1070[0]). The actual percentage input value is cyclically converted into the absolute velocity setpoint using the reference velocity (p2000).  
Example 2:  
The setpoint from PROFIBUS (r2050[1]) is connected to a velocity setpoint (e.g. p1070[0]). The actual input value is cyclically converted into a percentage value via the pre-specified scaling 4000 hex. This percentage value is converted to the absolute velocity setpoint via reference velocity (p2000).

## 2 Parameters

### 2.2 List of parameters

---

|  |   |  |   |
|--|---|--|---|
| <b>r2702</b>   | <b>CO: Reference current / Reference current</b>  |  |   |
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC,<br>A_INF, S_INF, R_INF,<br>B_INF, TM41 | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> -<br><b>Not for motor type:</b> -<br><b>Min</b><br>-   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- |
| <b>Description:</b>  | Connector output of the reference quantity for currents p2002.<br>All currents specified as relative value are referred to this reference quantity.<br>The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).<br>This parameter has the unit Arms.                                       |  |   |
| <b>Dependency:</b>   | Refer to: p2002   |  |   |
| <b>Note:</b>   | This BICO parameter provides the numerical value of the reference quantity p2002 as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC.<br>This BICO parameter is not suitable for interconnecting for cyclic communication. |  |   |

---

|   |   |  |   |
|---|---|--|---|
| <b>r2703</b>  | <b>CO: Reference torque / Reference torque</b>  |  |   |
| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC, TM41 | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> -<br><b>Not for motor type:</b> -<br><b>Min</b><br>-   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- |
| <b>Description:</b>   | Connector output of the reference quantity p2003 for torque (r0108.12 = 0) or force (r0108.12 = 1).<br>All torques specified as relative values (r0108.12 = 0) or forces (r0108.12 = 1) are referred to this reference quantity.<br>The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).<br>The unit of this parameter is the same as the unit selected for p2003. |  |   |
| <b>Dependency:</b>  | p0505, r0108.12<br>Refer to: p2003  |  |   |
| <b>Note:</b>  | This BICO parameter provides the numerical value of the reference quantity p2003 in the currently selected unit as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC.<br>This BICO parameter is not suitable for interconnecting for cyclic communication.  |  |   |

---

|  |  |  |   |
|--|--|--|---|
| <b>r2703</b>   | <b>CO: Reference force actual / Ref force cur</b>  |  |   |
| SERVO (Lin), HLA,<br>SERVO_AC (Lin),<br>SERVO_I_AC (Lin) | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> -<br><b>Not for motor type:</b> -<br><b>Min</b><br>-  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- |
| <b>Description:</b>                                      | Displays the actual reference quantity for forces.<br>All forces specified as relative value are referred to this reference quantity.<br>The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). |  |   |
| <b>Dependency:</b>                                       | p0505, r0108.12<br>Refer to: p2003   |  |   |

**Note:** This BICO parameter represents the numerical value of the reference quantity in the currently selected units and is only available for interconnection with Drive Control Chart (DCC).  
 This BICO parameter is not suitable for interconnecting for cyclic communication.  
 If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.  
 Example:  
 The actual value of the total force (r0079[0]) is connected to a test socket (e.g. p0771[0]). The actual force is cyclically converted into a percentage of the reference force (p2003) and output according to the parameterized scaling.

---

|  |   |  |   |
|--|---|--|---|
| <b>r2704</b>   | <b>CO: Reference power / Reference power</b>  |  |   |
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC,<br>A_INF, S_INF, R_INF,<br>B_INF, TM41 | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> -<br><b>Not for motor type:</b> -<br><b>Min</b><br>-   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- |
| <b>Description:</b>  | Connector output of the reference quantity for powers p2004.<br>All power ratings specified as relative value are referred to this reference quantity.<br>The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).<br>The unit of this parameter is the same as the unit selected for p2004.   |  |   |
| <b>Dependency:</b>   | This value is calculated as voltage x current for the infeed and as torque x speed for closed-loop controls.<br>Refer to: r2004   |  |   |
| <b>Note:</b>   | This BICO parameter provides the numerical value of the reference quantity p2004 in the currently selected unit as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC.<br>This BICO parameter is not suitable for interconnecting for cyclic communication.<br>The reference power is calculated as follows:<br>- $2 * \text{Pi} * \text{reference speed} / 60 * \text{reference torque (motor)}$<br>- $\text{reference voltage} * \text{reference current} * \text{root}(3) \text{ (infeed)}$ |  |   |

---

|  |   |  |   |
|--|---|--|---|
| <b>r2705</b>   | <b>CO: Reference angle / Reference angle</b>  |  |   |
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC,<br>A_INF, S_INF, R_INF,<br>B_INF, TM41 | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> -<br><b>Not for motor type:</b> -<br><b>Min</b><br>-   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- |
| <b>Description:</b>  | Connector output of the reference quantity for angles p2005.<br>All angles specified as relative value are referred to this reference quantity.<br>The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).<br>This parameter has the unit degree.   |  |   |
| <b>Dependency:</b>   | Refer to: p2005   |  |   |
| <b>Note:</b>   | This BICO parameter provides the numerical value of the reference quantity p2005 as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC.<br>This BICO parameter is not suitable for interconnecting for cyclic communication. |  |   |

|   |   |  |   |
|---|---|--|---|
| <b>r2706</b>  | <b>CO: Reference temperature / Reference temp</b>   |  |   |
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC,<br>A_INF, S_INF, R_INF,<br>B_INF, TM31, TM41,<br>TM120, TM150 | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> -<br><b>Not for motor type:</b> -<br><b>Min</b><br>- | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- |

**Description:** Connector output of the reference quantity for temperatures.  
All temperatures specified as relative value are referred to this reference quantity.  
The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).  
This parameter has the unit degree Celsius.

**Note:** This BICO parameter provides the numerical value of the reference quantity for the temperature as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC.  
This BICO parameter is not suitable for interconnecting for cyclic communication.

|  |   |  |   |
|--|---|--|---|
| <b>r2707</b>   | <b>CO: Reference acceleration / Ref a</b>   |  |   |
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC, TM41 | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> -<br><b>Not for motor type:</b> -<br><b>Min</b><br>- | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- |

**Description:** Connector output of the reference quantity for accelerations p2007.  
All acceleration rates specified as relative value are referred to this reference quantity.  
The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).  
The unit of this parameter is the same as the unit selected for p2007.

**Dependency:** r0108.12, p0505  
Refer to: p2007

**Note:** This BICO parameter provides the numerical value of the reference quantity p2007 as a connector output for interconnection with Drive Control Chart (DCC). The numerical value in the currently selected unit can be adopted unchanged from this connector output in DCC.  
This BICO parameter is not suitable for interconnecting for cyclic communication.

|  |   |   |  |
|--|---|---|--|
| <b>p2720[0...n]</b>  | <b>Load gear configuration / Load gear config</b>   |   |  |
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC | <b>Can be changed:</b> C2(1, 4)<br><b>Data type:</b> Unsigned32<br><b>P-Group:</b> Encoder<br><b>Not for motor type:</b> -<br><b>Min</b><br>- | <b>Calculated:</b> -<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>- | <b>Access level:</b> 1<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0000 bin |

**Description:** Sets the configuration for position tracking of a load gear.

| Bit field: | Bit | Signal name                          | 1 signal    | 0 signal    | FP |
|------------|-----|--------------------------------------|-------------|-------------|----|
|            | 00  | Load gear activate position tracking | Yes         | No          | -  |
|            | 01  | Axis type                            | Linear axis | Rotary axis | -  |
|            | 02  | Load gear reset position             | Yes         | No          | -  |

**Note:** For the following events, the non-volatile, saved position values are automatically reset:  
- when an encoder replacement has been identified.  
- when changing the configuration of the Encoder Data Set (EDS).  
- when adjusting the absolute encoder again

|   |  |   |  |
|---|--|---|--|
| <b>p2721[0...n]</b>   | <b>Load gear rotary absolute encoder revolutions virtual / Abs rot rev</b>   |   |  |
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC        | <b>Can be changed:</b> C2(1, 4)<br><b>Data type:</b> Unsigned32<br><b>P-Group:</b> Encoder<br><b>Not for motor type:</b> -<br><b>Min</b><br>0  | <b>Calculated:</b> -<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>4194303       | <b>Access level:</b> 1<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0          |
| <b>Description:</b>   | Sets the number of rotations that can be resolved for a rotary absolute encoder with activated position tracking of the load gear.   |   |  |
| <b>Dependency:</b>  | This parameter is only of significance for an absolute encoder (p0404.1 = 1) with activated position tracking of the load gear (p2720.0 = 1).  |   |  |
| <b>Note:</b>  | The resolution that is set must be able to be represented using r2723.<br>For rotary axes/modulo axes, the following applies:<br>This parameter is pre-set with p0421 when activating position tracking and can be changed.<br>For linear axes, the following applies:<br>This parameter is pre-assigned with p0421 when activating position tracking, expanded by 6 bits for multiturn information (maximum number of overflows) and cannot be changed. |   |  |
| <b>p2722[0...n]</b>   | <b>Load gear position tracking tolerance window / Pos track tol</b>  |   |  |
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC        | <b>Can be changed:</b> C2(1, 4)<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Encoder<br><b>Not for motor type:</b> -<br><b>Min</b><br>0.00  | <b>Calculated:</b> -<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>4294967300.00 | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0.00       |
| <b>Description:</b>   | Sets a tolerance window for position tracking.<br>After the system is switched on, the difference between the saved position and the actual position is determined, and depending on this, the following is initiated:<br>Difference within the tolerance window --> The position is reproduced as a result of the encoder actual value.<br>Difference outside the tolerance window --> An appropriate message is output.                                |   |  |
| <b>Dependency:</b>  | Refer to: F07449   |   |  |
| <b>Caution:</b>   | Rotation, for example through a complete encoder range is not detected.  |   |  |
|  |  |   |  |
| <b>Note:</b>  | The value is entered in integer (complete) encoder pulses.<br>For p2720.0 = 1, the value is automatically pre-assigned quarter of the encoder range.<br>Example:<br>Quarter of the encoder range = (p0408 * p0421) / 4<br>It is possible that the tolerance window may not be able to be precisely set due to the data type (floating point number with 23 bit mantissa).  |   |  |
| <b>r2723[0...n]</b>   | <b>CO: Load gear absolute value / Load gear AbsV</b>   |   |  |
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC        | <b>Can be changed:</b> -<br><b>Data type:</b> Unsigned32<br><b>P-Group:</b> Encoder<br><b>Not for motor type:</b> -<br><b>Min</b><br>-   | <b>Calculated:</b> -<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>-             | <b>Access level:</b> 1<br><b>Func. diagram:</b> 4010, 4704<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- |
| <b>Description:</b>   | Displays the absolute value after the load gear.   |   |  |
| <b>Notice:</b>  | The encoder position actual value must be requested using the encoder control word Gn_STW.13.  |   |  |
| <b>Note:</b>  | The increments are displayed in the format the same as r0483.  |   |  |

## 2 Parameters

### 2.2 List of parameters

|  |   |   |  |
|--|---|---|--|
| <b>r2724[0...n]</b>  | <b>CO: Load gear position difference / Load gear pos diff</b>   |   |  |
| SERVO, VECTOR,<br>HLA, SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC               | <b>Can be changed:</b> -<br><b>Data type:</b> Integer32<br><b>P-Group:</b> Encoder<br><b>Not for motor type:</b> -<br><b>Min</b><br>-   | <b>Calculated:</b> -<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>-   | <b>Access level:</b> 1<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>-          |
| <b>Description:</b>  | Displays the position difference before the load gear between switching off and switching on.   |   |  |
| <b>Note:</b>   | The increments are displayed in the same format as for r0483/r2723.<br>If the measuring gear of the motor encoder is not activated, the position difference should be read in encoder increments.<br>If the measuring gear of the motor encoder is activated, the position difference is converted using the measuring gear factor. |   |  |
| <b>p2730[0...3]</b>  | <b>BI: LR pos. actual value preprocessing activate neg. corr. (edge) / ActV_prep neg corr</b>   |   |  |
| SERVO (Pos ctrl),<br>VECTOR (Pos ctrl),<br>SERVO_AC (Pos ctrl),<br>VECTOR_AC (Pos<br>ctrl) | <b>Can be changed:</b> T<br><b>Data type:</b> Unsigned32 / Binary<br><b>P-Group:</b> Closed-loop position control<br><b>Not for motor type:</b> -<br><b>Min</b><br>-  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>-            | <b>Access level:</b> 1<br><b>Func. diagram:</b> 4010, 4015<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0 |
| <b>Description:</b>  | Sets the signal source for the function "activate position actual value preprocessing, negative corrective value (edge)".<br>0/1 signal:<br>The correction value available via CI: p2513 is negated and activated.  |   |  |
| <b>Index:</b>  | [0] = Position control<br>[1] = Encoder 1<br>[2] = Encoder 2<br>[3] = Encoder 3   |   |  |
| <b>Dependency:</b>   | Refer to: p2502, p2513, r2684   |   |  |
| <b>p2733[0...n]</b>  | <b>CO: LR encoder adjustment DDS / Enc_adj DDS</b>  |   |  |
| SERVO (Pos ctrl),<br>VECTOR (Pos ctrl),<br>SERVO_AC (Pos ctrl),<br>VECTOR_AC (Pos<br>ctrl) | <b>Can be changed:</b> T<br><b>Data type:</b> Unsigned8<br><b>P-Group:</b> Closed-loop position control<br><b>Not for motor type:</b> -<br><b>Min</b><br>0  | <b>Calculated:</b> -<br><b>Dyn. index:</b> EDS, p0140<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>255 | <b>Access level:</b> 4<br><b>Func. diagram:</b> 4010<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0       |
| <b>Description:</b>  | Number of the drive data set when adjusting the absolute encoder.   |   |  |
| <b>Dependency:</b>   | Refer to: p0404, p2507, p2525   |   |  |
| <b>Note:</b>   | This DDS number is only relevant for absolute encoders.<br>The drive determines the value when adjusting the absolute encoder and the user should not change it.<br>DDS: Drive Data Set   |   |  |

| <b>p2740</b>   |  |                      |                          |

 [13] = Fixed value -150 %  
 [14] = Fixed value -200 %

**Dependency:**

Refer to: p2900, p2901, p2930

**Note:**

The signal sources can, for example, be used to interconnect scalings.

**p2909****Characteristic measurement control word / Char meas STW**VECTOR,  
VECTOR\_AC,  
VECTOR\_I\_AC**Can be changed:** T**Calculated:** CALC\_MOD\_ALL**Access level:** 3**Data type:** Unsigned32**Dyn. index:** -**Func. diagram:** -**P-Group:** Motor identification**Unit group:** -**Unit selection:** -**Not for motor type:** -**Scaling:** -**Expert list:** 1**Min****Max****Factory setting**

-

-

0000 bin

**Description:**

Sets the configuration for the characteristic measurement.

**Bit field:**

| Bit | Signal name                                   | 1 signal | 0 signal | FP |
|-----|---|----------|----------|----|
| 00  | Continue last measurement                     | Yes      | No       | -  |
| 01  | Insert cooling down time during the Iq stages | Yes      | No       | -  |
| 02  | Deactivate speed check                        | Yes      | No       | -  |
| 03  | Deactivate automatic parameter preassignment  | Yes      | No       | -  |

**Notice:**

For bit 00:

- the function can only be activated if the measurement has still not been activated (p2911 = 0).

- the limit values for the measurement are loaded from the file. This means that the settings in p2920, p2921 and p2922 are not active.

**Note:**

For bit 00:

- the last measurement of the magnetic characteristics in the d and q axes (p2910 = 1) is continued at that position up until where the data were saved (in the file).

- to record the measurement again, the measurement with the highest index is used (data.txt or data\_xx.txt, xx = [1...99]).

For bit 01:

- after each measured value of the quadrature axis, the current setpoint is ramped to 0, and the system waits for the time defined in p2925[1].

For bit 03:

- the automated pre-assignment of the current controller and time parameters is deactivated (p1715, p1720, p1722, p1710, p1711, p1712, p2924, p0045).

**p2911****Activating characteristic measurement / Char meas act**VECTOR,

0

4

0

**Description:**

Activating characteristic measurement.

**Value:**

0: Deactivated  
 1: Activated with transfer  
 3: Activated with acceptance and conversion  
 4: Activated without acceptance

## 2 Parameters

### 2.2 List of parameters

**Dependency:** For p2910 = 1:  
 - the measurement can only be activated if the pulses are not enabled.  
 - with this setting, only a value of 4 is possible.  
 - for each measurement, a new file is generated with consecutive number.  
 - for p2909.0 = 1, as a start point, the last value saved in the file with the highest index is used, and the following values are attached to the existing file.  
 - the parameter cannot be changed if p0096 is not 0.  
 Refer to: r2928

**Note:** The characteristic measurement progress is indicated in r2928.

**Description:** Defines the number of measuring points in one coordinate direction. This defines the resolution of the measurement.  
 Uneven number of measuring points:  
 $Resolution = |p2921[x]-p2920[x]|/(p2922-1)$

**Index:** [0] = First coordinate  
 [1] = Second coordinate

**Dependency:** For p2910 = 1:  
 - for p2909.0 = 1, the parameter value is not taken into account .

**Notice:**

- the value of 0 is not included for an even number of measuring points.
- values less than 2 are not permitted.

| CU_I, CU_NX_CX,<br>CU_S_AC_DP,<br>CU_S_AC_PN,<br>CU_S120_PN,<br>CU_S150_PN,<br>CU_S120_DP,<br>CU_S150_DP,<br>CU_I_D410 | <b>Can be changed:</b> U, T<br><b>Data type:</b> Unsigned16<br><b>P-Group:</b> -<br><b>Not for motor type:</b> -<br><b>Min</b><br>0 | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>2 | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>2 |

**Description:** Sets the mode for the time stamp

**Value:**  
0: Operating hours  
1: UTC format  
2: Operating hours + 01.01.2000

**Notice:** For p3100 = 1:  
The system prevents this setting from being changed. The parameter can only be influenced after "Set factory setting" or with a "Project download".

**Note:** RTC: Real-time clock  
UTC: Universal Time Coordinates  
For p3100 = 1:  
Time of day synchronization is only possible with this setting.  
The UTC time started, according to the definition on 01.01.1970 at 00:00:00 and is output in days and milliseconds.

## 2 Parameters

### 2.2 List of parameters

|    |                                   |     |    |   |
|----|-----------------------------------|-----|----|---|
| 06 | Motor overload                    | Yes | No | - |
| 07 | Bus error                         | Yes | No | - |
| 08 | External safety-relevant shutdown | Yes | No | - |
| 09 | Mot encoder fault                 | Yes | No | - |
| 10 | Error communication internal      | Yes | No | - |
| 11 | Fault infeed                      | Yes | No | - |
| 15 | Other faults                      | Yes | No | - |

**Note:**

For bit 00:

Hardware or software malfunction was identified. Carry out a POWER ON of the component involved. If it occurs again, contact Technical Support.

For bit 01:

A line supply fault has occurred (phase failure, voltage level, ...). Check the line supply / fuses. Check the supply voltage. Check the wiring.

For bit 02:

The DC link voltage has assumed an inadmissibly high value. Check the dimensioning of the system (line supply, reactor, voltages). Check the infeed settings.

For bit 03:

An inadmissible operating state of the power electronics was identified (overcurrent, overtemperature, IGBT failure, ...). Check that the permissible load cycles are maintained. Check the ambient temperatures (fan).

For bit 04:

The temperature in the component has exceeded the highest permissible limit. Check the ambient temperature / control cabinet cooling.

For bit 05:

A ground fault / inter-phase short-circuit was detected in the power cables or in the motor windings. Check the power cables (connection). Check the motor.

For bit 06:

The motor was operated outside the permissible limits (temperature, current, torque, ...). Check the load cycles and limits that have been set. Check the ambient temperature / motor cooling.

For bit 07:

The communication to the higher-level control system (internal coupling, PROFIBUS, PROFINET, ...) is either faulted or interrupted. Check the state of the higher-level control system. Check the communication connection/wiring. Check the bus configuration / clock cycles.

For bit 08:

A safety operation monitoring function (Safety) has detected an error.

For bit 09:

When evaluating the encoder signals (track signals, zero marks, absolute values, ...) an illegal signal state was detected. Check the encoder / state of the encoder signals. Observe the maximum frequencies.

For bit 10:

The internal communication between the SINAMICS components is faulted or interrupted. Check the DRIVE-CLiQ wiring. Ensure an EMC-compliant design. Observe the maximum permissible quantity structure / clock cycles.

For bit 11:

The infeed is faulted or has failed. Check the infeed and the surroundings (line supply, filter, reactors, fuses, ...). Check the closed-loop infeed control.

For bit 15:

Group fault. Determine the precise cause of the fault using the commissioning tool.

**Description:**

Displays the global status word for messages.

The appropriate bit is set if at least one message is present at the drive objects.

| Bit field: | Bit | Signal name                  | 1 signal | 0 signal | FP   |
|------------|-----|------------------------------|----------|----------|------|
|            | 09  | Group alarm present          | Yes      | No       | 8065 |
|            | 10  | Group fault present          | Yes      | No       | 8060 |
|            | 11  | Safety group message present | Yes      | No       | -    |

**Note:** The status bits are displayed with delay.

### r3115[0...63] Fault drive object initiating / Fit DO initiating

|             |                              |                      |                                  |
|-------------|------------------------------|----------------------|----------------------------------|
| All objects | <b>Can be changed:</b> -     | <b>Calculated:</b> - | <b>Access level:</b> 3           |
|             | <b>Data type:</b> Integer32  | <b>Dyn. index:</b> - | <b>Func. diagram:</b> 8050, 8060 |

**Description:** Displays the drive object number of the initiating drive object for this fault as integer number.  
Value = 63:

The fault was initiated by the drive object itself.

**Dependency:** Refer to: r0945, r0947, r0948, r0949, r2109, r2130, r2133, r2136, r3120, r3122

**Notice:** The values of this parameter are only saved in a volatile fashion and are lost when switching off or for a warm restart.

**Note:** The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

The structure of the fault buffer and the assignment of the indices is shown in r0945.

### p3116 BI: Suppress automatic acknowledgment / Ackn suppress

|  |                                       |                      |                          |

|  | -                                     | -                    | 0                        |

**Description:** Sets the signal source for the automatic acknowledgment of Control Unit faults.

BI: p3116 = 0 signal

Acknowledgeable faults are automatically acknowledged on the Control Unit.

Control Unit faults with LOCAL propagation are passed on to the first active drive object.

BI: p3116 = 1 signal

Acknowledgeable faults are not automatically acknowledged on the Control Unit.

Control Unit faults with LOCAL propagation are not passed on.

**Dependency:** Refer to: p2102, p2103, p2104, p2105, p3981

**Note:** When selecting a standard telegram, the BICO interconnection for control signal STW1.10 (master control by PLC) is automatically established.

**Description:** Sets the re-parameterization of all safety messages for faults and alarms.

The relevant message type during changeover is selected by the firmware.

0: Safety messages are not re-parameterized

1: Safety messages are re-parameterized

**Note:** A change only becomes effective after a POWER ON.

**Description:**

Displays the diagnostic attribute of the alarm which has occurred.

**Bit field:**

| Bit | Signal name                      | 1 signal | 0 signal | FP |
|-----|----------------------------------|----------|----------|----|
| 00  | Hardware replacement recommended | Yes      | No       | -  |
| 11  | Alarm class bit 0                | High     | Low      | -  |
| 12  | Alarm class bit 1                | High     | Low      | -  |
| 13  | Maintenance required             | Yes      | No       | -  |
| 14  | Maintenance urgently required    | Yes      | No       | -  |
| 15  | Message has gone                 | Yes      | No       | -  |

| 20  | PROFIdrive fault class bit 4     | High     | Low      | -  |

**Dependency:**

Refer to: r2110, r2122, r2123, r2124, r2125, r2134, r2145, r2146, r3121

**Note:**

The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

The structure of the alarm buffer and the assignment of the indices is shown in r2122.

For bit 12, 11:

These status bits are used for the classification of internal alarm classes and are intended for diagnostic purposes only on certain automation systems with integrated SINAMICS functionality.

For bits 20 ... 16:

Bits 20, 19, 18, 17, 16 = 0, 0, 0, 0, 0 --&gt; PROFIdrive message class 0: not assigned

Bits 20, 19, 18, 17, 16 = 0, 0, 0, 0, 1 --&gt; PROFIdrive message class 1: hardware fault/software error

Bits 20, 19, 18, 17, 16 = 0, 0, 0, 1, 0 --&gt; PROFIdrive message class 2: line fault

Bits 20, 19, 18, 17, 16 = 0, 0, 0, 1, 1 --&gt; PROFIdrive message class 3: supply voltage fault

Bits 20, 19, 18, 17, 16 = 0, 0, 1, 0, 0 --&gt; PROFIdrive message class 4: DC link fault

Bits 20, 19, 18, 17, 16 = 0, 0, 1, 0, 1 --&gt; PROFIdrive message class 5: power electronics faulted

Bits 20, 19, 18, 17, 16 = 0, 0, 1, 1, 0 --&gt; PROFIdrive message class 6: overtemperature electronic components

Bits 20, 19, 18, 17, 16 = 0, 0, 1, 1, 1 --&gt; PROFIdrive message class 7: ground fault/phase fault detected

Bits 20, 19, 18, 17, 16 = 0, 1, 0, 0, 0 --&gt; PROFIdrive message class 8: motor overload

Bits 20, 19, 18, 17, 16 = 0, 1, 0, 0, 1 --&gt; PROFIdrive message class 9: communication error to the higher-level control

## 2 Parameters

### 2.2 List of parameters

Bits 20, 19, 18, 17, 16 = 0, 1, 0, 1, 0 --> PROFIdrive message class 10: safe monitoring channel has identified an error  
 Bits 20, 19, 18, 17, 16 = 0, 1, 0, 1, 1 --> PROFIdrive message class 11: incorrect position actual value/speed actual value or not available  
 Bits 20, 19, 18, 17, 16 = 0, 1, 1, 0, 0 --> PROFIdrive message class 12: internal (DRIVE-CLiQ) communication error  
 Bits 20, 19, 18, 17, 16 = 0, 1, 1, 0, 1 --> PROFIdrive message class 13: infeed unit faulted  
 Bits 20, 19, 18, 17, 16 = 0, 1, 1, 1, 0 --> PROFIdrive message class 14: braking controller/Braking Module faulted  
 Bits 20, 19, 18, 17, 16 = 0, 1, 1, 1, 1 --> PROFIdrive message class 15: line filter faulted  
 Bits 20, 19, 18, 17, 16 = 1, 0, 0, 0, 0 --> PROFIdrive message class 16: external measured value/signal state outside the permissible range  
 Bits 20, 19, 18, 17, 16 = 1, 0, 0, 0, 1 --> PROFIdrive message class 17: application/technology function faulted  
 Bits 20, 19, 18, 17, 16 = 1, 0, 0, 1, 0 --> PROFIdrive message class 18: error in the parameterization/configuration/commissioning sequence  
 Bits 20, 19, 18, 17, 16 = 1, 0, 0, 1, 1 --> PROFIdrive message class 19: general drive fault  
 Bits 20, 19, 18, 17, 16 = 0, 1, 1, 0, 0 --> PROFIdrive message class 20: auxiliary unit faulted

## 2 Parameters

### 2.2 List of parameters

**Index:** [0] = Function 1  
[1] = Function 2  
[2] = Function 3

**Dependency:** Refer to: p3290, p3291

**Caution:** The software can crash if an incorrect address and data type are set.

**Notice:** This parameter is only checked and becomes effective when restarting the variable message function.

**Note:** This parameter should only be set for p3291[0...2] = 1.

---

**r3294.0...2** **BO: Variable signaling function output signal / Var sig outp\_sig**

SERVO, HLA,  
SERVO\_AC,  
SERVO\_I\_AC

**Can be changed:** - **Calculated:** - **Access level:** 3  
**Data type:** Unsigned8 **Dyn. index:** - **Func. diagram:** 5301  
**P-Group:** - **Unit group:** - **Unit selection:** -  
**Not for motor type:** - **Scaling:** - **Expert list:** 1  
**Min** **Max** **Factory setting**  
 - - -

**Description:** Display and binector output of the output signal for the variable signaling function.

**Bit field:**

| Bit | Signal name              | 1 signal | 0 signal | FP |
|-----|--------------------------|----------|----------|----|
| 00  | Function 1 output signal | High     | Low      | -  |
| 01  | Function 2 output signal | High     | Low      | -  |
| 02  | Function 3 output signal | High     | Low      | -  |

**Dependency:** Refer to: p3290, p3291, p3295, p3296, p3297, p3298

---

**p3295[0...2]** **Variable signaling function threshold value / Var sig thr\_val**

SERVO, HLA,  
SERVO\_AC,  
SERVO\_I\_AC

**Can be changed:** U, T **Calculated:** - **Access level:** 3  
**Data type:** FloatingPoint32 **Dyn. index:** - **Func. diagram:** 5301  
**P-Group:** - **Unit group:** - **Unit selection:** -

**Description:** For the energy-saving display of a fluid-flow machine, a typical flow characteristic  $P = f(n)$  with 5 points along the characteristic is required.

This parameter specifies the speed (n) of point 1 as a [%].

The characteristic comprises the following value pairs:

Power (P) / speed (n)

p3320 / p3321 --> point 1 (P1 / n1)

p3322 / p3323 --> point 2 (P2 / n2)

p3324 / p3325 --> point 3 (P3 / n3)

p3326 / p3327 --> point 4 (P4 / n4)

p3328 / p3329 --> point 5 (P5 / n5)

**Dependency:** Refer to: r0041, p3320, p3322, p3323, p3324, p3325, p3326, p3327, p3328, p3329  
**Note:** The reference value for power and speed is the rated power/rated speed.  
The energy saved is displayed in r0041.

## 2 Parameters

### 2.2 List of parameters

|                    |  |
|--------------------|--|
| <b>Dependency:</b> | Refer to: p0210  |
| <b>Notice:</b>     | For bit 00:<br>The following applies for Active Infeed chassis:<br>When used with an Active Interface Module (AIM), it is not permissible to activate the Smart Mode.  |
| <b>Note:</b>       | For bit 00:<br>In the Smart Mode, the DC link voltage is not controlled - however, infeed can still regenerate. The magnitude of the DC link voltage depends on the actual line supply voltage and the DC link load.<br>The following applies for Active Infeed booksize:<br>When setting the device supply voltage (p0210) to greater than 415 V, then the Smart Mode is automatically activated. This means that the 660 V limit can be maintained for the steady-state DC link voltage (p0280) up to a line supply voltage of 480 V. If higher DC link voltages are permissible, then p0280 can be increased and the Smart Mode deactivated (see p0210).<br>For a Smart Infeed (S_INF), the Smart Mode is automatically activated (p3400.0 = 1).<br>For bit 01:<br>If the Flat Top Mode is deactivated, switching losses are higher. This means that the full power is no longer continuously available.<br>For p3400.0 = 1 or p1810.15 = 1, this bit is not effective.<br>For bit 03:<br>If the Vdc controller is switched out, overvoltage or undervoltage conditions occur in the DC link if no other voltage-regulating component is located in the DC link.<br>For p3400.0 = 1, this bit is not effective.<br>For bit 05:<br>If a VSM is detected when commissioning the system, this bit is automatically set.<br>When the bit is set, the line supply voltage input of the VSM must be connected (connected at the line side of the line reactor).<br>The bit must be set in the case of chassis power units.<br>VSM: Voltage Sensing Module |

## 2 Parameters

### 2.2 List of parameters

For bit 07:

When the alarm threshold is fallen below, alarm A06810 is output and r3405.7 is set = 1.

The alarm threshold is obtained from the sum of the undervoltage threshold r0296 and offset p0279. As a consequence, the alarm threshold is only effective for p0279 > 0.

Monitoring only takes place when operational.

The following applies for states r3402 ≤ 5 and r3402 = 12: r3405.7 = 0.

| <b>Recommendation:</b>                                  | <p>For line supplies with very low fault rating (short-circuit power), the line and DC link parameter identification may not be able to be carried with the preset control parameter values. The reason for this is that overcurrent or overvoltage faults are output (e.g. F3000x, F06200).</p> <p>For these special cases, please carefully observe the explanations and setting recommendations provided in the following reference:</p> <p>SINAMICS S120 System Manual Line Infeed, Chapter "Notes for commissioning for line supplies with low short-circuit power and variable line parameters".</p>   |                                 |                      |                        |                             |                      |                         |                                     |                      |                          |                              |                   |                       |            |            |                        |   |   |   |
| <b>Dependency:</b>                                      | Refer to: r3411, r3412, r3414, p3415, p3416, p3417, p3421, p3422, p3424, p3555, p3560, p3614<br>Refer to: A06400   |                                 |                      |                        |                             |                      |                         |                                     |                      |                          |                              |                   |                       |            |            |                        |   |   |   |
| <b>Notice:</b>  | For p3410 = 1, 3, 4, 5, 6, alarm A06400 is output, indicating that after the next pulse enable the set identification will take place.<br>The line and DC link adaptation is not permissible for Smart Line Modules in the chassis format.<br>During identification, no additional loads may be switched-in/switched out.<br>Mode p3410 = 6 is only permissible in conjunction with line filters p0220 >= 110.   |                                 |                      |                        |                             |                      |                         |                                     |                      |                          |                              |                   |                       |            |            |                        |   |   |   |
| <b>Note:</b>  | <p>p3410 is automatically set to 0 after an identification run has been completed.</p> <p>When p3410 = 1 an identification run for the total inductance and DC link capacitance is initiated when the pulses are next enabled. The results are displayed in r3411 and r3412. If a Voltage Sensing Module (VSM) is connected, then the line inductance (r3414) is also measured. The infeed then goes into the ready for switching on state.</p> <p>For p3410 = 2, the data (r3411, r3412 and r3414) determined during the identification run (p3410 = 1) are transferred into p3421, p3422 and p3424. The control loop parameters are suitably scaled to achieve a rugged controller setting (p3425); the fast controller response (p3555[2]) and the current actual value smoothing (p3614) are pre-set. Calculations for the controller are then repeated. The user must save the data in a non-volatile fashion so that the new controller setting is effective the next time that the system is switched on.</p> <p>When p3410 = 3 an identification run for the inductance and DC link capacitance is initiated when the pulses are next enabled. Data determined during the identification (r3411, r3412, r3414) are used, as described under p3410 = 2 for the setting of p3421, p3422, p3424, p3425, p3555 as well as p3614, and the controller is re-calculated. All of the parameters for the infeed module are then automatically stored in a non-volatile memory. The infeed continues to operate without any interruption with the new controller parameters.</p> <p>When p3410 = 4 an identification run for the inductance and DC link capacitance is initiated when the pulses are next enabled. Data determined during the identification (r3411, r3412, r3414) are used, as described under p3410 = 2 for the setting of p3421, p3422, p3424, p3425, p3555 as well as p3614, and the controller is re-calculated. The line inductance identification is then repeated, if p3415[1] &gt; p3514[0]. If the inductance measured the second time is lower than the first, the parameters are written to the current controller adaptation (p3620, p3622). All of the parameters for the infeed module are then automatically stored in a non-volatile memory. The infeed continues to operate without any interruption with the new controller parameters.</p> |                                 |                      |                        |                             |                      |                         |                                     |                      |                          |                              |                   |                       |            |            |                        |   |   |   |

## 2 Parameters

### 2.2 List of parameters

For p3410 = 5, the same measurements and write operations are always carried-out as for p3410 = 4. However, initially the controller setting is reset by writing the default values dependent on the power unit to p3421, p3422 and p3424 - and setting p3425[0...1] = 100 %. Further, before the measurements are carried out, a brief identification run is executed to coarsely set the controller.

For p3410 = 6, with the next pulse enable, the system will initiate identification of the DC link capacitance. The data (r3412) determined during the identification is used to set the Vdc controller (p3422). All of the parameters for the infeed module are then automatically stored in a non-volatile fashion. The infeed continues to operate without any interruption with the new controller parameters. This identification mode is used to achieve a robust closed-loop control setting, and is only permissible in conjunction with p0220 > 110.

| <b>Dependency:</b>   | Refer to: p3410, p3421, p3422, p3424, p3614  |  |  |
| <b>Note:</b>   | For index [0, 1]:<br>p3425 is automatically and optimally set when setting the controller parameters with the line supply data identification p3410 >= 2.<br>As the line supply inductance (p3424) increases in comparison to the total inductance (p3421), lower values must be selected for p3425. This means that the control is adapted to weak line supplies with high relative short-circuit voltage uk or high line supply inductance (refer to p3614).<br>The scaled control loop parameters become effective for closed-loop control, i.e. the products p3421 * p3425[0] and p3422 * p3425[1] represent the controller setting. |  |  |

## 2 Parameters

### 2.2 List of parameters

For index [2]:

Sets the inductance value, which is used for the calculations in the decoupling block of the closed-loop current control.

The value of 100% corresponds to the inductance  $p3421 * p3425[0]$ .

Setting values between 100 % and 200 % are recommended for fluctuating line fault levels.

For index [3]:

Sets the value for the line inductance, which is used for the calculations in the line (grid) model of the PLL.

The value of 100 % corresponds to inductance  $p3424$ .

Setting values up to 4x of  $p0223$  are recommended for fluctuating line fault levels.

For index [4]:

The dynamic performance of the current control is defined by the scaling  $p3425[4] * p3617$ .

An optimized setting of  $p3425[4]$  is automatically realized by setting the controller parameters with the line data identification  $p3410 \geq 2$ .

For index [5]:

The dynamic performance of the Vdc control is defined by the scaling  $p3425[5] * p3562$ .

An optimized setting of  $p3425[5]$  is automatically realized by setting the controller parameters with the line data identification  $p3410 \geq 2$ .

#### Description:

Sets the configuration of the Smart Mode.

#### Bit field:

| Bit | Signal name  | 1 signal | 0 signal | FP |
|-----|--|----------|----------|----|
| 00  | Soft Pulse Mode  | ON       | OFF      | -  |
| 01  | Extended Smart Mode                                      | ON       | OFF      | -  |
| 02  | Deselect automatic line identification after<br>POWER ON | Yes      | No       | -  |

#### Notice:

For bit 00:

This parameter influences the line harmonics for regenerative operation.

For operation with Active Interface Module (AIM) the soft-pulse mode must be activated.

For bit 01:

Operating BLM and SLM together (mixed operation) with bit 01 = 1 is not permissible.

#### Note:

For bit 00:

When the pulsed mode for Smart Mode is deactivated, when regenerating, higher phase current gradients occur.

For Smart Line Modules in the "chassis" format, pulsed operation is not effective.

Pulsed operation is not active for Active Line Modules in the "Chassis" format if bit 01 = 1.

For bit 01:

For active Extended Smart Mode, for partial load operation, the line reactive power requirement must be reduced and the average value of the DC link voltage increased.

At rated load and overload, the operating behavior is equivalent to the Smart Mode ( $p3440.1 = 0$ ).

For bit 02 (only effective for bit 01 = 1):

This line supply identification is only effective in the Extended Smart Mode (it should not be confused with the line supply identification using  $p3410$ ).

The values for inductance and DC link capacitance are required for the Extended Smart Mode ( $p3448[0...1]$ ).

Automatic line supply identification must be deselected ( $p3440.2 = 1$ ) when manually entering  $p3448[0...1]$ .

When automatic line supply identification is selected ( $p3440.2 = 0$ ), these values are determined at the first pulse enable after each POWER ON and saved in  $p3448[0...1]$ .

A new line supply identification with the next pulse enable can be initiated by setting  $p3440.2 = 1$  and then by setting  $p3440.2$  back to = 0.

| <b>Notice:</b>  | When automatic line supply identification is selected for the Extended Smart Mode (p3440.2 = 0), the following applies:<br>- the inductance and DC link capacitance values are calculated at the first pulse enable after each POWER ON and saved in p3448[0...1].<br>- the value range of the automatic identification is limited (100 % <= p3448[0...1], p3448[0] <= 100 % + 100 % / p0120). As a consequence, the preassigned values for the commutation inductance (p0223) and the DC link capacitance (p0227) must be correctly entered.<br>- values entered manually are overwritten after the next POWER ON.<br>When automatic line supply identification is deselected for the Extended Smart Mode (p3440.2 = 1), the following applies:<br>- the inductance and DC link capacitance values must be entered manually. |                        |                                  |

## 2 Parameters

### 2.2 List of parameters

**Note:** For index [0]:  
The value is used in the calculation of the reference value of p3443 and in the controller models.  
A value of 100% corresponds to the inductance parameterized in p0223.  
For a parallel circuit, the value corresponds to the inductance of a power unit.  
Values less than 100% do not make sense - and indicate an incorrect setting of p0223 or unsuitable operating points for the line supply identification (p3440.2).  
For index [1]:  
The value is used in the calculation of the reference value of p3441 and in the controller models.  
A value of 100% corresponds to the capacitance parameterized in p0227.  
The value includes the capacitances of all modules connected on the DC link.  
Values less than 100% do not make sense - and indicate an incorrect setting of p0227 or unsuitable operating points for the line supply identification (p3440.2).

**Description:** Sets the scaling values for the line PLL of the infeed.

**Index:**

- [0] = Synchronization fixed voltage value
- [1] = Synchronization angular offset
- [2] = Synchronization angular linearity

**Dependency:** Refer to: A06205, F06500

**Notice:** The default settings only have to be changed in exceptional cases.  
Unsuitable parameter values result in overcurrents and overvoltages.

**Note:** The setting values are only directly effective for pulse enable or for line synchronization. For adaptations, which are also effective in operation, the PLL can be switched over to the configurable transformer model (p5495).

For index [0]:

The setting value is used to finely adjust PLL line synchronization.

For setting values not equal to 0, p3457[0] \* p0210 is set as output voltage for pulse enable. This is especially practical for booksize devices without VSM line voltage measurement.

For index [1]:

The setting value is used to finely adjust PLL line synchronization, and when the pulses are enabled, is added to the line angle that is measured.

The value of 100% corresponds to an angle of 180 °.

For index [2]:

When synchronizing, the linearity of the phase angle is determined in order to check the line quality, and for instance, to detect whether a phase has failed (A06205, F06500). The setting value is used to scale this linearity measured value.

Setting values less than 100 % reduce the sensitivity of the line supply check, for example.

A setting value of 0 % deactivates scaling.

**Description:** Sets the smoothing time for the line supply PLL.

**Index:** [0] = Encoderless operation line supply frequency smoothing time  
[1] = VSM operation line supply frequency smoothing time

**Note:** It may be necessary to reduce the smoothing time for weak line supplies with high frequency fluctuations. There is otherwise a risk of brief orientation errors and the infeed could fail.

**Description:** Sets the time values for phase failure detection and current symmetry monitoring.

**Index:** [0] = Line fault max. duration  
[1] = Current symmetry rms value smoothing time  
[2] = Current symmetry fault delay time

## 2 Parameters

### 2.2 List of parameters

**Dependency:** Refer to: p3465, r3466  
Refer to: F06200, A06205, A06206, F06207

**Note:** For index [0]:  
Sets the maximum permissible wait time for the line supply to return after identifying a line fault.  
This parameter is used to define how long alarm A06205 may be continuously present. Fault F06200 is output after the wait time has expired.  
For p3462[0] = 0, the following applies:  
The time monitoring is deactivated. Fault F06200 is only output, if in addition to A06205, an additional message is initiated with a stop response.

For index [1]:  
Sets the smoothing time to calculate the rms phase current values (r3466) for the current symmetry monitoring (p3465).  
The smoothing time is internally limited to 30 s.

For index [2]:  
Sets the delay time between the Alarm A06206 being permanently active until Fault F06207 is output for the current symmetry monitoring (p3465).

| <b>Description:</b> | Sets scaling values for monitoring the symmetry between the phase currents (r3466).<br>The monitoring serves to identify continuous line phase failures in regular operation.<br>The monitoring for the current-controlled mode is deactivated if one of the indices 0, 1, 2 is set to zero.<br>The monitoring for the Smart Mode is deactivated if one of the indices 3, 4, 5 is set to zero. |                      |  |
| <b>Index:</b>       | [0] = Closed-loop control activation minimum current<br>[1] = Closed-loop control activation maximum current<br>[2] = Closed-loop control alarm asymmetry<br>[3] = Smart Mode activation minimum current<br>[4] = Smart Mode activation maximum current<br>[5] = Smart Mode asymmetry alarm  |                      |  |
| <b>Dependency:</b>  | Refer to: p3462, r3466<br>Refer to: A06205, F06207   |                      |  |
| <b>Notice:</b>      | Current symmetry monitoring is deactivated if the dynamic grid support (p5501) or the grid droop control (p5401) is activated. In these operating cases, asymmetrical loads should also be supplied.<br>The negative phase sequence system control (p3640) controls the current asymmetry - and includes an additional symmetry monitoring of the output voltage (p3647).                      |                      |  |

**Note:** The smoothing time constant for the phase current rms values r3466[0, 1, 2] can be set with p3462[1].

For index [0, 1]:  
Sets the current thresholds for activating symmetry monitoring in current-controlled operation (p3400.0 = 0).  
Monitoring is active if at least one rms phase current value r3466 is greater than p3465[0] \* r0207 - and at least one rms phase current value is less than p3465[1] \* r0207.

For index [2]:  
Sets the alarm threshold for the symmetry of the phase currents in the current-controlled mode.  
The ratio between the lowest and highest rms phase current is monitored (r3466). The thus defined symmetry relationship decreases with increasing asymmetry – and always lies in the range of 0 ... 100 %.  
In operation (r3452 >= 4) the following applies:  
If the symmetry relationship is less than threshold p3465[2], then alarm A06206 is output and status bit r3405.2 = 1 is set.  
If the alarm threshold is permanently exceeded for the time p3462[2], then the device is switched off with fault F06207.

For index [3, 4]:  
Sets the current thresholds for activating symmetry monitoring in the Smart Mode (p3400.0 = 1).  
The monitoring function is always active if at least one phase current rms value (r3466) is greater than p3465[3] \* r0207 - and at least one phase current rms value is less than p3465[4] \* r0207.

For index [5]:  
Sets the alarm threshold for the symmetry of the phase currents in the Smart Mode.  
The ratio between the lowest and highest rms phase current is monitored (r3466). The thus defined symmetry relationship decreases with increasing asymmetry – and always lies in the range of 0 ... 100 %.  
In operation (r3452 >= 4) the following applies:  
If the symmetry relationship is less than threshold p3465[5], then alarm A06206 is output and status bit r3405.2 = 1 is set.  
If the alarm threshold is permanently exceeded for the time p3462[2], then the device is switched off with fault F06207.

**Description:** Display and connector output for the line supply voltage at the input terminals of the line filter in alpha/beta components.

**Index:** [0] = Alpha  
[1] = Beta  
[2] = Alpha  
[3] = Beta  
[4] = Alpha  
[5] = Beta

**Note:** For index [0, 1]:  
The input terminals of the line filter form, for infeeds, the connection point of the Voltage Sensing Module (VSM) to measure the line supply voltage.  
For operation with VSM (p3400.5 = 1), the following applies:  
The voltage measured values r3661 and r3662, transformed into the alpha/beta system are displayed in r3468.  
For encoderless operation without VSM (p3400.5 = 0), the following applies:  
The estimated values of the voltages from the line supply model of the PLL transformed into the alpha/beta system are displayed in r3468.  
For index [2, 3]:  
The basic fundamental amplitudes of the clocked inverter output voltages are displayed.  
The values are only valid when operation is enabled.  
For index [4, 5]:  
The basic fundamental amplitudes of the voltage source calculated using a line model are displayed.  
The values are only valid when operation is enabled.

## 2 Parameters

### 2.2 List of parameters

**Note:** The following definition of the signs corresponds with that used in the relevant standards relating to line supplies (e.g. VDE-AR-4105).  
 For under-excited operation (negative reactive current:  $r0076 < 0$ ), the following applies:  
 Lower output voltage or lagging current is identified with a positive sign.  
 For over-excited operation (positive reactive current:  $r0076 > 0$ ), the following applies:  
 Higher output voltage or leading current is identified with a negative sign.

**Description:** Display and connector output for the absolute value of the offset factor (cos phi).  
 The offset factor cos phi is defined as the cosine of the phase angle between the sinusoidal oscillation of the voltage and of the current of the fundamental frequency.

**Index:** [0] = Space vector 1  
 [1] = Space vector 2

**Notice:** The current and voltage signals must come from the same line supply to which the Active Line Module is connected (identical line frequency).  
 p3475.2 can be used to compensate if the phase sequence is reversed with respect to the Active Line Module connection terminals.

**Description:** Sets a dead time for the current measurement.  
 This means that a calibration of the current measuring instant ensures a precise cos phi measurement in 3-conductor coordinates.

**Index:** [0] = Space vector 1  
 [1] = Space vector 2

**Notice:** A calibration is only required for signal sources in 3-conductor coordinates (p3475.1 = 1).

**Note:** A calibration value can be checked as follows:  
 1. Set p3473[0, 1] = p3467[2, 3], configuration p3475[0] = 1.  
 2. Determining a cos phi reference value.  
 3. Set p3473[2, 3] = p3671, p3672, configuration p3475[1] = 3.  
 4. When the calibration value is correctly set, both indices of "cos phi display actual absolute value" p3478[0, 1] contain the same value.

**Description:** Sets the maximum steady-state modulation depth.  
 When this limit is reached, the DC link voltage is boosted to maintain the control margin. This means that the control reserve is maintained.

**Dependency:** Refer to: p3481, r3485

|                     | 1.60   | 3.00                 | 1.60                     |
| <b>Description:</b> | Sets the maximum permissible step-up factor for the power unit used in conjunction with the line filter parameterized in p0220[0]. |                      |                          |
| <b>Dependency:</b>  | Refer to: p0210, p0220, p3510  |                      |                          |

**Note:** The maximum step-up factor determines the maximum ratio between the DC link voltage setpoint (p3510) and the unit supply voltage (p0210).  
 The input of the DC link voltage setpoint (p3510) is limited corresponding to the permissible step-up factor (p3508):  
 $p3510 \leq p0210 * p3508$ .  
 Pre-setting values:  
 380 ... 480 V booksize units without Active Interface Module: 1.60  
 380 ... 480 V booksize units with Active Interface Module (p0220 = 41 ... 45): 2.00  
 380 ... 480 V chassis units: 2.00  
 500 ... 690 V chassis units: 2.00  
 Maximum values:  
 380 ... 480 V booksize units without Active Interface Module: 1.60  
 380 ... 480 V booksize units with Active Interface Module (p0220 = 41 ... 45): 2.00  
 380 ... 480 V chassis units: 2.00  
 500 ... 690 V chassis units: 2.00  
 When the filter setting (p0220) is changed, then the setting of the maximum step-up factor (p3508) is also automatically adapted.

|--|---|--|---|
| SERVO (Tech_ctrl),<br>SERVO_AC<br>(Tech_ctrl),<br>SERVO_I_AC<br>(Tech_ctrl), A_INF,<br>R_INF | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Closed-loop control<br><b>Not for motor type:</b> -<br><b>Min</b><br>100.00 [V] | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> 5_2<br><b>Scaling:</b> p2001<br><b>Max</b><br>1600.00 [V] | <b>Access level:</b> 2<br><b>Func. diagram:</b> 8910, 8940<br><b>Unit selection:</b> p0505<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>600.00 [V] |

**Description:** Sets the setpoint for the DC link voltage.

**Dependency:** Refer to: p0210, p0280, p3400, p3508, p3511

**Warning:** Before increasing the voltage limit for pulsed operation of a controlled booksize infeed with line supply voltages  $p0210 > 415$  V it should be checked whether the motors connected to the DC link are specified for the higher motor voltages.

The warning information associated with p0210 must be carefully observed.

**Note:** When the Smart Mode is activated ( $p3400.0 = 1$ ) the DC link voltage is not regulated, i.e. the value entered here is in this case not effective.

The permissible range of the DC link voltage depends on the parameterized unit supply voltage (p0210) and the permissible, maximum continuous DC link voltage (p0280).

In voltage-controlled operation ( $p3400.0 = 0$ ) the following applies:

$p3510 \geq 1.42 * p0210$  and

$p3510 \leq p3508 * p0210$  and

$p3510 \leq p0280$ .

In the Smart Mode ( $p3400.0 = 1$ ) the following applies:

The setpoint p3510 for the DC link voltage control is inactive. In order to permit an adapted display, deviating from voltage-controlled operation, the lower limit p3510 is  $\geq 1.2 * p0210$ .

**Description:** Sets the signal source for dynamically limiting the reactive current and apparent current.

**Index:**  
[0] = Inductive reactive current limit  
[1] = Capacitive reactive current limit  
[2] = Absolute apparent current limit

**Dependency:** Refer to: r0209, p3525, p3526, p3527, r3535, r3536

**Note:**  
For index [0]:  
The effective current limit is obtained from  $p3524[0] * p3525 * r0209[0]$ .  
For index [1]:  
The effective current limit is obtained from  $p3524[1] * p3526 * r0209[0]$ .  
For index [2]:  
The effective current limit is obtained from  $p3524[2] * p3527 * r0209[0]$ .

|                     | <b>Min</b>   | <b>Max</b>              | <b>Factory setting</b>       |
|                     | 1.00 [Arms]  | 100000.00 [Arms]        | 10000.00 [Arms]              |
| <b>Description:</b> | Sets the motoring limit for the active line current.<br>The currently effective current limit is displayed in r0067[0].  |                         |                              |
| <b>Dependency:</b>  | Refer to: r0067, p3532   |                         |                              |
| <b>Notice:</b>      | If this limit is selected lower than the maximum current permissible for the power unit (r0067), the infeed can no longer provide its full controlled power. Operating faults of the infeed can occur due to the resulting DC link undervoltage.<br>For self-commutated infeeds, the DC link voltage decreases if more power is drawn from the DC link by the connected load than can be supplied by the line because of the power unit maximum current or a limit in p3530. If the DC link voltage decreases down to the rectified value, then the complete current - necessary to cover the required active power - flows, uncontrolled into the rectifier circuit via the diodes.<br>This is the reason that, for physical reasons, the value in p3530 cannot act as current limit that is always maintained. The value forms a current threshold from which point onwards the DC link energy is used as buffer for brief power fluctuations. |                         |                              |
| <b>Note:</b>        | If Smart Mode is activated (p3400.0 = 1), the setting in this parameter is not active.   |                         |                              |
| <b>p3531</b>        | <b>Infeed active current limit generating / INF I_lim gen</b>  |                         |                              |

| <b>Description:</b>    | Sets the fast Vdc controller intervention for a step-like decrease of the DC link voltage due to a high motor load of the infeed.<br>The Vdc controller fast intervention is deactivated for p3555[5] = 0 % or p3560 < 100% or p0225 > 0.5 * p0223.<br>For a line supply and DC link identification (p3410 >= 2) the level of the fast controller intervention (p3555[2]) is automatically adapted to the line supply inductance.   |                        |  |
| <b>Recommendation:</b> | Precise system knowhow is required when correctly changing this parameter!<br>- generally, the fast controller intervention is used to improve the control behavior for high-speed load changes. The function can therefore always be deactivated with p3555[5] = 0 % if no peak load duty cycles are required in the application.<br>- using p3555[0], the calculation of the modulation depth is determined in the case of high system deviations also when the controller intervention is deactivated. This is the reason that p3555[0] should generally not be changed.   |                        |  |
| <b>Index:</b>          | [0] = Intervention threshold 1: Vdc deviation from the setpoint<br>[1] = Intervention threshold 2: Vdc difference to the rectified value<br>[2] = Fast intervention automatic scaling<br>[3] = Fast intervention precontrol<br>[4] = Fast intervention timeout<br>[5] = Fast intervention manual scaling  |                        |  |
| <b>Note:</b>           | p3555[0]:<br>Vdc system deviation as a percentage of the setpoint of the DC link voltage (first condition to initiate fast controller intervention). The threshold is also used to internally change over the modulation depth calculation for high system deviations and should therefore generally not be changed!<br>p3555[1]:<br>Vdc threshold as a percentage of the rectified value of the actual line supply voltage (second condition to initiate the fast controller intervention). Both threshold conditions must be fulfilled to initiate the controller intervention.<br>p3555[2]:<br>Percentage overall level of the fast intervention (scaling factor). For a line supply identification with p3410 >= 2, the factor is automatically adapted or, for weak line supplies with a high inductance, set to 0.<br>p3555[3]:<br>Percentage correction of the precontrol for a fast voltage dip (dead time compensation).<br>p3555[4]:<br>Percentage minimum time between two controller interventions (100% corresponds to 100 ms). If high load change frequencies occur with the application, the minimum time between two controller interventions can be reduced using p3555[4]. |                        |  |

## 2 Parameters

### 2.2 List of parameters

p3555[5]:

Percentage overall level of the fast intervention (scaling factor). With p3555[5] = 0, the fast controller intervention is inhibited. For weak line supplies with a high inductance, it makes sense to deactivate the fast intervention.

**Description:**

The D component of the current precontrol is determined from the device data of the filter. p3603 can be used to weigh the precalculated D component. If no dynamic precontrol is to be used, set the factor to zero.

**p3604****CI: Infeed current precontrol factor D component scaling / INF I\_ctrl D scale**

| <b>Description:</b>                                  | Sets the time constant for the PT1 filtering of the active current actual value and reactive current actual value.   |                        |                                  |
| <b>Index:</b>  | [0] = Current actual value smoothing with dead time<br>[1] = Current actual value smoothing without dead time<br>[2] = System deviation smoothing without dead time<br>[3] = Automatic system deviation smoothing  |                        |                                  |

**Note:** The current actual value filter is deactivated with p3614[0, 1, 2] = 0.  
 For index [0]:  
 The PT1 filter with a clock cycle dead time can be used to stabilize the closed-loop current control for extremely weak line supplies (with higher relative short-circuit voltage uk).  
 For an automatic controller setting with p3410 >= 2, the current actual value filter is automatically pre-set.  
 For index [1]:  
 The PT1 filter without dead time can be used to optimize the closed-loop current control (e.g. in conjunction with frequency wobulation).  
 For index [2]:  
 The PT1 filter without dead time for the system deviation (r3606, r3608) can be used to stabilize the closed-current control for weak line supplies (with low line fault rating).  
 For index [3]:  
 For an automatic controller setting, the PT1 filter without dead time for the system deviation (r3606, r3608) is preset with p3410 >= 2.  
 The filter is only active if the following applies: p3614[2] = 0.

| <b>Description:</b> | Sets the switch-in threshold for the current controller adaptation.<br>The value refers to the maximum power unit current (r0209).<br>From the starting threshold onwards, the inductance value (p3421) used for current control is reduced linearly as a function of the current value. The inductance value for the maximum power unit current is therefore p3421 * p3622.  |                        |                              |
| <b>Dependency:</b>  | Refer to: p3410, p3415, p3622   |                        |                              |
| <b>Note:</b>        | The parameter can be set automatically using the line supply identification (p3410 = 4, 5) (also refer to p3622).<br>Prerequisite for a reliable measurement of p3622 is that the current magnitude for run 2 (p3415[1]) is at least 10 % higher than the current magnitude for run 1 of the line supply identification. Otherwise, the measurement result is rejected.<br>In the case of a correct measurement, p3620 is set to 80% of the current magnitude for run 1 (p3415[0]).<br>For chassis power units, it is generally not necessary to adapt p3620 and p3622 to the characteristics of the line supply. However, when required, the current controller adaptation can be optimized by selecting suitable current magnitudes for p3415.<br>For booksize power units, p3620 and p3622 are automatically adapted with the then valid factory setting of the line identification p3415. |                        |                              |

|                     | <b>Min</b>  | <b>Max</b>             | <b>Factory setting</b>       |
|                     | 0.01 [%]  | 100.00 [%]             | 85.00 [%]                    |
| <b>Description:</b> | Sets the inductance of the line reactor at the maximum power unit current (r0209) as a percentage of the inductance (p3421) at the application threshold (p3620).   |                        |                              |
| <b>Dependency:</b>  | Refer to: p3410, p3415, p3620   |                        |                              |

**Note:** The parameter for a line supply identification (p3410 = 4, 5) automatically optimized, if the following applies:  
 p3415[1] - p3415[0] > 10 %  
 Otherwise, the measurement result is rejected.  
 For chassis power units, it is generally not necessary to adapt p3620 and p3622 to the characteristics of the line supply. However, when required, the current controller adaptation can be optimized by selecting suitable current magnitudes for p3415.  
 For booksize power units, p3620 and p3622 are automatically adapted with the then valid factory setting of the line identification p3415.

**Description:** Sets the Order of the line harmonics for the current harmonics controller.  
 p3624[0]: Order of the line harmonics for the first harmonics controller.  
 p3624[1]: Order of the line harmonics for the second harmonics controller.

**Dependency:** Refer to: p3625, r3626

**Note:** Harmonics in the line supply voltage can cause harmonics in the converter current. These types of current harmonics can be reduced by activating additional controller modules.  
 Example:  
 For a 50 Hz line supply harmonics at 250 Hz in the phase currents can be reduced by activating a harmonic controller with Order 5 (p3624[0] = 5).

| <b>p3636[0...2] CI: Negative phase-sequence system controller phase current scaling / Neg_sys_ctr ph sc</b> |  |  |   |
|---|--|--|---|
| A_INF (Dyn. grid support), R_INF (Dyn. grid support)  | <b>Can be changed:</b> U, T<br><b>Data type:</b> Unsigned32 / FloatingPoint32<br><b>P-Group:</b> Closed-loop control<br><b>Not for motor type:</b> -<br><b>Min</b><br>-  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> PERCENT<br><b>Max</b><br>- | <b>Access level:</b> 4<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0 |
| <b>Description:</b>   | Sets the signal source for scaling the phase current using the negative phase-sequence system controller. Setpoints not equal to 0 result in shifting the corresponding phase currents to the two other phases. As a consequence, an identical scaling value for all 3 phases does not result in a change in the current.  |  |   |
| <b>Index:</b>   | [0] = Phase U<br>[1] = Phase V<br>[2] = Phase W  |  |   |
| <b>Caution:</b><br>        | Unequal scaling values result in an oscillating line power and therefore in voltage fluctuations in the DC link and asymmetrical line supply load.<br>As a consequence, additional thermal losses occur in the inverter<br>Further, this can have a negative impact on adjacent systems and components - or even damage them.<br>Depending on the magnitude of the asymmetry, increased harmonics can occur in the phase currents.<br>It may be necessary to increase the capacitance in the DC link to reduce the amplitude of the DC link voltage fluctuations.  |  |   |
| <b>Notice:</b>  | The phase current scaling requires the calculation of the line voltage negative-phase sequence system (p5500.3 = 1). Grid support (p5501) can be activated or deactivated.<br>Internally, the value range of p3636 is limited depending on p3527.<br>The following applies to the maximum absolute value of the scaling value:<br>$(100 \% - p3527) * 2$<br>The complete value range [-1, 1] assumes that p3527 is set $\leq 50 \%$ . For p3527 = 100 %, p3636 is not effective.<br>Contrary to entering setpoint pointers (p3641), the phase current scaling becomes active with p3636 after the dynamic grid support has entered a setpoint (p5506, p5509). As a consequence, dynamic grid support is influenced by p3636. Inversely, it also applies that the current change as a result of p3636 is not taken into account in the dynamic grid support, and therefore the dynamic phase-by-phase current limiting must be deactivated (p5500.7 = 0). |  |   |
| <b>Note:</b>  | The scaling signals are internally limited by the value range [-1, 1].<br>Example:<br>p3636[0] = 1 signal (corresponds to 100 %) results in a reduction of the current setpoint in phase U to approximately 0, if the following applies:<br>p3636[1] = p3636[2] = 0 signal<br>The current amplitudes of the two other phases V and W are then symmetrically increased by 50 %.<br>The setpoints r5510[4, 6] and the negative phase-sequence system setpoint pointer calculated using p3636 are added.  |  |   |

| <b>Description:</b>  | Sets the scaling values for the negative phase-sequence system controller.  |   |   |
| <b>Index:</b>  | [0] = Integral time<br>[1] = Integrator feedback coupling<br>[2] = DC link voltage extrapolation<br>[3] = DC link voltage filter  |   |   |
| <b>Note:</b>   | For index [0]:<br>The value 100% corresponds to the integral time, which is active for the regular positive phase-sequence system current controller (p3617).<br>With p3639[0] = 0, the integral component of the negative phase sequence system controller is deactivated.<br>For index [1]:<br>Sets an integrator feedback loop, which, for values greater than 0, results in a PT1 response. In the control, instead of an integrator, a 1st order delay element with time constant $[-p0115[0] / \ln(1 - p3639[1])]$ is active. This allows the negative phase-sequence system controller stability range to be extended.<br>Internally, the setting value is limited to 10 %.<br>We only recommend that this parameter is changed if stability problems are encountered. Typical setting values are in the range of 1%.<br>For index [2]:<br>Sets the extrapolation width for the actual value of the DC link voltage to compensate for Vdc oscillation. A value of 100% corresponds to an extrapolation of one current controller sampling time (p0115[0]).<br>The extrapolated value is displayed in r3643[1]. |   |   |

For index [3]:

Sets the scaling factor for the Vdc actual value filter.

At twice the line supply frequency, this component of the Vdc oscillation can pass through the bandstop and causes the Vdc controller to respond. As a consequence, the stability of the overall closed-loop control can be improved.

The setting values are internally limited to 100%.

**p3640****Negative phase-sequence system controller configuration / Neg\_sys ctr config**

A\_INF (Dyn. grid support, Line transf, Suppl cl-loop ctrl), R\_INF (Dyn. grid support, Line transf, Suppl cl-loop ctrl)

**Can be changed:** U, T

**Calculated:** -

**Access level:** 3

**Data type:** Unsigned16

**Dyn. index:** -

**Func. diagram:** 7987

**P-Group:** Closed-loop control

**Unit selection:** -

**Not for motor type:** -

**Scaling:** -

**Expert list:** 1

**Min**

**Max**

**Factory setting**

-

-

0000 bin

**Description:**

Sets the configuration for the negative phase-sequence system current controller.

**Recommendation:**

Setting p3640 = 7 is recommended if the emphasis is not on correcting current asymmetry, but on identifying high-ohmic line supply phase failures.

**Bit field:**

| Bit | Signal name   | 1 signal | 0 signal | FP |
|-----|---|----------|----------|----|
| 00  | Negative phase-sequence system current controller activated | Yes      | No       | -  |
| 01  | Asymmetry monitoring activated                              | Yes      | No       | -  |
| 02  | Output limiting activated                                   | Yes      | No       | -  |

**Note:**

For bit 00:

The negative phase-sequence system controller controls negative phase-sequence components in the line current.

For asymmetry in the line supply, this means that current harmonics with 2x the line frequency can be compensated.

For bit 01:

Only active for bit 0 = 1.

For bit 1 = 1, the following applies:

The smoothed amplitude of the controller output is monitored, and when a threshold is exceeded (p3647[1]) an alarm is output (A06208) - and the signal bit for phase failure is set (r3405.2 = 1).

When compared to passive monitoring, this negative phase-sequence system control represents active phase failure detection; even under no load conditions, it can be guaranteed that single-phase, high-ohmic line supply faults are detected.

For bit 02:

Only active for bit 0 = 1.

For bit 2 = 1, the following applies:

In the case of high-ohmic line supply faults (e.g. phase failure), the line asymmetry that occurs can result in a significant increase in the controller integral components, and as a consequence in a fault shutdown (e.g. fault F06200).

If these types of line supply faults are to be ridden through without shutdown (as far as is possible), then the controller output voltage limiting must be activated (threshold p3647[0]).

When monitoring is active (bit 1), for example, after A06208 occurs, a higher-level control system can initially shut down the drives in a controlled fashion - and then switch off the Active Infeed.

**p3641[0...1]****CI: Negative phase-sequence system controller setpoint pointer / Neg\_seq ctrl set**

A\_INF (Dyn. grid support, Line transf, Suppl cl-loop ctrl), R\_INF (Dyn. grid support, Line transf, Suppl cl-loop ctrl)

**Can be changed:** T

**Calculated:** -

**Access level:** 4

**Data type:** Unsigned32 / FloatingPoint32

**Dyn. index:** -

**Func. diagram:** 7987

**P-Group:** Closed-loop control

**Unit group:** -

**Unit selection:** -

**Not for motor type:** -

**Scaling:** p2002

**Expert list:** 1

**Min**

**Max**

**Factory setting**

-

-

0

**Description:**

Sets the signal source for the setpoint pointer of the negative phase-sequence system current controller.

**Index:**

[0] = Active

[1] = Reactive

**Warning:**

Setpoints not equal to zero result in an oscillating line power and therefore in voltage fluctuations in the DC link and asymmetrical line supply load.

## 2 Parameters

### 2.2 List of parameters

**Note:** When the function module "dynamic grid support" (r0108.7 = 1) is activated, the following applies:  
The setpoints r5510[4, 6] and the setpoints of the signal source are summed.

**Description:** Sets the voltage scaler for the Voltage Sensing Module (VSM).

**Note:** When the 690 V input is used (X522) without voltage scaler, 0 % should be entered.  
 When the 100 V input (X521) is used with voltage scaler to measure medium voltages, the dividing (scaling) factor multiplied by 100% should be entered.  
 Example:  
 1000 V line supply voltage, voltage scaling, 10:1  
 --> voltage at the VSM input is 100 V  
 --> p3660 = 10 \* 100 % = 1000 %

---

**p3660 VSM input line supply voltage voltage scaler / VSM inp U\_scaler**

**Description:** Sets CT gain of the CT connected at the 10 V input of the Voltage Sensing Module (VSM).  
The parameter specifies the current magnitude in [A] referred to the input voltage at the VSM in [V].

Example:

CT with 1 V per 200 A.

--> p3670 = 200

**Dependency:** Refer to: r3671, r3672

**Note:** The CT for phase 1 is connected at terminals X520.1 and X520.2 of the VSM.  
The CT for phase 2 is connected at terminals X520.3 and X520.4 of the VSM.

**Dependency:** Refer to: A06904

**Caution:** When the Braking Module is inhibited, no energy can be dissipated in the braking resistor.

---

### p3681 **BI: Activating Braking Module internal DC link fast discharge / BM intDCdischg act**

|       |                                       |                      |                          |
|-------|---------------------------------------|----------------------|--------------------------|
| B_INF | <b>Can be changed:</b> T              | <b>Calculated:</b> - | <b>Access level:</b> 3   |
|       | <b>Data type:</b> Unsigned32 / Binary | <b>Dyn. index:</b> - | <b>Func. diagram:</b> -  |
|       | <b>P-Group:</b> -                     | <b>Unit group:</b> - | <b>Unit selection:</b> - |
|       | <b>Not for motor type:</b> -          | <b>Scaling:</b> -    | <b>Expert list:</b> 1    |
|       | <b>Min</b>                            | <b>Max</b>           | <b>Factory setting</b>   |
|       | -                                     | -                    | 0                        |

**Description:** Sets the signal source to activate the DC link fast discharge for an internal braking module.  
When the following conditions apply, the DC link fast discharge is started later with delay time (p3682):

- BI: p3681 = 1 signal.
- an external line contactor is opened via r0863.1 "energize contactor".

The DC link fast discharge is interrupted when the following conditions apply:

- BI: p3681 = 0 signal.
- ON command for the infeed.

**Recommendation:** The DC link fast discharge should be activated if there is an external line contactor and is correctly interconnected (r0863.1, p0860). If the DC link fast discharge is not activated together with an external line contactor, then faults can occur when precharging (e.g. F30027).

**Dependency:** Refer to: p3682

Refer to: F30027

**Notice:** The parameter is only effective for Basic Line Modules with the internal Braking Module (this is valid for Basic Line Modules with a power rating of less than 100 kW).

---

|   | <b>Min</b>                                     | <b>Max</b>                    | <b>Factory setting</b>     |
|   | -  | -                             | 0                          |

**Description:** Sets the signal source for the actual value of the external velocity actual value for APC.

**Recommendation:** When interconnecting a speed actual value from another axis, it is recommended to evaluate the bit "Speed information available" (r1992.11) (e.g. interconnect to an external fault p2106 - p2108).

To avoid additional dead time as a result of the calculation sequence, it is recommended to set the drive object associated with the signal source of p3749 to a higher priority (p7900).

**Dependency:** Refer to: p3748

**Note:** APC: Advanced Positioning Control

**Note:** For bit 09:

For closed-control of an induction motors with encoder, the switchover between the current and observer model is displayed (see also r1751.19), if p3844 is > 0.

For bit 9 = 0 (observer model active), the following applies:

The frictional torque is calculated from the characteristic values from the characteristic point entered into p3844.

For bit 9 = 1 (current model active), the following applies:

The frictional torque is calculated from the characteristic values below the characteristic point entered into p3844.

| <b>Description:</b>                                    | <p>Selects the upper changeover point of the friction characteristic for the frictional torque input controlled by the motor model of the induction motor.</p> <p>The speed of this changeover point is pre-assigned when automatically calculating with the changeover speed p1752. The changeover point located below is pre-assigned with the changeover speed <math>p1752 * (1 - p1753)</math>.</p> <p>Example:<br/>p3844 = 3 means that the speed value for the change to the monitor model (p3823 = p1752) is entered into p3823 (friction characteristic value n3).</p> <p>Depending on the display of r3840.9, the frictional torque is calculated from the friction characteristic values, which are associated with these changeover points. For the changeover of the motor model, with hysteresis, the frictional torque smoothed with p3843 changes between these two states.</p> |                               |                          |
| <b>Dependency:</b>                                     | <p>As part of the automatic calculation (p0340), p3844 is only activated for closed loop control (p1300 = 21, 23) of induction motors with encoder.</p> <p>Refer to: p3843</p>   |                               |                          |
| <b>Notice:</b>   | <p>If the changeover point defined using p3844 does not match the changeover speed p1752, then internally, the model-controlled friction torque input is automatically deactivated (same as for p3844 = 0).</p>  |                               |                          |
| <b>Note:</b>   | <p>For p3844 = 0, the model-controlled frictional torque changeover is deactivated. The frictional torque is then calculated the same as for the encoderless control by interpolating between the points along the friction characteristic.</p>  |                               |                          |

| <b>p3845</b>  | <b>Record friction characteristic activation / Frict record act</b>  |                      |                            |

|   | <b>Min</b>   | <b>Max</b>           | <b>Factory setting</b>     |
|   | 0  | 3                    | 0                          |
| <b>Description:</b>   | <p>Setting for the friction characteristic record.</p> <p>After the next switch-on command, the friction characteristic is automatically recorded.</p>   |                      |                            |
| <b>Value:</b>   | <p>0: Record friction characteristic deactivated<br/> 1: Record friction characteristic activated all directions<br/> 2: Record friction characteristic activated positive direction<br/> 3: Record friction characteristic activated negative direction</p>   |                      |                            |
| <b>Dependency:</b>  | <p>When selecting the friction characteristic measurement, the drive data set changeover is suppressed.</p> <p>For linear drives (refer to r0108.12) it is not permissible to carry out the friction characteristic measurement for mechanical systems that limit travel.</p>  |                      |                            |
| <b>Danger:</b>  | <p>For drives with a mechanical system that limit the distance moved, it must be ensured that during recording, the friction characteristic is not reached. If this is not the case, then it is not permissible that the measurement is carried out.</p>   |                      |                            |
|  |  |                      |                            |
| <b>Notice:</b>  | <p>To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).</p>  |                      |                            |
| <b>Note:</b>  | <p>When the friction characteristic record is active, it is not possible to save the parameters (p0971, p0977).</p> <p>When the friction characteristic record is active (p3845 &gt; 0), it is not possible to change p3820 ... p3829, p3830 ... p3839 and p3842.</p> <p>When recording the friction characteristic, in addition to the friction, the motor losses are also determined (e.g. iron losses, eddy current losses and re-magnetizing losses). A differentiation is not made between these individual loss components. We recommend that a motor temperature sensor is used because torque deviations can also be emulated/mapped on the characteristic due to the thermal influence.</p> |                      |                            |

**Description:** Signal to energize terminal X21.1 "inhibit/acknowledgment" on the Braking Module.  
This binector output is used as signal source to interconnect to a digital output.  
For "booksize" formats the digital output must be connected to terminal X21.1 and for "chassis" formats the digital output must be connected to terminal X21.3 of the particular Braking Module.

| <b>Bit field:</b> | <b>Bit</b> | <b>Signal name</b>                   | <b>1 signal</b> | <b>0 signal</b> | <b>FP</b> |
|-------------------|------------|--------------------------------------|-----------------|-----------------|-----------|
|                   | 00         | Inhibit/acknowledge Braking Module 1 | High            | Low             | -         |
|                   | 01         | Inhibit/acknowledge Braking Module 2 | High            | Low             | -         |
|                   | 02         | Inhibit/acknowledge Braking Module 3 | High            | Low             | -         |
|                   | 03         | Inhibit/acknowledge Braking Module 4 | High            | Low             | -         |
|                   | 04         | Inhibit/acknowledge Braking Module 5 | High            | Low             | -         |
|                   | 05         | Inhibit/acknowledge Braking Module 6 | High            | Low             | -         |
|                   | 06         | Inhibit/acknowledge Braking Module 7 | High            | Low             | -         |
|                   | 07         | Inhibit/acknowledge Braking Module 8 | High            | Low             | -         |

**Warning:**  It is crucial that you ensure the correct interconnection of binector outputs r3861.n - and/or the wiring of the corresponding digital outputs!  
If the interconnections/connections are incorrect, and if the Braking Module develops a fault condition, then the software could execute a different (incorrect) function via binector outputs r3861.n.

**Description:** Sets the delay time for switching in the DC link fast discharge.  
**Dependency:** Refer to: p3863, r3864  
**Note:** The DC link fast discharge is only possible for "booksize" formats. This function is not supported for "chassis" formats.

| <b>p3863</b>  |                                       | <b>BI: Activating Braking Module DC link fast discharge / BM DC-dischg act</b> |                            |  |
|---|---------------------------------------|--|----------------------------|--|
| A_INF (Brk Mod ext),<br>S_INF (Brk Mod ext),<br>R_INF (Brk Mod ext),<br>B_INF (Brk Mod ext) | <b>Can be changed:</b> T              | <b>Calculated:</b> -   | <b>Access level:</b> 3     |  |
|   | <b>Data type:</b> Unsigned32 / Binary | <b>Dyn. index:</b> -   | <b>Func. diagram:</b> 9951 |  |
|   | <b>P-Group:</b> -                     | <b>Unit group:</b> -   | <b>Unit selection:</b> -   |  |
|   | <b>Not for motor type:</b> -          | <b>Scaling:</b> -  | <b>Expert list:</b> 1      |  |
|   | <b>Min</b>                            | <b>Max</b>   | <b>Factory setting</b>     |  |
|   | -                                     | -  | 0                          |  |

**Description:** Sets the signal source to activate the DC link fast discharge.  
The DC link fast discharge is started later with delay time (p3862) when the following conditions apply:  
- BI: p3863 = 1 signal.  
- an external line contactor is opened via r0863.1 "energize contactor".  
The DC link fast discharge is interrupted when the following conditions apply:  
- BI: p3863 = 0 signal.  
- ON command for the infeed.  
**Recommendation:** The DC link fast discharge should be activated if there is an external line contactor and is correctly interconnected (r0863.1, p0860). If the DC link fast discharge is not activated together with an external line contactor, then faults can occur when precharging (e.g. F30027).

## 2 Parameters

### 2.2 List of parameters

**Dependency:** Refer to: r3864  
Refer to: F30027

**Note:** The DC link fast discharge is only possible for "booksize" formats. This function is not supported for "chassis" formats.

## 2 Parameters

### 2.2 List of parameters

**Danger:**  Setting an incorrect commutation angle can result in instability in the closed-loop control and in turn injure personnel or cause damage to the machine!

**Note:** Setting takes place for a 0/1 signal edge.

---

**Description:** Sets the signal source for the commutation angle.  
This angle is set for a 0/1 edge of the signal via binector input p3871.

**Dependency:** Refer to: p3870, p3871, p3873, r3875, p3876, p3878, p3879

**Danger:**  Setting an incorrect commutation angle can result in instability in the closed-loop control and in turn injure personnel or cause damage to the machine!

**Description:** Sets the signal source to activate the essential service mode (ESM) via digital input. Using this function, when required the motor can be operated for as long as possible (e.g. to extract smoke).  
 BI: p3880 = 1 signal:  
 The essential service mode is activated.  
 BI: p3880 = 0 signal:  
 The essential service mode is deactivated.

**Dependency:** The function can only be activated for the following products:  
 - SINAMICS G130/G150/S150 (VECTOR)  
 - SINAMICS S120 AC drive (AC/AC, CU310-2 with PM240-2, VECTOR\_AC)  
 If the signal source for the ESM activation is interconnected (p3880 > 0), and a motor encoder is parameterized (p0187, p0400), then for an encoder fault, the fault response is automatically activated (p0491 = 1).  
 Refer to: p3881, p3882, p3883, p3886, r3887, p3888, r3889

**Warning:**  When activating the essential service mode (BI: p3880 = 1 signal), the motor immediately runs according to the selected setpoint source. When the essential service mode is activated, the motor cannot be stopped using the OFF commands.

**Note:** ESM: Essential Service Mode  
 Permissible signal sources:  
 - BO: r0722.x (high active)  
 - BO: r0723.x (low active), x = 0 ... 17, 20, 21

**Description:** Sets the setpoint source for essential service mode (ESM).

**Value:**

- 0: Last known setpoint (r1078 smoothed)
- 1: Fixed speed setpoint 15 (p1015)
- 3: Fieldbus
- 5: TB30/TM31 analog input
- 6: Enable the response OFF1
- 7: Enable the response OFF2

**Note:** ESM: Essential Service Mode  
 When the essential service mode is activated, the effective speed setpoint is displayed in r1114.  
 For p3881 = 0:  
 The last known setpoint value is only safely and reliably transferred if it was present for at least 30 s prior to activating the essential service mode.  
 Speed setpoints from the jog mode (p1058, p1059) are not taken into account.  
 For p3881 = 5:  
 The signal source for the setpoint via analog input for TB30/TM31 is set via p3886.  
 For p3881 = 6:  
 n\_act = 0: pulse suppression and switching on inhibited.  
 n\_active > 0: braking along the ramp-function generator down ramp (p1121), pulse cancellation and switching on inhibited.  
 For p3881 = 7:  
 n\_act = 0: pulse suppression and switching on inhibited.  
 n\_act > 0: immediate pulse cancellation and switching on inhibited.

**Description:** Sets the alternative setpoint source for essential service mode (ESM).  
 This setpoint is used when the setpoint source set in p3881 is lost.

## 2 Parameters

### 2.2 List of parameters

**Value:** 0: Last known setpoint (r1078 smoothed)  
1: Fixed speed setpoint 15 (p1015)  
2: Maximum speed (p1082)

**Dependency:** Refer to: p3881

**Note:** ESM: Essential Service Mode  
The alternative setpoint source is only active for p3881 = 3, 5.

---

**Description:** Sets the alternative setpoint source for essential service mode (ESM).  
This setpoint is used when the setpoint source set in p3881 is lost.

**Value:** 0: Last known setpoint (r1078 smoothed)  
1: Fixed speed setpoint 15 (p1015)  
2: Maximum speed (p1082)

**Dependency:** Refer to: p3881

**Note:** ESM: Essential Service Mode  
The alternative setpoint source is only active for p3881 = 2, 3, 5.

---

**p3883** **BI: ESM direction of rotation signal source / ESM rot dir s\_s**

**Description:** Sets the signal source for the direction of rotation during essential service mode (ESM).  
p3883 = 1 signal:  
Direction of rotation of the setpoint, parameterized for essential service mode, is reversed.  
p3883 = 0 signal:  
Direction of rotation of the setpoint parameterized for essential service mode is kept.

**Note:** ESM: Essential Service Mode

|     | 0                                 | 3                    | 0                        |

**Description:** Exits quick commissioning (p0010 = 1) with automatic calculation of all parameters of all existing drive data sets that depend on the entries made during quick commissioning.

p3900 = 1 initially includes a parameter reset (factory setting, the same as p0970 = 1) for all parameters of the drive object; however, without overwriting the entries made during the quick commissioning.

The interconnections of PROFIBUS PZD telegram selection (p0922) and the interconnections via p0700, p1000 and p1500 are re-established and all of the dependent motor, open-loop and control-loop control parameters are calculated (corresponding to p0340 = 1).

p3900 = 2 includes the restoration of the interconnections of PROFIBUS PZD telegram selection (p0922) and the interconnections via p0700, p1000 and p1500 and the calculations corresponding to p0340 = 1.

p3900 = 3 only includes the calculations associated with the motor, open-loop and closed-loop control parameters corresponding to p0340 = 1F.

|               |  |
|---------------|--|
| <b>Value:</b> | 0: No quick parameterization                                   |
|               | 1: Quick parameterization after parameter reset                |
|               | 2: Quick parameterization (only) for BICO and motor parameters |
|               | 3: Quick parameterization for motor parameters (only)          |

**Notice:** After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:** When the calculations have been completed, p3900 and p0010 are automatically reset to a value of zero. When calculating motor, open-loop and closed-loop control parameters (such as for p0340 = 1) parameters associated with a selected Siemens catalog motor are not overwritten.

## 2 Parameters

### 2.2 List of parameters

**Note:** When the calculations have been completed, p3900 and p0010 are automatically reset to a value of zero. When calculating motor, open-loop and closed-loop control parameters (such as for p0340 = 1) parameters associated with a selected Siemens catalog motor are not overwritten. If a catalog motor has not been selected (p0300), then the following parameters are reset with p3900 > 0 in order to restore the situation that applied when commissioning the drive for the first time:  
induction motors p0320, p0352, p0353, p0362 ... p0369, p0391 ... p0393, p0604, p0605, p0626 ... p0628  
synchronous motor p0326, p0327, p0352, p0353, p0391 ... p0393, p0604, p0605.

**Description:** Exits the quick commissioning (p0010 = 1) with automatic calculation of all of the parameters that depend on the entries made during the quick commissioning.  
p3900 = 1 initially includes a parameter reset (factory setting, the same as p0970 = 1) for all parameters of the drive object; however, without overwriting the entries made during the quick commissioning. The interconnections of PROFIBUS PZD telegram selection (p0922) and the interconnections via p0700 are re-established and all of the dependent filter and closed-loop control parameters are calculated (corresponding to p0340 = 1).  
p3900 = 2 includes the restoration of the interconnections of PROFIBUS PZD telegram selection (p0922) and the interconnections via p0700 and the calculations corresponding to p0340 = 1.  
p3900 = 3 only includes the end of quick commissioning.

**Value:**  
0: No quick parameterization  
1: Quick parameterization after parameter reset  
2: Quick param. (only) for controller par. and reset for BICO par  
3: Completion of quick commissioning

**Notice:** After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:** When the calculations have been completed, p3900 and p0010 are automatically reset to a value of zero.

**Description:** Differential voltage for calibrating the offset for DC link voltage measurement.

**Dependency:** Refer to: r0192, p0212

**Caution:** Incorrect use of the calibration can have a negative impact on the closed-loop control.

The parameter influences the upper and lower voltage detection.

**Note:** Parameter entries are directly saved in the DRIVE-CLiQ component involved.

The parameter is only effective in the case of booksize power units, if r0192.22 = 1 and p0212.0 = 1.

**Description:** Displays the actual input voltage in V when set as voltage input.  
Displays the actual input current in mA when set as current input and with the load resistor switched in.

**Index:** [0] = AI 0 (X521.1/X521.2, S5.0)  
[1] = AI 1 (X521.3/X521.4, S5.1)

**Dependency:** The type of analog input AI x (voltage or current input) is set using p4056.

Refer to: p4056

**Note:** AI: Analog Input

## 2 Parameters

### 2.2 List of parameters

**Notice:** The raw data of the digital inputs is directly displayed (e.g. without any debounce).

**Note:** Should only used for internal Siemens purposes (alternative r4022, r4023).
