For p0869.1 = 1, before starting to charge the DC link (r0899.8 = 1), the system waits for a feedback signal from the external main contactor (p0860 = 1 signal). The main contactor must be controlled using r0863.1.  
Waiting for the contactor feedback signal is especially necessary if the external main contactor has long switching times, which would lead to the precharging time being exceeded (F06000, F30027).

---

|   | -   | -                    | 0                        |

- Description:** Sets the signal source to close the main contactor.
- Note:** The main contactor is also closed when the converter is switched on after issuing the necessary enable signals.  
A binector input p0870 = 1 signal prevents the main contactor from being opened when enable signals are withdrawn.

**Description:** Sets the signal source to activate/deactivate a power unit component.

**Dependency:** BI: p0895 = 0 signal  
Deactivate power unit components.  
BI: p0895 = 1 signal  
Activate power unit components  
Refer to: p0125, r0126  
Refer to: A05054

**Caution:** It is not permissible to deactivate drive objects with safety functions enabled.

**Notice:** For Active Line Modules in the "Chassis" format, the Voltage Sensing Module (VSM, p0145) belonging to the power unit is automatically activated/deactivated.

**Note:** The power unit is only deactivated when the pulses are suppressed.  
For units connected in parallel, when one of the power units is deactivated, then the enable in p7001 is withdrawn.

**Note:** For bits 00, 01, 02, 04, 05, 06, 09:  
For PROFIdrive, these signals are used for status word 1.  
For bit 13:  
When the "Safe Brake Control" (SBC) is activated and selected, the brake is no longer controlled using this signal.  
For bit 14, 15:  
These signals are only of significance when the "extended brake control" function module is activated (r0108.14 = 1).

|               | [33] = PZD 34 |
|               | [34] = PZD 35 |
|               | [35] = PZD 36 |

**Note:**

Example:

The telegram for the actual values should have the following process data (PZD) and assignments:

PZD 1 (r4301), PZD 2 (r4304), PZD 3 (r4350), PZD 4 (r4350)

The actual value assignment must be implemented as follows:

p0916[0] = 4301 - 16 bit

p0916[1] = 4304 - 16 bit

p0916[2] = 4350 - 32 bit - specified twice one after the other

p0916[3] = 4350 - 32 bit

p0916[4] = 0

...

p0916[35] = 0

**Factory setting**

1

999

999

**Description:**

Sets the send and receive telegram.

**Value:**

1: Standard telegram 1, PZD-2/2  
2: Standard telegram 2, PZD-4/4  
20: Standard telegram 20, PZD-2/6  
220: SIEMENS telegram 220, PZD-10/10  
352: SIEMENS telegram 352, PZD-6/6  
999: Free telegram configuration with BICO

**Caution:**

Telegrams 2, 3 and 4 are not suitable for sensorless vector control (p1300 = 20). For sensorless vector control, it is necessary that the setpoint speed is entered at the ramp-function generator input (e.g. p1070) and not after the ramp-function generator (p1155).

**Note:**

If a value is not equal to 999, a telegram is set and the automatically set interconnections in the telegram are inhibited.

The inhibited interconnections can only be changed again after setting value 999.

When switching to telegram 220, parameter p0045 is restored to the factory setting.

## 2 Parameters

### 2.2 List of parameters

**Note:** If a value is not equal to 999, a telegram is set and the automatically set interconnections in the telegram are inhibited.  
The inhibited interconnections can only be changed again after setting value 999.

|--------------|--|--|---|
| <b>p0970</b> | <b>Reset drive parameters / Drive par reset</b>  |  |   |
| HLA          | <b>Can be changed:</b> C2(30)<br><b>Data type:</b> Unsigned16<br><b>P-Group:</b> Factory settings<br><b>Not for motor type:</b> -<br><b>Min</b><br>0 | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>100 | <b>Access level:</b> 2<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0 |

**Description:** The parameter is used to initiate the reset of the parameters of an individual drive object.  
Parameters of the basic drive commissioning (p0009) are not reset (p0107, p0108, p0111, p0112, p0115, p0121, p0130, p0131, p0140, p0141, p0142, p0170, p0186 ... p0189). These can only be reset using the factory setting of the complete drive unit (p0976).

**Value:** 0: Inactive  
1: Start a parameter reset  
100: Start a BICO interconnection reset

**Notice:** After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:** A factory setting run can only be started if p0010 was first set to 30 (parameter reset).  
At the end of the calculations, p0970 is automatically set to 0.  
Parameter reset has been completed if p0970 and p0010 have been set to 0.

## 2 Parameters

### 2.2 List of parameters

**Note:** A factory setting run can only be started if p0010 was first set to 30 (parameter reset).  
At the end of the calculations, p0970 is automatically set to 0.

| All objects | <b>Can be changed:</b> U, T      | <b>Calculated:</b> - | <b>Access level:</b> 1   |
|             | <b>Data type:</b> Unsigned16     | <b>Dyn. index:</b> - | <b>Func. diagram:</b> -  |
|             | <b>P-Group:</b> Factory settings | <b>Unit group:</b> - | <b>Unit selection:</b> - |
|             | <b>Not for motor type:</b> -     | <b>Scaling:</b> -    | <b>Expert list:</b> 1    |
|             | <b>Min</b>                       | <b>Max</b>           | <b>Factory setting</b>   |
|             | 0                                | 1                    | 0                        |

**Description:** Setting to save the parameter of the particular drive object in the non-volatile memory.  
When saving, only the adjustable parameters intended to be saved are taken into account.

**Value:** 0: Inactive  
1: Save drive object

**Dependency:** Refer to: p0977, p1960, p3845, r3996

**Warning:** If the Control Unit power supply is switched off while data is being saved, then the backup of all adjustable parameters can be lost, and the Control Unit must be recommissioned.

**Notice:** The Control Unit power supply may only be switched off after data has been saved (i.e. after data save has been started, wait until the parameter again has the value 0).  
Writing to parameters is inhibited while saving.

**Note:** The progress while saving is displayed in r3996.  
Starting from the particular drive object, the following parameters are saved:  
CU3xx: Device-specific parameters and PROFIBUS device parameters.  
Other objects: Parameters of the actual object and PROFIBUS device parameters.  
Prerequisite:  
Before saving with p0971, all parameters (topology, all drive objects) must have been saved at least once using p0977 = 1.

**Description:** Resets or downloads all parameters of the drive system.

**Value:**

- 0: Inactive
- 1: Start reset of all parameters to factory setting
- 2: Start dnload of param. saved in non-volatile mem w/ p0977=1
- 3: Start download of volatile parameters from RAM
- 10: Start dnload of param. saved in non-volatile mem w/ p0977=10
- 11: Start dnload of param. saved in non-volatile mem w/ p0977=11
- 12: Start dnload of param. saved in non-volatile mem w/ p0977=12
- 20: Start load of param. saved in non-volatile mem w/ p0977=20
- 21: Start load of param. saved in non-volatile mem w/ p0977=21
- 22: Start load of param. saved in non-volatile mem w/ p0977=22
- 23: Start load of param. saved in non-volatile mem w/ p0977=23
- 24: Start load of param. saved in non-volatile mem w/ p0977=24
- 25: Start load of param. saved in non-volatile mem w/ p0977=25
- 26: Start load of param. saved in non-volatile mem w/ p0977=26
- 30: Start loading the delivery state saved with p0977=30
- 100: Start resetting of all BICO interconnections
- 1011: Start dnload of param. saved in volatile mem w/ p0977=1011
- 1012: Start dnload of param. saved in volatile mem w/ p0977=1012
- 1013: Start dnload of param. saved in volatile mem w/ p0977=1013

**Notice:** After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:** After all of the parameters have been reset to their factory setting, the system must be commissioned for the first time again.

Resetting or loading is realized in the non-volatile memory.

Procedure:

1. Set p0009 = 30 (parameter reset).
  2. Set p0976 to "required value". The system is rebooted.
- p0976 is automatically set to 0 and p0009 is automatically set to 1 after this has been carried out.

|   | 04   | Ramp-function generator always active         | Yes                        | No              | -         |
| <b>Notice:</b>  | The following prerequisites must be fulfilled in order to be able to save the setpoint (Bit 03 = 1) in a non-volatile fashion:<br>- Firmware with V2.3 or higher.<br>- Control Unit 320 (CU320) with hardware version C or higher (module with NVRAM).   |   |                            |                 |           |
| <b>Note:</b>  | For bit 00:<br>0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p1040.<br>1: The setpoint for the motorized potentiometer is saved after OFF and after ON set to the saved value. In order to save in a non-volatile fashion, bit 03 should be set to 1.<br>For bit 01:<br>0: Without ramp-function generator in the automatic mode (ramp-up/ramp-down time = 0).<br>1: With ramp-function generator in the automatic mode.<br>For manual operation (0 signal via BI: p1041), the ramp-function generator is always active.<br>For bit 02:<br>0: Without initial rounding-off<br>1: With initial rounding-off. The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed).<br>The jerk for the initial rounding-off is independent of the ramp-up time and only depends on the selected maximum speed (p1082). It is calculated as follows:<br>$r = 0.01 \% * p1082 [1/s] / 0.13^2 [s^2]$<br>The jerk acts up until the maximum acceleration is reached ( $a_{max} = p1082 [1/s] / p1047 [s]$ ), and then the drive continues to run linearly with a constant rate of acceleration. The higher the maximum acceleration (the lower that p1047 is), the longer the ramp-up time increases with respect to the set ramp-up time. |   |                            |                 |           |

For bit 03:

0: Non-volatile data save deactivated.

1: The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for bit 00 = 1).

For bit 04:

When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r1050.

| <b>Description:</b>   | Sets the time with which new speed setpoints are interpolated.<br>With interpolation, the higher-level control adapts the speed setpoint steps to the time grid of the setpoint channel.   |  |  |
| <b>Recommendation:</b>  | For non-synchronous operation, a setting to the maximum time difference between two setpoints is recommended.<br>For sensorless vector control, interpolation should always be activated if the ramp-up and ramp-down times of the ramp-function generator are very short. The drive must be able to follow the external speed setpoint (the drive does not ramp up at the torque limit).  |  |  |
| <b>Note:</b>  | For acceleration precontrol of the speed controller, interpolation prevents torque peaks from occurring if the ramp-up or ramp-down times in the setpoint channel are zero.<br>When exiting commissioning, the parameter is preset using the automatic calculation if, as setpoint source for the main or supplementary setpoint, a PZD receive word is already set and the ramp-up time is zero.<br>Interpolation is limited to 127 cycles of the setpoint channel.<br>p1079 = 0 ms:<br>Interpolation is deactivated.<br>p1079 = 0.01 ms:<br>The interpolation time is automatically determined the first time that the speed setpoint is changed. After this, no other changes are made if the send times of the external control increase. Writing to p1079 again initiates the automatic adaptation of the interpolation time.<br>p1079 > 0.01 ms:<br>Interpolation is performed corresponding to the ratio to the computation clock cycle.<br>For a value of 0, for synchronized setpoint input, the currently valid application clock cycle is loaded. |  |  |
| <b>p1080[0...n]</b>   | <b>Minimum velocity / v_min</b>  |  |  |
| SERVO (Ext setp, Lin),<br>SERVO_AC (Ext setp,<br>Lin), SERVO_I_AC<br>(Ext setp, Lin)                        | <b>Can be changed:</b> C2(1), T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Setpoints<br><b>Not for motor type:</b> -<br><b>Min</b><br>0.000 [m/min]   | <b>Calculated:</b> -<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> 4_1<br><b>Scaling:</b> -<br><b>Max</b><br>1000.000 [m/min] | <b>Access level:</b> 1<br><b>Func. diagram:</b> 3050<br><b>Unit selection:</b> p0505<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0.000 [m/min] |
| <b>Description:</b>   | Sets the lowest possible motor velocity.<br>This value is not undershot in operation.  |  |  |
| <b>Dependency:</b>  | Refer to: p1106  |  |  |
| <b>Notice:</b>  | The effective minimum velocity is formed from p1080 and p1106.   |  |  |

## 2 Parameters

### 2.2 List of parameters

**Note:** The parameter value applies for both motor directions.  
In exceptional cases, the motor can operate below this value (e.g. when reversing).  
In order that a stationary motor – after all of the enable signals have been switched on, can operate at the minimum speed/minimum velocity once all of the enable signals are available, the direction must be entered using one of the following options:  
- direction input via small setpoint.  
- direction input by inhibiting the negative or positive direction (p1110, p1111).

---

#### p1080[0...n] Minimum speed / n\_min

|  |  |   |  |
|--|--|---|--|
| SERVO (Ext setp), VECTOR, SERVO_AC (Ext setp), VECTOR_AC, SERVO_I_AC (Ext setp), VECTOR_I_AC | <b>Can be changed:</b> C2(1), T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Setpoints<br><b>Not for motor type:</b> -<br><b>Min</b><br>0.000 [rpm] | <b>Calculated:</b> -<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> 3_1<br><b>Scaling:</b> -<br><b>Max</b><br>19500.000 [rpm] | <b>Access level:</b> 1<br><b>Func. diagram:</b> 3050<br><b>Unit selection:</b> p0505<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0.000 [rpm] |
|--|--|---|--|

**Description:** Sets the lowest possible motor speed.  
This value is not undershot in operation.

**Dependency:** Refer to: p1106

**Notice:** The effective minimum speed is formed from p1080 and p1106.

**Note:** The parameter value applies for both motor directions.  
In exceptional cases, the motor can operate below this value (e.g. when reversing).  
In order that a stationary motor – after all of the enable signals have been switched on, can operate at the minimum speed/minimum velocity once all of the enable signals are available, the direction must be entered using one of the following options:  
- direction input via small setpoint.  
- direction input by inhibiting the negative or positive direction (p1110, p1111).

---

#### p1081 Maximum speed scaling / n\_max scal

|   |   |   |   |
|---|---|---|---|
| SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Setpoints<br><b>Not for motor type:</b> -<br><b>Min</b><br>100.00 [%] | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> PERCENT<br><b>Max</b><br>105.00 [%] | <b>Access level:</b> 2<br><b>Func. diagram:</b> 3050, 3095<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>100.00 [%] |
|---|---|---|---|

**Description:** Sets the scaling for the maximum speed (p1082).  
For a higher-level speed control, this scaling allows the maximum speed to be briefly exceeded.

**Dependency:** Refer to: p1082

**Notice:** Continuous operation above a scaling of 100 % is not permitted.

---

#### p1081 Maximum velocity scaling / v\_max scal

|  |   |   |   |
|--|---|---|---|
| SERVO (Lin), HLA, SERVO_AC (Lin), SERVO_I_AC (Lin) | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Setpoints<br><b>Not for motor type:</b> -<br><b>Min</b><br>100.00 [%] | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> PERCENT<br><b>Max</b><br>105.00 [%] | <b>Access level:</b> 2<br><b>Func. diagram:</b> 3050, 3095<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>100.00 [%] |
|--|---|---|---|

**Description:** Sets the scaling for the maximum velocity (p1082).  
For a higher-level velocity control, this scaling allows the maximum velocity to be briefly exceeded.

**Dependency:** Refer to: p1082

**Notice:** Continuous operation above a scaling of 100 % is not permitted.

| p1082[0...n]                | Maximum velocity / v_max   |                                     |  |

|   | <b>Min</b><br>0.000 [rpm]   | <b>Max</b><br>210000.000 [rpm]                                   | <b>Factory setting</b><br>1500.000 [rpm]  |
| <b>Description:</b>                                 | Sets the highest possible speed.  |  |   |
| <b>Dependency:</b>                                  | <p>For vector control (p1300 = 20 ... 23) the maximum speed is limited to <math>60.0 / (8.333 * p0115[0] * r0313)</math>. This can be identified by a reduction in r1084. p1082 is not changed in this process due to the fact that the operating mode p1300 can be changed over.</p> <p>If a sine-wave filter (p0230 = 3) is parameterized as output filter, then the maximum speed is limited corresponding to the maximum permissible filter output frequency (refer to the filter data sheet). When using sine-wave filters (p0230 = 3, 4), the maximum speed r1084 is limited to 70% of the resonant frequency of the filter capacitance and the motor leakage inductance.</p> <p>For reactors and dU/dt filters, it is limited to <math>150 \text{ Hz} * 60 / r0313</math> (for chassis power units) or <math>120 \text{ Hz} * 60 / r0313</math> (for booksize power units).</p> <p>Refer to: p0115, p0230, r0313, p0322, p0324, r0336, p0532</p>   |  |   |

**Notice:** After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:** The parameter applies for both motor directions.

The parameter has a limiting effect and is the reference quantity for all ramp-up and ramp-down times (e.g. down ramps, ramp-function generator, motor potentiometer).

Since the parameter is part of quick commissioning (p0010 = 1), it is defined appropriately when p0310, p0311, p0322, p0324, p0530, p0531, and p0532 are changed.

$p1082 \leq \min(p0324, p0532)$  if  $p0324 > 0$  and  $p0532 > 0$

$p1082 \leq p0322$ , if  $p0324 = 0$  or  $p0532 = 0$  and  $p0322 > 0$

$p1082 \leq 60 \times \text{minimum} (15 \times r0336, 650 \text{ Hz}) / r0313$

$p1082 \leq 60 \times \text{Maximum power unit pulse frequency} / (k \times r0313)$

$k = 12$  for vector control ( $r0108.2 = 1$ ),  $k = 6.5$  for U/f control ( $r0108.2 = 0$ )

For the automatic calculation ( $p0340 = 1$ ) the value of the parameter is pre-assigned the maximum motor speed ( $p0322$ ). If  $p0322 = 0$ , the rated motor speed ( $p0311$ ) is used as default (pre-assignment) value. For induction motors that are not catalog motors ( $p0301 = 0$ ), the synchronous no-load speed is used as default (pre-assignment) value ( $p0310 \times 60 / r0313$ ).

For synchronous motors, the following additionally applies:

The maximum speed  $p1082$  is restricted to speeds ( $r1084$ ) where the EMF does not exceed the DC link voltage.

The effective assignment of the motor data set parameter (e.g.  $p0311$ ) to the drive data set parameter  $p1082$  when pre-assigning should be taken from  $p0186$ .

$p1082$  is also available in the quick commissioning ( $p0010 = 1$ ); this means that when exiting via  $p3900 > 0$ , the value is not changed.

---

The skip (suppression) range is skipped.<br>Example:<br>p1091 = 600 and p1101 = 20<br>--> setpoint velocities between 580 and 620 [rpm] are skipped.<br>For the skip bandwidths, the following hysteresis behavior applies:<br>For a setpoint velocity coming from below, the following applies:<br>r1170 < 580 [m/min] and 580 [m/min] <= r1114 <= 620 [m/min] --> r1119 = 580 [m/min]<br>For a setpoint velocity coming from above, the following applies:<br>r1170 > 620 [m/min] and 580 [m/min] <= r1114 <= 620 [m/min] --> r1119 = 620 [m/min] |  |  |                 |
| <b>p1101[0...n]</b>  | <b>Skip speed bandwidth / n_skip bandwidth</b>   |  |  |                 |
| SERVO (Ext setp), VECTOR, SERVO_AC (Ext setp), VECTOR_AC, SERVO_I_AC (Ext setp), VECTOR_I_AC | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Setpoints<br><b>Not for motor type:</b> -<br><b>Min</b><br>0.000 [rpm]   | <b>Calculated:</b> -<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> 3_1<br><b>Scaling:</b> p2000<br><b>Max</b><br>210000.000 [rpm] | <b>Access level:</b> 3<br><b>Func. diagram:</b> 3050<br><b>Unit selection:</b> p0505<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0.000 [rpm]   |                 |
| <b>Description:</b>  | Sets the bandwidth for the skip speeds/velocities 1 to 4.  |  |  |                 |
| <b>Dependency:</b>   | Refer to: p1091, p1092, p1093, p1094   |  |  |                 |
| <b>Note:</b>   | The setpoint (reference) speeds are skipped (suppressed) in the range of the skip speed +/-p1101.<br>Steady-state operation is not possible in the skipped (suppressed) speed range. The skip (suppression) range is skipped.<br>Example:<br>p1091 = 600 and p1101 = 20<br>--> setpoint speeds between 580 and 620 [rpm] are skipped.  |  |  |                 |

For the skip bandwidths, the following hysteresis behavior applies:

For a setpoint speed coming from below, the following applies:

$r1170 < 580 \text{ [rpm]}$  and  $580 \text{ [rpm]} \leq r1114 \leq 620 \text{ [rpm]} \rightarrow r1119 = 580 \text{ [rpm]}$

For a setpoint speed coming from above, the following applies:

$r1170 > 620 \text{ [rpm]}$  and  $580 \text{ [rpm]} \leq r1114 \leq 620 \text{ [rpm]} \rightarrow r1119 = 620 \text{ [rpm]}$

| SERVO (Ext setp, Lin),<br>SERVO_AC (Ext setp,<br>Lin), SERVO_I_AC<br>(Ext setp, Lin)                        | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Setpoints<br><b>Not for motor type:</b> -<br><b>Min</b><br>- [m/min] | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> 4_1<br><b>Scaling:</b> p2000<br><b>Max</b><br>- [m/min] | <b>Access level:</b> 3<br><b>Func. diagram:</b> 3001, 3040,<br>3050<br><b>Unit selection:</b> p0505<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- [m/min] |
| <b>Description:</b>   | Displays the speed/velocity setpoint after the changeover and limiting the direction.   |  |   |
| <b>r1114</b>  | <b>CO: Setpoint after the direction limiting / Set after limit</b>  |  |   |
| SERVO (Ext setp),<br>VECTOR, SERVO_AC<br>(Ext setp),<br>VECTOR_AC,<br>SERVO_I_AC (Ext<br>setp), VECTOR_I_AC | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Setpoints<br><b>Not for motor type:</b> -<br><b>Min</b><br>- [rpm]   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> 3_1<br><b>Scaling:</b> p2000<br><b>Max</b><br>- [rpm]   | <b>Access level:</b> 3<br><b>Func. diagram:</b> 3001, 3040,<br>3050<br><b>Unit selection:</b> p0505<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- [rpm]   |
| <b>Description:</b>   | Displays the speed/velocity setpoint after the changeover and limiting the direction.   |  |   |

|  |   |  |  |
|--|---|--|--|
| <b>p1115</b>   | <b>Ramp-function generator selection / RFG selection</b>  |  |  |
| SERVO (ESR, Ext setp), VECTOR, HLA (ESR), SERVO_AC (ESR, Ext setp), VECTOR_AC, SERVO_I_AC (ESR, Ext setp), VECTOR_I_AC | <b>Can be changed:</b> T<br><b>Data type:</b> Integer16<br><b>P-Group:</b> Setpoints<br><b>Not for motor type:</b> -<br><b>Min</b><br>0 | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>1 | <b>Access level:</b> 3<br><b>Func. diagram:</b> 3001, 3080<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0 |

**Description:** Sets the ramp-function generator type.

**Value:**  
0: Basic ramp-function generator  
1: Extended ramp-function generator

**Note:** Another ramp-function generator type can only be selected when the motor is at a standstill.

|                |   |  |   |
|----------------|---|--|---|
| <b>r1119</b>   | <b>CO: Ramp-function generator setpoint at the input / RFG set at inp</b>   |  |   |
| HLA, HLA (ESR) | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Setpoints<br><b>Not for motor type:</b> -<br><b>Min</b><br>- [m/min] | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> 4_1<br><b>Scaling:</b> p2000<br><b>Max</b><br>- [m/min] | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> p0505<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- [m/min] |

**Description:** Displays the setpoint at the input of the ramp-function generator.

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:** The setpoint is influenced by other functions, e.g. skip (suppressed) speeds, minimum and maximum limits.

|  |   |  |  |
|--|---|--|--|
| <b>r1119</b>   | <b>CO: Ramp-function generator setpoint at the input / RFG set at inp</b>   |  |  |
| SERVO (ESR, Ext setp, Lin), SERVO_AC (ESR, Ext setp, Lin), SERVO_I_AC (ESR, Ext setp, Lin) | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Setpoints<br><b>Not for motor type:</b> -<br><b>Min</b><br>- [m/min] | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> 4_1<br><b>Scaling:</b> p2000<br><b>Max</b><br>- [m/min] | <b>Access level:</b> 3<br><b>Func. diagram:</b> 3001, 3050, 3060, 3070, 6300<br><b>Unit selection:</b> p0505<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- [m/min] |

**Description:** Displays the setpoint at the input of the ramp-function generator.

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:** The setpoint is influenced by other functions, e.g. skip (suppressed) speeds, minimum and maximum limits.

|   |   |  |  |
|---|---|--|--|
| <b>r1119</b>  | <b>CO: Ramp-function generator setpoint at the input / RFG set at inp</b>   |  |  |

|  | <b>Not for motor type:</b> -   | <b>Scaling:</b> -             | <b>Expert list:</b> 1            |
|  | <b>Min</b>   | <b>Max</b>                    | <b>Factory setting</b>           |
|  | 0.000 [s]  | 999999.000 [s]                | 10.000 [s]                       |
| <b>Description:</b>  | The ramp-function generator ramps-up the speed setpoint from standstill (setpoint = 0) up to the maximum speed (p1082) in this time.   |                               |                                  |
| <b>Dependency:</b>   | Refer to: p1082, p1138   |                               |                                  |
| <b>Note:</b>   | The ramp-up time can be scaled via connector input p1138.<br>The parameter is adapted during the rotating measurement (p1960 > 0). This is the reason that during the rotating measurement, the motor can accelerate faster than was originally parameterized.<br>For U/f control and sensorless vector control (see p1300), a ramp-up time of 0 s does not make sense. The setting should be based on the startup times (r0345) of the motor. |                               |                                  |

## 2 Parameters

### 2.2 List of parameters

**Caution:** When "master control from PC" is activated, this binector input is ineffective.

**Notice:** The ramp-function generator is, independent of the state of the signal source, active in the following cases:  
 - OFF1/OFF3.  
 - ramp-function generator output within the suppression bandwidth.  
 - ramp-function generator output below the minimum speed.

---

#### **p1141 BI: Continue ramp-function generator/freeze ramp-function generator / Continue RFG**

|      |                                       |                      |                            |
|------|---------------------------------------|----------------------|----------------------------|
| TM41 | <b>Can be changed:</b> T              | <b>Calculated:</b> - | <b>Access level:</b> 3     |
|      | <b>Data type:</b> Unsigned32 / Binary | <b>Dyn. index:</b> - | <b>Func. diagram:</b> 9678 |
|      | <b>P-Group:</b> Setpoints             | <b>Unit group:</b> - | <b>Unit selection:</b> -   |
|      | <b>Not for motor type:</b> -          | <b>Scaling:</b> -    | <b>Expert list:</b> 1      |
|      | <b>Min</b>                            | <b>Max</b>           | <b>Factory setting</b>     |
|      | -                                     | -                    | 1                          |

**Description:** Sets the signal source for the command "continue ramp-function generator/freeze ramp-function generator".  
 For the PROFIdrive profile, this command corresponds to control word 1 bit 5 (STW1.5).  
 BI: p1141 = 0 signal:  
 Freezes the ramp-function generator.  
 BI: p1141 = 1 signal:  
 Continue ramp-function generator.

**Dependency:** Refer to: p1140, p1142

**Caution:** When "master control from PC" is activated, this binector input is ineffective.

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:** This parameter has no function in the "SINAMICS" (p4400 = 1) operating mode.

---

#### **p1142[0...n] BI: Enable setpoint/inhibit setpoint / Setpoint enable**

|  |                                       |                               |                            |

|  | <b>Min</b>                            | <b>Max</b>                    | <b>Factory setting</b>     |
|  | -                                     | -                             | 1                          |

**Description:** Sets the signal source for the command "enable setpoint/inhibit setpoint".  
 For the PROFIdrive profile, this command corresponds to control word 1 bit 6 (STW1.6).  
 BI: p1142 = 0 signal  
 Inhibits the setpoint (the ramp-function generator input is set to zero).  
 BI: p1142 = 1 signal  
 Setpoint enable.

**Dependency:** Refer to: p1140, p1141

**Caution:** When "master control from PC" is activated, this binector input is ineffective.

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:** When the function module "position control" (r0108.3 = 1) is activated, this binector input is interconnected as follows as standard:  
 BI: p1142 = 0 signal

|              |   |                      |                                  |

**Description:** Sets the signal source for accepting the setting value of the ramp-function generator.

**Dependency:** The signal source for the ramp-function generator setting value is set using parameters.

Refer to: p1144

**Note:** 0/1 signal:

The ramp-function generator output is immediately (without delay) set to the setting value of the ramp-function generator.

1 signal:

The setting value of the ramp-function generator is effective.

1/0 signal:

The input value of the ramp-function generator is effective. The ramp-function generator output is adapted to the input value using the ramp-up time or the ramp-down time.

0 signal:

The input value of the ramp-function generator is effective.

|  |  |                               |                                  |

**Description:** Sets the signal source for the ramp-function generator setting value.

**Dependency:** The signal source for accepting the setting value is set using parameters.

Refer to: p1143

| p1145[0...n]  | Ramp-function generator tracking intensity. / RFG track intens   |  |  |
|---|--|--|--|
| SERVO (ESR, Ext setp), SERVO_AC (ESR, Ext setp), SERVO_I_AC (ESR, Ext setp) | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Setpoints<br><b>Not for motor type:</b> -<br><b>Min</b><br>0.0   | <b>Calculated:</b> -<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>50.0 | <b>Access level:</b> 3<br><b>Func. diagram:</b> 3080<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>1.3 |
| <b>Description:</b>   | Sets the ramp-function generator tracking.<br>The output value of the ramp-function generator is tracked (corrected) corresponding to the maximum possible drive acceleration.<br>The reference value is the deviation at the speed/velocity controller input that is necessary to ensure that the motor accelerates at the torque/force limit.  |  |  |
| <b>Recommendation:</b>  | If at least one speed setpoint filter/velocity setpoint filter is activated (p1414), then the ramp-function generator tracking should be deactivated (p1145 = 0.0). When the speed setpoint filter is activated, the output value of the ramp-function generator can no longer be tracked (corrected) corresponding to the maximum possible drive acceleration.<br>For p1145 = 0.0:<br>This value deactivates the ramp-function generator tracking.<br>For p1145 = 0.0 ... 1.0:<br>Generally, these values are not practical. They cause the motor to accelerate below its torque limit. The lower the selected value, the greater the margin between the controller and torque limit when accelerating.<br>For p1145 > 1.0:<br>The greater the value, the higher the permissible deviation between the speed setpoint and speed actual value. |  |  |
| <b>Notice:</b>  | If ramp-function generator tracking is activated and the ramp time is set too short, this can cause unsteady acceleration.<br>Remedy:<br>- deactivate ramp-function generator tracking (p1145 = 0).<br>- increase the ramp-up/ramp-down time (p1120, p1121).   |  |  |
| <b>Note:</b>  | In the U/f mode, ramp-function generator tracking is not active.<br>For SERVO with U/f operation, the following applies:<br>The complete ramp-function generator is not active, i.e. ramp-up and ramp-down time = 0.   |  |  |

| p1145[0...n]                   | Ramp-function generator tracking intensity. / RFG track intens   |   |  |
|--------------------------------|--|---|--|
| VECTOR, VECTOR_AC, VECTOR_I_AC | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Setpoints<br><b>Not for motor type:</b> -<br><b>Min</b><br>0.0   | <b>Calculated:</b> CALC_MOD_ALL<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>50.0 | <b>Access level:</b> 3<br><b>Func. diagram:</b> 3080<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>1.3 |
| <b>Description:</b>            | Sets the ramp-function generator tracking.<br>The output value of the ramp-function generator is tracked (corrected) corresponding to the maximum possible drive acceleration.<br>The reference value is the deviation at the speed/velocity controller input that is necessary to ensure that the motor accelerates at the torque/force limit.  |   |  |
| <b>Recommendation:</b>         | If at least one speed setpoint filter/velocity setpoint filter is activated (p1414), then the ramp-function generator tracking should be deactivated (p1145 = 0.0). When the speed setpoint filter is activated, the output value of the ramp-function generator can no longer be tracked (corrected) corresponding to the maximum possible drive acceleration.<br>For p1145 = 0.0:<br>This value deactivates the ramp-function generator tracking.<br>For p1145 = 0.0 ... 1.0:<br>Generally, these values are not practical. They cause the motor to accelerate below its torque limit. The lower the selected value, the greater the margin between the controller and torque limit when accelerating.<br>For p1145 > 1.0:<br>The greater the value, the higher the permissible deviation between the speed setpoint and speed actual value. |   |  |

**Notice:** If ramp-function generator tracking is activated and the ramp time is set too short, this can cause unsteady acceleration.

Remedy:

- deactivate ramp-function generator tracking (p1145 = 0).

- increase the ramp-up/ramp-down time (p1120, p1121).

**Note:** In the U/f mode, ramp-function generator tracking is not active.

For ramp-function generator tracking and active acceleration model (p1400.20, 23), the integral component of the speed controller should be able to run freely up to the torque limit (p1400.16 = 1).

### p1148[0...n] Ramp-function gen. tolerance for ramp-up and ramp-down active / RFG tol HL/RL act

|  |                                   |                               |                                  |
|--|-----------------------------------|-------------------------------|----------------------------------|
| SERVO (ESR, Ext setp, Lin), HLA, HLA (ESR), SERVO_AC (ESR, Ext setp, Lin), SERVO_I_AC (ESR, Ext setp, Lin) | <b>Can be changed:</b> U, T       | <b>Calculated:</b> -          | <b>Access level:</b> 3           |
|  | <b>Data type:</b> FloatingPoint32 | <b>Dyn. index:</b> DDS, p0180 | <b>Func. diagram:</b> 3060, 3070 |
|  | <b>P-Group:</b> Setpoints         | <b>Unit group:</b> 4_1        | <b>Unit selection:</b> p0505     |
|  | <b>Not for motor type:</b> -      | <b>Scaling:</b> -             | <b>Expert list:</b> 1            |
|  | <b>Min</b>                        | <b>Max</b>                    | <b>Factory setting</b>           |

0.000 [m/min]

10.000 [m/min]

0.200 [m/min]

**Description:** Sets the tolerance value for the status of the ramp-function generator (ramp-up active, ramp-down active).

If the input of the ramp-function generator does not change in comparison to the output by more than the entered tolerance time, then the status bits "ramp-up active" and "ramp-down active" are not influenced.

**Dependency:** Refer to: r1199

---

|                                      | <b>Not for motor type:</b> REL  | <b>Scaling:</b> -             | <b>Expert list:</b> 1      |
|                                      | <b>Min</b>  | <b>Max</b>                    | <b>Factory setting</b>     |
|                                      | 0   | 6                             | 0                          |
| <b>Description:</b>                  | Sets the operating mode for flying restart.<br>The flying restart allows the drive converter to be switched on while the motor is still rotating. In so doing, the drive converter output frequency is changed until the actual motor speed/velocity is found. The motor then accelerates up to the setpoint at the ramp-function generator setting.  |                               |                            |
| <b>Value:</b>                        | 0: Flying restart inactive<br>1: Flying restart always active (start in setpoint direction)<br>2: FlyRestart active after on, fault, OFF2 (start in setp. dir.)<br>3: FlyRestart active after fault, OFF2 (start in setp. direction)<br>4: Flying restart always active (start only in setpoint direction)<br>5: FlyRestart active after on, fault, OFF2 (start only in setp_dir)<br>6: FlyRestart active after fault, OFF2 (start only in setp. dir.)  |                               |                            |
| <b>Dependency:</b>                   | The ground fault test is only possible when the motor is stationary, and is therefore only realized when flying restart is deactivated (p1200 = 0).<br>For induction motors, the following applies:<br>A differentiation is made between flying restart for U/f control and for vector control (p1300).<br>Flying restart, U/f control: p1202, p1203, r1204<br>Flying restart, vector control: p1202, p1203, r1205<br>For synchronous motors, the following applies:<br>Flying restart is not possible with U/f control or if, in the case of sensorless vector control, a Voltage Sensing Module (VSM) has not been connected and parameterized.<br>If two VSMs are connected to the Motor Module, then the motor voltage for the flying restart is measured using the second VSM (see p0151[1]).<br>If only one VSM is connected, then this can be used for the flying restart (p1200) (for induction motors, also see p0247 bit 5). When activating flying restart, line synchronization must be deactivated (p3800 = 0).<br>Refer to: p1201<br>Refer to: F07330, F07331 |                               |                            |
| <b>Notice:</b>                       | The "flying restart" function must be used in cases where the motor may still be running (e.g. after a brief line supply interruption) or is being driven by the load. The system might otherwise shut down as a result of overcurrent.<br>It does not make sense to use "flying restart" together with the "motor holding brake function" (p1215 > 0) because then the flying restart will always be realized with the motor stationary.<br>For a flying restart of induction motors without voltage measurement (VSM) the de-energization time (p0347) must be set long enough so that for fast restarts after a pulse inhibit, excessively high current peaks do not occur.<br>When operating synchronous reluctance motors and flying restart a motor data identification must first be carried out.  |                               |                            |

**Note:** For p1200 = 1, 4, the following applies:  
Flying restart is active after faults, OFF1, OFF2, OFF3.  
For p1200 = 2, 5, the following applies:  
The "switch-on" is the first switching-on operation after the drive system has been booted. This is practical for motors with a high-inertia load.  
For p1200 = 1, 2, 3, the following applies: The search is made in both directions.  
For reluctance motors, the converter is directly switched to the rotating motor without executing a search routine.  
For p1200 = 4, 5, 6, the following applies: The search is only made in the setpoint direction. For a setpoint of zero, a search is not made in the negative direction of rotation.  
This selection is not necessary for reluctance motors (see p1200 = 1, 2, 3).  
For operation with encoder, the following applies:  
p1200 = 1, 4 as well as p1200 = 2, 5 and p1200 = 3, 6 have the same meaning.  
For U/f control (p1300 < 20), the following applies:  
The speed can only be sensed for values above approx. 5 % of the rated motor speed. For lower speeds, it is assumed that the motor is at a standstill.  
If p1200 is changed while commissioning (p0009, p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1200 have been changed by a parameter that was set when the drive was commissioned (e.g. p0300).

**Dependency:** Refer to: r0331

**Caution:** An unfavorable parameter value can result in the motor behaving in an uncontrollable fashion.

**Note:**

In U/f control mode, the parameter serves as a threshold value for establishing the current at the beginning of the flying restart function. When the threshold value is reached, the actual search current is set as a function of the frequency based on the voltage setpoints.

Reducing the search current can also improve flying restart performance (if the system moment of inertia is not very high, for example).

The following applies for a synchronous reluctance motor:

- a parameter change only becomes effective after carrying out the motor data identification.
- the minimum search current is limited (p1202 >= 50 %).
- the search algorithm is optimized for 100%, and the current reached is internally limited. It is possible that a set value (p1202 != 100%) may not be able to be reached.
- if the ratio between motor power and converter power is greater than 1, then it may be advantageous to increase the search current.

| 10 [%]                               | 4000 [%]                      | 100 [%]                  |

**Description:**

Sets the factor for the search speed for flying restart.  
The value influences the rate at which the output frequency is changed during a flying restart . A higher value results in a longer search time.

**Recommendation:**

For sensorless vector control and motor cables longer than 200 m - as well as for du/dt filters (p0230) - the following applies:  
p1203 >= 300 %

**Caution:**

**Note:**

An unfavorable parameter value can result in the motor behaving in an uncontrollable fashion.  
For vector control, a value that is too low or too high can cause flying restart to become unstable.

The parameter factory setting is selected so that standard induction motors that are rotating can be found and restarted as quickly as possible (fast flying restart).  
With this pre-setting, if the motor is not found (e.g. for motors that are accelerated as a result of active loads or with U/f control and low speeds), we recommend that the search rate is reduced (by increasing p1203).  
For a fast flying restart with voltage model in the U/f control mode (p1300 < 20) the search duration can be modified using this parameter.  
The following applies for a synchronous reluctance motor:  
- the minimum search speed is limited (p1203 >= 50 %).

**Description:**

Display and BICO output for the status for checking and monitoring flying restart states with vector control.

**Bit field:**

| Bit | Signal name   | 1 signal | 0 signal | FP |
|-----|---|----------|----------|----|
| 00  | Speed adaptation circuit record angle                           | Yes      | No       | -  |
| 01  | Speed adaptation circuit set gain to 0                          | Yes      | No       | -  |
| 02  | Isd channel enable  | Yes      | No       | -  |
| 03  | Speed control switched out                                      | Yes      | No       | -  |
| 04  | Quadrature arm switched in                                      | Yes      | No       | -  |
| 05  | Special transformation active                                   | Yes      | No       | -  |
| 06  | Speed adaptation circuit set I component to 0                   | Yes      | No       | -  |
| 07  | Current control on  | Yes      | No       | -  |
| 08  | Isd_set = 0 A   | Yes      | No       | -  |
| 09  | Frequency held  | Yes      | No       | -  |
| 10  | Search in the positive direction                                | Yes      | No       | -  |
| 11  | Search Started  | Yes      | No       | -  |
| 12  | Current impressed   | Yes      | No       | -  |
| 13  | Search interrupted  | Yes      | No       | -  |
| 14  | Speed adaptation circuit deviation = 0                          | Yes      | No       | -  |
| 15  | Speed control activated   | Yes      | No       | -  |
| 16  | Fast flying restart w/ voltage model for induction motor activ. | Yes      | No       | -  |
| 17  | Fast flying restart w/ voltage model for induction motor exited | Yes      | No       | -  |
| 18  | Apply VSM voltage to the monitor                                | Yes      | No       | -  |
| 19  | Preassign flux ramp   | Yes      | No       | -  |
| 20  | Adaptation current controller and speed adapt. controller gain  | Yes      | No       | -  |
| 21  | Voltage pulse active  | Yes      | No       | -  |

**Note:**

For bit 00 ... 09:

Used to control internal sequences during the flying restart.

Depending on the motor type (p0300), the number of active bits differs.

For bits 10 ... 17:

Are used to monitor the flying restart sequence.

## 2 Parameters

### 2.2 List of parameters

**Danger:**

If the automatic restart is activated ( $p1210 > 1$ ) if there is an ON command (refer to p0840), the drive is switched on as soon as any fault messages that are present can be acknowledged. This also occurs after the line supply returns or the Control Unit boots if the DC link voltage is again present or the feedback of the line supply infeed (refer to p0864) is again available. This automatic switching-on operation can only be interrupted by withdrawing the ON command.

**Notice:**

A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1).

For  $p1210 > 1$ , the infeed is automatically started.

**Note:**

For  $p1210 = 1$ :

Faults that are present are automatically acknowledged. If new faults occur after a successful fault acknowledgment, then these are also automatically acknowledged again. A minimum time of  $p1212 + 1$  s must expire between a successful fault acknowledgment and a fault re-occurring if the signal ON/OFF1 (STW1.0) is at a HIGH signal level. If the signal ON/OFF1 is at a LOW signal level, then the time between a successful fault acknowledgment and a new fault must be at least 1 s.  $p1211$  has no influence on the number of acknowledgment attempts.

For  $p1210 = 6$ :

An automatic restart is carried out if any fault has occurred.

**Min**

**Max**

**Factory setting**

0

6

0

**Description:**

Sets the automatic restart mode (AR).

**Value:**

- 0: Inhibit automatic restart
- 1: Acknowledge all faults without restarting
- 4: Restart after line supply failure w/o additional start attempts
- 6: Restart after fault with additional start attempts

**Dependency:**

The automatic restart requires an active ON command (e.g., via a digital input). If, for  $p1210 > 1$ , there is no active ON command, then the automatic restart is interrupted.

When using an Advanced Operator Panel (AOP) in the LOCAL Mode, then there is no automatic restart.

Refer to: p0840, p0857, p1267

Refer to: F30003

**Danger:**

If the automatic restart is activated ( $p1210 > 1$ ) if there is an ON command (refer to p0840), the drive is switched on as soon as any fault messages that are present can be acknowledged. This also occurs after the line supply returns or the Control Unit boots if the DC link voltage is again present or the feedback of the line supply infeed (refer to p0864) is again available. This automatic switching-on operation can only be interrupted by withdrawing the ON command.

**Notice:**

A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1).

For  $p1210 > 1$ , the infeed is automatically started.

**Note:**

For  $p1210 = 1$ :

Faults that are present are automatically acknowledged. If new faults occur after a successful fault acknowledgment, then these are also automatically acknowledged again. A minimum time of  $p1212 + 1$  s must expire between a successful fault acknowledgment and a fault re-occurring if the signal ON/OFF1 (STW1.0) is at a HIGH signal level. If the signal ON/OFF1 is at a LOW signal level, then the time between a successful fault acknowledgment and a new fault must be at least 1 s.

$p1211$  has no influence on the number of acknowledgment attempts.

For  $p1210 = 4$ :

An automatic restart is only executed if fault F06200 has occurred. If additional faults are present, then these faults are also acknowledged and when successful, starting continues. If the 24 V Control Unit power supply fails, then this is interpreted as a line supply failure.

For  $p1210 = 6$ :

An automatic restart is carried out if any fault has occurred.

## 2 Parameters

### 2.2 List of parameters

**Note:** A start attempt starts immediately when a fault occurs. The restart attempt is considered to have been completed if the infeed is switched on and an additional delay time of 1 s has expired.

As long as a fault is present, an acknowledge command is generated in the time intervals of  $p1212 / 2$ . When successfully acknowledged, the start counter is decremented. If, after this, a fault re-occurs before a restart has been completed, then acknowledgment starts again from the beginning.

Fault F07320 is output if, after several faults occur, the number of parameterized start attempts has been reached. After a successful start attempt (i.e. a fault/error has no longer occurred up to the end of the switching-on operation) the start counter is again reset to the parameter value after 1 s. If faults re-occur, the parameterized number of start attempts is again available.

At least one start attempt is always carried out.

After a line supply failure, acknowledgment is immediate and when the line supply returns, the system is switched on. If, between successfully acknowledging the line fault and the line supply returning, another fault occurs, then its acknowledgment also causes the start counter to be decremented.

## 2 Parameters

### 2.2 List of parameters

For index [1]:

The start counter (refer to r1214) is only set back to the starting value p1211 if, after successful restart, the time in p1213[1] has expired. The delay time is not effective for fault acknowledgment without automatic restart (p1210 = 1). After a power failure (blackout) the delay time only starts after the line supply returns and the Control Unit boots. The start counter is set to p1211, if F07320 occurred, the switch-on command is withdrawn and the fault is acknowledged. The start counter is immediately updated if the starting value p1211 or the mode p1210 is changed.

| 12  | Start counter bit 0                          | ON       | OFF      | -  |
| 13  | Start counter bit 1                          | ON       | OFF      | -  |
| 14  | Start counter bit 2                          | ON       | OFF      | -  |
| 15  | Start counter bit 3                          | ON       | OFF      | -  |

#### Note:

For bit 00:

State to display the single initialization after POWER ON.

For bit 01:

State in which the automatic restart function waits for faults (initial state).

For bit 02:

General display that a fault has been identified and that the restart or acknowledgment has been initiated.

For bit 03:

Displays the acknowledge command within the "acknowledge alarms" state (bit 4 = 1). For bit 5 = 1 or bit 6 = 1, the acknowledge command is continually displayed.

For bit 04:

State in which the faults that are present are acknowledged. The state is exited again after successful acknowledgment. A change is only made into the next state if it is signaled that a fault is no longer present after an acknowledgment command (bit 3 = 1).

For bit 05:

State in which the drive is automatically switched on (only for p1210 = 4, 6).

For bit 06:

State in which the system waits after having been switched on, to the end of the start attempt (to the end of the magnetizing process).

For p1210 = 1, this signal is directly set after the faults have been successfully acknowledged.

For bit 07:

State which is assumed after a fault occurs within the automatic restart function. This is only reset after acknowledging the fault and withdrawing the switch-on command.

For bit 10:

When the automatic restart function is active, r1214.7 is displayed, otherwise the active fault r2139.3.

The bit is set if the automatic restart can no longer acknowledge a fault, and cancels with fault F07320.

For bits 12 ... 15:

Actual state of the start counter (binary coded).

**Note:**

For bit 00:

State to display the single initialization after POWER ON.

For bit 01:

State in which the automatic restart function waits for faults (initial state).

For bit 02:

General display that a fault has been identified and that the restart or acknowledgment has been initiated.

For bit 03:

Displays the acknowledge command within the "acknowledge alarms" state (bit 4 = 1). For bit 5 = 1 or bit 6 = 1, the acknowledge command is continually displayed.

For bit 04:

State in which the faults that are present are acknowledged. The state is exited again after successful acknowledgment. A change is only made into the next state if it is signaled that a fault is no longer present after an acknowledgment command (bit 3 = 1).

For bit 05:

State in which the drive is automatically switched on (only for p1210 = 4, 6).

For bit 06:

State in which the system waits after having been switched on, to the end of the start attempt.

For p1210 = 1, this signal is directly set after the faults have been successfully acknowledged.

For bit 07:

State which is assumed after a fault occurs within the automatic restart function.

For bit 10:

When the automatic restart function is active, r1214.7 is displayed, otherwise the active fault r2139.3.

The bit is set if the automatic restart can no longer acknowledge a fault, and cancels with fault F07320.

For bits 12 ... 15:

Actual state of the start counter (binary coded).

|---|--|--|---|
| <b>p1215</b>  | <b>Motor holding brake configuration / Brake config</b>  |  |   |
| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC           | <b>Can be changed:</b> T<br><b>Data type:</b> Integer16<br><b>P-Group:</b> Functions<br><b>Not for motor type:</b> -<br><b>Min</b><br>0  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>3 | <b>Access level:</b> 2<br><b>Func. diagram:</b> 2701, 2707,<br>2711<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0 |
| <b>Description:</b>   | Sets the holding brake configuration.  |  |   |
| <b>Value:</b>   | 0: No motor holding brake available<br>1: Motor holding brake acc. to sequence control<br>2: Motor holding brake always open<br>3: Motor holding brake like sequence control connection via BICO   |  |   |
| <b>Dependency:</b>  | Refer to: p1216, p1217, p1226, p1227, p1228, p1278   |  |   |
| <b>Caution:</b>   | For the setting p1215 = 0, if a brake is used, it remains closed. If the motor moves, this will destroy the brake.   |  |   |
|  |  |  |   |
| <b>Notice:</b>  | If p1215 was set to 1 or if p1215 was set to 3, then when the pulses are suppressed, the brake is closed even if the motor is still rotating. Pulse suppression can either be caused by a 0 signal at p0844, p0845 or p0852 or as a result of a fault with OFF2 response. If this is not desirable (e.g. for a flying restart), then the brake can be kept open using a 1 signal at p0855.   |  |   |
| <b>Note:</b>  | If the configuration is set to "no holding brake present" when booting, then the motor holding brake will be automatically identified. If a motor holding brake is detected, the configuration is set to "motor holding brake as for sequence control".<br>If a motor holding brake is used via the brake connection of the Motor Module integrated in the drive, then it is not permissible that p1215 is set to 3.<br>if an external motor holding brake is being used, then p1215 should be set to 3 and r0899.12 should be interconnected as control signal.<br>When the function module "extended brake control" is activated (r0108.14 = 1), r1229.1 should be interconnected as control signal.<br>The parameter can only be set to zero when the pulses are inhibited.<br>The parameterization "no motor holding brake available" and "Safe Brake Control" enabled (p1215 = 0, p9602 = 1, p9802 = 1) is not practical if there is no motor holding brake.<br>The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical. |  |   |

|   |  |   |   |
|---|--|---|---|
| <b>p1216</b>  | <b>Motor holding brake opening time / Brake t<sub>open</sub></b>   |   |   |
| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Functions<br><b>Not for motor type:</b> -<br><b>Min</b><br>0 [ms]  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>10000 [ms] | <b>Access level:</b> 2<br><b>Func. diagram:</b> 2701, 2711<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>100 [ms] |
| <b>Description:</b>   | Sets the time to open the motor holding brake.<br>After controlling the holding brake (opens), the speed/velocity setpoint remains at zero for this time. After this, the speed/velocity setpoint is enabled.                  |   |   |
| <b>Recommendation:</b>  | This time should be set longer than the actual opening time of the brake. This ensures that the drive cannot accelerate when the brake is applied.   |   |   |
| <b>Dependency:</b>  | Refer to: p1215, p1217   |   |   |
| <b>Note:</b>  | For a motor with DRIVE-CLiQ and integrated brake, for p0300 = 10000, this time is pre-assigned the value saved in the motor.<br>For p1216 = 0 ms, the monitoring and the message A07931 "Brake does not open" are deactivated. |   |   |

|   |  |   |  |
|---|--|---|--|
| <b>p1217</b>  | <b>Motor holding brake closing time / Brake t_close</b>  |   |  |
| SERVO, VECTOR,<br>SERVO_AC,<br>VECTOR_AC,<br>SERVO_I_AC,<br>VECTOR_I_AC   | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Functions<br><b>Not for motor type:</b> -<br><b>Min</b><br>0 [ms]  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>10000 [ms] | <b>Access level:</b> 2<br><b>Func. diagram:</b> 2701, 2711<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>100 [ms]                        |
| <b>Description:</b>   | Sets the time to apply the motor holding brake.<br>After OFF1 or OFF3 and the holding brake is controlled (the brake closes), then the drive remains closed-loop controlled for this time stationary with a speed setpoint/velocity setpoint of zero. The pulses are suppressed when the time expires. |   |  |
| <b>Recommendation:</b>  | This time should be set longer than the actual closing time of the brake. This ensures that the pulses are only suppressed after the brake has closed.   |   |  |
| <b>Dependency:</b>  | Refer to: p1215, p1216   |   |  |
| <b>Notice:</b>  | If the selected closing time is too short with respect to the actual closing time of the brake, then the load can sag.<br>If the closing time is selected to be too long with respect to the actual closing time of the brake, the control works against the brake and therefore reduces its lifetime. |   |  |
| <b>Note:</b>  | For a motor with DRIVE-CLiQ and integrated brake, for p0300 = 10000, this time is pre-assigned the value saved in the motor.<br>For p1217 = 0 ms, the monitoring and the message A07932 "Brake does not close" are deactivated.  |   |  |

## 2 Parameters

### 2.2 List of parameters

|   |  |   |   |
|---|--|---|---|
| <b>p1220</b>  | <b>CI: Open motor holding brake signal source threshold / Open brake thr</b>   |   |   |
| SERVO (Ext brake),<br>VECTOR (Ext brake),<br>SERVO_AC (Ext<br>brake), VECTOR_AC<br>(Ext brake),<br>SERVO_I_AC (Ext<br>brake),<br>VECTOR_I_AC (Ext<br>brake) | <b>Can be changed:</b> T<br><b>Data type:</b> Unsigned32 / FloatingPoint32<br><b>P-Group:</b> Functions<br><b>Not for motor type:</b> -<br><b>Min</b><br>-   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> PERCENT<br><b>Max</b><br>-    | <b>Access level:</b> 2<br><b>Func. diagram:</b> 2707<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>1        |
| <b>Description:</b>   | Sets the signal source for the command "open brake".   |   |   |
| <b>Dependency:</b>  | Refer to: p1215, p1221, r1229, p1277   |   |   |
| <b>p1221</b>  | <b>Open motor holding brake threshold / Open brake thr</b>   |   |   |
| SERVO (Ext brake),<br>VECTOR (Ext brake),<br>SERVO_AC (Ext<br>brake), VECTOR_AC<br>(Ext brake),<br>SERVO_I_AC (Ext<br>brake),<br>VECTOR_I_AC (Ext<br>brake) | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Functions<br><b>Not for motor type:</b> -<br><b>Min</b><br>0.00 [%]  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>200.00 [%] | <b>Access level:</b> 2<br><b>Func. diagram:</b> 2707<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0.00 [%] |
| <b>Description:</b>   | Sets the threshold value for the command "open brake".   |   |   |
| <b>Dependency:</b>  | Refer to: p1220, r1229, p1277  |   |   |
| <b>p1222</b>  | <b>BI: Motor holding brake feedback signal brake closed / Brake fdbk closed</b>  |   |   |
| SERVO (Ext brake),<br>VECTOR (Ext brake),<br>SERVO_AC (Ext<br>brake), VECTOR_AC<br>(Ext brake),<br>SERVO_I_AC (Ext<br>brake),<br>VECTOR_I_AC (Ext<br>brake) | <b>Can be changed:</b> T<br><b>Data type:</b> Unsigned32 / Binary<br><b>P-Group:</b> Functions<br><b>Not for motor type:</b> -<br><b>Min</b><br>-  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>-          | <b>Access level:</b> 2<br><b>Func. diagram:</b> 2711<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0        |
| <b>Description:</b>   | Sets the signal source for the feedback signal "brake closed".<br>For motor holding brakes with feedback signal, the signal "brake closed" can be activated using p1275.5 = 1.   |   |   |
| <b>Dependency:</b>  | Refer to: p1223, p1275   |   |   |
| <b>Note:</b>  | 1 signal: Brake closed.<br>When braking with 1 feedback signal, the inverted feedback signal is connected to the BICO input for the second feedback signal (p1223).<br>For r1229.5 = 1, OFF1/OFF3 are suppressed to prevent the drive accelerating by a load that drives the motor - whereby OFF2 remains effective. |   |   |
| <b>p1223</b>  | <b>BI: Motor holding brake feedback signal brake open / Brake fdbk open</b>  |   |   |
| SERVO (Ext brake),<br>VECTOR (Ext brake),<br>SERVO_AC (Ext<br>brake), VECTOR_AC<br>(Ext brake),<br>SERVO_I_AC (Ext<br>brake),<br>VECTOR_I_AC (Ext<br>brake) | <b>Can be changed:</b> T<br><b>Data type:</b> Unsigned32 / Binary<br><b>P-Group:</b> Functions<br><b>Not for motor type:</b> -<br><b>Min</b><br>-  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>-          | <b>Access level:</b> 2<br><b>Func. diagram:</b> 2711<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>1        |
| <b>Description:</b>   | Sets the signal source for the feedback signal "brake open".<br>For motor holding brakes with feedback signal, the signal "brake open" can be activated using p1275.5 = 1.   |   |   |
| <b>Dependency:</b>  | Refer to: p1222, p1275   |   |   |

**Note:** 1 signal: Brake open.  
When braking with 1 feedback signal, the inverted feedback signal is connected to the BICO input for the second feedback signal (p1222).

0

**Description:**

Setting to activate the various types for armature short-circuit / DC braking.

**Value:**

- 0: No function
- 1: External armature short-circuit with contactor feedback signal
- 2: Ext. armature short circuit without contactor feedback signal
- 3: Internal voltage protection
- 4: Internal armature short-circuit / DC braking
- 5: DC braking for OFF1/OFF3
- 14: DC braking below starting speed

**Dependency:**

Refer to: p0300, p1230, p1232, p1233, p1234, p1235, p1236, p1237, r1238, r1239, p1345, p1346

**Danger:**

For p1231 = 1, 2:

- only short-circuit-proof motors may be used, or suitable resistors must be used to short-circuit the motor

For p1231 = 3:

- when the internal voltage protection is active, after pulse suppression, all of the motor terminals are at half of the DC link voltage (without an internal voltage protection, the motor terminals are at zero potential)!

- it is only permissible to use motors that are short-circuit proof (p0320 &lt; p0323).

- the Motor Module must be able to conduct 180% short-circuit current (r0320) of the motor (r0209).

- the internal voltage protection cannot be interrupted due to a fault response. If an overcurrent condition occurs during the active, internal voltage protection, then this can destroy the Motor Module and/or the motor.

- if the Motor Module does not support the autonomous, internal voltage protection (r0192.10 = 0), in order to ensure safe, reliable functioning when the line supply fails, an external 24 V power supply (UPS) must be used for the components.

- if the Motor Module does support the autonomous, internal voltage protection (r0192.10 = 1), in order to ensure safe, reliable functioning when the line supply fails, the 24 V power supply for the components must be provided through a Control Supply Module.

- if the internal voltage protection is active, it is not permissible that the motor is driven by the load for a longer period of time (e.g. as a result of loads that move the motor or another coupled motor).

For p1231 = 4 and synchronous motor:

- when armature short-circuit is active, all of the motor terminals are at half of the DC link potential.

- it is only permissible to use motors that are short-circuit proof (p0320 &lt; p0323).

- the Motor Module must be able to conduct 180% short-circuit current (r0320) of the motor (r0209).

- for pulling loads, it is not permissible that an armature short circuit is used by itself. The reason for this is that until this becomes effective, the motor will have continued to rotate. In the case of a fault, it is only permissible to use an armature short circuit as support in conjunction with a mechanical brake.

For p1231 = 4 and induction motor:

- it is not permissible that DC braking is used for pulling loads; this is because during the demagnetization time (p0347) the motor rotates and a mechanical brake is then only closed while the motor is still rotating.

**Note:**

For p1231 = 1, 2:

The external armature short circuit can only be selected for synchronous motors (p0300). In this case, control bit BO: r1239.0 must be interconnected (e.g. to a digital input) to control the external contactor.

The external armature short circuit cannot be set as a fault response. It can be triggered via binector input p1230. It is also always activated in the case of pulse suppression.

When the external armature short circuit is activated, the system waits for the de-excitation time (p0347) before the short-circuit contactor is controlled. For vector control, for the de-excitation time, a value greater than zero may be required in order to avoid the overcurrent monitoring from responding.

For p1231 = 3:

Internal voltage protection (using an internal armature short circuit) can only be selected for synchronous motors (p0300) and Motor Modules in booksize or chassis format. Further, it is not permissible for Safety Integrated to be active on blocksize Motor Modules (i.e. p9501 = 0 and p9601 = 0). The internal voltage protection prevents the DC link capacitance from being charged if there is no possibility of regenerating the EMF of a motor operated in the field-weakening mode. The Motor Module must support this function (r0192.9 = 1).

a) If the Motor Module does not support the autonomous, internal armature short-circuit (r0192.10 = 0), the armature short-circuit is activated as soon as the activation criterion is fulfilled (refer below):

b) If the Motor Module supports the autonomous internal voltage protection (r0192.10 = 1), then the Motor Module itself decides - using the DC link voltage - as to whether the short-circuit should be activated. In this case, protection is also provided even if the DRIVE-CLiQ connection between the Control Unit and Motor Module was interrupted. The short circuit is activated if the DC link voltage exceeds 800 V. If the DC link voltage falls below 450 V, then the short-circuit is withdrawn. This therefore ensures that the required input voltage for the Control Supply Module is maintained.

For chassis units, the following applies:

The value for the voltage limits is calculated, depending on the voltage class, from EEPROM data of the particular power unit and a factor.

For p1231 = 4:

The function is activated as soon as the activation criterion is fulfilled.

- the function can be superseded by OFF2

a) For synchronous motors (p0300 = 2xx, 4xx), the internal armature short-circuit is initiated.

- the Motor Module must support this function (r0192.9 = 1).

b) For induction motors (p0300 = 1xx), the DC braking is initiated.

Activation criterion (one of the following criteria is fulfilled):

- binector input p1230 = 1 signal (DC braking activation).

- the drive is not in the state "S4: Operation" or in "S5x" (refer to function diagram 2610).

- the internal pulse enable is missing (r0046.19 = 0).

For p1231 = 5:

DC braking can only be set for induction motors.

DC braking is activated if the OFF1 or OFF3 command is present. Binector input p1230 is ineffective. If the drive speed still lies above the speed threshold p1234, then initially, the drive is ramped-down to this threshold, demagnetized (see p0347) and is then switched into DC braking for the time set in p1233. After this, the drive is switched-off. If, at OFF1/OFF3, the drive speed is below p1234, then it is immediately demagnetized and switched into DC braking. A change is made into normal operation if the OFF1 command is withdrawn prematurely.

DC braking by means of fault response continues to be possible.

For p1231 = 14:

DC braking can only be set for induction motors.

DC braking is initiated if binector input p1230 = 1 during operation and the actual speed is below the starting speed p1234 (before this, the drive must have operated above p1234 plus the hysteresis). Then, following upstream demagnetization (see p0347), the braking current p1232 is injected for the time set in p1233. The drive then changes into normal operation. During braking the command for DC braking can be withdrawn. If the time p1233 is exceeded, then DC braking is inhibited and the drive changes into normal operation.

For OFF1 and OFF3, DC braking is only executed, if binector input p1230 = 1 signal.

DC braking by means of fault response continues to be possible.

For operation with an encoder, the encoder signal may not exceed a ripple of 15 rpm in the range of p1234.

For p1231 = 3, 4, 5, 14:

The value can only be changed to values not equal to 3, 4, 5 or 14 if p0491 is not equal to 4 and p2101 is not equal to 6 (armature short-circuit/DC braking not set).

In order that the armature short-circuit/DC braking is active as fault response, the corresponding fault number must be entered in p2100 and fault response p2101 set = 6 (encoder fault response, see p0491).

Note:

ASC: Armature Short Circuit

CSM: Control Supply Module

DCBRK: DC Braking

IVP: Internal Voltage Protection

UPS: Uninterruptible Power Supply

- - 0

**Description:** Sets the signal source for the contactor feedback signal for external armature short-circuit.

**Dependency:** Refer to: p1230, p1231, p1236, p1237, r1239

**Notice:** In order that the pulses are not enabled when the contactor is closed, the contactor feedback signal must lag by a sufficiently long time when opening the contactor.

**Note:** 1 signal: The contactor is closed.

0 signal: The contactor is open.

0 [ms] 1000 [ms] 200 [ms]

**Description:** Sets the monitoring time of the contactor feedback signal for the external armature short-circuit configuration.

If the contactor feedback signal (p1235) is parameterized, then the appropriate feedback signal (r1239.1) is expected within this monitoring time after either opening or closing the contactor.

**Dependency:** Refer to: p1230, p1231, p1235, p1237, r1239

Refer to: F07904, F07905

0 [ms] 1000 [ms] 200 [ms]

**Description:** Sets the delay time when opening the contactor of the external armature short-circuit.

If no contactor feedback signal has been selected (p1235), then the system waits for this time before the pulses are switched in.

**Dependency:** Refer to: p1230, p1231, p1235, p1236, r1239

**Notice:** This delay time must be at least long enough so that the contactor contacts reliably open before the pulses are switched in. The delay time must be greater than the contactor response time. The Motor Module can be damaged if the delay time is too short.

## 2 Parameters

### 2.2 List of parameters

For bit 06:

a) Internal voltage protection (p1231 = 3) was selected and the Motor Module does not support the autonomous internal voltage protection (r0192.10 = 0).

The internal voltage protection is ready and is activated as soon as the activation criterion is fulfilled.

a) Internal voltage protection (p1231 = 3) was selected and the Motor Module supports the autonomous internal voltage protection (r0192.10 = 1).

The internal voltage protection is ready and the Motor Module decides autonomously - using the DC link voltage - whether the short-circuit is activated. In this case, protection is also provided even if the DRIVE-CLiQ connection between the Control Unit and Motor Module was interrupted. The short-circuit is activated if the DC link voltage exceeds 800 V. If the DC link voltage falls below 450 V, then the short-circuit is withdrawn.

c) Internal armature short-circuit (p1231 = 4) was selected.

The internal armature short-circuit is ready and is activated as soon as the activation criterion is fulfilled.

Activation criterion (one of the following criteria is fulfilled):

- the signal at BI: p1230 (armature short-circuit activation) is 1.
- the drive is not in the state "S4: Operation" or in S5x (refer to function diagram 2610).
- the internal pulse enable is missing (r0046.19 = 0).

For bits 12, 13:

Only effective for p1231 = 14.

| <b>Description:</b>         | Sets the configuration of the controller or monitoring for the DC link voltage (Vdc).   |                               |                                  |
| <b>Value:</b>               | 0: Inhibit Vdc ctrl<br>1: Enable Vdc_max controller<br>2: Enable Vdc_min controller (kinetic buffering)<br>3: Enable Vdc_min controller and Vdc_max controller<br>4: Activate Vdc_max monitoring<br>5: Activate Vdc_min monitoring<br>6: Activate Vdc_min monitoring and Vdc_max monitoring<br>7: Enable Vdc_max controller without accelerating<br>8: Enable Vdc_min controller without braking<br>9: Enable Vdc_min and Vdc_max controller w/o braking/accelerating   |                               |                                  |
| <b>Dependency:</b>          | Refer to: p1244, p1248, p1250, p1532  |                               |                                  |
| <b>Notice:</b>              | During a few steps of the rotating measurement (p1960 = 1) the Vdc_min controller and/or Vdc_max controller is disabled.  |                               |                                  |
| <b>Note:</b>                | p1240 = 1, 3:<br>When the upper DC link voltage threshold is reached (p1244), then the following applies:<br>- the Vdc_max controller limits the regenerative energy in order that the DC link voltage is kept below the maximum DC link voltage when braking.<br>- when other drives regenerate into the DC link, then the Vdc_max controller causes the motor to accelerate.<br>p1240 = 2, 3:<br>When the lower DC link voltage threshold is reached (p1248), the following applies:<br>- the Vdc_min controller limits the energy taken from the DC link in order to keep the DC link voltage above the minimum DC link voltage when accelerating.<br>- the motor is braked in order to use its kinetic energy to buffer the DC link.<br>p1240 = 4, 5, 6:<br>When the threshold in p1244 or p1248 is reached, the DC link voltage monitoring initiates a fault with a response and therefore reduces additional negative effects on the DC link voltage.<br>p1240 = 7, 9:<br>as for p1240 = 1, 3. However, the motor is prevented from accelerating as a result of the regenerative feedback (energy recovery) of the other drives. The effective lower torque limit cannot exceed the offset of the torque limit (p1532). |                               |                                  |

p1240 = 8, 9:

as for p1240 = 2, 3. However, the motor is prevented from braking due to the fact that the DC link voltage has been lowered. The effective upper torque limit cannot be less than the offset of the torque limit (p1532).

| <b>Warning:</b>  | When the Vdc_max controller is active, the motor can be accelerated (e.g. by driving loads or as a result of high DC link voltages). This can be caused by other drives that are operating on a common DC link busbar.   |   |  |
|   |  |   |  |
| <b>Caution:</b>  | If several drives are operated from the same DC link busbar, then it is recommended that the Udc control is only activated for the drives with high moments of inertia. If the Udc controls for various drives are simultaneously active, then they can mutually influence one another. In this case, the controller dynamic performance should be reduced or the Udc control of individual drives should be deactivated.  |   |  |
|  |  |   |  |
| <b>Notice:</b>   | Drives with Udc control must be able to brake and accelerate independently of one another.   |   |  |
| <b>Note:</b>   | An excessively high value in p1245 can possibly negatively influence the normal operation of the drive.<br>p1240 = 1, 3:<br>When the DC link voltage limit specified for the Motor Module is reached the following applies:<br>- the Vdc_max controller limits the regenerative energy in order that the DC link voltage is kept below the maximum DC link voltage when braking.<br>- the ramp-down times are automatically increased.<br>p1240 = 2, 3:<br>When the switch-in threshold of the Vdc_min controller is reached (p1245), the following applies:<br>- the Vdc_min controller limits the energy taken from the DC link in order to keep the DC link voltage above the minimum DC link voltage when accelerating.<br>- the motor is braked in order to use its kinetic energy to buffer the DC link.<br>p1240 = 4, 5, 6:<br>When the threshold in r1242 or r1246 is reached, the DC link voltage monitoring initiates a fault (F07403 or F07404) with a response and therefore reduces additional negative effects on the DC link voltage.<br>If a braking resistor is connected to the DC link, then the Vdc_max control should be disabled (also see p1531). |   |  |

| <b>Description:</b>                              | Sets the proportional gain for the DC link voltage controller (Vdc_min controller, Vdc_max controller).   |                                 |                              |
| <b>Dependency:</b>                               | The effective proportional gain is obtained taking into account p1243 (Vdc_max controller dynamic factor).  |                                 |                              |
| <b>Note:</b>                                     | The gain factor is proportional to the capacitance of the DC link. The parameter is pre-set to a value that is optimally adapted to the capacitance of the individual Motor Module. The capacitances of the other power units, which are connected to the DC link, can be taken into account using the dynamic factor (p1247 or p1243).   |                                 |                              |
| <b>p1250</b>                                     | <b>Vdc controller proportional gain / Vdc_ctrl Kp</b>   |                                 |                              |
| A_INF (Line droop ctrl), R_INF (Line droop ctrl) | <b>Can be changed:</b> U, T   | <b>Calculated:</b> -            | <b>Access level:</b> 4       |
|  | <b>Data type:</b> FloatingPoint32   | <b>Dyn. index:</b> -            | <b>Func. diagram:</b> -      |
|  | <b>P-Group:</b> -   | <b>Unit group:</b> -            | <b>Unit selection:</b> -     |
|  | <b>Not for motor type:</b> -  | <b>Scaling:</b> -               | <b>Expert list:</b> 1        |
|  | <b>Min</b>  | <b>Max</b>                      | <b>Factory setting</b>       |
|  | 0.00  | 100.00                          | 0.00                         |
| <b>Description:</b>                              | Sets the proportional gain for the DC link voltage controller (Vdc_min controller, Vdc_max controller) in line droop operation (p5401).<br>The controller actuating signal acts on the frequency output of the line droop control. The additional power to change the DC link voltage is therefore internally multiplied with the gradient of the frequency droop (p5407, p5408).   |                                 |                              |
| <b>Dependency:</b>                               | Refer to: p1241, p1245  |                                 |                              |
| <b>Notice:</b>                                   | The Vdc_min controller or Vdc_max controller for grid droop operation can only become correctly active from its inherent operating principle, if additional island grid components are connected whose power significantly changes with the grid frequency. Examples of this are other power generators at an operating point with sufficient reserve for higher and lower power output - or line motors with sufficient reserve for higher and lower power consumption.<br>Otherwise, when the activation level for the Vdc_min controller or Vdc_max controller is exceeded, serious line faults can occur (underfrequency/overfrequency and undervoltage/overvoltage). |                                 |                              |
| <b>Note:</b>                                     | Parameter p1250 acts as multiplier to the internal default setting of the gain factor.<br>The internal setting already takes into account the dependency on the capacitance of the DC link (corresponding to p3422).  |                                 |                              |

## 2 Parameters

### 2.2 List of parameters

|  |  |   |   |
|--|--|---|---|
| <b>p1251[0...n]</b>                                    | <b>Vdc controller integral time / Vdc_ctrl Tn</b>  |   |   |
| VECTOR (n/M),<br>VECTOR_AC (n/M),<br>VECTOR_I_AC (n/M) | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Functions<br><b>Not for motor type:</b> REL<br><b>Min</b><br>0 [ms]  | <b>Calculated:</b> -<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>10000 [ms]    | <b>Access level:</b> 3<br><b>Func. diagram:</b> 6220<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0 [ms] |
| <b>Description:</b>                                    | Sets the integral time for the DC link voltage controller (Vdc_min controller, Vdc_max controller).  |   |   |
| <b>Dependency:</b>                                     | The effective integral time is obtained taking into account p1243 (Vdc_max controller dynamic factor).   |   |   |
| <b>Note:</b>   | An integral time is normally not required for single axis drives. For multi-axis drives on the other hand, it may be possible to compensate for interference from other axes using the integral time (integral component) .<br>p1251 = 0: The integral component is deactivated.   |   |   |
| <b>p1252[0...n]</b>                                    | <b>Vdc controller rate time / Vdc_ctrl Tv</b>  |   |   |

| <b>Description:</b>  | Sets the response for the Vdc_min controller (kinetic buffering).   |  |   |
| <b>Value:</b>  | 0: Buffer Vdc until undervoltage, n<p1257 -> F07405<br>1: Buff. Vdc until undervolt., n<p1257 -> F07405, t>p1255 -> F07406  |  |   |
| <b>Dependency:</b>   | Refer to: F07405, F07406  |  |   |
| <b>p1257[0...n]</b>  | <b>Vdc_min controller speed threshold / Vdc_min n_thr</b>   |  |   |
| VECTOR (n/M),<br>VECTOR_AC (n/M),<br>VECTOR_I_AC (n/M)                   | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Functions<br><b>Not for motor type:</b> REL<br><b>Min</b><br>0.00 [rpm]   | <b>Calculated:</b> CALC_MOD_ALL<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> 3_1<br><b>Scaling:</b> -<br><b>Max</b><br>210000.00 [rpm] | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> p0505<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>50.00 [rpm] |
| <b>Description:</b>  | Sets the speed threshold for the Vdc-min controller (kinetic buffering).<br>If this value is exceeded a fault is output; the required response can be parameterized .<br>Kinetic buffering is not started below the speed threshold.  |  |   |
| <b>Note:</b>   | Exiting the Vdc_min control before reaching motor standstill prevents the regenerative braking current from increasing significantly at low speeds, and after a pulse inhibit, means that the motor coasts down.<br>However, the maximum braking torque can be set via the appropriate torque limiting. |  |   |
| <b>r1258</b>   | <b>CO: Vdc controller output / Vdc_ctrl output</b>  |  |   |
| VECTOR (n/M),<br>VECTOR_AC (n/M),<br>VECTOR_I_AC (n/M)                   | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Functions<br><b>Not for motor type:</b> REL<br><b>Min</b><br>- [Arms]  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> 6_2<br><b>Scaling:</b> p2002<br><b>Max</b><br>- [Arms]                        | <b>Access level:</b> 3<br><b>Func. diagram:</b> 6220<br><b>Unit selection:</b> p0505<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- [Arms] |
| <b>Description:</b>  | Displays the actual output of the Vdc controller (DC link voltage controller)   |  |   |
| <b>Note:</b>   | The regenerative power limit p1531 is used for vector control to precontrol the Vdc_max controller. The lower the power limit is set, the lower the correction signals of the controller when the voltage limit is reached.   |  |   |
| <b>p1260</b>   | <b>Bypass configuration / Bypass config</b>   |  |   |
| VECTOR (Tech_ctrl),<br>VECTOR_AC (Tech_ctrl),<br>VECTOR_I_AC (Tech_ctrl) | <b>Can be changed:</b> U, T<br><b>Data type:</b> Integer16<br><b>P-Group:</b> -<br><b>Not for motor type:</b> RESM<br><b>Min</b><br>0   | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>3                                     | <b>Access level:</b> 2<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0               |
| <b>Description:</b>  | Sets the configuration for the bypass function.   |  |   |
| <b>Value:</b>  | 0: Bypass deactivated<br>1: Bypass with synchronization and overlap<br>2: Bypass with synchronization without overlap<br>3: Bypass without synchronization  |  |   |

## 2 Parameters

### 2.2 List of parameters

**Note:** If the bypass function is selected (p1260 > 0), then when the power unit restarts after POWER OFF, the state of the bypass switch is evaluated. This means that after the ramp-up, it is possible to directly change into the standby mode. This is only possible for p1267 = 1 (bypass using the control signal) and if the control command after the system has been booted is still available (p1266). This function has a higher priority than the automatic restart function (p1210).

The "bypass" function can only be switched off again (p1260 = 0) if the bypass is not active or the bypass function has a fault.

The corresponding function should be activated in p3800 for bypass with synchronization.

---

#### r1261.0...12 CO/BO: Bypass control/status word / Bypass STW / ZSW

|  |                                 |                      |                          |

|                   | 12         | DC link voltage monitoring activated                   | Yes             | No              | -         |

**Dependency:** Refer to: p1200, p2369

**Note:** Control bits 0 and 1 should be interconnected to the signal outputs via which the switches in the motor feeder cables should be controlled. These should be selected/dimensioned for switching under load.

For bit 12:

The DC link voltage monitoring is only available for a synchronized bypass. The overcurrent monitoring is also activated together with the DC link voltage monitoring. For debypass, monitoring is only activated if "Flying restart" is activated.

---

#### p1262[0...n] Bypass dead time / Bypass t\_dead

|  |                                   |                                 |                          |
|--|-----------------------------------|---------------------------------|--------------------------|
| VECTOR (Tech_ctrl),<br>VECTOR_AC<br>(Tech_ctrl),<br>VECTOR_I_AC<br>(Tech_ctrl) | <b>Can be changed:</b> U, T       | <b>Calculated:</b> CALC_MOD_REG | <b>Access level:</b> 2   |
|  | <b>Data type:</b> FloatingPoint32 | <b>Dyn. index:</b> DDS, p0180   | <b>Func. diagram:</b> -  |
|  | <b>P-Group:</b> -                 | <b>Unit group:</b> -            | <b>Unit selection:</b> - |
|  | <b>Not for motor type:</b> RESM   | <b>Scaling:</b> -               | <b>Expert list:</b> 1    |
|  | <b>Min</b>                        | <b>Max</b>                      | <b>Factory setting</b>   |
|  | 0.000 [s]                         | 20.000 [s]                      | 1.000 [s]                |

**Description:** Sets the dead time for non-synchronized bypass.

**Note:** This parameter is used to define the changeover time of the contactors. It should not be shorter than the demagnetizing time of the motor (p0347).

The total time for switching over to line operation or returning back to converter operation is obtained from the sum of p1262 and the monitoring time of the relevant switch (p1274[x]).

## 2 Parameters

### 2.2 List of parameters

**Note:** The parameter only has an effect for a non-synchronized bypass.  
 p1267.0 = 1:  
 The bypass is initiated by setting a binary signal. When the command is reset, after the debypass delay time (p1263) has expired, operation at the power unit is re-selected.  
 p1267.1 = 1:  
 When the speed threshold entered in p1265 is reached, the bypass is switched in. The system only switches back when the speed setpoint again falls below the threshold value.

**Caution:** For bit 00 = 1:  
 When using a dv/dt filter, it is not permissible that a flying restart with voltage model is activated.

**Notice:** For bit 00:  
 When selecting - also for U/f characteristic operation - a standstill measurement to identify the motor data must have been performed to set the necessary current controller for a fast flying restart.

**Note:** ASM: Induction motor  
PMSM: permanent-magnet synchronous motor  
For bit 00:  
This bit is equivalent to p1780 bit 11.  
For bit 01:  
This bit should only be set when required for large drives.

**Description:** Sets the maximum search frequency for a flying restart in an inhibited setpoint direction (p1110, p1111).

**Note:** The parameter has no effect for an operating mode, which only searches in the setpoint direction (p1200 > 3).

---

**p1272 Simulation mode / Simulation mode**

|                                      |                              |                      |                          |

|                                      | <b>Not for motor type:</b> - | <b>Scaling:</b> -    | <b>Expert list:</b> 1    |
|                                      | <b>Min</b>                   | <b>Max</b>           | <b>Factory setting</b>   |
|                                      | 0                            | 1                    | 0                        |

**Description:** In the simulation mode, the closed-loop control or U/f control can be operated without motor.

The simulation mode is used to test the power unit. Even though the DC link voltage is missing, the pulses are enabled when switching on. The DC link precharging is bypassed and the undervoltage detection is disabled.

Closed-loop speed control with an encoder is possible if the torque setpoint (r0079) is used in order to operate a second drive in the closed-loop torque controlled mode.

**Value:**  
0: OFF  
1: ON

**Dependency:** The following functions are deactivated in the simulation mode:

- motor data identification routine
- motor data identification routine, rotating without encoder
- pole position identification

For U/f control and sensorless vector control, flying restart is not carried out (refer to p1200).

Refer to: r0192, p1900, p1910, p1960, p1990

Refer to: A07825, F07826

**Notice:** In simulation mode, binector output r0863.1 = 1 is set. This is why you need to check whether other devices are switched on via this signal before activating simulation mode. You might need to disconnect the corresponding BICO interconnection temporarily.

**Note:** Simulation mode is only possible for DC link voltages below 40 V. In order that the closed-loop control can be calculated, the displayed DC link voltage (r0026, r0070) is set to the rated DC link voltage (refer to p0210). Closed-loop current control and motor model are switched out (disabled) - the same is true for the speed controller for encoderless closed-loop speed control.

When fault messages occur, the parameter is not automatically reset. This function is not implemented for SINAMICS GM.

**Description:** Sets the brake control type (with or without diagnostics evaluation).

Example for brake control with diagnostics evaluation.

- brake control in the Motor Modules in booksize format

- Safe Brake Relay for AC Drive

Example for brake control without diagnostics evaluation.

- Brake Relay for AC Drive

**Value:** 0: Brake control with diagnostics evaluation  
1: Brake control without diagnostics evaluation

**Note:** If the configuration of the motor holding brake (p1215) is set to "no holding brake present" when booting, then an automatic identification of the motor holding brake will be carried out. If a brake control is detected without diagnostics evaluation (e.g. Brake Relay for AC Drive), then the parameter is set to "brake control without diagnostics evaluation".

It is not permissible to parameterize "brake control without diagnostics evaluation" and also enable "safe brake control" (p1278 = 1, p9602 = 1, p9802 = 1).

| <b>Description:</b>                  | Sets the configuration of the controller for the DC link voltage (Vdc controller) in the U/f operating mode.  |                               |                                  |
| <b>Value:</b>                        | 0: Inhibit Vdc ctrl<br>1: Enable Vdc_max controller<br>2: Enable Vdc_min controller (kinetic buffering)<br>3: Enable Vdc_min controller and Vdc_max controller<br>4: Activate Vdc_max monitoring<br>5: Activate Vdc_min monitoring<br>6: Activate Vdc_min monitoring and Vdc_max monitoring   |                               |                                  |
| <b>Warning:</b>                      |  When the Vdc_max controller is active, the motor can be accelerated (e.g. by driving loads or as a result of high DC link voltages). This can be caused by other drives that are operating on a common DC link busbar.  |                               |                                  |
| <b>Caution:</b>                      |  If several drives are operated from the same DC link busbar, then it is recommended that the Udc control is only activated for the drives with relatively high moments of inertia.<br>If the Udc controls for various drives are simultaneously active, then they can mutually influence one another. In this case, the controller dynamic performance should be reduced or the Udc control of individual drives should be deactivated.<br>Drives with Udc control must be able to brake and accelerate independently of one another. |                               |                                  |
| <b>Note:</b>                         | For p1280 = 4, 5, 6:<br>When the threshold in r1282 or r1286 is reached, the DC link voltage monitoring initiates a fault (F07403 or F07404) with a response and therefore reduces additional negative effects on the DC link voltage.<br>If a braking resistor is connected to the DC link, then the Vdc_max control should be disabled.<br>For p1280 = 1, 3:<br>Only U/f control: When the Vdc max controller is active, fault F07404 is initiated if the speed setpoint ramp is stopped (held) longer than the time set in p1284.  |                               |                                  |

## 2 Parameters

### 2.2 List of parameters

**Note:** The closed-loop torque control can only be changed over in operation (p1300 = 20, 21) by selecting the closed-loop speed control (p1501). At the changeover, the setting of p1300 does not change. In this case, the actual state is displayed in r1407, bit 2 and bit 3.

For encoderless operation (p1404 = 0 or p1300 = 20), the following applies:

- the following condition must be fulfilled:  $p1800 \geq 1 / (4 * p0115[0])$
- for motors with a low power rating (< 300 W), we recommend to set  $p1800 \geq 1 / p0115[0]$ .
- although pulse frequencies  $p1800 = 1 / (n * p0115[0])$  with  $n = 3$  or  $4$  are possible, for  $p0115[0] > 62.5 \mu s$ , they result in unsteady closed-loop control and should be avoided.
- for a blocksize unit with a current controller sampling time  $p0115[0] < 80 \mu s$  and a pulse frequency of  $p1800 = 0.5 / p0115[0]$ , then it may be necessary to increase the switchover speed of the model p1755.

|               | 18: I/f control with fixed current                                  |
|               | 19: U/f control with independent voltage setpoint                   |
|               | 20: Speed control (encoderless)                                     |
|               | 21: Speed control (with encoder)                                    |
|               | 22: Torque control (encoderless)                                    |
|               | 23: Torque control (with encoder)                                   |

**Recommendation:** The use of the vector control operating modes is recommended for synchronous motors.

**Dependency:** Closed-loop speed or torque control (with encoder) cannot be selected if the encoder type is not entered (p0400).  
Closed-loop speed or torque control can be selected if the closed-loop speed/torque control was selected as operating mode (p0108.2).  
Only operation with U/f characteristic is possible if the rated motor speed is not entered (p0311).  
A reluctance motor (p0300 = 8) can only be operated in a U/f control mode (p1300 < 20), a synchronous-reluctance motor (p0300 = 6, 6xx) only in closed-loop speed/torque control.  
Sensorless control on separately excited synchronous motors is only possible with a VSM module (see p0150, p0151).  
For chassis power units with reduced line voltage (see r0212.0), the drive can only be operated in a control mode (p1300 = 20...23) and with the DC link voltage control activated.  
Refer to: r0108, p0212, p0300, p0311, p0400, p1501

**Notice:** Active slip compensation is required in the U/f control types with Eco mode (p1300 = 4, 7). Slip compensation scaling (p1335) must be set so that the slip is completely compensated (or generally, 100 %).  
The Eco mode is only effective in steady-state operation and when the ramp-function generator is not bypassed. In the case of analog setpoints, if required the tolerance for ramp-up and ramp-down should be actively increased for the ramp-function generator using p1148 in order to reliably signal a steady-state condition.

## 2 Parameters

### 2.2 List of parameters

**Note:** The closed-loop torque control can only be changed over in operation (p1300 = 20, 21) by selecting the closed-loop speed control (p1501). At the changeover, the setting of p1300 does not change. In this case, the actual state is displayed in r1407, bit 2 and bit 3.

For the open-loop control modes p1300 = 5 and 6 (textile sector), slip compensation p1335, resonance damping p1338, and the I<sub>max</sub> frequency controller are switched off internally so that the output frequency can be set precisely. The I<sub>max</sub> voltage controller remains active.

For the open-loop control modes p1300 = 4 and 7 (Eco mode), the efficiency can be optimized by varying the voltage (when the operating point is constant).

Separately excited synchronous motors can only be operated in modes p1300 = 20, 21 and 23 - or for diagnostic purposes in modes p1300 = 0, 3 and 18. For I/f control (p1300 = 18), the current amplitude can be set using p1609. Both for U/f as well as for I/f control only a small load may be applied to the separately excited synchronous motor because the excitation current is not calculated as a function of the load.

During operation (pulses enabled) the open-loop/closed-loop control mode cannot be changed by changing over drive data sets.

p1300 is pre-assigned depending on r0108.2 and p0187.

|                   | 06         | Immediate setpoint transfer for pulse inhibit | Yes             | No              | -         |

**Note:** For bit 00:  
If the bit is set the device will always start up with setpoint angle zero on pulse enable. This also affects the setpoint angle for DC braking (p1231).

For bit 01:  
If the bit is set, in the case of U/f control with independent voltage setpoint (p1300 = 19) and negative setpoint voltages at the input of p1330, the setpoint angle is rotated through 180 degrees, thereby achieving a negative output voltage. The voltage boost is in this case not active (p1310, p1311).

For bit 02:  
When the bit is set, for U/f controls with independent voltage setpoint (p1300 = 19), the setpoint angle should be entered directly at connector input p1356.

For bit 06 (only for p1300 = 19):  
When the bit is set, the setpoints from p1330 for pulse inhibit are transferred without any delay.

**Description:** The programmable characteristic for the U/f control is defined using 4 points and 0 Hz/p1310.

This parameter specifies the voltage of the second point along the characteristic.

**Dependency:** The following applies to the frequency values: p1320 <= p1322 <= p1324 <= p1326. Otherwise, a standard characteristic is used that contains the rated motor operating point.  
Refer to: p1310, p1311, p1320, p1321, p1323, p1324, p1325, p1326, p1327

|                                      | 0.0 [%]   | 600.0 [%]                       | 0.0 [%]                          |
| <b>Description:</b>                  | Sets the setpoint for slip compensation in [%] referred to r0330 (motor rated slip).<br>p1335 = 0.0 %: Slip compensation deactivated.<br>p1335 = 100.0 %: The slip is completely compensated.   |                                 |                                  |
| <b>Dependency:</b>                   | Prerequisite for a precise slip compensation for p1335 = 100 % are the precise motor parameters (p0350 ... p0360). If the parameters are not precisely known, a precise compensation can be achieved by varying p1335.<br>For U/f control modes with ECO optimization (p1300 = 4, 7), slip compensation must be activated in order to guarantee correct operation.  |                                 |                                  |
| <b>Note:</b>                         | The purpose of slip compensation is to maintain a constant motor speed regardless of the applied load. The fact that the motor speed decreases with increasing load is a typical characteristic of induction motors.<br>For synchronous motors, this effect does not occur and the parameter has no effect in this case.<br>For U/f control modes, for textile applications (p1300 = 5, 6), slip compensation is internally deactivated, allowing the output frequency to be precisely adjusted.<br>If p1335 is changed during commissioning (p0009, p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1335 have been changed by a parameter that was set when the drive was commissioned (e.g. p0300). |                                 |                                  |

|                                      | <b>Not for motor type:</b> -  | <b>Scaling:</b> -               | <b>Expert list:</b> 1        |
|                                      | <b>Min</b>  | <b>Max</b>                      | <b>Factory setting</b>       |
|                                      | 0.000   | 0.500                           | 0.000                        |
| <b>Description:</b>                  | Sets the proportional gain of the I_max frequency controller.<br>The I_max controller reduces the drive converter output current if the maximum current (r0067) is exceeded. In the U/f operating modes (p1300) for the I_max control, one controller is used that acts on the output frequency and one controller that acts on the output voltage. The frequency controller reduces the current by decreasing the converter output frequency. The frequency is reduced down to a minimum value (equaling twice rated slip). If the overcurrent condition cannot be successfully resolved using this measure, then the drive converter output voltage is reduced using the I_max voltage controller. Once the overcurrent condition has been resolved, the drive is accelerated along the ramp set in p1120 (ramp-up time). |                                 |                              |
| <b>Dependency:</b>                   | In the U/f modes (p1300) for textile applications and for external voltage setpoints, only the I_max voltage controller is used.  |                                 |                              |
| <b>Notice:</b>                       | When deactivating the I_max controller, the following must be carefully observed:<br>When the maximum current (r0067) is exceeded, the output current is no longer reduced. The drive is switched off when the overcurrent limits are exceeded.   |                                 |                              |
| <b>Note:</b>                         | The I_max limiting controller becomes ineffective if the ramp-function generator is deactivated with p1122 = 1. p1341 = 0:<br>I_max frequency controller deactivated and I_max voltage controller activated over the complete speed range.  |                                 |                              |
| <b>p1341[0...n]</b>                  | <b>I_max frequency controller integral time / I_max_ctrl Tn</b>   |                                 |                              |

| <b>Note:</b>                         | For p1349 = 0, the changeover limit is automatically set to 95 % of the rated motor frequency - however, to a max. of 45 Hz.  |   |  |

## 2 Parameters

### 2.2 List of parameters

---

|                                      |  |   |  |
|--------------------------------------|--|---|--|
| <b>p1350[0...n]</b>                  | <b>U/f control soft start / U/f soft start</b>   |   |  |
| VECTOR,<br>VECTOR_AC,<br>VECTOR_I_AC | <b>Can be changed:</b> U, T<br><b>Data type:</b> Integer16<br><b>P-Group:</b> V/f open-loop control<br><b>Not for motor type:</b> -<br><b>Min</b><br>0   | <b>Calculated:</b> -<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>1 | <b>Access level:</b> 3<br><b>Func. diagram:</b> 6300<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0 |
| <b>Description:</b>                  | Sets whether the voltage is continuously increased during the magnetizing phase (p1350 = 1, On) or whether it jumps directly to the voltage boost (p1350 = 0, Off).  |   |  |
| <b>Value:</b>                        | 0: OFF<br>1: ON  |   |  |
| <b>Dependency:</b>                   | The function is not effective for p1300 = 15.  |   |  |
| <b>Note:</b>                         | The settings for this parameter have the following advantages and disadvantages:<br>0 = off (jump directly to voltage boost)<br>Advantage: Flux is established quickly -> torque is quickly available<br>Disadvantage: The motor can move while it is being magnetized<br>1 = on (voltage is continually established)<br>Advantage: The motor is unlikely to rotate<br>Disadvantage: The flux is established slower -> torque is available later |   |  |

---

|                                      |  |  |   |
|--------------------------------------|--|--|---|
| <b>p1351[0...n]</b>                  | <b>CO: Motor holding brake starting frequency / Brake f_start</b>  |  |   |
| VECTOR,<br>VECTOR_AC,<br>VECTOR_I_AC | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> V/f open-loop control<br><b>Not for motor type:</b> REL<br><b>Min</b><br>-300.00 [%] | <b>Calculated:</b> -<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> -<br><b>Scaling:</b> PERCENT<br><b>Max</b><br>300.00 [%] | <b>Access level:</b> 3<br><b>Func. diagram:</b> 6310<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0.00 [%] |
| <b>Description:</b>                  | Sets the frequency setting value at the slip compensation output for starting up with motor holding brake.   |  |   |
| <b>Dependency:</b>                   | When setting p1351 > 0, then slip compensation is automatically activated (p1335 = 100 %).   |  |   |
| <b>Notice:</b>                       | A BICO interconnection to a parameter that belongs to a drive data set always acts on the effective data set.  |  |   |
| <b>Note:</b>                         | A value of 100% corresponds to the motor rated slip (r0330).   |  |   |

---

|                                      |   |   |   |
|--------------------------------------|---|---|---|
| <b>p1356[0...n]</b>                  | <b>CI: U/f control angular setpoint / Uf ang setpoint</b>   |   |   |
| VECTOR,<br>VECTOR_AC,<br>VECTOR_I_AC | <b>Can be changed:</b> U, T<br><b>Data type:</b> Unsigned32 / FloatingPoint32<br><b>P-Group:</b> V/f open-loop control<br><b>Not for motor type:</b> -<br><b>Min</b><br>- | <b>Calculated:</b> -<br><b>Dyn. index:</b> CDS, p0170<br><b>Unit group:</b> -<br><b>Scaling:</b> p2005<br><b>Max</b><br>- | <b>Access level:</b> 3<br><b>Func. diagram:</b> -<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0 |
| <b>Description:</b>                  | Sets the signal source for the differential angular generation for U/f control.   |   |   |

|            | 16  | I component for limiting                            | Enable           | Hold           | -  |

**Note:**

For bit 00:

Force limiting when the force limit is exceeded as replacing mode. This function is only recommended for low velocities, and requires a precise compensation of the characteristic.

For bit 01:

The closed-loop force control is active if "Travel to end stop" (BI: p1545) is selected and the force limit has been exceeded. The force controller remains active until "Travel to end stop" is deselected.

For bit 02:

The force for both velocity signs must be constant, and parameterized in p1555 and p1556. Further, all of the preconditions for operation of the force controller must be fulfilled.

For bit 05:

P gain and derivative-action time of the velocity controller are adapted via the position. The position adaptation only becomes effective if a piston calibration has been performed, and the piston position is known (r1407.3 = 1).

For bit 09:

The stiction is essentially compensated without force controller and pressure sensors with a voltage pulse for reversal of the traversing direction. The duration and magnitude of the voltage pulse must be set in p1570, p1571 and p1572. Further, the standstill threshold in p1552 is effective. The piston must be calibrated. It is not necessary to know the adhesive forces.

For bit 11:

The stiction is essentially compensated without force controller and pressure sensors with a voltage ramp for reversal of the traversing direction. The duration and magnitude of the voltage ramp must be set in p1570, p1571 and p1572. Further, the standstill threshold in p1552 is effective. The piston must be calibrated. It is not necessary to know the adhesive forces. For elastic motion during the force change, a ramp-shaped velocity can be advantageous.

For bit 14:

The force controller is continuously activated, and the force setpoint entered via the sources of p1511 and p1512 (scaling). The force setpoint is limited to r1538 and r1539. All of the preconditions for operation of the force controller must be fulfilled.

|                   | 18         | Moment of inertia estimator active                         | Yes              | No                 | -         |
|                   | 22         | Obtain moment of inertia estimator value for pulse inhibit | Yes              | No                 | -         |
|                   | 26         | J_est load estimation only for constant velocity travel    | Yes              | No                 | -         |
|                   | 27         | Load gearbox, take into account torque limit               | No               | Yes                | -         |

**Note:**

For bit 07:  
The interpolator is only active for isochronous PROFIBUS operation, and with the sign-of-life received from the master (STW2.12 ... STW2.15). Further, for active Dynamic Servo Control (DSC) an additional dead time of one speed controller sampling time occurs.

For bit 10:  
The precontrol signal via connector input p1430 only becomes effective at p1402.4 = 1 (torque-speed precontrol with encoder) at p1400.10 = 0 (for setp\_filter 2).

For bit 11:  
If the motor rotates when the pulses are enabled, then we recommend p1400.11 = 1 (starting value = setpoint) with the matching sign.  
If the motor remains stationary (zero speed) when the pulses are enabled, then we recommend p1400.11 = 0 (starting value = 0.0).

For bit 12:  
If a changeover is made from operation with encoder to encoderless operation while accelerating (with the threshold from p1404), then we recommend p1400.12 = 0.  
If the changeover is made from operation with encoder to encoderless at constant speed/velocity (e.g. with a DDS changeover or if there is an encoder fault via p0491) then we recommend p1400.12 = 1.

For bit 17:  
In order to avoid limit cycles (e.g. as a result of disturbing torques) for DSC with a high Kv factor, the position controller output can be limited using a root function corresponding to the currently available deceleration capability of the drive. In this case, the total moment of inertia (J\_tot) must be parameterized precisely (if necessary, determine the moment of inertia p0341, p0342 and p1498 using the motor data identification). If the limiting function responds, then this is indicated in r1407.19.  
As a result of the absolute value limiting above  $n[\text{rpm}] = 0.91 \times M_{\text{max}}[\text{Nm}] / (K_v[1000/\text{min}] \times J_{\text{tot}}[\text{kgm}^2])$  the dynamic response of the position controller is no longer linear ( $M_{\text{max}}$ , see r1538, r1539). This is the reason that speed precontrol is recommended.

For bit 18:

Only active when the "moment of inertia estimator" function module is active (r0108.10 = 1).

The result of the moment of inertia estimator is displayed in r1493 when the function is activated.

The function assumes that speed changes are made without load change. If a speed change must be realized with associated load change, then during this time, the estimated moment of inertia should be frozen using binector input p1502.

For bit 22:

Only active when the "moment of inertia estimator" function module is active (r0108.10 = 1) and when the moment of inertia estimator is active (p1400.18 = 1).

For bit = 0, the following applies:

The starting value after withdrawing the pulse inhibit is the parameterized moment of inertia (p0341 \* p0342 + p1498).

For bit = 1, the following applies:

The starting value after withdrawing the pulse inhibit is the last estimated value for the moment of inertia.

For bit 26:

Only active when the "moment of inertia estimator" function module is active (r0108.10 = 1) and when the moment of inertia estimator is active (p1400.18 = 1).

For bit 27:

When the bit is set, the torque limit of an existing load gearbox is not taken into account in the resulting torque limiting.

For bit = 0, the following applies:

The load can be estimated even if the speed setpoint changes.

Recommended if the traversing profile does not include any constant speed setpoints (e.g. sinusoidal speed setpoints).

For bit = 1, the following applies:

Speed setpoint changes prevent load estimation.

Recommended for constant speed setpoints in the traversing profile. Results in a more accurate estimate of the load and moment of inertia.

| 12  | Encoderless operation changeover                       | Steady-state     | When accelerating  | -    |
| 13  | Motoring/regenerative depending on                     | Speed setpoint   | Speed actual value | -    |
| 16  | I component for limiting                               | Enable           | Hold               | -    |
| 17  | DSC position controller limit active                   | Yes              | No                 | 3090 |
| 18  | Moment of inertia estimator active                     | Yes              | No                 | -    |

## 2 Parameters

### 2.2 List of parameters

|    |  |     |     |   |
|----|--|-----|-----|---|
| 22 | Obtain moment of inertia estimator value for pulse inhibit | Yes | No  | - |
| 26 | J_est load estimation only for constant velocity travel    | Yes | No  | - |
| 27 | Load gearbox, take into account torque limit               | No  | Yes | - |

**Note:**

For bit 07:

The interpolator is only active for isochronous PROFIBUS operation, and with the sign-of-life received from the master (STW2.12 ... STW2.15). Further, for active Dynamic Servo Control (DSC) an additional dead time of one velocity controller sampling time occurs.

For bit 10:

The precontrol signal via connector input p1430 only becomes effective at p1402.4 = 1 (force-velocity precontrol with encoder) at p1400.10 = 0 (for setp\_filter 2).

For bit 11:

If the motor rotates when the pulses are enabled, then we recommend p1400.11 = 1 (starting value = setpoint) with the matching sign.

If the motor remains stationary (zero speed) when the pulses are enabled, then we recommend p1400.11 = 0 (starting value = 0.0).

For bit 12:

If a changeover is made from operation with encoder to encoderless operation while accelerating (with the threshold from p1404), then we recommend p1400.12 = 0.

If the changeover is made from operation with an encoder to encoderless at constant velocity (e.g. with a DDS changeover or if there is an encoder fault via p0491), then we recommend p1400.12 = 1.

For bit 17:

In order to avoid limit cycles (e.g. as a result of disturbing forces) for DSC with a high Kv factor, the position controller output can be limited using a root function corresponding to the currently available deceleration capability of the drive. In this case, the total mass (m\_tot) must be parameterized precisely (if necessary, determine the mass p0341, p0342 and p1498 using the motor data identification). If the limiting function responds, then this is indicated in r1407.19.

As a result of the absolute value limiting above  $v[\text{m/min}] = 5.7 \times F_{\text{max}}[\text{N}] / (\text{Kv}[1000/\text{min}] \times m_{\text{tot}}[\text{kg}])$ , the dynamic response of the position controller is no longer linear ( $F_{\text{max}}$ , see r1538, r1539). This is the reason that velocity precontrol is recommended.

For bit 18:

Only active when the "moment of inertia estimator" function module is active (r0108.10 = 1).

The result of the moment of inertia estimator is displayed in r1493 when the function is activated.

The function assumes that the velocity changes without the load changing. If the velocity must be changed with associated load change, then during this time, the estimated mass should be frozen using binector input p1502.

|    |  |     |     |      |
|----|--|-----|-----|------|
| 18 | Moment of inertia estimator active                         | Yes | No  | 6030 |
| 19 | Anti-windup for integral component                         | Yes | No  | 6030 |
| 20 | Acceleration model   | ON  | OFF | 6031 |
| 22 | Obtain moment of inertia estimator value for pulse inhibit | Yes | No  | 6030 |
| 23 | Acceleration model (with speed encoder)                    | Yes | No  | 6030 |
| 24 | Moment of inertia estimator fast estimation active         | Yes | No  | 6030 |
| 25 | Acceleration torque instantaneous in the I/f mode          | Yes | No  | -    |
| 27 | Load gearbox, take into account torque limit               | No  | Yes | -    |

**Note:**

For bit 01:

When the bit is set, the I component of the speed controller is kept when changing into the open-loop controlled mode.

For bit 10:

The change to the bit is only accepted when switched off (non-operational).

For bit 16:

When the bit is set, the integral component of the speed controller is only held if it reaches the torque limit.

For bit 19:

When this bit is set, speed overshoots when accelerating along the torque limit and for load surges are reduced. If the setpoint torque reaches the torque limit, then the integral component is set to the difference between the torque limit and P component.

For bits 20, 23:

The acceleration model for the speed setpoint is only active if p1496 is not zero. When the acceleration model and the ramp-function generator (p1145) are simultaneously activated, it is recommended that p1400 bit 16 is set (this allows the I component to run freely up to the torque limit).

For bit 24:

When the bit is set, assuming that the motor accelerates smoothly, the moment of inertia can be determined faster.

For bit 25:

When the bit is set, for high dynamic starting in the I/f mode, the acceleration precontrol torque smoothing only has a short minimum time (4 ms).

For bit 27:

When the bit is set, the torque limit of an existing load gearbox is not taken into account in the resulting torque limiting.

| 14 | Efficiency optimization 2 active | Yes | No | 6722,<br>6837 |

#### Note:

For bit 00 (only for induction motors):

Initially, the flux is only established with a low rate of rise when magnetizing the induction motor. The flux setpoint p1570 is reached again at the end of the magnetizing time p0346.

For bit 01 (only for induction motors and separately excited synchronous motors):

The flux differentiation can be switched out if a significant ripple occurs in the field-generating current setpoint (r0075) when entering the field weakening range. However, this is not suitable for fast acceleration operations because then, the flux decays more slowly and the voltage limiting responds.

For bit 02 (only for induction motors):

The flux build-up control operates during the magnetizing phase p0346 of the induction motor. If it is switched out, a constant current setpoint is injected and the flux is built up corresponding to the rotor time constant. When quick magnetizing (p1401.6 = 1) is selected and when flux build-up control is de-energized alarm A07416 is displayed.

For bit 03:

Separately excited synchronous machine: flux characteristic is calculated as a function of the load.

Synchronous-reluctance motor (RESM): activation of the load-dependent optimum flux characteristic.

For bit 04 (only for induction motors with encoder):

The flux controller does not operate in the range of the current model and not in the range of the flux impression (refer to p1750.4).

For bit 05 (only for induction motors with encoder):

Extremely rugged control operation is possible by directly toggling between the current model and flux impression. We therefore recommend that, in addition, the time-controlled model change is switched in (p1750.4 = 1) or the model changeover limits are significantly increased (p1752 > 0.35 \* p0311; p1753 = 5 %).

For bit 06 (not for induction motors):

Magnetizing is carried out with the maximum current ( $0.9 * r0067 \leq p1603 * r0209$ ). Magnetization has been completed if the flux threshold value p1573 or the magnetizing time p0346 has been reached. With active identification of the stator resistance (see p0621) quick magnetizing is internally deactivated and alarm A07416 is displayed. During a flying restart of a rotating motor (see p1200) no quick magnetizing takes place.

For bit 07:

If the speed of the drive exceeds the effective speed limit of the speed limiting controller, the torque limit is reduced linearly to zero as the deviation becomes greater. This reduces the integral component of the speed controller and, in turn, the overshoot during load shedding (see also F07901 and p2162).

For bit 08:

The speed limiting controller sets the speed to maximum by opening the torque limits as far as the current limits (bit 8 = 0) or taking the torque limits into account (bit 8 = 1).

For bit 09:

Synchronous reluctance motor (RESM):

Dynamic increase in the flux setpoint when torque is quickly established.

For bit 10:

Synchronous reluctance motor (RESM):

For load-dependent optimum flux characteristic (p1401.3 = 1) the flux setpoint is increased at low speeds.

Flux boost at low speeds is not effective when using an encoder - or for encoderless operation with HF signal injection (p1750.5).

For bit 13:

PESM: activation of the load-dependent precontrol characteristic

For bit 14:

When the function is activated, the following applies:

- the optimum flux is calculated and the power loss is entered for optimization purposes
- the efficiency optimization (p1580) is not active.

It only makes sense to activate this function if the dynamic response requirements of the speed controller are low.

In order to avoid oscillations, if required, the speed controller parameters should be adapted (increase  $T_n$ , reduce  $K_p$ ). Further, the smoothing time of the flux setpoint filter (p1582) should be increased.

**Description:** Sets the configuration for the closed-loop control and the motor model.

| Bit field: | Bit | Signal name   | 1 signal | 0 signal | FP |
|------------|-----|---|----------|----------|----|
|            | 00  | Speed-following error correction active                       | Yes      | No       | -  |
|            | 02  | Current controller adaptation active                          | Yes      | No       | -  |
|            | 07  | Taking into account slip for speed and frequency calculation  | Yes      | No       | -  |
|            | 08  | Changeover current model/voltage model with speed setpoint    | Yes      | No       | -  |
|            | 10  | d-current controller adaptation model-based                   | Yes      | No       | -  |
|            | 11  | Ldiq/dt precontrol model at the voltage limit                 | Yes      | No       | -  |
|            | 12  | q-current controller adaptation model-based                   | Yes      | No       | -  |
|            | 13  | Current controller decoupling filter                          | Yes      | No       | -  |
|            | 15  | Current controller precontrol active for Vdc controller oper. | Yes      | No       | -  |

**Note:**

For bit 00:  
When the bit is set, the speed following error is compensated that is obtained as a result of the smoothing time constant in p1441.

For bit 02:  
The current controller adaptation (p0391 ... p0393) is only calculated when the bit is set.

For bit 07:  
Only with encoderless control of separately excited synchronous motors.

For bit 08:  
Only with encoderless control of separately excited synchronous motors.

For bit 11:  
Model for the dynamic voltage precontrol Ldi/dt of the q current controller when reaching the voltage limit with the I component held (see p0500 = 4).

For bit 13 (only permanent-magnet synchronous motor):  
Operation in the field weakening range is stabilized when the bit is set.

For bit 15:  
For DC link voltage control (see function diagram 7960) the dynamic current controller precontrol is activated (scalable using p1702, p1703).

| 05  | Speed controller I component frozen      | Yes      | No       | -    |
| 06  | Speed controller I component set         | Yes      | No       | -    |
| 07  | Torque limit reached                     | Yes      | No       | 5610 |
| 08  | Upper torque limit active                | Yes      | No       | 5610 |
| 09  | Lower torque limit active                | Yes      | No       | 5610 |
| 11  | Speed setpoint limited                   | Yes      | No       | -    |
| 13  | Encoderless operation due to a fault     | Yes      | No       | -    |
| 19  | DSC position controller limited          | Yes      | No       | 3090 |
| 20  | DSC with spline on                       | Yes      | No       | -    |
| 21  | Speed precontrol for DSC with spline on  | Yes      | No       | -    |
| 22  | Torque precontrol for DSC with spline on | Yes      | No       | -    |
| 23  | Torque-speed precontrol with encoder on  | Yes      | No       | -    |
| 24  | Moment of inertia estimator active       | Yes      | No       | -    |
| 25  | Load estimate active                     | Yes      | No       | -    |
| 26  | Moment of inertia estimator stabilized   | Yes      | No       | -    |

**Note:**

For bit 01, 13:

If, after a fault, the encoder still provides a valid commutation position ( $p1992.10 = 1$ ), then a switch is not immediately made into encoderless operation. Both bits remain at 0 for this time.

For bit 04:

The following conditions must be fulfilled to set to 1:

- connector input p1190 and p1191 must be interconnected with a signal source that is not equal to zero.
- OFF1, OFF3 or STOP2 must not be active.
- it is not permissible that the motor data identification is active.
- Master control must not be active.

## 2 Parameters

### 2.2 List of parameters

The following conditions can mean that the DSC function is not active in spite of the fact that the bit is set:

- isochronous operation is not selected (r2054 not equal to 4).
- the PROFIBUS is not isochronous (r2064[0] not equal to 1).
- DSC is not activated on the control side, therefore KPC = 0 is transferred as value to connector input p1191.

#### Description:

Display and BICO output for the status word of the velocity controller.

#### Bit field:

| Bit | Signal name                                | 1 signal | 0 signal | FP   |
|-----|--|----------|----------|------|
| 00  | U/f control active                         | Yes      | No       | -    |
| 01  | Encoderless operation active               | Yes      | No       | -    |
| 02  | Force control active                       | Yes      | No       | 8010 |
| 04  | Velocity setpoint from DSC                 | Yes      | No       | 2522 |
| 05  | Velocity controller I component frozen     | Yes      | No       | -    |
| 06  | Velocity controller I component set        | Yes      | No       | -    |
| 07  | Force limit reached                        | Yes      | No       | 5610 |
| 08  | Upper force limit active                   | Yes      | No       | 5610 |
| 09  | Lower force limit active                   | Yes      | No       | 5610 |
| 11  | Velocity setpoint limited                  | Yes      | No       | -    |
| 13  | Encoderless operation due to a fault       | Yes      | No       | -    |
| 19  | DSC position controller limited            | Yes      | No       | 3090 |
| 20  | DSC with spline on                         | Yes      | No       | -    |
| 21  | Velocity precontrol for DSC with spline on | Yes      | No       | -    |
| 22  | Force precontrol for DSC with spline on    | Yes      | No       | -    |
| 23  | Torque-speed precontrol with encoder on    | Yes      | No       | -    |
| 24  | Mass estimate active                       | Yes      | No       | -    |
| 25  | Load estimate active                       | Yes      | No       | -    |
| 26  | Moment of inertia estimator stabilized     | Yes      | No       | -    |

#### Note:

For bit 01, 13:

If, after a fault, the encoder still provides a valid commutation position (p1992.10 = 1), then a switch is not immediately made into encoderless operation. Both bits remain at 0 for this time.

For bit 04:

The following conditions must be fulfilled to set to 1:

- connector input p1190 and p1191 must be interconnected with a signal source that is not equal to zero.
- OFF1, OFF3 or STOP2 must not be active.
- it is not permissible that the motor data identification is active.
- Master control must not be active.

The following conditions can mean that the DSC function is not active in spite of the fact that the bit is set:

- isochronous operation is not selected (r2054 not equal to 4).
- the PROFIBUS is not isochronous (r2064[0] not equal to 1).
- DSC is not activated on the control side, therefore KPC = 0 is transferred as value to connector input p1191.

**Dependency:** In conjunction with p1429, this parameter can emulate the characteristics of how the torque is established (dynamic response of closed current control loop).  
The parameter is only effective if the acceleration model is supplied using external acceleration signals (p1400.2 = 1). For p1400.2 = 0, a fixed dead time is used.

**Description:** Sets the time constant (PT1) for symmetrizing the speed setpoint for active torque precontrol.

**Dependency:** In conjunction with p1428, this parameter can emulate the characteristics of how torque is established (dynamic response of the closed current control loop).  
For VECTOR (r0107) the following applies:  
The parameter is only effective if the acceleration model is supplied using external acceleration signals (p1400.2 = 1). For p1400.2 = 0, time constant p1442 (or p1452 for sensorless vector control) is used.

|   | -  | -                             | 63[0]                      |
| <b>Description:</b>   | Sets the signal source for the speed actual value of the speed controller.   |                               |                            |
| <b>Dependency:</b>  | Refer to: r1443  |                               |                            |
| <b>Danger:</b>  | When using external speed actual values for the speed controller, for a direction of rotation change via p1821 = 1, then its polarity must also be changed (e.g. for an encoder DO via p0410). Otherwise, a positive coupling can occur in the speed control loop and the drive would then be accelerated up to the speed limit.                   |                               |                            |
|  |  |                               |                            |
| <b>Caution:</b>   | Speed control with encoder (p1300 = 21):   |                               |                            |
|  | For the speed or position signal of the motor model there must always be a motor encoder available (evaluation via SMC/SMI, see p0400). The actual speed of the motor (r0061) and the position data for synchronous motors continue to come from this motor encoder and are not affected by the setting of p1440.                                  |                               |                            |
|   | Interconnection of p1440:  |                               |                            |
|   | If connector input p1440 is interconnected with an external speed actual value, the identical scaling of the speed should be observed (p2000).   |                               |                            |
| <b>Notice:</b>  | Speed control without encoder (p1300 = 20):  |                               |                            |
|   | Dependent upon the transmission path of the external speed signal there will be dead times which have to be taken into account when setting the speed controller parameters (p1470, p1472) and can lead to dynamic losses accordingly. It is for this reason that signal transmission times have to be kept as low as possible.                    |                               |                            |
|   | So that the speed controller can also work at standstill, set p1750.2 = 1 (closed-loop operation from zero speed for passive loads). If you do not make this setting, operation will switch to open-loop speed control in the low speed range, switching the closed-loop speed controller off and rendering the measured actual speed ineffective. |                               |                            |
| <b>Note:</b>  | Speed control with encoder (p1300 = 21):   |                               |                            |
|   | An external speed signal should, on the average, correspond to the speed of the motor encoder (r0061).   |                               |                            |

|  | 0.00 [ms]   | 32000.00 [ms]                   | 4.00 [ms]                        |
| <b>Description:</b>                              | Sets the smoothing time for the actual speed value of the speed controller for closed-loop control with encoder.  |                                 |                                  |
| <b>Note:</b>                                     | The smoothing must be increased if there is gear backlash. For longer smoothing times, the integral time of the speed controller must also be increased (e.g. using p0340 = 4).   |                                 |                                  |

| <b>Description:</b>                              | Sets the loop gain of the velocity controller.   |  |  |
| <b>p1475[0...n]</b>                              | <b>CI: Speed controller torque setting value for motor holding brake / n_ctrl M_sv MHB</b>   |  |  |
| VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M) | <b>Can be changed:</b> T<br><b>Data type:</b> Unsigned32 / FloatingPoint32<br><b>P-Group:</b> Closed-loop control<br><b>Not for motor type:</b> REL<br><b>Min</b><br>-   | <b>Calculated:</b> -<br><b>Dyn. index:</b> CDS, p0170<br><b>Unit group:</b> -<br><b>Scaling:</b> p2003<br><b>Max</b><br>-                        | <b>Access level:</b> 3<br><b>Func. diagram:</b> 6040<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0               |
| <b>Description:</b>                              | Sets the signal source for the torque setting value when starting up with motor holding brake.   |  |  |
| <b>Recommendation:</b>                           | The offset for the torque limiting p1532 can be used as torque setting value.<br>Sensorless vector control:<br>To hold the actual torque when stopping the motor, you are advised to set p1400.1 = 1. As a result, the integral component of the speed controller is frozen when changing to the open-loop controlled operating range. |  |  |
| <b>Dependency:</b>                               | The switching in of the torque setting value for the motor holding brake has a higher priority than the setting of the integrator value using p1477 and p1478.   |  |  |

**Note:** The setting of the integral output of the speed controller begins after magnetizing (see p0346, r0056.4) and ends at the end of the brake control opening time p1216.  
A setting value of zero means that no setting procedure will take place.

|  | -   | -                             | 0                          |

**Description:** Sets the signal source for the integrator setting value for the velocity controller.  
The signal to set this integrator setting value is interconnected via p1477.

**Dependency:** The setting value of the speed controller integrator is weighted with the scaling factor of the signal source in p1479.  
If p1478 is interconnected to the integral output of the speed controller (r1482), then after the magnetizing time (r0346) and if the speed controller is enabled, the integral component of the controller is set to the last value before the pulse inhibit. This value is set if no setting command (p1477) is interconnected or, at the instant that the pulses were inhibited, a setting command is available, which is not deactivated up to the next time that the pulses are inhibited. For sensorless vector control, in addition p1400.1 should be set to 1 so that when the drive is stopped, the integral component of the speed controller is not controlled down to zero.

In order that when setting the integrator output, only the static torque is detected, we recommend that the accelerating torque is completely precontrolled (e.g. p1496).

If p1478 is interconnected to another output other than r1482, then after magnetizing and speed controller enable, the integral output is set once if the setting command is not interconnected (p1477 = 0).

Refer to: p1477, p1479

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

| <b>Description:</b>                                    | Sets the scaling for the compensation torque within the droop calculation. |   |  |

|   |  |   |  |
|---|--|---|--|
| <b>p1488[0...n]</b>   | <b>Droop input source / Droop input source</b>   |   |  |
| VECTOR (n/M),<br>VECTOR_AC (n/M),<br>VECTOR_I_AC (n/M)                            | <b>Can be changed:</b> U, T<br><b>Data type:</b> Integer16<br><b>P-Group:</b> Closed-loop control<br><b>Not for motor type:</b> REL<br><b>Min</b><br>0   | <b>Calculated:</b> -<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>3     | <b>Access level:</b> 3<br><b>Func. diagram:</b> 6030<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0           |
| <b>Description:</b>   | Sets the source for droop feedback.<br>With increasing torque, the speed setpoint is reduced (enabled using p1492), so that for mechanically coupled drives a load equalization (load compensation) is obtained.<br>A load difference compensation is also possible, if p1486 is interconnected with the torque setpoint of the other drive. |   |  |
| <b>Value:</b>   | 0: Droop feedback not connected<br>1: Droop from torque setpoint<br>2: Droop from speed controller output<br>3: Droop from integral output speed controller  |   |  |
| <b>Dependency:</b>  | Refer to: p1486, p1487, p1489, r1490, p1492  |   |  |
| <b>Caution:</b>   | For active acceleration precontrol of the speed controller (refer to p1496), it is not recommended that p1488 is set to 1, as this could result in positive coupling effects. Instead of this, as source of the droop feedback, the output signal of the speed controller should be used, which generally sets the load torque.              |   |  |
|  |  |   |  |
| <b>p1489[0...n]</b>   | <b>Droop feedback scaling / Droop scal</b>   |   |  |

| <b>Description:</b>   | Sets the scaling for the droop feedback  |   |  |
| <b>Dependency:</b>  | Refer to: p1486, p1487, p1488, r1490, p1492  |   |  |
| <b>Note:</b>  | Example:<br>A value of 0.05 means that for a torque equal to the rated motor torque, the rated motor speed is reduced by 5 %.  |   |  |
| <b>r1490</b>  | <b>CO: Droop feedback speed reduction / Droop n_reduction</b>  |   |  |
| VECTOR (n/M),<br>VECTOR_AC (n/M),<br>VECTOR_I_AC (n/M)                            | <b>Can be changed:</b> -<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Closed-loop control<br><b>Not for motor type:</b> REL<br><b>Min</b><br>- [rpm]  | <b>Calculated:</b> -<br><b>Dyn. index:</b> -<br><b>Unit group:</b> 3_1<br><b>Scaling:</b> p2000<br><b>Max</b><br>- [rpm]  | <b>Access level:</b> 3<br><b>Func. diagram:</b> 6030<br><b>Unit selection:</b> p0505<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>- [rpm] |
| <b>Description:</b>   | Displays the output signal of the droop calculation. The droop feedback result is subtracted from the speed setpoint when activated (p1492).   |   |  |
| <b>Dependency:</b>  | Refer to: p1486, p1487, p1488, p1489, p1492  |   |  |
| <b>p1492[0...n]</b>   | <b>BI: Droop feedback enable / Droop enable</b>  |   |  |
| VECTOR (n/M),<br>VECTOR_AC (n/M),<br>VECTOR_I_AC (n/M)                            | <b>Can be changed:</b> U, T<br><b>Data type:</b> Unsigned32 / Binary<br><b>P-Group:</b> Closed-loop control<br><b>Not for motor type:</b> REL<br><b>Min</b><br>-   | <b>Calculated:</b> -<br><b>Dyn. index:</b> CDS, p0170<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>-     | <b>Access level:</b> 3<br><b>Func. diagram:</b> 2520, 6030<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>0     |
| <b>Description:</b>   | Enables the droop to be applied to the speed/velocity setpoint.  |   |  |
| <b>Dependency:</b>  | Refer to: p1486, p1487, p1488, p1489, r1490  |   |  |

## 2 Parameters

### 2.2 List of parameters

**Note:** Even when not enabled, the droop speed is calculated but not subtracted from the setpoint speed. This makes it possible to subtract the result of this calculation from the speed of another drive.

## 2 Parameters

### 2.2 List of parameters

**Note:** Applications:  
Motion at zero setpoint and dominant stiction can be suppressed but this has a negative impact on the remaining setpoint-actual value difference. This can be used, for example, to avoid oscillation of a position-controlled axis at standstill (stick-slip effect) or overshoot when traversing (moving) in micrometer steps.  
Also prevents tension/stressing for axes that are mechanically and rigidly coupled with one another (e.g. for synchronous spindles, master - slave axes).

|  | <b>Not for motor type:</b> REL  | <b>Scaling:</b> -             | <b>Expert list:</b> 1            |
|  | <b>Min</b>  | <b>Max</b>                    | <b>Factory setting</b>           |
|  | 0.0 [%]   | 10000.0 [%]                   | 0.0 [%]                          |
| <b>Description:</b>                                    | Sets the scaling for the acceleration precontrol of the speed/velocity controller.  |                               |                                  |
| <b>Dependency:</b>                                     | When the reference model is activated (p1400.3 = 1) and for an internal acceleration precontrol (p1400.2 = 0), the acceleration precontrol is switched out (disabled). The reference model (p1400.3 = 1) and external acceleration precontrol (p1400.2 = 1) can be operated together.<br>Refer to: p0341, p0342 |                               |                                  |

**Warning:**  The acceleration precontrol r1518 is kept at the old value if the ramp-function generator tracking (r1199.5) is active or the ramp-function generator output is set (r1199.3). This is used to avoid torque peaks. Depending on the application, it may therefore be necessary to disable the ramp-function generator tracking (p1145 = 0) or the acceleration precontrol (p1496 = 0).

The acceleration precontrol is set to zero, if the Vdc control is active (r0056.14/15).

**Note:** The parameter is set to 100% by the rotating measurement (refer to p1960).

The acceleration precontrol may not be used if the speed setpoint manifests significant ripple (e.g. analog setpoint) and the rounding-off in the speed ramp-function generator is disabled.

We also recommend that the precontrol mode is not used if there is gearbox backlash.

## 2 Parameters

### 2.2 List of parameters

**Danger:**

Negative values resulting from the signal source and scaling can cause the motor to accelerate in an uncontrolled manner.

|   | <b>Min</b>   | <b>Max</b>  | <b>Factory setting</b>                             |
|   | -100000.00 [N]   | 100000.00 [N]                                       | 0.00 [N]   |
| <b>Description:</b>   | Sets the force offset for the force limit.   |   |  |
| <b>Recommendation:</b>  | The torque offset can also be used for torque precontrol or as integrator setting value for the speed controller.                    |   |  |
| <b>Dependency:</b>  | Refer to: p1520, p1521, p1522, p1523, p1528, p1529   |   |  |
| <b>Danger:</b>  | If the offset is set higher/lower than the lower/upper torque limit, then the unloaded drive can accelerate up to the maximum speed. |   |  |
|  |  |   |  |
| <b>Notice:</b>  | A BICO interconnection to a parameter that belongs to a drive data set always acts on the effective data set.                        |   |  |

**Description:** Display and connector output for the monitored load torque in the negative direction of rotation.  
The moment of inertia estimator estimates the load torque drawn while the speed is constant.

**Dependency:** Refer to: p1400, p1560, p1561

**p1565 Moment of inertia estimator reset moment of inertia / J\_est reset J**

**Description:** Setting to reset the moment of inertia estimator for the currently selected drive data set (DDS).

**Value:**  
-1: Reset moment of inertia and load  
0: Inactive  
1: Reset moment of inertia

**Dependency:** Refer to: p1400, p1560, p1561, p1562, p1563, p1564

**Note:** The parameter is automatically reset to 0 after the reset.

|  | <b>Min</b>  | <b>Max</b>                      | <b>Factory setting</b>     |
|  | 10.0 [%]  | 200.0 [%]                       | 100.0 [%]                  |
| <b>Description:</b>                                    | Sets the flux threshold value for enabling the speed setpoint and the end of magnetizing (r0056.4).   |                                 |                            |
| <b>Note:</b>   | The parameter only has an influence if the flux actual value reaches the threshold value p1573 more quickly during magnetizing than the time set in p0346. This is generally the case when selecting fast magnetization (p1401.6).<br>The parameter has no influence for flying restart (see p1200) and after DC braking (see p1231). |                                 |                            |

## 2 Parameters

### 2.2 List of parameters

---

|  |  |  |  |
|--|--|--|--|
| <b>p1574[0...n]</b>                                    | <b>Voltage reserve dynamic / U_reserve dyn</b>   |  |  |
| VECTOR (n/M),<br>VECTOR_AC (n/M),<br>VECTOR_I_AC (n/M) | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Closed-loop control<br><b>Not for motor type:</b> REL<br><b>Min</b><br>0.0 [Vrms]  | <b>Calculated:</b><br>CALC_MOD_LIM_REF<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> 5_1<br><b>Scaling:</b> -<br><b>Max</b><br>150.0 [Vrms] | <b>Access level:</b> 3<br><b>Func. diagram:</b> 6723, 6724<br><b>Unit selection:</b> p0505<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>10.0 [Vrms] |
| <b>Description:</b>                                    | Sets a dynamic voltage reserve.  |  |  |
| <b>Note:</b>   | In the field weakening range, it must be expected that the control dynamic performance is somewhat restricted due to the limited possibilities of controlling/adjusting the voltage. This can be improved by increasing the voltage reserve. Increasing the reserve reduces the steady-state maximum output voltage (r0071). |  |  |

|  |   |  |   |
|--|---|--|---|
| <b>p1575[0...n]</b>                                    | <b>Voltage target value limit / U_tgt val lim</b>   |  |   |
| VECTOR (n/M),<br>VECTOR_AC (n/M),<br>VECTOR_I_AC (n/M) | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> -<br><b>Not for motor type:</b> REL<br><b>Min</b><br>50.00 [%]  | <b>Calculated:</b> -<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> -<br><b>Scaling:</b> -<br><b>Max</b><br>300.00 [%] | <b>Access level:</b> 4<br><b>Func. diagram:</b> 6725<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1<br><b>Factory setting</b><br>200.00 [%] |
| <b>Description:</b>                                    | Sets the limit of the voltage target value.<br>In steady-state field weakening operation this corresponds to the required output voltage.<br>The value of 100% refers to p0304.   |  |   |
| <b>Note:</b>   | The output voltage is only limited if the maximum output voltage (r0071) minus the voltage reserve (p1574) corresponds to a value higher than p1575.<br>Limiting via p1575 allows the influence of the voltage ripple of the line supply voltage to be eliminated at the operating point. |  |   |

| VECTOR (n/M),<br>VECTOR_AC (n/M),<br>VECTOR_I_AC (n/M) | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Closed-loop control<br><b>Not for motor type:</b> PMSM, SESM, REL, RESM  | <b>Calculated:</b> -<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> -<br><b>Scaling:</b> - | <b>Access level:</b> 2<br><b>Func. diagram:</b> 6722<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1 |
|  | <b>Min</b><br>0 [%]  | <b>Max</b><br>100 [%]  | <b>Factory setting</b><br>0 [%]   |
| <b>Description:</b>                                    | Sets the efficiency optimization.<br>When optimizing the efficiency, the flux setpoint of the closed-loop control is adapted as a function of the load.<br>For p1580 = 100 %, under no-load operating conditions, the flux setpoint is reduced to 50 % of the rated motor flux.  |  |   |
| <b>Note:</b>   | It only makes sense to activate this function if the dynamic response requirements of the speed controller are low.<br>In order to avoid oscillations, if required, the speed controller parameters should be adapted (increase Tn, reduce Kp).<br>Further, the smoothing time of the flux setpoint filter (p1582) should be increased.  |  |   |
| p1581[0...n]   | Flux reduction factor / Flux red factor  |  |   |
| SERVO, SERVO_AC,<br>SERVO_I_AC                         | <b>Can be changed:</b> U, T<br><b>Data type:</b> FloatingPoint32<br><b>P-Group:</b> Closed-loop control<br><b>Not for motor type:</b> PMSM, SESM, REL  | <b>Calculated:</b> -<br><b>Dyn. index:</b> DDS, p0180<br><b>Unit group:</b> -<br><b>Scaling:</b> - | <b>Access level:</b> 2<br><b>Func. diagram:</b> 5722<br><b>Unit selection:</b> -<br><b>Expert list:</b> 1 |
|  | <b>Min</b><br>20 [%]   | <b>Max</b><br>100 [%]  | <b>Factory setting</b><br>100 [%]   |
| <b>Description:</b>                                    | Sets the factor to which the flux is reduced under no-load conditions.<br>For a value of 100%, the flux reduction is deactivated.<br>This parameter refers to the flux saved in the field weakening characteristic.<br>By reducing the flux, the losses in induction motors can be reduced under no-load conditions or at low torques.<br>However, the time it takes to reach the maximum torque is extended.  |  |   |
| <b>Recommendation:</b>                                 | For induction motors with closed rotor slots, we recommend that the integral time of the current controller (p1717) is increased to three times the value, for example.<br>For stable operation, the maximum field-weakening factor in operation with an encoder must be less than 16 and in operation without an encoder must be less than 4. Lower field weakening factors are recommended. The field weakening factor is calculated as follows:<br>$(p1082 * 100 \% * 600 \text{ V}) / (p0348 * p1581 * p0070)$<br>In order to reduce losses due to magnetizing and de-magnetizing, we recommend that the smoothing times are adapted for flux decrease (p1578) and flux build-up (p1579).<br>In order to reduce the losses as a result of building-up and reducing the torque, we recommend that the torque setpoint is smoothed (current setpoint filter (p1656 ...) or speed actual value filter (p1441)). |  |   |
| <b>Dependency:</b>                                     | Refer to: p1578, p1579   |  |   |
| <b>Note:</b>   | It only makes sense to activate this function if there are low dynamic requirements placed on the speed controller and there are frequent phases with a low load.<br>In order to avoid oscillations, if required, the speed controller parameters should be adapted (decrease Kp (p1460, p1470), increase Tn (p1462, p1472)).<br>When used without an encoder, flux reduction is not possible for induction motors with closed rotor slots.  |  |   |

|  | <b>Min</b>  | <b>Max</b>                      | <b>Factory setting</b>                 |
|  | 4 [ms]  | 10000 [ms]                      | 40 [ms]                                |
| <b>Description:</b>                              | Sets the smoothing time for the current/torque setpoint in the open-loop-controlled operating range in the case of sensorless vector control.   |                                 |  |

**Note:** This parameter is only effective in the range where current is injected for sensorless vector control.  
 For permanent magnet synchronous motors, the parameter is effective over the complete speed range.  
 For induction motors, the current setpoint is calculated from p1610 and p1611 and for separately excited synchronous motors the torque setpoint is calculated from p1610 and p1611.

## 2 Parameters

### 2.2 List of parameters

**Note:** After the on command for the excitation (r1648.0 = 1), its feedback signal must be available at r1649.1 within this monitoring time (BI: p1645[1]).  
The same monitoring time is effective after the excitation is enabled for operation (r1648.3 = 1) up to the feedback signal "excitation operational" (r1649.2 = 1, BI: p1645[2]).

**Description:** Sets the speed actual value filter 5 as low pass (PT2) or general 2nd-order filter.

**Value:**  
 1: PT2 low pass  
 2: General 2nd order filter

**Dependency:** The speed actual value filter is activated via p1656.4 and parameterized via p1677 ... p1681.

**Note:** For a general 2nd order filter, by inserting the same natural frequency in both the numerator and in the denominator, i.e. bandstop frequency, a bandstop filter is implemented. If the numerator damping of zero is selected, the bandstop frequency is completely suppressed.

The denominator damping can be determined from the equation for the 3 dB bandwidth:

$$f_{3dB} \text{ bandwidth} = 2 * D_{\text{denominator}} * f_{\text{bandstop frequency}}$$

**Description:** Sets the numerator damping for speed actual value filter 5.

**Dependency:** The speed actual value filter is activated via p1656.4 and parameterized via p1677 ... p1681.

## 2 Parameters

### 2.2 List of parameters

**Notice:** When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

**Note:** For p1712 = 100 % or p1402.2 = 0, the current controller adaptation is disabled and p1720 is effective over the entire range.

|  | 1   | 2                               | 1                            |                 |
| <b>Description:</b>                                    | Sets the precontrol filter as low pass (PT2) or as general 2nd-order filter.  |                                 |                              |                 |
| <b>Value:</b>  | 1: PT2 low pass<br>2: General 2nd order filter  |                                 |                              |                 |
| <b>Dependency:</b>                                     | The precontrol filter is activated via p1721.0 and parameterized via p1721 ... p1726.   |                                 |                              |                 |

**Note:** For an extended general 2nd order filter, by inserting the same natural frequency in both the numerator and in the denominator, i.e. bandstop frequency, a bandstop filter is implemented. If the numerator damping of zero is selected, the bandstop frequency is completely suppressed.

The denominator damping can be determined from the equation for the 3 dB bandwidth:

$$f_{3dB} \text{ bandwidth} = 2 * D_{\text{denominator}} * f_{\text{bandstop frequency}}$$

## 2 Parameters

### 2.2 List of parameters

**Note:** Speed monitoring is only effective in operation with a speed encoder (refer to p1300).  
Stalling is also identified if steps/jumps occur in the speed signal, which exceed the value in p0492.

0.00 [%]

99.00 [%]

50.00 [%]

**Description:**

Separately excited synchronous motor:

Sets the upper speed for the transition "n\_set -&gt; n\_act" in sensorless operation.

This value is entered as a percentage of p1755.

Induction motor without speed encoder:

Depending on the motor data, the drive has calculated a minimum value of the operating frequency for rugged operation.

If the minimum value is greater than the lower changeover limit parameterized with p1755 \* (1 - 2 \* p1756), then the difference is displayed using p1749 \* p1755. The parameter value cannot be changed.

**Dependency:**

Refer to: p1748, p1752, p1755, p1756

**Note:**

RESM: reluctance synchronous motor (synchronous reluctance motor)

-

-

0000 0000 0000 0000 bin

**Description:**

Sets the configuration for the motor model.

Bit 0 = 1: Forces open-loop speed-controlled starting (ASM).

Bit 1 = 1: Forces the system to pass through frequency zero, open-loop-controlled (ASM).

Bit 2 = 1: Drive remains in full closed-loop control mode, even at zero frequency (ASM).

Bit 3 = 1: Motor model evaluates the saturation characteristic (ASM).

Bit 4 = 1: Time-controlled change between current and observer models (ASM).

Bit 5 = 1: test signal technique (pulse technique) to estimate the progressing (RESM, PMSM).

Bit 6 = 1: If the motor is blocked, sensorless vector control remains speed-controlled (ASM).

For a stalled (blocked) synchronous motor (PMSM), the sensorless vector control remains open-loop speed controlled.

Bit 7 = 1: Use rugged switchover limits to switchover the model between open-loop and closed-loop controlled operation (ASM).

Bit 8 = 1: Open-loop speed controlled operation independent of the speed setpoint (except for OFF3) (ASM).

**Bit field:**

| Bit | Signal name  | 1 signal        | 0 signal         | FP |

| 03  | Motor model Lh_pre = f(PsiEst)                                   | Yes             | No               | -  |
| 04  | Model changeover   | Time controlled | Freq. controlled | -  |
| 05  | Closed-loop controlled operation down to f = 0 Hz w/ test signal | Yes             | No               | -  |
| 06  | Closed-/open-loop controlled when motor is blocked               | Yes             | No               | -  |
| 07  | Use rugged changeover limits                                     | Yes             | No               | -  |
| 08  | Closed-loop controlled until wait time p1758 has expired         | Yes             | No               | -  |

**Caution:**

Do not use bit 6 = 1 if the motor can be slowly reversed by the load at the torque limit. Long delay times due to blocking (p2177 > p1758) can cause the motor to stall. In this case you should deactivate the function or use closed-loop control throughout the speed range (note the information re bit 2 = 1).

**Note:**

Bit 0 ... 3 only have influence for sensorless vector control, bit 4 only for vector control with encoder. Bit 2 is pre-assigned depending on p0500.

For bit 02 = 1:

The sensorless vector control is effective down to zero frequency. A change is not made into the open-loop speed controlled mode.

This operating mode is possible for passive loads. These include applications where the load itself does not generate any active torque and therefore only acts reactively to the drive torque of the induction motor.

If bit 2 = 1, then bit 3 is automatically set to 1. Manual deselection is possible and may be sensible if the saturation characteristic (p1960) was not measured for third-party motors. Generally, for standard SIEMENS motors, the already pre-assigned (default value) saturation characteristic is adequate.

When the bit is set, the selection of bits 0 and 1 is ignored.

For bit 02 = 0:

If the model feedback is deactivated (p1784 = 0), with bit 2 = 0, then bit 3 is also automatically set to 0.

For bit 05:

This test signal technique (pulse technique) is only supported for synchronous-reluctance motors (RESM) and permanent-magnet synchronous motors (PMSM) with power units (Motor Modules) in the "Booksize" format.

It is only possible to change bit 5 when the pulses are inhibited.

For p1750.5 = 1, initially p1810.3 is set, and then a system power up is requested via F01040 to configure the power unit in the oversampling mode.

When deactivating p1750.5 = 0, p1810.3 remains unchanged. As a consequence, to undo the configuration of the power unit from the oversampling mode you must perform the following

(after manually deselecting p1750.5), then initially p1810.3 must be manually deleted - and then a manual warm restart initiated.

As an alternative to a warm restart: save the parameters and carry out a POWER ON (switch-off/switch-on).

When the function "safety without encoder" (p9306/p9506) is activated, this setting is not permissible and results in monitoring errors.

For bit 06 = 1:

The following applies for sensorless vector control of induction motors:

For a blocked motor (see p2175, p2177) the time condition in p1758 is bypassed and a change is not made into open-loop controlled operation.

The following applies for sensorless vector control of synchronous motors:

For a blocked motor (see p2175, p2177), the speed ramp-function generator is held in open-loop speed controlled operation, and a switchover is not made into closed-loop controlled operation.

For bit 07 = 1:

The following applies for sensorless vector control of induction motors:

If the changeover limits are parameterized too low (p1755, p1756), then they are automatically increased to rugged values by the absolute amount  $p1749 * p1755$ .

The effective time condition for changing over into open-controlled operation is obtained from the minimum of p1758 and  $0.5 * r0384$ .

Activation can make sense for applications that demand a high torque at low frequencies and therefore low speed gradients.

Adequate parameterization must be ensured (p1610, p1611).

For bit 08 = 1: no influence on the functionality of bits 0, 1, 2

The following applies for sensorless vector control of induction motors:

Changeover into open-loop speed controlled operation is no longer dependent on the speed setpoint (except for OFF3), but instead is essentially dependent on time condition p1758. As a consequence, a drive can be started or reversed in closed-loop speed controlled operation with setpoints from an external control system, if these briefly lie in the open-loop speed control range.

**Description:** Sets the speed to change over the motor model for operation with encoder.

**Dependency:** Refer to: p1756

**Note:** Induction motor (ASM):  
The motor model is influenced for speeds greater than p1752.  
Synchronous motor (SRM):  
A monitoring function (F07412) is activated for speeds greater than p1752.  
The motor model is additionally influenced when kT adaptation is activated (p1780.3 = 1).

---

**Description:** Sets the speed to change over the motor model for operation with encoder.

**Dependency:** In U/f characteristic mode the parameter is of no significance.

Using the friction characteristic for operation with encoder:  
When changing the motor model changeover speed p1752, the points along the friction characteristic should be recalculated (p0340 = 5) and the friction characteristic recorded again (p3845). For slight changes, only the associated friction characteristic points must be recorded (see p3844).  
Refer to: p1756

**Description:** Sets the hysteresis for the changeover speed of the motor model for operation with speed encoder.

**Dependency:** Refer to: p1752

**Note:** The value refers to p1752.  
In the case of separately excited synchronous motors, the lower hysteresis value is calculated with  $p1752 * p1753$ ; in the case of all other types of motor,  $p1752 * (1 - p1753)$  is used.

## 2 Parameters

### 2.2 List of parameters

**Notice:** The changeover speed represents the steady-state minimum speed up to which the motor model can be used in sensorless steady-state operation.  
If the stability is not adequate close to the changeover speed, it may make sense to increase the parameter value.

**Note:** The changeover speed applies for the changeover between open-loop and closed-loop control mode.

## 2 Parameters

### 2.2 List of parameters

**Index:** [0] = Smoothed  
[1] = Angle for F07412  
[2] = Unsmoothed

**Note:** For index [0]:  
Displays the smoothed angular error.  
Induction motor (ASM):  
Displays the difference between the motor model flux angle and transformation angle.  
Permanent-magnet synchronous motor (PMSM):  
Displays the angular difference between motor model and encoder.  
For index [1]:  
Displays the smoothed absolute angular error, which is used for fault F07412. F07412 is output above 80 °.  
For index [2]:  
Displays the unsmoothed angular error.

**Caution:**

For the PMSM kT adaptation (p1780.3) as well as the compensation of the voltage emulation error (p1780.8) and for the kT(iq) characteristic (p1780.9), the function module "Extended torque control" (r0108.1) should be activated.

**Note:**

ASM: Induction motor

PMSM: permanent-magnet synchronous motor

The kT adaptation is only active at a speed greater than the changeover speed with encoder (p1752).

The kT adaptation and the kT characteristic can be simultaneously selected.

For kT adaptation (p1780.3 = 1):

- the kT adaptation is only active at a speed greater than the changeover speed with encoder (p1752).

- beforehand, an identification of the voltage emulation error must be started (p1909.14 = 1).

- if the electrical configuration (e.g. Motor Module, cable routing) or the pulse frequency (p1800) changes, then a new identification run must be carried out.

- To identify the voltage emulation error the Motor Module should still be warm.

- the motor temperature (r0035) should not change significantly (i.e. it should not be identified immediately after a load duty cycle).

For kT(iq) characteristic (p1780.9 = 1):

- for the kT(iq) characteristic  $kT(iq) = kT + kT3 * iq^2 + kT5 * iq^4 + kT7 * iq^6$ , the parameters must first be identified (p1959.6 = 1, kT: p0316, kT3: p0646, kT5: p0647, kT7: p0647).

**p1780[0...n]****Motor model adaptation configuration / MotMod adpt config**

VECTOR,  
VECTOR\_AC,  
VECTOR\_I\_AC

**Can be changed:** U, T

**Calculated:** CALC\_MOD\_CON

**Access level:** 3

**Data type:** Unsigned16

**Dyn. index:** DDS, p0180

**Func. diagram:** -

**P-Group:** Closed-loop control

**Unit group:** -

**Unit selection:** -

**Not for motor type:** REL

**Scaling:** -

**Expert list:** 1

**Min**

**Max**

**Factory setting**

-

-

0000 0000 0111 1100 bin

**Description:**

Sets the configuration for the adaptation circuit of the motor model.

Induction motor (ASM): Rs, Rr (only for operation with encoder), Lh and offset compensation.

Permanent-magnet synchronous motor (PMSM): kT

## 2 Parameters

### 2.2 List of parameters

| Bit field: | Bit | Signal name   | 1 signal | 0 signal | FP |
|------------|-----|---|----------|----------|----|
|            | 01  | Select motor model ASM Rs adaptation                            | Yes      | No       | -  |
|            | 02  | Select motor model ASM Lh adaptation                            | Yes      | No       | -  |

|            | 04  | Select motor model offset adaptation                            | Yes      | No       | -  |
|            | 05  | Select ASM Rr adaptation (only with encoder)                    | Yes      | No       | -  |
|            | 06  | Select pole position identification PMSM encoderless            | Yes      | No       | -  |
|            | 07  | Select T(valve) with Rs adaptation                              | Yes      | No       | -  |
|            | 08  | Deselect prelim. meas. of inductance for pole position ident.   | Yes      | No       | -  |
|            | 10  | Filter time combination current like current ctrl integral time | Yes      | No       | -  |
|            | 11  | Fast flying restart with voltage model for induction motor      | Yes      | No       | -  |
|            | 12  | Start PMSM sensorless with last angle                           | Yes      | No       | -  |
|            | 13  | Fast pulsed pole position identification                        | Yes      | No       | -  |
|            | 14  | Delay of the precontrol speed to the motor model                | Yes      | No       | -  |
|            | 15  | RESM Q flux model linear  | Yes      | No       | -  |

#### Dependency:

In U/f characteristic operating mode, only bit 7 and bit 11 are relevant.

For active motor model feedback (see p1784), the Lh adaptation is internally deactivated automatically.

When the power units are connected in parallel with separate, offset motor winding systems (p7003 = 2), then the compensation of the valve interlocking times should be implemented as Rs adaptation (bit 7 = 1).

#### Caution:

For bit 11:

The selection is not enabled for dv/dt filters (see p0230).

#### Notice:

It is only permissible to change bit 11 if the drive is switched off.

When selecting bit 11, also for U/f characteristic operation, a standstill measurement must have been performed to set the necessary current controller for a fast flying restart.

#### Note:

ASM: Induction motor

PMSM: permanent-magnet synchronous motor

When selecting the compensation of the valve interlocking via Rs (bit 7), the compensation in the gating unit is deactivated and is instead taken into account in the motor model.

In order that the correction values of the Rs, Lh and kT adaptation (selected using bit 0 ... bit 2) are correctly accepted when changing over the drive data set, a dedicated motor number must be entered into p0826 for each different motor.

For bit 11:

This bit has no influence on flying restart with speed encoder. Depending on the motor, the fast flying restart is suitable for speeds of maximum 1.5x to 4x the rated motor speed.

For bit 12 (only for synchronous motors and bit 6 = 1):

The pole position identification is only carried out after power on and after the motor has coasted down. The switch-off speed p1226 should be as low as possible. If the power unit is switched off when the motor is stationary, then the next time that the power unit is switched on, the old angle is used as starting value. The precondition applies that while the power unit is switched off the motor does not rotate.

For bit 13:

When the bit is set, the duration of the pole position identification is shortened. As a consequence, the pole wheel angle error can be slightly greater.

| <b>Description:</b>                                    | Sets the pulse frequency for the converter.<br>This parameter is pre-set to the rated converter value when the drive is first commissioned.  |                                 |                            |                 |
| <b>Dependency:</b>                                     | The pulse frequency can, depending on the current controller sampling time (p0115[0]) assume the following values:<br>a) $p1800 = 1000 / (p0115[0] * n)$ with $n = 2, 3, 4, 5$<br>b) $p1800 = 1000 * n / p0115[0]$ with $n = 1, 2, 3, 4, \dots$<br>Example:<br>$p0115[0] = 125 \mu s \rightarrow p1800 = 1.6, 2, 2.6, 4 \text{ kHz}$ (from equation a)<br>$p0115[0] = 125 \mu s \rightarrow p1800 = 8, 16 \text{ kHz}$ (from equation b)<br>Possible setting values can be taken from r0114 (if p0009 = p0010 = 0).<br>Refer to: r0110, r0111, p0112, p0113, r0114, p0115, r0193, p0230, p1817 |                                 |                            |                 |

**Note:** The maximum possible pulse frequency is also determined by the power unit being used. When the pulse frequency is increased, depending on the particular power unit, the maximum output current can be reduced (derating, refer to r0067).  
 If p1800 is changed while commissioning (p0009, p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1800 have been changed by a parameter that was set when the drive was commissioned (e.g. p1082).  
 For encoderless operation (p1404 = 0 or p1300 = 20), the following conditions apply:  
 $p1800 = 1 / (n * p0115[0])$  with  $n = 2, 3, 4$   
 or  
 $p1800 \geq n / p0115[0]$ ,  $n = 1, 2, \dots$   
 For motors with a low power rating (< 300 W) we recommend that p1800 is set acc. to the second condition. Although, pulse frequencies  $p1800 = 1 / (n * p0115[0])$  with  $n = 3$  or  $4$  are possible, for  $p0115[0] > 62.5 \mu s$ , they result in unsteady closed-loop control and should be avoided.  
 For motors with a low leakage inductance, it is not permissible to set the pulse frequency to an excessively low value.

## 2 Parameters

### 2.2 List of parameters

**Notice:** The pulse frequency p1800 can also be asynchronously set to the current controller sampling time (0.05 kHz increment). To do this, p1810.12 must be set to 1 (secondary condition, see p1810).

Effects:

- switching over the gating unit (p1810.2).
- activating the current actual value correction (p1840.0).
- minimum pulse frequency  $1000 * 0.5 / p0115[0]$ .
- maximum pulse frequency  $1000 * 2 / p0115[0]$ .
- fluctuating deadtimes and dynamic performance in the current control loop.
- increased level of current ripple in the current display.

**Note:** The maximum possible pulse frequency is also determined by the power unit being used.

When the pulse frequency is increased, depending on the particular power unit, the maximum output current can be reduced (derating, refer to r0067).

When using output reactors and dv/dt filters (see p0230), the following restrictions apply:

- maximum 4 kHz
- maximum double rated pulse frequency (2.5 or 4 kHz)
- maximum rated pulse frequency for chassis converters with set property bit r0193.14

When using a sine-wave filter as output filter (p0230 = 3), then the pulse frequency cannot be set below the minimum value required for the filter.

For an external sine-wave filter (p0230 = 4), then the minimum pulse frequency is calculated as follows:

$$f_{\text{puls\_min}} = 1.6 / (2 * \text{Pi} * \text{root}(p0233 * p0234 * p0235))$$

- p0233 in H
- p0234 in F

In this case, the pulse frequency must be a multiple of the inverse value of the current controller sampling time (p0115[0]).

If a sine-wave filter is parameterized as output filter (p0230 = 3), then the pulse frequency cannot be changed below the minimum value required for the filter.

If p1800 is changed while commissioning (p0009, p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1800 have been changed by a parameter that was set when the drive was commissioned (e.g. p1082).

It is not possible to change the pulse frequency as long as motor data identification is selected.

**Min**

**Max**

**Factory setting**

1.000 [kHz]

16.000 [kHz]

8.000 [kHz]

**Description:** Sets the pulse frequency for the converter.

This parameter is pre-set to the rated converter value when the drive is first commissioned.

**Dependency:**

The switching frequency can only be changed so that it remains an integer multiple of the current controller sampling rate (p0115[0]). For p1810.12 = 1, pulse frequency p1800 can also be asynchronously set to the current controller sampling time (increment width, 0.05 kHz).

The minimum pulse frequency is always half the value of the current controller sampling rate (current controller frequency). Further, whether a setting value is actually permissible also depends on the line filter being used (p0220).

**Danger:**

An incorrectly set line filter (p0220) - and a consequentially incorrect setting of the pulse frequency (p1800), which does not match the actually connected line filter (Active Interface Module, AIM) can result in significant damage to the line filter and the converter. Further, this represents a fire hazard.

**Notice:**

The following should be noted for an asynchronous pulse frequency (p1810.12 = 1):

- fluctuating deadtimes and dynamic performance in the current control loop.
- increased level of current ripple in the current display.

**Note:**

The Power Unit being used defines the maximum possible pulse frequency.

|                                      | 0   | 19                                     | 0                        |
| <b>Description:</b>                  | Sets the modulator mode.  |  |                          |
| <b>Value:</b>                        | 0: Automatic changeover SVM/FLB<br>1: Flat top modulation (FLB)<br>2: Space vector modulation (SVM)<br>3: SVM without overcontrol<br>4: SVM/FLB without overcontrol<br>5: SVM with pulse frequency reduction<br>6: SVM/FLB with pulse frequency reduction<br>7: No edge modulation up to 100 Hz<br>8: No edge modulation up to 60 Hz<br>9: Edge modulation<br>19: Optimized pulse pattern   |  |                          |
| <b>Dependency:</b>                   | If a sine-wave filter is parameterized as output filter (p0230 = 3, 4), or if the power unit firmware is not able to calculate edge modulation (r0192.0 = 0), then only space vector modulation without overcontrol can be set as modulation type (p1802 = 3).<br>For permanent-magnet synchronous motors and chassis power units, the following applies:<br>Edge modulation or optimized pulse pattern can only be used, if p1810 bit 2 = 1 is set.<br>Refer to: r0192, p0230, p7003 |  |                          |
| <b>Notice:</b>                       | If the pulse patterns are enabled with overmodulation option (p1802 < 3) or edge modulation (p1802 > 6), then the current actual value correction is automatically activated (p1840.0 = 0).   |  |                          |

**Note:** When modulation modes are enabled that could lead to overmodulation (p1802 = 0, 1, 2, 5, 6), the modulation depth must be limited using p1803 (default p1803 < 100 %). The higher the overmodulation, the greater the current ripple and torque ripple.

When changing p1802[x], the values for all of the other existing indices are also changed.

p1802 = 7, 8 should be used if the drive is operated below 100 Hz or 60 Hz, and it is necessary to avoid changing over to edge modulation. Above these output frequencies, the modulation depth remains limited so that there the full output voltage of the edge modulation is not reached.

The setting p1802 = 19 is only released for chassis power units and SIMOTICS FD motors.

**Description:**

Sets the configuration for the modulator.

**Bit field:**

| Bit | Signal name                                     | 1 signal | 0 signal | FP |
|-----|---|----------|----------|----|
| 01  | DC link voltage compensation in the power unit. | Yes      | No       | -  |
| 11  | Current controller dynamics higher              | Yes      | No       | -  |

## 2 Parameters

### 2.2 List of parameters

**Note:** For bit 11:  
Prerequisite:  
- firmware version 4.4 or higher for the Control Unit and power unit.  
- booksize or S120 Combi power unit (r0192.27 = 1).  
- current controller sampling time p0115[0] >= 62.5 µs.  
- for a Double Motor Module the two drive controls must be operated with the same current controller sampling time (p0115[0]). Otherwise, the higher current controller dynamics can only be activated on the drive with the longer sampling time.  
- when operating servo and vector U/f on a Double Motor Module, p1810.11 must be set = 0.  
- it is not permissible that the "safety without encoder" is activated (p9306/p9506).  
The following changes are necessary after changing bit 11:  
- computing dead time (p0118 = 20.5 µs for bit 11 = 1, p0118 = 0 µs for bit 11 = 0).  
- controller gains (p1715, p1460).  
- with p0340 = 4 computing dead time and controller gains can be automatically pre-assigned. It may be necessary to still optimize the speed controller.  
Before commissioning for the first time (p3925.0 = 0 for all data sets) this parameter is automatically pre-assigned to the optimum value.

|                   | 15         | Increase overmodulation range                                    | Yes             | No              | -         |

**Dependency:** If bit 2 is set from 1 to 0, p1811 = 0 is set.

**Notice:** Bit 1 = 0 can only be set when the pulses are inhibited and for r0192.14 = 1.

Bit 2 can only be set to 1 subject to the following prerequisites:

- Pulse inhibit
- r0192.16 = 1
- p1800 < 2 x 1000/p0115[0]

Bit 12 can only be changed subject to the following prerequisites:

- preconditions, the same as bit 2 = 1
- p1810.3 = 0

For fast current changes, bit 15 = 1 together with p1802 = 0, 2 and p1803 > 106 % result in a significant increase in the torque ripple. As a consequence, increasing the modulation limit must be checked on an application for application basis.

**Note:**

For bit 00 = 0:

Voltage limitation from the minimum of the DC link voltage (lower ripple in the output current, reduced output voltage).

For bit 00 = 1:

Voltage limitation from averaged DC link voltage (higher output voltage with increased ripple in the output current).

The selection is only valid if the DC link compensation is not performed in the Control Unit (bit 1 = 0).

For bit 01 = 0:

DC link voltage compensation in the modulator.

For bit 01 = 1:

DC link voltage compensation in the current control.

For bit 02 = 0:

A gating unit that does not permit wobulation is used.

Edge modulation is not possible for a parallel connection with a single-winding system (p7003 = 0).

Bit 02 cannot be set to 0 if bit 12 = 1.

For bit 02 = 1:

A gating unit that permits wobulation is used.

For a wobulation amplitude  $p1811 = 0$ , the maximum possible pulse frequency in  $p1800 = 2 \times 1000 / p0115[0]$ .

For a wobulation amplitude  $p1811 > 0$ , the maximum possible pulse frequency in  $p1800 = 1000 / p0115[0]$ .

If optimized pulse patterns has been activated ( $p1802 > 6$ ), then a parameter save is required and switch off and switch on again. This is displayed using a message (F01040).

For bit 03 = 1:

The current actual value sensing and the determination of the valve ON times takes place with a double current controller clock cycle and phase offset.

The activation is only possible with  $r0192.23 = 1$  and  $p1810.12 = 0$  - and takes effect the next time the system is powered up.

For bit 08 = 1:

Above the frequency threshold  $r1836[0]$ , the pulse frequency is switched to the value in  $p1800$ . Below  $r1836[0]$  (minus the hysteresis), the pulse frequency is reduced to the next possible pulse frequency (see  $r0114$ ).

For bit 09 = 1:

Above the frequency threshold  $r1836[1]$ , the pulse frequency is increased to the next possible value. Below  $r1836[1]$  (minus the hysteresis), the pulse frequency is reduced to the next possible pulse frequency.

If bit 8 is set to 0, bit 9 is automatically reset.

For bit 10 = 0:

Pulse-locking function activated.

For bit 10 = 1:

Pulse-dropping function activated.

For bit 12 = 0:

The pulse frequency  $p1800$  can also be synchronously set to the current controller clock cycle (see  $r0114$ ).

Bit 12 can only be set from 1 to 0 if the pulse frequency  $p1800$  is set synchronously to the current controller clock cycle. In this case, the gating unit is not switched over.

For bit 12 = 1:

The pulse frequency  $p1800$  can also be asynchronously set to the current controller clock cycle. In this case, the effects should be observed (see  $p1800$ ).

If bit 12 is set to 1, then the gating unit is automatically switched over ( $p1810.2 = 1$ ). If this is not possible (see above), then bit 12 cannot be set to 1.

Bit 12 cannot be set to 1, if  $p1810.3 = 1$  is set.

For bit 15 = 1:

For  $p1802 = 0, 2$  and  $p1803 > 106\%$ , dynamically, a modulation depth of more than 106 % is permitted. When  $p1803$  is increased, the dynamic modulation depth reserve  $p1574$  should be increased so that the maximum output voltage  $r0071$  approximately remains the same. For U/f control, the overcontrol in  $p1381$  can be separately reduced.

## 2 Parameters

| 15 | Activate flat-top modulation                                    | Yes | No | - |

**Dependency:** The modulator configuration is overwritten when the power unit (p0201) or the line filter type (p0220) is changed. It is possible that special settings required for the modulator must be newly set.

**Notice:** For bit 02 = 1:

The wobble function influences the quality of the current control (grid droop operation with p5401 = 1 is not influenced). This is the reason that the risk of faults due to overcurrent increases for applications with the highest dynamic response in the overload range,

For booksize drive units, the following additionally applies:

This function involves additional computing time. It may be necessary to reduce the number of DO objects computed on the same Control Unit, or longer sampling times must be used (observe the messages). For example, a current controller sampling time setting of p0115[0] = 125 µs is not possible.

For bit 13 = 1:

This function involves additional computing time. It may be necessary to reduce the number of DO objects computed on the same Control Unit, or longer sampling times must be used (observe the messages).

**Note:**

The following applies to all bits:

If the line droop control (p5401) is active or the grid support (p5501) is active, the setting can only be changed when the pulses are inhibited (see also p5456, p5526).

For bit 02, 05, 14, 15:

The setting can only be changed when the pulses are inhibited.

For bit 02 = 0:

A gating unit that does not permit wobulation is used.

For bit 02 = 1 (only permissible for r0192.16 = 1):

A gating unit that permits wobulation is used.

The frequency range of the wobulation function is set using p1811.

The Smart Mode (p3400.0 = 1) is not permissible and results in F06050.

For bit 04 = 0 (only valid for bit 2 = 1):

The pulse frequency wobulation amplitude (p1811) is enabled.

For bit 04 = 1 (only valid for bit 2 = 1):

The pulse frequency wobulation amplitude (p1811) is disabled.

For bit 05 = 1 (only permissible for r0192.19 = 1):

Reserved.

For bit 06 (only valid for bit 05 = 1):

Reserved.

For bit 07 (only valid for bit 05 = 1):

Reserved.

For bit 10 = 0:

The pulse-locking function is activated.

For bit 10 = 1:

The pulse-dropping function is activated.

For bit 12:

Reserved.

For bit 13 = 0:

The gating unit is separately calculated in each power unit.

For bit 13 = 1 (only permissible for r0192.26 = 1):

The gating unit is calculated in the Control Unit.

The Smart Mode (p3400.0 = 1) is not permissible and results in F06050.

## 2 Parameters

### 2.2 List of parameters

For bit 14 = 0:

The phase angle for flattop modulation is independent of the cos phi value (see r0038).

For bit 14 = 1 (only permissible for bit 13 = 1 and ALM Chassis-2 devices):

The phase angle of the flattop modulation is dependent on the cos phi value (see r0038), to guarantee minimum power loss for a high reactive power ( $r0038 \ll 1$ ).

Angle-dependent modulation is active, if  $|r0076| > 0.15 * r0207$ .

Depending on the cos phi value, the offset angle can reach a maximum absolute value of  $30^\circ$  if  $|r0076| > 0.35 * r0207$ .

Offset angle smoothing is set using p1882.

For bit 15 = 0:

To deactivate the flattop control mode, p3400.1 must also be set to 0.

For bit 15 = 1:

Flattop control mode is active regardless of the setting for p3400.1.

## 2 Parameters

### 2.2 List of parameters

**Dependency:** Refer to: r0116, p1800, p1819

---

#### p1817 Pulse frequency to output frequency ratio minimum / f\_pulse/f\_outp min

VECTOR,  
VECTOR\_AC,  
VECTOR\_I\_AC

**Can be changed:** C2(2)

**Data type:** FloatingPoint32

**P-Group:** Converter

**Not for motor type:** -

**Min**

8.3

**Calculated:** -

**Dyn. index:** -

**Unit group:** -

**Scaling:** -

**Max**

15.0

**Access level:** 4

**Func. diagram:** -

**Unit selection:** -

**Expert list:** 1

**Factory setting**

12.0

**Description:** Sets the minimum ratio between the pulse frequency and the output frequency.

**Notice:** If the ratio between the pulse frequency and the output frequency is reduced, then oscillations can occur in the output current that can result in significant levels of current ripple with the appropriate negative effects.

**Note:** When the maximum speed is changed, the pulse frequency p1800 is automatically limited to this minimum ratio. It is not permissible to reduce the pulse frequency if this would result in this ratio being undershot.

---

#### p1818 Phase for PWM generation configuration / Ph for PWM config

CU\_I, CU\_NX\_CX,  
CU\_S\_AC\_DP,  
CU\_S\_AC\_PN,  
CU\_S120\_PN,  
CU\_S150\_PN,  
CU\_S120\_DP,  
CU\_S150\_DP,  
CU\_I\_D410

**Can be changed:** T

**Data type:** Integer16

**P-Group:** Modulation

**Not for motor type:** -

**Min**

0

**Calculated:** -

**Dyn. index:** -

**Unit group:** -

**Scaling:** -

**Max**

1

**Access level:** 3

**Func. diagram:** -

**Unit selection:** -

**Expert list:** 1

**Factory setting**

1

**Description:** Sets the phase shift for offset clocking.

For the first active power unit, it is specified whether clocking is to start at 0° (value = 0) or 180° (value = 1). All other active power units are clocked alternately according to the setting made here.

**Dependency:** Refer to: p1819

**Note:** A change only becomes effective after a POWER ON.

The parameter is not influenced by setting the factory setting.

---

#### p1819 Phase for PWM generation / Ph for PWM

SERVO, VECTOR,  
SERVO\_AC,  
VECTOR\_AC,  
SERVO\_I\_AC,  
VECTOR\_I\_AC,  
S\_INF

**Can be changed:** U, T

**Data type:** Integer16

**P-Group:** Modulation

**Not for motor type:** -

**Min**

-1

**Calculated:** -

**Dyn. index:** -

**Unit group:** -

**Scaling:** -

**Max**

16

**Access level:** 3

**Func. diagram:** -

**Unit selection:** -

**Expert list:** 1

**Factory setting**

-1

**Description:** Display for "offset clocking".

Depending on the particular case, the value is interpreted differently:

Case 1:

The PWM clock cycle (1/p1800[D]) is greater than the current controller clock cycle (p115[0]) and the ratio between the PWM clock cycle and the current controller clock cycle is an integer and even multiple of it (e.g. p0115[0] = 125 µs, p1800[D] = 4 kHz, 2 kHz, 1 kHz).

The value displayed refers to:

- the phase shift in the current-controller cycles to be executed by the power unit.

Case 2:

The PWM clock cycle (1/p1800[D]) is less than or equal to the current controller clock cycle (p0115[0]) and the ratio between the current controller clock cycle and the PWM clock cycle is an integer and even multiple of it (e.g. p0115[0] = 125 µs, p1800[D] = 8 kHz, 16 kHz).

The value 1 displayed means that:

- the power unit is to apply a phase shift of 180 ° (from the PWM cycle).

A value of 0 displayed on all power units of the drive line-up means the following:

- the general conditions of the "offset clocking" (see p1815) are not fulfilled, i.e. no power unit is clocked with an offset.

**Dependency:** Refer to: r0108, p0115, p1800, p1815, p1816, p1818

**Note:** For reasons of compatibility, the parameter is an adjustable parameter. However, it functions solely as a display parameter. This means that factory setting -1 no longer has any significance and is only available for reasons of compatibility.

---

|              | -1                           | 16                   | 0                        |

**Description:** Display for "offset clocking".  
Depending on the particular case, the value is interpreted differently:  
Case 1:  
The PWM clock cycle is greater than the current controller clock cycle (p0115[0]) and the ratio between the PWM clock cycle and the current controller clock cycle is an integer and even multiple of it (e.g. p0115[0] = 125  $\mu$ s, pulse frequency = 4 kHz, 2 kHz).  
The value displayed refers to:  
- the phase shift in the current-controller cycles to be executed by the power unit.  
Case 2:  
The PWM clock cycle is less than or equal to the current controller clock cycle (p0115[0]) and the ratio between the current controller clock cycle and the PWM clock cycle is an integer and even multiple of it (e.g. p0115[0] = 125  $\mu$ s, pulse frequency = 8 kHz, 16 kHz).  
The value 1 displayed means that:  
- the power unit is to apply a phase shift of 180 ° (from the PWM cycle).  
A value of 0 displayed on all power units of the drive line-up means the following:  
- the general conditions of the "offset clocking" (see p1815) are not fulfilled, i.e. no power unit is clocked with an offset.

**Dependency:** Refer to: r0108, p0115, p1800, p1815, p1816, p1818

**Note:** For reasons of compatibility, the parameter is an adjustable parameter. However, it functions solely as a display parameter. This means that the minimum value -1 no longer has any significance and is only available for reasons of compatibility.

|   | <b>Min</b><br>0   | <b>Max</b><br>1                                       | <b>Factory setting</b><br>0  |
| <b>Description:</b>   | Setting to change the direction of rotation.<br>If the parameter is changed, it reverses the direction of rotation of the motor and the encoder actual value without changing the setpoint.   |   |  |
| <b>Value:</b>   | 0: Clockwise<br>1: Counter-clockwise  |   |  |
| <b>Dependency:</b>  | Refer to: p6278<br>Refer to: F07434   |   |  |
| <b>Danger:</b><br> | When using external speed actual values for the speed controller (see p1440), for a direction of rotation change (p1821 = 1), then its polarity must also be changed (e.g. for drive object ENCODER via p0410). Otherwise, a positive coupling can occur in the speed control loop and the drive would then be accelerated up to the speed limit. |   |  |

**Caution:**

For 12-pulse converters with 30° offset angle for system 2, for a direction of rotation reversal, the phase offset changes by 60° as the sign of the angle offset changes. This can be adapted in p1810.15.

When using a separately excited synchronous machine with reverse field excitation, when setting p1821, it must be checked as to whether the phase sequence of the exciter converter must also be changed.

**Notice:**

An appropriate fault is output for a drive data set changeover where the direction of rotation changes and the pulses are enabled.

After changing parameter p1821, the direction of rotation is not automatically adapted in the safety area. The following parameters can be used to set the direction of rotation for safety monitoring:

- p9516.1/p9316.1 "Position actual value sign change" (only for operation with encoder)
- p9539/p9339 "SI Motion gearbox direction of rotation reversal" (also in encoderless operation)

**Note:**

For operation with the phase sequence U/V/W, the direction of rotation is defined when viewing the face side of the motor output shaft.

When changing the direction of rotation, the rotating field direction of the current controller is reversed. The speed actual value (e.g. r0063) is also reversed so that the control sense is kept and internally causing the direction of rotation to be reversed with the same setpoint. Further, the position actual values of the actual encoder are reversed (e.g. r0482[0...2]).

p1820 can be used to reverse the direction of the motor without reversing the encoder actual value.

**Note:** If the Control Unit is operated with a PM240-2 with hardware STO (HW-STO), then the following assignments are obtained for the two HW-STO input terminals:

Input terminal STO\_A -> r1838.4 switch-off signal path lower

Input terminal STO\_B -> r1838.3 switch-off signal path upper

The bits that are not written to are used for internal diagnostics.

| <b>Value:</b>                                  | 0: Inhibited<br>2: Identify motor data (stationary)   |                                 |                            |
| <b>Dependency:</b>                             | In the simulation mode, the parameter cannot be written into.<br>When selecting the motor data identification routine, the drive data set changeover is suppressed.<br>Refer to: p1272, p1300, p1910<br>Refer to: F07990, A07991  |                                 |                            |
| <b>Notice:</b>                                 | If there is a motor holding brake, it must be open (p1215 = 2).<br>To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).<br>It is not permissible to activate write protection during the motor identification (p7761).<br>During the rotating measurement it is not possible to save the parameters (p0971, p0977).   |                                 |                            |

**Note:** The motor and control parameters of the vector control are only optimally set when both measurements are carried out (initially at standstill, and then with the motor rotating). The measurement with rotating motor is not performed for  $p1300 < 20$  (U/f controls).  
An appropriate alarm is output when the parameter is set.  
The switch-on command must remain set during a measurement and after the measurement has been completed, the drive automatically resets it.  
The duration of the measurements can lie between 0.3 s and several minutes. This time is, for example, influenced by the motor size and the mechanical conditions.  
p1900 is automatically set to 0 after the motor data identification routine has been completed.  
For a reluctance motor, a pole position identification is carried out during the stationary measurement. As a consequence, faults that occur can also be assigned to the pole position identification.  
For U/f control (p1300), identification with speed controller optimization does not make sense (e.g. p1900 = 1).

| <b>p1900</b>   | <b>Motor data identification and rotating measurement / MotID and rot meas</b> |                      |                          |
|--|--|----------------------|--------------------------|
| VECTOR (n/M),<br>VECTOR_AC (n/M),<br>VECTOR_I_AC (n/M) | <b>Can be changed:</b> C2(1), T  | <b>Calculated:</b> - | <b>Access level:</b> 1   |
|  | <b>Data type:</b> Integer16  | <b>Dyn. index:</b> - | <b>Func. diagram:</b> -  |
|  | <b>P-Group:</b> Motor identification   | <b>Unit group:</b> - | <b>Unit selection:</b> - |
|  | <b>Not for motor type:</b> -   | <b>Scaling:</b> -    | <b>Expert list:</b> 1    |
|  | <b>Min</b>   | <b>Max</b>           | <b>Factory setting</b>   |
|  | 0  | 3                    | 2                        |

**Description:** Sets the motor data identification and speed controller optimization.  
The motor identification should first be performed with the motor stationary (p1900 = 1, 2; also refer to p1910). Based on this, additional motor and control parameters can be determined using the motor data identification with the motor rotating (p1900 = 1, 3; also refer to p1960); not for  $p1300 < 20$ .  
p1900 = 0:  
Function inhibited.  
p1900 = 1:  
Induction motors --> set p1910 = 1 and p1960 = 0, 1, 2 depending on p1300  
Permanent-magnet or separately excited synchronous motors --> set p1910 = 1, p1990 = 1 and p1960 = 0, 1, 2 depending on p1300  
When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next switch-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution.  
For permanent-magnet or separately excited synchronous motors, the encoder is adjusted with the next switch-on command. The motor must be free to rotate and rotates through 1.5 revolutions of the motor encoder.  
With the following switch-on command, a rotating motor data identification routine is carried out - and in addition, a speed controller optimization by making measurements at different motor speeds.  
p1900 = 2:  
Induction motors --> set p1910 = 1 and p1960 = 0  
Permanent-magnet or separately excited synchronous motors --> set p1910 = 1, p1990 = 1 and p1960 = 0  
When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next switch-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution.  
For permanent-magnet or separately excited synchronous motors, the encoder is adjusted with the next switch-on command. The motor must be free to rotate and rotates through 1.5 revolutions of the motor encoder.  
p1900 = 3:  
Sets p1960 = 0, 1, 2 depending on p1300  
This setting should only be selected if the motor data identification was already carried out at standstill.  
When the drive enable signals are present, with the next switch-on command, a rotating motor data identification routine is carried out - and in addition, speed controller optimization by taking measurements at different motor speeds.

**Value:**

- 0: Inhibited
- 1: Motor data ident. (stationary) and sp. contr. opt.
- 2: Identify motor data (stationary)
- 3: Optimize speed controller (rotating)

## 2 Parameters

### 2.2 List of parameters

- Dependency:** In the simulation mode, the parameter cannot be written into.  
When selecting the motor data identification routine, the drive data set changeover is suppressed.  
Refer to: p1272, p1300, p1910, p1960, p1990  
Refer to: A07980, A07981, F07982, F07983, F07984, F07985, F07986, A07987, F07988, F07990, A07991
- Notice:** If there is a motor holding brake, it must be open (p1215 = 2).  
To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).  
It is not permissible to activate write protection during the motor identification (p7761).  
During the rotating measurement it is not possible to save the parameters (p0971, p0977).  
p1900 = 3:  
This setting should only be selected if the motor data identification was already carried out at standstill.
- Note:** The motor and control parameters of the vector control are only optimally set when both measurements are carried out (initially at standstill, and then with the motor rotating). The measurement with rotating motor is not performed for p1300 < 20 (U/f controls).  
An appropriate alarm is output when the parameter is set.  
The switch-on command must remain set during a measurement and after the measurement has been completed, the drive automatically resets it.  
The duration of the measurements can lie between 0.3 s and several minutes. This time is, for example, influenced by the motor size and the mechanical conditions.  
p1900 is automatically set to 0 after the motor data identification routine has been completed.  
For a reluctance motor, a pole position identification is carried out during the stationary measurement. As a consequence, faults that occur can also be assigned to the pole position identification.  
For U/f control (p1300), identification with speed controller optimization does not make sense (e.g. p1900 = 1).

| <b>P-Group:</b> Motor identification | <b>Unit group:</b> -            | <b>Unit selection:</b> - |
| <b>Not for motor type:</b> -         | <b>Scaling:</b> -               | <b>Expert list:</b> 1    |
| <b>Min</b>                           | <b>Max</b>                      | <b>Factory setting</b>   |
| -                                    | -                               | 0000 bin                 |

- Description:** Sets the configuration for the test pulse evaluation.  
Bit 00: Check for conductor-to-conductor short circuit once/always when the pulses are enabled.  
Bit 01: Check for ground fault once/always when the pulses are enabled.  
Bit 02: Activation of the tests selected using bit 00 and/or bit 01 each time the pulses are enabled

- Recommendation:** If the ground fault test is incorrectly initiated because the motor is not at a complete standstill, then the pulse cancellation delay time (p1228) should be increased.

| Bit field: | Bit | Signal name                              | 1 signal | 0 signal | FP |
|------------|-----|--|----------|----------|----|
|            | 00  | Phase short-circuit test pulse active    | Yes      | No       | -  |
|            | 01  | Ground fault detection test pulse active | Yes      | No       | -  |
|            | 02  | Test pulse at each pulse enable          | Yes      | No       | -  |

- Dependency:** The ground fault test is only possible when the motor is stationary, and is therefore only realized when flying restart is deactivated (p1200 = 0).  
When a sine-wave filter is connected, the short-circuit and the ground fault test are deactivated, as the filter could be excited by the test pulse.  
Refer to: p0287

- Note:** If a conductor-to-conductor short-circuit is detected during the test, this is displayed in r1902.1.  
If a ground fault is detected during the test, this is displayed in r1902.2.  
For bit 02 = 0:  
If the test was successful once after POWER ON (see r1902.0), it is not repeated.  
For bit 02 = 1:  
The test is not only performed after POWER ON, but also each time the pulses are enabled.

**Note:** For an induction motor (ASM) the following bits: 8, 9, 10, 13 are effective  
 For a synchronous motor (SRM) the following bits: 8, 9, 13, 14 are effective  
 For bit 14:

- the display of the phase voltage actual values (r0089), the actual active power value (r0082) and the torque actual value (r0080) is significantly more accurate after successfully determining the voltage emulation error.
- the voltage emulation errors should be identified with the Motor Module in the warm state.
- the motor temperature (r0035) should not change significantly (i.e. it should not be identified immediately after a load duty cycle).

|                   | 10         | Magnetizing field inductance and measure rotor resistance | Yes             | No              | -         |
|                   | 13         | Measure commutation angle and direction of rotation       | Yes             | No              | -         |
|                   | 14         | Determining the voltage emulation error                   | Yes             | No              | -         |

**Dependency:** Refer to: p1910, r1912, r1913, r1915, r1925, r1927, r1932, r1933, r1934, r1935, r1936, r1950, r1951, p1952, p1953

**Note:** For an induction motor (ASM) the following bits: 8, 9, 10, 13 are effective  
For a synchronous motor (SRM) the following bits: 8, 9, 13, 14 are effective  
For bit 14:  
- the display of the phase voltage actual values (r0089), the actual active power value (r0082) and the force actual value (r0080) is significantly more accurate after successfully determining the voltage emulation error.  
- the voltage emulation errors should be identified with the Motor Module in the warm state.  
- the motor temperature (r0035) should not change significantly (i.e. it should not be identified immediately after a load duty cycle).

| 25 | Deactivate gating unit switchover                                | Yes | No | - |

**Note:**

For bit 20 = 1 (only for p0352 = 0 Ohm):

For motors with code number (with the exception of 1LE1, 1PE5, 1PC1), the cable resistance p0352 is calculated from the difference between the measurement results of the overall stator resistance and the stator resistance listed in the motor data sheet.

For all other motors, the stator resistance from the automatic calculation is used instead of that from the motor data sheet.

The following applies to permanent-magnet synchronous motors:

Bit 11 = 0 and "Closed-loop control" operating mode:

The direct inductance Ld and the quadrature inductance Lq are measured at a low current.

Bit 11 = 1 or "U/f" operating mode:

The stator inductance is measured with half the rated motor current.

If the stator inductance is not measured but is to be estimated, then bit 0 should be set and bit 11 should be deselected.

**Description:**

Setting to activate the standstill data valve offset calibration when enabled.

**Value:**

0: Inactive/cancel  
1: Start calibration

**Dependency:**

Precondition is position-controlled operation.

Refer to: p1909

Refer to: A07991

**Note:**

The offset is entered in p1832.

The calibration is started when enabled, and after data identification has been completed, is automatically set back to a value of zero.

 25: Triangular voltage vector input with filter  
 26: Enter voltage vector with DTC correction  
 27: Enter voltage vector with AVC  
 28: Enter voltage vector with DTC + AVC correction

- Dependency:** "Quick commissioning" must be carried out (p0010 = 1, concluded with p3900 > 0) before executing the motor data identification routine!  
 In the simulation mode, the parameter cannot be written into. When selecting the motor data identification routine, the drive data set changeover is suppressed.  
 When the sine-wave filter is connected, p1909.15 must be activated as only the stator resistance can be measured.  
 Refer to: p1272, p1900  
 Refer to: F07990, A07991
- Notice:** After the motor data identification (p1910 > 0) has been selected, alarm A07991 is output and a motor data identification routine is carried out as follows at the next switch-on command:  
 - current flows through the motor and a voltage is present at the drive converter output terminals.  
 - during the identification routine, the motor shaft can rotate through a maximum of half a revolution.  
 - however, no torque torque is generated.
- Note:** If there is a motor holding brake, it must be open (p1215 = 2).  
 To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).  
 When setting p1910, the following should be observed:  
 1. "With acceptance" means:  
 The parameters specified in the description are overwritten with the identified values and therefore have an influence on the controller setting.  
 2. "Without acceptance" means:  
 The identified parameters are only displayed in the range r1912 ... r1926. The controller settings remain unchanged.  
 3. p1910 = 3, 4, 5 can only be selected for induction motors.  
 4. For settings 27 and 28, the AVC configuration set using p1840 is active.  
 The switch-on command must remain set during a measurement and after the measurement has been completed, the drive automatically resets it. The duration of the measurements can lie between 0.3 s and several minutes. This time is mainly influenced by the motor size. p1910 is automatically set = 0 after the motor data identification routine has been completed. If only the stationary measurement is selected, then p1900 is also reset to 0. Otherwise, the rotating measurement is activated.

 [10] = Force characteristic identified measuring point 10

**Dependency:**

Refer to: r1938, r1939, p1959, p1960, r1969

**Note:**

- the value in r1937[0] corresponds to the force constant (p0316) and was identified with the current in r1935[10]. If the reluctance force constant is identified (p1959.7 = 1), the force constant is identified with 150% rated current (p0305), otherwise with 100% rated current.

**r1938****Voltage constant identified / kE ident**

SERVO, SERVO\_AC,  
SERVO\_I\_AC

**Can be changed:** -

**Calculated:** -

**Access level:** 3

| <b>Notice:</b>      | To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).   |  |                          |                 |           |
| <b>Note:</b>        | For bit 00:<br>In order to automatically correct the control sense for the velocity controller, the complete traversing distance must be free. When required, p1820 is automatically adapted.<br>For bit 01:<br>The drive moves to correct the valve offset. When required, p1832 is automatically adapted.<br>For bit 02:<br>Full automatic piston calibration, the drive must either be referenced, or must be equipped with an absolute encoder. Further, the complete traversing distance must be free.<br>For piston calibration, the drive is traversed to the end stop (completely inserted) with a negative search voltage (p1955[3]) and the associated absolute position entered in p0476. |  |                          |                 |           |

For bit 03:

For automatic traversing range identification, the drive must either be referenced (homed), or must be equipped with an absolute encoder. Further, the piston must have been calibrated and the complete traversing distance must be free.

To prepare for the identification of the characteristic, the possible traversing range is determined. To do this, the drive is traversed to the right-hand and left-hand end stops with the search voltage (p1955[3...4]) and the position with distance reserve is entered into p1956.

If there are pressure sensors, then the correct interconnection for pressure measurements A and B is checked.

For bit 04:

For automatic characteristic identification, the drive must either be referenced (homed), or must be equipped with an absolute encoder. Further, the piston must have been calibrated and the free traversing range must have been entered in p1956.

The drive traverses with different valve voltages and takes into account p1958.

For bit 05:

The drive is moved with a positive and negative velocity, and the measured stiction forces are entered into p1555 and p1556.

For bit 06:

The drive is traversed to both end stops. In so doing, the dead volume and the loop gain of the force control loop is measured, and entered into p0314 and p0315.

For bit 08:

For the automatic characteristic identification (p1959.4), the measured velocity with the measured system pressure is converted to the average system pressure; this means that system pressure fluctuations hardly influence the measurement. The system pressure as well as pressures A and B must be measured. The conversion is not performed if the pressure measurements are not available. If the pressure measurements do not measure the specified pressures, then the conversion must be deactivated in order to avoid any errors.

## 2 Parameters

### 2.2 List of parameters

**Notice:** The step p1959.8 (identify q inductance on the test stand) may only be selected if the drive can be kept at zero speed or at a fixed speed either using a test stand or other mechanical measures.

During steps p1959.2 (identifying the moment of inertia) and p1959.6 (identifying the torque constant) the Vdc\_min controller is disabled (p1240).

During step p1959.7 (identifying the reluctance torque constant) the Vdc\_min controller and Vdc\_max controller are disabled (p1240).

**Note:** For an induction motor (ASM), the following bits 1, 2, 5, 8, 9, 10, 14, 15 are effective  
For a synchronous motor (SRM), the following bits 2, 5, 6, 7, 8, 10, 14, 15 are effective  
For bit 00:

This function is only active when the "Cogging torque compensation" function module is activated (r0108.22 = 1). The motor should not be operated with any mounted load.

For bit 05:

For "motor holding brake the same as sequence control" (p1215 = 1 or 3), the Lq characteristic is only measured up to approximately the rated motor current (p0305) instead of up to the current limit (p0640). Before carrying out the rotation measurement for motors with brake, the brake should be opened (p1215 = 2) - as long as this can be done without incurring any danger.

For bit 10:

If the motor holding brake is set just the same as the sequence control (p1215 = 1 or 3), the commutation angle and the direction of rotation are not measured. Before carrying out the rotation measurement for motors with brake, the brake should be opened (p1215 = 2) - as long as this can be done without incurring any danger.

For bit 14, 15:

The following applies for bit 14 and 15 = 0:

When the function module "extended setpoint channel" is activated (r0108.8 = 1), the direction inhibit of the setpoint channel becomes effective. No direction of inhibit is effective if the function module is inactive.

The following applies for minimum bit 14 = 1 or bit 15 = 1:

The direction inhibit set in p1959 becomes effective.

**Description:** Sets the configuration of the moving measurement.

**Recommendation:** A direction inhibit should not be activated for the moving measurement (p1959.14 = 1 and p1959.15 = 1) as long as this can be done without incurring any danger. This means that the identification is complete and more accurate.

When the direction inhibit is activated, the reluctance force constant (p1959.7) is not identified and the angular commutation offset (p1959.10, p0431) is inaccurately determined. The reluctance force constant (p1959.7) is also not identified in encoderless operation.

**Bit field:**

| Bit | Signal name   | 1 signal | 0 signal | FP |
|-----|---|----------|----------|----|
| 00  | Identify periodic position error                          | Yes      | No       | -  |
| 01  | Identify the saturation characteristic                    | Yes      | No       | -  |

| 15  | Negative direction permitted                              | Yes      | No       | -  |

**Dependency:** Refer to: p1958, p1960

- Notice:** The step p1959.8 (identify q inductance on the test stand) may only be selected if the drive can be kept at zero speed or at a fixed velocity either using a test stand or other mechanical measures.  
During steps p1959.2 (identifying the moment of inertia) and p1959.6 (identifying the force constant) the Vdc\_min controller is disabled (p1240).  
During step p1959.7 (identifying the reluctance force constant) the Vdc\_min controller and Vdc\_max controller are disabled (p1240).
- Note:** For an induction motor (ASM), the following bits 1, 2, 5, 8, 9, 10, 14, 15 are effective  
For a synchronous motor (SRM), the following bits 2, 5, 6, 7, 8, 10, 14, 15 are effective  
For bit 00:  
This function is only active when the "Cogging torque compensation" function module is activated (r0108.22 = 1). The motor should not be operated with any mounted load.  
For bit 05:  
For "motor holding brake the same as sequence control" (p1215 = 1 or 3), the Lq characteristic is only measured up to approximately the rated motor current (p0305) instead of up to the current limit (p0640). Before carrying out the rotation measurement for motors with brake, the brake should be opened (p1215 = 2) - as long as this can be done without incurring any danger.  
For bit 10:  
If the motor holding brake is set just the same as the sequence control (p1215 = 1 or 3), the commutation angle and the direction of rotation are not measured. Before carrying out the rotation measurement for motors with brake, the brake should be opened (p1215 = 2) - as long as this can be done without incurring any danger.  
For bit 14, 15:  
The following applies for bit 14 and 15 = 0:  
When the function module "extended setpoint channel" is activated (r0108.8 = 1), the direction inhibit of the setpoint channel becomes effective. No direction of inhibit is effective if the function module is inactive.  
The following applies for minimum bit 14 = 1 or bit 15 = 1:  
The direction inhibit set in p1959 becomes effective.

|            | 13  | After measurement direct transition into operation              | Yes      | No       | -  |
|            | 14  | Calculate speed actual value smoothing time                     | Yes      | No       | -  |

**Dependency:** Refer to: F07988

**Note:** The encoder is only tested if the rotating measurement with encoder is selected (p1960 = 2).  
 The following parameters are influenced for the individual optimization steps:  
 Bit 00: None  
 Bit 01: p0320, p0360, p0362 ... p0369  
 Bit 02: p0341, p0342  
 Bit 03: p1400.0, p1458, p1459, p1460, p1462, p1463, p1470, p1472, p1496  
 Bit 04: Dependent on p1960  
 Bit 05: p0391, p0392, p0393, p1402.2 only for induction motors  
 p1960 = 1, 3: p1458, p1459, p1470, p1472, p1496, p1400.0  
 p1960 = 2, 4: p1458, p1459, p1460, p1462, p1496, p1461, p1463  
 The identification of the q leakage inductance can only be carried out for unloaded motors or motors with a low load (load approx. 30% below the rated motor torque). Only then is a current controller adaptation (p0391 ... p0393) parameterized if the q-leakage inductance under no-load conditions is at least 30 % higher than the total leakage inductance (p0356, p0358).  
 For bit 11 = 1:  
 Bits 02, 03, 04 no longer have any effect. It makes sense to set bit 11 if the speed controller and its adaptation were already set before the measurement.  
 For bit 12 = 1:  
 The selection only has an effect on the measurement p1960 = 1, 2. For the shortened measurement, the magnetizing current and moment of inertia are determined with a somewhat lower accuracy.  
 For bit 13 = 1:  
 After the measurement has been completed, the system immediately goes into closed-loop speed controlled operation.

| <b>Value:</b>   | -3: Accept identified parameters<br>-2: Acknowledge encoder inversion actual value (F07993)<br>-1: Start motor data identification without acceptance<br>0: Inactive/inhibit<br>1: Start motor data identification with acceptance   |  |                          |
| <b>Recommendation:</b>  | Before carrying out the rotation measurement for motors with brake, the brake should be opened (p1215 = 2) - as long as this can be done without incurring any danger. The commutation angle and the direction are also determined. Motor data identification is not required for catalog motors and DRIVE-CLiQ motors. It is recommended to increase the torque accuracy or for third-party motors. |  |                          |
| <b>Dependency:</b>  | Refer to: r1934, r1935, r1936, r1937, r1938, r1939, r1947, r1948, p1958, p1959, r1962, r1963, r1969<br>Refer to: F07990, A07991, F07993  |  |                          |
| <b>Danger:</b>  | For the moving measurement, the motor is accelerated up to the maximum velocity. Only the parameterized current limit (p0640) and the maximum velocity (p1082) are effective.<br>The behavior of the motor can be influenced using the direction inhibit (p1959.14, p1959.15) and the ramp-up/ramp-down time (p1958).  |  |                          |
|  |  |  |                          |
| <b>Notice:</b>  | If there is a motor holding brake, it must be open (p1215 = 2).<br>To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).  |  |                          |

**Note:** The moving measurement can only be selected when the pulses of all of the drive objects of the Control Unit have been suppressed. After selection, all of the other drive objects of the Control Unit are interlocked so that they cannot be switched on until the moving measurement has been completed or deselected.  
When the moving measurement is activated (p1960 = 1), it is not possible to save the parameters (p0971, p0977).

| <b>Description:</b>   | <p>Sets the rotating measurement.</p> <p>The rotating measurement is carried out after the next switch-on command.</p> <p>The setting possibilities of the parameter depend on the open-loop/closed-loop control mode (p1300).</p> <p>p1300 &lt; 20 (U/f open-loop control):<br/>It is not possible to select rotating measurement or speed controller optimization.</p> <p>p1300 = 20, 22 (encoderless operation):<br/>Only rotating measurement or speed controller optimization can be selected in the encoderless mode.</p> <p>p1300 = 21, 23 (operation with encoder):<br/>Both versions (encoderless and with encoder) of the rotating measurement and speed controller optimization can be selected.</p>   |                      |                          |
| <b>Value:</b>   | <p>0: Inhibited</p> <p>1: Rotating measurement in encoderless operation</p> <p>2: Rotating measurement with encoder</p> <p>3: Speed controller optimization in encoderless operation</p> <p>4: Speed controller optimization with encoder</p>   |                      |                          |
| <b>Dependency:</b>  | <p>Before the rotating measurement is carried out, the motor data identification routine (p1900, p1910, r3925) should have already been done.</p> <p>In the simulation mode, a value of 1 cannot be written into the parameter.</p> <p>When selecting the rotating measurement, the drive data set changeover is suppressed.</p> <p>When selecting rotating measurement (with the exception for p1959.13 = 1) the following BICO parameters are set to standard values, and after the measurement has been completed, are reset back to the original parameter assignments:<br/>p1020 ... p1023, p1070, p1075, p1138, p1139, p1140 ... p1143, p1155, p1160, p1437, p1476, p1477<br/>Refer to: p1272, p1300, p1900, p1959, p1967, r1968<br/>Refer to: A07987</p>   |                      |                          |
| <b>Danger:</b>  | <p>For drives with a mechanical system that limits the distance moved, it must be ensured that this is not reached during the rotating measurement. If this is not the case, then it is not permissible that the measurement is carried out.</p>  |                      |                          |
|  |   |                      |                          |
| <b>Notice:</b>  | <p>If there is a motor holding brake, it must be open (p1215 = 2).</p> <p>To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).</p> <p>During the rotating measurement it is not possible to save the parameters (p0971, p0977).</p>   |                      |                          |
| <b>Note:</b>  | <p>When the rotating measurement is activated, it is not possible to save the parameters (p0971, p0977).</p> <p>Parameter changes are automatically made for the rotating measurement (e.g. p1120); this is the reason that up to the end of the measurement, and if no faults are present, no manual changes should be made.</p> <p>The ramp-up and ramp-down times (p1120, p1121) are limited, for the rotating measurement, to 900 s.</p> <p>For speed controller optimization with encoder (p1960 = 2, 4), the speed controller for encoderless operation is also pre-assigned (p1470, p1472).</p> <p>Depending on whether the speed controller optimization is carried out with or without encoder, different Kp/Tn adaptations of the speed controller are set (p1464, p1465). If the drive should be controlled with as well as without speed encoder, then we recommend the use of two drive data sets (p0180). These can then be executed with different speed controller adaptations.</p> |                      |                          |

## 2 Parameters

### 2.2 List of parameters

**Dependency:** Refer to: p1959, r1968

Refer to: F07985

**Note:** For a rotating measurement, this parameter can be used to optimize the speed controller.

p1967 = 100 % --> speed controller optimization according to a symmetric optimum.

p1967 > 100 % --> optimization with a higher dynamic response (Kp higher, Tn lower).

If the actual dynamic response (see r1968) is significantly reduced with respect to the required dynamic response (p1967), then this can be as a result of mechanical load oscillations. If, in spite of this load behavior, a higher dynamic response is required, then the oscillation test (p1959.4 = 0) should be deactivated and the measurement repeated.

---

#### r1968 Speed\_ctrl\_opt dynamic factor actual / n\_opt dyn\_fact act

VECTOR (n/M),  
VECTOR\_AC (n/M),  
VECTOR\_I\_AC (n/M)

**Can be changed:** -

**Data type:** FloatingPoint32

**P-Group:** Motor identification

**Not for motor type:** REL

**Min**

- [%]

**Calculated:** -

**Dyn. index:** -

**Unit group:** -

**Scaling:** -

**Max**

- [%]

**Access level:** 3

**Func. diagram:** -

**Unit selection:** -

**Expert list:** 1

**Factory setting**

- [%]

**Description:** Displays the dynamic factor which is actually achieved for the vibration test

**Dependency:** Refer to: p1959, p1967

Refer to: F07985

**Note:** This dynamic factor only refers to the control mode of the speed controller set in p1960.

---

#### r1969 Moment of inertia identified / M\_inert ident

SERVO, SERVO\_AC,  
SERVO\_I\_AC

**Can be changed:** -

**Data type:** FloatingPoint32

**P-Group:** Motor identification

**Not for motor type:** REL

**Min**

- [kgm<sup>2</sup>]

**Calculated:** -

**Dyn. index:** -

**Unit group:** 25\_1

**Scaling:** -

**Max**

- [kgm<sup>2</sup>]

**Access level:** 3

**Func. diagram:** -

**Unit selection:** p0100

**Expert list:** 1

**Factory setting**

- [kgm<sup>2</sup>]

**Description:** Displays the identified moment of inertia.

**Dependency:** IEC drives (p0100 = 0): unit kg m<sup>2</sup>

NEMA drives (p0100 = 1): unit lb ft<sup>2</sup>

Refer to: p0341, p0342, p1498, p1959, p1960

---

#### r1969 High load inertia identified / High load inert id

SERVO (Lin),  
SERVO\_AC (Lin),  
SERVO\_I\_AC (Lin)

**Can be changed:** -

**Data type:** FloatingPoint32

**P-Group:** Motor identification

**Not for motor type:** REL

**Min**

- [kg]

**Calculated:** -

**Dyn. index:** -

**Unit group:** 27\_1

**Scaling:** -

**Max**

- [kg]

**Access level:** 3

**Func. diagram:** -

**Unit selection:** p0100

**Expert list:** 1

**Factory setting**

- [kg]

**Description:** Displays the identified high load inertia.

**Dependency:** IEC drives (p0100 = 0): unit kg m<sup>2</sup>

NEMA drives (p0100 = 1): unit lb ft<sup>2</sup>

Refer to: p0341, p0342, p1498, p1959, p1960

0

99

99

**Description:**

Sets the pole position identification technique.

**Value:**

0: Saturation-based 1st + 2nd harmonics  
 1: Saturation-based 1st harmonics  
 4: Saturation based 2-stage  
 10: Motion-based  
 20: Elasticity-based  
 99: No technique selected

**Dependency:**

Refer to: p0325, p0329, p1981, p1982, p1983, r1984, r1985, r1986, r1987, p1990, r1992, p1993, p1994, p1995, p1996, p1997, p3090, p3091, p3092, p3093, p3094, p3095, p3096, r3097  
 Refer to: F07995

**Notice:**

If the incorrect technique is applied, this can cause the motor to accelerate in an uncontrolled fashion.  
 Under the following conditions, the integral time must be disabled (p1996 = 0):  
 - p1980 = 10 (motion-based).  
 - motor encoder with track A/B sq-wave (p0404.3 = 1)  
 - p0430.20 = 0 (flank time measurement).

Once the integral time has been disabled, the motion is increased during the identification (a minimum of 90 ° electrical). As a result of this, the maximum distance (p1981) must also be increased.

**Note:****PollD:** Pole position identification

When commissioning a catalog motor, the technique is automatically selected depending on the motor type being used.

The following applies for 1FN3 motors:

A technique with 2nd harmonic may not be used (do not use p1980 = 0, 4).

For 1FK7 motors, the following applies:

A two-stage technique may not be used (do not use p1980 = 4).

The automatically set value in p0329 may not be changed.

| <b>Description:</b>                                    | Starts the pole position identification routine for test purposes.<br>p1983 = 1:<br>Start of pole position identification. The parameter is set to zero automatically on completion of the identification process.   |  |   |
| <b>Dependency:</b>                                     | Refer to: p0325, p0329, p1980, p1981, p1982, r1984, r1985, r1986, r1987, p1990, r1992, p1993, p1994, p1995, p1996, p1997, p3090, p3091, p3092, p3093, p3094, p3095, p3096, r3097   |  |   |
| <b>Notice:</b>   | For p1983 = 1 and if the pulses are not enabled, then the function is only executed the next time that the pulses are enabled.   |  |   |
| <b>Note:</b>   | When this test is executed, it does not influence the commutation angle.   |  |   |
| <b>r1984</b>   | <b>PolID angular difference / PolID ang diff</b>   |  |   |
