1. Click the "Cancel" button.

#### Result

The running calibration is canceled, and afterwards the channel to be calibrated has the same settings as before the calibration.

All operator controls in the user interface are deactivated until the cancelation is complete. Except for the "Status" field, the user interface appears the same afterwards as before the calibration. The "Status" field displays the result of the cancelation.

### Resetting an S7-1500 analog module to factory settings

#### Requirement

- You have opened the Online and Diagnostic view of the S7-1500 analog module from the project context and are in the "Calibrate" group of the "Functions" folder.
- The associated CPU is online.

#### Procedure

To reset a channel of an S7-1500 analog module to factory settings, follow these steps:

1. Select the line associated with the channel to be reset in the overview table.
2. Click the "Set to factory settings" button.

## Result

All operator controls in the user interface are deactivated until the reset operation is complete. Except for the "Status" field, the user interface appears the same afterwards as before the reset operation. The "Status" field displays the result of the reset operation.

### 8.2.1.6 Diagnostics in STOP mode

#### Basic information on the diagnostics buffer

#### Function

The operating system of the CPU enters the errors detected by the CPU and the diagnostics-capable modules into the diagnostics buffer in the order in which they occurred. This includes the following events:

- Every mode change of the CPU (POWER UP, change to STOP mode, change to RUN mode)
- Every hardware and diagnostic error interrupt

The top entry contains the most recent event. The entries in the diagnostics buffer are stored permanently. They are retained even if the power supply fails and can only be deleted by resetting the CPU to factory settings.

A diagnostics buffer entry contains the following elements:

- Time stamp
- Error ID
- Additional information specific to the error ID

#### Advantages of the diagnostics buffer

The diagnostics buffer offers the following advantages:

- After the CPU has changed to STOP mode, you can evaluate the last events prior to the STOP so that you can locate and identify the cause of the STOP.
- You can detect and eliminate the causes of errors more quickly and thus increase the availability of the system.
- You can evaluate and optimize the dynamic system response.

#### Organization of the diagnostics buffer

The diagnostics buffer is a ring buffer. The maximum number of entries for the S7-1200 CPUs is 50. When the diagnostics buffer is full and a further entry needs to be made, all existing entries are shifted by one position (which means that the oldest entry is deleted) and the new entry is made at the top position that is now free (FIFO principle: first in, first out).

## Evaluation of the diagnostics buffer

The contents of the diagnostics buffer can be accessed as follows:

- Using the Online and Diagnostics view

The evaluation of events occurring prior to the error event (e.g., transition to STOP mode) allows you to obtain a picture of the possible causes or to zero in more closely or specify in more detail the possible causes (depending on the error type).

Read the detailed information about the events carefully and use the "Help on event" button to obtain additional information and possible causes of individual entries.

---

### Note

To make the best use of the time stamp information on the diagnostics buffer entries in time-critical systems, it is advisable to check and correct the date and time of day on the CPU occasionally.

Alternatively, it is possible to perform a time-of-day synchronization using an NTP time server.

---

## See also

Resetting an S7-1200 CPU to factory settings (Page 1175)

Determining the cause of a STOP of a CPU (Page 1188)

Determining and setting the time of day on a CPU (Page 1172)

Assigning the clock parameters (Page 1037)

## Determining the cause of a STOP of a CPU

### Requirement

The CPU you want to analyze is in STOP mode.

### Procedure

To find out the reason why a CPU changed to STOP, follow these steps:

1. Open the online and diagnostics view of the CPU.
2. Select the "Diagnostics buffer" group from the "Diagnostics" folder.
3. Evaluate the events occurring prior to the transition to STOP mode. Use this to obtain a picture of the possible causes or to zero in on or specify in more detail the possible causes (depending on the error type).  
Read the detailed information about the events carefully and use the "Help on event" button to obtain additional information and possible causes of individual entries.

## Result

You were able to zero in on or determine in more detail the cause of the CPU STOP.

---

### Note

If the analysis does not enable you to overcome the problem, contact Customer Support. In this case, use the "Save as" button to back up the content of the diagnostics data to a text file and submit it to Customer Support.

---

## See also

Reading out the diagnostics buffer of a CPU (Page 1165)

### 8.2.1.7 Online accesses in the Online and Diagnostics view

#### Displaying status of the online connection

##### Requirement

- The associated device can be accessed using at least one PG/PC interface.

##### Procedure

1. Open the online and diagnostics view for the device whose online connection status you want to display.
2. Select the "Online access" group.

---

### Note

The "Online access" group exists only for CPUs and some CPs. However, if you have opened the online and diagnostics view using the "Show/update accessible devices" function, it is not displayed.

---

## Result

The status of the online connection is displayed in the "Status" area both graphically and in text form.

#### Specifying a PG/PC interface, going online

##### Requirement

- The associated device can be accessed using at least one PG/PC interface.
- There is currently no online connection to the relevant device.

## Procedure

1. Open the Online and Diagnostics view of the device to which you want to establish an online connection.
2. Choose the "Online access" group and the "Online access" area within this group.

---

### Note

The "Online access" group exists only for CPUs and some CPs. If you have opened the Online and Diagnostics view using the "Show/update accessible devices" function, it is not displayed.

---

3. If an online connection was established previously for the device, the associated data for this online connection is preset in the drop-down lists. In this case, you can immediately continue with the last step of this operation, provided you have not changed the IP address in the meantime using the Online and Diagnostics view.
4. Choose the interface type in the "Type of PG/PC interface" drop-down list. The "PG/PC interface for online access" drop-down list then shows only the interfaces of the programming device or PC that match the selected interface type.
5. In the "PG/PC interface for online access" drop-down list, select the programming device or PC interface via which you want to establish the online connection.
6. Optional: Click the "Properties" button to change the properties of the associated CP.
7. In the "Connection to subnet" drop-down list, select the subnet via which the device is connected to the PG/PC interface.

---

### Note

The PG/PC interface is connected to an interface of a device.

If you only want to access this device, select the setting "Directly at slot <interface name>" in the drop-down list.

If you want to access another device by means of routing, however, create a subnet at this interface in the hardware configuration and then select this subnet in the drop-down list.

---

8. If the device is accessible via a gateway, select the gateway that connects the two subnets involved in the "1st gateway" drop-down list.
9. In the "Device address" entry field, enter the IP address of the device to which you want to establish an online connection, if necessary.

---

### Note

For CPUs with multiple IP addresses, select the IP address of the PROFINET interface you want to use to establish an online connection from the "Device address" drop-down list.

---

10. Alternatively: Click the "Show accessible devices" button and choose the device from the list of accessible devices to which you want to establish an online connection.
11. Click the "Go online" button.

## Result

The online connection to the desired device is established.

## Going offline

## Requirement

- There is currently an online connection to the relevant device.

## Procedure

1. Open the online and diagnostics view of the device for which you want to disconnect the online connection.
2. Choose the "Online access" group and the "Online access" area within this group.

---

### Note

The "Online access" group exists only for CPUs and some CPs. However, if you have opened the online and diagnostics view using the "Show/update accessible devices" function, it is not displayed.

---

3. Click the "Go offline" button.

## Result

The online connection to the desired device will be disconnected.

## Performing the flash test for a device with an online connection

## Requirement

- There is currently an online connection to the relevant device.
- The FORCE function is not active.

### Procedure

1. Open the online and diagnostics view of the device for which you want to perform a flash test.
2. Choose the "Online access" group and the "Status" area within this group.

---

#### Note

The "Online access" group exists only for CPUs and some CPs. However, if you have opened the online and diagnostics view using the "Show/update accessible devices" function, it is not displayed.

---

3. Select the "LED flash test" check box.

### Result

- On an S7-1200 CPU, the RUN/STOP, ERROR and MAINT LEDs flash.
- On an S7-1500 CPU, the RUN/STOP, ERROR, and MAINT LEDs flash.
- On an S7-300 or S7-400 CPU, the FRCE LED flashes.

The LEDs flash until you cancel the flash test. This is done, for example, by clearing the "LED flash test" check box, by changing to another group of the online and diagnostics view, or by changing settings in the "Online access" area.

#### 8.2.1.8 Checking PROFIBUS DP subnets for faults

### Basic information on the diagnostic repeater

#### What is the diagnostic repeater?

The diagnostic repeater is a repeater that can monitor a segment of an RS 485 PROFIBUS subnet (copper cable) during operation and signal line errors to the DP master via a diagnostics message frame.

The diagnostic repeater detects, localizes and visualizes line errors during operation at an early stage. As a result, problems in the system are identified early and production downtimes will be minimized.

#### Function of the diagnostic repeater

The diagnostic repeater can perform line diagnostics on the DP2 and DP3 segments because it has a measuring circuit for these segments.

The line diagnostics run in two steps:

- **Step 1: Topology determination**  
You start the topology determination by calling the "DP\_TOPOL" instruction in your program. The diagnostic repeater then determines the PROFIBUS addresses and the distance of the devices and creates a topology table.
- **Step 2: Error localization**  
The diagnostic repeater checks the lines during operation. It determines the distance to the point of the error and the reason for the error; it then issues a diagnostics alarm with relative information on the error location.

### Display of detailed information on the determined error location

You receive detailed information on the determined error location in the Online and Diagnostics view of the diagnostic repeater.

- By means of icons
- By means of a display with graphics and text

### See also

Displaying the status of the segment diagnostics using icons (Page 1193)

Displaying the status of the segment diagnostics using graphics and text (Page 1194)

### Displaying the status of the segment diagnostics using icons

#### Where do I find the information I need?

The icons for the status of the segment diagnostics are available:

- In the expanded "Segment diagnostics" folder in the navigation pane of the Online and Diagnostics view of the relevant diagnostic repeater.

The diagnostics icon associated with the segment will be displayed behind the segment designation. It must be noted here that line errors will be displayed for the DP2 and DP3 segments only. The DP1 and programming device segments do not display errors in the form of a diagnostics icon; rather, they signal only a few bus errors.

### Diagnostics icons

The following table shows the available icons and their meaning.

Icon	Meaning
	Segment is error-free
	Segment contains errors
	Segment is deactivated

## Displaying the status of the segment diagnostics using graphics and text

### Where is the status of the segment diagnostics displayed with graphics and text?

The status of the segment diagnostics will be displayed using graphics and text in the "DP1", "DP2", "DP3", and "PG" groups of the "Segment diagnostics" folder in the Online and Diagnostics view of the relevant diagnostic repeater.

### Structure of the "DP1", "DP2", "DP3", and "PG" groups

The "DP1", "DP2", "DP3", and "PG" groups consist of the following elements:

- "Error location" field
- "Error" field
- "Resolution" field
- "Help on event" button
- "Freeze display" or "Cancel freeze" button

### "Error location" field

This field displays the error location graphically, provided the diagnostic repeater can determine the location.

The following picture shows an example for a line error occurring in the DP2 segment.

In this example, the diagnostic repeater has the PROFIBUS address 2, and a line error has occurred between the devices with PROFIBUS addresses 16 and 17. This line error is located 25 m from device 16, 4 m from device 17, and 72 m from the diagnostic repeater.

### "Error" field

The error is explained in plain text in this field.

### "Resolution" field

Here, you will find actions for resolving the error.

### **"Help on event" button**

Click this button to obtain a more detailed explanation of the error and additional details on resolving the error, if applicable.

### **"Freeze display" or "Cancel freeze" button**

The "Freeze display" or "Cancel freeze" button is only enabled when there is an online connection to the diagnostic repeater.

The default setting is "Freeze display".

The following happens when you click the "Freeze display" button:

- The current display of the segment diagnostics is frozen.
- The labeling of the button changes to "Cancel freeze".

If the display is frozen and you click the "Cancel freeze" button, the following happens:

- The display of the segment diagnostics is updated again.
- The labeling of the button changes to "Freeze display".

## **8.2.2 Connection diagnostics**

### **8.2.2.1 Overview of connection diagnostics**

#### **Basics**

Connection diagnostics, as described below, refers to the diagnostics of communication connections.

The connection diagnostics is started each time an online connection is established to a module (CPU or CP) that participates in one or more communication services. The connection status is updated automatically in the background.

In the case of one-way connections, an online connection must exist to the communication partner that has established the communication connection.

On connections configured at both ends, a distinction between the following two situations must be made:

- If there is an online connection to only one connection endpoint, only the part of the connection belonging to this connection endpoint can be diagnosed.
- If there is an online connection to both connection endpoints, both parts of the connection (and therefore the entire connection) can be diagnosed.

### Basic connections diagnostics options

Connection diagnostics can be performed as follows:

- Using icons on the connection status display  
This display is generated in the connection table.
- Through detailed connection diagnostics  
This step is available in the "Diagnostics > Connection information" area of the Inspector window.

### Requirement for the connection diagnostics described below

You can display the details of either all the communication connections created in the project (default) or selected communication connections in the connection table.

The connection diagnostics described in the following assume that you display the details of selected communication connections. To do this, clear the "Show all connections" option in the shortcut menu.

#### 8.2.2.2 Displaying the connection status using icons

##### Content of connection table without an online connection

- For a CPU or CP, the connection table lists the communication connections (including properties) configured offline, if an online connection is not established.

##### Content of connection table with an online connection

After the online connection has been established, the properties of the communication connections listed offline will be expanded to include diagnostics icons for the connection status ("Online status" column).

In addition, entries for all communication connections that exist online only (e.g., connections for the instructions for Open User Communication, programming device and OP connections, connections for web server access) will now be added to the connection table.

For connections that exist online or offline only, the diagnostics icon at the bottom right is combined with a smaller additional comparison status icon.

### Diagnostics icons for communication connections

The following table shows the diagnostics icons for communication connections.

Icon	Meaning
	Connection setup
	Connection not setup / is being setup
	Connection not available

## Diagnostics icons for the comparison status

The diagnostic icons for communication connections can be combined at the bottom right with additional smaller icons that indicate the result of the online/offline comparison. The following table shows the available comparison icons and their meaning.

Icon	Meaning
	Connection exists online only
	Connection exists offline only

### 8.2.2.3 Detailed connection diagnostics

#### Detailed connection diagnostics - overview

#### Where do I perform detailed connection diagnostics?

To perform detailed connection diagnostics, go to the "Diagnostics > Connection" information of the Inspector window.

#### How do I open the "Diagnostics > Connection information" area of the Inspector window?

The following options are available for opening the "Connection information" tab of the Inspector window.

- Select the line of the relevant connection in the connection table. Click the "Diagnostics" and "Connection information" tabs one after the other in the Inspector window.
- Double-click the diagnostics icon of the relevant connection in the connection table.
- This step takes you to the programming editor for a S7 communication instruction or open user communication instruction. Double-click the diagnostic icon of the instruction (stethoscope).

#### Structure of the "Diagnostics > Connection information" area of the Inspector window

Requirements: the content of the "Connection information" tab has been filled, and an online connection to at least one end point of the relevant connection has been established.

If a module has been selected (network view), the tab will contain the following group:

- Connection resources (for S7-1200 and S7-1500)

If a connection has been selected (connection table), it will contain the following groups:

- Connection details
- Address details of the connection (for S7-1200 and S7-1500)

## Determining online connection resources for S7-1200

### Where do you determine the online connection resources?

The online connection resources are obtained in the "Connection resources" group. This group is located in the "Diagnostics > Connection information" area of the Inspector window. It is displayed only if you have selected a module in the network view to which an online connection exists.

### Number of connection resources

- **Maximum number:** Specifies the maximum number of available connection resources of the module.
- **Not assigned:** Indicates how many connection resources are not yet assigned. If connection resources are already reserved for certain types of communication, then the unreserved connection resources cannot always be used for the various connection types.

### Reserved and currently assigned connection resources

For the communication types indicated below, the connection resources that are reserved and currently assigned by the module will be displayed.

Communication type	Meaning
PG communication	Resources for connections between the module and programming devices (for example, for the establishment of a connection from the project tree, for online diagnostics, etc.)
HMI communication	Resources for connections between the module and HMI devices
Open User Communication	Resources for connection of open user communication instructions
S7 communication	Resources for configured S7 connections, through which data can be exchanged by calling instructions in the user program.
Other communication	Specifies other assigned connection resources for which connection resources are not reserved.

## Determining online connection resources for S7-1500

### Where do you determine the online connection resources?

The online connection resources are obtained in the "Connection resources" group. This group is located in the "Diagnostics > Connection information" area of the Inspector window. It is displayed only if you have selected a module in the network view to which an online connection exists.

## **Description of the detailed display of the connection resources**

The detailed display of the connection resources includes:

- Number of available connection resources
- Number of configured connection resources
- Number of connection resources still available

For a description of these, go to [here](#) .

## **Determining connection details**

### **Where do I determine the connection details?**

The connection details are obtained in the "Connection details" group. This group is located in the "Diagnostics > Connection information" area of the Inspector window.

### **When is the "Connection details" group filled in?**

The following requirements must be met to fill in the "Connection details" group on the "Connection information" tab:

- An online connection to the end point of the relevant connection must exist.
- You have selected a line in the connection table.

### **Structure of the "Connection details" group**

The "Connection details" group consists of the following elements:

- Local ID (hex)
- Connection type (for S7-1200 and S7-1500)
- Protocol
- Connection status: icon and description
- Details
- Last status change (for S7-300 and S7-400 only)

## **Determining the address details of a connection**

### **Where do I determine the address details of a connection?**

The address details of a connection are obtained in the "Connection address details" group. This group is located in the "Diagnostics > Connection information" area of the Inspector window.

### **For which CPUs is the "Connection address details" group available?**

The "Connection address details" group of the "Connection information" tab is available for S7-1200 and S7-1500 CPUs.

### **When is the "Connection address details" group filled in?**

The following requirements must be met to fill in the "Connection address details" group on the "Connection information" tab:

- An online connection to the end points of the relevant connection must exist.
- You have selected a line in the connection table.

### **Structure of the "Connection address details" group**

The address details relevant to the connection type are specified for the two communication partners.

# Programming the PLC

## 9.1 Creating the user program

### 9.1.1 Programming basics

#### 9.1.1.1 Operating system and user program

##### Operating system

###### Function

The operating system is contained in every CPU and organizes all CPU functions and sequences that are not associated with a specific control task.

The tasks of the operating system, for example, include the following:

- Processing a warm restart
- Updating the process image of the inputs and outputs
- Calling the user program
- Detecting interrupts and calling interrupt OBs
- Detecting and handling errors
- Managing memory areas

The operating system is a component of the CPU and is already installed there upon delivery.

###### See also

User program (Page 1201)

##### User program

###### Function

The user program contains all functions that are necessary for processing your specific automation task.

The tasks of the user program include:

9.1 Creating the user program

- Checking the requirements for a (warm) restart using startup OBs, for example, limit switch in correct position or safety relay active.
- Processing process data, e.g. linking binary signals, reading in and evaluating analog values, defining binary signals for output, and outputting analog values
- Reaction to interrupts, for example, diagnostic error interrupt if the limit value of an analog expansion module is overshoot.
- Error handling in normal program execution

You write the user program and load it into the CPU.

See also

Operating system (Page 1201)

9.1.1.2 Blocks in the user program

Linear and structured programming

Linear programming

Solutions for small automation tasks can be programmed linearly in a program cycle OB. This is only recommended for simple programs.

The following figure shows a linear program schematically: The "Main1" program cycle OB contains the complete user program.

Structured programming

Complex automation tasks can be more easily handled and managed by dividing them into smaller sub-tasks that correspond to the technological functions of the process or that can be reused. These sub-tasks are represented in the user program by blocks. Each block is then an independent section of the user program.

Structuring the program offers the following advantages:

- Extensive programs are easier to program through the structure.
- Individual program sections can be standardized and used repeatedly with changing parameters.
- Program organization is simplified.
- Changes to the program can be made more easily.
- Debugging is simplified since separate sections can be tested.
- Commissioning is simplified.

The following figure shows a structured program schematically: The "Main1" program cycle OB calls subprograms one after the other that execute defined subtasks.

## Overview of the block types

### Block types

Different BLOCK types are available to perform tasks within an automation system. The following table shows the available block types:

Block type	Brief description
Organization blocks (Page 1204) (OB)	Organization blocks define the structure of the user program.
Functions (Page 1204) (FC)	Functions contain program routines for recurring tasks. They have no "memory".
Function blocks (Page 1205) (FB)	Function blocks are code blocks that store their values permanently in instance data blocks, so that they remain available even after the block has been executed.
Instance data blocks (Page 1207)	Instance data blocks are assigned to a function block when it is called for the purpose of storing program data.
Global data blocks (Page 1206)	Global data blocks are data areas for storing data that can be used by any blocks.

## Organization blocks (OB)

### Definition

Organization blocks (OBs) form the interface between the operating system and the user program. They are called by the operating system and control, for example, the following operations:

- Startup characteristics of the automation system
- Cyclic program processing
- Interrupt-driven program execution
- Error handling

You can program the organization blocks and at the same time determine the behavior of the CPU. Various organization blocks are available to you depending on the CPU used.

For more information on organization blocks, refer to the descriptions of the modes of operation of CPUs in the "Additional information on configurations" chapter in "Configuring Hardware and Networks".

### Start information of organization blocks

When certain organization blocks are started, the operating system provides information that can be evaluated in the user program. Refer to the descriptions of the organization blocks to find out which information is provided, if any.

### See also

Creating organization blocks (Page 1390)

## Functions (FCs)

### Definition

Functions (FCs) are code blocks without memory. You have no data memory in which values of block parameters can be stored. Therefore, when a function is called, all formal parameters must be assigned actual parameters.

Functions can use global data blocks to store data permanently.

### Application

A function contains a program that is executed when the function is called by another code block. Functions can be used, for example, for the following purposes:

- To return function values to the calling block, e.g. for mathematical functions
- To execute technological functions, e.g. individual controls using bit logic operations

A function can also be called several times at different points in a program. As a result, they simplify programming of frequently recurring functions.

---

**Note****Parameter transfer when calling functions**

To avoid errors when working with functions, observe the information in chapter "Auto-Hotspot".

---

**See also**

Creating functions and function blocks (Page 1391)

**Function blocks (FB)****Definition**

Function blocks are code blocks that store their input, output and in-out parameters permanently in instance data blocks, so that they remain available even after the block has been executed. Therefore they are also referred to as blocks "with memory".

Function blocks can also operate with temporary tags. Temporary tags are will not be stored in the instance DB, but are available for one cycle only.

**Application**

Function blocks contain subroutines that are always executed when a function block is called by another code block. A function block can also be called several times at different points in a program. As a result, they simplify programming of frequently recurring functions.

**Instances of function blocks**

A call of a function block is referred to as an instance. An instance data block is required for each instance of a function block; it contains instance-specific values for the formal parameters declared in the function block.

The function block can store its instance-specific data in its own instance data block or in the instance data block of the calling block.

## Access modes

S7-1200 and S7-1500 offer two different access options for the instance data blocks, which can be assigned to a function block when this is called:

- Data blocks with optimized access  
Data blocks with optimized access have no firmly defined memory structure. The data elements contain only a symbolic name in the declaration, no fixed address within the block.
- Data blocks with standard access (compatible with S7-300/400)  
Data blocks with standard access have a fixed memory structure. The declaration elements contain both a symbolic name in the declaration and a fixed address within the block.

---

### Note

To avoid errors when working with function blocks, refer to the section "Auto-Hotspot".

---

## See also

Creating functions and function blocks (Page 1391)

Multi-instances (Page 1217)

Instance data blocks (Page 1207)

Basics of block access (Page 1209)

## Global data blocks (DB)

### Definition

Data blocks are used to store program data. Data blocks thus contain variable data that is used by the user program. Global data blocks store data that can be used by all other blocks.

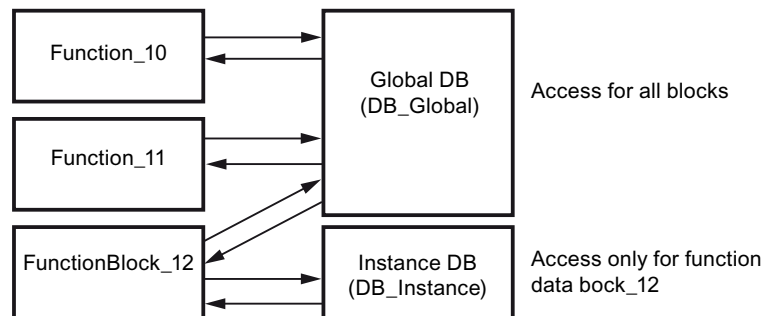

The maximum size of data blocks varies depending on the CPU. You can define the structure of global data blocks anyway you please.

You also have the option of using PLC data types (UDT) as a template for creating global data blocks.

### Global data blocks in the user program

Every function block, function, or organization block can read the data from a global data block or can itself write data to a global data block. This data remains in the data block even after the data block is exited. A global data block and an instance data block can be open at the same time.

The following figure shows the different accesses to data blocks:

## Access modes

S7-1200 and S7-1500 offer two different access options for global data blocks:

- Data blocks with optimized access  
Data blocks with optimized access have no fixed defined structure. In the declaration, the data elements are assigned only a symbolic name and no fixed address within the block.
- Data blocks with standard access (compatible with S7-300/400)  
Data blocks with standard access have a fixed structure. In the declaration, the data elements are assigned both a symbolic name and a fixed address within the block.

## ARRAY data blocks (S7-1500)

ARRAY data blocks are a particular type of global data block. These consist of an ARRAY of any data type. For example, an ARRAY of a PLC data type (UDT) is possible. The DB contains no other elements besides the ARRAY. Because of their flat structure, ARRAY data blocks facilitate access to the ARRAY elements and their transfer to called blocks.

The "Optimized block access" attribute is always enabled for ARRAY data blocks. ARRAY data blocks with standard access are not possible.

The "Move operations" section of the "Instructions" task card offers options for addressing of ARRAY DBs.

## See also

Creating data blocks (Page 1392)

Basics of block access (Page 1209)

## Instance data blocks

### Definition

The call of a function block is referred to as an instance. The data with which the instance works is stored in an instance data block.

The maximum size of instance data blocks varies depending on the CPU. The tags declared in the function block determine the structure of the instance data block.

### Access modes

S7-1200 and S7-1500 offer two different access options for the instance data blocks, which can be assigned to a function block when this is called:

- Data blocks with optimized access  
Data blocks with optimized access have no firmly defined structure. The declaration elements contain only one symbolic name in the declaration, and no fixed address within the block.
- Data blocks with standard access (compatible with S7-300/400)  
Data blocks with standard access have a fixed structure. The declaration elements contain both a symbolic name in the declaration and a fixed address within the block.

See also: Auto-Hotspot

### See also

Creating data blocks (Page 1392)

Basics of block access (Page 1209)

### CPU data blocks

#### Definition

CPU data blocks are generated by the CPU at runtime. To this purpose, insert the "CREATE\_DB" instruction into your user program. You can use the data block that is generated at runtime to save your data.

CPU data blocks are indicated by means of a small CPU icon in the "Program blocks" folder of an available node. You can monitor the values of the variables of a CPU data block in online mode, similar to those of a different data block type.

You cannot create CPU data blocks in your offline project.

#### Loading CPU data blocks

The CPU data block that the user program has generated by means of the "CREATE\_DB" instruction is initially only available on the device in online mode. All CPU data blocks will be included with the other blocks the next time you perform a complete download from the device to the project. The CPU data blocks are marked with a small CPU icon in the process. However, you cannot upload these CPU data blocks to your device again.

## Restrictions on CPU data blocks in the project

Once the CPU data blocks have been loaded into your offline project, you can open and view their content. However, note that the CPU data blocks in the project are write-protected. The CPU data blocks in the project are therefore subject to the following restrictions:

- You cannot edit CPU data blocks, or convert these into a different data block type.
- CPU data blocks cannot be assigned a know-how protection.
- You cannot change the programming language of a CPU data block.
- CPU data blocks cannot be compiled or downloaded to a device.

## Comparing CPU data blocks

Once the CPU data blocks have been loaded into your offline project, you can run an online/offline comparison for the CPU DBs loaded. The comparison editor provides you with a corresponding overview of the differences. It is possible to synchronize the online and off-line version of CPU data blocks if differences are found, but not by downloading the offline version to the device.

## Deleting CPU data blocks

You can delete CPU data blocks both from the project and from the CPU.

## Blocks with optimized access

### Basics of block access

#### Introduction

STEP 7 offers data blocks with different access options:

- Data blocks with optimized access (S7-1200/S7-1500)
- Data blocks with standard access (S7-300 / S7-400 / S7-1200 / S7-1500)

Within one program you can combine the two types of blocks.

#### Data blocks with optimized access

Data blocks with optimized access have no fixed defined structure. In the declaration, the data elements are assigned only a symbolic name and no fixed address within the block. The elements are saved automatically in the available memory area of the block so that there are no gaps in the memory. This makes for optimal use of the memory capacity.

### 9.1 Creating the user program

Tags are identified by their symbolic names in these data blocks. To address the tag, enter its symbolic name. For example, you access the "Fill Level" tag in the "Data" DB as follows:

```
"Data".Fill Level
```

Blocks with optimized access offers the following advantages:

- You can create data blocks with any structure without paying attention to the physical arrangement of the individual data elements.
- Quick access to the optimized data is always available because the data storage is optimized and managed by the system.
- Access errors, as with indirect addressing or from the HMI, for example, are not possible.
- You can define specific individual tags as retentive.
- Optimized blocks are equipped with a memory reserve by default which lets you expand the interfaces of function blocks or data blocks during operation. You can download the modified blocks without setting the CPU to STOP and without affecting the values of already loaded tags.

---

#### Note

The "Optimized block access" attribute is always enabled for the following blocks and cannot be deselected.

- GRAPH blocks
  - ARRAY data blocks
- 

### Data blocks with standard access

Data blocks with standard access have a fixed structure. In the declaration, the data elements are assigned both a symbolic name and a fixed address within the block. The address is shown in the "Offset" column.

Tags in these data blocks can be addressed in both symbolic and absolute form.

```
"Data".Fill Level
```

```
DB1.DBW2
```

### Setting Retentivity for Optimized Access or Standard Access

If you define data as retentive, its values are retained even after a power failure or a network off. A retentive tag is not initialized after the hot restart but retains the value it had prior to the power failure. If a DB tag is defined as retentive, it is stored in the retentive memory area of the data block.

The options for setting the retentivity depend on the access type of the block.

- In data blocks with standard access, you cannot set the retentive behavior of individual tags. The retentivity setting is valid for all tags of the data block.
- In data blocks with optimized access you can define the retentive behavior of individual tags.  
For structured data type tags, the retentivity setting always applies to the entire structure. You cannot make any individual retentivity setting for separate elements within the data type.

### Setting Addressing Options for Optimized Access or Standard Access

Blocks with optimized access permit only "type-safe" access. Type-safe access addresses tags by their symbolic name only. This means even changes to the block or the block interface will not result in inconsistencies in the program or access errors.

The following table shows the permitted addressing options for optimized data:

Addressing	Block with standard access	Block with optimized access
Symbolic addressing	x	x
Indexed addressing of ARRAYS		x
Slice access	x	x
Overlapping with AT	x	-
Absolute addressing	x	-
Indirect addressing via ANY	x	-
Indirect addressing via POINTER and VARIANT	x	with symbolic notation only

### Setting up block access

#### Introduction

Block access is set up automatically when you create a block:

- Blocks created on CPUs of the S7-1200/1500 product range provide optimized access by means of a default setting.
- New blocks created on CPUs of the S7-300/S7-400 product range provide standard access by means of a default setting.

Access to a block that you copy or migrate to a CPU of a different product range is not converted automatically. However, in certain situations it may be useful to change block access in manual mode, e.g., in order to utilize the full functional scope of the CPU.

In most cases, you will have to recompile and load the program after block access has been converted.

**NOTICE**

**Optimized block access for GRAPH blocks**

The "Optimized block access" attribute is always enabled for GRAPH blocks in S7-1500 and cannot be deselected.

**Procedure**

To set the block access, proceed as follows:

1. Open the "Program blocks" folder in the project tree.
2. Right-click on the block whose block access you want to change.
3. Select the "Properties" command in the shortcut menu.  
The properties dialog box of the block opens.
4. Click "Attributes" in the area navigation.
5. Enable or disable the "Optimized block access" option.
6. Confirm your entries with "OK".

**Restrictions and special features**

As a matter of principle, you can only convert block access on CPUs of the S7-1200/1500 product range, as only these support the "optimized" access mode.

The following restrictions or special features apply in this context:

- Instance data blocks  
The block access of instance data blocks is always determined by the assigned function block and cannot be changed in manual mode. If you change the access mode on a function block, you also need to update the assigned instance data blocks. This update procedure adapts the access mode of the instance data block.
- System blocks and know-how protected blocks  
You cannot manually edit the block access for system blocks and know-how protected blocks.
- Organization blocks  
The start information of an OB with standard access is always stored in the first 20 bytes of the "Temp" section in the block interface. By contrast, the start information of an OB with optimized access is always written to the "Input" section. For this reason, the block interface of OBs will also change whenever you convert block access. Additional information is provided in the following sections.

**Converting block access from "standard" to "optimized".**

A block copied from the CPU of the S7-300/400 product range to a CPU of the S7-1200/1500 product range will initially retain the "standard" access mode. However, you can significantly

increase the performance of program execution by using blocks with optimized access, which is why it may be useful to modify the access mode manually.

The blocks are adapted as follows in the course of conversion:

- **Function blocks**  
All interface parameters are assigned the "Non-retain" retentivity setting.
- **Global data blocks**  
The retentivity setting that was assigned centrally to the entire data block is transferred to the individual interface parameters. It is now possible to manipulate the retentivity setting of the various parameters.  
However, the following rule will still apply: For structured data type tags, the retentivity setting always applies to the entire structure. You cannot assign separate retentivity settings to the various elements within a structured data type. It therefore follows that you cannot assign individual retentivity settings to the tags of data blocks that are based on PLC data types.
- **Organization blocks**  
All interface parameters that are stored in the first 20 bytes of the "Temp" section will be deleted. New CPU-specific start information is entered in the "Input" section. Naming conflicts with user-defined interface parameters occurring in the process are resolved by renaming the user-defined interface parameters.

**CAUTION**

**The conversion of the block access has the following consequences:**

- Absolute addressing of the interface parameters of the block is no longer possible after conversion of block access to the "optimized mode."  
Example: #L0.1 is no longer valid.
- Since conversion to the "optimized" block access mode of organization blocks also modifies the OB interface,

you may possibly have to adapt, recompile and load the program again due to these changes.

See also: Auto-Hotspot

### Converting block access from "optimized" to "standard".

If you want to copy or move a block from the CPU of the S7-300/400 product range to a CPU of the S7-1200/1500 product range, you first need to set the "standard" access mode.

The blocks are adapted as follows in the course of conversion:

- Function blocks and global data blocks.  
You can no longer set a retentivity in the function block. The corresponding setting is made in the instance data block.  
All interface parameters in the instance DB or global DB are assigned the same retentivity setting. The conversion is subject to the following rule:
  - If all interface parameters in the original block were retentive, the entire block will be retentive after conversion.
  - If all interface parameters in the original block were non-retentive, the entire block will be non-retentive after conversion.
  - If the interface parameters in the original block had different retentivity settings, the entire block will be non-retentive after conversion.
- Organization blocks  
All interface parameters stored in the "Input" section will be deleted. New CPU-specific start information is entered in the "Temp" section. This data is written to the first 20 bytes. Naming conflicts with user-defined interface parameters occurring in the process are resolved by renaming the user-defined interface parameters.

 <b>CAUTION</b>
<b>The conversion of the block access has the following consequences:</b> Since a conversion to "standard" block access mode might change the retentivity settings of the interface parameters, you may possibly have to adapt, recompile and load the program again due to these changes. **9.1.1.3 Block calls**

**Principles of block calls**

**Function of block calls**

For your blocks to be executed in the user program, they need to be called from another block. When one block calls another block, the instructions of the called block are executed. Only when execution of the called block has been completed does execution of the calling block resume. The execution is continued with the instruction that follows on the block call.

The following figure shows the sequence of a block call within a user program:

## Parameter transfer

When a block is called, you must assign values to the parameters in the block interface. By providing input parameters you specify the data with which the block is executed. By providing the output parameters you specify where the execution results are saved.

## See also

Call hierarchy (Page 1215)

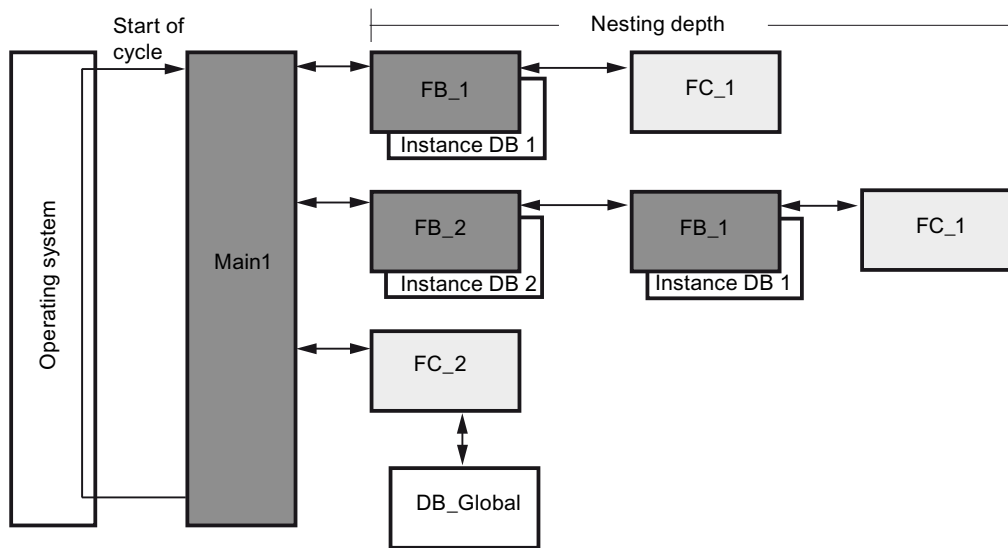

Principles for single instances and multi-instances (Page 1216)

## Call hierarchy

### Definition

The order and nesting of block calls is referred to as the call hierarchy. The permissible nesting depth depends on the CPU.

The following figure shows an example of the order and nesting of block calls within an execution cycle:

**See also**

Principles for single instances and multi-instances (Page 1216)

Principles of block calls (Page 1214)

**Call function blocks as single or multi-instances**

**Principles for single instances and multi-instances**

**Use of single instances and multiple instances**

Function blocks (FBs) store their data in instance data blocks. Instance data blocks store the values of the block parameters and the static local data of the function blocks.

You can assign instance data blocks as follows:

- Single instance:  
One instance data block for each instance of a function block
- Multiple instance:  
An instance data block for the instance of a function block and all instances of function blocks called in it.

**See also**

Principles of block calls (Page 1214)

Multi-instances (Page 1217)

Single instances (Page 1217)

Call hierarchy (Page 1215)

## Single instances

### Definition

The call of a function block, which is assigned its own instance data block, is called a single instance data block.

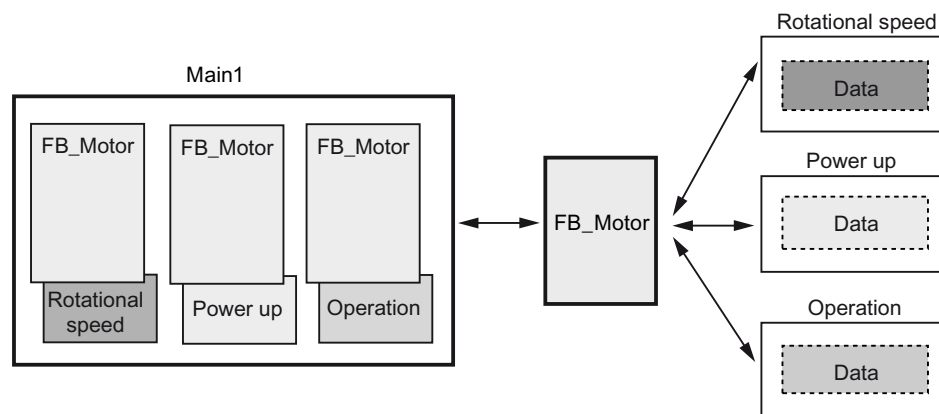

By assignment of the instance data block, you specify where the instance data of the FB is to be stored. By assigning a different instance data block to each call, you can use the same FBs several times with different instance data in each case.

### Example of a single instance

You can control several motors using one function block. For this purpose, you assign a different instance data block for each function block call for motor control.

The different data for the various motors, such as speed, ramp-up time, total operating time, are saved in the different instance data blocks. A different motor will be controlled, depending on the instance data block assigned.

The following figure shows the control of three motors using one function block and three different data blocks:

### See also

Principles for single instances and multi-instances (Page 1216)

Multi-instances (Page 1217)

## Multi-instances

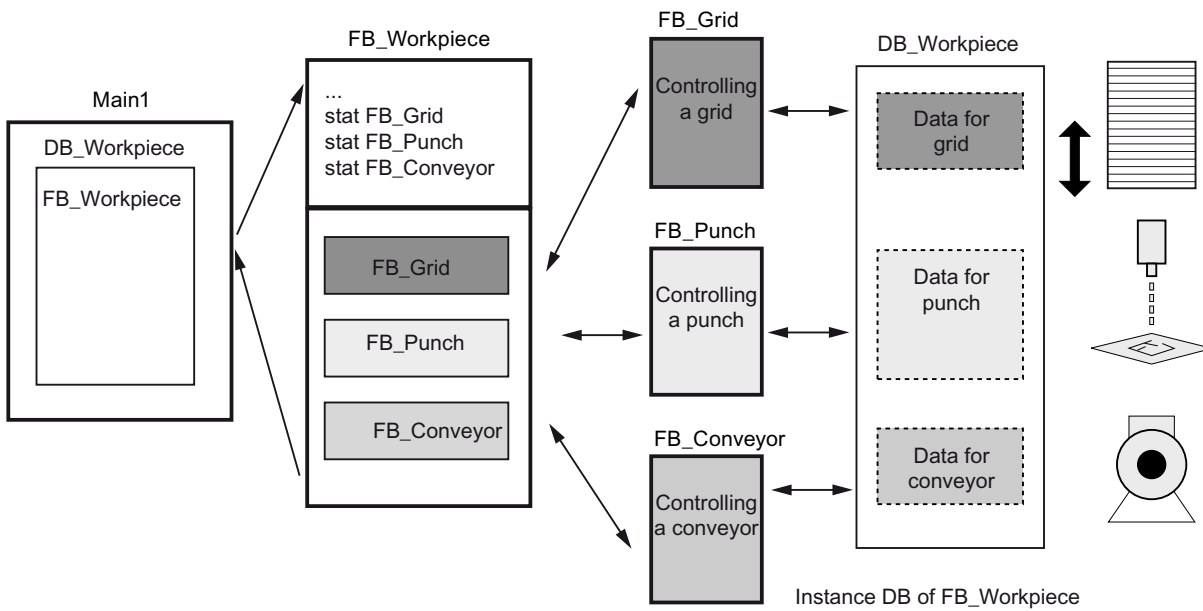

### Definition

Multi-instances enable a called function block to store its data in the instance data block of the calling function block.

This allows you to concentrate the instance data in one instance data block and thus make better use of the number of instance data blocks available.

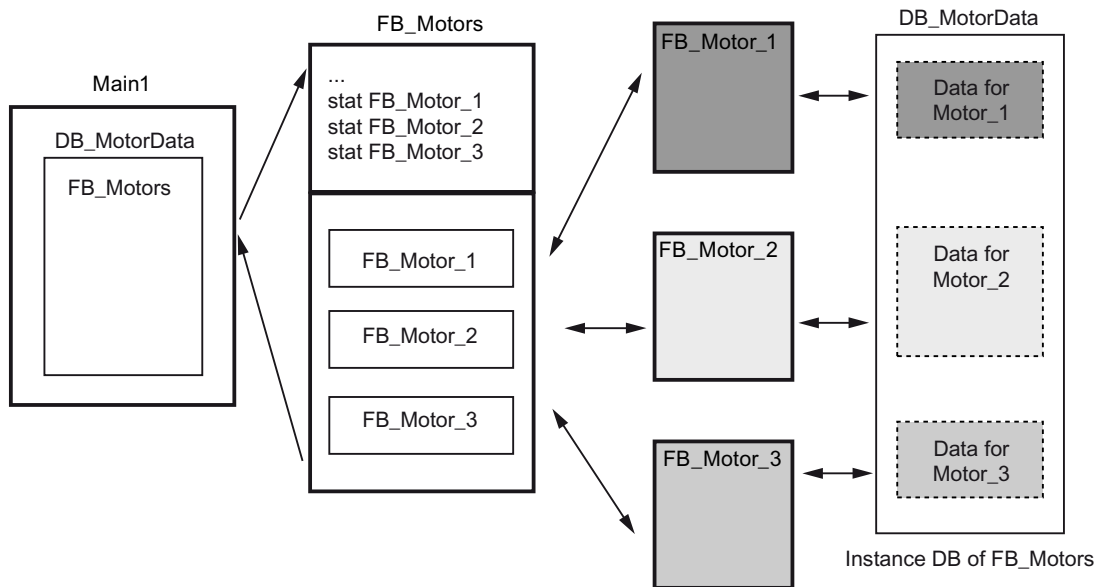

### One instance data block for the instances of different function blocks

The following figure shows how multiple different function blocks store their data in a calling block. The FB\_Workpiece calls the following one after the other: FB\_Grid, FB\_Punch and FB\_Conveyor. The called blocks store their data in the DB\_Workpiece, the instance data block of the calling block.

## One instance data block for multi-instances of a function block

The following figure shows how a function block that is called in multi-instances stores the data for all the instances in one instance data block.

The function block `FB_Motors` calls three instances of the `FB_Motor`. The instances are "Motor\_1", "Motor\_2" and "Motor\_3". Each call uses different instance data. However, all instance data are located in a single instance data block, `DB_MotorData`.

Single instances (Page 1217)

## Parameter transfer at block call

### Basics of block parameters

#### Introduction

The calling block gives the called block the values with which it is to work. These values are referred to as block parameters. The input parameters provide the called block with the values that it has to process. The block returns the results via the output parameters.

Block parameters are therefore the interface between the calling and the call block.

You use input parameters when you want to only query or read values, and output parameters when you want to set or write these values. If block parameters are read and written you have to create these as in-out parameters.

## Formal and actual parameters

The block parameters are defined in the interface of the called block. These parameters are referred to as formal parameters. They are placeholders for the parameters that are transferred to the block when it is called. The parameters transferred to the block when it is called are referred to as actual parameters.

## Rules for using the block parameters

The following rules apply to the use of block parameters within the block:

- Input parameters may only be read.
- Output parameters may only be written.
- In/out parameters may be read and written.

General rules for assigning parameters (Page 1220)

Using tags within the program (Page 1237)

Keywords (Page 1231)

## Supplying block parameters during call

## General rules for assigning parameters

### Introduction

When you call a block with block parameters, assign actual parameters to its formal parameters. The rules described below apply here.

### Compatible data types

The data types of actual and formal parameters must be identical or convertible according to the rules of data type conversion.

### Transferring ARRAYS

You can transfer ARRAYS as parameters. If a block has an input parameter of ARRAY type, you must transfer as actual parameter an ARRAY with identical structure. You can also transfer individual elements of an ARRAY as actual parameter if the element corresponds to the data type of the formal parameter.

## Transferring PLC data types

You can also transfer tags that are declared as PLC data type as actual parameters. If the formal parameter is declared as PLC data type in the tag declaration, you must transfer a tag that has the same PLC data type as actual parameter.

An element of a tag declared by means of PLC data type can also be transferred as actual parameter at block call, provided that the data type of the element of the tag matches the data type of the formal parameter.

## Transferring structures (STRUCT)

You can transfer structures as parameters. If a block has an input parameter of the STRUCT type, you must transfer as actual parameter a STRUCT with identical structure. This means that the names and data types of all structure components have to be identical.

You can also transfer individual elements of an STRUCT as actual parameter if the element corresponds to the data type of the formal parameter.

---

### Note

We recommend programming structures as PLC data types. PLC data types make programming easier, since they can be used multiple times and modified centrally.

---

## See also

Parameter assignment to function blocks (Page 1223)

Parameter assignment to functions (Page 1221)

Basics of block parameters (Page 1219)

## Parameter assignment to functions

### Parameters of functions (FC)

Functions have no data memory in which values of block parameters can be stored. Therefore, when a function is called, all formal parameters must be assigned actual parameters.

### Input parameters (Input)

Input parameters are read only once per cycle, namely before the block call. Therefore, the rule is that writing an input parameter within the block does not affect the actual parameter. Only the formal parameter is written.

### Output parameters (Output)

Output parameters are read only once per cycle, namely after the block call. Therefore, the rule is that output parameters should not be read within the block. If you nevertheless read an

### 9.1 Creating the user program

output parameter, please note that only the value of the formal parameter is read. The value of the actual parameter cannot be read within the block.

If an output parameter of a function is not written in this function, the value that is predefined for the specified data type is used. For example, the value "false" is predefined for BOOL. However, structured output parameters are not pre-assigned with a value.

To prevent unintentional further processing of the predefined value or an undefined value, note the following when programming the block:

- Make sure that the output parameters are written with values for all possible program paths within the block. In doing so, note that jump commands may skip instruction sequences in which outputs are set, for example.
- Note that the set and reset commands are dependent on the result of the logic operation. If the value of an output parameter is determined with these commands and RLO = 0, a value will not be generated.
- If possible, assign a default value for the output parameters of functions.

#### In/out parameters (InOut)

In/out parameters are read before the block call and written after the block call. If you read or write the parameter within the block, you only access its formal parameter.

An exception is in/out parameters with a structured data type. Structured data types consist of several data elements, for example ARRAY or STRUCT. These are passed to the called block through a POINTER. You therefore always access the actual parameter when you read or write a structured in/out parameter within a block.

When an in/out parameter of a function is not written to this function, the old output value or the input value is used as a value. Nevertheless, you should observe the information provided above for output parameters so that old values are not inadvertently processed further.

#### Temporary local data (Temp)

Temporary local data is only available within a cycle. It is treated differently depending on the block type:

- **Standard access**  
The following rule applies to code blocks with standard access as well as to all tags with retentivity setting "Set in IDB":  
If you use temporary local data, you have to make sure that the values are written within the cycle in which you want to read them. Otherwise, the values will be random. Temporary data of the STRING data type is an exception: It is automatically pre-assigned the correct length information.
- **Optimized access**  
The following rule applies to code blocks with optimized access:  
If a temporary tag is not written within a function, the value that is predefined for the specified data type is used. For example, the value "false" is predefined for BOOL. Elements of the PLC data types are pre-assigned with the default value that is specified in the declaration of the PLC data type (UDT). ARRAY elements are pre-assigned with the value "0", even if they are used within a PLC data type. Strings are pre-assigned the correct length information.

## Function value (Return)

Functions normally calculate a function value. This function value can be returned to the calling block via the RET\_VAL output parameter. For this, the RET\_VAL output parameter must be declared in the interface of the function. RET\_VAL is always the first output parameter of a function. All data types are permitted for the RET\_VAL parameter except ARRAY and STRUCT, as well as parameter types TIMER and COUNTER.

In the SCL programming language functions can be call directly in an expression. The result of the expression is then formed with the calculated function value. Therefore, the data type ANY is not permitted in SCL for the function value.

## See also

Parameter assignment to function blocks (Page 1223)

Basics of block parameters (Page 1219)

General rules for assigning parameters (Page 1220)

Calling functions (Page 1564)

Examples for calling functions in SCL (Page 1567)

## Parameter assignment to function blocks

### Supplying parameters of function blocks (FB)

In the case of function blocks the parameter values will be stored in the instance data.

If the input, output, or in-out parameters of a function block were not assigned with values, the stored values are used.

In some cases, it is mandatory to specify an actual parameter.

The following table shows which parameters of a function block must be assigned actual parameters:

Parameter	Elementary data type	Structured data type	Parameter type
Input (Input)	optional	optional	required
Output (Output)	optional	optional	required
In-out (InOut)	optional	required	Permitted with S7-1200 only, parameter assignment required
Temporary (Temp)	required S7-1500: Optional with optimized block access	required S7-1500: Optional with optimized block access	required

## Access to block parameters during program execution

### Introduction

Block parameters of functions and function blocks are processed differently during program execution. The type of access varies depending on the CPU family, block type and data type of the block parameter.

We generally distinguish between the two following types of access:

- Parameters are transferred as parameter pointers  
A parameter pointer is transferred to the called block.  
This means that the called block can directly access the operand that is specified as actual parameter. Writing a parameter in the called block results in a change of the actual parameter in the calling block. Read access to a block parameter reads the actual parameter directly.
- Parameters are transferred as copy  
The value of the actual parameter is copied to the temporary data of the called blocks during a block call.  
This means that the called block always works with the value that the actual parameter had at the block call. It cannot directly access the operand that is specified as actual parameter. Writing a parameter in the called block does not result in a change of the actual parameter in the calling block. During read access, the formal parameter and not the actual parameter is accessed.  
The procedure for copying is as follows:
  - Input parameter:  
The value of the actual parameter is copied to the formal parameter of the called blocks during a block call.
  - Output parameter:  
The value of the formal parameter is copied to the actual parameter after leaving the block.
  - In/out parameter:  
The value of the actual parameter is copied to the formal parameter of the called block prior to the block call and copied back to the actual parameter after exiting the function.

### Parameter transfer for elementary data types

The following table shows how the different CPU families transfer block parameters with elementary data type. Elementary data types are, for example, Bool, Int, Byte.

Called block	Actual parameter in the area	S7-300/400	S7-1500
FC	I, Q, M, P, L	Pointer	Pointer
	Partially qualified DB address (e.g. DBW 2)	Pointer	Partially qualified DB addresses are not supported in S7-1500.
	Fully qualified DB address (e.g. "MyDB".value), forwarded parameters of the caller, static parameters of the caller	Copy	Copy
FB	All actual parameters	Copy	Copy

### Parameter transfer for structured data types

The following table shows how the different CPU families transfer block parameters with structured data type. Structured data types are data types that consist of several data elements, e.g. ARRAY or STRUCT.

Called block	Actual parameter in the area	S7-300/400	S7-1500
FC	IN, OUT, InOut	Pointer	Pointer
FB	IN, OUT	Copy	Copy
	InOut	Pointer	Pointer

### Forwarding of block parameters

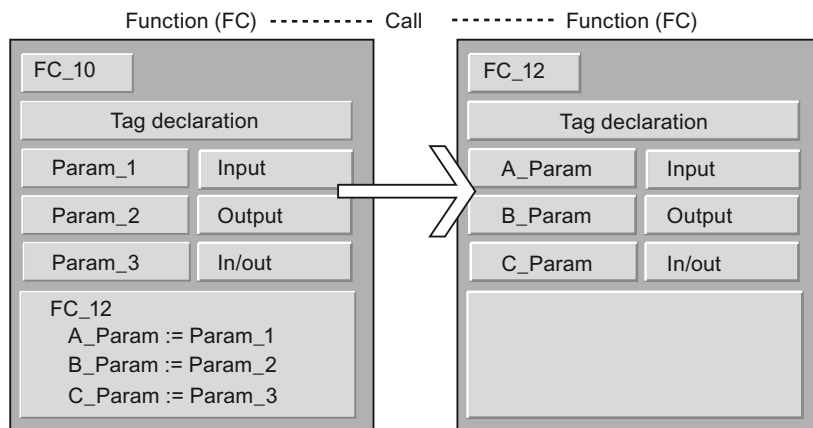

#### Basic information on forwarding block parameters

#### Introduction

#### Definition

The "Forwarding" of block parameters is a special type of parameter use. In this case the block parameters of the calling block are forwarded to the parameters of the called block. The called block uses the values that are currently present at the block parameters of the calling block as the actual parameters.

The following figure shows how the parameters of the function FC\_10 are forwarded to the function FC\_12:

### Rules for LAD/FBD

The following general rules apply in LAD and FBD:

- Input parameters can only be forwarded to input parameters.
- Output parameters can only be forwarded to output parameters.
- In/out parameters can be forwarded to all parameter types.
- In S7-300/400, the two block parameters must have the same data type.
- In S7-1200/1500, the parameters can also be converted according to the rules of implicit conversion.

### Rules for STL

The following general rules apply in STL:

- Input parameters can only be forwarded to input parameters.
- Output parameters can only be forwarded to output parameters.
- In/out parameters can be forwarded to all parameter types.
- Both block parameters must have the same data type. In STL, this rule applies to all CPU families.

### Rules for SCL

The rules for SCL are less stringent. So that programs from previous SCL versions can be taken over more easily, additional parameter transfer options are permissible, but subject to warning. You can, for example, forward an in/out parameter to an input parameter, but a warning is output as the transferred in/out parameter cannot be written by the program.

Additional rules are described in detail in the following chapters.

Basic information on forwarding block parameters (Page 1225)

#### 9.1.1.4 Using and addressing operands

### Basic information about operands

#### Introduction

When you program instructions you must specify which data values the instruction should process. These values are referred to as operands. You can, for example, use the following elements as operands:

- PLC tags
- Constants
- Tags in instance data blocks
- Tags in global data blocks

#### Absolute address and symbolic name

Operands are identified by means of an absolute address and a symbolic name. You define the names and addresses in the PLC tag table or in the tag declaration of the blocks.

#### Data blocks with optimized access (S7-1200, S7-1500)

Data elements in data blocks with optimized access only receive a symbolic name and no absolute address in the declaration. For more information on this, refer to "See also".

#### See also

Displaying symbolic and absolute addresses (Page 1422)

Basics of block access (Page 1209)

#### Keywords

SIMATIC recognizes a range of key words whose definitions are fixed and which have a certain meaning in the program. You should not use these keywords as names for tags or constants.

#### Table of keywords

The following table shows all keywords.

Keywords German mnemonics	Keywords English mnemonics	Description
&	&	And logical operation of logical expressions
A	Q	Output, bit
A1	CC1	Condition code bit

Keywords German mnemonics	Keywords English mnemonics	Description
A0	CC0	Condition code bit
AB	QB	Output, byte
AD	QD	Output, double word
AND	AND	And logical operation of logical expressions
ANY	ANY	Data type, pointer
AR1	AR1	Address Register 1
AR2	AR2	Address Register 2
ARRAY	ARRAY	Introduces the specification of an array and is followed by the index list between "[" and "]"
AT	AT	Overlying tag declaration
AUTHOR	AUTHOR	Name of the author, company name, department name, or other name (max. 8 characters, no spaces)
AW	QW	Output, word
B	B	Byte
BEGIN	BEGIN	Introduces the instruction part for code blocks or initialization part for a data block
BIE	BR	Binary result
BLOCK_FB	BLOCK_FB	Parameter type for specification of an FB
BLOCK_FC	BLOCK_FC	Parameter type for specification of an FC
BLOCK_SDB	BLOCK_SDB	Parameter type for specification of an SDB
BOOL	BOOL	Data type
BY	BY	Increment of the FOR loop
BYTE	BYTE	Data type
CALL	CALL	Call
CASE	CASE	Introduction to the CASE statement
CHAR	CHAR	Elementary data type
CODE_VERSION1	CODE_VERSION1	Label, whether an FB is multiple instance capable or not. If you want to declare multiple instances, the FB must not have this characteristic.
CONST	CONST	Start of the constant declaration
CONTINUE	CONTINUE	Instruction to exit a loop in SCL
COUNTER	COUNTER	Parameter type for specification of a counter
DATA_BLOCK	DATA_BLOCK	Introduces the data block
DATE	DATE	Data type

Keywords German mnemonics	Keywords English mnemonics	Description
DATE_AND_TIME	DATE_AND_TIME	Data type
DB	DB	Data block
DB_ANY	DB_ANY	Data type
DBB	DBB	Data block, data byte
DBD	DBD	Data block, data double word
DBLG	DBLG	Data block length
DBNO	DBNO	Data block number
DBW	DBW	Data block, data word
DBX	DBX	Data block, data bit
DI	DI	Instance data block
DIB	DIB	Instance data block, data byte
DID	DID	Instance data block, data double word
DILG	DILG	Instance data block length
DINO	DINO	Instance data block number
DINT	DINT	Data type
DIW	DIW	Instance data block, data word
DIX	DIX	Instance data block, data bit
DO	DO	Introduction of the instruction part in FOR and WHILE instruction
DT	DT	Data type
DTL	DTL	Data type
DWORD	DWORD	Data type
E	I	Input (via process image), bit
EB	IB	Input (via process image), byte
ED	ID	Input (via process image), double word
ELSE	ELSE	Alternative branch in IF and CASE statement
ELSIF	ELSIF	Alternative condition of the IF instruction
EN	EN	System operand of the EN/ENO mechanism
ENO	ENO	System operand of the EN/ENO mechanism
END_CASE	END_CASE	End of the CASE statement
END_DATA_BLOCK	END_DATA_BLOCK	Ends the data block
END_FOR	END_FOR	End of the FOR statement
END_FUNCTION	END_FUNCTION	Ends the function
END_FUNCTION_BLOCK	END_FUNCTION_BLOCK	Ends the function block
END_IF	END_IF	End of the IF instruction
END_ORGANIZATION_BLOCK	END_ORGANIZATION_BLOCK	Ends the organization block
END_REPEAT	END_REPEAT	End of the REPEAT statement

Keywords German mnemonics	Keywords English mnemonics	Description
END_STRUCT	END_STRUCT	Ends the specification of a structure
END_SYSTEM_FUNCTION	END_SYSTEM_FUNCTION	Ends the system function
END_SYSTEM_FUNCTION_BLOCK	END_SYSTEM_FUNCTION_BLOCK	Ends the system function block
END_TYPE	END_TYPE	Ends the PLC data type
END_VAR	END_VAR	Ends a declaration block
END_WHILE	END_WHILE	End of the WHILE instruction
EW	IW	Input (via process image), word
EXIT	EXIT	Instruction to exit a loop in SCL
FALSE	FALSE	Predefined Boolean constant: Logical condition false, value equal to 0
FAMILY	FAMILY	Block family name: e.g. controller
FB	FB	Function block
FC	FC	Function
FOR	FOR	Introduction of the FOR statement
FUNCTION	FUNCTION	Introduces the function
FUNCTION_BLOCK	FUNCTION_BLOCK	Introduces the function block
GOTO	GOTO	Introduction of the GOTO statement
IF	IF	Introduction of the IF instruction
INSTANCE	INSTANCE	Data type
INT	INT	Data type
KNOW_HOW_PROTECT	KNOW_HOW_PROTECT	Block protection
L	L	Local data bit
LB	LB	Local data byte
LD	LD	Local data double word
LDT	LDT	Data type
LINT	LINT	Data type
LTIME	LTIME	Data type
LTOD	LTOD	Data type
LW	LW	Local data word
LWORD	LWORD	Data type
M	M	Memory bit
MB	MB	Memory byte
MD	MD	Memory double word
MOD	MOD	Modulo operator
MW	MW	Memory word
NAME	NAME	Block name
NETWORK	NETWORK	Network
NOT	NOT	Logic inversion

Keywords German mnemonics	Keywords English mnemonics	Description
NULL	NULL	Zero pointer
OB	OB	Organization block
OF	OF	Introduction of the data type specification / Introduction of the instruction part of the CASE statement
OR	OR	Or logical operation of logical expressions
ORGANIZATION_BLOCK	ORGANIZATION_BLOCK	Introduces the organization block
OS	OS	Save overflow
OV	OV	Overflow
PA	PQ	Output (direct peripherals), bit
PAB	PQB	Output (direct peripherals), byte
PAD	PQD	Output (direct peripherals), double word
PAW	PQW	Output (direct peripherals), word
PE	PI	Input (direct peripherals), bit
PEB	PIB	Input (direct peripherals), byte
PED	PID	Input (direct peripherals), double word
PEW	PIW	Input (direct peripherals), word
POINTER	POINTER	Data type
READ_ONLY	READ_ONLY	Write protection for data blocks
REAL	REAL	Data type
REPEAT	REPEAT	Introduction of the REPEAT statement
RET_VAL	RET_VAL	Return value
RETURN	RETURN	RETURN statement in SCL
S5T	S5T	Syntax for data type S5TIME
S5TIME	S5TIME	Data type
S7_	S7_	Keywords for system attributes
SDB	SDB	System data block
SFB	SFB	System function block
SFC	SFC	System function
SINT	SINT	Data type
STRING	STRING	Data type
STRUCT	STRUCT	Introduces the specification of a structure and is followed by a list of components
STW	STW	Status word
SYSTEM_FUNCTION	SYSTEM_FUNCTION	System function
SYSTEM_FUNCTION_BLOCK	SYSTEM_FUNCTION_BLOCK	System function block
T	T	Time element (timer)

Keywords German mnemonics	Keywords English mnemonics	Description
THEN	THEN	Introduction of the instruction part of an IF instruction
THIS	THIS	Syntax for access to an ARRAY data block
TIME	TIME	Elementary data type for time information
TIME_OF_DAY	TIME_OF_DAY	Data type
TIMER	TIMER	Parameter type for specification of a timer
TITLE	TITLE	Optional block title or network title
TO	TO	Definition of the full-scale value of a FOR statement
TOD	TOD	Data type
TRUE	TRUE	Predefined Boolean constant: Logical condition true, value not equal to 0
TYPE	TYPE	Introduction of the PLC data type
UDT	UDT	Global or PLC data type
UDINT	UDINT	Data type
UINT	UINT	Data type
ULINT	ULINT	Data type
UNLINKED	UNLINKED	Marking 'non runtime-related'
UNTIL	UNTIL	End of the instruction part of a REPEAT statement
USINT	USINT	Data type
UO	UO	Query after (Q1=1) AND (Q0=1)
VAR	VAR	Introduces a declaration block
VAR_IN_OUT	VAR_IN_OUT	Introduces a declaration block
VAR_INPUT	VAR_INPUT	Introduces a declaration block
VAR_OUTPUT	VAR_OUTPUT	Introduces a declaration block
VAR_TEMP	VAR_TEMP	Introduces a declaration block
VARIANT	VARIANT	Data type
VERSION	VERSION	Version number of the block
VOID	VOID	Function has no return value
WCHAR	WCHAR	Data type
WSTRING	WSTRING	Data type
WHILE	WHILE	Introduction of a WHILE instruction
WORD	WORD	Data type
XOR	XOR	Logic operation
Z	C	Counter

## Using tags within the program

### Definition

A variable is a placeholder for a data value that can be changed in the program. The format of the data value is defined. The use of variables makes your program more flexible. For example, you can assign different values to variables that you have declared in the block interface for each block call. As a result, you can reuse a block you have already programmed for various purposes.

A variable consists of the following elements:

- Name
- Data type
- Absolute address
  - PLC tags and DB tags in blocks with standard access have an absolute address.
  - DB variables in blocks with optimized access have no absolute address.
- Value (optional)

### Declaring Variables

You can define variables with different scopes for your program:

- PLC tags that apply in all areas of the CPU
- DB variables in global data block that can be used by all blocks throughout the CPU.
- DB tags in instance data blocks that are predominantly used within the block in which they are declared.

The following table shows the difference between the variable types:

	PLC tags	Variables in instance DBs	Variables in global DBs
Range of application	<ul style="list-style-type: none"> <li>• Are valid throughout the entire CPU.</li> <li>• Can be used by all blocks on the CPU.</li> <li>• The name is unique within the CPU.</li> </ul>	<ul style="list-style-type: none"> <li>• Are predominantly used in the block in which they are defined.</li> <li>• The name is unique within the instance DB.</li> </ul>	<ul style="list-style-type: none"> <li>• Can be used by all blocks on the CPU.</li> <li>• The name is unique within the global DB.</li> </ul>
Permissible characters	<ul style="list-style-type: none"> <li>• Letters, numbers, special characters</li> <li>• Quotation marks are not permitted.</li> <li>• Reserved keywords are not permitted.</li> </ul>	<ul style="list-style-type: none"> <li>• Letters, numbers, special characters</li> <li>• Reserved keywords are not permitted.</li> </ul>	<ul style="list-style-type: none"> <li>• Letters, numbers, special characters</li> <li>• Reserved keywords are not permitted.</li> </ul>
Use	<ul style="list-style-type: none"> <li>• I/O signals (I, IB, IW, ID, Q, QB, QW, QD)</li> <li>• Bit memory (M, MB, MW, MD)</li> </ul>	<ul style="list-style-type: none"> <li>• Block parameters (input, output and in-out parameters),</li> <li>• Static data of a block</li> </ul>	<ul style="list-style-type: none"> <li>• Static data</li> </ul>
Location of definition	PLC tag table	Block interface	Declaration table of the global DB

## Constants

### Basics of constants

### Definition

Constants are data with a fixed value that you cannot change during program runtime. Constants can be read by various program elements during the execution of the program but cannot be overwritten. There are defined notations for the value of a constant, depending on the data type and data format. A distinction is made between the typed and non-typed notation.

### Non-typed constants

In the non-typed notation, you only enter the value of the constant without a data type. Non-typed constants do not receive their type until the first arithmetic or logical operation in which they are used.

The example below shows the non-typed notation:

```
SCL
-----
#My_Int1 := #My_Int2 + 12345      (*The data type of the constant "12345"
                                results from the addition with My_Int 2. "12345"
                                receives the data type INT.*)

#My_Real1 := #My_Real2 + 12345  (*The data type of the constant "12345" results
                                from the addition with My_Real2. "12345"
                                receives the data type REAL.*)
```

### Typed constants

In the typed notation, you specify a data type in addition to the value of the constant.

The example below shows the typed notation:

```
SCL
-----
#My_Int1 := INT#12345            (*The data type of the constant is always
                                INT.*)
```

---

**Note**

**Constants of the BOOL type**

Constants of the BOOL type may not be used as inputs in LAD or FBD in S7-300/400.

---

**Additional information**

Additional information on the data types of constants, their input formats and value ranges:

Data types

**See also**

Layout of the block interface (Page 1433)

**Declaration of symbolic names for constants**

**Symbolic constants**

You have the option of declaring symbolic names for constants and thus making constant values available under a name in the program. This makes a program more readable and easier to maintain when changing constant values.

A symbolic constant consists of the following elements:

- Name
- Data type  
Symbolic constants always have a data type; non-typed notation is not possible for symbolic constants.
- Constant value  
You can select any value from the value range of the specified data type as constant value. For information on the value ranges, refer to the "Data types" chapter.

**Declaration of constants**

You can define constants with different scopes of validity:

- Global constants that apply to all areas of the CPU
- Local constants that only apply within a block

The table below shows the difference between the constant types:

	Global constants	Local constants
Scope of validity	<ul style="list-style-type: none"><li>• Are valid throughout the entire CPU</li><li>• The name is unique within the CPU.</li></ul>	<ul style="list-style-type: none"><li>• Are valid only in the block in which they were declared.</li><li>• The name is unique within the block.</li></ul>
Permitted characters	<ul style="list-style-type: none"><li>• The permitted characters in constant names are letters, digits and special characters.</li></ul>	<ul style="list-style-type: none"><li>• The permitted characters in constant names are letters, digits and special characters.</li></ul>
Location of definition	"Constants" tab from the PLC tag table	Block interface
Representation	In quotation marks, for example.: "Glob_Const"	Prefixed with a number sign, for example: #Loc_Const

**Note**

**Downloading constant declarations (S7-300/400)**

Local and global constant declarations are not downloaded into the CPU. If you download a program from a device, the constant declarations may no longer be available.

**Additional information**

Additional information on the procedure for declaring constants:

Auto-Hotspot

Auto-Hotspot

Auto-Hotspot

**Data types of constants**

**Permitted data types**

For constants, all basic data types as well as all derived data types are permitted:

- Binary numbers
- Bit strings
- Integers
- Floating-point numbers
- Timers
- Date and time
- Character strings

All general rules for explicit and implicit type conversion apply.

## Data types of non-typed constants

Non-typed constants do not contain an explicit type specification. They do not receive their type until the first arithmetic or logical operation in which they are used.

The example below shows how non-typed constants are used:

```
SCL
-----
#My_Int1 := #My_Int2 + 12345      (*The data type of the constant "12345"
                                  results from the addition with My_Int 2. "12345"
                                  receives the data type INT.*)
#My_Real1 := #My_Real2 + 12345   (*The data type of the constant "12345" results
                                  from the addition with My_Real2. "12345"
                                  receives the data type REAL.*)
```

---

### Note

#### STEP 7 always uses the data type with the highest possible precision

Unless the data type of a constant can be clearly defined in an expression, the data type with the highest precision available on the current CPU is used.

Example:

```
#My_Real := #My_Int / 3.5
```

In this expression an integer tag is combined with a non-typed floating point constant. In S7-300/400 the right part of the assignment is calculated in the REAL format. In S7-1200/1500, calculation is performed using the highest possible precision, which in this case means LREAL. As a result, the assignment to a REAL tag is invalid or generates a warning.

To precisely define the data type of a constant, use the typed notation.

Example:

```
#My_Real := #My_Int / REAL#3.5
```

---

## Additional information

Additional information on the data types of constants, their input formats and value ranges:

Data types

## Examples of using constants

### Use in instructions, assignments and expressions

Constants can be used in place of tags in instructions or assignments. You can also use constants in expressions in SCL. But because constants cannot be written, they may only be used as inputs.

The example below shows possible uses of constants:

```
SCL
#My_Int := 3;
#My_Real1 := #My_Real2 * 3;
#My_Real1 := #My_Real2 * #My_local_const;
#My_Real1 := #My_Real2 * "My_global_const";
```

### Use as a default value

You can also use a constant as the default value of a tag. To do so, enter either the value or the symbolic name of the constant in the "Default value" column of the block interface. The data type of the constant must match the data type of the tag or be convertible with it according to the implicit conversion with IEC check.

Name conflicts can occur if you have declared a local and a global constant with the same symbolic name and have used this doubly specified name as the default value of a tag. In this case, the local constant is automatically used.

### Use as an ARRAY limit

Local constants of data type INT or DINT can also be used as ARRAY limits.

The example below shows the use of local constants as ARRAY limits:

```
SCL
Array[My_local_const1..My_local_const1] of REAL
```

---

#### Note

##### Constants as ARRAY limits

Note the following information on the topic of "Constants as ARRAY limits":

- Global constants are not permitted as ARRAY limits.
  - Local constants which are used as ARRAY limits cannot be changed if the memory reserve of the block is activated.
-

## Addressing operands

### Addressing global variables

#### Addressing global variables

To address a global PLC variable, you can use the absolute address or the symbolic name.

---

#### Note

The LWORD, LINT, ULINT, LREAL, LTIME, LTOD and LDT data types can only be addressed by means of their symbolic name.

---

#### Addressing global variables in symbolic form

When you use addressing in symbolic form, you enter the variable name from the PLC tag table. The symbolic name of global variables are automatically enclosed in quotation marks.

You address structured tags that are based on a PLC data type with the symbolic name of the PLC tag. You can also indicate the names of the individual components separated by a dot.

#### Addressing global variables in absolute form

When you use addressing in absolute form, you enter the address of the variables from the PLC tag table. The absolute address uses numerical addresses starting with zero for each operand range. The address identifier % is set automatically as prefix for the absolute address of global tags.

## Examples

The following examples show applications of symbolic and absolute addressing:

Addressing	Description
%Q1.0	Absolute address: Output 1.0
%I16.4	Absolute address: Input 16.4
%IW4	Absolute address: Input word 4
"Motor"	Symbolic address "Motor"
"Value"	Symbolic address "Value"
"Structured_Tag"	Symbolic address of a tag that is based on a PLC data type
"Structured_Tag".Component	Symbolic address of the component of a structured tag.

See also: Permissible addresses and data types of PLC tags (Page 1366)

**See also**

Displaying symbolic and absolute addresses (Page 1422)

Accessing I/O devices (Page 1244)

**Accessing I/O devices**

**Description**

The process image of the CPU is updated once in a cycle. In time-critical applications, however, it can be that the current state of a digital input or output has to be read or transferred more often than once per cycle. For this purpose you can use a suffix for I/O access identifiers on the operand to directly access the I/O.

If you want to read the input directly from the peripherals, use the peripheral inputs memory area (PI) instead of the process input image (I). The peripherals memory area can be read as a bit, byte, word, or double word.

If you want to write directly to the output, use the peripheral output (PQ) memory area instead of the process output image (Q). The peripheral output memory area can be written as a bit, byte, word, or double word.

To read or write a signal directly from a peripheral input, you can add the suffix for I/O access ":P", to the operand.

Components of structured PLC tags can also be addressed with ":P". However, access to the higher-level tag with ":P" is not possible.

 <b>WARNING</b>
<b>Direct writing of the I/O</b>
Immediate writing to the I/O can lead to hazardous states, for example when writing multiple times to an output in one program cycle.

**Syntax**

<Operand>:P

**Example**

The following example shows applications of I/O access identifiers:

Addressing	Description
"Motor"	Addresses the "Motor" tag in the process image.
"Motor":P	Addresses the "Motor" tag in the I/O memory area (PI or PQ).
"Structured_Tag".Component	Addresses the component of a structured PLC tag in the process image.

Addressing	Description
"Structured_Tag".Component:P	Addresses the component of a structured PLC tag in the I/O memory area (PI or PQ).

## See also

Addressing global variables (Page 1243)

## Addressing variables in data blocks

## Addressing variables in global data blocks

### Description

Tags in global data blocks can be addressed in symbolic or absolute form. For symbolic addressing, you use the name of the data block and the name of the tag, separated by a dot. The name of the data block is enclosed in quotation marks.

For absolute addressing, you use the number of the data block and the absolute address of the tags in the data block, separated by a dot. The address identifier % is set automatically as prefix for the absolute address.

The S7-1200/1500 provides you with an option of accessing a data block that is not yet known during programming. For this purpose, create a block parameter of data type DB\_Any in the block interface of the accessing block. The data block name or data block number is transferred to this parameter during runtime. In order to access the internal tags of the data block, use the name of the block parameter of data type DB\_Any and the absolute address of the tag, separated by a dot.

---

### Note

Absolute addressing is not possible for the following tags:

- Tags in blocks with optimized access.
- Tags of data type LWORD, LINT, ULINT, LREAL, LTIME, LTOD and LDT.

Best practice is to use the more convenient symbolic addressing for these tags.

---

## ARRAY data blocks

ARRAY data blocks are a particular type of global data block. These consist of an ARRAY of any data type. For example, an ARRAY of a PLC data type (UDT) is possible.

You address elements in ARRAY data blocks with the help of the keyword "THIS". The index is then specified in square brackets. The index can be a constant as well as a tag. Integers with a width of up to 32 bits are permitted as tags for the index.

Extended options for addressing ARRAY DBs are available in the "Move" section of the "Instructions" task card. These instructions give you the option, for example, to also address the DB name indirectly.

**Syntax**

```
"<DBname>".TagName
%<DBnumber>.absoluteAddress
#<DBAny_name>.%absoluteAddress
"<ArrayDBname".THIS[#i].<Component>.<ComponentElement>
```

**SCL:**

```
"<ArrayDBname". "THIS" [#i].<Component>.<ComponentElement>
```

The following table show the possible absolute addresses of tags in data blocks:

Data type	Absolute address	Example	Description
BOOL	%DBn.DBXx.y	%DB1.DBX1.0	Data bit 1.0 in DB1
BYTE, CHAR, SINT, USINT	%DBn.DBBy	%DB1.DBB1	Data bit 1 in DB1
WORD, INT, UINT	%DBn.DBWy	%DB1.DBW1	Data word 1 in DB1
DWORD, DINT, UDINT, REAL, TIME	%DBn.DBBy	%DB1.DBD1	Data double word 1 in DB1

**Example**

The following examples show the addressing of tags in global data blocks:

Addressing	Description
"Motor".Value	Symbolic addressing of the "Value" tag in the "Motor" global data block.
%DB1.DBX1.0	Absolute addressing of the "DBX1.0" tags in the "DB1" global data block.
#MyDBAny.%DBX30.0	Absolute addressing of the "DBX30.0" tag in the global DB that is transferred at runtime at the "MyDBAny" parameter.
"MyARRAY_DB".THIS[#MyIndex].MyComponent.MyComponentElement	Addressing an ARRAY data block. The ARRAY index is specified with the "MyIndex" tag. The ARRAY element has two additional substructures: "MyComponent" and "MyComponentElement".

## Addressing instance data

### Description

You can address data elements from the interface of the current block. These tags are stored in the instance data block.

---

#### Note

Tags in blocks with optimized access can only be addressed in symbolic form.

---

To address a tag from the interface of the current block, enter the character # followed by the symbolic tag name.

You can also access the tags of a multiple instance block. Within the multiple instance block, also use the character # followed by the tag name to address the data. You access the data of the multiple instance block from the calling block using #<Multiple instanceName.TagName>.

### Syntax

Use the following syntax for addressing tags in instance data blocks:

```
#<TagName>
```

```
#<Multiple instanceName.TagName>
```

### Examples

The following examples show the addressing of tags in instance data blocks:

Addressing	Description
#Value	Addressing the "Value" tag in the instance data block.
#On	Addressing the "On" tag within the multiple instance block
#Multi.On	Addressing the "On" tag of the multiple instance block from the calling block

Basics of indirect addressing (Page 1254)

## Addressing structured variables

### Addressing data elements of an ARRAY

You access an element in an ARRAY using the syntax `ArrayName[i,j,k...]`.

The index of the element is specified in square brackets. The index includes an integer value (-2147483648 ... 2147483647) for each ARRAY dimension.

Access errors result when you access an element during runtime which is located outside the declared ARRAY limits. The various CPU families react differently to violations of the ARRAY limits:

- S7-300/400
  - The CPU changes to "STOP" mode.
  - You can program the program execution error OB (OB 85) to prevent this.
  - In SCL, you also have the option of enabling the attribute "Check ARRAY limits" in the block properties. This causes the enable output ENO to be set to FALSE in the case of ARRAY access errors.
- S7-1200
  - The CPU generates a diagnostic buffer entry and remains in "RUN" mode.
- S7-1500
  - The CPU changes to "STOP" mode.
  - You can program the programming error OB (OB 121) to prevent this.
  - You also have the option of programming the local error handling with the instructions "GET\_ERROR: Get error locally" or "GET\_ERROR\_ID: Get error ID locally".

---

#### Note

##### Monitoring ARRAY access errors with ENO

The enable output ENO is not set to the signal state FALSE if the ARRAY limits are violated during execution of an instruction. The only exception is SCL blocks on CPUs of the S7-300/400 series for which the block property "Check ARRAY limits" is set.

---

See also:

Auto-Hotspot

Indirect indexing of ARRAY components (Page 1256)

### Addressing ARRAY data blocks

ARRAY data blocks are a particular form of the ARRAY. ARRAY data blocks are global data blocks that consist of exactly one ARRAY. You address elements in ARRAY data blocks using the following syntax:

```
"<GlobArrayDBname".THIS[#i].<componentname>."<elementname>"
```

SCL:

```
"<GlobArrayDBname>". "THIS" [#i]. <componentname>. "<elementname>" .
```

The "Move" section of the "Instructions" task card offers extended options for addressing ARRAY DBs. These instructions give you the option, for example, to also address the DB name indirectly.

### Addressing data elements in structures

You access individual elements in a structure using `StructureName.ElementName`.

See also:

Auto-Hotspot

### Addressing data elements of an PLC data type

The syntax `PLCDataTypeName.ElementName` is used to access elements of a PLC data type.

See also:

Auto-Hotspot

### Addressing individual characters of a STRING or WSTRING

Use the syntax `StringName[i]` to access an individual character of a STRING or WSTRING tag. The counting index "i" begins with "1". Thus, you access the first character of the string with `StringName[1]`.

You cannot access individual characters of a STRING or WSTRING constant.

Errors result when you access a character during runtime which is located outside the STRING length. The various CPU families react differently to violations of the STRING length:

- S7-300/400
  - If the instruction has the enable output ENO, ENO is set to the signal state FALSE.
  - If the instruction does not have an enable output ENO, violation of the STRING length is not monitored:  
If access takes place outside the STRING, the wrong memory area is accessed.  
If the access takes place outside the data block, the CPU goes to STOP. You can program the program execution error OB (OB 85) to prevent this.
- S7-1200/1500
  - If the access takes place outside the declared length, the CPU goes to STOP. You can choose whether you want to respond to violations with the global error handling of the CPU or with separate local error handling.
  - If the access is located within the declared STRING length but outside the actual STRING length, violation of the STRING length is not monitored and the CPU does not go to STOP. You receive the character '\$00' or '\$0000' with read access; write access is not executed.  
If the instruction has the enable output ENO, ENO is set to the signal state FALSE.

See also:

Auto-Hotspot

Examples:

The following examples show the addressing of structured data type tags:

Addressing	Description
Motor.Value_1x3[2]	Addressing of a one-dimensional array
Motor.Value_2x4[2,4]	Addressing of a two-dimensional array
Motor.Value_4x7[2,4,1,3]	Addressing of a four-dimensional array
Batch_1.Temperature	Addressing of the element "Temperature" in the structure "Batch_1"
Values.Temperature	Addressing of the "Temperature" element in the "Values" tag, which is based on a PLC data type.
STRING[3]	Addresses the third character of the string.

Basics of indirect addressing (Page 1254)

Addressing areas of a tag with slice access

Description

You have the option to specifically address areas within declared tags. You can access areas of the 1-bit, 8-bit, 16-bit, or 32-bit width. The type of access is referred to as "slice access".

Constants cannot be addressed by slice access.

Syntax

The following syntax is used for addressing:

- <Tag>.X<Bit number>
- <Tag>.B<BYTE number>
- <Tag>.W<WORD number>
- <Tag>.D<DWORD number>

The syntax has the following components:

Part	Description
<Tag>	Tag that you access. The tag must be of the "Bit string" data type. In the case of activated IEC check, the access to tags of the "Integer" data type is also possible.
X	ID for the access width "Bit (1Bit)"
B	ID for the access width "Byte (8 Bit)"
W	ID for the access width "Word (16 Bit)"
D	ID for access width "DWord (32-bit)"
<BIT number>	Bit number within <tag> that is accessed. Number 0 accesses the least significant BIT.
<BYTE number>	Byte number within <tag> that is accessed. The number 0 accesses the least significant BYTE.
<WORD number>	Word number within <tag> that is accessed. The number 0 accesses the least significant WORD.
<DWORD number>	DWord number within <tag> that is accessed. The number 0 accesses the least significant DWORD.

## Examples

The following examples show the addressing of individual bits:

Addressing	Description
"Engine".Motor.X0	"Motor" is a tag of the BYTE, WORD, DWORD or LWORD data type in the global data block "Engine". X0 addresses the bit address 0, X7 the bit address 7 within "Motor".
"Engine".Motor.X7	
"Engine".Speed.B0	"Speed" is a tag of the WORD, DWORD or LWORD data type in the global data block "Engine". B0 addresses the byte address 0, B1 the byte address 1 within "Speed".
"Engine".Speed.B1	
"Engine".Fuel.W0	"FUEL" is a tag of the DWORD or LWORD data type in the global data block "Engine". W0 addresses the word address 0, W1 the word address 1 within "Fuel".
"Engine".Fuel.W1	
"Engine".Data.D0	"Data" is a tag of the LWORD data type in the global data block "Engine". D0 addresses the double word address 0, D1 the double word address 1 within "Data".
"Engine".Data.D1	

## Overlaying tags with AT

### Description

To access data areas within a declared tag, you can overlay the declared tags with an additional declaration. This provides you with the option of addressing an already declared tag with a different data type. You can, for example, address the individual bits of a tag of WORD data type with an ARRAY of BOOL.

**Rules**

The following general rules are valid for tag overlaying:

- Overlaying is possible in S7-1200 and S7-1500 in STL, LAD, FBD and GRAPH.
- SCL supports overlaying in all CPU families.
- Overlaying of tags is possible in the following blocks:
  - In code blocks with standard access
  - In code blocks with optimized access for tags with the retain setting "Set in IDB"
- The data width of the overlaying tag must be equal to or less than that of the overlaid tag.
- It is not possible to overlay tags of the VARIANT and INSTANCE data types.
- Blocks from libraries which are declared as parameters in the interface cannot be overlaid.
- Structured PLC tags that are declared as parameters in the interface cannot be overlaid.

**Note**

**S7-1200/1500: Using AT in FCs**

The data widths of the overlaying tag and the overlaid tag must be identical for FCs in S7-1200/1500. If this is not possible in your program, you can also address areas within existing tags with the .X, .B, .W or .D syntax.

See also: Addressing individual areas of a tag (Page 1250)

The following combination rules are also valid:

		Overlying tag	Overlaid tag			
Elementary	Structured *	Any/Pointer	DB_ANY			
FB	Input	Elementary	x	x		x
		Structured *	x	x	x	x
		Any/Pointer		x		
	Temp	Elementary	x	x		
		Structured	x	x	x	
		Any/Pointer		x		
	Static, Output	Elementary	x	x		x
		Structured	x	x		x
		Any/Pointer				
InOut	Elementary	x			x	
	Structured		x			
	Any/Pointer					
FC	Temp	Elementary	x	x		
		Structured	x	x	x	
		Any/Pointer		x		

		Overlying tag	Overlaid tag			
	Input, Output, InOut	Elementary (both tags must have the same bit width)	x			x
		Structured		x	x	
		Any/Pointer				
OB	Temp	Elementary	x	x		
		Structured	x	x	x	
		Any/Pointer		x		

\* Structured data types consist of several data elements, e.g. ARRAY or STRUCT.

### Declaration

To overlay a tag, declare an additional tag directly after the tag that is to be overlaid and identify it with the keyword "AT".

### Example

The following figure shows the declaration of an overlaid tag in the interface of a FB:

▼ Input		
■ MyByte		Byte
▼ AT	AT "MyByte"	Array [0..7] of Bool
■ AT[0]		Bool
■ AT[1]		Bool
■ AT[2]		Bool
■ AT[3]		Bool
■ AT[4]		Bool
■ AT[5]		Bool
■ AT[6]		Bool
■ AT[7]		Bool

When a block is called with the shown tag declaration, the "MyByte" tag is assigned. Within the block there are now two options for interpreting the data:

- as a byte
- As one-dimensional ARRAY of BOOL

## Addressing operands indirectly

### Basics of indirect addressing

#### Introduction

Indirect addressing offers the option of addressing operands whose address is not calculated until during runtime. With indirect addressing, program sections can be executed several times and a different operand can be used during each run.

 **WARNING**

**Risk of access errors**

Since operands are only calculated during runtime with indirect addressing, there is a risk that access errors may occur and that the program will operate with incorrect values. In addition, memory areas may inadvertently be overwritten with incorrect values. The automation system can then react in unexpected manner.

Therefore, use indirect addressing only with caution.

## Indirect addressing

### Basics of indirect addressing

#### General indirect addressing options in S7-1200 and S7-1500

The following indirect addressing options are available in all programming languages:

- Indirect addressing via pointer
- Indirect indexing of ARRAY components
- Indirect addressing of a data block via DB\_ANY data type.

## Language-specific options of indirect addressing

The following specific addressing options are also available in the various programming languages:

- In STL, you can address operands indirectly via the address register.
- In SCL, you can read or write a variable memory area with the following instructions:
  - POKE - Write memory address
  - POKE\_BOOL - Write memory bit
  - PEEK - Read memory address
  - PEEK\_BOOL - Read memory bit
  - POKE\_BLK - Write memory area

For a detailed description of these addressing options, refer to "See also".

PEEK\_BOOL: Read memory bit (Page 2453)

POKE\_BLK: Write memory area (Page 2458)

Indirect addressing via pointer (Page 1255)

Indirect indexing of ARRAY components (Page 1256)

Indirect addressing in STL (Page 1260)

## Indirect addressing via pointer

### Description

For indirect addressing, a special data format is required that contains the address and possibly also the range and the data type of an operand. This data format is referred to as pointer. The following types of pointers are available to you:

- POINTER (S7-1500)
- ANY (S7-1500, only for blocks with standard access)
- VARIANT (S7-1200/1500)

For more information on the pointer data types, refer to "See also".

---

**Note**

In SCL the use of the POINTER is restricted. The only option available is to forward it to the called block.

---

**Example**

The following example shows an indirect addressing with an area-internal pointer:

Addressing in STL	Explanation
L P#10.0	// Load pointer (P#10.0) in accumulator 1
T MD20	// Transfer pointer to the operand MD20
L MW [MD20]	// Load MW10 in accumulator 1
....	// Any program
L MD [MD20]	// Load MD10 in accumulator 1
....	// Any program
= M [MD20]	// If RLO=1, set the memory bit M10.0

The pointer P#10.0 is transferred to the operand MD20. If the operand MD20 in square brackets is programmed, this will be replaced in runtime by the address that is contained in the pointer.

**See also**

Basics of indirect addressing (Page 1254)

**Indirect indexing of ARRAY components**

**Description**

For addressing the components of an ARRAY, you can specify tags of the integer data type as well as constants as the index. Integers with a length of up to 32 bits are allowed here. When tags are used, the index is calculated during runtime. You can, for example, use a different index for each cycle in program loops.

---

**Note**

When you call a block and transfer an indirectly indexed ARRAY component ("**<Data block>**".**<ARRAY>**["i"]) to it as in/out parameter (InOut), you cannot change the value of the index tag [i] while the block is being executed. The value is therefore always written back to the same ARRAY component from which it was read.

---

## Syntax

The following syntax is used for the indirect indexing of a ARRAY:

```
"<Data block>".<ARRAY>["i"] // one-dimensional ARRAY
"<Data block>".<ARRAY>["i"] // one-dimensional ARRAY of STRUCT
"<Data block>".<ARRAY>["i"] // multidimensional ARRAY
"<Data block>".<ARRAY>["i"] // multidimensional ARRAY of STRUCT
```

The syntax has the following components:

Part	Description
Data block	Name of the data block in which the ARRAY is located
ARRAY	Tag of the ARRAY data type
i, j	PLC tags of the integer data type that are used as pointers
a	Additional partial tag of the structure

## Examples

The following example shows indirect array indexing of an ARRAY component in STL:

Several axes traverse at different angles. The values for axis number and angle are stored in the two-dimensional ARRAY "control\_axis".

You can use the "SEL" instruction to select the components of the "control\_axis" ARRAY to be written at the "#out" output parameter.

The axis number is defined by the constants "Constant\_Axis\_NoX" and "Constant\_Axis\_NoY"; the angle is defined by the "#Angle" tag.

### Addressing in STL

```
CALL SEL
  value_type:=Int
  G := "Select"
  IN0 := #control_axis["Constant_Axis_NoX", #Angle]
  IN1 := #control_axis["Constant_Axis_NoY", #Angle]
  OUT := #out
```

The following examples are based on SCL and demonstrate indirect indexing of an ARRAY component. "MOTOR" is a one-dimensional ARRAY\_of\_INT with three rows. "VALUES" is a PLC tag of data type "Integer".

Addressing in SCL	Explanation
MOTOR[2] := VALUES;	(*Direct addressing: Assignment of VALUES to the second row of the ARRAY MOTOR*)
MOTOR["Tag_1"] := VALUES;	(*Indirect addressing: Assignment of VALUES to the rows of ARRAY MOTOR* specified by "Tag_1")

Addressing in SCL	Explanation
#MOTOR["Tag_2"+"Tag_3"] := #Values;	(*Indirect addressing: Assignment of VALUES to the row of the MOTOR*) ARRAY specified by the expression "Tag_2"+"Tag_3"

The following example shows the indirect indexing of an ARRAY component as an example of LAD. "ARRAY" is a three-dimensional ARRAY. "Tag\_1", "Tag\_2" and "Tag\_3" are PLC tags of the "Integer" data type. Depending on their values, one of the "ARRAY" components will be copied to the "MyTarget" tag.

### Indexing ARRAY components using the "FieldRead" and "FieldWrite" instructions

You may also use the following instructions for indirect indexing of ARRAY components in LAD and FBD:

- FieldWrite - Write field
- FieldRead - Read field

For more information on these instructions, refer to the "References" chapter.

### Additional information

For more information on the ARRAY data type, refer to "See also".

### See also

Basics of indirect addressing (Page 1254)

Addressing structured variables (Page 1248)

### Indirect addressing of individual characters of a STRING

#### Description

For addressing the individual characters of a STRING or WSTRING, you can specify constants and also tags as the index. The tags must be of the Integer data type. When tags are used, the index is calculated during runtime. You can, for example, use a different index for each cycle in program loops.

If you transfer a STRING or WSTRING with variable index to an in/out parameter during a block call, please note that: The index tag [i] is read once at the start of the block call and cannot be changed by the called block while it is being executed.

---

#### Note

##### Monitoring STRING access in runtime

When a STRING or WSTRING that exceeds the defined length is written in runtime, unwanted reactions may occur in the program. Violation of the STRING or WSTRING length is monitored in S7-1200/1500. You can choose whether you want to respond to violations with the global error handling of the CPU or with separate local error handling.

---

## Syntax

The following syntax is used for the indirect indexing of a STRING or WSTRING:

```
"<Data block>".<STRING>["i"]
"<Data block>".<WSTRING>["i"]
```

## Example

The indirect indexing of a STRING is illustrated below based on the example of SCL. "STRING" is a tag of the STRING data type. "Tag\_1" is a PLC tag of the "Integer" data type.

Addressing in SCL	Description
STRING["Tag_1"] := CHARACTER;	(*Indirect addressing: Assignment of "CHARACTER" to the characters of the *) STRING specified by "Tag_1"

## Additional information

For additional information on the STRING data type, refer to "See also".

## See also

STRING (Page 1289)

## Indirect addressing in STL

## Basic information about address registers

## Introduction

Two address registers are available for the indirect addressing of operands: address register 1 (AR1), and address register 2 (AR2). The address registers are equal and are 32 bits in length. You can store area-internal and cross-area pointers in the address registers. To define the address of an operand, you can call the stored data in the program.

Data is exchanged between the registers and the other available memory areas with the assistance of load and transfer instructions.

**Note**

In S7-1500, special rules apply to data exchange via address register and data block register:

- The values in the registers do not remain in existence beyond the block limits.
- The registers are reset when the language is changed within a block.
- You can only reference data in blocks with optimized access if these have the retain setting "Set in IDB".
- It is not possible to reference local data in blocks with optimized access with the help of the address registers (across areas).

**Additional information**

For more information on the statements that address registers use and on indirect addressing, refer to "See also".

**See also**

Indirect addressing in STL (Page 1260)

Addressing areas of a tag with slice access (Page 1250)

**Indirect addressing in STL**

In STL, the following options are available for indirect addressing:

- Memory-indirect addressing
- Register-indirect area-internal addressing
- Register-indirect cross-area addressing

**Memory-indirect addressing**

In the case of memory-indirect addressing, you store the address in a tag. The tag can be of WORD or DWORD data type. The tag can be located in the memory areas "Data" (DB or DI), "Bit memory" (M) or "Temporary local data" (L). In S7-1500, FB parameters can also be used to store the address. If the tag is located in a data block, it must be a data block with standard access.

The following example shows applications of memory-indirect addressing:

Addressing in STL	Explanation
U E [MD 2]	// Execute an AND logic operation with a variable input bit. The address of the input bit is located in the memory double word MD2.
= DIX [DBD 2]	// Assign the RLO to a variable data bit. The address of the data bit is located in the data double word DBD2.

Addressing in STL	Explanation
L EB [DID 4]	// Load a variable input byte to ACCU 1. The address of the input byte is located in the instance double word DID4.
AUF DB [LW 2]	// Open a variable data block. The number of the data block is located in the local data word LW2.

## Register-indirect area-internal addressing

Register-indirect addressing uses one of the address registers (AR1 or AR2) to pick up the address of the operand.

In the case of register-indirect, area-internal addressing, you index only the bit address and the byte address via the address register (e.g. P#10.0). You do not enter the memory area for which the address in the address register is to apply until during programming of the instruction. The address in the address register then moves to the memory area specified in the instruction.

Possible memory areas are "Inputs" (I), "Outputs" (Q), "I/O" (PI or PQ), "Bit memory" (M), "Temporary local data" (L) and "Data" (DB or DI). If the operand is located in a data block, it must be a data block with standard access.

When you enter register-indirect, area-internal addressing, specify an offset after the specification of the address register. This offset is added to the contents of the address register without changing the address register. This offset also has the format of a pointer. The specification of a pointer is mandatory and must be entered as constant (e.g. P#0.0 or P#2.0).

The following example shows an application of register-indirect area-internal addressing:

STL	Explanation
LAR1 P#10.0	// Load pointer (P#10.0) to address register 1
L IW [AR1, P#2.0]	// Increase contents of address register 1 (P#10.0) by offset P#2.0.
	// Load contents of input word IW12 into accumulator 1
L IW [AR1, P#0.0]	// Increase contents of address register 1 (P#10.0) by offset P#0.0.
	// Load contents of input word IW10 into accumulator 1

## Register-indirect cross-area addressing

In the case of register-indirect, cross-area addressing, use the address register to index the entire address of the operand, in other words, the bit address and byte address, as well as the memory area. Possible memory areas are "Inputs" (I), "Outputs" (Q), "I/O" (P), "Bit memory" (M), "Temporary local data" (L) and "Data" (DB or DI). If the operand is located in a data block, it must be a data block with standard access or the operand must have the retain setting "Set in IDB".

In the instruction, program only the operand width. Possible operand widths are bit, byte, word, and double word.

The following example shows an application of register-indirect cross-area addressing:

```
LAR1 P#M10.0      // Load cross-area pointer (P#M10.0) to address register 1
L W [AR1, P#2.0] // Increase contents of address register 1 (P#M10.0) by offset
                  P#2.0.
                  // Load contents of memory word "MW12" into accumulator 1
LAR1 P#A10.0      // Load cross-area pointer (P#A10.0) to address register 1
L W [AR1, P#2.0] // Add contents of address register 1 (P#A10.0) by offset P#2.0
                  // Load contents of output word QW12.0 into accumulator 1
```

---

### Note

#### Special features in S7-1500

In S7-1500, special rules apply to data exchange via address register and data block register:

- The values in the registers do not remain in existence beyond the block limits. The registers are also reset when the language is changed within a block.
- If you access an operand of the BYTE, WORD or DWORD type using register-indirect addressing, the address must begin at a byte limit.

Examples:

```
LAR1 P#0.0
```

```
L MW [AR1, P#0.0] // P#0.0 + P#0.0 = P#0.0 - The addressing is allowed, because P#0.0
points to a byte limit.
```

```
L MW [AR1, P#2.1] // P#0.0 + P#2.1 = P#2.1 - The addressing is not allowed, because
P#2.1 does not point to a byte limit.
```

---

### 9.1.1.5 Data types

#### Overview of the valid data types

#### Validity of data type groups

The data type groups define the properties of the data, for example, the representation of the contents and the valid memory areas. In the user program, you can use predefined data type or also data types that you have defined.

The following tables show the availability of predefined data types in the various S7-CPU:

Table 9-1 Binary numbers

Binary numbers	S7-300/400	S7-1200	S7-1500
BOOL (Page 1266)	X	X	X
<b>Bit strings</b>			
BYTE (Page 1267)	X	X	X
WORD (Page 1268)	X	X	X
DWORD (Page 1269)	X	X	X
LWORD (Page 1269)	-	-	X

Table 9-2 Integers

Integers	S7-300/400	S7-1200	S7-1500
SINT (Page 1270)	-	X	X
INT (Page 1272)	X	X	X
DINT (Page 1274)	X	X	X
USINT (Page 1271)	-	X	X
UINT (Page 1273)	-	X	X
UDINT (Page 1274)	-	X	X
LINT (Page 1275)	-	-	X
ULINT (Page 1277)	-	-	X

Table 9-3 Floating-point numbers

Floating-point numbers	S7-300/400	S7-1200	S7-1500
REAL (Page 1278)	X	X	X
LREAL (Page 1279)	-	X	X

**Note**

Depending on the CPU version, the actually valid data types can deviate slightly from the table.

**Binary numbers**

**BOOL (bit)**

**Description**

An operand of data type BOOL represents a bit value and contains one of the following values:

- TRUE
- FALSE

The following table shows the properties of data type BOOL:

Length (bits)	Format	Range of values	Examples of value input
1	Boolean	FALSE or TRUE BOOL#0 or BOOL#1 BOOL#FALSE or BOOL#TRUE	TRUE BOOL#1 BOOL#TRUE
	Unsigned integers	0 or 1	1
	Binary numbers	2#0 or 2#1	2#0
	Octal numbers	8#0 or 8#1	8#1
	Hexadecimal numbers	16#0 or 16#1	16#1

**Note****Applies to CPUs of the S7-1500 series**

For a block with the block property "Optimized block access", the bit has a length of 1 byte.

**Bit strings****BYTE (byte)****Description**

An operand of data type BYTE is a bit string of 8 bits.

The following table shows the properties of data type BYTE:

Length (bits)	Format	Value range	Examples of value input
8	Unsigned integers <sup>1)</sup>	-128 to +127 or 0 to +255	15, BYTE#15, B#15
	Binary numbers	2#0 to 2#11111111	2#00001111, BYTE#2#00001111, B#2#00001111
	Octal numbers	8#0 to 8#377	8#17, BYTE#8#17, B#8#17
	Hexadecimal numbers	B#16#0 to B#16#FF, 16#0 to 16#FF	16#0F, BYTE#16#0F, B#16#0F

<sup>1)</sup> The value range depends on the relevant interpretation or conversion.

**Note**

The BYTE data type cannot be compared for more than or less than. It can only be supplied with the same decimal data that can be processed by the SINT and USINT data types.

**See also**

## DWORD

### Description

An operand of data type DWORD is a bit string of 32 bits.

The following table shows the properties of data type DWORD:

Length (bits)	Format	Value range	Examples of value input
32	Unsigned integers	-2147483648 to 4294967295	15793935, DWORD#15793935, DW#15793935
	Binary numbers	2#0 to 2#11111111111111111111111111111111	2#0000000011110000111111110001111, DWORD#2#0000000011110000111111100001111, DW#2#000000001111000011111100001111
	Octal numbers	8#0 to 8#3777777777	8#74177417, DWORD#8#74177417, DW#8#74177417
	Hexadecimal numbers	DW#16#00000000 to DW#16#FFFFFFFF, 16#00000000 to 16#FFFFFFFF	16#00F0FF0F, DWORD#16#00F0FF0F, DW#16#00F0FF0F
	Decimal sequence	B#(0, 0, 0, 0) to B#(255, 255, 255, 255)	B#(127, 200, 127, 200)

### Note

The DWORD data type cannot be compared for more than or less than. It can only be supplied with the same decimal data that can be processed by the DINT and UDINT data types.

## LWORD

### Description

An operand of data type LWORD is a bit string of 64 bits.

The following table shows the properties of data type LWORD:

Length (bits)	Format	Range of values	Examples of value input
8	Signed integers	-128 to 127	+44, SINT#+44
	Binary numbers	2#0 to 2#01111111	2#00101100, SINT#2#00101100
	Octal numbers (only positive)	8#0 to 8#177	8#54, SINT#8#54
	Hexadecimal numbers (only positive)	16#0 to 16#7F	16#2C, SINT#16#2C

### Example

The following figure shows the integer +44 as a binary number:

### USINT (8-bit integers)

#### Description

An operand of data type USINT (Unsigned Short INT) has a length of 8 bits and contains unsigned numerical values:

An operand of data type USINT occupies one BYTE in the memory.

The following table shows the properties of data type USINT:

Length (bits)	Format	Range of values	Examples of value input
8	Unsigned integers	0 to 255	78, USINT#78
	Binary numbers	2#0 to 2#11111111	2#01001110, USINT#2#01001110
	Octal numbers	8#0 to 8#377	8#116, USINT#8#116
	Hexadecimal numbers	16#0 to 16#FF	16#4E, USINT#16#4E

**Example**

The following figure shows the integer 78 as a binary number:

**See also**

Overview of the valid data types (Page 1262)

Basics of constants (Page 1238)

**INT (16-bit integers)**

**Description**

An operand of data type INT has a length of 16 bits and consists of two components: a sign and a numerical value in the two's complement. The signal states of bits 0 to 14 represent the number value. The signal state of bit 15 represents the sign. The sign may assume "0" for the positive, or "1" for the negative signal state.

An operand of data type INT occupies two BYTE in the memory.

The following table shows the properties of data type INT:

Length (bits)	Format	Range of values	Examples of value input
16	Signed integers	-32768 to 32767	+3785, INT#+3785
	Binary numbers (only positive)	2#0 to 2#0111111111111111	2#0000111011001001, INT#2#0000111011001001
	Octal numbers	8#0 to 8#77777	8#7311, INT#8#7311
	Hexadecimal numbers (only positive)	16#0 to 16#7FFF	16#0EC9, INT#16#0EC9

**Example**

The following figure shows the integer +3785 as a binary number:

**See also**

- Overview of the valid data types (Page 1262)
- Basics of constants (Page 1238)

**UINT (16-bit integers)**

**Description**

An operand of data type UINT (Unsigned INT) has a length of 16 bits and contains unsigned numerical values.

An operand of data type UINT occupies two BYTE in the memory.

The following table shows the properties of data type UINT:

Length (bits)	Format	Range of values	Examples of value input
16	Unsigned integers	0 to 65535	65295, UINT#65295
	Binary numbers	2#0 to 2#1111111111111111	2#1111111100001111, UINT#2#1111111100001111
	Octal numbers	8#0 to 8#177777	8#177417, UINT#8#177417
	Hexadecimal numbers	16#0 to 16#FFFF	16#FF0F, UINT#16#FF0F

**Example**

The following figure shows the integer 65295 as a binary number:

**See also**

- Overview of the valid data types (Page 1262)
- Basics of constants (Page 1238)

## DINT (32-bit integers)

### Description

An operand of data type DINT (Double INT) has a length of 32 bits and consists of two components: a sign and a numerical value in the two's complement. The signal states of bits 0 to 30 represent the number value. The signal state of bit 31 represents the sign. The sign may assume "0" for the positive, or "1" for the negative signal state.

An operand of data type DINT occupies four BYTE in the memory.

The following table shows the properties of data type DINT:

Length (bits)	Format	Range of values	Examples of value input
32	Signed integers	-2147483648 to +2147483647	125790, DINT#125790, L#275
	Binary numbers (only positive)	2#0 to 2#01111111111111111111111111111111	2#00000000000000000000000011110101101011110, DINT#2#000000000000000000001110101101011110
	Octal numbers (only positive)	8#0 to 8#17777777777	8#365536, DINT#8#365536
	Hexadecimal numbers	16#00000000 to 16#7FFFFFFF	16#0001EB5E, DINT#16#0001EB5E

### Example

The following figure shows the integer +125790 as a binary number:

### See also

Overview of the valid data types (Page 1262)

Basics of constants (Page 1238)

## UDINT (32-bit integers)

### Description

An operand of data type UDINT (Unsigned Double INT) has a length of 32 bits and contains unsigned numerical values.

An operand of data type UDINT occupies four BYTE in the memory.

The following table shows the properties of data type UDINT:

Length (bits)	Format	Range of values	Examples of value input
32	Unsigned integers	0 to 4294967295	4042322160, UDINT#4042322160
	Binary numbers	2#0 to 2#11111111111111111111111111111111	2#11111000011110000111100001111000011110000, UDINT#2#11111000011110000111100001111000011110000
	Octal numbers	8#0 to 8#377777777777	8#36074170360, UDINT#8#36074170360
	Hexadecimal numbers	16#00000000 to 16#FFFFFFFF	16#F0F0F0F0, UDINT#16#F0F0F0F0

### Example

The following figure shows the integer 4042322160 as a binary number:

### See also

Overview of the valid data types (Page 1262)

Basics of constants (Page 1238)

### LINT (64-bit integers)

#### Description

An operand of data type LINT (Long INT) has a length of 64 bits and consists of two components: a sign and a numerical value in the two's complement. The signal states of bits 0 to 62 represent the number value. The signal state of bit 63 represents the sign. The sign may assume "0" for the positive, or "1" for the negative signal state.

An operand of data type LINT occupies eight BYTE in the memory.

The following table shows the properties of data type LINT:

Overview of the valid data types (Page 1262)

Basics of constants (Page 1238)

Floating-point numbers

REAL

Description

Operands of the data type REAL have a length of 32 bits and are used to display floating-point numbers. An operand of the REAL data type consists of the following three components:

- Sign: The sign is determined by the signal state of bit 31. The bit 31 assume the value "0" (positive) or "1" (negative).
- 8-bit exponents to basis 2: The exponent is increased by a constant (base, +127), so that it has a value range of 0 to 255.
- 23-bit mantissa: Only the fraction part of the mantissa is shown. The integer part of the mantissa is always 1 with normalized floating-point numbers and is not stored.

The REAL data type is processed with a precision of 7 digits after the decimal point.

The following figure shows the structure of the REAL data type:

Note

With floating-point numbers, only the precision defined by the IEEE754 standard is stored. Additionally specified decimals are rounded off according to IEEE754.

The number of decimal places may decrease for frequently nested arithmetic calculations.

If more decimal places are specified than can be stored by the data type, the number is rounded to the corresponding value of the precision allowed by this value range .

The following table shows the properties of data type REAL:

Length (bits)	Format	Value range	Examples of value input
32	Floating-point numbers according to IEEE754	-3.402823e+38 to -1.175495e-38 ±0.0 +1.175495e-38 to +3.402823e+38	1.0e-5, REAL#1.0e-5
	Floating-point numbers		1.0, REAL#1.0

**See also**

Overview of the valid data types (Page 1262)

Basics of constants (Page 1238)

**LREAL**

**Description**

Operands of the data type LREAL have a length of 64 bits and are used to represent floating-point numbers. An operand of the LREAL data type consists of the following three components:

- Sign: The sign is determined by the signal state of bit 63. The bit 63 assumes the value "0" (positive) or "1" (negative).
- 11-bit exponents to base 2: The exponent is increased by a constant (base, +1023), so that it has a value range of 0 to 2047.
- 52-bit mantissa: Only the fraction part of the mantissa is shown. The integer part of the mantissa is always 1 with normalized floating-point numbers and is not stored.

The LREAL data type is processed with a precision of 15 digits after the decimal point.

The following figure shows the structure of the LREAL data type:

The following table shows the properties of data type LREAL:

Length (bits)	Format	Value range	Examples of value input
64	Floating-point numbers according to IEEE754	-1.7976931348623158e+308 to -2.2250738585072014e-308 ±0.0	1.0e-5, LREAL#1.0e-5
	Floating-point numbers	+2.2250738585072014e-308 to +1.7976931348623158e+308	1.0, LREAL#1.0

---

**Note**

With floating-point numbers, only the precision defined by the IEEE754 standard is stored. Additionally specified decimals are rounded off according to IEEE754.

The number of decimal places may decrease for frequently nested arithmetic calculations.

If more decimal places are specified than can be stored by the data type, the number is rounded to the corresponding value of the precision allowed by this value range .

---

**See also**

Overview of the valid data types (Page 1262)

Basics of constants (Page 1238)

**Invalid floating-point numbers**

**Description**

We distinguish between four number ranges for data types REAL and LREAL:

- normalized numbers stored with full accuracy
- denormalized numbers not stored with full accuracy
- Infinite numbers: +Inf/-Inf (infinity)
- Invalid numbers: NaN (Not a Number)

---

**Note**

Floating-point numbers are stored as specified by the IEEE754 standard. Results of conversion or arithmetic functions with a denormalized, infinite or NaN (Not a Number) floating point depend on the CPU.

---

If you are not working with normalized floating-point numbers in mathematical functions, the result will show significant differences depending on the series of the CPU which you are using.

A CPU cannot calculate with denormalized floating-point numbers, with the exception of older CPU versions of the S7-300 and S7-400 series. The bit pattern of a denormalized number is interpreted as a zero. If the result of calculation falls into this range, it is continued with zero; the status bits OV and OS are set (number range undershoot).

Even though the values of invalid floating-point numbers can only be displayed with limited accuracy for mathematical functions, numbers with an exponent of -39 (e.g., 2.4408e-039) can

be monitored in the TIA Portal and therefore do not necessarily represent a faulty result. This means that floating-point values may be located outside the range of valid numerical values.

---

**Note**

**The following applies to CPUs of the series S7-1200 V1, V2 and V3:**

The comparison operation "Equal" uses the bit pattern of the invalid floating-point number. If two "NaN numbers" with the same bit pattern are compared, the output of the "Equal" comparison operation returns the result TRUE.

---

**Note**

**The following applies to CPUs of the S7-1200 V4 and S7-1500 series:**

If two invalid numbers (NaN) are compared with each other, the result is always FALSE, regardless of the bit pattern of the invalid number or the relation (>, >, ...).

---

**Note**

**Comparison of denormalized floating-point numbers**

For the comparison operation "Equal" with two denormalized floating-point numbers, the output for CPUs of the S7-300/400 series is set to the signal state "0" and for CPUs of the S7-1200/1500 series to the signal state "1".

---

If the input variables of a mathematical function represent an invalid floating-point number, an invalid floating-point number will also be output as result.

You have the following options to evaluate possible errors caused by invalid floating-point numbers:

- In LAD/FBD and SCL, you can query the enable output ENO for FALSE
- In STL, you can evaluate the status bit OV

Overview of the valid data types (Page 1262)

Basics of constants (Page 1238)

**Timers****S5TIME (duration)****Format**

Data type S5TIME stores the duration in BCD format. The duration is the product from a time in the range 0 to 999 and a time basis. The time basis indicates the interval at which a timer decrements the time value by one unit until it reaches "0". The resolution of the times can be controlled via the time basis.

**See also**

Overview of the valid data types (Page 1262)

Basics of constants (Page 1238)

**TIME (IEC time)****Description**

The contents of an operand of the data type TIME is interpreted as milliseconds. The representation contains information for days (d), hours (h), minutes (m), seconds (s) and milliseconds (ms).

The following table shows the properties of data type TIME:

Length (bits)	Format	Value range	Examples of value input
32	Signed duration	T#-24d20h31m23s648ms to T#+24d20h31m23s647ms	T#10d20h30m20s630ms, TIME#10d20h30m20s630ms
	Hexadecimal numbers	16#00000000 to 16#7FFFFFFF	16#0001EB5E

It is not necessary to specify all time units. T#5h10s is a valid entry, for example. If only one unit is specified, the absolute value of days, hours, and minutes must not exceed the high or low limits. When more than one time unit is specified, the value must not exceed 24 days, 23 hours, 59 minutes, 59 seconds or 999 milliseconds.

Basics of constants (Page 1238)

**LTIME (IEC time)****Description**

The contents of an operand of data type LTIME is interpreted as nanoseconds. The representation contains information for days (d), hours (h), minutes (m), seconds (s) and milliseconds (ms), microseconds (us) and nanoseconds (ns).

The following table shows the properties of data type LTIME:

Length (bits)	Format	Range of values	Examples of value input
64	Signed duration	LT#-106751d23h47m16s854ms775us808ns to LT#+106751d23h47m16s854ms775us807ns	LT#11350d20h25m14s830ms652us315ns, LTIME#11350d20h25m14s830ms652us315ns
	Hexadecimal numbers	16#0 to 16#8000000000000000	16#2

It is not necessary to specify all time units. LT#5h10s is therefore a valid entry, for example. If only one unit is specified, the absolute value of days, hours, and minutes must not exceed the high or low limits. When more than one time unit is specified, the value must not exceed 106751 days, 23 hours, 59 minutes, 59 seconds, 999 milliseconds, 999 microseconds or 999 nanoseconds.

Basics of constants (Page 1238)

**Date and time**

**DATE**

**Format**

The DATE data type saves the date as an unsigned integer. The representation contains the year, the month, and the day.

The contents of an operand of DATE data type correspond in hexadecimal format to the number of days since 01-01-1990 (16#0000).

The following table shows the properties of data type DATE:

Length (bytes)	Format	Range of values	Examples of value input
2	IEC date (Year-Month-Day)	D#1990-01-01 to D#2168-12-31	D#2009-12-31, DATE#2009-12-31
	Hexadecimal numbers	16#0000 to 16#FF62	16#00F2

**See also**

Basics of constants (Page 1238)

## TIME\_OF\_DAY (TOD)

### Format

Data type TOD (TIME\_OF\_DAY) occupies a double word and stores the number of milliseconds since the beginning of the day (0:00 h) as unsigned integer.

The following table shows the properties of data type TOD:

Length (bytes)	Format	Range of values	Examples of value input
4	Time-of-day (hours:minutes:seconds)	TOD#00:00:00.000 to TOD#23:59:59.999	TOD#10:20:30.400, TIME_OF_DAY#10:20:30.40 0

You always need to specify the hours, minutes and seconds. The specification of milliseconds is optional.

### See also

Basics of constants (Page 1238)

## LTOD (LTIME\_OF\_DAY)

### Format

Data type LTOD (LTIME\_OF\_DAY) occupies two double words and stores the number of nanoseconds since the beginning of the day (0:00 h) as unsigned integer.

The following table shows the properties of data type LTOD:

Length (bytes)	Format	Range of values	Examples of value input
8	Time-of-day (hours:minutes:seconds.millis econds.microseconds.nanose conds)	LTOD#00:00:00.0000000 00 to LTOD#23:59:59.9999999 99	LTOD#10:20:30.400_365_21 5, LTIME_OF_DAY#10:20:30.4 00_365_215

You always need to specify the hours, minutes and seconds. The specification of milliseconds, microseconds and nanoseconds is optional.

**DATE\_AND\_TIME (date and time of day)**

**Format**

The DT (DATE\_AND\_TIME) data type saves the information on date and time of day in BCD format.

The following table shows the properties of data type DT:

Length (bytes)	Format	Range of values	Example of value input
8	Date and time (year-month-day-hour:minute:second:millisecond <sup>3)</sup> )	Min.: DT#1990-01-01-00:00:00.000 Max.: DT#2089-12-31-23:59:999	DT#2008-10-25-8:12:34.567, DATE_AND_TIME#2008-10-25-08:12:34.567

The following table shows the structure of the DT data type:

Byte	Contents	Range of values
0	Year	0 to 99 (Years 1990 to 2089) BCD#90 = 1990 ... BCD#0 = 2000 ... BCD#89 = 2089
1	Month	BCD#0 to BCD#12
2	Day	BCD#1 to BCD# 31
3	Hour	BCD#0 to BCD#23
4	Minute	BCD#0 to BCD#59
5	Second	BCD#0 to BCD#59
6	The two most significant digits of MSEC	BCD#0 to BCD#999
7 (4MSB) <sup>1)</sup>	The least significant digit of MSEC	BCD#0 to BCD#9
7 (4LSB) <sup>2)</sup>	Weekday	BCD#1 to BCD#7 BCD#1 = Sunday ... BCD#7 = Saturday
<sup>1)</sup> MSB: Most significant bit <sup>2)</sup> LSB: Least significant bit <sup>3)</sup> Fixed point number

Overview of the valid data types (Page 1262)

Basics of constants (Page 1238)

**DTL****Description**

An operand of data type DTL has a length of 12 bytes and stores date and time information in a predefined structure.

The following table shows the properties of data type DTL:

Length (bytes)	Format	Value range	Example of value input
12	Date and time (Year-Month-Day-Hour:Minute:Second.Nanos econds)	Min.: DTL#1970-01-01-00:00:00.0 Max.: DTL#2200-12-31-23:59:59.9 99999999	DTL#2008-12-16-20:30:20 .250

9.1 Creating the user program

The structure of data type DTL consists of several components each of which can contain a different data type and range of values. The data type of a specified value must match the data type of the corresponding components.

The following table shows the structure components of data type DTL and their properties:

Byte	Component	Data type	Value range
0	Year	UINT	1970 to 2200
1			
2	Month	USINT	1 to 12
3	Day	USINT	1 to 31
4	Weekday	USINT	1(Sunday) to 7(Saturday) The weekday is not considered in the value entry.
5	Hour	USINT	0 to 23
6	Minute	USINT	0 to 59
7	Second	USINT	0 to 59
8	Nanosecond	UDINT	0 to 999999999
9			
10			
11

Overview of the valid data types (Page 1262)

Basics of constants (Page 1238)

**Character strings**

**CHAR (character)**

**Description**

An operand of data type CHAR has a length of 8 bits and occupies one BYTE in the memory.

The CHAR data type stores a single character in ASCII format. You can find information on the encoding of special characters under "See also > STRING".

The following table shows the value range of the CHAR data type:

Length (bits)	Format	Value range	Example of value inputs
8	ASCII characters	ASCII character set	'A', CHAR#'A'

**See also**

Overview of the valid data types (Page 1262)

Basics of constants (Page 1238)

STRING (Page 1289)

**WCHAR (character)****Description**

An operand of data type WCHAR (Wide Characters) has a length of 16 bits and occupies two BYTE in the memory.

The WCHAR data type saves a single character of an expanded character set which is stored in Unicode format. However, only a subset of the entire Unicode range is covered. When a control character is entered, it is represented with a dollar sign.

The following table shows the value range of the WCHAR data type:

Length (bits)	Format	Range of values	Example of value input
16	Unicode	\$0000 - \$D7FF	WCHAR#'a'

**See also**

Overview of the valid data types (Page 1262)

**STRING****Description**

An operand of the STRING data type saves several characters in a character string that can consist of up to 254 characters. In a character string, all characters of the ASCII code are permitted. The characters are specified in single quotation marks.

The following table shows the properties of a STRING tag:

Length (bytes)	Format	Value range	Example of value input
n + 2 *	ASCII character string incl. special characters	0 to 254 characters	'Name', STRING#'NAME'
* An operand of the STRING data type occupies two bytes more than the specified maximum length in the memory.			

A character string can also contain special characters. The escape character \$ is used to identify control characters, dollar signs and single quotation marks.

The table below shows examples for the notation of special characters:

Character	Hex	Meaning	Example
\$L or \$l	0A	Line feed	'\$LText', '\$0AText'
\$N	0A and 0D	Line break The line break occupies 2 characters in the character string.	'\$NText', '\$0A\$0DText'
\$P or \$p	0C	Page feed	'\$PText', '\$0CText'
\$R or \$r	0D	Carriage return (CR)	'\$RText', '\$0DText'
\$T or \$t	09	Tab	'\$TText', '\$09Text'
\$\$	24	Dollar sign	'100\$\$', '100\$26'
\$'	27	Single quotation mark	'\$'Text\$', '\$27Text\$27'

The maximum length of the character string can be specified during the declaration of an operand using square brackets after the keyword STRING (for example, STRING[4]). If the specification of the maximum length is omitted, the standard length of 254 characters is set for the respective operand.

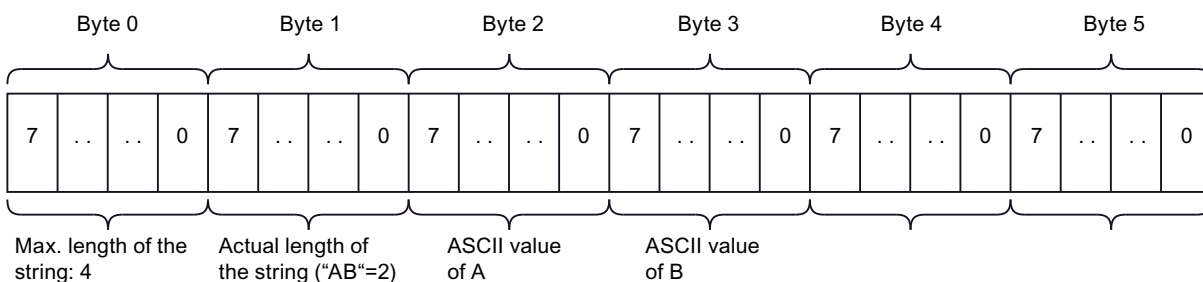

If the actual length of a specified character string is shorter than the declared maximum length, the characters are written to the character string left-justified and the remaining character spaces remain undefined. Only occupied character spaces are considered in the value processing.

**Note**

For S7-300/400 CPUs, please note: If a temporary tag of the STRING data type was defined, you must describe the BYTE "Max. length of string" with the defined length before you use the tags in the user program.

**Example**

The example below shows the byte sequence if the STRING[4] data type is specified with output value 'AB':

**See also**

- Overview of the valid data types (Page 1262)
- Basics of constants (Page 1238)

## WSTRING

### Description

An operand of data type WSTRING (Wide String) stores several Unicode characters of data type WCHAR in one character string. If you do not specify a length, the character string has a preset length of 254 characters. In a character string, all characters of the Unicode format are permitted. This means you can also use Chinese characters in a character string.

When declaring an operand of data type WSTRING you can define its length using square brackets (for example WSTRING[10]). If you do not specify a length, the length of the WSTRING is set to 254 characters by default. You can declare a length of up to 16382 characters (WSTRING[16382]).

#### Note

##### Use in the watch table

If you wish to monitor or control a tag with data type WSTRING in the watch table, it cannot contain more than 254 characters.

The specification of the characters occurs in single quotes and always with the qualifier WSTRING#.

The table below shows the properties of a WSTRING tag:

Length (WORD)	Format	Range of values	Example of value input
n + 2 *	Unicode character string; n specifies the length of the character string.	Preset value: 0 to 254 characters Max. possible value: 0 to 16382	WSTRING#'Hello World'
* An operand of the WSTRING data type occupies two WORDs more in the memory than the specified maximum length.			

A character string can also contain special characters. The escape character \$ is used to identify control characters, dollar signs and single quotation marks.

The table below shows examples for the notation of special characters:

Character	Hex	Meaning	Example
\$L or \$l	000A	Line feed	'\$LText', '\$000AText'
\$N	000A and 000D	Line break The line break occupies 2 characters in the character string.	'\$NText', '\$000A\$000DText'
\$P or \$p	000C	Page feed	'\$PText', '\$000CText'
\$R or \$r	000D	Carriage return (CR)	'\$RText', '\$000DText'
\$T or \$t	0009	Tab	'\$TText', '\$0009Text'
\$\$	0024	Dollar sign	'100\$\$', '100\$0024'
\$'	0027	Single quotation mark	'\$'Text\$', '\$0027Text\$0027'

9.1 Creating the user program

The maximum length of the character string can be specified during the declaration of an operand using square brackets after the keyword WSTRING (for example, WSTRING[4]). If the specification of the maximum length is omitted, the standard length of 254 characters is set for the respective operand.

If the actual length of a specified character string is shorter than the declared maximum length, the characters are written to the character string left-justified and the remaining character spaces remain undefined. Only occupied character spaces are considered in the value processing.

**Note**

**Conversion of WSTRING tags**

Implicit conversion of the WSTRING data type is not possible. Explicit conversion from the WSTRING data type to STRING is generally possible. However, normally only the conversion of characters in the code range from 0 - 127 will work in all Windows code pages. For all characters outside this range, the code page character and the Unicode character must be in exactly the same position for the conversion to work without errors.

**Access to block parameters of data type WSTRING**

Operands of the data type WSTRING can be transferred as parameters up to the maximum length for blocks with "optimized" access.

For function blocks (FB) with "standard" access, operands of the data type WSTRING can be declared as parameters in all sections of the block interface except in the section "InOut". For a function (FC) with "standard" access, only operands of the data type STRING can be transferred as parameters.

The function value of an FC in the "Return" section and expressions in the SCL programming language are another exception to this rule. In these cases, the WSTRING tag must not be longer than 1022 characters. If you need a WSTRING tag with more than 1022 characters, declare a tag of the data type "WSTRING" with the required character length in the section "Temp" and assign the function value to the tag.

**Example**

The example below shows the byte sequence if the WSTRING[4] data type is specified with output value 'AB':

**See also**

Overview of the valid data types (Page 1262)

**Array****Format of array (16-bit limits)****Description**

The Array data type represents a data structure that consists of a fixed number of components of the same data type. All data types except Array are permitted.

A tag with the Array data type always starts at a WORD limit.

The array components are addressed by means of an index. In the array declaration, the index limits are defined in square brackets after the keyword Array. The low limit must be smaller than or equal to the high limit. An array may contain up to six dimensions, the limits of which can be specified separated by a comma.

The following table shows the property of the Array data type:

Length	Format	Index limits	Data type
Number of components * length of the data type	Array [low limit...high limit] of <data type>	[-32768..32767] of <data type>	Bit strings, integers, floating-point numbers, timers, character strings, structures

**Example**

The following example shows how operands of data type Array can be declared:

Name	Declaration	Comment
Measured value	Array[1..20] of REAL	One-dimensional array with 20 components
Time-of-day	Array[-5..5] of INT	One-dimensional array with 11 components
Character	Array[1..2, 3..4] of CHAR	Two-dimensional array with 4 components

**Maximum array limits**

The maximum Array limits depend on the following factors:

- Data type of the Array elements
- Maximum storage capacity of the CPU (you can find more information in the relevant device manual)

**See also**

Overview of the valid data types (Page 1262)

Indirect indexing of ARRAY components (Page 1256)

**Format of array (32-bit limits)**

**Description**

The Array data type represents a data structure that consists of a fixed number of components of the same data type. All data types except Array are permitted.

The array components are addressed by means of an index. In the array declaration, the index limits are defined in square brackets after the keyword Array. The low limit must be smaller than or equal to the high limit. An array may contain up to six dimensions, the limits of which can be specified separated by a comma.

**Note**

Depending on the CPU, the storage capacity of a data block is limited and the number of components of the Array is therefore also limited. However, you may initialize the addressing of the array components at any position within index limits.

The following table shows the property of the Array data type:

Length	Format	Index limits	Data type
Number of components * length of the data type	Array [low limit...high limit] of <data type>	[-2147483648..2147483647] of <data type>	Bit strings, integers, floating-point numbers, timers, character strings, structures

**Note**

The length of the array depends on whether the block was created with the "Standard" or "with optimized access" block property.

**Note**

**Applies to CPUs of the S7-1500 series**

For a block with the block property "Optimized block access", a bit requires 1 byte of memory. This is also true when you use an ARRAY of <data type>. An ARRAY [0..1] of BOOL, for example, thus requires 2 bytes in an optimized block.

## Example

The following example shows how operands of data type Array can be declared:

Name	Declaration	Comment
Measured value	Array[1..20] of REAL	One-dimensional array with 20 components
Time-of-day	Array[-5..5] of INT	One-dimensional array with 11 components
Character	Array[1..2, 3..4] of CHAR	Two-dimensional array with 4 components

## Maximum array limits

The maximum array limits depend on the following factors:

- Data type of the array elements
- Memory reserve (only in blocks with optimized access)  
You can find additional information on this topic in the section "Loading block changes without reinitialization".
- Maximum size of a data block for a CPU (you can find more information in the respective device manual)
- The entire length of the array is available within a data block. Within a program block (OB, FB or FC), the possible length is reduced by the memory capacity required by the program code.

## Example based on a CPU of the S7-1200 series

The following table shows the maximum number of elements within a block with the "with optimized access" block property:

Data type width (bits)	Maximum number of elements	Note
1	524272	= 65534*8
8	65534	Refer to the respective device manual of the CPU for the value.
16	32767	= 65534/2 (integer division, remainder 0)
32	16383	= 65534/4 (integer division, remainder 2)
64	8191	= 65534/8 (integer division, remainder 6)

Due to various technical/internal constraints, the actual usable memory area may be approximately 70 - 100 bytes less. The memory area may be further restricted due to a default setting, for example, by the "Load without reinitialization" block property.

## See also

Overview of the valid data types (Page 1262)

Indirect indexing of ARRAY components (Page 1256)

### Example of a one-dimensional array

#### Declaration

The following table shows the declaration of a one-dimensional Array tag:

Name	Data type	Comment
Op_Temp	Array[1..3] of INT	One-dimensional array tag with 3 components.

The following figure shows the structure of the declared array tag:

#### Access to ARRAY components

The individual array components are accessed via an index.. The index of the first ARRAY component is [1], of the second [2], and of the third [3]. To access the value of the second ARRAY component, you need to declare "Op\_Temp[2]" in the program.

### Example of a multi-dimensional array

#### Declaration

The following table shows the declaration of a two-dimensional Array tag:

Name	Data type	Value	Comment
Betr_Temp	Array[1..2, 1..3] of INT	1,1,4(0)	Two-dimensional array tag with 6 components. The first two components are assigned the value "1". The remaining four components are assigned the value "0".

The following figure shows the structure of the declared array tag:

### Access to the array components

The values of the individual array components are accessed via an index. The index of the first array component is, for example, [1, 1] and the index of the fourth array component is [2, 1]. For example, you need to declare "Betr\_Temp[2,1]" in the program to enable access to the value of the fourth array component.

### Additional access option

You can also declare the "Betr\_Temp" TAG as a six-dimensional array. The following table shows an example of the declaration of a six-dimensional Array tag:

Name	Data type	Value	Comment
Betr_Temp	Array[1..3, 1..2, 1..3, 1..4, 1..3, 1..4] of INT	-	Six-dimensional array tag

The index of the first array component is in this case [1,1,1,1,1,1] and the index of the last component is [3,2,3,4,3,4]. Intermediate values are accessed by entering the corresponding value for each dimension.

## Structures

### STRUCT

#### Description

Data type STRUCT represents a data structure that consists of a fixed number of components of various data types. Components of STRUCT or ARRAY data type can also be nested in a structure. The nesting depth is hereby limited to eight levels. Structures can be used to group data according to the process control system and to transfer parameters as one data unit.

You can create up to 65534 structures for a CPU of the S7-1200 or S7-1500 series. Each of these structures can include up to 252 components. In addition, you can create up to 65534 function blocks, 65535 functions and 65535 organization blocks with up to 252 components each.

A component of the ARRAY data type always starts at a WORD limit.

The following table shows the properties of data type STRUCT:

Length	Format	Range of values	Example of value input
A STRUCT variable starts with one byte with even address and occupies the memory up to the next word limit.	STRUCT	The value ranges of the used data types apply.	The value input rules of the used data types apply.

**Example**

The following figure shows an example of the structure of a STRUCT variable:

**See also**

Overview of the valid data types (Page 1262)

**Pointer**

**POINTER**

**Description**

A parameter of the type POINTER is a pointer that can point to a specific tag. It occupies 6 bytes (48 bits) in memory and may contain the following tag information:

- DB number, or 0 if the data is not stored in a DB
- Memory area in the CPU
- Tag address

The following figure shows the structure of parameter type POINTER:

### Types of pointer

Depending on the information, you can use parameter type POINTER to declare the following four types of pointer:

- **Area-internal pointer:**  
An area-internal pointer contains information on the address of a tag.
- **Cross-area pointer:**  
A cross-area pointer contains information on the memory area and the address of a tag.
- **DB pointer:**  
You can use a DB pointer to point to a data block tag. A DB pointer also contains a data block number in addition to the memory area and the address of a tag.
- **Zero pointer:**  
Use the zero pointer to indicate a missing value. A missing value may indicate that no value exists, or that the value is not yet known. A zero value represents the absence of a value, but is also a value.

The following table shows the formats for the declaration of various pointer types:

P#ByteRepresentation	Format	Example of value input	Description
Symbolic	P#Byte.Bit	"MyTag"	Area-internal pointer
	P#OperandAreaByte.Bit	"MyTag"	Cross-area pointer
	P#Data_block.Data_oper and	"MyDB"."MyTag"	DB pointer
	P#Zero value	-	Zero pointer
Absolute	P#Byte.Bit	P#20.0	Area-internal pointer
	P#OperandAreaByte.Bit	P#M20.0	Cross-area pointer
	P#Data_block.Data_oper and	P#DB10.DBX20.0	DB pointer
	P#Zero value	P#0.0, ZERO	Zero pointer

You can enter a parameter of the type POINTER without prefix (P#). The entry is then automatically converted to the POINTER format.

**Note**

If you use the prefix P#, you can only point to memory areas with "standard" access mode.

**Memory areas**

The following table shows the hexadecimal codes of the memory areas for parameter type POINTER:

Hexadecimal code	Memory area	Description
B#16#80 <sup>1)</sup>	P	Peripherals on a CPU S7-300/400
16#1	P	Peripheral inputs on a CPU S7-1500
16#2	P	Peripheral outputs on a CPU S7-1500
B#16#81	I	Memory area of inputs
B#16#82	Q	Memory area of outputs
B#16#83	M	Memory area of bit memory
B#16#84	DBX	Data block
B#16#85	DIX	Instance data block
B#16#86	L	Local data
B#16#87	V	Previous local data

<sup>1)</sup> These data types can only be used for the POINTER pointer on a CPU S7-300/400.

Basics of indirect addressing (Page 1254)

Overview of the valid data types (Page 1262)

Basics of constants (Page 1238)

**ANY**

**Description**

An ANY type parameter points to the start of a data area and specifies its length. An ANY pointer occupies 10 bytes of memory and may contain the following information:

- Data type:  
Data type of the elements of the data area
- Repetition factor:  
Number of elements of the data area

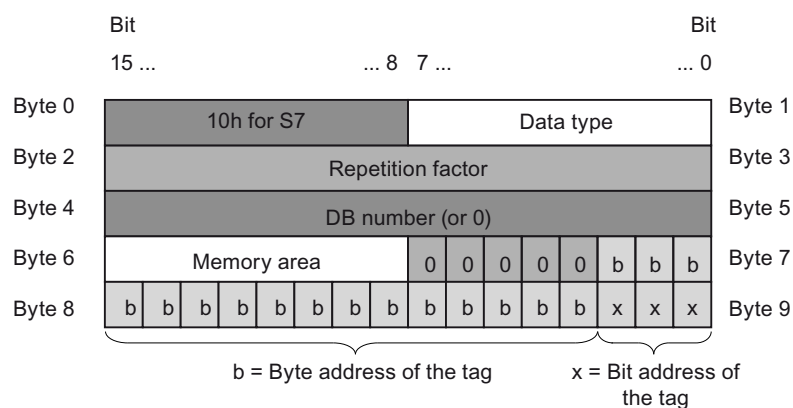

- **DB number:**  
Data block that contains the declaration of data area elements.
- **Memory area:**  
Memory area of the CPU that stores the data area elements.
- **Start address of the data in the format "byte.bit":**  
Data area start identified by the ANY pointer.
- **Zero pointer:**  
Use the zero pointer to indicate a missing value. A missing value may indicate that no value exists, or that the value is not yet known. A zero value represents the absence of a value, but is also a value.

**Note**

**Memory area**

For an S7-1500 CPU, the ANY pointer can also only point to memory areas with "Standard" access mode.

The following figure shows the structure of the ANY pointer:

An ANY pointer cannot identify structures. It can only be assigned to local tags.

The following table shows the formats for the declaration of an ANY pointer:

Representation	Format	Example of value input	Description
Symbolic	P#DataBlock.MemoryArea DataAddress Type Number	"MyDB".StructTag.InitialComponents	Area with 10 words in global DB11 starting with DBB20.0
	P#MemoryArea DataAddress Type Number	"MyMarkerTag"	Area with 4 bytes starting with MB 20.0
		"MyTag"	Input I1.0
	P#Zero value	-	Zero value
Absolute	P#DataBlock.MemoryArea DataAddress Type Number	P#DB11.DBX20.0 INT 10	Area with 10 words in global DB11 starting with DBB20.0

Representation	Format	Example of value input	Description
	P#MemoryArea	P#M20.0 BYTE 10	Area with 10 bytes starting with MB 20.0
	DataAddress Type Number	P#E1.0 BOOL 1	Input I1.0
	P#Zero value	P#0.0 VOID 0, ZERO	Zero value

### Coding of data types

The following table lists the coding of data types for the ANY pointer:

Hexadecimal code	Data type	Description
B#16#00	NIL	Null pointer
B#16#01 <sup>1)</sup>	BOOL	Bits
B#16#02	BYTE	bytes, 8 bits
B#16#03	CHAR	8-bit characters
B#16#04	WORD	16-bit words
B#16#05	INT	16-bit integers
B#16#06	DWORD	32-bit words
B#16#07	DINT	32-bit integers
B#16#08	REAL	32-bit floating-point numbers
B#16#0B	TIME	Time duration
B#16#0C	S5TIME	Time duration
B#16#09	DATE	Date
B#16#0A	TOD	Date and time
B#16#0E	DT	Date and time
B#16#13	STRING	Character string
B#16#17 <sup>1)</sup>	BLOCK_FB	Function block
B#16#18 <sup>1)</sup>	BLOCK_FC	Function
B#16#19 <sup>1)</sup>	BLOCK_DB	Data block
B#16#1A <sup>1)</sup>	BLOCK_SDB	System data block
B#16#1C <sup>1)</sup>	COUNTER	Counter
B#16#1D <sup>1)</sup>	TIMER	Timer

<sup>1)</sup> These data types can only be used for the ANY pointer on a CPU S7-300/400.

### Coding of the memory area

The following table lists the coding of the memory areas for the ANY pointer:

Hexadecimal code	Area	Description
B#16#80 <sup>1)</sup>	P	I/O
B#16#81	I	Memory area of inputs
B#16#82	Q	Memory area of outputs
B#16#83	M	Memory area of bit memory
B#16#84	DBX	Data block

Hexadecimal code	Area	Description
B#16#85	DIX	Instance data block
B#16#86	L	Local data
B#16#87	V	Previous local data
1) These memory areas can only be used for the ANY pointer on an S7-300/400 CPU.

## VARIANT

### Description

A parameter of the VARIANT type is a pointer that can point to tags of different data types other than an instance. The VARIANT pointer can be an object of an elementary data type, such as INT or REAL. It can also be a STRING, DTL, array of STRUCT, UDT, or array of UDT. The VARIANT pointer can recognize structures and point to individual structure components. An operand of data type VARIANT occupies no space in the instance DB or L stack. However, it will occupy memory space on the CPU.

A tag of the VARIANT type is not an object but rather a reference to another object. Individual elements of the VARIANT type can only be declared within the block interface of a function. For this reason, it cannot be declared in a data block or in the static section of the block interface of a function block, for example, because its size is unknown. The size of the referenced objects can change.

The VARIANT data type can only be defined on formal parameters in the block interface of a block.

### Note

You can only point to a complete data block if it was originally derived from a user-defined data type (UDT).

The following table shows the properties of the VARIANT pointer:

Length (bytes)	Representation	Format	Example of value input
0	Symbolic	Operand	"TagResult"
		NameDataBlock.NameOperand.Component	"Data_TIA_Portal".StructVariable.FirstComponent
	Absolute	Operand	%MW10

Length (bytes)	Representation	Format	Example of value input
		DataBlockNumber.Operand Type Length (valid only for blocks with standard access)	P#DB10.DBX10.0 INT 12
		P#Zero value	P#0.0 VOID 0, ZERO

**Note**

If you use the prefix P#, you can only point to memory areas with "standard" access mode.

**Coding of data types**

If you use absolute addressing with P#, the following data types are permitted:

Hexadecimal code	Data type	Description
B#16#00	NIL	Null pointer
B#16#01	BOOL	Bits
B#16#02	BYTE	bytes, 8 bits
B#16#03	CHAR	8-bit characters
B#16#04	WORD	16-bit words
B#16#05	INT	16-bit integers
B#16#06	DWORD	32-bit words
B#16#07	DINT	32-bit integers
B#16#08	REAL	32-bit floating-point numbers
B#16#0B	TIME	Time duration
B#16#0C	S5TIME	Time duration
B#16#09	DATE	Date
B#16#0A	TOD	Date and time
B#16#0E	DT	Date and time
B#16#13	STRING	Character string
B#16#17	BLOCK_FB	Function block
B#16#18	BLOCK_FC	Function
B#16#19	BLOCK_DB	Data block
B#16#1A	BLOCK_SDB	System data block
B#16#1C	COUNTER	Counter
B#16#1D	TIMER	Timer

**Example**

The following example shows how VARIANT works using the "MOVE: Move value" instruction of STL:

STL	Description
CALL MOVE	// The "Move value" instruction is called.

STL	Description
VARIANT	// Data type of the instruction
IN := "Data_TIA_Portal".StructVariable.FirstComponent	// The contents of the "FirstComponent" operand are moved from the "Data_TIA_Portal" DB.
OUT := "MotorDB".StructResult.TagResult	// And transferred to the "TagResult" operand from the "MotorDB" DB.

## Parameter types

## Parameter types

## Description

The parameter types are data types for formal parameters that are transferred to called blocks. A parameter type can also be a PLC data type.

The following table shows the available parameter data types and their purpose:

Parameter type	Length (bits)	Description
TIMER	16	Is used to specify a timer that is used in the called code block. If you supply a formal parameter of the TIMER parameter type, the associated actual parameter must be a timer. Example: T1
COUNTER	16	Is used to specify a counter that is used in the called code block. If you supply a formal parameter of the COUNTER parameter type, the associated actual parameter must be a counter. Example: C10
BLOCK_FC	16	Is used to specify a block that is used as input in the called code block.
BLOCK_FB	16	
BLOCK_DB	16	The declaration of the parameter determines the block type (for example FB, FC, DB) that is to be used. If you supply a formal parameter of the BLOCK parameter type, specify a block address as the actual parameter. Example: DB3
BLOCK_SDB	16	
BLOCK_SFB	16	
BLOCK_SFC	16	

Parameter type	Length (bits)	Description
BLOCK_OB	16	
VOID	-	The VOID parameter type does not save any values. This parameter type is used if the return values of an output are not required. The VOID parameter type can be specified at the STATUS output, for example, if no error information is required.

Overview of the valid data types (Page 1262)

Basics of PLC data types (Page 1609)

**PLC data types**

**PLC data types**

**Description**

PLC data types are data structures that you define and that can be used multiple times within the program. The structure of a PLC is made up of several components, each of which can contain different data types. You define the type of components during the declaration of the PLC data type.

You can create up to 65534 PLC data types for a CPU of the S7-1200 or S7-1500 series. Each of these PLC data types can include up to 252 components.

PLC data types can be used for the following applications:

- PLC data types can be used as data types for variables in the variable declaration of logic blocks or in data blocks.
- PLC data types can be used as templates for the creation of global data blocks with identical data structures.
- PLC data types can be used in S7-1200 and S7-1500 as a template for the creation of structured PLC tags.

**See also**

Addressing structured variables (Page 1248)

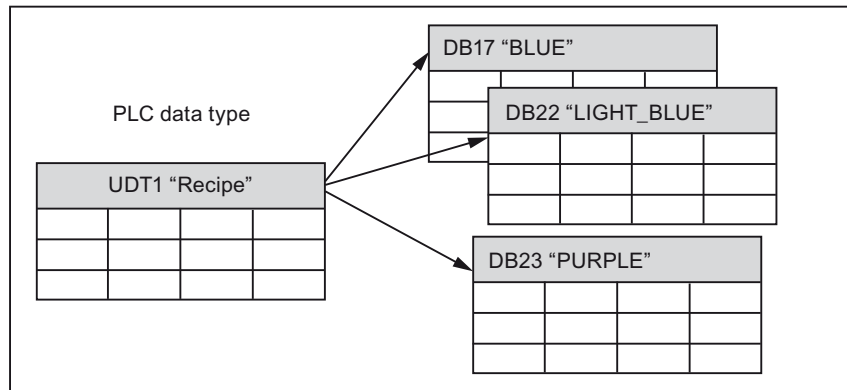

**Example of a PLC data type**

**Example**

You can declare PLC data types as the type when creating data blocks. Based on this type you can create a number of data blocks, all of which have the same data structure. These data blocks can be adapted by entering different actual values for the corresponding task.

For instance, create a PLC data type for a recipe for blending paints. You can then assign this data type to several data blocks, each of which contains other quantity information.

The following figure shows this application:

## System data types

## System data types

## Description

The system data types (SDT) are made available by the system and have a predefined structure. The structure of a system data type consists of a fixed number of components that can have various data types. It is not possible to change the structure of a system data type.

The system data types can only be used for specific instructions. The following table shows the available system data types and their purpose:

System data type	Length (bytes)	Description
IEC_TIMER	16	Structure of a timer whose timer values are of TIME data type. This data type is used for the "TP", "TOF", "TON", "TONR", "RT" and "PT" instructions, for example.
IEC_LTIMER	32	Structure of a timer whose timer values are of LTIME data type. This data type is used for the "TP", "TOF", "TON", "TONR", "RT" and "PT" instructions, for example.
IEC_SCOUNTER	3	Structure of a counter whose count values are of SINT data type. This data type is used for the "CTU", "CTD" and "CTUD" instructions, for example.
IEC_USCOUNTER	3	Structure of a counter whose count values are of USINT data type. This data type is used for the "CTU", "CTD" and "CTUD" instructions, for example.

System data type	Length (bytes)	Description
IEC_COUNTER	6	Structure of a counter whose count values are of INT data type. This data type is used for the "CTU", "CTD" and "CTUD" instructions, for example.
IEC_UCOUNTER	6	Structure of a counter whose count values are of UINT data type. This data type is used for the "CTU", "CTD" and "CTUD" instructions, for example.
IEC_DCOUNTER	12	Structure of a counter whose count values are of DINT data type. This data type is used for the "CTU", "CTD" and "CTUD" instructions, for example.
IEC_UDCOUNTER	12	Structure of a counter whose count values are of UDINT data type. This data type is used for the "CTU", "CTD" and "CTUD" instructions, for example.
IEC_LCOUNTER	24	Structure of a counter with count values of data type UDINT. This data type is used for the "CTU", "CTD" and "CTUD" instructions, for example.
IEC_ULCOUNTER	24	Structure of a counter with count values of data type UINT. This data type is used for the "CTU", "CTD" and "CTUD" instructions, for example.
ERROR_STRUCT	28	Structure of an error information to a programming or I/O access error. This data type is used, for example, for the "GET_ERROR" instruction.
CREF	8	Components of the ERROR_STRUCT data type, in which information about the address of a block is saved.
NREF	8	Components of the ERROR_STRUCT data type, in which information about the address of an operand is saved.
VREF	12	Is used for storage of a VARIANT pointer. This data type is, for example, used for instructions from S7-1200 Motion Control.
STARTINFO	12	Specifies the data structure in which the start information is saved. This data type is used, for example, for the "RD_SINFO" instruction.
SSL_HEADER	4	Specifies the data structure in which information about the data records are saved during the reading of the system status lists. This data type is used, for example, for the "RDSYSST" instruction.
CONDITIONS	52	User-defined data structure defining the conditions for start and end of a data reception. This data type is used, for example, for the "RCV_CFG" instruction.

System data type	Length (bytes)	Description
TADDR_Param	8	Specifies the structure of a data block which stores descriptions of connections for Open User Communication via UDP. This data type is used for the "TUSEND" and "TUSV" instructions, for example.
TCON_Param	64	Specifies the structure of a data block which stores descriptions of connections for Open User Communication via Industrial Ethernet (PROFINET). This data type is used for the "TSEND" and "TRSV" instructions, for example.

Overview of the valid data types (Page 1262)

**Hardware data types****Hardware data types****Description**

The hardware data types are made available by the CPU. The number of available hardware data types depends on the CPU.

Constants of a specific hardware data type are stored based on the modules set in the hardware configuration. When an instruction for controlling or activating a configured module is inserted in the user program, the available constants can be used for the parameters.

The following table shows the available hardware data types and their purpose:

Data type	Basic data type	Description
REMOTE	ANY	Serves to specify the address of a remote CPU. This data type is used, for example, for the "PUT" and "GET" instructions.
GEOADDR	HW_IOSYSTEM	Geographical address information
HW_ANY	WORD	Identification of any hardware component, e.g. a module.
HW_DEVICE	HW_ANY	Identification of a DP slave/PROFINET IO device
HW_DPMaster	HW_INTERFACE	Identification of a DP master
HW_DPSlave	HW_DEVICE	Identification of a DP slave
HW_IO	HW_ANY	Identification number of the CPU or the interface The number is automatically allocated and is stored in the properties of the CPU or of the interface in the hardware configuration.
HW_IOSYSTEM	HW_ANY	Identification of a PN/IO system or DP master system
HW_SUBMODULE	HW_IO	Identification of a central hardware component

Data type	Basic data type	Description
HW_MODULE	HW_IO	Identification of a module
HW_INTERFACE	HW_SUBMODULE	Identification of an interface component
HW_IEPORT	HW_SUBMODULE	Identification of a port (PN/IO)
HW_HSC	HW_SUBMODULE	Identification of a high-speed counter This data type is used, for example, for the "CTRL_HSC" instruction.
HW_PWM	HW_SUBMODULE	Identification of a pulse width modulation This data type is used, for example, for the "CTRL_PWM" instruction.
HW_PTO	HW_SUBMODULE	Identification of a pulse encoder This data type is used for Motion Control.
AOM_AID	DWORD	Is used only in connection with a system function block.
AOM_IDENT	DWORD	Identification of an object in the runtime system of the AS
EVENT_ANY	AOM_IDENT	Used to identify any event
EVENT_ATT	EVENT_ANY	Is used to specify an event that can be assigned dynamically to an OB This data type is used, for example, for the "ATTACH" and "DETACH" instructions.
EVENT_HWINT	EVENT_ATT	Is used to specify a hardware interrupt event
OB_ANY	INT	Serves to specify any organization block.
OB_DELAY	OB_ANY	Used to specify an organization block that is called when a time-delay interrupt occurs. This data type is used, for example, for the "SRT_DINT" and "CAN_DINT" instructions.
OB_TOD	OB_ANY	Specifies the number of a time-of-day interrupt OB. This data type is used, for example, for the "SET_TINT", "CAN_TINT", "ACT_TINT" and "QRY_TINT" instructions.
OB_CYCLIC	OB_ANY	Is used to specify an organization block that is called when a watchdog interrupt occurs.
OB_ATT	OB_ANY	Is used to specify an organization block that can be assigned dynamically to an event. This data type is used, for example, for the "ATTACH" and "DETACH" instructions.
OB_PCYCLE	OB_ANY	Is used to specify an organization block that can be assigned to an event of the "Cyclic program" event class.
OB_HWINT	OB_ATT	Is used to specify an organization block that is called when a hardware interrupt occurs.
OB_DIAG	OB_ANY	Is used to specify an organization block that is called when a diagnostic interrupt occurs.
OB_TIMEERROR	OB_ANY	Is used to specify an organization block that is called when a time error occurs.
OB_STARTUP	OB_ANY	Is used to specify an organization block that is called when a startup event occurs.

Data type	Basic data type	Description
PORT	HW_SUBMODULE	Serves to specify a communication port. This data type is used for point-to-point communication.
RTM	UINT	Serves to specify the number of an operating hours counter. This data type is used, for example, for the "RTM" instruction.
PIP	UINT	Is used to create and connect a "Synchronous Cycle" OB. This data type is used for the SFCs 26, 27, 126 and 127.
CONN_ANY	WORD	Serves to specify any connection.
CONN_PRG	CONN_ANY	Serves to specify a connection for open communication over UDP.
CONN_OUC	CONN_ANY	Used to specify a connection for open communication over Industrial Ethernet (PROFINET).
CONN_R_ID	DWORD	Data type for the R_ID parameter on the S7 communication blocks.
DB_ANY	UINT	Identification (number) of any DB The data type "DB_ANY" has the length 0 in the section "Temp".
DB_WWW	DB_ANY	Number of a DB generated via the Web application (for example, "WWW" instruction) The data type "DB_WWW" has the length 0 in the section "Temp".
DB_DYN	DB_ANY	Number of a DB generated by the user program

**Data type conversion****Data type conversion****Overview of data type conversion****Introduction**

If you link several operands in an instruction, you must make sure that the data types are compatible. This applies also for assignments or for supplying block parameters. If the operands are not the same data type, a conversion has to be carried out.

There are two options for the conversion:

- **Implicit conversion**  
The conversion take place automatically when the instruction is executed.
- **Explicit conversion**  
You use an explicit conversion instruction before the actual instruction is executed.

---

**Note**

The data type conversion options described always refer to the latest version of the CPU (V. 4) Conversions marked as possible may not be available in CPU versions 1 - 3.

---

**Note**

**Converting bit strings in SCL**

All bit strings (BYTE, WORD, DWORD and LWORD) are handled like the corresponding unsigned integers (USINT, UINT, UDINT and ULINT) in expressions. Therefore, implicit conversion from DWORD to REAL is carried out like a conversion from UDINT to REAL, for example.

---

## Implicit conversion

An implicit conversion is executed automatically if the data types of the operands are compatible. This compatibility test can be carried out according to criteria that are more or less strict:

- **With IEC check (default)**  
If IEC check is set, the following rules are applied:
  - Implicit conversion of BOOL to other data types is not possible.
  - Only the REAL, BYTE, WORD, DINT, INT, SINT, UDINT, UINT, USINT, TIME, DT, STRING and CHAR data types can be converted implicitly.
  - The bit length of the source data type must not exceed the bit length of the target data type. An operand of data type WORD, for example, cannot be declared at a parameter at which data type BYTE is expected.
- **Without IEC check**  
If IEC check is not set, the following rules are applied:
  - Implicit conversion of BOOL to other data types is not possible.
  - Only the REAL, LREAL, BYTE, WORD, DWORD, SINT, INT, DINT, USINT, UINT, UDINT, TIME, DTL, TOD, DATE, STRING and CHAR data types can be converted implicitly.
  - The bit length of the source data type must not exceed the bit length of the target data type. An operand of data type DWORD, for example, cannot be declared at a parameter at which data type WORD is expected.
  - The bit length of an operand entered in-out parameters InOut) must be the same as the programmed bit length for the parameter in question.

**Note****Implicit conversion without IEC check**

The programming editor uses a gray rectangle to mark operands that are implicitly converted. The dark gray rectangle signals that an implicit conversion is possible without any accuracy loss, for example, if you convert the data type SINT to INT. A light gray rectangle signals that implicit conversion is possible, but errors could occur during runtime. If, for example, you are converting the data type DINT to INT and an overflow occurs, the enable output ENO is set to "0".

For more information about the setting of the IEC check and the implicit conversion, refer to "See also".

**Explicit conversion**

If the operands are not compatible and an implicit conversion is therefore not possible, you can use an explicit conversion instruction. You can find the conversion instructions in the "Instructions" task card.

A possible overflow is displayed at the ENO enable output. An overflow is created, for example, if the value of the source data type is greater than the value of the target data type.

For more information about explicit conversion, refer to "See also".

The following figure shows an example in which an explicit data type conversion must be carried out:

The "Block" function block expects a tag of the INT data type at the "IN\_INT" input parameter. Therefore, the value of the "IN\_DINT" tag must first be converted from DINT to INT. If the value of the "IN\_DINT" tag is within the permitted value range of the INT data type, the conversion takes place. Otherwise, an overflow is signaled. A conversion still takes place even in case of an overflow, but the values are cut off and the enable output ENO is set to "0".

**See also**

Setting and canceling the IEC check (Page 1314)

## Implicit conversion

### Setting and canceling the IEC check

The data types of the operands used are checked for compatibility. This compatibility test can be carried out according to criteria that are more or less strict. If "IEC check" is activated, stricter criteria are applied.

You can set the IEC check centrally for all new blocks of the project or for individual blocks.

### Setting IEC check for new blocks

To set the IEC check for all new blocks in the project, proceed as follows:

1. Select the "Settings" command in the "Options" menu.  
The "Settings" window is displayed in the work area.
2. Select the "PLC programming > General" group in the area navigation.
3. Select or clear the "IEC check" check box in the "Default settings for new blocks" group.  
The IEC check is enabled or disabled for all new blocks in the program.

### Setting IEC check for a block

To set the IEC check for a block, proceed as follows:

1. Open the block.
2. Open the "Properties" tab in the Inspector window.
3. Select the "Attributes" group in the area navigation.
4. Select or clear the "IEC check" check box.  
The IEC check is enabled or disabled for this block. The setting is stored together with the project.

## Binary numbers

### Implicit conversion of BOOL

### Options for implicit conversion

The implicit conversion of the BOOL data type is not possible.

## Implicit conversion of WORD

### Options for implicit conversion

The following table shows the options for implicit conversion of the WORD data type:

Source	Target	With IEC check	Without IEC check	Description
WORD	BOOL	-	-	No implicit conversion
	BYTE	-	X	The least significant byte is transferred to the target data type, while the most significant byte is ignored.
	DWORD	X	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.
	SINT	-	X	The least significant byte is transferred to the target data type, while the most significant byte is ignored.
	USINT	-	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.
	INT	-	X	
	UINT	-	X	
	DINT	-	X	
	UDINT	-	X	
	REAL	-	-	
	LREAL	-	-	
	TIME	-	-	
	DTL	-	-	
	TOD	-	-	
	DATE	-	X	The bit pattern of the source value is transferred unchanged to the target data type.
	STRING	-	-	No implicit conversion
	CHAR	-	X	The bit pattern of the source value is transferred unchanged to the target data type.

x: Conversion possible  
 -: Conversion not possible

## Implicit conversion of DWORD

### Options for implicit conversion

The following table shows the options for implicit conversion of the DWORD data type:

Source	Target	With IEC check	Without IEC check	Description
DWORD	BOOL	-	-	No implicit conversion
	BYTE	-	X	The right bytes are transferred to the target data type; the left bytes are ignored.
	WORD	-	X	
	SINT	-	X	
	USINT	-	X	
	INT	-	X	
	UINT	-	X	
	DINT	-	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.
	UDINT	-	X	
	REAL	-	X	The value is converted to the format of the target data type. (The value "-1", for example, is converted to the value "-1.0".)
	LREAL	-	-	No implicit conversion
	TIME	-	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.
	DTL	-	-	No implicit conversion
	TOD	-	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.
	DATE	-	-	No implicit conversion
	STRING	-	-	
CHAR	-	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.	
x: Conversion possible -: Conversion not possible

#### Options for implicit conversion

The following table shows the options for implicit conversion of the INT data type:

Source	Target	With IEC check	Without IEC check	Description
INT	BOOL	-	-	No implicit conversion
	BYTE	-	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.
	WORD	-	X	
	DWORD	-	X	
	SINT	-	X	The bit pattern of the source value is converted and transferred to the target data type. (for example, value conversion from INT #-1 -> SINT #-1, or INT #-32 767 -> UINT #32 769)
	USINT	-	X	
	UINT	-	X	
	DINT	X	X	
	UDINT	-	X	
	REAL	X	X	The value is converted to the format of the target data type. (The value "-1", for example, is converted to the value "-1.0".)
	LREAL	X	X	
	TIME	-	-	No implicit conversion
	DTL	-	-	
	TOD	-	-	
	DATE	-	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.
	STRING	-	-	No implicit conversion
	CHAR	-	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.
x: Conversion possible -: Conversion not possible

## Implicit conversion of UINT

### Options for implicit conversion

The following table shows the options for implicit conversion of the UINT data type:

Source	Target	With IEC check	Without IEC check	Description
UINT	BOOL	-	-	No implicit conversion
	BYTE	-	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.
	WORD	-	X	
	DWORD	-	X	
	SINT	-	X	The bit pattern of the source value is converted and transferred to the target data type. (for example, value conversion from UINT #100 -> DINT #100 or UINT #60 000 -> INT #-5536)
	USINT	-	X	
	INT	-	X	
	DINT	X	X	
	UDINT	X	X	
	REAL	X	X	The value is converted to the format of the target data type. (The value "1", for example, is converted to the value "1.0".)
	LREAL	X	X	
	TIME	-	-	No implicit conversion
	DTL	-	-	
	TOD	-	-	
	DATE	-	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.
	STRING	-	-	No implicit conversion
	CHAR	-	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.
x: Conversion possible -: Conversion not possible

## Implicit conversion of DINT

### Options for implicit conversion

The following table shows the options for implicit conversion of the DINT data type:

Source	Target	With IEC check	Without IEC check	Description
DINT	BOOL	-	-	No implicit conversion
	BYTE	-	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.
	WORD	-	X	
	DWORD	-	X	
	SINT	-	X	The bit pattern of the source value is converted and transferred to the target data type. (for example, value conversion from DINT #-1 -> SINT #-1 or DINT #-1 -> USINT #255)
	USINT	-	X	
	INT	-	X	
	UINT	-	X	
	UDINT	-	X	
	REAL	-	X	The bit pattern of the source value is converted and transferred to the target data type. (for example, value conversion from DINT #-1 -> REAL #-1.0, but there is a loss in accuracy for numbers with an absolute value greater than 8 388 608)
	LREAL	X	X	The value is converted to the format of the target data type. (The value "-1", for example, is converted to the value "-1.0".)
	TIME	-	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.
	DTL	-	-	No implicit conversion
	TOD	-	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.
	DATE	-	-	No implicit conversion
	STRING	-	-	
CHAR	-	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.	

x: Conversion possible  
 -: Conversion not possible

## Implicit conversion of UDINT

### Options for implicit conversion

The following table shows the options for implicit conversion of the UDINT data type:

Source	Target	With IEC check	Without IEC check	Description
UDINT	BOOL	-	-	No implicit conversion
	BYTE	-	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.
	WORD	-	X	
	DWORD	-	X	
	SINT	-	X	The bit pattern of the source value is converted and transferred to the target data type. (for example, value conversion from DINT #-1 -> SINT #-1 or DINT #-1 -> USINT #255)
	USINT	-	X	
	INT	-	X	
	UINT	-	X	
	DINT	-	X	
	REAL	-	X	The bit pattern of the source value is converted and transferred to the target data type. (for example, value conversion from DINT #-1 -> REAL #-1.0, but there is a loss in accuracy for numbers with an absolute value greater than 8 388 608)
	LREAL	X	X	The value is converted to the format of the target data type. (The value "1", for example, is converted to the value "1.0".)
	TIME	-	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.
	DTL	-	-	No implicit conversion
	TOD	-	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.
	DATE	-	-	No implicit conversion
STRING	-	-		
CHAR	-	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.	
x: Conversion possible -: Conversion not possible

### Implicit conversion of REAL

#### Options for implicit conversion

The following table shows the options for implicit conversion of the REAL data type:

Source	Target	With IEC check	Without IEC check	Description
REAL	BOOL	-	-	No implicit conversion
	BYTE	-	-	
	WORD	-	-	
	DWORD	-	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.
	SINT	-	X	The bit pattern of the source value is rounded off and converted and transferred to the target data type. (for example, rounding off and value conversion of REAL #2.5 -> INT #2 or negative number REAL #-2.5 -> INT #-2 -> USINT #254. With an overflow, the remainder is determined REAL #305.5 -> INT #306 -> USINT #50)
	USINT	-	X	
	INT	-	X	
	UINT	-	X	
	DINT	-	X	
	UDINT	-	X	
	LREAL	X	X	
	TIME	-	-	No implicit conversion
	DTL	-	-	
	TOD	-	-	
	DATE	-	-	
	STRING	-	-	
	CHAR	-	-	
x: Conversion possible -: Conversion not possible

## Implicit conversion of LREAL

### Options for implicit conversion

The following table shows the options for implicit conversion of the LREAL data type:

Source	Target	With IEC check	Without IEC check	Explanation
LREAL	BOOL	-	-	No implicit conversion
	BYTE	-	-	
	WORD	-	-	
	DWORD	-	-	
	SINT	-	X	The bit pattern of the source value is rounded off and converted and transferred to the target data type. (for example, rounding off and value conversion of REAL #2.5 -> INT #2 or negative number REAL #-2.5 -> INT #-2 -> USINT #254. With an overflow, the remainder is determined REAL #305.5 -> INT #306 -> USINT #50)
	USINT	-	X	
	INT	-	X	
	UINT	-	X	
	DINT	-	X	
	UDINT	-	X	
	REAL	-	-	No implicit conversion
	TIME	-	-	
	DTL	-	-	
	TOD	-	-	
	DATE	-	-	
	STRING	-	-	
	CHAR	-	-	
x: Conversion possible -: Conversion not possible

**Implicit conversion of TIME**

**Options for implicit conversion**

The following table shows the options for implicit conversion of the TIME data type:

Source	Target	With IEC check	Without IEC check	Description
TIME	BOOL	-	-	No implicit conversion
	BYTE	-	-	
	WORD	-	-	
	DWORD	-	X	The bit pattern of the source value is transferred unchanged to the target data type. The result of the conversion shows the duration in milliseconds.
	SINT	-	-	No implicit conversion
	USINT	-	-	
	INT	-	-	
	UINT	-	-	
	DINT	-	X	The bit pattern of the source value is transferred unchanged to the target data type. The result of the conversion shows the duration in milliseconds.
	UDINT	-	X	
	REAL	-	-	No implicit conversion
	LREAL	-	-	
	DTL	-	-	
	TOD	-	X	The bit pattern of a source value that is less than 24 h (86 400 00 ms) is transferred without changes to the target data type. No further changes are made to the target value. The result of the conversion shows the time that has passed since midnight.
	DATE	-	-	No implicit conversion
	STRING	-	-	
CHAR	-	-		

x: Conversion possible

**Explicit conversion of SINT**

**Options for explicit conversion**

The following table shows the options and instructions for explicit conversion of the SINT data type:

Source	Target	Conversion	Description	Mnemonics of the instruction
SINT	BOOL	X	The following scenarios are possible: <ul style="list-style-type: none"> <li>• If the source is "0", the target data type is also "0" and enable output ENO is "1".</li> <li>• If only the LSB (Least Significant Bit) "1" is set in the source value, the target data type is also "1" and enable output ENO is "1".</li> <li>• If bit is not equal to LSB in the source value, the target data type is set according to LSB and enable output ENO is "0".</li> </ul>	SINT_TO_BOOL
	BYTE <sup>1)</sup>	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type. If a negative value is converted to an unsigned target data type, the enable output ENO is set to "0".	SINT_TO_BYTE
	WORD <sup>1)</sup>	X		SINT_TO_WORD
	DWORD <sup>1)</sup>	X		SINT_TO_DWORD
	USINT	X	The bit pattern of the source value is converted and transferred to the target data type. (The value "-1" (16#FF) becomes the value "-1" (16#FFFFFFF)).	SINT_TO_USINT
	INT	X		SINT_TO_INT
	UINT	X		SINT_TO_UINT

Source	Target	Conversion	Description	Mnemonics of the instruction
	DINT	X	Enable output ENO is set to "0" if a negative value is converted to an unsigned target data type.	SINT_TO_DINT
	UDINT	X		SINT_TO_UDINT
	REAL	X	The value is converted into the format of the target data type (the value "-1" will be converted into the value "-1.0" with the "Convert value" (CONVERT) instruction).	SINT_TO_REAL, NORM_X
	LREAL	X		SINT_TO_LREAL, NORM_X
	TIME	X	The value is transferred to the target data type and interpreted as milliseconds.	SINT_TO_TIME
	DTL	-	No explicit conversion	-
	TOD	X	The bit pattern of the source value is converted and transferred to the target data type. (The value "-1" (16#FF) becomes the value "-1" (16#FFFFFFFF)). Enable output ENO is set to "0" if a negative value is converted to an unsigned target data type. (interpretation in milliseconds since 0:0)	SINT_TO_TOD
	DATE	X	The bit pattern of the source value is converted and transferred to the target data type. (The value "-1" (16#FF) becomes the value "-1" (16#FFFFFFFF)). Enable output ENO is set to "0" if a negative value is converted to an unsigned target data type. (interpretation in days since 1990-1-1)	SINT_TO_DATE
	STRING	X	The value is converted to a character string. The character string is shown preceded by a sign. If the permitted length of the character string is violated, the enable output ENO is set to "0".	SINT_TO_STRING, S_CONV, VAL_STRG
	CHAR <sup>1)</sup>	X	The bit pattern of the source value is transferred unchanged to the target data type. If negative values are converted, the enable output ENO is set to "0".	SINT_TO_CHAR

x: Conversion possible  
- : Conversion not possible

<sup>1)</sup> Bit strings (BYTE, WORD, DWORD) and data type CHAR are first extended to the necessary width including sign, and then the bits are copied. The source type determines the interpretation.

### Explicit conversion of USINT

#### Options for explicit conversion

The following table shows the options and instructions for explicit conversion of the USINT data type:

Source	Target	Conversion	Description	Mnemonics of the instruction
USINT	BOOL	X	The following scenarios are possible: <ul style="list-style-type: none"> <li>• If the source is "0", the target data type is also "0" and enable output ENO is "1".</li> <li>• If only the LSB (Least Significant Bit) "1" is set in the source value, the target data type is also "1" and enable output ENO is "1".</li> <li>• If bit is not equal to LSB in the source value, the target data type is set according to LSB and enable output ENO is "0".</li> </ul>	USINT_TO_BOOL
	BYTE <sup>1)</sup>	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.	USINT_TO_BYTE
	WORD <sup>1)</sup>	X		USINT_TO_WORD
	DWORD <sup>1)</sup>	X		USINT_TO_DWORD
	SINT	X	The bit pattern of the source value is transferred unchanged to the target data type. If the sign is changed during the conversion, the enable output ENO is set to "0".	USINT_TO_SINT
	INT	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.	USINT_TO_INT
	UINT	X		USINT_TO_UINT
	DINT	X		USINT_TO_DINT
	UDINT	X		USINT_TO_UDINT
	REAL	X	The value is converted into the format of the target data type (the value "1" will be converted into the value "1.0" with the "Convert value" (CONVERT) instruction).	USINT_TO_REAL, NORM_X
	LREAL	X		USINT_TO_LREAL, NORM_X
	TIME	X	The value is transferred to the target data type and interpreted as milliseconds.	USINT_TO_TIME
	DTL	-	No explicit conversion	-
	TOD	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.	USINT_TO_TOD
	DATE	X		USINT_TO_DATE
STRING	X	The value is converted to a character string. If the permitted length of the character string is violated, the enable output ENO is set to "0".	USINT_TO_STRING, S_CONV, VAL_STRG	

Source	Target	Conversion	Description	Mnemonics of the instruction
	CHAR <sup>1)</sup>	X	The bit pattern of the source value is transferred unchanged to the target data type.	USINT_TO_CHAR
x: Conversion possible - : Conversion not possible <sup>1)</sup> Bit strings (BYTE, WORD, DWORD) and data type CHAR are first extended to the necessary width (the non-existing sign is replaced with zeros) and then the bits are copied. The source type determines the interpretation.

## Explicit conversion of INT

### Options for explicit conversion

The following table shows the options and instructions for explicit conversion of the INT data type:

Source	Target	Conversion	Description	Mnemonics of the instruction
INT	BOOL	X	The following scenarios are possible: <ul style="list-style-type: none"> <li>• If the source is "0", the target data type is also "0" and enable output ENO is "1".</li> <li>• If only the LSB (Least Significant Bit) "1" is set in the source value, the target data type is also "1" and enable output ENO is "1".</li> <li>• If bit is not equal to LSB in the source value, the target data type is set according to LSB and enable output ENO is "0".</li> </ul>	INT_TO_BOOL
	BYTE <sup>1)</sup>	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type. If a negative value is converted to an unsigned target data type, the enable output ENO is set to "0".	INT_TO_BYTE
	WORD <sup>1)</sup>	X		INT_TO_WORD
	DWORD <sup>1)</sup>	X		INT_TO_DWORD
	SINT	X	The bit pattern of the source value is converted and transferred to the target data type. (The value "-1" (16#FF) becomes the value "-1" (16#FFFFFFFF). Enable output ENO is set to "0" if a negative value is converted to an unsigned target data type.	INT_TO_SINT
	USINT	X		INT_TO_USINT
	UINT	X		INT_TO_UINT
	DINT	X		INT_TO_DINT
	UDINT	X		INT_TO_UDINT
	REAL	X	The value is converted to the format of the target data type (the value "-1", for example, is converted with the instruction "Convert value" (CONVERT) to the value "-1.0").	INT_TO_REAL, NORM_X
LREAL	X	INT_TO_LREAL, NORM_X		

Source	Target	Conversion	Description	Mnemonics of the instruction
	TIME	X	The value is transferred to the target data type and interpreted as milliseconds.	INT_TO_TIME
	DTL	-	No explicit conversion	-
	TOD	X	The bit pattern of the source value is converted and transferred to the target data type. (The value "-1" (16#FF) becomes the value "-1" (16#FFFFFFFF). Enable output ENO is set to "0" if a negative value is converted to an unsigned target data type. (interpretation in milliseconds since 0:0; check for 24h limit)	INT_TO_TOD
	DATE	X	The bit pattern of the source value is converted and transferred to the target data type. (The value "-1" (16#FF) becomes the value "-1" (16#FFFFFFFF). Enable output ENO is set to "0" if a negative value is converted to an unsigned target data type. (interpretation in days since 1990-1-1; check for negative value)	INT_TO_DATE
	STRING	X	The value is converted to a character string. The character string is shown preceded by a sign. If the permitted length of the character string is violated, the enable output ENO is set to "0".	INT_TO_STRING, S_CONV, VAL_STRG <sup>1)</sup>
	CHAR <sup>1)</sup>	X	The bit pattern of the source value is converted and transferred to the target data type. (The value "-1" (16#FF) becomes the value "-1" (16#FFFFFFFF). Enable output ENO is set to "0" if a negative value is converted to an unsigned target data type.	INT_TO_CHAR
	BCD16	X	The value to be converted has type INT and is accepted as an integer with a value between -999 and +999. The result is available after conversion as a BCD-coded number of the type WORD. A real conversion takes place. If the value is outside the target area, a synchronous error is not triggered, but rather only the status bit OV is set.	INT_TO_BCD16
	BCD16_WORD	X		INT_TO_BCD16_WORD

x: Conversion possible

- : Conversion not possible

<sup>1)</sup> Bit strings (BYTE, WORD, DWORD) and data type CHAR are first extended to the necessary width including sign, and then the bits are copied. The source type determines the interpretation.

## Explicit conversion of UINT

### Options for explicit conversion

The following table shows the options and instructions for explicit conversion of the UINT data type:

Source	Target	Conversion	Description	Mnemonics of the instruction
UINT	BOOL	X	The following scenarios are possible: <ul style="list-style-type: none"> <li>If the source is "0", the target data type is also "0" and enable output ENO is "1".</li> <li>If only the LSB (Least Significant Bit) "1" is set in the source value, the target data type is also "1" and enable output ENO is "1".</li> <li>If bit is not equal to LSB in the source value, the target data type is set according to LSB and enable output ENO is "0".</li> </ul>	UINT_TO_BOOL
	BYTE <sup>1)</sup>	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type. If bits are lost in the process, the enable output ENO is set to "0".	UINT_TO_BYTE
	WORD <sup>1)</sup>	X		UINT_TO_WORD
	DWORD <sup>1)</sup>	X		UINT_TO_DWORD
	SINT	X		UINT_TO_SINT
	USINT	X		UINT_TO_USINT
	INT	X	The bit pattern of the source value is transferred unchanged to the target data type. If the sign bit is changed during the conversion, the enable output ENO is set to "0".	UINT_TO_INT
	DINT	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type.	UINT_TO_DINT
	UDINT	X		UINT_TO_UDINT
	REAL	X	The value is converted to the format of the target data type (the value "1", for example, is converted with the instruction "Convert value" (CONVERT) to the value "1.0").	UINT_TO_REAL, NORM_X
	LREAL	X		UINT_TO_LREAL, NORM_X
	TIME	X	The value is transferred to the target data type and interpreted as milliseconds.	UINT_TO_TIME
	DTL	-	No explicit conversion	-
	TOD	X	The bit pattern of the source value is converted and transferred to the target data type. (The value "-1" (16#FF) becomes the value "-1" (16#FFFFFFFF). Enable output ENO is set to "0" if a negative value is converted to an unsigned target data type. (interpretation in milliseconds since 0:0; check for 24h limit)	UINT_TO_TOD

Source	Target	Conversion	Description	Mnemonics of the instruction
	DATE	X	The bit pattern of the source value is converted and transferred to the target data type. (The value "-1" (16#FF) becomes the value "-1" (16#FFFFFFFF). Enable output ENO is set to "0" if a negative value is converted to an unsigned target data type. (interpretation in days since 1990-1-1; check for negative value)	UINT_TO_DATE, T_CONV
	STRING	X	The value is converted to a character string. If the permitted length of the character string is violated, the enable output ENO is set to "0".	UINT_TO_STRING, S_CONV, VAL_STRG
	CHAR <sup>1)</sup>	X	The bit pattern of the source value is transferred unchanged to the target data type. The enable output ENO is set to "0" in the event of overflow.	UINT_TO_CHAR

x: Conversion possible  
 - : Conversion not possible  
<sup>1)</sup> Bit strings (BYTE, WORD, DWORD, LWORD) and the data type CHAR are initially extended to the necessary width (the non-existing sign is replaced with zeros) and then the bits are copied. The source type determines the interpretation.

## Explicit conversion of DINT

### Options for explicit conversion

The following table shows the options and instructions for explicit conversion of the DINT data type:

Source	Target	Conversion	Description	Mnemonics of the instruction
DINT	BOOL	X	The following scenarios are possible: <ul style="list-style-type: none"> <li>If the source is "0", the target data type is also "0" and enable output ENO is "1".</li> <li>If only the LSB (Least Significant Bit) "1" is set in the source value, the target data type is also "1" and enable output ENO is "1".</li> <li>If bit is not equal to LSB in the source value, the target data type is set according to LSB and enable output ENO is "0".</li> </ul>	DINT_TO_BOOL
	BYTE <sup>1)</sup>	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type. If a negative value is converted to an unsigned target data type, the enable output ENO is set to "0".	DINT_TO_BYTE
	WORD <sup>1)</sup>	X		DINT_TO_WORD
	DWORD <sup>1)</sup>	X		DINT_TO_DWORD
	SINT	X	The bit pattern of the source value is converted and transferred to the target data type. (The value "-1" (16#FF) becomes the value "-1" (16#FFFFFFFF). Enable output ENO is set to "0" if a negative value is converted to an unsigned target data type.	DINT_TO_SINT
	USINT	X		DINT_TO_USINT
	INT	X		DINT_TO_INT
	UINT	X		DINT_TO_UINT
	UDINT	X		DINT_TO_UDINT
	REAL	X		The value is converted to the format of the target data type (the value "-1", for example, is converted with the instruction "Convert value" (CONVERT) to the value "-1.0").
	LREAL	X	DINT_TO_LREAL, NORM_X	
	TIME	X	The value is transferred to the target data type and interpreted as milliseconds.	DINT_TO_TIME, T_CONV
	DTL	-	No explicit conversion	-
	TOD	X	The bit pattern of the source value is converted and transferred to the target data type. (The value "-1" (16#FF) becomes the value "-1" (16#FFFFFFFF). Enable output ENO is set to "0" if a negative value is converted to an unsigned target data type. (interpretation in milliseconds since 0:0)	DINT_TO_TOD

Source	Target	Conversion	Description	Mnemonics of the instruction
	DATE	X	The bit pattern of the source value is converted and transferred to the target data type. (The value "-1" (16#FF) becomes the value "-1" (16#FFFFFFFF). Enable output ENO is set to "0" if a negative value is converted to an unsigned target data type. (interpretation in days since 1990-1-1)	DINT_TO_DATE
	STRING	X	The value is converted to a character string. The character string is shown preceded by a sign. If the permitted length of the character string is violated, the enable output ENO is set to "0".	DINT_TO_STRING, S_CONV, VAL_STRG
	CHAR <sup>1)</sup>	X	The bit pattern of the source value is converted and transferred to the target data type. (The value "-1" (16#FF) becomes the value "-1" (16#FFFFFFFF). Enable output ENO is set to "0" if a negative value is converted to an unsigned target data type.	DINT_TO_CHAR
	BCD32	X	The value to be converted has type DINT and is accepted as an integer with a value between -999999 and +9999999. The result is available after conversion as a BCD-coded number of the type DWORD. The enable output is set to "0" in the event of overflow. A real conversion takes place. If the value is outside the target area, a synchronous error is not triggered, but rather only the status bit OV is set.	DINT_TO_BCD32
	BCD32_DWORD	X		DINT_TO_BCD32_DWORD

x: Conversion possible

- : Conversion not possible

<sup>1)</sup> Bit strings (BYTE, WORD, DWORD) and data type CHAR are first extended to the necessary width including sign, and then the bits are copied. The source type determines the interpretation.

## Explicit conversion of UDINT

### Options for explicit conversion

The following table shows the options and instructions for explicit conversion of the UDINT data type:

Source	Target	Conversion	Description	Mnemonics of the instruction
UDINT	BOOL	X	The following scenarios are possible: <ul style="list-style-type: none"> <li>• If the source is "0", the target data type is also "0" and enable output ENO is "1".</li> <li>• If only the LSB (Least Significant Bit) "1" is set in the source value, the target data type is also "1" and enable output ENO is "1".</li> <li>• If bit is not equal to LSB in the source value, the target data type is set according to LSB and enable output ENO is "0".</li> </ul>	UDINT_TO_BOOL
	BYTE <sup>1)</sup>	X	The bit pattern of the source value is transferred unchanged to the target data type. If bits are lost in the process, the enable output ENO is set to "0".	UDINT_TO_BYTE
	WORD <sup>1)</sup>	X		UDINT_TO_WORD
	DWORD <sup>1)</sup>	X		UDINT_TO_DWORD
	SINT	X		UDINT_TO_SINT
	USINT	X		UDINT_TO_USINT
	INT	X		UDINT_TO_INT
	UINT	X		UDINT_TO_UINT
	DINT	X	The bit pattern of the source value is transferred unchanged to the target data type. If the sign bit is changed during the conversion, the enable output ENO is set to "0".	UDINT_TO_DINT
	REAL	X	The value is converted to the format of the target data type (the value "1", for example, is converted with the instruction "Convert value" (CONVERT) to the value "1.0").	UDINT_TO_REAL, NORM_X
	LREAL	X		UDINT_TO_LREAL, NORM_X
	TIME	X	The bit pattern of the source value is transferred unchanged right-justified and interpreted as milliseconds to the target data type.	UDINT_TO_TIME
	DTL	-	No explicit conversion	-
TOD	X	The bit pattern of the source value is converted and transferred to the target data type. (The value "-1" (16#FF) becomes the value "-1" (16#FFFFFFFF). Enable output ENO is set to "0" if a negative value is converted to an unsigned target data type. (interpretation in milliseconds since 0:0; check for 24h limit)	UDINT_TO_TOD, T_CONV	

9.1 Creating the user program

Source	Target	Conversion	Description	Mnemonics of the instruction
	DATE	X	The bit pattern of the source value is converted and transferred to the target data type. (The value "-1" (16#FF) becomes the value "-1" (16#FFFFFFFF). Enable output ENO is set to "0" if a negative value is converted to an unsigned target data type. (interpretation in days since 1990-1-1; check for negative value)	UDINT_TO_DATE
	STRING	X	The value is converted to a character string. If the permitted length of the character string is violated, the enable output ENO is set to "0".	UDINT_TO_STRING, S_CONV, VAL_STRG
	CHAR <sup>1)</sup>	X	The bit pattern of the source value is transferred unchanged to the target data type. The enable output ENO is set to "0" in the event of overflow.	UDINT_TO_CHAR

x: Conversion possible  
 - : Conversion not possible  
<sup>1)</sup> Bit strings (BYTE, WORD, DWORD, LWORD) and the data type CHAR are initially extended to the necessary width (the non-existing sign is replaced with zeros) and then the bits are copied. The source type determines the interpretation.

Floating-point numbers

Explicit conversion of REAL

Options for explicit conversion

The following table shows the options and instructions for explicit conversion of the REAL data type:

Source	Target	Conversion	Description	Mnemonics of the instruction
REAL	BOOL	-	No explicit conversion	-
	BYTE	-		-
	WORD	-		-
	DWORD	X	The bit pattern of the source value is transferred unchanged to the target data type.	REAL_TO_DWORD
	SINT	X	The value is converted to the target data type. The result of the conversion depends on the instruction used. Enable output ENO is set to "0" if the valid range of values of the target	REAL_TO_SINT, ROUND, CEIL, FLOOR, TRUNC, NORM_X, SCALE_X

Source	Target	Conversion	Description	Mnemonics of the instruction
	USINT	X	data type is exceeded during conversion, or if the value to be converted is an invalid floating-point number.	REAL_TO_USINT, ROUND, CEIL, FLOOR, TRUNC, NORM_X, SCALE_X
	INT	X		REAL_TO_INT, ROUND, CEIL, FLOOR, TRUNC, NORM_X, SCALE_X
	UINT	X		REAL_TO_UINT, ROUND, CEIL, FLOOR, TRUNC, NORM_X, SCALE_X
	DINT	X		REAL_TO_DINT, ROUND, CEIL, FLOOR, TRUNC, NORM_X, SCALE_X
	UDINT	X		REAL_TO_UDINT, ROUND, CEIL, FLOOR, TRUNC, NORM_X, SCALE_X
	LREAL	X	The value is converted to the target data type. The result of the conversion depends on the instruction used, e.g. TRUNC(2.5) = 2.0; CEIL(2.5) = 3.0	REAL_TO_LREAL, ROUND, CEIL, FLOOR, TRUNC, NORM_X, SCALE_X
	TIME	-	No explicit conversion	-
	DTL	-		-
	TOD	-		-
	DATE	-		-
	STRING	X	The value is converted to a character string. Enable output ENO is set to "0" if the character string length is exceeded, or if the value to be converted is an invalid floating-point number. The string has a minimum length of 14 characters.	REAL_TO_STRING, S_CONV, VAL_STRG
	CHAR	-	No explicit conversion	-
x: Conversion possible -: Conversion not possible

Overview of data type conversion (Page 1311)

Explicit conversion of LREAL

Options for explicit conversion

The following table shows the options and instructions for explicit conversion of the LREAL data type:

Source	Target	Conversion	Description	Mnemonics of the instruction
LREAL	BOOL	-	No explicit conversion	-
	BYTE	-		-
	WORD	-		-
	DWORD	-		-
	SINT	X	The value is converted to the target data type. The result of the conversion depends on the instruction used. Enable output ENO is set to "0" if the valid range of values of the target data type is exceeded during conversion, or if the value to be converted is an invalid floating-point number.	LREAL_TO_SINT, ROUND, CEIL, FLOOR, TRUNC, NORM_X, SCALE_X
	USINT	X		LREAL_TO_USINT, ROUND, CEIL, FLOOR, TRUNC, NORM_X, SCALE_X
	INT	X		LREAL_TO_INT, ROUND, CEIL, FLOOR, TRUNC, NORM_X, SCALE_X
	UINT	X		LREAL_TO_UINT, ROUND, CEIL, FLOOR, TRUNC, NORM_X, SCALE_X
	DINT	X		LREAL_TO_DINT, ROUND, CEIL, FLOOR, TRUNC, NORM_X, SCALE_X
	UDINT	X		LREAL_TO_UDINT, ROUND, CEIL, FLOOR, TRUNC, NORM_X, SCALE_X
	REAL	X		The value is converted to the target data type. Enable output ENO is set to "0" if the valid range of values of the target data type is exceeded during conversion, or if the value to be converted is an invalid floating-point number. A loss in accuracy is tolerated.
	TIME	-	No explicit conversion	-
	DTL	-		-
	TOD	-		-
DATE	-	-		
STRING	X	The value is converted to a character string. Enable output ENO is set to "0" if the character string length is exceeded, or if the value to be converted is an invalid floating-point number. The string has a minimum length of 21 characters.	REAL_TO_STRING, S_CONV, VAL_STRG	

Source	Target	Conversion	Description	Mnemonics of the instruction
	CHAR	-	No explicit conversion	-

**Timers**

**Explicit conversion of TIME**

**Options for explicit conversion**

The following table shows the options and instructions for explicit conversion of the TIME data type:

Source	Target	Conversion	Description	Mnemonics of the instruction
TIME	BOOL	-	No explicit conversion	-
	BYTE <sup>1)</sup>	X	The bit pattern of the source value is transferred unchanged to the target data type.	TIME_TO_BYTE
	WORD <sup>1)</sup>	X		TIME_TO_WORD
	DWORD <sup>1)</sup>	X		TIME_TO_DWORD
	SINT	X	The bit pattern of the source value is transferred unchanged right-justified and interpreted as milliseconds to the target data type.	TIME_TO_SINT
	USINT	X		TIME_TO_USINT
	INT	X		TIME_TO_INT
	UINT	X		TIME_TO_UINT
	DINT	X	The bit pattern of the source value is transferred unchanged to the target data type. The result of the conversion shows the duration in milliseconds.	TIME_TO_DINT, T_CONV
	UDINT	X	The bit pattern of the source value is transferred unchanged right-justified and interpreted as milliseconds to the target data type. Enable output ENO is set to "0" if the sign changes.	TIME_TO_UDINT
	REAL	-	No explicit conversion	-
	LREAL	-		-
	DTL	-		-

Source	Target	Conversion	Description	Mnemonics of the instruction
	TOD	X	The bit pattern of the source value is transferred unchanged right-justified to the target data type. If the source value exceeds the range of values of TOD, the target data type remains unchanged.	TIME_TO_TOD
	DATE	-	No explicit conversion	-
	STRING	-		-
	CHAR	-		-

x: Conversion possible  
 -: Conversion not possible  
 1) Bit strings (BYTE, WORD, DWORD) and data type CHAR are first extended to the necessary width and then the bits are copied. The source type determines the interpretation.

### 9.1.1.6 Program flow control

#### EN/ENO mechanism

#### Basics of the EN/ENO mechanism

#### Introduction

Runtime errors that require a program abort can occur during the processing of instructions. You can use the EN/ENO mechanism to avoid such program aborts. This mechanism can be used at two levels:

- EN/ENO mechanism for individual instructions
- EN/ENO mechanism for block calls

#### EN/ENO mechanism for instructions in LAD/FBD

In LAD and FBD, certain instructions have an enable input EN and an enable output ENO.

You can use the enable input EN to make the execution of the instruction dependent on conditions. The instructions are only executed if the signal state is "1" at the enable input EN.

You can use the enable output ENO to query runtime errors in instructions and react to these.

The enable output ENO returns the signal state "1" if one of the following conditions applies:

- No error occurred during processing.

The enable output ENO returns signal state "0" if one of the following conditions applies:

- The EN input has signal state "0".
- An error occurred during processing.

The EN/ENO mechanism is used for the following basic instructions:

- Mathematical functions
- Move operations
- Conversion operations
- Word logic operations
- Shift + rotate

In LAD and FBD, you can switch the evaluation of the enable output ENO on and off by means of the shortcut menu specifically for certain instructions.

### EN/ENO mechanism for block calls in LAD/FBD

All blocks that you call in LAD or FBD are provided with an enable input EN and an enable output ENO when called. This applies to all called blocks, regardless of the programming language in which they were created.

You can use the enable input EN to call the block depending on conditions. The block is only executed if the signal state is "1" at the enable input EN.

You can query the error status of the block with the enable output ENO. It has signal "1" as soon as the execution of the block starts. If you do not explicitly set the output ENO to "0" in the program code, it retains signal "1".

However, you can explicitly set it to "0" to return an error statement to the called block. In LAD or FBD, the output ENO is set with the instruction "RET: Return".

See also:

Example of the use of the EN/ENO mechanism in LAD (Page 1360)

Example of the use of the EN/ENO mechanism in FBD (Page 1360)

### EN/ENO mechanism for STL

In STL, the EN/ENO mechanism is not required for individual instructions. This function is mapped by language-specific instruction sequences.

Blocks that you call from an STL block are not provided with the EN and ENO parameters. Regardless of the programming language in which they were created, you can transfer an error statement to the calling STL block using the BR bit of the status word.

In STL, you can evaluate the error status of the called block by linking the BR bit of the status word with the RLO. It has signal "1" as soon as the execution of the block starts. If you do not explicitly set it to "0" in the program code, it retains signal "1".

However, you can explicitly set it to "0" to return an error statement to the calling block. In STL, the error statement is set with the instructions "SAVE" or "JNB".

See also: Example of the simulation of the EN/ENO mechanism in STL (Page 1362)

## EN/ENO mechanism in SCL

With SCL, the use of the EN/ENO mechanism for instructions is optional. You can activate it with the block property "Set ENO automatically". If the property is active, all blocks implicitly receive an error handling.

You can implement a conditional block call with the enable input EN. Use the enable input EN in the parameter list as a normal input parameter. If EN has signal "1" or when EN is not used, the block is called. If EN has signal "0", the block is not called.

---

### Note

When you call functions in SCL, you cannot use the release mechanism via EN. Use an IF statement instead to call functions conditionally.

---

You can query the error status of the block with the enable output ENO. If the ENO has signal "1", the block was processed without errors. If the ENO has signal "0", an error occurred during processing. To query the state of the enable output, insert an additional output parameter with the name ENO in the parameter list during a block call.

See also: Example of the use of the EN/ENO mechanism in SCL (Page 1361)

## ENO in GRAPH (S7-1500)

In GRAPH, you can use the ENO operand to evaluate whether an action has been completed successfully. You can select the "Set ENO automatically" option for this.

- Select the option in the program properties in order for it to be used as the default setting for new GRAPH blocks.
- Select the option in the block properties in order for it to be used for specific blocks.

If this option is selected, the ENO operand is displayed when testing with program status. This operand has the value "TRUE" if the action was successful and "FALSE" if the action failed.

The ENO operand can be used in the following cases:

- When blocks are called that have the enable output ENO.
- For instructions in which errors can occur, e.g., conversions or mathematical functions.

## EN/ENO mechanism for memory and I/O access errors

You cannot evaluate memory and I/O access errors with the EN/ENO mechanism. You do this either with the global troubleshooting via OBs (S7-300/400 and S7-1200/1500) or local troubleshooting using the "GetError" instruction (S7-1200/1500 only). If a memory access error occurred for an instruction, you can evaluate the associated ENO.

## See also

Enabling and disabling the EN/ENO mechanism (Page 1487)

### Example of the use of the EN/ENO mechanism in LAD

#### Description

The following figure shows an ADD instruction with EN and ENO protective circuit:

After the normally open contact, the RLO contains the previous result of logic operation:

- If "TagIn" signal is "0", the addition is not executed. EN and ENO both lead to the signal state "0".
- If "TagIn" signal is "1", EN is also "1" and the addition is executed. If no errors occur during the processing of the instruction, the output ENO also has the signal state "1" and the output ""TagOut"" is set.

#### See also

Basics of the EN/ENO mechanism (Page 1357)

ADD: Add (Page 1906)

### Example of the use of the EN/ENO mechanism in FBD

#### Description

The following figure shows an ADD instruction with EN and ENO protective circuit:

- If "TagIn" signal is "1", EN is also "1" and the addition is executed. If no errors occur during the processing of the instruction, the output ENO also has the signal state "1" and the output ""TagOut"" is set.
- If "TagIn" signal is "0", the addition is not executed. EN and ENO both lead to the signal state "0".

## See also

Basics of the EN/ENO mechanism (Page 1357)

## Example of the use of the EN/ENO mechanism in SCL

### Example of the EN/ENO mechanism for basic instructions

To use the EN/ENO mechanism for instructions in SCL, you have to activate the block property "Set ENO automatically". The following example shows the use of the enable output ENO for the "a/b" instruction.

```
SCL
-----
"MyoutputREAL" :=a/b;
IF ENO
    THEN "MyOutputBool":=1;
    ELSE "MyOutputBool":=0;
END_IF;
```

If the "a/b" instruction is executed error-free, MyOutputBool has signal "1".

### Example of the use of the EN/ENO mechanism in block calls

The following example shows the use of the enable output ENO for a block call.

```
SCL
-----
"MyDB"."MyFB" (EN:="MyTag1">"MyTag2",
               in1:="MyInputBool1",
               in2:="MyInputBool1",
               ENO=>"MyOutputBool");
```

If MyTag1 is not greater than MyTag2 the block call is not processed. EN and ENO both lead to the signal state "0".

If MyTag1 is greater than MyTag2, EN has signal "1" and the block call is executed.

If all instructions within MyFB are executed error-free, MyOutputBool has signal "1".

## See also

Basics of the EN/ENO mechanism (Page 1357)

### Example of the simulation of the EN/ENO mechanism in STL

#### Description

The following example shows an program section for adding values with EN and ENO connected:

STL	Description
A"Tag_Input_1"	// Query whether the signal state of the operand is "1" and AND with current RLO
JNBMyLABEL	// Evaluation of the EN input // If RLO="0" jump to jump label "MyLABEL" and save the current RLO in the BR // Execute next instruction if RLO="1"
L"Tag_Input_2"	// Load first value of addition
L"Tag_Input_3"	// Load second value of addition
+I	// Add values
T "Tag_Result"	// Transfer sum to the operand "Tag_Result"
AN OV	// Query if errors occurred
SAVE	// Transfer signal state of the RLO to the BR bit
CLR	// Reset RLO to "0"
MyLABEL: U BR	// Jump label "MyLABEL" // Query BR and AND with RLO
= "Tag_Output"	// Assign signal state of the RLO to the operand "Tag_Output"

The query of the operand "U" Tag\_Input\_1"" provides the result of the preceding logic operation (RLO). The instruction "Jump at RLO = 0 and save RLO (SPBNB)" saves the RLO to the BR. The instruction "Jump if RLO = 0 and save RLO" also evaluates the RLO and executes one of the following actions depending on the evaluation:

- If the RLO is "0", the processing of the program is continued at the jump label "MyLABEL" with the query of the BR. The addition is not executed. Assign the current RLO to the operand "Tag\_Output".
- If the RLO is "1", the addition is executed. A query of the overflow bit (OV) shows if an error occurred during the addition. The query result is saved in the BR. The operation "CLR" resets the RLO to "0". The BR is then queried for "1" and AND'd with the current RLO. The result is assigned to the operand "Tag\_Output". The signal state of the BR and of the operand "Tag\_Output" shows if the addition was carried out with any error

## 9.1.2 Declaring PLC tags

### 9.1.2.1 Overview of PLC tag tables

#### Introduction

PLC tag tables contain the definitions of the PLC tags and symbolic constants that are valid throughout the CPU. A PLC tag table is created automatically for each CPU used in the project. You can create additional tag tables and use these to sort and group tags and constants.

In the project tree there is a "PLC tags" folder for each CPU of the project. The following tables are included:

- "All tags" table
- Standard tag table
- Optional: Other user-defined tag tables

#### All tags

The "All tags" table gives an overview of all PLC tags, user constants and system constants of the CPU. This table cannot be deleted or moved.

#### Standard tag table

There is one standard tag table for each CPU of the project. It cannot be deleted, renamed or moved. The default tag table contains PLC tags, user constants and system constants. You can declare all PLC tags in the default tag table, or create additional user-defined tag tables as you want.

#### User-defined tag tables

You can create multiple user-defined tag tables for each CPU to group tags according to your requirements. You can rename, gather into groups, or delete user-defined tag tables. User-defined tag tables can contain PLC tags and user constants.

#### See also

Structure of the PLC tag tables (Page 1364)

Using tags within the program (Page 1237)

Basics of constants (Page 1238)

### 9.1.2.2 Structure of the PLC tag tables

#### Introduction

Each PLC tag table contains a tab for tags and a tab for user constants. The default tag table and the "All tags" table also have a "System constants" tab.

#### Structure of the "PLC tags" tab

In the "Tags" tab you declare the global PLC tags that you require in the program. The following figure shows the tab structure. The number of columns shown may vary.

	Name	Data type	Address	Retain	Visible in HMI	Accessible from HMI	Comment
	Motor1	Bool	%Q3.1	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	
	Motor2	Bool	%Q3.2	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	
	Control	Bool	%I3.3	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	

The following table shows the meaning of the individual columns. The number of columns shown may vary. You can show or hide the columns as required.

Column	Description
	Symbol you can click on to drag-and-drop a tag to a program for use as an operand.
Name	Unique name for the constants throughout the CPU.
Data type	Data type of the tags.
Address	Tag address.
Retain	Marks the tag as retentive. The values of retentive tags are retained even after the power supply is switched off.
Accessible from HMI	Shows whether HMI can access this tag during runtime.
Visible in HMI	Shows whether the tag is visible by default in the operand selection of HMI.
Monitor value	Current data value in the CPU. This column only appears if an online connection is established and you select the "Monitor all" button.
Tag table	Shows which tag table includes the tag declaration. This column is only available in the "All tags" table.
Comment	Comment to document the tags.

#### Structure of the "User constants" and "System constants" tabs

In the "User constants" you define symbolic constants that are valid throughout the CPU. The constants required by the system are shown in the "Systems constants" tab. System constants can be hardware IDs, for example, which can be used for identification of modules.

The following figure shows the structure of both tabs. The number of columns shown may vary.

	Name	Data type	Value	Comment
	Const_1	Bool	true	
	Const_2	Byte	12	
	Const_3	Bool	false	
	Const_4	Real	1.0	

The following table shows the meaning of the individual columns. You can show or hide the columns as required.

Column	Description
	Symbol you can click to move a tag into a network via a drag-and-drop operation for use as an operand.
Name	Unique name for the constants throughout the CPU.
Data type	Data type of the constants
Value	Value of the constants
Tag table	Shows which tag table includes the constant declaration. This column is only available in the "All tags" table.
Comment	Comments to document the tags.

Editing tables (Page 284)

### 9.1.2.3 Rules for PLC tags

#### Valid names of PLC tags

#### Permissible characters

The following rules apply to the use of names for PLC tags:

- Letters, numbers, special characters are permitted.
- Quotation marks are not permitted.

### Unique tag names

The names of the PLC tags must be unique throughout the CPU, even if the tags are located in different tag tables of a CPU. A name that is already used for a block, another PLC tag or a constant within the CPU, cannot be used for a new PLC tag. The uniqueness check does not differentiate between use of small and capital letters.

If you enter an already assigned name another time, a sequential number is automatically appended to the second name entered. For example, if you enter the name "Motor" a second time, the second entry is changed to "Motor(1)".

### Unique table names

The names of the PLC tag tables must also be unique throughout the CPU. A unique name is automatically suggested when user-defined PLC tag tables are being created.

### See also

Using tags within the program (Page 1237)

Permissible addresses and data types of PLC tags (Page 1366)

Keywords (Page 1231)

### Permissible addresses and data types of PLC tags

The addresses of PLC tags are made up of the particulars of the operand area and the address within this area.

The addresses must be unique throughout the CPU. If you enter an address that is already assigned to another tag, the address will be highlighted at both places in yellow and an error message will be issued.

## Operand areas

The following table shows the possible operand areas. The available data types depend on the CPU you use:

Operand area		Description	Data type	Format	Address area:		
International mnemonics	German mnemonics				S7-1200	S7-300/400	S7-1500
I	E	Input bit	BOOL	I x.y E x.y	0.0..1023.7	0.0..65535.7	0.0..32767.7
I	E	Input (64-bit)	LWORD, LINT, ULINT, LTIME, LTOD, LDT, LREAL, PLC data type	I x.0 E x.0	-	-	0.0..32760.0
IB	EB	Input byte	BYTE, CHAR, SINT, USINT, PLC data type	IB x EB y	0..1023	0..65535	0..32767
IW	EW	Input word	WORD, INT, UINT, DATE, S5TIME, PLC data type	IW x EW y	0..1022	0..65534	0..32766
ID	ED	Input double word	DWORD, DINT, UDINT, REAL, TIME, TOD, PLC data type	ID x ED y	0..1020	0..65532	0..32764
Q	A	Output bit	BOOL	Q x.y A x.y	0.0..1023.7	0.0..65535.7	0.0..32767.7
Q	A	Output (64-bit)	LWORD, LINT, ULINT, LTIME, LTOD, LDT, LREAL, PLC data type	Q x.0 A x.0	-	-	0.0..32760.0
QB	AB	Output byte	BYTE, CHAR, SINT, USINT, PLC data type	QB x AB y	0..1023	0..65535	0..32767
QW	AW	Output word	WORD, INT, UINT, DATE, S5TIME, PLC data type	QW x AW y	0..1022	0..65534	0..32766

9.1 Creating the user program

Operand area		Description	Data type	Format	Address area:		
International mnemonics	German mnemonics				S7-1200	S7-300/400	S7-1500
QD	AD	Output double word	DWORD, DINT, UDINT, REAL, TIME, TOD, PLC data type	QD x AD y	0..1020	0..65532	0..32764
M	M	Memory bit	BOOL	M x.y	0.0..8191.7	0.0..65535.7	0.0..16383.7
M	M	Bit memory (64-bit)	LREAL	M x.0	0.0..8184.0	-	0.0..16376.0
M	M	Bit memory (64-bit)	LWORD, LINT, ULINT, LTIME, LTOD, LDT	M x.0	-	-	0.0..16376.0
MB	MB	Memory byte	BYTE, CHAR, SINT, USINT	MB x	0..8191	0..65535	0..16383
MW	MW	Memory word	WORD, INT, UINT, DATE, S5TIME	MW x	0..8190	0..65534	0..16382
MD	MD	Memory double word	DWORD, DINT, UDINT, REAL, TIME, TOD	MD x	0..8188	0..65532	0..16380
T	T	Time function (for S7-300/400 only)	Timer	T n	-	0..65535	0..2047
C	Z	Counter function (for S7-300/400 only)	Counter	Z n C n	-	0..65535	0..2047

Addresses

The following table shows the possible addresses of tags:

Data type	Address	Example
BOOL	Tags with BOOL data type are addressed with a byte number and a bit number. The numbering of the bytes begins for each operand area at 0. The numbering of the bits goes from 0 to 7.	A 1.0
BYTE, CHAR, SINT, USINT	Tags with BYTE, CHAR, SINT, and USINT data type are addressed with a byte number.	MB 1

Data type	Address	Example
WORD, INT, UINT, DATE, S5TIME	Tags with WORD, INT, UINT, DATE, S5TIME data type consist of two bytes. They are addressed with the number of the lowest byte.	IW 1
DWORD, DINT, UDINT, REAL, TIME, TOD	Tags with DWORD, DINT, UDINT, REAL, TIME, TOD data type consist of four bytes. They are addressed with the number of the lowest byte.	AD 1
LWORD, LINT, ULINT, LTIME, LTOD, LDT, LREAL	Tags of data type LWORD, LINT, ULINT, LTIME, LTOD, LDT, and LREAL consist of eight bytes. They are addressed with it number 0 and the number of the lower byte.	I 1.0

### Mnemonics used

The addresses that you enter in the PLC tag table are automatically adapted to the set mnemonics.

### See also

- Setting the mnemonics (Page 1422)
- Using tags within the program (Page 1237)
- Valid names of PLC tags (Page 1365)
- Overview of the valid data types (Page 1262)

## 9.1.2.4 Creating and managing PLC tag tables

### Creating a PLC tag table

You can create multiple user-defined PLC tag tables in a CPU. Each tag table must have a unique name throughout the CPU.

### Requirement

The project view is open.

### Procedure

To create a new PLC tag table, follow these steps:

1. Open the "PLC tags" folder under the CPU in the project tree.
2. Double-click the "Add new tag table" entry.  
A new PLC tag table with the default name "TagTable\_x" is created.
3. Select the PLC tag table in the project tree.

4. Select the "Rename" command in the shortcut menu.
5. Type in a name that is unique throughout the CPU.

### Result

A new PLC tag table is created. You can now declare tag and constants in this table.

### See also

Overview of PLC tag tables (Page 1363)

Structure of the PLC tag tables (Page 1364)

### Grouping PLC tag tables

You can gather the user-defined tag tables of the CPU into groups. You cannot, however, move the standard tag table and the "All tags" table into a group.

### Requirement

Multiple user-defined tag tables are contained in the "PLC tags" folder of the CPU.

### Procedure

To gather multiple PLC tag tables into a group, follow these steps:

1. Select the "PLC tags" folder under the CPU in the project tree.
2. Select the "Insert > Group" menu command.  
A new group with the standard name "Group\_x" is inserted.
3. Select the newly inserted group in the project tree.
4. Select the "Rename" command in the shortcut menu.
5. Assign the new group a unique name throughout the CPU.
6. Drag to the new group the tables you want to group together.

### Result

The tag tables are gathered in the new group.

### See also

Overview of PLC tag tables (Page 1363)

Structure of the PLC tag tables (Page 1364)

## Opening the PLC tag table

### Procedure

To open the PLC tag table in a CPU, proceed as follows:

1. Open the "PLC tags" folder under the CPU in the project tree.
2. Double-click the PLC tag table in the folder.
3. Select the desired tab in the upper corner.

### Result

The PLC tag table associated with the CPU opens. You can declare the required tags and constants.

### See also

- Overview of PLC tag tables (Page 1363)
- Structure of the PLC tag tables (Page 1364)

## 9.1.2.5 Declaring PLC tags

### Entering a PLC tag declaration

### Declaring tags in the PLC tag table

### Requirements

The "Tags" tab of the PLC tag table is open.

### Procedure

To define PLC tags, follow these steps:

1. Enter a tag name in the "Name" column.
2. Enter the required data type in the "Data type" column. You will be supported by autocompletion during input.  
An address corresponding to the data type is automatically appended.
3. Optional: Click on the arrow key in the "Address" column and enter an operand identifier, an operand type, an address and a bit number in the dialog which then opens.
4. Optional: Enter a comment in the "Comments" column.
5. Repeat steps 1 to 4 for all the tags you require.

See also: Permissible addresses and data types of PLC tags (Page 1366)

## Syntax check

A syntax check is performed automatically after each entry, and any errors found are displayed in red. You do not have to correct these errors immediately - you can continue editing and make any corrections later. As long as the tag declaration contains syntax errors and the tag is used in the program, you will not be able to compile the program.

## See also

- Valid names of PLC tags (Page 1365)
- Declaring PLC tags in the program editor (Page 1372)
- Structure of the PLC tag tables (Page 1364)
- Editing tables (Page 284)

## Declaring PLC tags in the program editor

### Requirement

- The program editor is open.

### Procedure

To declare operands as global PLC tags, follow these steps:

1. Insert an instruction in your program.  
The "<???", "<???.?>" or "..." strings represent operand placeholders.
2. Replace an operand placeholder with the name of the PLC tag to be created.
3. Select the tag name.  
If you want to declare multiple PLC tags, select the names of all the tags to be declared.
4. Select the "Define tag" command in the shortcut menu.  
The "Define tag" dialog box opens. This dialog displays a declaration table in which the name of the tag is already entered.
5. Click the arrow key in the "Section" column and select one of the following entries:
  - Global Memory
  - Global Input
  - Global Output
6. In the other columns, enter the address, data type, and comments.  
See also: Permissible addresses and data types of PLC tags (Page 1366)
7. If the CPU contains multiple PLC tag tables, you can use an entry in the "PLC tag table" column to indicate in which table the tag is to be inserted. If you make no entry in the column, the new tag will be inserted in the default tag table.
8. Click the "Define" button to complete your entry.

## Result

The tag declaration is written to the PLC tag table and is valid for all blocks in the CPU.

## See also

Valid names of PLC tags (Page 1365)  
Editing tables (Page 284)  
Declaring tags in the PLC tag table (Page 1371)

## Setting the retentivity of PLC tags

### Retentive behavior of PLC tags

#### Retentive PLC tags

Each CPU has a memory area whose content remains available even after the supply voltage has been switched off. This area is referred to as retentive memory area.

To avoid data loss during power failure, you can save specific PLC tags to this memory area. You specify the retain setting of PLC tags in the PLC tag table.

Depending on the CPU family, the retentive memory area can accommodate various type of PLC tags. The following table provides an overview of the options of the various CPUs:

CPU type	Retentive bit memories	Retentive SIMATIC timers	Retentive SIMATIC counters
S7-300/400 series	✓	-	-
S7-1200 series	✓	-	-
S7-1500 series	✓	✓	✓

## See also

Setting the retentive behavior of PLC tags (Page 1373)

## Setting the retentive behavior of PLC tags

### Introduction

In the PLC tag table you can specify the width of the retentive memory area for PLC tags. All tags with addresses in this memory area are then designated as retentive. You can recognize the retentivity setting of a tag by the check mark set in the "Retain" column of the PLC tag table.

### Requirement

The "PLC tags" tab of the PLC tag table is open.

## Procedure

To define the width of the retentive memory area for PLC tags, follow these steps:

1. On the toolbar, click the "Retain" button.  
The "Retain memory" dialog will open.
2. Specify the width of the retentive memory area by entering the number of retentive bytes, timers or counters in the input field.
3. Click the "OK" button.

## Result

The width of the retentive memory area is defined. In the "Retain" column of the tag table a check mark is automatically set for all tags that are located within the retentive memory area.

### 9.1.2.6 Grouping PLC tags for inputs and outputs in structures

#### Other useful information regarding structured PLC tags

#### Use of structured PLC tags (S7-1200 V4 and higher/S7-1500)

To make your program easier to view, you can group several input or output addresses in a higher-level PLC tag. The higher-level PLC tag represents a structure that contains several logically related inputs or outputs. When the block is called, you transfer the higher-level tag and thus need only an input or output parameter for all associated inputs or outputs.

#### Principle of operation

To create a structured PLC tag, you initially define a PLC data type (UDT). In it you declare the necessary data elements and specify their names and data types.

Then, you switch to the PLC tag table and specify the higher-level PLC tag there. As a data type for the tag, you select your PLC data types. The system now reserves a certain number of input or output addresses starting from the start address of the higher-level tag. The number of reserved addresses depends on the length of your PLC data type.

If you call a block that requires the reserved inputs or outputs for program execution, you transfer the higher-level tag as a block parameter.

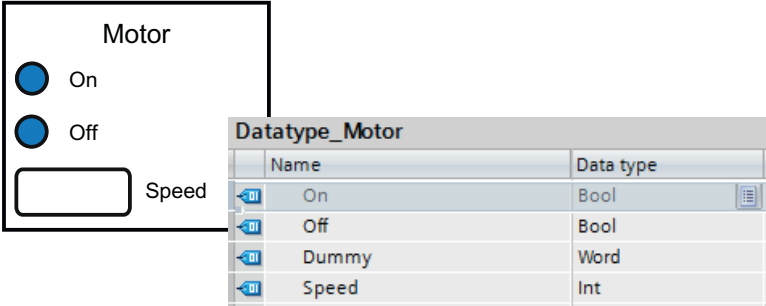

You can address the individual PLC tags like structure elements in the program code.

A detailed description of the individual handling steps can be found in the following chapters.

**Application example**

You can use structured PLC tags in order to group the inputs or outputs of a function module. The following figure shows the schematic representation of a motor: A component was created in the "Datatype\_Motor" PLC data type for each of the three inputs.

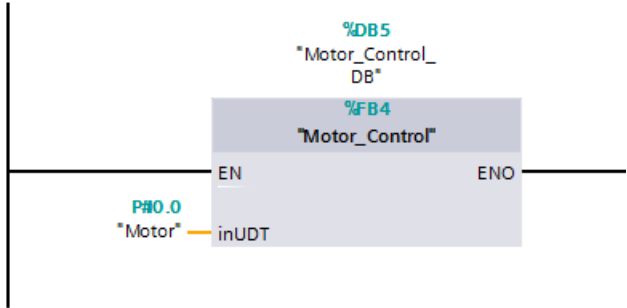

The memory areas of the declared tags must not overlap. In the example, you see that the "Speed" component has the data type "Integer" and therefore must start at a word address. For this reason, the first input word has been filled with the "Dummy" fill tag. This means that "Speed" is located on the second input word.

The following figure shows the higher-level "Motor" PLC tag that is based on the "Datatype\_Motor" data type. With the declaration of "Motor", the addresses IW0 and IW1 are reserved on the input module.

MyTagTable			
	Name	Data type	Address
1	Motor	*Datatype_Motor*	%I0.0
2	<Add new>		

The following figure shows the transfer of the "Motor" PLC tag as an input parameter of the "Motor\_Control" block.

You can address the individual components of the tag in the "Motor\_Control" block.

Addressing	Description
"Motor"	Addressing the higher-level PLC tag.
"Motor".On	Addressing a component of a structured PLC tag.
"Motor".On:P	Addressing an I/O input or output (PI or PO).

### Rules for use of structured PLC tags

Note the following rules when creating and using structured PLC tags.

- Structured PLC tags can be used in the "Inputs" and "Outputs" operand areas.
- Structured tags are not permitted in the bit memory address area.
- Structured PLC tags cannot be addressed from HMI.

Observe the following rules when creating the PLC data type that is to serve as the basis for a PLC tag:

- The memory areas of the individual elements must not overlap.  
See also: Permissible addresses and data types of PLC tags (Page 1366)
- Do not group inputs and outputs in one PLC data type but create different PLC data types for inputs and outputs.
- Do not group inputs or outputs from different modules in a PLC data type because it is not guaranteed that the process images of the modules are updated synchronously.
- In the lower-level PLC data types, all data types are permitted except for the "STRING" data type.

### See also

Creating structured PLC tags (Page 1376)

### Creating structured PLC tags

#### Rules

Note the following rules when creating structured PLC tags:

- Use separate PLC data types for the "Inputs" and "Outputs" operand areas.
- Structured tags are not permitted in the bit memory address area.
- Do not group inputs or outputs from different modules in a PLC data type because it is not guaranteed that the process images of the modules are updated synchronously.

## Procedure

To create a structured PLC tag, follow these steps:

1. Double-click the "Add new data type" command in the "PLC data types" folder in the project tree.  
A new declaration table for creating a PLC data type will be created and opened.
2. Declare all the necessary components in the PLC type. All data types except the "STRING" data type are permitted.
3. Select the PLC data type in the project tree and select the "Compile > Software (only changes)" command from the shortcut menu.  
The PLC data type is compiled and can then be used in the PLC tag table.  
Even when you make changes to existing PLC data types, you must recompile the program.  
This updates all locations of use of the PLC data type.
4. Open a PLC tag table within the same CPU.
5. Declare a new tag or select an existing tag.
6. In the "Data type" column, select the PLC data type and assign it to the PLC tag.  
The PLC tag receives the structure of the PLC data type. A suitable address is assigned automatically. Structured PLC tags always start at word addresses.  
The highest structure element is displayed without its subelements in the table.

---

### Note

#### Assignment rules and default values

- For the declaration of the PLC data type, note that the memory areas of the individual tags must not overlap. For example, tags of data type "Integer" must start at a word limit. If necessary, insert "fill tags" to prevent overlaps.  
See also: Permissible addresses and data types of PLC tags (Page 1366)
  - It is not possible to assign default values for the individual components. Values that you enter in the "Default value" column are not evaluated. Tags of data types "DT" and "DTL" may therefore contain invalid values.
-

Other useful information regarding structured PLC tags (Page 1374)

### 9.1.2.7 Declaring global constants

#### Rules for global constants

#### Permitted characters

Names of global constants may consist of the following characters:

- Letters, numbers, special characters are permitted.
- Quotation marks are not permitted.

### Unique constant names

The names of global constants must be unique throughout the CPU, even if the constants are located in different tag tables of a CPU. A name that is already used for a block, a PLC tag or another constant within the CPU, cannot be used for new constant. The uniqueness check does not differentiate between use of small and capital letters.

If you enter an already assigned name another time, a sequential number is automatically appended to the second name entered. For example, if you enter the name "Motor" a second time, the second entry is changed to "Motor(1)".

### Permitted data types

For constants, all data types supported by the CPU are permitted, with the exception of structured data types.

### Permitted values

You can select any value from the value range of the specified data type as constant value. For information on the value ranges, refer to the "Data types" chapter.

See also: Auto-Hotspot

### See also

Basics of constants (Page 1238)

Declaring global constants (Page 1378)

## Declaring global constants

### Introduction

You declare constants in the "User constants" tab of a PLC tag table. During declaration you have to enter a symbolic name, a data type and a fixed value for each constant. You can select any value from the value range of the specified data type as constant value. For information on the value ranges, refer to the "Data types" chapter.

See also: Auto-Hotspot

### Procedure

To declare constants, follow these steps:

1. Open a PLC tag table.
2. Open the "User constants" tab.  
The constants table opens.
3. Enter a constant name in the "Name" column.
4. Enter the required data type in the "Data type" column. You will be supported by autocompletion during input.

5. Enter a constant value in the "Value" column; this constant value must be valid for the selected data type.
6. If you want, enter comments on the constants in the "Comments" column. The entry of a comment is optional.
7. If you want to declare additional constants, place the cursor in the next row and repeat steps 3 to 6.

### Syntax check

A syntax check is performed automatically after each entry, and any errors found are displayed in red. You do not have to correct these errors immediately - you can continue editing and make any corrections later. As long as the tag declaration contains syntax errors and the constant is used in the program, you will not be able to compile the program.

## 9.1.2.8 Editing properties

### Editing the properties of PLC tags

#### Properties of PLC tags

#### Overview

The following table provides an overview of the properties of PLC tags. The display of properties may vary depending on the CPU type.

Group	Property	Description
General	Name	A unique name within the CPU.
	Data type	Data type of the tags.
	Address	Tag address.
	Retain	Shows whether the tag is in the retentive memory area.
	Comment	Comment on the tag.
History	Date created	Time when the tag was created (cannot be changed).
	Last modified	Time when the tag was last changed (cannot be changed).

Group	Property	Description
Usage	Visible in HMI	Shows whether the tag is visible by default in the HMI selection list.
	Accessible from HMI	Shows whether HMI can access this tag during runtime.

**See also**

Editing the properties of PLC tags (Page 1380)

**Editing the properties of PLC tags**

**Editing properties in a PLC tag table**

To edit the properties of one or more tags, follow these steps:

1. In the project tree, double-click the PLC tag table that contains the tags.  
The PLC tag table opens.
2. Change the entries in the columns.

**Editing addresses in the program editor**

To edit the address of a tag in the program editor, follow these steps:

1. Select the tag name.
2. Select the "Rewire tag" command in the shortcut menu.  
The "Rewire tag" dialog will open. The dialog shows a declaration table.
3. Enter the new address in the "Address" column.
4. Click the "Change" button to confirm the input.

**Editing names in the program editor**

To edit the name of a tag in the program editor, follow these steps:

1. Select the tag name.
2. Select the "Rename tag" command in the shortcut menu.  
The "Rename tag" dialog opens. The dialog shows a declaration table.
3. Enter the new name in the "Name" column.
4. Click the "Change" button to confirm the input.

**Effect in the program**

In the case of a change of the tag's name, data type or address, each location of use of the tag is automatically updated in the program.

**See also**

Properties of PLC tags (Page 1379)

**Editing properties of global constants****Properties of global constants****Overview**

The following table gives an overview of the properties of constants:

Group	Property	Description
General	Name	A unique name within the table
	Data type	Data type of the constants
	Value	Value that you defined for the constants. This value must be compatible with the declared data type. See also: Auto-Hotspot
	Comment	Comment on the constants
History	Date created	Time when the constant was created (cannot be changed)
	Last modified	Time when the constant was last changed (cannot be changed)

**Editing properties of global constants****Editing properties in a PLC tag table**

To edit the properties of one or more constants, follow these steps:

1. In the project tree, double-click the PLC tag table that contains the constants.  
The PLC tag table opens.
2. Open the "User constants" tab.
3. Change the entries in the "Name", "Data type", "Value", or "Comments" column.

**Effect in the program**

In the case of a change of a constant's name, data type or value, each location of use of the constant is automatically updated in the program.

Editing tables (Page 284)

### 9.1.2.9 Monitoring of PLC tags

#### Monitoring of PLC tags

You can monitor the current data values of the tags on the CPU directly in the PLC tag table.

#### Requirements

An online connection to the CPU is available.

#### Procedure

To monitor the data values, proceed as follows:

1. Open a PLC tag table.
2. Start monitoring by clicking the "Monitor all" button.  
The additional "Monitor value" column is displayed in the table. This shows the current data values.
3. End the monitoring by clicking the "Monitor all" button again.

---

#### Note

You also have the option of copying PLC tags to a monitor or force table so that you can monitor, control or force them in the table.

---

#### See also

Structure of the PLC tag tables (Page 1364)

Introduction to testing with the watch table (Page 1713)

Introduction for testing with the force table (Page 1740)

Copying entries in the PLC tag table (Page 1383)

### 9.1.2.10 Editing PLC tag tables

#### Inserting a table row in the PLC tag table

#### Procedure

Proceed as follows to insert a row above the selected row:

1. Select the row in front of which you want to insert a new row.
2. Click the "Insert row" button on the toolbar of the table.

## Result

A new row is inserted above the selected row.

## See also

Editing tables (Page 284)

## Copying entries in the PLC tag table

You can copy PLC tags within a table or to other tables.

## Procedure

To copy a tag, follow these steps:

1. Select the tags you want to copy.  
You can also select several tags by clicking on them one after the other while holding down the <Ctrl> key or by pressing and holding down <Shift> and clicking on the first and last tag.
2. Select "Copy" in the shortcut menu.
3. Position the insertion pointer at the location where you want to insert the tags.
4. Select "Paste" in the shortcut menu.

Or

1. Select the tag.
2. Hold down the left mouse button.
3. At the same time, press <Ctrl>.
4. Drag the tag to the destination.

## Result

- The tag is copied to the destination.
- If there is a name conflict, a number is automatically appended to the tag name. For example, "Tag" becomes "Tag(1)".
- All other properties of the tag remain unchanged.

## See also

Editing tables (Page 284)

## Deleting entries in the PLC tag table

### Procedure

Follow the steps below to delete elements:

1. Select the row with the element to be deleted. You can also select several rows by clicking on them one after the other while holding down the <Ctrl> key or by pressing and holding down <Shift> and clicking on the first and last row.
2. Select the "Delete" command in the shortcut menu.

### See also

Editing tables (Page 284)

## Sorting rows in the PLC tag tables

You can sort the rows in the tables alphanumerically by name, data type, or address.

### Procedure

To sort the table rows, follow these steps:

1. Select the column by which you want to sort.
2. Click the column header.  
The column will be sorted in order of increasing values.  
An up arrow shows the sort sequence.
3. In order to change the sort sequence, click the arrow.  
The column will be sorted in order of decreasing values. A down arrow shows the sort sequence.
4. To restore the original sequence, click a third time on the column header.

### See also

Editing tables (Page 284)

## Automatically filling in cells in the PLC tag table

You can load the contents of one or several table cells into the cells below, automatically filling in the successive cells.

If you automatically fill in cells in the "Name" column, a consecutive number will be appended to each name. For example, "Motor" will become "Motor\_1".

If you fill the cells in the column "Address" automatically, the addresses will be increased depending on the indicated data type.

## Procedure

To automatically fill in successive cells, follow these steps:

1. Select the cells to be loaded.
2. Click the "Fill" symbol in the bottom right corner of the cell.  
The mouse pointer is transformed into a crosshair.
3. Keep the mouse button pressed and drag the mouse pointer downwards over the cells that you want to fill in automatically.
4. Release the mouse button.  
The cells are filled in automatically. If entries are already present in the cells that are to be automatically updated, a dialog appears in which you can indicate whether you want to overwrite the existing entries or whether you want to insert new rows for the new tags.

## See also

Editing tables (Page 284)

## Show and hide table columns

You can show or hide the columns in a table as needed.

## Procedure

To show or hide table columns, follow these steps:

1. Click a column header.
2. Select the "Show/Hide" command in the shortcut menu.  
The selection of available columns is displayed.
3. To show a column, select the column's check box.
4. To hide a column, clear the column's check box.

## See also

Editing tables (Page 284)

## Editing PLC tags with external editors

## Basics for importing and exporting

## Introduction

You can export PLC tag tables to a standardized XLSX format for editing with external table editors. Similarly, you can import PLC tag tables created with external table editors to the TIA Portal.

### Overwriting existing PLC tags and constants during import

Existing entries of the same name will be overwritten during import if they have the same name as the entries that will be imported.

### Link to existing objects

References to PLC tags or constants that already exist in the project are updated automatically during import. The update is executed based on the name of the PLC tags and constants.

### See also

Format of the export file (Page 1386)

Exporting PLC tags (Page 1387)

Importing PLC tags (Page 1387)

### Format of the export file

#### Introduction

During the export of PLC tag tables, a standardized XSLX format will be generated that you can edit with external table editors.

This format is also expected during the import of tables.

#### Format of the export file

The sheet is always named "PLC Tags". This sheet can contain the displayed columns. The sorting order of columns can vary. The sheet does not necessarily have to include all columns. During import, the following values will be identified by a <no value> entry.

The names of the column headers are also clearly defined and are always expected in English.

The following table specifies the contents expected for the individual columns:

Element	Explanation
Name	Name of the tags
Path	Group and name of the PLC tag table
Data Type	The notation of the data type corresponds to the notation used in the PLC tag table.
Logical Address	The address can be specified with German or international mnemonics.
Comment	Free-form comments
Hmi Visible	The value TRUE or FALSE is expected.
Hmi Accessible	The value TRUE or FALSE is expected.

## See also

Basics for importing and exporting (Page 1385)  
Exporting PLC tags (Page 1387)  
Importing PLC tags (Page 1387)

## Exporting PLC tags

### Requirement

A PLC tag table is open.

### Procedure

To export PLC tags and constants, follow these steps:

1. In the PLC tag table, click the "Export" button.  
The "Export to Excel" dialog opens.
2. Select the path to which you want to save the export file.
3. Select whether to export tags and/or constants.
4. Click the "OK" button.

### Result

The export file will be generated. Errors and warnings generated during export are indicated in the "Info" tab of the Inspector window.

## See also

Basics for importing and exporting (Page 1385)  
Format of the export file (Page 1386)  
Importing PLC tags (Page 1387)

## Importing PLC tags

### Requirement

A table exists and it conforms to format specifications.

## Procedure

To import a PLC tag table, follow these steps:

1. Open the "All tags" table.
2. Click the "Import" button.  
The "Import from Excel" dialog opens.
3. Select whether to import PLC tags and/or constants.
4. Select the table you want to import.
5. Click the "OK" button.

## Result

The PLC tag table will be imported.

Errors and warnings generated during export are indicated in the "Info" tab of the Inspector window.

## See also

Basics for importing and exporting (Page 1385)

Format of the export file (Page 1386)

Exporting PLC tags (Page 1387)

## Editing individual PLC tags with external editors

To edit individual PLC tags in external editors outside the TIA portal, you can export or import these tags using copy and paste. However, you cannot copy structured tags to an editor.

## Requirement

A PLC tag table and an external editor are opened.

## Procedure

To export and import individual PLC tags, follow these steps:

1. Select one or more PLC tags.
2. Select "Copy" in the shortcut menu.
3. Switch to the external editor and paste the copied tags.
4. Edit the tags as required.
5. Copy the tags in the external editor.
6. Switch back to the PLC tag table.
7. Select "Paste" in the shortcut menu.

---

**Note**

You also have the option of export or importing PLC tags as mass data.

See also: Auto-Hotspot

---

## 9.1.3 Creating and managing blocks

### 9.1.3.1 Creating blocks

#### Block folder

#### Function

You can find a "Program blocks" folder in the project tree, in which you can create and manage the following blocks:

- Organization blocks (OB)
- Function blocks (FB)
- Functions (FCs)
- Data blocks (DB)

A "System blocks" subfolder containing another subfolder, "Program resources", is also created in the "Program blocks" folder the first time you drag an instruction to your program which is an internal system function block. The instance data block of the internal system function block is also pasted to the "Program resources" folder. You can move or copy such instance data blocks from the "Program resources" folder to any other folder and rename or delete them. You can also move your blocks into the "Program resources" folder. Blocks in the "Program resources" folder that are not required to run the user program are removed during the next compilation. If the "Program resources" folder contains no more blocks then it is also deleted with the "System blocks" folder.

A program cycle OB is automatically generated for each device and inserted in the "Program blocks" folder.

#### See also

Creating functions and function blocks (Page 1391)

Creating data blocks (Page 1392)

Creating organization blocks (Page 1390)

Using blocks from libraries (Page 1393)

## Creating organization blocks

### Requirement

The "Program blocks" folder in the project tree is open.

### Procedure

To create an organization block, follow these steps:

1. Double-click the "Add new block" command.  
The "Add new block" dialog box opens.
2. Click the "Organization block (OB)" button.
3. Select the type of new organization block.
4. Enter a name for the new organization block.
5. Enter the properties of the new organization block.
6. To enter additional properties for the new organization block, click "Additional information".  
An area with further input fields is displayed.
7. Enter all the properties you require.
8. Activate the "Add new and open" check box if the organization block does not open as soon as it is created.
9. Confirm your entries with "OK".

### Result

The new organization block is created. You can find the organization block in the project tree in the "Program blocks" folder. You can assign additional parameters to some organization blocks in the inspector window or device view after they have been created. The organization block description will state whether the newly created organization block has additional parameters.

### See also

- Entering a block title (Page 1399)
- Entering a block comment (Page 1400)

## Creating functions and function blocks

### Requirement

The "Program blocks" folder in the project tree is open.

### Procedure

To create a function (FC) or a function block (FB), follow these steps:

1. Double-click the "Add new block" command.  
The "Add new block" dialog box opens.
2. Click the "Function block (FB)" or "Function (FC)" button.
3. Enter a name for the new block.
4. Enter the properties of the new block.
5. To enter additional properties for the new block, click "Additional information".  
An area with further input fields is displayed.
6. Enter all the properties you require.
7. Activate the "Add new and open" check box if the block does not open as soon as it is created.
8. Confirm your entries with "OK".

### Result

The new block is created. You can find the block in the project tree in the "Program blocks" folder.

Entering a block comment (Page 1400)

## Creating data blocks

### Requirement

The "Program blocks" folder in the project tree is open.

### Procedure

To create a data block, follow these steps:

1. Double-click the "Add new block" command.  
The "Add new block" dialog box opens.
2. Click the "Data block (DB)" button.
3. Select the type of the data block. You have the following options available to you:
  - To create a global data block, select the list entry "Global DB".
  - To create an ARRAY data block, select the "ARRAY DB" entry in the list.
  - To create an instance data block, select the function block to which you want to assign the instance data block from the list. The list contains only the function blocks that were previously created for the CPU.
  - To create a data block based on a PLC data type, select the PLC data type from the list. The list contains only the PLC data types that were previously created for the CPU.
  - To create a data block based on a system data type, select the system data type from the list. The list contains only those system data types that have already been inserted to program blocks in the CPU.
4. Enter a name for the data block.
5. Enter the properties of the new data block.
6. If you have selected an ARRAY DB as the data block type, enter the ARRAY data type and the high limit for the ARRAY.  
You can change the high limit for the ARRAY at any time in the property window of the created block. The ARRAY data type cannot be changed subsequently.
7. To enter additional properties of the new data block, click "Additional information".  
An area with further input fields is displayed.
8. Enter all the properties you require.
9. Activate the "Add new and open" check box if the block does not open as soon as it is created.
10. Confirm your entry with "OK".

### Result

The new data block is created. You can find the data block in the project tree in the "Program blocks" folder.

## See also

Basics of block access (Page 1209)  
System data types (Page 1307)

## Using blocks from libraries

You can save blocks in the project library or in a global library, so that you can use them more than once within a user program. You can insert the blocks as master copies or as types.

See also: Library basics (Page 383)

## Requirement

- The "Libraries" task card is displayed.
- No write protection is set for global libraries.

## Adding blocks as master copies to the project library or to a global library

To add new blocks as master copies to the project library or to a global library, follow these steps:

1. Maximize the project library or the global library.
2. Use drag-and-drop to move the block you wish to add to the library to the "Master copies" folder or any one of the "Master copies" subfolders in the project library or a global library. Do not release the left mouse button until a small plus sign appears underneath the mouse pointer.

Or:

1. Copy the element you want to add as master copy.
2. Maximize the project library or the global library.
3. Right-click the "Master copies" folder or any of its subfolders.
4. Select "Paste" in the shortcut menu.

### Adding blocks as types to the project library or to a global library

To add new blocks as types to the project library or to a global library, follow these steps:

1. Maximize the project library or the global library.
2. Drag-and-drop the element you want to add as a type into the "Types" folder or any of its subfolders in the project library or a global library. Do not release the left mouse button until a small plus sign appears underneath the mouse pointer.

Or:

1. Copy the element you want to add as a type.
2. Maximize the project library or the global library.
3. Right-click the "Types" folder or any of its subfolders.
4. Select "Paste" in the shortcut menu.

### Using blocks of the project library or a global library

To use a block from the project library or a global library in your project, follow these steps:

1. Maximize the project library or the global library so that you can see the block you wish to use.
2. Use a drag-and-drop operation to move the block to the CPU block folder. If the selected insertion points is not allowed, the mouse pointer will appear as a circle with a slash.

---

#### Note

If you derive an instance from a type in a global library, the type is also inserted into the project library. The instance is then only linked to the type in the project library.

---

Using libraries (Page 383)

## Copying and pasting blocks

### Basics of copying and pasting blocks

#### Function

You can also create new blocks by copying existing blocks and pasting the copy. Note the following principles when copying to CPUs of the same device family:

- You can copy organization blocks (OBs), functions (FCs), function blocks (FBs), and global data blocks (DBs) without restriction.
- You can copy instance data blocks only for the same function block, since the assignment to the function block cannot be changed afterwards. However, the assignment is canceled if you copy the instance data block to a different CPU. If a function block with the same name exists there, the instance data block will be assigned to this function block. If you copy the instance data block together with the function block into the other CPU, the instance data block is assigned to the copy of the function block.

The various device families sometimes support different blocks, especially in the case of organization blocks. However, function blocks and functions can also be programmed on the various devices with different access types. Therefore, not all blocks are supported on all devices. Note the following principles when copying to a different device family:

- Copying to an S7-1200 CPU:
  - Organization blocks with "Optimized" access type can be copied to an S7-1200. If the copied OB type is supported by the S7-1200 CPU, the copied OB retains the properties of its event. You must, however, compile it again.
  - Although organization blocks with the "Standard" access type can be copied to an S7-1200, they are not supported by the CPU.
  - Function blocks (FBs), functions (FCs) and global data blocks (DBs) with "Optimized" access type can be copied to an S7-1200. However, they must be recompiled after this.
  - Although function blocks (FBs), functions (FCs) and global data blocks (DBs) with "Standard" access type can be copied to an S7-1200, they are not supported by the CPU.
  - Instance data blocks: If there is a function block in the target CPU with the name that was assigned to the instance data block in the source CPU, the instance data block is assigned to the function block in the target CPU. If you copy the instance data block together with the function block to which it was assigned in the source CPU into the target CPU, the instance data block is assigned to the copy of the function block.
- Copying to an S7-1500 CPU:
  - Organization blocks with "Optimized" access type can be copied to an S7-1500. If the copied OB type is supported by the S7-1500 CPU, the copied OB retains the properties of its event. You must, however, compile it again. OB types that are not supported receive a no parking symbol.
  - Organization blocks with "Standard" access type can be copied to an S7-1500. If the OB derives from an S7-300/400 CPU, it receives the standard event of the corresponding OB type. If the OB derives from an S7-1200/1500 CPU, it receives the properties of its event. However, it must be compiled again.
  - Function blocks (FBs), functions (FCs) and global data blocks (DBs) with "Optimized" access type can be copied to an S7-1500. However, they must be recompiled after this.
  - Although function blocks (FBs), functions (FCs) and global data blocks (DBs) with "Standard" access type can be copied to an S7-1500, they are not supported by the CPU.
  - Instance data blocks: If there is a function block in the target CPU with the name that was assigned to the instance data block in the source CPU, the instance data block is assigned to the function block in the target CPU. If you copy the instance data block

together with the function block to which it was assigned in the source CPU into the target CPU, the instance data block is assigned to the copy of the function block.

- Copying to S7-300/400 CPUs:
  - Organization blocks can be copied as required between S7-300 and S7-400.
  - Although organization blocks from S7-1200/1500 CPUs can be copied to S7-300/400 CPUs, they are not supported by the target CPU.
  - Function blocks (FBs), functions (FCs) and global data blocks (DBs) can be copied as required between S7-300 and S7-400.
  - Although function blocks (FBs), functions (FCs) and global data blocks (DBs) can be copied from S7-1200/1500 CPUs to S7-300/400 CPUs, they are not supported by the target CPU.
  - Instance data blocks: If there is a function block in the target CPU with the name that was assigned to the instance data block in the source CPU, the instance data block is assigned to the function block in the target CPU. If you copy the instance data block together with the function block to which it was assigned in the source CPU into the target CPU, the instance data block is assigned to the copy of the function block.

In the project tree, blocks that are not supported are indicated by the no parking symbol. Blocks with a no parking symbol cannot be edited, but only used again as copy source.

## Copying data

With paste, all the block data is copied and forwarded to the copy. This data includes:

- Block interface tags
  - All networks
  - Comments in all existing compilations
  - Messages defined in the block
  - The entire program code of the copied block including the call instructions contained in the block.
- However, called blocks and their associated instance data blocks are not copied.

## Avoiding name conflicts during pasting

When pasting copied blocks with identical names to already existing blocks, the following mechanisms are used to avoid name conflicts:

- Pasting the copied block into the same CPU:

The copy of the block gets a name that is extended by a number. For example, if block "A" is copied, a possible name for the copy is "A\_1". Consecutive numbering is not used, but rather the smallest free number. The copy of block "A" can also get the name "A\_25", if no lower number is available.
- Pasting the copied block into another CPU:

A dialog box opens in which you can select whether the block with the same name will be replaced or the copied block will be pasted with a duplicate designation (Name\_Number).

---

**Note**

**Number conflicts**

Number conflicts may occur, if the pasted block has the same block number as an existing block. The block number is not automatically changed during pasting. This double number may have an effect on block calls. When you copy blocks you should therefore check the block number carefully and correct duplicate block numbers manually or using the block properties. Duplicate block numbers lead to a compilation error.

---

**See also**

Copying blocks (Page 1398)

Pasting blocks (Page 1398)

**Copying blocks**

**Requirement**

The "Program blocks" folder is opened in the project tree.

**Procedure**

To copy a block, follow these steps:

1. Right-click the block that you want to copy.
2. Select "Copy" in the shortcut menu.

**Result**

A copy of the block is now on the clipboard and can be pasted either into the same CPU or into another one.

**See also**

Basics of copying and pasting blocks (Page 1395)

Pasting blocks (Page 1398)

**Pasting blocks**

**Requirement**

You have copied a block.

## Procedure

To paste a copied block and its data into a CPU, follow these steps:

1. In the project tree, open the folder structure for the CPU into which you want to paste the copied block.

---

### Note

Please note that you can only paste the copied block into a CPU which supports the block programming language and type.

---

2. Right-click on the "Program blocks" folder.
3. Select "Paste" in the shortcut menu.
  - If you are pasting the block into the same CPU as the original block, "\_<consecutive number>" will be appended to the name of the copy.
  - If you are pasting the block into a different CPU where a block of the same name already exists, the "Paste" dialog box opens. Select the required option and confirm with "OK".

Basics of copying and pasting blocks (Page 1395)

Copying blocks (Page 1398)

## Entering a block title

The block title is the title of the block. It is not the same thing as the block name, which was assigned when the block was created. The length of the block title is restricted to one row. You can enter the block title for open and closed blocks.

## Requirement

A code block is available.

### Enter block title for open block

To insert the block title in an open block, follow these steps:

1. Click on the title bar of the block in the program editor.
2. Enter the block title.

### Enter block title for closed blocks

To insert the block title in a closed block, follow these steps:

1. Right-click the block in the project tree.
2. Select the "Properties" command in the shortcut menu.  
The dialog with the properties of the block opens.

3. Select the entry "Information" in the area navigation.
4. Enter the block title in the "Title" input field.
5. Confirm your entry with "OK".

### See also

Creating organization blocks (Page 1390)

Creating functions and function blocks (Page 1391)

Entering a block comment (Page 1400)

### Entering a block comment

You can use the block comment to document the entire code block. For example, you can indicate the purpose of the block or draw attention to special characteristics. You can enter the block comment for open and closed blocks.

### Requirement

A code block is available.

### Enter block comment for open blocks

To insert a block comment in an open block, proceed as follows:

1. Click the small arrow in front of the block title.  
The right arrow becomes a down arrow, and the comment area is displayed.
2. Click "Comment" in the comment area.  
The "Comment" text passage is selected.
3. Enter the block comment.

### Enter block comments for closed blocks

To insert the block comment in a closed block, follow these steps:

1. Right-click the block in the project tree.
2. Select the "Properties" command in the shortcut menu.  
The dialog with the properties of the block opens.
3. Select the entry "Information" in the area navigation.
4. Enter the block comment in the "Comment" input field.
5. Confirm your entry with "OK".

### 9.1.3.2 Specifying block properties

#### Basics of block properties

#### Block properties

Each block has certain properties, which you can display and edit. These properties are used amongst other things to:

- Identify the block
- Display the memory requirements and the compilation status of the block
- Display the time stamp
- Display the reference information
- Specify the access protection

## See also

- Overview of block properties (Page 1401)
- Block time stamps (Page 1404)
- Displaying and editing block properties (Page 1406)
- Setting the mnemonics (Page 1422)

#### Overview of block properties

#### Overview

The properties of the blocks are block and CPU-specific. Not all properties are therefore available for all blocks or in all CPU families. The following table gives an overview of block properties:

Group	Property	Description
General	Name	Unique block name within the station
	Constant name	Name of the constant pasted for the OB in the PLC tag table
	Type	Block type (cannot be changed)
	Number	Block number
	Event class	Event class of an OB (cannot be changed)

9.1 Creating the user program

Group	Property	Description
	Language	Programming language of the block
	Language in networks	Language used to program conditions in GRAPH blocks.
	Process image partition number	Display of the process image partitions that are assigned to the organization block (cannot be changed)
	ARRAY data type	Data type of an ARRAY data block (cannot be changed)
	ARRAY limit	High limit of an ARRAY data block The "Move operations" section of the "Instructions" task card offers options for addressing of ARRAY data blocks.
Information	Title	Block title
	Comment	Block comment
	Version	Version number of the block
	Family	Block family name
	Author	Name of the author, company name, department name, or other names
	User-defined ID	ID created by the user
Time stamps	Block	Times of creation and time of change of the block (cannot be changed)
	Interface	Time of creation of the block interface (cannot be changed)
	Code	Code modification time (non-editable)
	Data	Data modification time (non-editable)
Compilation	Status	Details of the last compilation run (cannot be changed)
	Lengths	Details of the block lengths (cannot be changed)
Protection	Protection	Setting up know-how protection and copy protection for the block See also: Protecting blocks
Attributes	Optimized block access	The tag declaration for blocks with optimized access contains only the symbolic names of the data elements. The system automatically optimizes and manages the addresses. The CPU performance increases and access errors, for example, from SIMATIC HMI, are prevented. See also: Auto-Hotspot
	IEC check	The compatibility of the operands in comparison operations and arithmetic operations are tested according to IEC 61131. You have to explicitly convert non-compatible operands. See also: Overview of data type conversion (Page 1311)
	Handle errors within block	Troubleshooting inside the block with the GET_ERROR or GET_ERR_ID instruction (cannot be changed). See also: Auto-Hotspot
	Create extended status information	Allows you to monitor all tags in an SCL block. This option does, however, increase the program memory space required and the execution times.
	Check ARRAY limits	Checks whether array indexes are within the range declared for an ARRAY during the runtime of an SCL block. The block enable output ENO is set to "0" if an array index is outside of the permitted range.
	Set ENO automatically	Checks whether errors occur in the processing of certain instructions during the runtime of an SCL block. The block enable output ENO is set to "0" if a runtime error occurs.

Group	Property	Description
	Create minimized DB	Creates instance data blocks for GRAPH blocks of the S7-300 and S7-400 in minimized format. This option reduces the GRAPH FB memory space required, however you will only receive limited program status information.
	Skip steps	If the transitions before and after a step become valid simultaneously in a GRAPH block, the step will not be activated and will be skipped.
	Acknowledge supervision alarms	Any supervision error which occurs during the operation of a GRAPH block must be acknowledged before the program can continue.
	Permanent processing of all interlocks in manual mode	Permanently monitors all interlock conditions in a GRAPH block in manual mode.
	Lock operating mode selection	Prevents a GRAPH block operating mode being selected.
	Data block write-protected in the device	Indicates whether the data block is read-only in the target system, and cannot be overwritten while the program is running (for data blocks only)
	Only store in load memory	On activation the data block is stored only in the load memory, occupies no space in the work memory, and is not linked into the program. The "Move operations" section of the "Instructions" task card offers options for transferring data blocks to the work memory (for data blocks only).
	Start information	Here you specify the structure of the start information of the OB for S7-1500 CPUs: either like for S7-300 and S7-400 CPUs or optimized start information.
	Priority	Shows the priority set for organization blocks. The CPU family used and the type of the organization block determine whether you can change the priority.
	Parameter assignment by means of registers	Enables parameter input by means of registers in an STL block of S7-1500. This feature allows you to use the "Conditional call of blocks" (CC) and "Unconditional call of blocks" (UC) instructions in the block.
	Block can be used as know-how protected library item	Shows whether or not the block in the library can be used with know-how protection.
	Enable readback	Enables you to mark individual parameters of the block for readback. The "Tag readback" function is relevant if the block is used in a CFC chart.
	Block representation	Specifies how the block is represented in a CFC chart.
Time-of-day interrupt	Time-of-day interrupt	Parameters of the time-of-day interrupt OB: active (yes or no), execution, start date and time, local time or system time
Cyclic interrupt	Cyclic interrupt	Cycle time and phase shift of the cyclic interrupt OB
Triggers	Triggers	Display of start events of the hardware interrupt OB
Isochronous mode	Isochronous mode	Parameters of the isochronous mode interrupt OB: application cycles, automatic setting (yes or no), delay time. Also indicated is the PROFINET IO system or DP master system whose IO devices or DP slaves are assigned to the isochronous mode interrupt OB.
Download without re-initialization	Reserve in volatile memory	Defines the reserve in volatile memory that can be used for interface extensions. The number of currently available bytes is displayed in parentheses. This information is updated with each compilation.

Group	Property	Description
	Activate download without re-initialization for retentive tags	Enables definition of a reserve in retentive memory.
	Reserve in retentive memory	Defines the reserve in retentive memory that can be used for interface extensions. The number of currently available bytes is displayed in parentheses. This information is updated with each compilation.

**See also**

- Basics of block properties (Page 1401)
- Block time stamps (Page 1404)
- Displaying and editing block properties (Page 1406)
- Basics of block access (Page 1209)

**Block time stamps**

**Introduction**

Blocks receive a number of different time stamps which show you when the block was created and when it was last changed. These time stamps are also used for automatic consistency checks before compilation.

**Code block time stamps**

The following time stamps are generated for code blocks (OBs, FBs, FCs):

- Block: Created on, Modified on
- Interface: Modified on
- Code/data: Modified on

A time stamp conflict is displayed during compilation if the time stamp for the block calling is older than that of the interface for the block called.

Time stamps for code blocks are updated as follows:

- Block: The time stamp for the last block modification is always the same as the time stamp either of the interface or of the code depending on which area was modified last.
- Interface: The interface time stamp is updated each time the interface is modified. Even if you manually undo a change to the interface, for example change the name back, that is also a change which updates the time stamp. However, if you undo the change using the "Undo" function, the time stamp will be reset to the value it had before the undone change.
- Code/data: The code time stamp is updated each time the block code is changed. Even if you manually undo a change to the code, for example remove an instruction, that is also a change which will update the time stamp. However, if you undo the change using the "Undo" function, the time stamp will be reset to the value it had before the undone change.

### Global data block time stamps

The following time stamps are generated for global data blocks:

- Block: Created on, Modified on
- Interface: Modified on
- Data: Modified on

Time stamp conflict is reported during compilation of a global data block based on a PLC data type if the time stamp of the global data block is older than the time stamp of the PLC data type used.

The time stamps for global data blocks are updated as follows:

- Block: The time stamp for the last change to a global data block is always the same as the time stamp for the interface and the data.
- Interface and data: The interface time stamps and the data are updated each time the global data block is changed. Even if you manually undo a change, for example remove a tag, that is also a change which will update the time stamp. However, if you undo the change using the "Undo" function, the time stamps will be reset to the value they had before the undone change.

### Instance data block time stamps

The following time stamps are generated for instance data blocks:

- Block: Created on, Modified on
- Interface: Modified on
- Data: Modified on

A time stamp conflict will be reported during compilation of an instance data block if the interface time stamps of the instance data block are not identical to those of the function block.

The time stamps for instance data blocks are updated as follows:

- Block: The time stamp for the last change to an instance data block is always the same as the time stamp for the interface and the data.
- Interface and data: The interface time stamps and the data are updated each time the instance data block is changed. Even if you manually undo a change, for example cancel the tag retain setting, that is also a change which will update the time stamps. However, if you undo the change using the "Undo" function, the time stamps will be reset to the value they had before the undone change.

### PLC data type time stamps

The following time stamps are generated for PLC data types:

- Block: Created on, Modified on
- Interface: Modified on

The time stamps for PLC data types are updated as follows:

- **Block:** The time stamp for the last change to a PLC data type is always the same as the interface time stamp.
- **Interface:** The interface time stamp is updated each time the PLC data type is changed. Even if you manually undo a change, for example delete the content of a PLC data type, that is also a change which will update the time stamp. However, if you undo the change using the "Undo" function, the time stamp will be reset to the value it had before the undone change.

### See also

Basics of block properties (Page 1401)

Overview of block properties (Page 1401)

Displaying and editing block properties (Page 1406)

Basic information on compiling blocks (Page 1652)

### Displaying and editing block properties

The properties of the blocks are block and CPU-specific. Not all properties are therefore available for all blocks or in all CPU families. Properties that can only be displayed are write-protected.

### Displaying and editing properties of a closed block

To display and edit the properties of a closed block, follow these steps:

1. Open the "Program blocks" folder in the project tree.
2. Right-click the block whose properties you want to display or edit.
3. Select the "Properties" command in the shortcut menu.  
The properties dialog box of the block opens.
4. In the area navigation, click a group whose properties you want to display or edit.
5. Change the relevant property.
6. Confirm your entries with "OK".

### Displaying and editing properties of an open block

To display or edit the properties of an open block, follow these steps:

1. Select the "Inspector window" check box in the "View" menu.  
The Inspector window opens.
2. Click the "Properties" tab.  
The properties of the block are shown in the "Properties" tab of the Inspector window.
3. In the area navigation, click a group whose properties you want to display or edit.
4. Change the relevant property.

## Result

The properties of the block will be changed. The changes are not saved until the project is saved.

### 9.1.3.3 Managing blocks

#### Opening blocks

You can open a block in several different ways:

- Open block directly  
You can open a block directly if the corresponding block folder is open in the project tree or in the overview window.
- Find and open block  
You can look for blocks within a project, a device or the "Program blocks" folder and then open them.

#### Open block directly

To open a block directly, follow these steps:

1. Open the folder with the block you wish to open in the project tree or in the overview window.
2. Double-click on the block you wish to open.

#### Find and open block

To find and then open a block, follow these steps:

1. Right-click on the project, a device, the "Program blocks" folder or a lower-level folder of "Program blocks" in the project tree.
2. Select the "Search in PLC and open" command from the shortcut menu.  
The "Search in PLC and open" dialog box is displayed.
3. Enter the name, the address or the type of block you are looking for.  
The block list is filtered further with each letter entered. The block list is closed if there is no block that matches the input. You can show the complete block list at any time by clicking the button to the right of the text box. Keep in mind that there is no filtering in this case. If you want to filter for your inputs again, click the button once again.
4. In the block list, click the block you wish to open.

## Result

The block will open in the program editor.

Renaming blocks (Page 1409)

Deleting blocks offline (Page 1410)

Deleting blocks online (Page 1410)

Opening know-how protected blocks (Page 1672)

## Saving blocks

Blocks are always saved together with the project. Faulty blocks can also be saved. This allows the error to be resolved at a convenient time.

## Procedure

To save a block, follow these steps:

1. Select the "Save" or "Save as" command in the "Project" menu.  
See also: Saving projects (Page 306)

## See also

Opening blocks (Page 1407)

Closing blocks (Page 1408)

Renaming blocks (Page 1409)

Deleting blocks offline (Page 1410)

Deleting blocks online (Page 1410)

## Closing blocks

## Procedure

To close a block, follow these steps:

1. Click the "Close" button in the title bar of the program editor.

---

### Note

Note that the block will not be saved on closing.

---

## See also

Opening blocks (Page 1407)  
Saving blocks (Page 1408)  
Renaming blocks (Page 1409)  
Deleting blocks offline (Page 1410)  
Deleting blocks online (Page 1410)

## Renaming blocks

### Requirement

The "Program blocks" folder is opened in the project tree.

### Procedure

To change the name of a block, follow these steps:

1. Right-click the block that you want to rename.
2. Select the "Rename" command in the shortcut menu.  
The block name in the project tree changes to an input field.
3. Input the new name for the block.
4. Confirm your entry with the Enter key.

### Result

The name of the block is now changed at all points of use in the program.

## See also

Opening blocks (Page 1407)  
Saving blocks (Page 1408)  
Closing blocks (Page 1408)  
Deleting blocks offline (Page 1410)  
Deleting blocks online (Page 1410)

## Deleting blocks offline

### Requirement

The "Program blocks" folder opens in the project tree.

### Procedure

To delete a block that exists offline, proceed as follows:

1. In the project tree in the "Program blocks" folder, right-click on the block that you want to delete.
2. Select the "Delete" command in the shortcut menu.
3. Confirm the safety prompt with "Yes".  
The block is deleted offline from the project.

---

### Note

If you are deleting organization blocks, note that events may be assigned to these blocks. If you delete such organization block the program cannot respond to parameterized events.

---

### See also

- Deleting blocks online (Page 1410)

## Deleting blocks online

### Requirement

The "Program blocks" folder in the project tree is open.

### Procedure

To delete a block that exists online, follow these steps:

1. In the "Program blocks" folder in the project tree, right-click on the block that you wish to delete from the device.
2. Select the "Delete" command from the shortcut menu.  
The "Delete" dialog opens.

3. Select the "Delete from device" check box.
4. Click "Yes".  
The block will be deleted from the device online.

### **See also**

- Opening blocks (Page 1407)
- Saving blocks (Page 1408)
- Closing blocks (Page 1408)
- Renaming blocks (Page 1409)
- Deleting blocks offline (Page 1410)

### **Deleting CPU data blocks**

You may delete CPU data blocks both in offline and online mode.

#### **Deleting CPU data blocks in offline mode**

Proceed as follows to delete a CPU data block from the offline project:

1. Right-click the CPU data blocks that you want to delete in the project navigation, "Program blocks" folder.
2. Select the "Delete" command from the shortcut menu.
3. Confirm the safety prompt with "Yes".  
The CPU data block is deleted from the offline project.

#### **Deleting CPU data blocks in online mode**

Proceed as follows to delete a CPU data block from the online project:

1. Establish an online connection to the device containing the CPU data block that you want to delete.
2. Right-click the CPU data block that you want to delete from the device in the project navigation, "Program blocks" folder.
3. Select the "Delete" command from the shortcut menu.  
The "Delete" dialog opens.
4. Select the "Delete from device" check box.
5. Click "Yes".  
The CPU data block is deleted from the online device.

## **9.1.4 Programming blocks**

### **9.1.4.1 Program editor**

#### **Overview of the program editor**

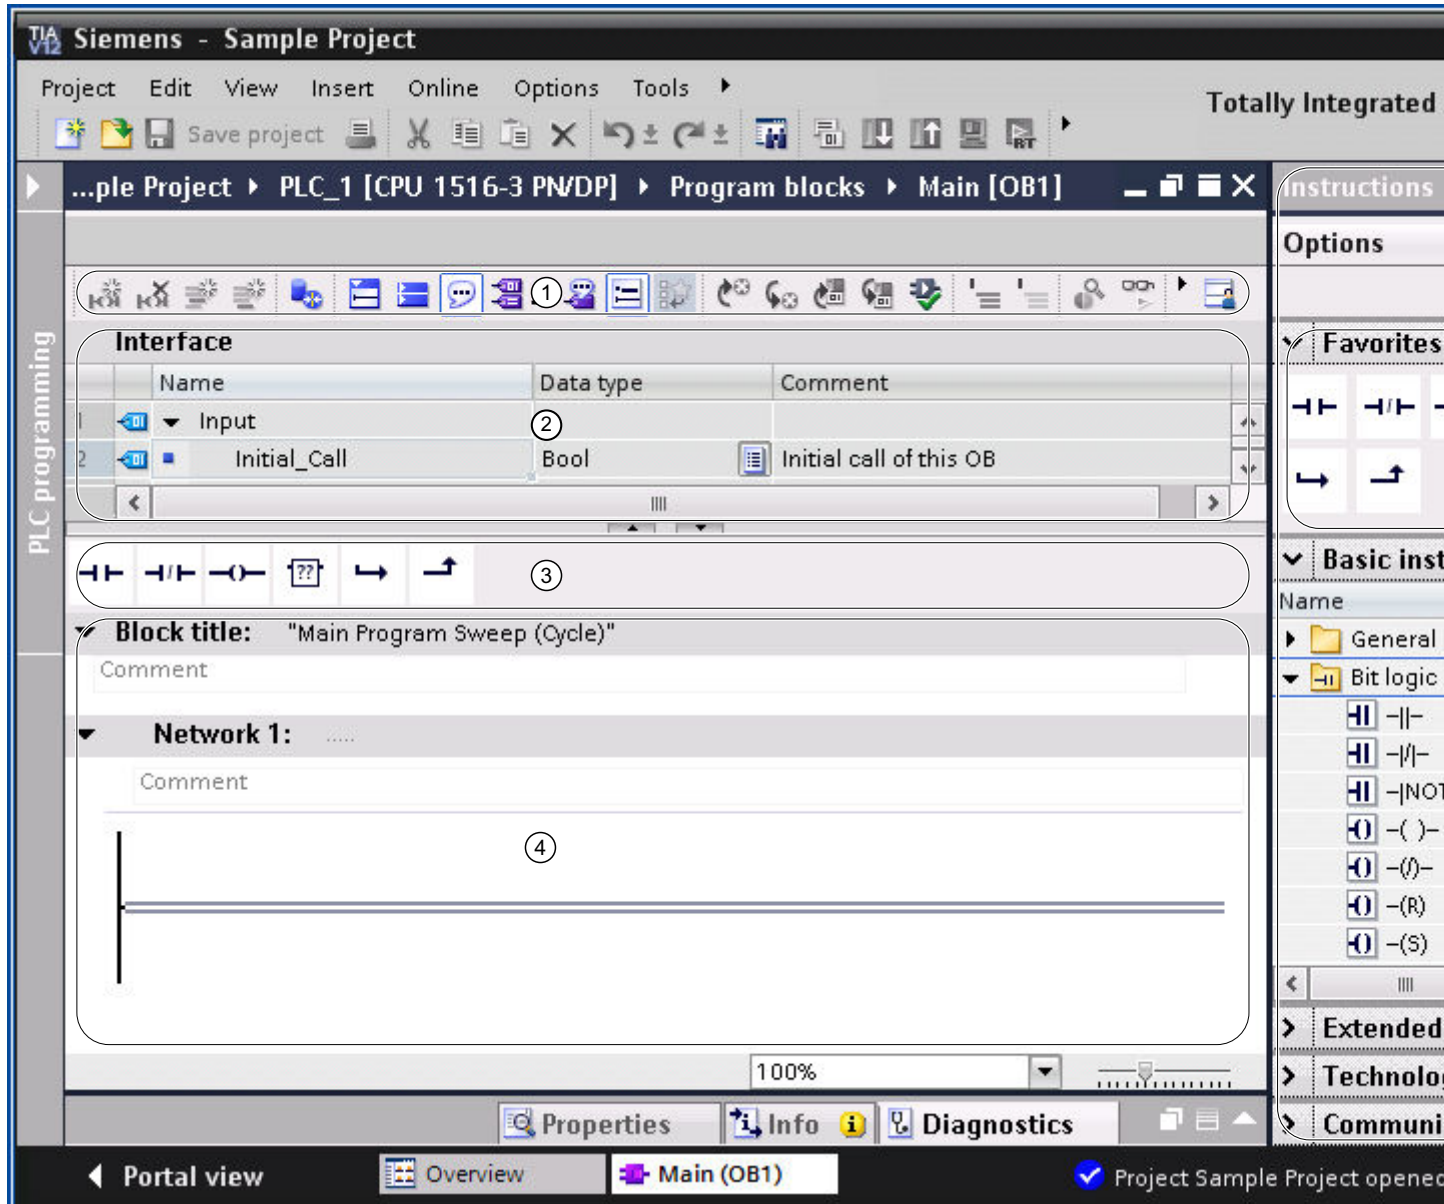

#### **Function of the program editor**

The program editor is the integrated development environment for programming functions, function blocks, and organization blocks. It offers comprehensive support for programming and troubleshooting.

The appearance and functionality of the program editor can vary depending on the CPU, programming language and block type used.

## Structure of the program editor

Using LAD as an example, the following figure shows the components of the program editor:

- ① Toolbar
- ② Block interface
- ③ "Favorites" pane in the "Instructions" task card and favorites in the program editor
- ④ Programming window
- ⑤ "Instructions" task card
- ⑥ "Testing" task card

## Toolbar

The toolbar allows you to access the principal functions of the program editor, such as:

- Show and hide absolute operands
- Showing and hiding favorites
- Skip to syntax errors
- Update block calls
- Show and hide program status

The functions available in the toolbar can vary depending on the programming language used.

## Block interface

The block interface contains the declarations for local tags used solely within the block. The sections available depend on the block type.

## Favorites

You can save frequently used instructions as favorites. These favorites are then displayed in the "Instructions" task card and the "Favorites" pane. You can also display favorites in the program editor using the program editor toolbar. This allows you to access your favorites even when the "Instructions" task card is not visible.

## Programming window

The programming window is the work area of the program editor. You can enter the program code in this window. The appearance and functionality of the program window can vary depending on the programming language used.

## "Instructions" task card

The "Instructions" task card offers you easy access to all instructions available for creating your program. The instructions are broken down by area into a number of different palettes. You can show additional information on the instructions via the "Show column headers and additional columns" button in the task card toolbar. You can modify the arrangement of columns by clicking a column header and moving the column to the new position by means of drag-and-drop.

If an instruction profile is active, the offered instructions may vary.  
See also: Using instruction profiles

## "Testing" task card

You can set settings in the "Testing" task card for troubleshooting using the program status. The functions of the "Testing" task card are only available in online mode. It contains the

following panes, which are displayed depending on the selected CPU and the configured programming language of the block:

- CPU operator panel  
The CPU operator panel allows you to switch the CPU operating mode.
- Breakpoints  
You can test blocks you created in the textual programming languages STL and SCL in single step mode. To do this, set breakpoints in the program code.  
In the "Breakpoints" pane, you can find all breakpoints that you have set and you can activate, delete, navigate to, or set the call environment for the individual breakpoints.
- PLC register  
This pane allows you to read off the values for the PLC registers and the accumulators.
- Sequence control  
In this pane you can set the operating mode for testing sequencers for GRAPH blocks.
- Test settings  
This pane allows you to specify the test settings for the GRAPH block.
- Call environment  
This pane allows you to specify the call environment for the block.
- Call hierarchy  
In this pane, you can trace the call hierarchy of the blocks. You only see the call hierarchy during block monitoring.

Layout of the block interface (Page 1433)

Enlarging the programming window (Page 1420)

## Using the keyboard in the program editor

### Navigating in the editor

Function	Shortcut key
Open "Instructions" task card	<Ctrl+Shift+C>
Open "Testing" task card	<Ctrl+Shift+O>
Add new block	<Ctrl+N>
Expand all networks	<Alt+F11>
Collapse all networks	<Alt+F12>
Navigate to the next point of use of the selected block or operand	<Ctrl+Shift+F>
Navigate to the previous point of use of the selected block or operand	<Ctrl+Shift+G>
Navigate to the next read/write access	<Alt+F8>
Navigate to the previous read/write access	<Alt+F9>

**Navigating in the program code (LAD/FBD)**

Function	Selected object	Shortcut key
Navigating between objects in the network	Object in the network	Arrow keys
Navigate to the first element of the network	Object in the network	<Home>
Navigate to the last element of the network	Object in the network	<End>
Navigate to the next element of the network	Object in the network	<Tab>
Navigate to the previous element of the network	Object in the network	<Shift+Tab>
Insert network	Any	<Ctrl+R>

**Navigating in the program code (STL/SCL)**

Function	Position of the cursor	Shortcut key
Navigating in the program code	Line	Arrow keys
One word to the right/left	Line	<Ctrl+arrow keys>
Cursor to start of line	Line	<Home>
Cursor to end of line	Line	<End>
Cursor to start of code section	Line	<Ctrl+Home>
Cursor to end of code section	Line	<Ctrl+End>
To the next network (STL only)	Network title	<Down arrow>
To the next network (STL only)	Line	<Tab> Repeat the shortcut keys until the insertion point is in the next network.
To the previous network (STL only)	Network title	<Up arrow>
To the previous network (STL only)	Line	<Shift+Tab> Repeat the shortcut keys until the insertion point is in the previous network.
Insert network	Any	<Ctrl+R>

**Inserting instructions (LAD)**

Function	Selected object	Shortcut key
Insert normally open contact	Rung	<Shift+F2>
Insert normally closed contact	Rung	<Shift+F3>
Insert empty box	Rung	<Shift+F5>
Insert assignment	Rung	<Shift+F7>
"Insert "Open branch"	Rung	<Shift+F8>
"Insert "Close branch"	Rung	<Shift+F9>

## Inserting instructions (FBD)

Function	Selected object	Shortcut key
Insert assignment	Network, input or output	<Shift+F7>
Insert empty box	Network	<Shift+F5>
"Insert "Open branch"	Connection line between two boxes	<Shift+F8>
Invert RLO	Network, input or output	<Ctrl+Shift+4>
Insert input	Network, input or output	<Ctrl+Shift+3>

## Entering operands (LAD/FBD/GRAPH)

Function	Selected object	Shortcut key
Activate the input field for the first operand of the instruction	Instruction	<Return> Or <Any letters/numbers> An empty input field opens on <Return>, any letters or numbers will be entered in the input field.
Activate input field for the operand	Operand	<F2>
Delete operand	Operand	<Del>
Define tag	Operand	<Ctrl+Shift+I>
Rewire tag	Operand	<Ctrl+Shift+P>
Rename tag	Operand	<Ctrl+Shift+T>
Entering operands	Input field for operands	<Any letters/numbers>
Confirm entry of the operand	Input field for operands	<Return>
Open autocompletion	Input field for operands	<Ctrl+I>
Discard current change	Input field for operands	<Esc> The input field is deactivated and the previous contents restored.

**Process instructions (STL/SCL)**

Function	Selected object	Shortcut key
Indent line (SCL only)	Line	<Tab> or <Ctrl+R>
Outdent line (SCL only)	Line	<Shift+Tab> or <Ctrl+Shift+R>
Automatically formatting selected text (SCL only)		<Ctrl+Shift+W>
Open "Call options" dialog	Cursor after block call	<Return>
Define tag	Operand	<Ctrl+Shift+I>
Rewire tag	Operand	<Ctrl+Shift+P>
Rename tag	Operand	<Ctrl+Shift+T>
Expand/collapse parameter list (SCL only)	Operand	<Ctrl+Shift+Space>
Expand/collapse code section	Insertion mark within the code section	<Ctrl+Shift+Num+> <Ctrl+Shift+Num->
Expand/collapse all code sections	Any	<Ctrl+Shift+Num*> <Ctrl+Shift+Num/>
Open autocompletion	Any	<Ctrl+I> or <Ctrl+Spacebar>
Set/delete bookmarks		<Ctrl+Shift+M>
To the next bookmark		<Ctrl+Shift+6>
To the previous bookmark		<Ctrl+Shift+5>
Comment out selection	Line	<Ctrl+Shift+Y>
Remove comment	Line	<Ctrl+Shift+U>

**Programming window of GRAPH**

Function	Area	Shortcut key
Page Up/Down	Navigation view, single step view, sequence view, permanent instructions	<Page Up>/ <Page Down>
Navigate in the navigation view	Navigation view	<Up arrow> <Down arrow>
Expand/collapse object	Navigation view	<+> or <Right arrow> <-> or <Left arrow>
Switch between single step view and sequence view when a step or a transition is selected	Navigation view	<Return>
Switch between navigation view and work area	Navigation view, single step view, sequence view, permanent instructions	<ALT+F6>

Function	Area	Shortcut key
Go to first element in a network	Single step view	<Home>
Go to last element in a network	Single step view	<End>
Switch to interlock	Single step view	<Ctrl+Home>
Switch to transition	Single step view	<Ctrl+End>
Navigate in the structure	Sequence view	Arrow keys
Go to first step	Sequence view	<Home> or <Ctrl+Home>
Go to last step	Sequence view	<End> or <Ctrl+End>
Open branch	Sequence view	<Shift+F8>
Close branch	Sequence view	<Shift+F9>
Insert sequence end	Sequence view	<Shift+F7>
Insert jump	Sequence view	<Shift+F12>
Insert step and transition	Sequence view	<Shift+F5>
Delete element	Sequence view	<Del>
Go to first editable element	Permanent instructions	<Home>
Go to next editable element	Permanent instructions	<Tab>
Go to last editable element	Permanent instructions	<End>
Go to previous editable element	Permanent instructions	<Shift+Tab>
Jump to the start of the "Action" cell	Actions	<Home>
Jump to the end of the "Action" cell	Actions	<End>
Insert new action	Actions	<Return>

## Monitor program

Function	Shortcut key
Set/remove breakpoint (STL, SCL)	<Ctrl+Shift+F9>
Step over breakpoint (STL, SCL)	<Ctrl+Shift+F10>
Jump to lower-level block (STL, SCL)	<Ctrl+Shift+F11>
Return to calling block (STL, SCL)	<Ctrl+Shift+F12>
Run program up to marker (cursor position) (STL, SCL)	<Ctrl+F3>
Display program status (SCL, STL)	<Ctrl+T>
Enable all breakpoints (STL, SCL)	<Ctrl+Shift+F2>
Disable all breakpoints (STL, SCL)	<Ctrl+Shift+F3>
Modify to 0 (LAD, FBD)	<Ctrl+Shift+9>
Modify to 1 (LAD, FBD)	<Ctrl+Shift+1>
Modify operand (LAD, FBD)	<Ctrl+Shift+2>

## Enlarging the programming window

### Introduction

The programming window is relatively small when all components of the application are shown. If the program code is large, you may find you have to rearrange the work area constantly. To avoid this problem, you can hide or minimize the display of the following components of the application and of the program editor:

- Project tree
- Task cards
- Block interface
- Favorites
- Comments
- Networks

---

#### Note

You can also use the "Reduce automatically" option for the task cards, project tree, and Inspector window. These windows will then be minimized automatically when you do not need them.

See also: Maximizing and minimizing the work area

---

## Hiding and showing the project tree

The project tree allows you to access all areas of the project. You can hide the project tree while you are creating a program so you have more space for the programming window.

To show and hide the project tree, follow these steps:

1. To hide the project tree, deselect the "Project tree" check box in the "View" menu, or click on "Collapse" on the project tree title bar.
2. To show the project tree, select the "Project tree" check box in the "View" menu or click on "Extend" on the project tree title bar.

### Opening and closing task cards

The task cards are located at the right-hand edge of the programming window.

To open or close the task cards, follow these steps:

1. To close the task cards, deselect the "Task card" check box in the "View" menu or click "Collapse" on the task cards title bar.
2. To open the task cards, select the "Task card" check box in the "View" menu or click "Expand" on the task cards title bar.

### Hiding and showing the block interface

The block interface is shown in the upper section of the program editor. During programming you can show and hide it as required.

To show and hide the block interface, follow these steps:

1. In the lower part of the interface within the window splitter, click on the Up arrow or Down arrow.

### Showing and hiding favorites

To hide or show the favorites in the program editor, follow these steps:

1. Click the "Display favorites in the editor" button in the program editor toolbar.

### Showing and hiding comments

Within a block you can enter a comment for the block or for each network. These two types of comments are shown and hidden differently.

To show or hide a block comment, follow these steps:

1. Click the the triangle at the start of the line with the block title.

To show or hide network comments, follow these steps:

1. Click "Network comments on/off" on the program editor toolbar.

---

#### **Note**

The comments available can vary depending on the programming language used.

---

### Opening and closing networks

Some programming languages use networks. You can open or close these networks as required.

To open or close networks, follow these steps:

1. If you want to open a network, click the right arrow in front of the network title. If you want to close a network, click the down arrow in front of the network title.

To open and close all networks, follow these steps:

1. Click "Open all networks" or "Close all networks" in the program editor toolbar.

---

**Note**

Networks are not used in every programming language.

---

**See also**

Overview of the program editor (Page 1412)

Maximizing and minimizing the work area (Page 255)

**Setting the mnemonics**

You can program blocks using German or international mnemonics. If you open the TIA portal for the first the international mnemonics is set as default. You can change the mnemonics at any time.

**Procedure**

To set the mnemonics, follow these steps:

1. Select the "Settings" command in the "Options" menu.  
The "Settings" window is displayed in the work area.
2. Select the "General" group in the area navigation.
3. In the "General settings" group, select the mnemonics that you want to use.  
The mnemonics is changed in all blocks.

**Displaying symbolic and absolute addresses**

You have the following options for displaying operands in the program editor:

- Symbolic representation  
The symbolic operands are displayed in the program. The corresponding absolute addresses are shown in tooltips if you hold the mouse pointer over the operand.
- Absolute representation  
The absolute addresses are displayed in the program. The corresponding symbolic operands are displayed in tooltips.
- Symbolic and absolute representation  
Symbolic operands and absolute addresses are displayed in program.

**Requirement**

The program editor is open.

## Procedure

To change the representation of the operands, follow these steps:

1. Click the "Absolute/symbolic operands" button in the program editor toolbar.  
Each time you click the button, the representation and the symbol on the button change.

Or:

1. Click the small arrow next to the "Absolute/symbolic operands" button in the program editor toolbar.  
A drop-down list is displayed.
2. Select the required representation from the drop-down list.  
The symbol on the button changes.

## See also

Basic information about operands (Page 1231)

## Use instruction versions

### Basic information on instruction versions

The instructions available to you for programming the user program are managed in system libraries. If a new version of a system library is installed by an update, the newer versions of the instructions of this system library may also be installed.

If there are several versions for an instruction, these are listed in the "Instructions" task card after the respective instruction. If the instruction versions are not shown, you can show them via the "Show column headers and additional columns" button in the toolbar of the "Instructions" task card. You can then select the versions of the instructions to be used in the program from the dropdown-list box of the "Version" column. If you do not select any versions, the most recent versions are used.

---

### Note

Note the following information:

- You can only ever use the same version of an instruction within a device.
  - If you change the version of an instruction that other instructions depend on, the versions of the dependent instructions are also changed.
  - If you select a version for an instruction that can not be run on the CPU used, the instruction is shaded out. This means that you cannot use this instruction in this version with your CPU.
  - When you change the version of an instruction, you must compile the block before the new version number is displayed in the properties of the instruction.
  - If an instruction is a block within the system, the block also receives its own block version number. This version number can be different from the instruction version and can vary on different CPU types.
-

## Changes in the versions

New versions can be main versions or secondary versions. New versions, such as 2.0 or 3.0, have more substantial changes to them. New main versions may therefore result in changes to the block interface. New secondary versions, such as 1.3 or 1.4, contain lesser changes or remedies to errors.

## Using instruction versions

You can decide within a device which version of an instruction you want to use. If you select another version for an instruction, the new version is specified for all locations of use of this instruction within your program. These instructions are identified in the program by a red frame. You must then download your program to the device to use the new instruction version.

## Using instruction profiles

### Basics of instruction profiles

#### Introduction

The TIA Portal provides you with numerous instructions that you can use to program the user program. However, you may filter out specific instructions that you do not want to use. To this end you can create instruction profiles in which you can explicitly specify the instructions to be listed in the "Instructions" task card. However, although you may create several instruction profiles in a project, only one of these profiles may be active at any given time. You can exchange instruction profiles with other users by means of shared libraries.

---

#### Note

Please note the following:

- The use of instructions that are not allowed in the active profile in a block will trigger the output of a block compilation error. Such a situation may be triggered if you drag-and-drop a block from the library to your program.
  - Instructions of a profile that are not supported by the currently installed products are deleted from the profile the next time it is edited. If you transfer this profile to an engineering system in which these instructions are supported by the installed products, the instructions are again present in the profile but they are disabled. You can enable these instructions as required at any time.
  - If you want to make changes to the active profile, you must recompile the blocks in the project. This is also necessary when you disable or delete the active profile or when you enable a profile.
- 

#### See also

Creating new instruction profiles (Page 1425)

Opening and editing instruction profiles (Page 1426)

Activating and deactivating instruction profiles (Page 1427)

Deleting instruction profiles (Page 1428)

## Creating new instruction profiles

### Requirement

The "Common data > Instruction profiles" folder is open in the project navigation.

### Procedure

Proceed as follows to create a new instruction profile:

1. Double-click the "Add new profile" command.  
The Instruction Profile Editor opens and displays the new instruction profile. All instructions are activated for the new instruction profile.
2. Edit the new instruction profile to suit your requirements.

If necessary, you can rename the new instruction profile. To do this, follow these steps:

1. Right-click on the new instruction profile.
2. Select the "Rename" command in the shortcut menu.
3. Enter a name for the new instruction profile.

---

### Note

The first instruction profile that you create will be used as active profile. In this case, compile all blocks in the project. If other instruction profiles are already available you must explicitly activate the new one in order to use it as active profile. You can identify the active profile by its icon in the project navigation.

---

### See also

Basics of instruction profiles (Page 1424)

Opening and editing instruction profiles (Page 1426)

Activating and deactivating instruction profiles (Page 1427)

Deleting instruction profiles (Page 1428)

## Opening and editing instruction profiles

Once you have opened an instruction profile, you can edit it as follows:

- Activating and deactivating instructions  
You can explicitly specify the instructions to be allowed in the instruction profile.

---

### Note

Note that dependencies exist between some instructions. As a result, it is possible that several instructions may be activated or deactivated by an action. The check box icon indicates the folders in which instructions are deactivated.

---

- Activating and deactivating instruction versions  
Certain instructions are available with different versions. You can explicitly specify the instruction versions to be allowed in the instruction profile.
- Renumbering blocks  
An instruction representing an internal function block (FB) or function (FC) in the system is assigned a specific block number by the system. You can replace this block number with your own block number. Within a version, there are several implementations for certain instructions. The block numbers in such instructions can only be changed for the specific implementation.

---

### Note

If an instruction from the instruction profile is used in the program and the specified block number is already in use by a different block, the specified block number of the instruction will be replaced by a free block number.

---

## Requirement

The "Common data > Instruction profiles" folder is open in the project navigation.

## Opening instruction profiles

Proceed as follows to open an instruction profile:

1. Double-click the instruction profile that you want to edit.  
The instruction profile opens in the Instruction Profile Editor.

## Editing instruction profiles

Proceed as follows to edit an instruction profile in the Instruction Profile Editor:

1. Select the device that you want to edit from the "Device family" drop-down list box.
2. Select the programming language for which you want to edit the instruction profile from the "Language" drop-down list box.
3. Deactivate the instructions or instruction versions that you want to exclude from the instruction profile. You can deactivate a folder to deactivate all subordinate instructions.

4. Activate the instructions or instruction versions that you want to allow in the instruction profile.
5. You may assign your own block numbers.

---

**Note**

You can assign the number up to 65535 for CPUs of the S7-1200/1500 series. For CPUs of the S7300/400 series you find the restrictions of the number ranges in the respective CPU manual.

---

---

**Note**

A new compilation process is required for all blocks in the project when you change the active profile.

---

**See also**

- Basics of instruction profiles (Page 1424)
- Creating new instruction profiles (Page 1425)
- Activating and deactivating instruction profiles (Page 1427)
- Deleting instruction profiles (Page 1428)
- Use instruction versions (Page 1423)

**Activating and deactivating instruction profiles**

You first need to activate an instruction profile in order to include filtering of its instructions. You can always deactivate the instruction profile to reset the instructions task card to the default scope of instructions.

---

**Note**

A new compilation process is required for all blocks in the project.

---

**Requirement**

The "Common data > Instruction profiles" folder is open in the project navigation.

**Activating instruction profiles**

Proceed as follows to activate an instruction profile:

1. Right-click on the instruction profile that you want to activate.
2. Select the "Activate profile" command from the shortcut menu.  
The selected instruction profile is now active. Instructions can now only be used in accordance with the settings of this profile.

## Deactivating instruction profiles

Proceed as follows to deactivate the instruction profile:

1. Right-click on the instruction profile that you want to deactivate.
2. Select the "Deactivate profile" command from the shortcut menu.  
No instruction profile is active and the "Instructions" task card once again shows all instructions that are available for use.

## See also

Basics of instruction profiles (Page 1424)

Creating new instruction profiles (Page 1425)

Opening and editing instruction profiles (Page 1426)

Deleting instruction profiles (Page 1428)

## Deleting instruction profiles

### Requirement

The "Common data > Instruction profiles" folder is open in the project tree.

### Procedure

Proceed as follows to delete an instruction profile:

1. Right-click on the instruction profile that you want to delete.
2. Select the "Delete" command in the shortcut menu.

---

### Note

A new compilation process is required for all blocks in the project when you delete the active profile.

---

### Result

The selected instruction profile is deleted. If you deleted the active instruction profile, no more active profiles are available and the "Instructions" task card once again shows all instructions that are available for use.

## See also

Basics of instruction profiles (Page 1424)

Creating new instruction profiles (Page 1425)

Opening and editing instruction profiles (Page 1426)

Activating and deactivating instruction profiles (Page 1427)

## Using autocompletion

### Basics of autocompletion

#### Function

You can use autocompletion in the program window of the program editor as an easy way to access available tags or instructions during programming. Autocompletion means a context-specific list appears in a dialog from which you can select the tags or instructions you need.

#### See also

Using autocompletion in graphic programming languages (Page 1429)

Using autocompletion in textual programming languages (Page 1430)

## Using autocompletion in graphic programming languages

### Inserting tags using autocompletion

To insert tags in graphic programming languages using autocompletion, follow these steps:

1. Select an operand of the instruction to which you wish to assign a tag.  
The input field for the operand opens. The autocompletion button will appear beside the input field.
2. Either click the autocompletion button or use the shortcut <Ctrl+I>.  
Autocompletion opens. It contains only the local and global tags, data blocks and multiple instances which are admissible for the operand in the given context. You can exit autocompletion at any time by pressing <Esc>.

3. Select the required tag from the list. If necessary, you can also filter the list:
  - For example, enter the first few letters of the name of the tag or instruction you wish to insert. Autocompletion will be filtered further with each letter entered. If there is no tag or instruction starting with the letters entered, autocompletion will remain at the last match.
  - Enter # to access the local tags from the block interface.
  - Enter " to access the global tags.
  - Enter % to access absolute addresses.

If the tag is a structured tag, a data block or a multiple instance, then an arrow is displayed at the end of the row. Click on the arrow to display the lower-level elements. You can navigate to the very last level in this way. If a structure is allowed as a data type for the operand, you can choose "None" from the list. This assigns the entire structure to the operand as a tag. Use the <Backspace> key to return to the previous level.

4. Press the <Return> key to apply the tag.

## See also

Basics of autocompletion (Page 1429)

Using autocompletion in textual programming languages (Page 1430)

## Using autocompletion in textual programming languages

### Inserting tags and instructions using autocompletion

To insert tags and instructions in textual programming languages using autocompletion, follow these steps:

1. Enter the first few letters of the name of the tag or instruction you wish to insert. If necessary, you can directly filter the kind of tags:
  - Enter # to access the local tags from the block interface.
  - Enter " to access the global tags.
  - Enter % to access absolute addresses.

Autocompletion opens. It contains only the local and global tags, data blocks, multiple instances and instructions which are admissible at the current position. You can exit autocompletion at any time by pressing <Esc>.

2. Enter more letters of the name of the tag or instruction you wish to insert. You can use <Enter> or <Tab> to apply the tag or instruction and close autocompletion. Autocompletion will be filtered further with each letter entered. If there is no tag or instruction starting with the letters entered, autocompletion only contains the previous matches.

3. Select the tag or instruction required from the list.  
If a tag is a structured tag, a data block or a multiple instance, first select the tag, the data block or multiple instance from the autocompletion and apply the selection with <Enter>. To select the additional components of the structure, data block, or multiple instance, enter a period. Autocompletion then reopens and you can select the next component.
4. Press the <Return> key to apply the tag.

## General settings for the PLC programming

### Overview of the general settings

#### Overview

The following table shows the general settings that you can make:

Group	Setting	Description
View	With comments	Network comments are shown.
	Tag information	Additional information for the tags used is displayed in the program editor. When you select the option "Tag information with hierarchy", the comments of the higher structure levels are also displayed for structured tags.
Compilation	Delete actual parameters on interface update	Actual parameters are deleted if the associated formal parameters were deleted in the called block, and you run the "Update block call" function or compile the block.
Default settings for new blocks	IEC check	The compatibility of operands in comparison operations and arithmetic operations are tested according to IEC rules. You have to explicitly convert non-compatible operands.
Additional settings	Set network title automatically	Sets the title of a network based on the comment of the output parameter of the first writing instruction in the network. See also: Inserting network title (Page 1463)
	Show autocompletion list	The autocompletion list is displayed.
	Mnemonics	German or international designation of operations and operands

Group	Setting	Description
Download without reinitialization	Memory reserve	Defines the size of reserve in volatile memory that can be used for interface extensions.
Block interface / data blocks	Set "HMI accessible" for new elements and ARRAY data blocks	Enables the option "HMI accessible" for new tags in the block interface and in data blocks. The use of this option makes sense especially when working with large amounts of data in ARRAY data blocks.  See also: Basic principles for programming of data blocks (Page 1581)

**See also**

- Layout of the block interface (Page 1433)
- Changing the settings (Page 1432)
- Permissible addresses and data types of PLC tags (Page 1366)
- Overview of the print settings (Page 244)
- Basics of block access (Page 1209)
- Setting and canceling the IEC check (Page 1314)

**Changing the settings**

**Procedure**

- To change the settings, follow these steps:
1. Select the "Settings" command in the "Options" menu.  
The "Settings" window is displayed in the work area.
  2. In the area navigation, select the "PLC programming" group.
  3. Change the settings.

**Result**

The change will be loaded directly, there is no need to save it explicitly.

- Overview of the general settings (Page 1431)

9.1.4.2 Programming code blocks

Declaring the block interface

Layout of the block interface

Introduction

The interface contains the declarations of local tags and constants that are used within the block. The tags are subdivided into two groups:

- Block parameters that form the block interface when it is called in the program.
- Local data that are used for storage of intermediate results.

You use the tag declaration to define the call interface of a block in the program and the names and data types of tags and constants that you want to use in the block.

The interface of function blocks also defines the structure of the instances that are assigned to the function block.

Layout of the block interface

The following figure shows the structure of the block interface. The number of columns and sections varies depending on the type of block.

Name	Data type	Default value	Retain	Visible in HMI	Comment
▼ Input				<input type="checkbox"/>	
My_Input1	Bool	false	Non-retain	<input checked="" type="checkbox"/>	
▼ Output				<input type="checkbox"/>	
My_Output1	Bool	1	Retain	<input checked="" type="checkbox"/>	
▼ InOut				<input type="checkbox"/>	
<Hinzufügen>				<input type="checkbox"/>	
▶ Static				<input type="checkbox"/>	
▶ Temp				<input type="checkbox"/>	
▼ Constant				<input type="checkbox"/>	
My_Constant1	Int	22		<input type="checkbox"/>	

Block parameters

The following table shows the types of block parameters:

Type	Section	Function	Available in
Input parameters	Input	Parameters whose values are read by the block.	Functions, function blocks and some types of organization blocks
Output parameters	Output	Parameters whose values are written by the block.	Functions and function blocks

9.1 Creating the user program

Type	Section	Function	Available in
In/out parameters	InOut	Parameters whose values are read by the block when it is called, and whose values are written again by the block after execution.	Functions and function blocks
Return value	Return	Value that is returned to the calling block.	Functions

Depending on the type of block opened, additional sections may be displayed.

Local data

The following table shows the types of local data:

Type	Section	Function	Available in
Temporary local data	Temp	Tags that are used to store temporary intermediate results. Temporary local data are retained for only one cycle. If you use temporary local data, you have to make sure that the values are written within the cycle in which you want to read them. Otherwise the values will be random.	Functions, function blocks and organization blocks <b>Note:</b> Temporary local data is not shown in instance data blocks.
Static local data	Static	Tags that are used for storage of static intermediate results in the instance data block. Static data is retained until overwritten, which may be after several cycles. The names of the blocks, which are called in this code block as multiple instance, will also be stored in the static local data.	Function blocks
Constant	Constant	Constants with declared symbolic names that are used within the block.	Functions, function blocks and organization blocks <b>Note:</b> Local constants are not shown in instance data blocks.

Meaning of the columns

The following table shows the meaning of the individual columns. You can show or hide the columns as required. The number of columns displayed varies depending on the CPU series and the type of the open object.

Column	Description
	Symbol you can click on to drag-and-drop an element to a program for use as an operand.
Name	Name of the element.
Data type	Data type of the element.
Offset	Relative address of a tag. The column is only visible in blocks with standard access.

Column	Description
Default value	Value with which you can pre-assign specific tags in the interface of the code block, or the value of a local constant. Specification of the default value is optional for tags. If you do not specify any value the predefined value for the indicated data type is used. For example, the value "false" is predefined for BOOL. The default value of a tag is applied as the start value in the corresponding instance data block. You can replace these values with instance-specific start values in the instance data block. Constants always have the default value declared in the block interface. They are not shown in instance data blocks and cannot be assigned instance-specific values there.
Retentivity	Marks a tag as retentive. The values of retentive tags are retained even after the power supply is switched off. This column is only visible in the interface of the function block with optimized access.
Visible in HMI	Shows whether a tag is visible by default in the HMI selection list.
Accessible from HMI	Shows whether HMI can access this tag during runtime.
Setting value	Marks a tag as a setpoint. Setting values are the values that will probably have to be fine tuned during commissioning. The column is only available in the interface of function blocks.
Comment	Comments on documentation of the element.

## Rules for declaring the block interface

### General rules for declaring the block interface

#### Using POINTER

The following rules apply to the use of block parameters within the block:

- Input parameters may only be read.
- Output parameters may only be written.
- In/out parameters may be read and written.

### Assigning default values to block parameters

You can assign default values to specific parameters in the function block interface. The possibility of the assignment depends on the declaration subsection and data type of the parameter.

The following table shows which parameters can be assigned a default value:

Parameter type	Section	Assignment of a default value is possible		
		Elementary data types	Structured data types	Parameter types
Input parameters	Input	X	X	-
Output parameters	Output	X	X	-
In/out parameters	InOut	X	- <sup>(1)</sup>	-
Static local data	Static	X	X	-
Temporary local data	Temp	-	-	-
Constants	Constant	X	-	-

<sup>(1)</sup> Exception: In blocks with optimized access, you have the option to use PLC data types as default values under certain conditions.

See also: Declaring PLC data types (UDT) as actual parameters for in-out parameters. (Page 1452)

### See also

### Valid data types in the block interface

#### Valid data types in the block interface in S7-300/400

The following table shows which data types you can assign to the parameters in the individual sections of the interface.

Section	Standard Data types	ARRAY STRUCT STRING DT	Parameter types	VOID	POINTER	ANY
<b>Organization block</b>						
Temp	X	X	-	-	-	X
Constant	X	X <sup>(3)</sup>	-	-	-	-
<b>Function block</b>						
Input	X	X	X	-	X	X
Output	X	X	-	-	-	-

Section	Standard Data types	ARRAY STRUCT STRING DT	Parameter types	VOID	POINTER	ANY
InOut	X	X <sup>(1)</sup>	-	-	X	X
Static	X	X	-	-	-	-
Temp	X	X	-	-	-	X
Constant	X	X <sup>(3)</sup>	-	-	-	-
<b>Function</b>						
Input	X	X <sup>(1)</sup>	X	-	X	X
Output	X	X <sup>(1)</sup>	-	-	X	X
InOut	X	X <sup>(1)</sup>	-	-	X	X
Temp	X	X	-	-	-	X
Return	X	X	-	X	X	X <sup>(2)</sup>
Constant	X	X <sup>(3)</sup>	-	-	-	-
<sup>(1)</sup> STRING can only be defined in the standard length of 254 characters. <sup>(2)</sup> In SCL, ANY is not permitted as a function value. <sup>(3)</sup> Constants with the ARRAY or STRUCT data type are not permitted.						

### Valid data types in the block interface

### Valid data types in the block interface in S7-1200

The following table shows which data types you can assign in the parameters in the individual sections of the interface.

Section	Standard Data types	ARRAY STRUCT STRING DT	VOID	VARIANT
<b>Organization block</b>				
Temp	X	X	-	X
Constant	X	X <sup>(2)</sup>	-	-
<b>Function block</b>				
Input	X	X	-	X
Output	X	X	-	-
InOut	X	X <sup>(1)</sup>	-	X
Static	X	X	-	-
Temp	X	X	-	X
Constant	X	X <sup>(2)</sup>	-	-
<b>Function</b>				
Input	X	X <sup>(1)</sup>	-	X
Output	X	X <sup>(1)</sup>	-	X

9.1 Creating the user program

Section	Standard Data types	ARRAY STRUCT STRING DT	VOID	VARIANT
InOut	X	X <sup>(1)</sup>	-	X
Temp	X	X	-	X
Return	X	X	X	-
Constant	X	X <sup>(2)</sup>	-	-

<sup>(1)</sup> STRING can only be defined in the standard length of 254 characters.

<sup>(2)</sup> Constants with the ARRAY or STRUCT data type are not permitted.

Valid data types in the block interface in S7-1500

The following table shows which data types you can assign in the parameters in the individual sections of the interface.

Section	Standard Data types	ARRAY STRUCT STRING / WSTRING DT	Parameter types	VOID	DB_ANY	POINTER	ANY	VARIANT
<b>Organization block</b>								
Temp	X	X	_ <sup>(4)</sup>	-	X	-	X <sup>(3)</sup>	X
Constant	X	X <sup>(5)</sup>	-	-	-	-	-	-
<b>Function block</b>								
Input	X	X	X	-	X	X	X	X
Output	X	X	-	-	X	-	-	-
InOut	X	X <sup>(1)</sup>	_ <sup>(4)</sup>	-	X	X	X	X
Static	X	X	-	-	X	-	-	-
Temp	X	X	_ <sup>(4)</sup>	-	-	-	X <sup>(3)</sup>	X
Constant	X	X <sup>(5)</sup>	-	-	-	-	-	-
<b>Function</b>								
Input	X	X <sup>(1)</sup>	X	-	X	X	X	X
Output	X	X <sup>(1)</sup>	-	-	X	X	X	X
InOut	X	X <sup>(1)</sup>	_ <sup>(4)</sup>	-	X	X	X	X
Temp	X	X	_ <sup>(4)</sup>	-	X	-	X <sup>(3)</sup>	X
Return	X	X	-	X	X	X	x <sup>(2)</sup>	-
Constant	X	X <sup>(5)</sup>	-	-	-	-	-	-

<sup>(1)</sup> You cannot make length declarations for STRING and WSTRING in these sections. Here, STRINGS always have the standard length 254, WSTRINGS the standard length 16832. A declaration in the format MyString[3] would not be permitted. WSTRING is only permitted in blocks with optimized access in these sections.

<sup>(2)</sup> In SCL, ANY is not permitted as a function value.

<sup>(3)</sup> ANY can only be used in blocks with standard access in the "Temp" section.

<sup>(4)</sup> The "INSTANCE" parameter type is the only exception permissible in the "TEMP" and "InOut" sections.

<sup>(5)</sup> Constants with the ARRAY or STRUCT data type are not permitted.

## Declaring local tags and constants

### Declaring local tags and constants in the block interface

#### Requirement

The block interface is open.

#### Procedure

To declare a tag or constant of the elementary data type, follow these steps:

1. Select the appropriate declaration section in the interface.
2. Enter a name for the element in the "Name" column.
3. Enter the required data type in the "Data type" column. You will be supported by autocompletion during input.
4. For constants, enter a value in the "Default value" column.
5. Optional: Change the properties that are displayed in the other columns of the block interface.

#### Result

The element is created.

#### Syntax check

A syntax check is performed after each entry, and any errors found are displayed in red. You do not have to correct these errors immediately - you can continue editing and make any corrections later. However, you will not be able to compile the program if the tag declaration contains syntax errors.

---

#### Note

If you change the interface of a block, the calls of the block in the program will possibly become inconsistent. The call locations are automatically updated, if possible.

If an automatic updating is not possible, the inconsistent blocks have to be updated manually.

See also:

Updating block calls in LAD (Page 1476)

Updating block calls in FBD (Page 1518)

Properties of local tags and constants (Page 1448)

Setting the retentivity of local tags (Page 1449)

## Declaring a local tag in the program editor

### Requirement

The program editor is open.

### Procedure

To declare a local tag, follow these steps:

1. Insert an instruction in your program.  
The "<???", "<??.>" or "..." strings represent operand placeholders.
2. Replace an operand placeholder with the name of the tag to be created.
3. Select the name of the element.  
If you want to declare multiple elements, select the names of all the elements to be declared.
4. Select the "Define tag" command in the shortcut menu.  
The "Define tag" dialog box opens. It displays a declaration table in which the name of the element is already entered.
5. To declare a local tag, select one of the following sections:
  - Local In
  - Local Out
  - Local InOut
  - Local Static
  - Local Temp
6. In the other columns, enter data type and comments.
7. Click the "Define" button to complete your entry.

## Result

The declaration is written directly into the block interface and is valid within the entire block.

---

### Note

If you change the interface of a block, the calls of the block in the program will possibly become inconsistent. The call locations are automatically updated, if possible.

If an automatic updating is not possible, the inconsistent blocks have to be updated manually.

Keywords (Page 1231)

Basic information on start values (Page 1591)

Properties of local tags and constants (Page 1448)

Setting the retentivity of local tags (Page 1449)

## Declaring tags of the ARRAY data type

### Requirement

The block interface is open.

### Procedure

To declare a tag of the ARRAY data type, follow these steps:

1. Select the appropriate declaration section in the interface.
2. Enter a tag name in the "Name" column.
3. In the "Data type" column, click the button for the data type selection.  
A list of the permissible data types is opened.
4. Select the "Array" data type.  
The "Array" dialog opens.
5. In the "Data type" text box, specify the data type of the array elements.

### 9.1 Creating the user program

6. In the "ARRAY limits" text box, specify the high and low limit for each dimension.  
Example of a one-dimensional ARRAY:  
[0..3]  
Example of a three-dimensional ARRAY:  
[0..3, 0..15, 0..33]
7. Confirm your entry.
8. Optional: Change the properties of the tags that are displayed in the other columns of the block interface.

#### Result

The tag of ARRAY data type is created.

---

#### Note

You cannot define specific default values for ARRAY elements. However, you can assign them start values in the instance.

---

#### See also

- Using tags within the program (Page 1237)
- Keywords (Page 1231)
- Properties of local tags and constants (Page 1448)
- Setting the retentivity of local tags (Page 1449)
- Editing tables (Page 284)

#### Declaring tags of STRUCT data type

#### Requirement

The block interface is open.

#### Procedure

To declare a tag of the STRUCT data type, follow these steps:

1. Select the appropriate declaration section in the interface:
2. Enter a tag name in the "Name" column.
3. Enter "Struct" in the "Data type" column. You will be supported by autocompletion during input.  
An empty, indented row is inserted after the new tag.
4. Insert the first structural element in the first empty row.  
An additional empty row is inserted after the element.
5. Select a data type for the structure element.

6. Optional: Change the properties of the structural element that is displayed in the other columns of the block interface.
7. Repeat the step 4 to 7 for all additional structure elements.  
It is not necessary to end the structure explicitly. The structure ends with the last element that is entered.
8. To insert a new tag after the structure, leave a blank row after the end of the structure and then start the new tag in the second empty row.

## Result

The tag of STRUCT data type is created.

## See also

Using tags within the program (Page 1237)

Keywords (Page 1231)

Properties of local tags and constants (Page 1448)

Setting the retentivity of local tags (Page 1449)

Editing tables (Page 284)

## Declaring tags based on a PLC data type

### Requirement

A PLC data type is declared in the current CPU.

### Procedure

To declare a tag based on a PLC data type, follow these steps:

1. Select the appropriate declaration section in the interface:
2. Enter the PLC data type in the "Data type" column. You will be supported by Autocomplete during input.

## Result

The tag is created.

---

**Note**

You define the default values of tags within a PLC data type when the PLC data type is created. You cannot change these values at the point of use of the PLC data type.

If you change or delete PLC data types that are used in the block interface, the interface becomes inconsistent. To remedy this inconsistency, the interface has to be updated.

See also: Updating the block interface (Page 1445)

---

**See also**

Editing tables (Page 284)

Basics of PLC data types (Page 1609)

**Declaring higher-level tags**

**Introduction**

To access data areas within a declared tag, you can overlay the declared tags with an additional declaration. This provides you with the option of addressing an already declared tag with a different data type. You can, for example, address the individual bits of a tag of WORD data type with an ARRAY of BOOL.

**Overlaying tags**

To overlay a tag with a new data type, follow these steps:

1. Open the block interface.
2. In the interface, select the tag that you want to overlay with a new data type.
3. Click "Add row" in the toolbar.  
A row is inserted after the tag to be overlaid. The overlaying tag must be declared in the row directly after the tag that is to be overlaid.
4. Enter a tag name in the "Name" column.
5. Enter the "AT" entry in the "Data type" column. You will be supported by Autocomplete in this step.  
The following is added to the entry in the "Name" column.  
"AT<Name of the higher-level tag>"
6. Click the data type selection button again and select the data type for the new tag.  
The tag is created. It points to the same data as the higher-level tag, however interprets this data with the new data type.

## Removing overlay

To remove the overlay of a tag, follow these steps:

1. Select the overlaid tag that you want to remove.
2. Select the "Delete" command in the shortcut menu.
3. The overlay is removed.

## See also

Editing tables (Page 284)

Overlying tags with AT (Page 1251)

## Declaring multi-instances

### Requirement

- The function block to be called exists in project tree and is multi-instance capable.
- The block interface of the calling function block is open.

### Procedure

To declare a function block to be called as a multi-instance, follow these steps:

1. In the "Name" column of the "Static" section, enter a designation for the block call.
2. In the "Data type" column, enter the symbolic name for the function block to be called.

---

#### Note

The program editor will declare the multi-instance automatically if you program a block call in a network and then specify in the "Call options" dialog that you want to call the block as a multiple instance.

---

## See also

Updating the block interface (Page 1445)

## Updating the block interface

### Introduction

If you change or delete PLC data types or multiple instances that are used in the block interface, the interface will become inconsistent. To remedy this inconsistency, the interface has to be updated.

You have two options for updating the block interface:

## 9.1 Creating the user program

- **Explicit updating of the block interface.**  
The used PLC data types and multiple instances will be updated. The instance data blocks that belong to the block are not implicitly updated during this process.
- **Implicit updating during compilation.**  
All used PLC data types and multiple instances as well as the related instance data blocks will be updated.

### Explicit updating of the block interface

To explicitly update the block interface, follow these steps:

1. Open the block interface.
2. Select the "Update" command in the shortcut menu.

### Implicit Updating during Compilation

Proceed as follows to implicitly update all uses of PLC data types and multiple instances as well as the instance data blocks during compilation:

1. Open the project tree.
2. Select the "Program blocks" folder.
3. Select the command "Compile > Software (rebuild all blocks)" in the shortcut menu.

### Extending the block interface

#### Description

In order to enable the editing of PLC programs that have already been commissioned and that are running without error on a system, CPUs of the S7-1500 series and most CPUs of the S7-1200 V4 series support the option of extending the interfaces of function blocks during runtime.

You can download the modified blocks without setting the CPU to STOP and without affecting the values of already loaded tags.

This is a simple means of implementing program changes. This load process (download without reinitialization) will not have a negative impact on the controlled process.

### Principle of operation

Each function block is always assigned a default memory reserve. The memory reserve is not used initially. Activate the memory reserve if you decide on loading interface changes after having compiled and downloaded the block. All tags that you subsequently declare will be saved to the memory reserve. The subsequent download does not influence any tags that are already loaded or have a negative impact on runtime.

If you decide to review your program at a later time while the plant is not in operation, you are also provided an option of reworking the memory layout of individual or several blocks in a single pass. With this action, you move all tags from the reserve area to the regular area. The memory reserve is now cleared and made available for further interface extensions.

### Requirements

This "Download without reinitialization" function is available if the following requirements are met:

- The project is in the "TIA Portal V12" format or a higher version.
- You are working with a CPU that supports "Download without reinitialization".
- The blocks were created in LAD, FBD, STL, or SCL.
- The blocks were created by the user, i.e. they are not included with the blocks delivered in your package.
- These blocks are assigned the optimized access attribute.

### Basic steps

Perform the following steps if you want to extend the interface of a function block and then load the block without re-initialization.

1. All blocks have a default memory reserve of 100 bytes. You can adapt this memory reserve to suit your requirements.
2. Activate the memory reserve.
3. Extend the block interface.
4. Compile the block.
5. Download the block to the CPU as usual.

For more information on the various steps, refer to chapter "Loading blocks (S7-1200/1500)".

**Note**

The full scope of the "Download without reinitialization" function is only available on CPUs of the S7-1500 and S7-1200 V4 series.

However, all CPU families support the option of extending the interface of function blocks and downloading newly declared tags without repercussion:

- You may add new tags in the "Temp" section and download these without influencing the process.
- You may create new tags of a structured data type in the "InOut" section and download these without influencing the process.

**Editing the properties of local tags and constants**

**Properties of local tags and constants**

**Properties**

The table below provides an overview of the properties of local tags and constants:

Group	Property	Description
General	Name	Name of the element.
	Data type	Data type of the element.
	Default value	Value with which you can pre-assign specific tags in the interface of the code block, or the value of a local constant. Specification of the default value is optional for tags. If you do not specify any value the predefined value for the indicated data type is used. For example, the value "false" is predefined for BOOL. The default value of a tag is applied as the start value in the corresponding instance. You can then replace these adopted values with instance-specific start values.
	Comment	Comment for the element.
Attributes	Retain	Marks the tag as retentive. The values of retentive tags are retained even after the power supply is switched off. This attribute is only available in the interface of the function block with optimized access.

Group	Property	Description
	Accessible from HMI	Indicates whether the tag can be used in HMI. When the attribute is set, you have read or write access to the tag from the HMI. When the attribute is not set, you cannot access the tag from the HMI. Please note, however, that you cannot implement general access protection for the tag with the "Accessible from HMI" attribute. Read or write access from other applications is possible even if the attribute is not enabled.
	Visible in HMI	Shows whether the tag is visible by default in the HMI selection list.
	Hidden parameter	Indicates whether the tag should be hidden for the block call. This is only possible if you have specified a valid predefined actual parameter beforehand.
	Predefined actual parameter	Defines a parameter that is to be used as actual parameter during the block call.
	Configurable	Indicates whether a parameter is configurable in CFC.
	For test	Indicates whether a parameter is registered for the CFC test mode.
	Visible	Indicates whether a parameter is visible in CFC.
	Interconnectable	Indicates whether a parameter is interconnectable in CFC.
	Enable tag readback	Indicates whether a parameter is relevant for the "Read back chart" function in CFC.
	Enumeration texts	Assigns a parameter to an enumeration in CFC.
	Engineering unit	Assigns a parameter to a unit in CFC.
	Low limit	Defines the low limit for the parameter in CFC.
	High limit	Defines the high limit for the parameter in CFC.

## Setting the retentivity of local tags

### Introduction

Function blocks store their data in an instance. To prevent data loss in the event of power failure, you can mark the data as retentive. This data is stored in a retentive memory area. The option of setting the retentivity depends on the set access type of the function block.

### Retentive behavior in blocks with standard access

In blocks with standard access you cannot set the retentive behavior of individual tags. You can only define them as retentive in the assigned instance. All tags contained in the block are then considered as retentive.

### Retentivity for optimized block access

In data blocks with optimized access you can define the retentive behavior of individual tags.

For structured data type tags, the retentivity setting always applies to the entire structure. You can make no individual retentivity setting for individual elements within the structure.

You cannot create retentive tags of the structured data type in the "InOut" section. In/out parameters with structured data type, for example ARRAY, STRUCT, or STRING, are always non-retentive.

The following settings are available:

- Retentive  
The values of the tags or the structure are available even after a power failure.
- Non-retentive  
The values of the tags or the structure are lost in the event of a power failure.
- Set in IDB  
The retentivity can be set in the instance data block. The setting that is made in the instance data block then applies, however, centrally to all tags that are selected with "Set in IDB".

Basics of block access (Page 1209)

### Changing properties of local tags and constants

#### Editing properties of an element in the block interface

To edit the properties of an element in the block interface, follow these steps:

1. Open the block interface.
2. Select the required element in the table.
3. Change the entries in the columns.

#### Editing properties of several elements in the block interface

You can also simultaneously set or reset the "Retain", "Visible in HMI", "Accessible in HMI" and "Setpoint" columns for one or more selected elements.

To change one of these properties for several elements, follow these steps:

1. Open the block interface.
2. Hold down the CTRL key.
3. In the required column, select each of the table cells whose value you want to change.
4. Select the "Set <property>" or "Reset <property>" command in the shortcut menu.

### Editing properties in the properties window

To edit the properties of an individual tag or constant, follow these steps:

1. Select an element in the table.  
The properties of the element are shown in the Inspector window.
2. Change the entries in the inspector window.

### Renaming tags directly in the program editor

To rename one or more elements, follow these steps:

1. Select one or more elements in the program.
2. Select the "Rename tag" command in the shortcut menu.  
The "Rename tag" dialog opens. It displays a declaration table with the selected elements.
3. Change the entries in the "Name" column.
4. Confirm the input by clicking the "Change" button.

### Editing the data type or comment in the program editor

Proceed as follows to edit the data type or tag comment in the program editor:

1. Select the name of the tag.
2. Select the "Rewire tag" command in the shortcut menu.  
The "Rewire tag" dialog will open. The dialog shows a declaration table.
3. Change the entry in the "Data type" or "Comment" columns.
4. Click the "Change" button to confirm the input.

### Effect in the program

In case of a change of the name, data type or address of a tag or constant, each location of use of the tag is automatically updated in the program.

---

**Note**

If you change the interface of a block, the program may become inconsistent. The inconsistencies are automatically updated, if possible.

If an automatic updating is not possible, the inconsistent calls are marked in red. You then have to manually update the inconsistencies.

Keywords (Page 1231)

Updating the block interface (Page 1445)

**Declaring PLC data types (UDT) as actual parameters for in-out parameters.**

**Use of PLC data types as predefined actual parameters**

In blocks with optimized access, you have the option to use PLC data types as actual parameters for in/out parameters (InOut) under certain conditions. This can be useful if you are using program blocks as library elements and want to store information about the actual parameters to be used along with the library element.

Additionally, you have the option of hiding in/out parameters that have a valid predefined actual parameter when the block is called. Hidden parameters are not visible initially when the block is called but can be displayed via a small arrow at the bottom edge of the box.

## Requirements

- The in/out parameter (InOut) is based on a PLC data type or a system data type.
- The in/out parameter has the retentivity setting "Retain" or "Non-retain". For in/out parameters with setting "Set in IDB", it is not possible to predefine actual parameters.
- The program block is a block with optimized access.

## Procedure

To predefine the actual parameter of an in/out parameter, follow these steps:

1. Open the block interface.
2. Select an in/out parameter (InOut) in the block interface.
3. Open the "Properties" tab in the Inspector window.
4. Select the "Attributes" group in the area navigation.
5. Enter the required actual parameter in the "Predefined actual parameter" input box.
6. Select the "Hidden parameter" check box (optional).

## Result

- An actual parameter is predefined. If you save the program block as a library element, it thus also contains information about the actual parameter to be used.
- If the library element is used in the program, a check is made to determine whether the actual parameter you have predefined can be addressed. If so, it is automatically used as the actual parameter.
- If the actual parameter is not found in the program, a syntax error is signaled. The parameter is not hidden and the parameter must be initialized manually.

## Editing the block interface

### Inserting table rows

#### Procedure

Proceed as follows to insert a row above the selected row:

1. Select the row in front of which you want to insert a new row.
2. Click the "Insert row" button on the toolbar of the table.

#### Result

A new row is inserted above the selected row.

## See also

Editing tables (Page 284)

## Inserting table rows

### Procedure

Proceed as follows to insert a row below the selected row:

1. Select the row below which you want to insert a new row.
2. Click the "Add row" button on the table toolbar.

### Result

A new empty row will be inserted below the selected row.

## See also

Editing tables (Page 284)

## Deleting tags

### Procedure

Follow the steps below to delete elements:

1. Select the row with the element to be deleted. You can also select several rows by clicking on them one after the other while holding down the <Ctrl> key or by pressing and holding down <Shift> and clicking on the first and last row.
2. Select the "Delete" command in the shortcut menu.

## See also

Editing tables (Page 284)

## Automatically filling in successive cells

You can load the contents of one or several table cells into the cells below, automatically filling in the successive cells.

If you automatically fill in cells in the "Name" column, a consecutive number will be appended to each name. For example, "Motor" will become "Motor\_1".

You can define individual or more cells as well as entire rows as source area.

If less rows exist in the open table than you want to fill, then you will first have to insert additional empty rows.

## Requirement

- The table is open.
- Sufficient declaration rows are available.

## Procedure

To automatically fill in successive cells, follow these steps:

1. Select the cells to be loaded.
2. Click the "Fill" symbol in the bottom right corner of the cell.  
The mouse pointer is transformed into a crosshair.
3. Keep the mouse button pressed and drag the mouse pointer downwards over the cells that you want to fill in automatically.
4. Release the mouse button.  
The cells are filled in automatically.
5. If entries are already present in the cells that are to be automatically filled in, a dialog appears. In this dialog you can indicate whether you want to overwrite the existing entries or insert new rows for the new tags.

## See also

Editing tables (Page 284)

## Show and hide table columns

You can show or hide the columns in a table as needed.

## Procedure

To show or hide table columns, follow these steps:

1. Click a column header.
2. Select the "Show/Hide" command in the shortcut menu.  
The selection of available columns is displayed.
3. To show a column, select the column's check box.
4. To hide a column, clear the column's check box.

## Editing tags with external editors

To edit individual tags in external table editors, such as Excel, you can export or import these tags using copy and paste. However, you cannot copy structured tags to an editor.

## Requirements

The block interface and an external editor are opened.

### Procedure

To export individual tags to an external editor and import them again, follow these steps:

1. Select one or more tags.
2. Select "Copy" in the shortcut menu.
3. Switch to the external editor and paste the copied tags.
4. Edit the tags as required.
5. Copy the tags in the external editor.
6. Select the tags in the external editor.
7. Switch back to the block interface.
8. Select "Paste" in the shortcut menu.

### Creating program code

### Creating LAD programs

### Basic information on LAD

### LAD programming language

### Overview of the Ladder Logic (LAD) programming language

LAD is a graphical programming language. The representation is based on circuit diagrams.

The program is mapped in one or more networks. A network contains a power rail on the left where the rungs originate. The binary signal scans are arranged in the form of contacts on the rungs. The serial arrangement of the elements on a rung creates a series connection; arrangement on simultaneous branches creates a parallel connection. Complex functions are represented by boxes.

### Example of networks in LAD

The following figure shows a LAD network with two normally open contacts, one normally closed contact and one coil:

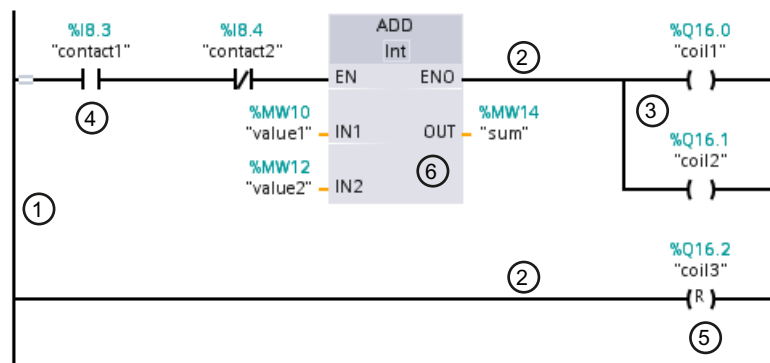

## Overview of the LAD elements

### LAD elements

A LAD program consists of separate elements that you can arrange in series or parallel on the power rail of a network. Most program elements must be supplied with tags.

There is at least one rung from the power rail. Network programming starts at the left edge of the rung. You can expand the power rail by several rungs and branches.

For example, the following figure shows elements of a LAD network:

- 1) Power rail
- 2) Rung
- 3) Branch
- 4) Contact
- 5) Coil
- 6) Box

### Power rail

Each LAD network consists of a power rail that contains at least one rung. A network can be extended by adding additional rungs. You can use branches to program parallel connections in the specific rungs.

### Contacts

You can use contacts to create or interrupt a current-carrying connection between two elements. The current is relayed from left to right. You can use contacts to query the signal state or the value of an operand and control it depending on the result of the current flow.

The following types of contact are available to you in a LAD program:

### 9.1 Creating the user program

- Normally open contact:  
Normally open contacts forward the current if the signal state of a specified binary operand is "1".
- Normally closed contacts:  
Normally closed contacts forward the current if the signal state of a specified binary operand is "0".
- Contact with additional function:  
Contacts with additional function forward the current if a specific condition is met. With these contacts you can also execute an additional function, such as an RLO edge detection and a comparison.

### Coils

You can use coils to control binary operands. Coils can set or reset a binary operand depending on the signal state of the result of logic operation.

The following types of coils are available to you in a LAD program:

- Standard coils:  
Standard coils set a binary operand if current flows in the coil. The "Assignment" instruction is an example of a standard coil.
- Coils with additional function:  
These coils have additional functions in addition to the evaluation of the logic operation result. Coils for RLO edge detection and program control are examples of coils with additional function.

### Boxes

Boxes are LAD elements with complex functions. The empty box is an exception. You can use the empty box as a placeholder in which you can select the required instruction.

The following types of boxes are available to you in a LAD program:

- Boxes without EN/ENO mechanism:  
A box is executed depending on the signal state at the box inputs. The error status of the processing cannot be queried.
- Boxes with EN/ENO mechanism:  
A box is only executed if the enable input "EN" carries the signal state "1". If the box is processed correctly, the "ENO" enable output has signal state "1". If an error occurs during the processing, the "ENO" enable output is reset.

Calls of code block are also shown in the network as boxes with EN/ENO mechanism.

Rules for the use of LAD elements (Page 1467)

## Settings for LAD

### Overview of the settings for LAD

#### Overview

The following table shows the settings that you can make:

Group	Setting	Description
Font	Font size	Font size in program editor
View	Layout	Compact or wide Changes the vertical spacing between operands and other objects (such as operand and contact). The change becomes visible once the block is reopened.
	With absolute information	Additional display of the absolute addresses
Operand field	Maximum width	Maximum number of characters that can be entered horizontally in the operand field. This setting recalculates the layout of the networks.
	Maximum height	Maximum number of characters that can be entered vertically in the operand field. This setting recalculates the layout of the networks.

#### See also

Changing the settings (Page 1459)

### Changing the settings

#### Procedure

To change the settings, follow these steps:

1. Select the "Settings" command in the "Options" menu.  
The "Settings" window is displayed in the work area.
2. In the area navigation, select the "PLC programming" group.
3. Change the settings.

#### Result

The change will be loaded directly, there is no need to save it explicitly.

## **See also**

Overview of the settings for LAD (Page 1459)

## **Working with networks**

### **Using networks**

#### **Function**

The user program is created in the block within networks. For a code block to be programmed, it must contain at least one network. To achieve a better overview of the user program, you can also subdivide your program into several networks.

## **See also**

Inserting network title (Page 1463)

Entering a network comment (Page 1465)

Navigating networks (Page 1466)

## **Inserting networks**

### **Requirement**

A block is open.

### **Procedure**

To insert a new network, follow these steps:

1. Select the network after which you want to insert a new network.
2. Select the "Insert network" command in the shortcut menu.

### **Result**

A new empty network is inserted into the block.

## **See also**

Selecting networks (Page 1461)

Entering a network comment (Page 1465)

Navigating networks (Page 1466)

## Selecting networks

### Requirements

A network is available.

### Selecting a network

To select a network, follow these steps:

1. Click the title bar of the network that you want to select.

### Selecting several networks

Proceed as follows to select several individual networks:

1. Press and hold down the <Ctrl> key.
2. Click all the networks that you want to select.

To select several successive networks, follow these steps:

1. Press and hold down the <Shift> key.
2. Click the first network that you want to select.
3. Click the last network that you want to select.  
The first and last networks and all those in between are selected.

### See also

Entering a network comment (Page 1465)

Navigating networks (Page 1466)

### Copying and pasting networks

Copied networks can be pasted within the block or in another block. Networks that were created in LAD or FBD can also be inserted in blocks of the respective other programming language.

## Requirement

A network is available.

## Procedure

To copy and paste a network, follow these steps:

1. Select the network or networks to be copied.
2. Select "Copy" in the shortcut menu.
3. Select the network after which you want to paste in the copied network.
4. Select "Paste" in the shortcut menu.

## See also

Inserting network title (Page 1463)

Entering a network comment (Page 1465)

Navigating networks (Page 1466)

## Expanding and collapsing networks

### Requirements

A network is available.

### Opening and closing a network

To open a network, follow these steps:

1. Click on the right arrow in the network title bar.

To close a network, follow these steps:

1. Click on the down arrow in the network title bar.

### Opening and closing all networks

To open and close all networks, follow these steps:

1. In the toolbar, click "Open all networks" or "Close all networks".

### See also

Inserting networks (Page 1460)

Selecting networks (Page 1461)

Copying and pasting networks (Page 1461)

Deleting networks (Page 1462)

Inserting network title (Page 1463)

Entering a network comment (Page 1465)

Navigating networks (Page 1466)

### Inserting network title

The network title is the header of a network. The length of the network title is limited to one line. You can enter the title manually or set it automatically. When you set it automatically, you can do this for individual networks or use the settings to specify that the network title is always set automatically.

For automatic insertion of the network title, the comment of the operand in one of the following instructions in the network is evaluated:

### 9.1 Creating the user program

- Assignment
- Set output
- Reset output

The instruction that is listed first in the network is used.

The network title is only inserted automatically when the following conditions are fulfilled:

- The network does not have a title yet.
- The operand of the instruction used for the comment has a comment.

---

#### Note

Note the following restrictions for automatic insertion of the network title:

- The network title is not adapted if you change the comment of the operand at a later time.
  - The network title is not adapted if you change the operand of the instruction.
  - The network title is only set by the writing instructions listed above.
  - If the operand is of the data type array, the comment of the array is used and not the comments of the array elements.
  - Comments of invalid operands are not taken into consideration.
- 

#### Entering the network title manually

To enter a network title, follow these steps:

1. Click on the title bar of the network.
2. Enter the network title.

#### Setting the network title automatically

To specify that the network titles are always set automatically, follow these steps:

1. Select the "Settings" command in the "Options" menu.  
The "Settings" window is displayed in the work area.
2. In the area navigation, select the "PLC programming" group.
3. Select the "Set network title automatically" check box in the "Additional settings" group.  
The network titles are set automatically as of this time if the conditions listed above are fulfilled.

To set an individual network title automatically, follow these steps:

1. Right-click "Network <Number of the network>" in the title bar of a network.
2. Select the "Set network title automatically" command in the shortcut menu.  
The title of the selected network is set based on the comment of the operand if the conditions listed above are fulfilled.

## See also

Expanding and collapsing networks (Page 1463)  
Entering a network comment (Page 1465)  
Navigating networks (Page 1466)

## Entering a network comment

You can use network comments to provide comments on the program contents of individual networks. For example, you can indicate the function of the network or draw attention to special characteristics.

## Requirement

A network is available.

## Procedure

To enter a network comment, follow these steps:

1. Click on the right arrow before the network title.
2. If the comment area is not visible, click "Network comments on/off" in the toolbar.  
The comment area is displayed.
3. Click "Comment" in the comment area.  
The "Comment" text passage is selected.
4. Enter the network comment.

Navigating networks (Page 1466)

## **Navigating networks**

You can navigate straight to a specific position within a block.

### **Procedure**

To navigate to a specific position within a block, follow these steps:

1. Right-click in the code area of the programming window.
2. Select the "Go to > Network/line" command in the shortcut menu.  
The "Go to" dialog will open.
3. Enter the network to which you want to navigate.
4. Enter the line number of the network to which you want to navigate.
5. Confirm your entry with "OK".

### **Result**

The relevant line will be displayed if this is possible. If the network or line requested does not exist, the last existing network or the last existing line in the network requested will be displayed.

### **See also**

## Inserting LAD elements

### Rules for the use of LAD elements

#### Rules

Note the following rules when inserting LAD elements:

- Every LAD network must terminate with a coil or a box. However, the following LAD elements must not be used to terminate a network:
  - Comparator boxes
  - Instructions for positive and negative RLO edge detection
- The starting point of the branch for a box connection must always be the power rail. Logic operations or other boxes can be present in the branch before the box.
- Only contacts can be inserted into simultaneous branches with preceding logic operations. The contact for negating the result of logic operation (-|NOT|-) is an exception here. The contact for negating the result of logic operation, as well as coils and boxes, can be used in simultaneous branches if they originate directly from the power rail.
- Constants (e.g. TRUE or FALSE) cannot be assigned to normally closed or normally open contacts. Instead, use operands of the BOOL data type.
- Only one jump instruction can be inserted in each network.
- Only one jump label can be inserted in each network.
- Instructions with positive or negative edge detection may not be arranged directly at the left margin of the rung as they requires a prior logic operation.

### Placement rules for S7-1200/1500 CPUs

The following table sets out the instructions that can only be positioned at the end of the network:

Instruction		Preceding logic operation required
Mnemonics	Name	
SET_BF	Set bit field	No
RESET_BF	Reset bit field	No
JMP	Jump if RLO = 1	No
JMPN	Jump if RLO = 0	Yes
JMP_LIST	Define jump list	No
SWITCH	Jump distributor	No
RET	Return	No

**Placement rules for S7-300/400 CPUs**

The following table sets out the instructions that can only be positioned at the end of the network:

Instruction		Preceding logic operation required
Mnemonics	Name	
S	Set output	Yes
R	Reset output	Yes
SP	Start pulse timer	Yes
SE	Start extended pulse timer	Yes
SD	Start on-delay timer	Yes
SS	Start retentive on-delay timer	Yes
SF	Start off-delay timer	Yes
SC	Set counter value	Yes
CU	Count up	Yes
CD	Count down	Yes
JMP	Jump if RLO = 1	No
JMPN	Jump if RLO = 0	Yes
RET	Return	No
OPN	Open global data block	No
OPNI	Open instance data block	No
CALL	Call block	No
SAVE	Save RLO in BR bit	No
MCRA	Enable MCR range	No
MCRD	Disable MCR range	No
MCR<	Open MCR ranges	No
MCR>	Close MCR ranges	No

**See also**

Prohibited interconnections in LAD (Page 1469)

Overview of the LAD elements (Page 1457)

## Prohibited interconnections in LAD

### Power flow from right to left

No branches can be programmed that could result in a power flow in the reverse direction.

### Short-circuit

No branches may be programmed that would cause a short-circuit.

## Logic operations

The following rules apply to logic operations:

- Only Boolean inputs can be combined with preceding logic operations.
- Only the first Boolean output can be combined with a further logic operation.
- Only one complete logical path can exist per network. Paths that are not connected can be linked.

## See also

Rules for the use of LAD elements (Page 1467)

## Inserting LAD elements using the "Instructions" task card

### Requirement

A network is available.

## Procedure

To insert a LAD element into a network using the "Instructions" task card, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to the LAD element that you want to insert.
3. Use drag-and-drop to move the element to the desired place in the network.  
If the element is an internal system function block (FB), the "Call options" dialog opens. In this dialog you can create an instance data block of the single-instance or multiple-instance type for the function block in which the data of the inserted element will be saved. You will find the new instance data block created in the project tree in the "Program resources" folder under "Program blocks > System blocks". If you have selected "multiple instance", these are located in the block interface in the "Static" section.

Or:

1. Select the point in the network at which you want to insert the element.
2. Open the "Instructions" task card.
3. Double-click on the element you want to insert.  
If the element is an internal system function block (FB), the "Call options" dialog opens. In this dialog you can create an instance data block of the single-instance or multiple-instance type for the function block in which the data of the inserted element will be saved. You will find the new instance data block created in the project tree in the "Program resources" folder under "Program blocks > System blocks". If you have selected "multiple instance", these are located in the block interface in the "Static" section.

## Result

The selected LAD element is inserted with placeholders for the parameters.

## Inserting LAD elements using an empty box

### Requirement

A network is available.

### Procedure

To insert an LAD element into a network using an empty box, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "General > Empty box" in the "Basic instructions" palette.
3. Use a drag-and-drop operation to move the "Empty box" element to the desired place in the network.

4. Position the cursor over the triangle in the top right-hand corner of the empty box. A drop-down list is displayed.
5. Select the required LAD element from the drop-down list.  
If the element is an internal system function block (FB), the "Call option" dialog opens. In this dialog you can create an instance data block of the single-instance or multiple-instance type for the function block in which the data of the inserted element will be saved. You will find the new instance data block created in the project tree in the "Program resources" folder under "Program blocks > System blocks". If you have selected "multi-instance", these are located in the block interface in the "Static" section.

## Result

The empty box is changed to the respective LAD element. Placeholders are inserted for the parameters.

## Selecting the data type of a LAD element

### Selecting a data type

#### Introduction

Some instructions can be executed with several different data types. If you use one of these instructions in the program, you have to specify a valid data type for the instruction at the specific point in the program. For some instructions, you have to select the data types for the inputs and outputs separately.

---

#### Note

The valid data type (BOOL) for the tags on the enable input EN and the enable output ENO is predefined by the system and cannot be changed.

---

The valid data types for an instruction are listed in the instruction drop-down list. You specify the data type of the instruction by selecting an entry from the drop-down list. If the data type of an operand differs from the data type of the instruction and cannot be converted implicitly, the operand is displayed in red and a rollout with the corresponding error message appears.

## Data type selection of mathematical instructions

Some mathematical instructions provide you with the option of having the data type automatically set corresponding to the data types of the operand. In the drop-down list for data type selection, these instructions have the entry "Auto" in addition to the actual data types. If you select this entry and then allocate the first operand, the data type of the operand is selected as data type for the instruction. The entry in the drop-down list changes to "Auto (<Data type>)",

e.g. "Auto (Real)". If you allocate additional operands, the automatically set data type of the instruction is adjusted according to the following criteria:

- You supply all other operands with tags of the same data type:  
The data type of the instruction is not changed.
- You supply all other operands with tags whose data type is smaller than the data type of the instruction:  
The data type of the instruction is not changed. For the operand with the smaller data type, an implicit conversion is conducted if necessary.
- You supply an additional operand with a tag whose data type is greater than the data type of the instruction:  
The data type of the instruction is changed to the larger data type. An implicit conversion is performed, if necessary, for operands that deviate from the newly set data type of the instruction.

Each change in the data type of an operand can result in a change of the data type of the instruction. Other operands may possibly be implicitly converted as a result. Operands for which an implicit conversion is performed are marked with a gray square.

---

**Note**

Please also observe the information on data type conversion for your device and, in particular, the notes on the IEC check.

Defining the data type of an instruction (Page 1472)

**Defining the data type of an instruction**

**Introduction**

Some instructions can be executed with several different data types. When you insert such instructions into your program, you must specify the data type for these instructions at the actual point in the program.

**Specifying the data type by means of the drop-down list**

To define the data type of an instruction using the drop-down list, follow these steps:

1. Insert the instruction at the required point in the program using drag-and-drop.  
The entry "???" (undefined) is displayed in the drop-down list of the inserted instruction.
2. Click the triangle in the upper corner of the drop-down list.  
The drop-down list will open to display the data types valid for the instruction.

3. Select a data type from the drop-down list.  
The selected data type is displayed.
4. If the instruction has two drop-down lists, select the data type for the instruction inputs in the left-hand drop-down list and the data type for the instruction outputs in the right-hand drop-down list.

### Specifying data type by assigning tags

To define the data type of an instruction by assigning tags, follow these steps:

1. Insert the instruction at the required point in the program using drag-and-drop.  
The entry "???" (undefined) is displayed in the drop-down list of the inserted instruction.
2. At an input or output, specify a valid tag, the data type of which is to be applied as the instruction data type.  
The data type of the tag is displayed in the drop-down list.
3. Enter a valid tag at an input and a valid tag at an output if data types need to be defined for both the inputs and outputs of the instruction. The tag specified at the input determines the data type of the inputs; the tag specified at the output determines the data type of the outputs of the instruction.

### Automatically specifying the data type of mathematical instructions

To automatically specify the data type for mathematical instructions, follow these steps:

1. Insert the mathematical instruction at the required point in the program using drag-and-drop.  
The entry "???" (undefined) is displayed in the drop-down list of the inserted instruction.
2. Select the "Auto" entry from the drop-down list.
3. Enter a valid tag at an input or output.  
The data type of the tag is applied as data type of the instruction. The entry in the drop-down list changes to "Auto (<Data type>").

### Using favorites in LAD

### Adding LAD elements to Favorites

### Requirement

- A block is open.
- The multipane mode is set for the "Instructions" task card or the Favorites are also displayed in the editor.

## Procedure

To add SCL instructions to the Favorites, follow these steps:

1. Open the "Instructions" task card.
2. Maximize the "Basic instructions" pane.
3. Navigate in the "Basic instructions" pane to the instruction that you want to add to the Favorites.
4. Drag-and-drop the instruction into the "Favorites" pane or into the Favorites area in the program editor.

---

### Note

To additionally display the Favorites in the program editor, click the "Display favorites in the editor" button in the program editor toolbar.

---

## See also

Removing LAD elements from Favorites (Page 1475)

Overview of the program editor (Page 1412)

## Inserting LAD elements using favorites

### Requirement

- A block is open.
- Favorites are available.

### Procedure

To insert an instruction into a program using Favorites, follow these steps:

1. Drag-and-drop the desired instruction from Favorites to the desired position.

Or:

1. Select the position in the program where you want to insert the instruction.
2. In the Favorites, click on the instruction you want to insert.

---

### Note

To additionally display the Favorites in the program editor, click the "Display favorites in the editor" button in the program editor toolbar.

---

## See also

Removing LAD elements from Favorites (Page 1475)  
Overview of the program editor (Page 1412)

## Removing LAD elements from Favorites

### Requirement

A code block is open.

### Procedure

To remove instructions from Favorites, follow these steps:

1. Right-click on the instruction you want to remove.
2. Select the "Remove instruction" command in the shortcut menu.

---

#### Note

To additionally display the Favorites in the program editor, click the "Display favorites in the editor" button in the program editor toolbar.

---

## Insert block calls in LAD

### Inserting block calls using a drag-and-drop operation

You can insert calls for existing functions (FC) and function blocks (FB) using a drag-and-drop operation from the project tree. If you call function blocks from other function blocks, you can either call them as single-instance or multi-instance blocks. If a function block is called as single instance, it will store its data in a data block of its own. If a function block is called as multi-instance, it will store its data in the instance data block of the calling function block.

### Requirement

- A network is available.
- The block that is to be called is available.

### Inserting a call of a function (FC)

To insert a call of a function (FC) into a network using a drag-and-drop operation, follow these steps:

1. Drag the function from the project tree to the required network.

### Inserting a call for a function block (FB)

To insert a call for a function block (FB), follow these steps:

1. Drag the function block from the project tree to the required network.  
The "Call options" dialog opens.
2. Enter in the dialog whether you wish to call the block as single or multi-instance.
  - If you click on the "Single instance" button, you will have to enter a name in the "Name" text box for the data block that you want to assign to the function block.
  - If you click on the "Multi-instance" button, you will have to enter the name of the tag in the "Name in the interface" text box; this is the name that you use to enter the called function block as a static tag in the interface of the calling block.
3. Confirm your entries with "OK".

### Result

The function or the function block is inserted with its parameters. You can then assign the parameters.

See also: Auto-Hotspot

---

#### Note

If when calling a function block you specify an instance data block that does not exist, it will be created. If you have called a function block as a multi-instance, this will be entered as a static tag in the interface.

---

### See also

Updating block calls in LAD (Page 1476)

Changing the instance type (Page 1477)

Single instances (Page 1217)

Multi-instances (Page 1217)

### Updating block calls in LAD

If interface parameters of a called block are changed, the block call can no longer be executed correctly. You can avoid such inconsistent block calls by updating the block calls.

You have two options to update the block calls:

- Explicit updating in the program editor.  
The block calls in the open block will be updated.
- Implicit updating during compilation.  
All block calls in the program as well as the used PLC data types will be updated.

### **Update blocks in the program editor**

To update a block call within a block, follow these steps:

1. Open the block in the program editor.
2. Click "Update inconsistent block calls" in the toolbar.

Or:

1. Open the block in the program editor.
2. Right-click on the instruction with the block call.
3. Select the "Update" command in the shortcut menu.  
The "Interface update" dialog opens. This dialog shows the differences between the block interface in use and the changed interface of the called block.
4. If you want to update the block call, click "OK". To cancel the update, click "Cancel".

### **Update block calls during compilation**

Follow these steps to update all block calls and uses of PLC data types during compilation implicitly:

1. Open the project tree.
2. Select the "Program blocks" folder.
3. Select the command "Compile > Software (rebuild all blocks)" in the shortcut menu.

### **See also**

Inserting block calls using a drag-and-drop operation (Page 1475)

Changing the instance type (Page 1477)

### **Changing the instance type**

#### **Instance type**

There are two ways of calling function blocks:

- As a single instance
- As a multiple instance

See also: Auto-Hotspot

You can modify a defined instance type at any time.

## Requirement

The user program contains a block call.

## Procedure

To change the instance type of a function block, follow these steps:

1. Open the code block and select the block call.
2. Select the "Change instance" command in the shortcut menu.  
The "Call options" dialog opens.
3. Click the "Single instance" or "Multi instance" button.
  - If you select the "Single instance" instance type, enter a name for the data block that is to be assigned to the function block.
  - If you select "Multiple instance" as the instance type, enter in the "Name in the interface" text field the name of the tag with which the called function block is to be entered as a static tag in the interface of the calling block.
4. Confirm your entries with "OK".

---

### Note

The previous single and multiple instances will not be deleted automatically.

---

## Inserting complex LAD instructions

### Using the "Calculate" instruction

#### Requirement

A network is available.

#### Procedure

Proceed as follows to use the "Calculate" instruction:

1. Open the "Instructions" task card.
2. Navigate to "Math functions > CALCULATE" in the "Basic instructions" pane.

3. Use drag-and-drop to move the element to the desired place in the network.  
The instruction "Calculate" will be inserted for the data type with a placeholder expression and question mark.
4. Enter the data type for the calculation.
5. Enter the operands for the calculation.

---

**Note**

The calculation is run with the inputs of the "Calculate" instruction. If you want to use constants you must also insert appropriate inputs for them.

---

6. Click on the "Edit 'Calculate' instruction" button to replace the placeholder expression with the correct expression.  
The "Edit 'Calculate' instruction" dialog will open.
7. Enter the required expression in the "OUT:=" text box.

---

**Note**

In the "Example" area you can find an example of a valid expression and possible instructions that you can use.

To determine a value with the help of Pythagoras' theorem, for example, enter "OUT := SQRT (SQR (IN1) + SQR (IN2))".

---

8. Confirm your entry with "OK".

CALCULATE: Calculate (Page 1903)

**Using free-form comments****Basic information on using free-form comments in LAD****Introduction**

Free-form comments allow you to add comments to the source code for graphic programming languages similar to line comments for textual languages.

Free-form comments can be used for the following elements:

- Boxes
- Coils

## See also

Inserting free-form comments (Page 1480)

Editing free-form comments (Page 1480)

Deleting free-form comments (Page 1482)

## Inserting free-form comments

### Requirement

A network with instructions is available.

### Procedure

To insert a free comment on an instruction, proceed as follows:

1. If necessary, activate the "Free-form comments on/off" button in the toolbar.
2. Right-click on the instruction for which you want to insert a free-form comment.
3. Select the "Insert comment" command in the shortcut menu.  
A comment box with a standard comment opens. The comment box is connected by an arrow to the corresponding instruction.
4. Enter the required comment in the comment box.

## See also

Basic information on using free-form comments in LAD (Page 1479)

Editing free-form comments (Page 1480)

Deleting free-form comments (Page 1482)

## Editing free-form comments

### Introduction

Free-form comments can be edited as follows:

- Changing the comment text
- Changing the position and size of the comment box
- Attaching a comment to another element
- Showing and hiding free comments

### **Changing the comment text**

To change the text of free-form comments, follow these steps:

1. Click on the comment box.
2. Enter the desired text.

### **Changing the position of the comment box**

To change the positioning of the comment box, follow the steps below:

1. Left-click the comment box and keep the mouse button pressed.
2. Drag the comment box to the desired location.

### **Changing the size of the comment box**

To change the size of the comment box, follow the steps below:

1. Click on the comment box.
2. Drag the comment box on the move handle in the lower right corner to the desired size.

### **Attaching a comment to another element**

To attach a free-form comment to another element, follow these steps:

1. Left-click the point of the arrow that links the comment box with the instruction and keep the mouse button pressed.
2. Drag the arrow to the element to which you want to attach the comment. Possible insertion points are marked with a green square.
3. Release the mouse button.

### **Showing and hiding free comments**

To show or hide a free-form comments, follow these steps:

1. Click the "Free-form comment on/off" button in the toolbar.

### **See also**

Editing free-form comments (Page 1480)

## Editing LAD elements

### Selecting LAD elements

You can select several individual elements or all elements in a network.

### Requirement

LAD elements are available

### Selecting several individual LAD elements

To select several individual LAD elements, follow these steps:

1. Press and hold down the <Ctrl> key.
2. Click on all the LAD elements you wish to select.
3. Now release the <Ctrl> key.

### Selecting all LAD elements in a network

To select all LAD elements in a network, follow these steps:

1. Go to the network whose elements you wish to select.
2. Select the "Select all" command in the "Edit" menu or press <Ctrl A>.

## See also

Deleting LAD elements (Page 1489)

## Copying LAD elements

### Requirement

An LAD element is available.

### Procedure

To copy a LAD element, follow these steps:

1. Right-click the LAD element that you want to copy.
2. Select "Copy" in the shortcut menu.

### Result

The LAD element will be copied and saved to the clipboard.

## See also

Selecting LAD elements (Page 1482)  
Cutting LAD elements (Page 1484)  
Pasting an LAD element from the clipboard (Page 1484)

Inserting additional inputs and outputs in LAD elements (Page 1486)  
Removing inputs and outputs (Page 1487)  
Enabling and disabling the EN/ENO mechanism (Page 1487)  
Deleting LAD elements (Page 1489)

## Cutting LAD elements

### Requirement

An LAD element is available.

### Cutting

To cut a LAD element, follow these steps:

1. Right-click the LAD element that you want to cut.
2. Select "Cut" in the shortcut menu.

### Result

The LAD element will be cut and saved to the clipboard.

### See also

Selecting LAD elements (Page 1482)

Copying LAD elements (Page 1483)

Pasting an LAD element from the clipboard (Page 1484)

Removing inputs and outputs (Page 1487)

Enabling and disabling the EN/ENO mechanism (Page 1487)

Deleting LAD elements (Page 1489)

## Pasting an LAD element from the clipboard

### Requirement

An LAD element is available.

### Procedure

To paste an LAD element from the clipboard, follow these steps:

1. Copy a LAD element or cut a LAD element.
2. Right-click the point in the network where you want to paste the element.
3. Select "Paste" in the shortcut menu.

## See also

Selecting LAD elements (Page 1482)  
Copying LAD elements (Page 1483)  
Cutting LAD elements (Page 1484)

Removing inputs and outputs (Page 1487)  
Enabling and disabling the EN/ENO mechanism (Page 1487)  
Deleting LAD elements (Page 1489)

## Replacing LAD elements

You can easily exchange LAD elements with other LAD elements of the same type. This has the advantage that the parameters are retained and need not be entered again. For example, you can exchange normally open contacts and normally closed contacts or RS FlipFlop and SR FlipFlop.

## Requirements

A network with at least one LAD element is present.

## Procedure

To replace an LAD element with another LAD element, follow these steps:

1. Select the LAD element that you want to replace.
2. Position the cursor over the triangle in the top right-hand corner of the LAD element.  
A drop-down list is displayed.
3. From the drop-down list, select the LAD element that you want to use to replace the existing LAD element.

## See also

Removing inputs and outputs (Page 1487)  
Enabling and disabling the EN/ENO mechanism (Page 1487)  
Deleting LAD elements (Page 1489)

## Inserting additional inputs and outputs in LAD elements

### Introduction

You can expand LAD elements which execute commutative arithmetic instructions by adding additional inputs. Such elements are, for example, the instructions "Add" (ADD) and "Multiply" (MUL). You can expand the MOVE and DEMUX instruction boxes by adding additional outputs.

### Requirement

An LAD element is available that permits the insertion of additional inputs and outputs.

### Inserting an additional input

To add an additional input to the box of a LAD element, follow these steps:

1. Right-click on an existing input of the LAD element.
2. Select "Insert input" in the shortcut menu.  
An additional input is added to the box of the LAD element.

Or:

1. Click on the yellow star symbol beside the last input in the instruction box.  
An additional input is added to the box of the LAD element.

### Inserting an additional output

To add an additional output to the box of a LAD element, follow these steps:

1. Right-click on an existing output of the LAD element.
2. Select "Insert output" from the shortcut menu.  
An additional output is added to the box of the LAD element.

Or:

1. Click on the yellow star symbol beside the last input in the instruction box.  
An additional output is added to the box of the LAD element.

### See also

- Selecting LAD elements (Page 1482)

- Removing inputs and outputs (Page 1487)
- Enabling and disabling the EN/ENO mechanism (Page 1487)
- Deleting LAD elements (Page 1489)

## Removing inputs and outputs

### Introduction

Inputs and outputs which you have added to an instruction can be removed.

### Requirement

An LAD element is available to which you have added additional inputs and outputs.

### Remove input

To remove an input, follow these steps:

1. Select the input that you want to remove.
2. Select the "Delete" command in the shortcut menu.  
The input of the LAD element is removed.

### Remove output

To remove an output, follow these steps:

1. Select the output that you want to remove.
2. Select the "Delete" command in the shortcut menu.  
The output of the LAD element will be removed.

### See also

Replacing LAD elements (Page 1485)

Inserting additional inputs and outputs in LAD elements (Page 1486)

Enabling and disabling the EN/ENO mechanism (Page 1487)

Deleting LAD elements (Page 1489)

## Enabling and disabling the EN/ENO mechanism

In LAD and FBD, certain instructions have an enable output ENO and thus use the EN/ENO mechanism. This allows you to query runtime errors in instructions and react to them. In order to increase the performance of the CPU, the EN/ENO mechanism is disabled in the default setting. This means that you are not initially able to react to runtime errors of the instruction

using the ENO value. However, you can enable the EN/ENO mechanism again at any time, if required.

You can enable the EN/ENO mechanism individually for each instruction in order to generate the ENO. If you enable the EN/ENO mechanism for an instruction, other instructions that you subsequently add to your program are also inserted with the EN/ENO mechanism enabled. You can disable the EN/ENO mechanism again at any time if you do not want to use the evaluation of ENO for an instruction. Further instructions that you subsequently add to your program will then be inserted without the EN/ENO mechanism.

See also: Basics of the EN/ENO mechanism (Page 1357)

### Activating the EN/ENO mechanism

Proceed as follows to activate the EN/ENO mechanism of an instruction:

1. In your program, right-click the instruction at which you want to activate the EN/ENO mechanism.
2. Select the "Generate ENO" command from the shortcut menu.  
The ENO value is again generated for the instruction. Other instructions are inserted with the enable output.

### Deactivating the EN/ENO mechanism

Proceed as follows to deactivate the EN/ENO mechanism of an instruction:

1. In your program, right-click the instruction at which you want to deactivate the EN/ENO mechanism.
2. Select the "Do not generate ENO" command from the shortcut menu.  
The ENO value is no longer generated for the instruction. Other instructions are inserted without enable output.

### See also

Inserting additional inputs and outputs in LAD elements (Page 1486)

Removing inputs and outputs (Page 1487)

Enabling and disabling the EN/ENO mechanism (Page 1487)

## Inserting operands into LAD instructions

### Inserting operands

The character strings "<???">", "<???.?>" and "..." are inserted as placeholders for the parameters when an LAD element is inserted. The "<???">" and "<???.?>" strings displayed in red indicate parameters that need to be connected. The "..." string displayed in black indicates parameters that may be connected. "<???.?>" stands for Boolean placeholders.

---

#### Note

If you position the cursor over the placeholder, the expected data type will be displayed.

---

### Requirement

An LAD element is available.

## Procedure

To connect the parameters of a LAD element, follow these steps:

1. Double-click the placeholder of the parameter.  
An entry field opens, and the placeholder is selected.
2. Enter the appropriate parameter.

---

### Note

If you enter the absolute address of a parameter that has already been defined, this absolute address will be changed to the symbolic name of the parameter as soon as the input is confirmed. If you have not yet defined the parameter, a new tag with this absolute address and the default name "Tag\_<n>" will be entered in the PLC tag table. When you confirm your input, the absolute address will be replaced with the symbolic name "Tag\_<n>".

---

3. Confirm the parameter with the Enter key.
4. If you have not yet defined the parameter, you can define it directly in the program editor using the shortcut menu.  
See also:  
Declaring PLC tags in the program editor (Page 1372)  
Declaring local tags in the program editor (Page 1440)

Or drag from it the PLC tag table:

1. In the project tree, select the "PLC tags" folder or open the PLC tag table.
2. If you have opened the PLC tag table, drag the symbol from the first column of the desired tag to the appropriate place in your program. If you have not opened the PLC tag table yet, open the detail view now. Drag the desired tag from the detail view to the appropriate place in your program.

Or drag from it the block interface:

1. Open the block interface.
2. Drag the required operand from the block interface to the instruction window.

## Result

- If the syntax is error-free, the displayed parameter is black. The editor then jumps to the next placeholder.
- If there is an error in the syntax, the cursor stays in the entry field and a corresponding error message is displayed in the status line. If you press the Enter key again, the entry field is closed and the faulty entry is displayed in red italics.

## Wiring hidden parameters

### Introduction

Depending on the CPU used, you can use complex instructions in your program that are dispatched with the TIA portal. These instructions can contain parameters that are declared as hidden.

If an instruction contains hidden parameters, the instruction box has a small arrow on the lower edge. You can recognize hidden parameters by their white font.

You can show and wire the hidden parameters at any time.

### Showing or hiding hidden parameters

To show or hide hidden parameters, follow these steps:

1. Click on the down arrow at the bottom edge of the instruction box to show hidden parameters.
2. Click on the up arrow at the bottom edge of the instruction box to hide hidden parameters.

### Wiring hidden parameters

To wire parameters, follow these steps:

1. Wire the hidden parameters like normally visible parameters.  
The hidden parameter is transformed into a visible parameter.

### See also

Using libraries (Page 383)

## Displaying or hiding variable information

### Introduction

You can display the following information about the tags to be used in the Program editor:

- Name of the tag
- Address of the tag
- Simple or hierarchical comments for tag documentation

The information is taken from the block interface for local tags and DB tags and from the PLC tag table for tags that are valid CPU-wide.

You can display the tag information either for all the blocks or for individually opened blocks. If you display the tag information for all the blocks, the tag information for all the blocks currently opened and opened in future is shown.

You can hide the tag information at any time again. If you have hidden the tag information for all blocks, you can display it again for individual blocks that are open.

When you select the display of tag information with hierarchical comments, the comments of the higher structure levels are also displayed for structured tags. The comments are shown in brackets after the tag comment; the comments of the individual levels are separated by a dot. If there is no comment for a tag on a structure level, it is not displayed. This is indicated by two successive dots.

### Displaying or hiding tag information for all the blocks

Proceed as follows to display or hide the tag information for all the blocks:

1. Select the "Settings" command in the "Options" menu.  
The "Settings" window is displayed in the work area.
2. In the area navigation, select the "PLC programming" group.
3. If you want to display the tag information, select the "Show" option or the "Tag information with hierarchical comments" option in the drop-down list, depending on whether you want to display simple or hierarchical comments.
4. If you want to hide the tag information, select the option "Collapse" in the "Tag information" drop-down list.  
The tag information is displayed or hidden for all the blocks. When you open additional blocks, the tag information is displayed or hidden depending on the selected setting.

### Displaying or hiding tag information for an opened block

Proceed as follows to display or hide the tag information for an opened block:

1. If you want to display the tag information, select the "Show tag information" option or the "Tag information with hierarchical comments" option in the "Shows the tag information" drop-down list, depending on whether you want to display simple or hierarchical comments.
2. If you want to hide the tag information, select the option "Hide tag information" in the "Shows the tag information" drop-down list.  
The tag information is displayed or hidden.

## Branches in LAD

### Basic information on branches in LAD

#### Definition

You use branches to program parallel circuits with the Ladder Logic (LAD) programming language. Branches are inserted in the main rung. You can insert several contacts into the branch and thus achieve a parallel circuit of series connections. This allows you to program complex ladder logic.

The figure below shows an example of the use of branches:

MOTOR carries signal 1, if one of the following conditions is fulfilled:

- Signal 1 is pending on S2 or S4
- Signal 0 is pending on S5.

### See also

Rules for branches in LAD (Page 1493)

Inserting branches into the LAD network (Page 1494)

Closing branches in the LAD network (Page 1494)

Deleting branches in LAD networks (Page 1495)

## Rules for branches in LAD

### Rules

The following rules apply to simultaneous branches:

- A simultaneous branch can only be inserted if the main branch already contains an LAD element.
- Simultaneous branches are opened downwards or are connected directly to the power rail. They are terminated upwards.
- Simultaneous branches are opened after the selected LAD element.
- Simultaneous branches are terminated after the selected LAD element.
- To delete a simultaneous branch, you must delete all LAD elements of this branch. When the last LAD element is removed from the branch, the rest of the branch is also removed.

### See also

Basic information on branches in LAD (Page 1492)

Inserting branches into the LAD network (Page 1494)

Deleting branches in LAD networks (Page 1495)

Closing branches in the LAD network (Page 1494)

## Inserting branches into the LAD network

You can create several branches in a network.

### Requirement

- A network is available.
- The network contains elements.

### Procedure

To insert a new branch in a network, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "General > Open branches" in the "Simple instructions" palette.
3. Use drag-and-drop to move the element to the desired place in the network.  
If you want to connect the new branch directly to the power rail, drag the element to the power rail.

### See also

Basic information on branches in LAD (Page 1492)

Rules for branches in LAD (Page 1493)

Deleting branches in LAD networks (Page 1495)

## Closing branches in the LAD network

Branches must be closed again at suitable places. If necessary, branches will be arranged so that they do not cross each other.

### Requirement

A branch is available.

### Procedure

To close an open branch, follow these steps:

1. Select the open branch.
2. Press and hold down the left mouse button.  
A dashed line will appear as soon as the cursor is moved.
3. Drag the dashed line to a suitable place on the network. Permissible connections are indicated by green lines.
4. Release the left mouse button.

## See also

Basic information on branches in LAD (Page 1492)  
Rules for branches in LAD (Page 1493)

## Deleting branches in LAD networks

### Requirement

A branch is available.

### Procedure

To delete a branch, follow these steps:

1. Select the connection line that links the branch to the main branch.
2. Select the "Delete" command in the shortcut menu.

## See also

Basic information on branches in LAD (Page 1492)  
Rules for branches in LAD (Page 1493)  
Inserting branches into the LAD network (Page 1494)

## Crossings in LAD

### Basic information on crossings in LAD

### Definition

A crossing is a place in a LAD network where one branch is closed and at the same time another branch is opened.

"TagOut" receives signal 1, if the following two conditions are met:

- "TagIn\_1" or "TagIn\_3" has signal 1
- "TagIn\_2" or "TagIn\_4" has signal 0

### Inserting crossings

You can insert crossings in a LAD network by creating connections between the main branch and an additional branch or between different branches.

### Requirements

A branch is available.

### Procedure

To insert a new crossing in an LAD network, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "General > Open branches" in the "Simple instructions" palette.
3. Drag the element behind the existing branch.
4. Insert any element into the open branch.
5. Click the arrow of the open branch after the inserted element.
6. Hold down the left mouse button and drag the dashed connecting line to the main branch.
7. Release the left mouse button.

### See also

Rearranging crossings (Page 1496)

Deleting crossings (Page 1497)

Inserting branches into the LAD network (Page 1494)

### Rearranging crossings

### Requirement

A crossing is available.

### Procedure

To rearrange a connection, follow these steps:

1. Select the connection line that defines the crossings in the respective branches.
2. Select the "Delete" command in the shortcut menu.
3. Open the "Instructions" task card.
4. Navigate to "General > Open branches" in the "Simple instructions" palette.
5. Use a drag-and-drop operation to move the element to the place in the network where you want to insert the new crossing.
6. Click on the arrow for the open branch.

7. Hold down the left mouse button and drag the dashed connecting line to the subsidiary branch in which you wish to insert the new crossing.
8. Release the left mouse button.

### See also

Inserting crossings (Page 1496)

Deleting crossings (Page 1497)

### Deleting crossings

#### Requirement

A crossing is available.

#### Procedure

To delete a crossing, follow these steps:

1. Select the connection line that defines the crossings in the respective branches.
2. Select the "Delete" command in the shortcut menu.

### Rungs in LAD

#### Basic information on rungs in LAD

#### Using rungs

The program is mapped in one or more networks. A network contains a power rail on the left where one or more rungs originate. The binary signal scans are arranged in the form of contacts on the rungs. The serial arrangement of the elements on a rung creates a series connection; arrangement on simultaneous branches creates a parallel connection. A rung is closed by a coil or a box in which the result of logic operation will be written.

The figure below shows an example of the use of several rungs within a network:

### Rules

Remember the following rules when using several rungs:

- Connections are not permitted between rungs.
- Only one jump instruction is permissible per network. The positioning rules for jump instructions remain valid.

### Running rungs

Rungs and networks are executed from top to bottom and from left to right. This means that the first instruction in the first rung of the first network is processed first. All instructions of this rung are then processed. After this come all other rungs of the first network. The next network is processed only after all rungs have first been run.

### Differences between branches and rungs

The difference between branches and rungs is that the rungs are independent branches that can also stand in a different network. Branches, on the other hand, permit the programming of a parallel connection.

### See also

[Insert rung \(Page 1498\)](#)

[Deleting a rung \(Page 1499\)](#)

### Insert rung

### Requirement

- A block is open.
- A network is available.

## Procedure

To insert a new rung in a network, proceed as follows:

1. Insert any coil on the power rail.  
A new rung will be inserted and the coil positioned at the end of the rung.
2. Insert additional instructions in the new rung.

## See also

Basic information on rungs in LAD (Page 1497)

Deleting a rung (Page 1499)

## Deleting a rung

## Requirement

A rung is available.

## Procedure

To delete a rung, proceed as follows:

1. Hold down the left mouse button and draw a frame around the rung. At the same time, make sure that you select all instructions. Alternatively, you can hold down the <Shift> key and select the first the last instruction of the rung.
2. Right-click on one of the instructions in the rung.
3. Select the "Delete" command in the shortcut menu.

## See also

Basic information on rungs in LAD (Page 1497)

Insert rung (Page 1498)

## Creating FBD programs

## Basic information on FBD

## FBD programming language

## Overview of the Function Block Diagram (FBD) programming language

FBD is a graphical programming language. The representation is based on electronic circuit systems.

The program is mapped in one or more networks. A network contains one or more logic operation paths. The binary signal scans are linked by boxes. The representation of the logic is based on the graphical logic symbols used in Boolean algebra.

### Example of networks in FBD

The following figure shows an FBD network with AND and OR boxes and an assignment:

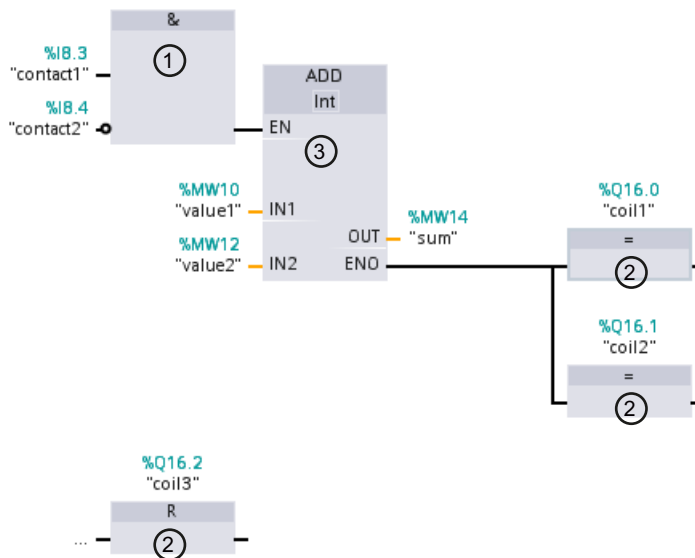

### Overview of the FBD elements

#### FBD elements

An FBD program consists of separate elements that are linked by means of a binary signal flow. Most program elements must be supplied with tags.

A FBD network is programmed from left to right.

For example, the following figure shows elements of an FBD network:

- 1) Binary function
- 2) Standard box
- 3) Complex box

## Binary functions

You can use binary functions to query binary operands and to combine their signal states. The following operations are examples of binary functions: "AND operation", "OR operation" and "EXCLUSIVE OR operation".

## Standard boxes:

You can use standard boxes to control binary operands, perform RLO edge detection or execute jump functions in the program. Standard boxes generally have only one single input.

## Complex boxes

Complex boxes represent program elements with complex functions. The empty box is an exception. You can use the empty box as a placeholder in which you can select the required instruction.

The following types of boxes are available to you in an FBD program:

- **Complex boxes without EN/ENO mechanism:**  
A box is executed independently of the signal state at the box inputs. The error status of the processing cannot be queried.
- **Complex boxes with EN/ENO mechanism:**  
A box is only executed if the enable input "EN" has the signal state "1". If the box is processed correctly, the "ENO" enable output has signal state "1". If an error occurs during processing, the "ENO" output is reset.  
If the EN enable input is not interconnected, the box is always executed.

Calls of code block are also shown in the network as complex boxes with EN/ENO mechanism.

## Settings for FBD

### Overview of the settings for FBD

#### Overview

The following table shows the settings that you can make:

Group	Setting	Description
Font	Font size	Font size in program editor
View	Layout	Compact or wide Changes the vertical spacing between operands and other objects (such as operand and contact). The change becomes visible once the block is reopened.
	With absolute information	Additional display of the absolute addresses

Group	Setting	Description
Operand field	Maximum width	Maximum number of characters that can be entered horizontally in the operand field. This setting recalculates the layout of the networks.
	Maximum height	Maximum number of characters that can be entered vertically in the operand field. This setting recalculates the layout of the networks.

**See also**

Changing the settings (Page 1502)

**Changing the settings**

**Procedure**

To change the settings, follow these steps:

1. Select the "Settings" command in the "Options" menu.  
The "Settings" window is displayed in the work area.
2. In the area navigation, select the "PLC programming" group.
3. Change the settings.

**Result**

The change will be loaded directly, there is no need to save it explicitly.

**See also**

Overview of the settings for FBD (Page 1501)

**Working with networks**

**Using networks**

**Function**

The user program is created in the block within networks. For a code block to be programmed, it must contain at least one network. To achieve a better overview of the user program, you can also subdivide your program into several networks.

Inserting network title (Page 1506)  
Entering a network comment (Page 1508)  
Navigating networks (Page 1508)

## Inserting networks

### Requirement

A block is open.

### Procedure

To insert a new network, follow these steps:

1. Select the network after which you want to insert a new network.
2. Select the "Insert network" command in the shortcut menu.

### Result

A new empty network is inserted into the block.

## See also

Inserting network title (Page 1506)  
Entering a network comment (Page 1508)  
Navigating networks (Page 1508)

## Selecting networks

### Requirements

A network is available.

### Selecting a network

To select a network, follow these steps:

1. Click the title bar of the network that you want to select.

### Selecting several networks

Proceed as follows to select several individual networks:

1. Press and hold down the <Ctrl> key.
2. Click all the networks that you want to select.

To select several successive networks, follow these steps:

1. Press and hold down the <Shift> key.
2. Click the first network that you want to select.
3. Click the last network that you want to select.  
The first and last networks and all those in between are selected.

### See also

Inserting networks (Page 1503)

Inserting network title (Page 1506)

Entering a network comment (Page 1508)

Navigating networks (Page 1508)

### Copying and pasting networks

Copied networks can be pasted within the block or in another block. Networks that were created in LAD or FBD can also be inserted in blocks of the respective other programming language.

### Requirement

A network is available.

### Procedure

To copy and paste a network, follow these steps:

1. Select the network or networks to be copied.
2. Select "Copy" in the shortcut menu.
3. Select the network after which you want to paste in the copied network.
4. Select "Paste" in the shortcut menu.

Selecting networks (Page 1503)  
Copying and pasting networks (Page 1504)  
Inserting network title (Page 1506)  
Entering a network comment (Page 1508)  
Navigating networks (Page 1508)

## Expanding and collapsing networks

### Requirements

A network is available.

### Opening and closing a network

To open a network, follow these steps:

1. Click on the right arrow in the network title bar.

To close a network, follow these steps:

1. Click on the down arrow in the network title bar.

### Opening and closing all networks

To open and close all networks, follow these steps:

1. In the toolbar, click "Open all networks" or "Close all networks".

### See also

Inserting networks (Page 1503)

Selecting networks (Page 1503)

Copying and pasting networks (Page 1504)

Deleting networks (Page 1505)

Inserting network title (Page 1506)

Entering a network comment (Page 1508)

Navigating networks (Page 1508)

### Inserting network title

The network title is the header of a network. The length of the network title is limited to one line. You can enter the title manually or set it automatically. When you set it automatically, you can do this for individual networks or use the settings to specify that the network title is always set automatically.

For automatic insertion of the network title, the comment of the operand in one of the following instructions in the network is evaluated:

- Assignment
- Set output
- Reset output

The instruction that is listed first in the network is used.

The network title is only inserted automatically when the following conditions are fulfilled:

- The network does not have a title yet.
- The operand of the instruction used for the comment has a comment.

**Note**

Note the following restrictions for automatic insertion of the network title:

- The network title is not adapted if you change the comment of the operand at a later time.
  - The network title is not adapted if you change the operand of the instruction.
  - The network title is only set by the writing instructions listed above.
  - If the operand is of the data type array, the comment of the array is used and not the comments of the array elements.
  - Comments of invalid operands are not taken into consideration.
- 

**Entering the network title manually**

To enter a network title, follow these steps:

1. Click on the title bar of the network.
2. Enter the network title.

**Setting the network title automatically**

To specify that the network titles are always set automatically, follow these steps:

1. Select the "Settings" command in the "Options" menu.  
The "Settings" window is displayed in the work area.
2. In the area navigation, select the "PLC programming" group.
3. Select the "Set network title automatically" check box in the "Additional settings" group.  
The network titles are set automatically as of this time if the conditions listed above are fulfilled.

To set an individual network title automatically, follow these steps:

1. Right-click "Network <Number of the network>" in the title bar of a network.
2. Select the "Set network title automatically" command in the shortcut menu.  
The title of the selected network is set based on the comment of the operand if the conditions listed above are fulfilled.

Entering a network comment (Page 1508)

Navigating networks (Page 1508)

## Entering a network comment

You can use network comments to provide comments on the program contents of individual networks. For example, you can indicate the function of the network or draw attention to special characteristics.

## Requirement

A network is available.

## Procedure

To enter a network comment, follow these steps:

1. Click on the right arrow before the network title.
2. If the comment area is not visible, click "Network comments on/off" in the toolbar. The comment area is displayed.
3. Click "Comment" in the comment area. The "Comment" text passage is selected.
4. Enter the network comment.

Expanding and collapsing networks (Page 1505)

Inserting network title (Page 1506)

Navigating networks (Page 1508)

## Navigating networks

You can navigate straight to a specific position within a block.

## Procedure

To navigate to a specific position within a block, follow these steps:

1. Right-click in the code area of the programming window.
2. Select the "Go to > Network/line" command in the shortcut menu.  
The "Go to" dialog will open.
3. Enter the network to which you want to navigate.
4. Enter the line number of the network to which you want to navigate.
5. Confirm your entry with "OK".

## Result

The relevant line will be displayed if this is possible. If the network or line requested does not exist, the last existing network or the last existing line in the network requested will be displayed.

## Inserting FBD elements

### Rules for the use of FBD elements

#### Rules

Note the following rules when inserting FBD elements:

- An FBD network can consist of several elements. All elements of a logic path must be linked to each other according to IEC 61131-3.
- Standard boxes (flip flops, counters, timers, math operations, etc.) can be added as output to boxes with binary logic operations (for example, AND, OR). Comparison boxes are excluded from this rule.
- Only Boolean inputs in an instruction can be combined with preceding logic operations.
- Only the bottom Boolean output in an instruction can be combined with an additional logic operation.

9.1 Creating the user program

- Enable input EN or enable output ENO can be connected to boxes, but this is not mandatory.
- Constants (for example, TRUE or FALSE) cannot be assigned to binary logic operations. Instead, use tags of the BOOL data type.
- Only one jump instruction can be inserted in each network.
- Only one jump label can be inserted in each network.
- Instructions for positive or negative RLO edge detection may not be arranged right at the left of the network as this requires a prior logic operation.

Placement rules for S7-1200/1500 CPUs

The following table sets out the instructions that can only be positioned at the end of the network:

Instruction		Preceding logic operation required
Mnemonics	Name	
SET_BF	Set bit field	No
RESET_BF	Reset bit field	No
JMP	Jump if RLO = 1	No
JMPN	Jump if RLO = 0	Yes
JMP_LIST	Define jump list	No
SWITCH	Jump distributor	No
RET	Return	No

Placement rules for S7-300/400 CPUs

The following table sets out the instructions that can only be positioned at the end of the network:

Instruction		Preceding logic operation required
Mnemonics	Name	
S	Set output	Yes
R	Reset output	Yes
SP	Start pulse timer	Yes
SE	Start extended pulse timer	Yes
SD	Start on-delay timer	Yes
SS	Start retentive on-delay timer	Yes
SF	Start off-delay timer	Yes
SC	Set counter value	Yes
CU	Count up	Yes
CD	Count down	Yes
JMP	Jump if RLO = 1	No
JMPN	Jump if RLO = 0	Yes

Instruction		Preceding logic operation required
Mnemonics	Name	
RET	Return	No
OPN	Open global data block	No
OPNI	Open instance data block	No
CALL	Call block	No
SAVE	Save RLO in BR bit	No
MCRA	Enable MCR range	No
MCRD	Disable MCR range	No
MCR<	Open MCR ranges	No
MCR>	Close MCR ranges	No

## Inserting FBD elements using the "Instructions" task card

### Requirement

A network is available.

### Procedure

To insert FBD elements into a network using the "Instructions" task card, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to the FBD element that you want to insert.
3. Use drag-and-drop to move the element to the desired place in the network.  
If the element is an internal system function block (FB), the "Call options" dialog opens. In this dialog you can create an instance data block of the single-instance or multiple-instance type for the function block in which the data of the inserted element will be saved. You will find the new instance data block created in the project tree in the "Program resources" folder under "Program blocks > System blocks". If you have selected "multiple instance", these are located in the block interface in the "Static" section.

Or:

1. Select the point in the network at which you want to insert the element.
2. Open the "Instructions" task card.
3. Double-click on the element you want to insert.  
If the element is an internal system function block (FB), the "Call options" dialog opens. In this dialog you can create an instance data block of the single-instance or multiple-instance type for the function block in which the data of the inserted element will be saved. You will find the new instance data block created in the project tree in the "Program resources" folder under "Program blocks > System blocks". If you have selected "multiple instance", these are located in the block interface in the "Static" section.

## Result

The selected FBD element is inserted with dummy entries for the parameters.

## See also

Rules for the use of FBD elements (Page 1509)

## Inserting FBD elements using an empty box

### Requirement

A network is available.

### Procedure

To insert FBD elements into a network using an empty box, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "General > Empty box" in the "Basic instructions" palette.
3. Use a drag-and-drop operation to move the "Empty box" element to the desired place in the network.
4. Position the cursor over the triangle in the top right-hand corner of the empty box.  
A drop-down list is displayed.
5. Select the desired FBD element from the drop-down list.  
If the element is an internal system function block (FB), the "Call options" dialog opens. In this dialog you can create an instance data block of the single-instance or multiple-instance type for the function block in which the data of the inserted element will be saved. You will find the new instance data block created in the project tree in the "Program resources" folder under "Program blocks > System blocks". If you have selected "multi-instance", these are located in the block interface in the "Static" section.

## Result

The empty box is changed to the respective FBD element. Placeholders are inserted for the parameters.

## Selecting the data type of an FBD element

### Selecting a data type

### Introduction

Some instructions can be executed with several different data types. If you use one of these instructions in the program, you have to specify a valid data type for the instruction at the

specific point in the program. For some instructions, you have to select the data types for the inputs and outputs separately.

---

**Note**

The valid data type (BOOL) for the tags on the enable input EN and the enable output ENO is predefined by the system and cannot be changed.

---

The valid data types for an instruction are listed in the instruction drop-down list. You specify the data type of the instruction by selecting an entry from the drop-down list. If the data type of an operand differs from the data type of the instruction and cannot be converted implicitly, the operand is displayed in red and a rollout with the corresponding error message appears.

### Data type selection of mathematical instructions

Some mathematical instructions provide you with the option of having the data type automatically set corresponding to the data types of the operand. In the drop-down list for data type selection, these instructions have the entry "Auto" in addition to the actual data types. If you select this entry and then allocate the first operand, the data type of the operand is selected as data type for the instruction. The entry in the drop-down list changes to "Auto (<Data type>)", e.g. "Auto (Real)". If you allocate additional operands, the automatically set data type of the instruction is adjusted according to the following criteria:

- You supply all other operands with tags of the same data type:  
The data type of the instruction is not changed.
- You supply all other operands with tags whose data type is smaller than the data type of the instruction:  
The data type of the instruction is not changed. For the operand with the smaller data type, an implicit conversion is conducted if necessary.
- You supply an additional operand with a tag whose data type is greater than the data type of the instruction:  
The data type of the instruction is changed to the larger data type. An implicit conversion is performed, if necessary, for operands that deviate from the newly set data type of the instruction.

Each change in the data type of an operand can result in a change of the data type of the instruction. Other operands may possibly be implicitly converted as a result. Operands for which an implicit conversion is performed are marked with a gray square.

---

**Note**

Please also observe the information on data type conversion for your device and, in particular, the notes on the IEC check.

See also: Data type conversion

---

### See also

Defining the data type of an instruction (Page 1514)

## Defining the data type of an instruction

### Introduction

Some instructions can be executed with several different data types. When you insert such instructions into your program, you must specify the data type for these instructions at the actual point in the program.

### Specifying the data type by means of the drop-down list

To define the data type of an instruction using the drop-down list, follow these steps:

1. Insert the instruction at the required point in the program using drag-and-drop.  
The entry "???" (undefined) is displayed in the drop-down list of the inserted instruction.
2. Click the triangle in the upper corner of the drop-down list.  
The drop-down list will open to display the data types valid for the instruction.
3. Select a data type from the drop-down list.  
The selected data type is displayed.
4. If the instruction has two drop-down lists, select the data type for the instruction inputs in the left-hand drop-down list and the data type for the instruction outputs in the right-hand drop-down list.

### Specifying data type by assigning tags

To define the data type of an instruction by assigning tags, follow these steps:

1. Insert the instruction at the required point in the program using drag-and-drop.  
The entry "???" (undefined) is displayed in the drop-down list of the inserted instruction.
2. At an input or output, specify a valid tag, the data type of which is to be applied as the instruction data type.  
The data type of the tag is displayed in the drop-down list.
3. Enter a valid tag at an input and a valid tag at an output if data types need to be defined for both the inputs and outputs of the instruction. The tag specified at the input determines the data type of the inputs; the tag specified at the output determines the data type of the outputs of the instruction.

### Automatically specifying the data type of mathematical instructions

To automatically specify the data type for mathematical instructions, follow these steps:

1. Insert the mathematical instruction at the required point in the program using drag-and-drop.  
The entry "???" (undefined) is displayed in the drop-down list of the inserted instruction.
2. Select the "Auto" entry from the drop-down list.
3. Enter a valid tag at an input or output.  
The data type of the tag is applied as data type of the instruction. The entry in the drop-down list changes to "Auto (<Data type>".

## See also

Selecting a data type (Page 1512)

## Using favorites in FBD

### Adding FBD elements to Favorites

#### Requirement

- A block is open.
- The multipane mode is set for the "Instructions" task card or the Favorites are also displayed in the editor.

#### Procedure

To add SCL instructions to the Favorites, follow these steps:

1. Open the "Instructions" task card.
2. Maximize the "Basic instructions" pane.
3. Navigate in the "Basic instructions" pane to the instruction that you want to add to the Favorites.
4. Drag-and-drop the instruction into the "Favorites" pane or into the Favorites area in the program editor.

---

#### Note

To additionally display the Favorites in the program editor, click the "Display favorites in the editor" button in the program editor toolbar.

---

Removing FBD elements from Favorites (Page 1516)

Overview of the program editor (Page 1412)

### Inserting FBD elements using favorites

#### Requirement

- A block is open.
- Favorites are available.

### Procedure

To insert an instruction into a program using Favorites, follow these steps:

1. Drag-and-drop the desired instruction from Favorites to the desired position.

Or:

1. Select the position in the program where you want to insert the instruction.
2. In the Favorites, click on the instruction you want to insert.

---

#### Note

To additionally display the Favorites in the program editor, click the "Display favorites in the editor" button in the program editor toolbar.

---

### See also

Overview of the program editor (Page 1412)

### Removing FBD elements from Favorites

#### Requirement

A code block is open.

#### Procedure

To remove instructions from Favorites, follow these steps:

1. Right-click on the instruction you want to remove.
2. Select the "Remove instruction" command in the shortcut menu.

---

#### Note

To additionally display the Favorites in the program editor, click the "Display favorites in the editor" button in the program editor toolbar.

---

## Inserting block calls in FBD

### Inserting block calls using a drag-and-drop operation

You can insert calls for existing functions (FC) and function blocks (FB) using a drag-and-drop operation from the project tree. If you call function blocks from other function blocks, you can either call them as single-instance or multi-instance blocks. If a function block is called as single instance, it will store its data in a data block of its own. If a function block is called as multi-instance, it will store its data in the instance data block of the calling function block.

### Requirement

- A network is available.
- The block that is to be called is available.

### Inserting a call of a function (FC)

To insert a call of a function (FC) into a network using a drag-and-drop operation, follow these steps:

1. Drag the function from the project tree to the required network.

### Inserting a call for a function block (FB)

To insert a call for a function block (FB), follow these steps:

1. Drag the function block from the project tree to the required network.  
The "Call options" dialog opens.
2. Enter in the dialog whether you wish to call the block as single or multi-instance.
  - If you click on the "Single instance" button, you will have to enter a name in the "Name" text box for the data block that you want to assign to the function block.
  - If you click on the "Multi-instance" button, you will have to enter the name of the tag in the "Name in the interface" text box; this is the name that you use to enter the called function block as a static tag in the interface of the calling block.
3. Confirm your entries with "OK".

### Result

The function or the function block is inserted with its parameters. You can then assign the parameters.

See also: Auto-Hotspot

---

#### Note

If when calling a function block you specify an instance data block that does not exist, it will be created. If you have called a function block as a multi-instance, this will be entered as a static tag in the interface.

---

## See also

Updating block calls in FBD (Page 1518)

Changing the instance type (Page 1519)

Single instances (Page 1217)

Multi-instances (Page 1217)

## Updating block calls in FBD

If interface parameters of a called block are changed, the block call can no longer be executed correctly. You can avoid such inconsistent block calls by updating the block calls.

You have two options to update the block calls:

- Explicit updating in the program editor.  
The block calls in the open block will be updated.
- Implicit updating during compilation.  
All block calls in the program as well as the used PLC data types will be updated.

## Update blocks in the program editor

To update a block call within a block, follow these steps:

1. Open the block in the program editor.
2. Click "Update inconsistent block calls" in the toolbar.

Or:

1. Open the block in the program editor.
2. Right-click on the instruction with the block call.
3. Select the "Update" command in the shortcut menu.  
The "Interface update" dialog opens. This dialog shows the differences between the block interface in use and the changed interface of the called block.
4. If you want to update the block call, click "OK". To cancel the update, click "Cancel".

## Update block calls during compilation

Follow these steps to update all block calls and uses of PLC data types during compilation implicitly:

1. Open the project tree.
2. Select the "Program blocks" folder.
3. Select the command "Compile > Software (rebuild all blocks)" in the shortcut menu.

## See also

Inserting block calls using a drag-and-drop operation (Page 1517)  
Changing the instance type (Page 1519)

## Changing the instance type

### Instance type

There are two ways of calling function blocks:

- As a single instance
- As a multiple instance

See also: Auto-Hotspot

You can modify a defined instance type at any time.

### Requirement

The user program contains a block call.

### Procedure

To change the instance type of a function block, follow these steps:

1. Open the code block and select the block call.
2. Select the "Change instance" command in the shortcut menu.  
The "Call options" dialog opens.
3. Click the "Single instance" or "Multi instance" button.
  - If you select the "Single instance" instance type, enter a name for the data block that is to be assigned to the function block.
  - If you select "Multiple instance" as the instance type, enter in the "Name in the interface" text field the name of the tag with which the called function block is to be entered as a static tag in the interface of the calling block.
4. Confirm your entries with "OK".

---

#### Note

The previous single and multiple instances will not be deleted automatically.

---

Inserting block calls using a drag-and-drop operation (Page 1517)  
Updating block calls in FBD (Page 1518)

## Inserting complex FBD instructions

### Using the "Calculate" instruction

#### Requirement

A network is available.

#### Procedure

Proceed as follows to use the "Calculate" instruction:

1. Open the "Instructions" task card.
2. Navigate to "Math functions > CALCULATE" in the "Basic instructions" pane.
3. Use drag-and-drop to move the element to the desired place in the network.  
The instruction "Calculate" will be inserted for the data type with a placeholder expression and question mark.
4. Enter the data type for the calculation.
5. Enter the operands for the calculation.

---

#### Note

The calculation is run with the inputs of the "Calculate" instruction. If you want to use constants you must also insert appropriate inputs for them.

---

6. Click on the "Edit 'Calculate' instruction" button to replace the placeholder expression with the correct expression.  
The "Edit 'Calculate' instruction" dialog will open.
7. Enter the required expression in the "OUT:= " text box.

---

#### Note

In the "Example" area you can find an example of a valid expression and possible instructions that you can use.

To determine a value with the help of Pythagoras' theorem, for example, enter "OUT := SQRT (SQR (IN1) + SQR (IN2))".

---

8. Confirm your entry with "OK".

#### See also

CALCULATE: Calculate (Page 2181)

## Using free-form comments

### Basic information on using free comments in FBD

#### Introduction

Free-form comments allow you to add comments to the source code for graphic programming languages similar to line comments for textual languages.

Free-form comments can be used for all non-binary boxes.

#### See also

Inserting free-form comments (Page 1521)

Editing free-form comments (Page 1522)

Deleting free-form comments (Page 1523)

### Inserting free-form comments

#### Requirement

A network with instructions is available.

#### Procedure

To insert a free comment on an instruction, proceed as follows:

1. If necessary, activate the "Free-form comments on/off" button in the toolbar.
2. Right-click on the instruction for which you want to insert a free-form comment.
3. Select the "Insert comment" command in the shortcut menu.  
A comment box with a standard comment opens. The comment box is connected by an arrow to the corresponding instruction.
4. Enter the required comment in the comment box.

#### See also

Basic information on using free comments in FBD (Page 1521)

Editing free-form comments (Page 1522)

Deleting free-form comments (Page 1523)

## Editing free-form comments

### Introduction

Free-form comments can be edited as follows:

- Changing the comment text
- Changing the position and size of the comment box
- Attaching a comment to another element
- Showing and hiding free comments

### Changing the comment text

To change the text of free-form comments, follow these steps:

1. Click on the comment box.
2. Enter the desired text.

### Changing the position of the comment box

To change the positioning of the comment box, follow the steps below:

1. Left-click the comment box and keep the mouse button pressed.
2. Drag the comment box to the desired location.

### Changing the size of the comment box

To change the size of the comment box, follow the steps below:

1. Click on the comment box.
2. Drag the comment box on the move handle in the lower right corner to the desired size.

### Attaching a comment to another element

To attach a free-form comment to another element, follow these steps:

1. Left-click the point of the arrow that links the comment box with the instruction and keep the mouse button pressed.
2. Drag the arrow to the element to which you want to attach the comment. Possible insertion points are marked with a green square.
3. Release the mouse button.

## Showing and hiding free comments

To show or hide a free-form comments, follow these steps:

1. Click the "Free-form comment on/off" button in the toolbar.

## See also

Basic information on using free comments in FBD (Page 1521)

Inserting free-form comments (Page 1521)

Deleting free-form comments (Page 1523)

## Deleting free-form comments

### Procedure

To delete a free-form comment, proceed as follows:

1. Right-click on the free-form comment that you want to delete.
2. Select the "Delete" command in the shortcut menu.

## See also

Basic information on using free comments in FBD (Page 1521)

Inserting free-form comments (Page 1521)

Editing free-form comments (Page 1522)

## Editing FBD elements

### Selecting FBD elements

You can select several individual elements or all elements in a network.

### Requirement

FBD elements are available

### Selecting several individual FBD elements

To select several individual FBD elements, follow these steps:

1. Press and hold down the <Ctrl> key.
2. Click on all the FBD elements you wish to select.
3. Now release the <Ctrl> key.

### Selecting all FBD elements in a network

To select all FBD elements in a network, follow these steps:

1. Go to the network whose elements you wish to select.
2. Select the "Select all" command in the "Edit" menu or press <Ctrl+A>.

### See also

Removing instruction inputs and outputs (Page 1528)

Enabling and disabling the EN/ENO mechanism (Page 1529)

Deleting FBD elements (Page 1530)

### Copying FBD elements

#### Requirement

An FBD element is available.

#### Procedure

To copy an FBD element, follow these steps:

1. Right-click the FBD element that you want to copy.
2. Select "Copy" in the shortcut menu.

#### Result

The FBD element will be copied and saved to the clipboard.

### See also

Selecting FBD elements (Page 1523)

Removing instruction inputs and outputs (Page 1528)

Enabling and disabling the EN/ENO mechanism (Page 1529)

Deleting FBD elements (Page 1530)

## **Cutting FBD elements**

### **Requirement**

An FBD element is available.

### **Cutting**

To cut an FBD element, follow these steps:

1. Right-click the FBD element that you want to cut.
2. Select "Cut" in the shortcut menu.

### **Result**

The FBD element will be cut and saved to the clipboard.

### **See also**

Selecting FBD elements (Page 1523)

Copying FBD elements (Page 1524)

Pasting an FBD element from the clipboard (Page 1525)

Removing instruction inputs and outputs (Page 1528)

Enabling and disabling the EN/ENO mechanism (Page 1529)

Deleting FBD elements (Page 1530)

## **Pasting an FBD element from the clipboard**

### **Requirement**

An FBD element is available.

## Procedure

To paste an FBD element from the clipboard, follow these steps:

1. Copy an FBD element or cut an FBD element.
2. Right-click the point in the network where you want to paste the element.
3. Select "Paste" in the shortcut menu.

## See also

Selecting FBD elements (Page 1523)

Copying FBD elements (Page 1524)

Cutting FBD elements (Page 1525)

Replacing FBD elements (Page 1526)

Removing instruction inputs and outputs (Page 1528)

Enabling and disabling the EN/ENO mechanism (Page 1529)

Deleting FBD elements (Page 1530)

## Replacing FBD elements

You can easily exchange FBD elements with other FBD elements of the same type. This has the advantage that the parameters are retained and need not be entered again. For example, you can exchange OR and AND, RS-FlipFlop and SR-FlipFlop, comparison functions or jump instructions.

## Requirements

A network with at least one FBD element is present.

## Procedure

To replace an FBD element with another FBD element, follow these steps:

1. Select the FBD element that you want to replace.  
If elements compatible with the selected FBD element are available, a triangle will appear in the upper right-hand corner of the element.
2. Position the cursor above the triangle of the FBD element.  
A drop-down list is displayed.
3. From the drop-down list, select the FBD element that you want to use to replace the existing FBD element.

## See also

- Adding additional inputs and outputs to FBD elements (Page 1527)
- Removing instruction inputs and outputs (Page 1528)
- Enabling and disabling the EN/ENO mechanism (Page 1529)
- Deleting FBD elements (Page 1530)

## Adding additional inputs and outputs to FBD elements

### Introduction

You can expand several FBD elements with additional inputs that execute arithmetic or binary operations. Such elements are, for example, the instructions "Add" (ADD), "Multiply" (MUL), AND or OR. You can expand the "MOVE value" (MOVE) and "Demultiplex" (DEMUX) instruction boxes by adding additional outputs.

The name of the new inputs and outputs is comprised of the type of inserted element and a consecutive number. The name of a new input is may be "IN2"; the name of a new output may be "OUT2".

### Requirements

An FBD element is available that permits the insertion of additional inputs and outputs.

### Inserting an additional input

To add an additional input to the box of an FBD element, follow these steps:

1. Right-click on an existing input of the FBD element.
2. Select "Insert input" in the shortcut menu.  
An additional input is added to the box of the FBD element.

Or:

1. Click on the yellow star symbol beside the last input in the instruction box.  
An additional input is added to the box of the FBD element.

### Inserting an additional output

To add an additional output to the box of an FBD element, follow these steps:

1. Right-click on an existing output of the FBD element.
2. Select "Insert output" from the shortcut menu.  
An additional output is added to the box of the FBD element.

Or:

1. Click on the yellow star symbol beside the last output of the instruction box.  
An additional output is added to the box of the FBD element.

Removing instruction inputs and outputs (Page 1528)

Enabling and disabling the EN/ENO mechanism (Page 1529)

Deleting FBD elements (Page 1530)

## Removing instruction inputs and outputs

### Introduction

Inputs and outputs which you have added to an instruction can be removed.

### Requirement

An FBD element is available, which you have expanded with additional inputs or outputs.

### Remove input

To remove an input, follow these steps:

1. Select the input that you want to remove.
2. Select the "Delete" command in the shortcut menu.  
The input of the FBD element is removed.

### Remove output

To remove an output, follow these steps:

1. Select the output that you want to remove.
2. Select the "Delete" command in the shortcut menu.  
The output of the FBD element will be removed.

## See also

- Selecting FBD elements (Page 1523)

- Cutting FBD elements (Page 1525)
- Pasting an FBD element from the clipboard (Page 1525)
- Replacing FBD elements (Page 1526)
- Adding additional inputs and outputs to FBD elements (Page 1527)
- Enabling and disabling the EN/ENO mechanism (Page 1529)
- Deleting FBD elements (Page 1530)

## Enabling and disabling the EN/ENO mechanism

In LAD and FBD, certain instructions have an enable output ENO and thus use the EN/ENO mechanism. This allows you to query runtime errors in instructions and react to them. In order to increase the performance of the CPU, the EN/ENO mechanism is disabled in the default setting. This means that you are not initially able to react to runtime errors of the instruction using the ENO value. However, you can enable the EN/ENO mechanism again at any time, if required.

You can enable the EN/ENO mechanism individually for each instruction in order to generate the ENO. If you enable the EN/ENO mechanism for an instruction, other instructions that you subsequently add to your program are also inserted with the EN/ENO mechanism enabled. You can disable the EN/ENO mechanism again at any time if you do not want to use the evaluation of ENO for an instruction. Further instructions that you subsequently add to your program will then be inserted without the EN/ENO mechanism.

See also: Basics of the EN/ENO mechanism (Page 1357)

## Activating the EN/ENO mechanism

Proceed as follows to activate the EN/ENO mechanism of an instruction:

1. In your program, right-click the instruction at which you want to activate the EN/ENO mechanism.
2. Select the "Generate ENO" command from the shortcut menu.  
The ENO value is again generated for the instruction. Other instructions are inserted with the enable output.

## Deactivating the EN/ENO mechanism

Proceed as follows to deactivate the EN/ENO mechanism of an instruction:

1. In your program, right-click the instruction at which you want to deactivate the EN/ENO mechanism.
2. Select the "Do not generate ENO" command from the shortcut menu.  
The ENO value is no longer generated for the instruction. Other instructions are inserted without enable output.

## See also

- Selecting FBD elements (Page 1523)
- Copying FBD elements (Page 1524)
- Cutting FBD elements (Page 1525)
- Pasting an FBD element from the clipboard (Page 1525)
- Replacing FBD elements (Page 1526)
- Adding additional inputs and outputs to FBD elements (Page 1527)
- Removing instruction inputs and outputs (Page 1528)
- Deleting FBD elements (Page 1530)

## Deleting FBD elements

### Requirement

An FBD element is available.

### Procedure

To delete an FBD element, follow these steps:

1. Right-click the FBD element that you want to delete.
2. Select the "Delete" command in the shortcut menu.

## See also

- Selecting FBD elements (Page 1523)
- Copying FBD elements (Page 1524)
- Cutting FBD elements (Page 1525)

- Replacing FBD elements (Page 1526)
- Adding additional inputs and outputs to FBD elements (Page 1527)
- Removing instruction inputs and outputs (Page 1528)
- Enabling and disabling the EN/ENO mechanism (Page 1529)

## Inserting operands in FBD instructions

### Inserting operands

The character strings "<???", "<??.>" and "..." are inserted as placeholders for the parameters when a FBD element is inserted. The "<???" and "<??.>" strings displayed in

red indicate parameters that need to be connected. The "..." string displayed in black indicates parameters that may be connected. "<??.?>" stands for Boolean placeholders.

---

**Note**

To display the available data types in a tooltip, move the cursor over the placeholder.

---

**Requirement**

An FBD element is available.

**Procedure**

To connect the parameters of an FBD element, follow these steps:

1. Click the placeholder of the parameter.  
An input field is opened.
2. Enter the corresponding parameters, for example a PLC tag, a local tag or a constant.

---

**Note**

If you enter the absolute address of a parameter that has already been defined, this absolute address will be changed to the symbolic name of the parameter as soon as the input is confirmed. If you have not yet defined the parameter, a new tag with this absolute address and the default name "Tag\_1" will be entered in the PLC tag table. When you confirm your input, the absolute address will be replaced with the symbolic name "Tag\_1".

---

3. Confirm the parameter with the Enter key.
4. If you have not yet defined the parameter, you can define it directly in the program editor using the shortcut menu.  
See also: "Declaring PLC tags in the program editor (Page 1372)".

Or drag from it the PLC tag table:

1. In the project tree, select the "PLC tags" folder and open the PLC tag table.
2. If you have opened the PLC tag table, drag the desired tag to the corresponding location in your program. If you have not opened the PLC tag table yet, open the detail view now. Drag the desired tag from the detail view to the appropriate place in your program.

Or drag from it the block interface:

1. Open the block interface.
2. Drag the desired operand from the block interface to the corresponding location in your program.

## Result

- If the syntax is error-free, the displayed parameter is black.
- If there is an error in the syntax, the cursor stays in the input field and a corresponding error message is displayed in the inspector window in the "Info > Syntax" register.

## Wiring hidden parameters

### Introduction

Depending on the CPU used, you can use complex instructions in your program that are dispatched with the TIA portal. These instructions can contain parameters that are declared as hidden.

If an instruction contains hidden parameters, the instruction box has a small arrow on the lower edge. You can recognize hidden parameters by their white font.

You can show and wire the hidden parameters at any time.

### Showing or hiding hidden parameters

To show or hide hidden parameters, follow these steps:

1. Click on the down arrow at the bottom edge of the instruction box to show hidden parameters.
2. Click on the up arrow at the bottom edge of the instruction box to hide hidden parameters.

### Wiring hidden parameters

To wire parameters, follow these steps:

1. Wire the hidden parameters like normally visible parameters.  
The hidden parameter is transformed into a visible parameter.

### See also

Using libraries (Page 383)

## Displaying or hiding variable information

### Introduction

You can display the following information about the tags to be used in the Program editor:

- Name of the tag
- Address of the tag
- Simple or hierarchical comments for tag documentation

The information is taken from the block interface for local tags and DB tags and from the PLC tag table for tags that are valid CPU-wide.

You can display the tag information either for all the blocks or for individually opened blocks. If you display the tag information for all the blocks, the tag information for all the blocks currently opened and opened in future is shown.

You can hide the tag information at any time again. If you have hidden the tag information for all blocks, you can display it again for individual blocks that are open.

When you select the display of tag information with hierarchical comments, the comments of the higher structure levels are also displayed for structured tags. The comments are shown in brackets after the tag comment; the comments of the individual levels are separated by a dot. If there is no comment for a tag on a structure level, it is not displayed. This is indicated by two successive dots.

### Displaying or hiding tag information for all the blocks

Proceed as follows to display or hide the tag information for all the blocks:

1. Select the "Settings" command in the "Options" menu.  
The "Settings" window is displayed in the work area.
2. In the area navigation, select the "PLC programming" group.
3. If you want to display the tag information, select the "Show" option or the "Tag information with hierarchical comments" option in the drop-down list, depending on whether you want to display simple or hierarchical comments.
4. If you want to hide the tag information, select the option "Collapse" in the "Tag information" drop-down list.  
The tag information is displayed or hidden for all the blocks. When you open additional blocks, the tag information is displayed or hidden depending on the selected setting.

### Displaying or hiding tag information for an opened block

Proceed as follows to display or hide the tag information for an opened block:

1. If you want to display the tag information, select the "Show tag information" option or the "Tag information with hierarchical comments" option in the "Shows the tag information" drop-down list, depending on whether you want to display simple or hierarchical comments.
2. If you want to hide the tag information, select the option "Hide tag information" in the "Shows the tag information" drop-down list.  
The tag information is displayed or hidden.

## Branches in FBD

### Basic information on branches in FBD

#### Definition

You can use the Function Block Diagram (FBD) programming language to program parallel branches. This is done using branches that are inserted between the boxes. You can insert additional boxes within the branch and in this way build up complex function block diagrams.

The figure below shows an example of the use of branches:

#### See also

- Rules for branches in FBD (Page 1534)
- Inserting branches in FBD networks (Page 1535)
- Deleting branches in FBD networks (Page 1535)

### Rules for branches in FBD

#### Rules

The following rules apply to the use of branches in FBD:

- Branches are opened downward.
- Branches can be inserted only between FBD elements.
- To delete a branch, you must delete all FBD elements, including the branch itself.
- If you delete the connection between two branches, the FBD elements of the interrupted branch will be positioned freely in the network.

#### See also

- Basic information on branches in FBD (Page 1534)
- Inserting branches in FBD networks (Page 1535)
- Deleting branches in FBD networks (Page 1535)

## Inserting branches in FBD networks

### Requirement

A network is available.

### Procedure

To insert a new branch in a network, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "General > Branch" in the "Basic instructions" palette.
3. Drag the element from the "Elements" pane to the a required location on a connection line between two boxes.

### See also

Rules for branches in FBD (Page 1534)  
Basic information on branches in FBD (Page 1534)  
Deleting branches in FBD networks (Page 1535)

## Deleting branches in FBD networks

### Requirement

A branch is available.

### Procedure

To delete a branch, follow these steps:

1. Select the connection line that links the branch to the main branch.
2. Select the "Delete" command in the shortcut menu.

### Result

The branch is now deleted. Boxes connected to the deleted branch are placed freely within the network.

### See also

Rules for branches in FBD (Page 1534)  
Basic information on branches in FBD (Page 1534)  
Inserting branches in FBD networks (Page 1535)

## Logic paths in FBD

### Basic information on logic paths in FBD

#### Use of logic paths

The user program will be mapped in one or more networks. The networks can contain one or more logic paths on which the binary signals are arranged in the form of boxes.

The following figure shows an example of the use of several logic paths within a network:

#### Rules

Remember the following rules when using logic paths:

- Connections are not permitted between logic paths.
- Only one jump instruction is permissible per network. The positioning rules for jump instructions remain valid.

#### Executing logic paths

Logic paths are executed from top to bottom and from left to right. This means that the first instruction in the first logic path of the first network is executed first. All instructions of this logic path are then executed. After this come all other logic paths of the first network. The next network is executed only after all logic paths have first been executed.

When jumps are used the regular execution of the logic paths is circumvented and the instruction is executed at the jump destination.

#### Differences between branches and logic paths

The difference between branches and logic paths is that the logic paths are independent branches that can also stand in a different network. Branches, on the other hand, permit the programming of a parallel connection and have a common preceding logic operation.

#### See also

Inserting a logic path (Page 1537)

Deleting a logic operation path (Page 1537)

## Inserting a logic path

### Requirement

- A block is open.
- A network is available.

### Procedure

To insert a new logic path in a network, follow these steps:

1. Insert any instruction in a network in such a way that it has no connection to existing instructions.  
A new logic path is inserted.
2. Insert an assignment at the end of the new logic path.
3. Insert additional instructions in the new logic path.

### See also

Basic information on logic paths in FBD (Page 1536)  
Deleting a logic operation path (Page 1537)

## Deleting a logic operation path

### Requirement

A logic path is available.

### Procedure

To delete a logic path, proceed as follows:

1. Hold down the left mouse button and draw a frame around the logic path. At the same time, make sure that you select all instructions of the logic path. Alternatively, you can hold down the <Shift> key and select the first the last instruction of the logic path.
2. Right-click on one of the instructions in the logic path.
3. Select the "Delete" command in the shortcut menu.

Inserting a logic path (Page 1537)

## Creating SCL programs

### Basics of SCL

### Programming language SCL

### Programming language SCL

SCL (Structured Control Language) is a high-level programming language based on PASCAL. The language is based on DIN EN 61131-3 (international IEC 1131-3).

The standard standardizes programming languages for programmable logic controllers. The SCL programming language fulfills the PLCopen Basis Level of ST language (Structured Text) defined in this standard.

### Language elements

SCL also contains higher programming languages in addition to the typical elements of the PLC, such as inputs, outputs, timers or memory bits.

- Expressions
- Value assignments
- Operators

### Program control

SCL provides convenient instructions for controlling the program allowing you, for example, to create program branches, loops or jumps.

### Application

SCL is therefore particularly suitable for the following areas of application:

- Data management
- Process optimization
- Recipe management
- Mathematical / statistical tasks

### Expressions

#### Description

Expressions are calculated during the runtime of the program and return a value. An expression consists of operands (such as constants, tags or function calls) and optionally out of operators (such as \*, /, + or -). Expressions can be linked together or nested within each other by operators.

## Evaluation order

The evaluation of the expression occurs in a specific order that is defined by the following factors:

- Priority of the operators involved
- Left-to-right order
- Brackets

## Types of expressions

The following expression types are available depending on the operator:

- Arithmetic expressions  
Arithmetic expressions consist of either a numerical value or combine two values or expressions with arithmetic operators.
- Relational expressions  
Relational expressions compare the values of two operands and yield a Boolean value. The result is TRUE if the comparison is true, and FALSE if it is not met.
- Logical expressions  
Logical expressions combine two operands with logical operators (AND, OR, XOR) or negating operands (NOT).

## How expressions are used

You can use the result of an expression in different ways:

- As a value assignment for a tag
- As as a condition for a control instruction
- As a parameter for a calling a block or instruction

## See also

Operators and operator precedence (Page 1544)

Arithmetic expressions (Page 1539)

Relational expressions (Page 1542)

Logical expressions (Page 1543)

## Arithmetic expressions

### Description

Arithmetic expressions consist of either a numerical value or combine two values or expressions with arithmetic operators.

Arithmetic operators can process the data types that are allowed in the CPU in use. If two operands are involved in the operation, the data type of the result is determined based on the following criteria:

- If both operands are integers with sign and have different lengths, the result receives the data type of the longer integer (e. g. INT + DINT = DINT).
- If both operands are integers without sign and have different lengths, the result receives the data type of the longer integer (e. g. USINT + UDINT = UDINT).
- If one operand is an integer with sign and the other integer is an operand without sign, the result receives the next larger data type with sign that covers the integer without sign (e. g. SINT + USINT = INT).  
You can only execute an operation with such operands if the IEC check is not set.
- If one operand is an integer and the other operand is a floating-point number, the result receives the data type of the floating-point number (e. g. INT + REAL = REAL).
- If both operands are floating-point numbers and have different lengths, the result receives the data type of the longer floating-point number (e. g. REAL + LREAL = LREAL).
- The data type of the result of an operation that involves operands of the data type groups "Times" and "Date and time" can be found in the table in section "Data types of arithmetic expressions".  
You cannot use data types of the data type groups "Times" and "Date and time" when the IEC check is set.

### Data types of arithmetic expressions

The following table shows the data types you can use in arithmetic expressions:

Operation	Operator	1st Operand	2nd Operand	Result
Power	**	Integer/floating-point number	Integer/floating-point number	Integer/floating-point number
Unary plus	+	Integer/floating-point number TIME, LTIME	-	Integer/floating-point number TIME, LTIME
Unary minus	-	Integer/floating-point number TIME, LTIME	-	Integer/floating-point number TIME, LTIME
Multiplication	*	Integer/floating-point number	Integer/floating-point number	Integer/floating-point number
		TIME, LTIME	Integer	TIME, LTIME
Division	/	Integer/floating-point number	Integer/floating-point number (not equal 0)	Integer/floating-point number
		TIME, LTIME	Integer	TIME, LTIME
Modulo function	MOD	Integer	Integer	Integer
Addition	+	Integer/floating-point number	Integer/floating-point number	Integer/floating-point number
		TIME	TIME	TIME
		TIME	DINT	TIME

Operation	Operator	1st Operand	2nd Operand	Result
		LTIME	TIME, LTIME	LTIME
		LTIME	LINT	LTIME
		TOD	TIME	TOD
		TOD	DINT	TOD
		LTOD	TIME, LTIME	LTOD
		LTOD	LINT	LTOD
		DATE	LTOD	DTL
		DATE	TOD	<ul style="list-style-type: none"> <li>• S7-300/400: DT</li> <li>• S7-1200/1500: DTL</li> </ul>
		DT	TIME	DT
		LDT	TIME, LTIME	LDT
		DTL	TIME, LTIME	DTL
Subtraction	-	Integer/floating-point number	Integer/floating-point number	Integer/floating-point number
		TIME	TIME	TIME
		TIME	DINT	TIME
		LTIME <sup>1)</sup>	TIME, LTIME	LTIME
		LTIME	LINT	LTIME
		TOD	TIME	TOD
			DINT	TOD
		LTOD	TIME, LTIME	LTOD
		LTOD	LINT	LTOD
		DATE	DATE	<ul style="list-style-type: none"> <li>• S7-300/400/1200: TIME</li> <li>• S7-1500: LTIME</li> </ul>
		DT	TIME	DT
		LDT	TIME, LTIME	LDT
		DTL	TIME, LTIME	DTL
		DTL	DTL	<ul style="list-style-type: none"> <li>• S7-1200: TIME</li> <li>• S7-1500: LTIME</li> </ul>

<sup>1)</sup> Combinations between nanoseconds and milliseconds are not possible within expressions.

For additional information on valid data types, refer to "See also".

### Example

The following example shows an arithmetic expression:

```
SCL
"MyTag1" := "MyTag2" * "MyTag3";
```

**See also**

Expressions (Page 1538)

Operators and operator precedence (Page 1544)

**Relational expressions**

**Description**

Relational expressions compare the values of two operands and yield a Boolean value. The result is TRUE if the comparison is true, and FALSE if it is not met.

Relational operators can process the data types that are allowed in the CPU in use. The data type of the result always is BOOL.

Note the following rules when forming relational expressions:

- All tags are comparable within the following data type groups:
  - Integers/floating-point numbers
  - Binary numbers
  - String
- With the following data types/data groups, only tags of the same type can be compared:
  - TIME, LTIME
  - Date and time
- The comparison of strings is based on the ASCII character set. The length of the tags and the numerical value of each ASCII character are used for the comparison.
- S5TIME tags are not permitted as comparison operands. An explicit conversion from S5TIME to TIME or LTIME is necessary.

**Data types of relational expressions**

The following table shows the data types/data type groups you can use in relational expressions:

Operation	Operator	1st Operand	2nd Operand	Result
Compare for equal, not equal	=, <>	Integer/floating-point number	Integer/floating-point number	BOOL
		Binary number	Binary number	BOOL
		String	String	BOOL
		TIME, LTIME	TIME, LTIME	BOOL
		Date and time	Date and time	BOOL
Compare for less than, less than-equal to, greater than, greater than or equal to	<, <=, >, >=	Integer/floating-point number	Integer/floating-point number	BOOL
		Bit strings (S7-1200/1500 only)	Bit strings (S7-1200/1500 only)	BOOL

Operation	Operator	1st Operand	2nd Operand	Result
		String	String	BOOL
		TIME, LTIME	TIME, LTIME	BOOL
		Date and time	Date and time	BOOL

For additional information on valid data types, refer to "See also".

## Example

The following example shows a relational expression:

### SCL

```
IF a > b THEN c:= a;
IF A > 20 AND B < 20 THEN C:= TRUE;
IF A<>(B AND C) THEN C:= FALSE;
```

### Note

The comparison for STRING and DT are executed internally in the S7-300/400 by extended instructions. The following operands are not permitted for these functions:

- Parameter of a FC
- In-out parameter of an FB of type STRUCT or ARRAY

## See also

Expressions (Page 1538)

Operators and operator precedence (Page 1544)

## Logical expressions

### Description

Logical expressions combine two operands with logical operators AND OR XOR or negating operands NOT.

Logical operators can process the data types that are allowed in the CPU in use. The result of a logical expression is of BOOL data type, if both operands are of BOOL data type. If at least one of both operands is a bit string, then the result is also a bit string and is determined by the type of the highest operand. For example, when you link a BYTE type operand to a WORD type operand, the result is type WORD.

To link a BOOL type operand with a bit string, you must first explicitly convert it to a bit string.

### Data types of logical expressions

The following table shows the data types you can use in logical expressions:

Operation	Operator	1st Operand	2nd Operand	Result
Negation	NOT	BOOL	-	BOOL
AND logic operation	AND or &	BOOL	BOOL	BOOL
		Bit string	Bit string	Bit string
OR logic operation	OR	BOOL	BOOL	BOOL
		Bit string	Bit string	Bit string
EXCLUSIVE OR logic operation	XOR	BOOL	BOOL	BOOL
		Bit string	Bit string	Bit string

### Example

The following example shows a logical expression:

```

SCL
IF "MyTag1" AND NOT "MyTag2" THEN c:=a;
MyTag:=ALPHA OR BETA;
    
```

### See also

- Expressions (Page 1538)
- Operators and operator precedence (Page 1544)

### Operators and operator precedence

#### Operators and their order of evaluation

Expressions can be linked together or nested within each other by operators.

The order of evaluation for expressions depends on the precedence of operators and brackets. The following basic rules apply:

- Arithmetic operators are evaluated before relational operators and relational operators are evaluated before logical operators.
- Operators with no precedence are evaluated according to their occurrence from left to right.
- Operations in brackets are evaluated first.

The following table provides an overview of the operators and their precedence:

Operator	Operation	Precedence
<b>Arithmetic expressions</b>		
+ (Page 1539)	Unary plus	2
- (Page 1539)	Unary minus	2

Operator	Operation	Precedence
** (Page 1539)	Power	3
* (Page 1539)	Multiplication	4
/ (Page 1539)	Division	4
MOD (Page 1539)	Modulo function	4
+ (Page 1539)	Addition	5
- (Page 1539)	Subtraction	5
<b>Relational expressions</b>		
< (Page 1542)	Less than	6
> (Page 1542)	Greater than	6
<= (Page 1542)	Less than or equal	6
>= (Page 1542)	Greater than or equal	6
= (Page 1542)	Equal	7
<> (Page 1542)	Not equal	7
<b>Logical expressions</b>		
NOT (Page 1543)	Negation	3
AND (Page 1543) or & (Page 1543)	Boolean AND	8
XOR (Page 1543)	Exclusive OR	9
OR (Page 1543)	Boolean OR	10
<b>Miscellaneous operations</b>		
( ) (Page 1538)	Brackets	1
:= (Page 1545)	Assignment	11

## Value assignments

### Definition

You can use a value assignment to assign the value of an expression to a tag. On the left side of the assignment is the tag that takes the value of the expression on the right.

The name of a function can also be specified as an expression. The function is called by the value assignment and returns its function value to the tag on the left.

The data type of value assignment is defined by the data type of the tag on the left. The data type of the expression on the right must match this type.

For additional information on compatibility and conversion of data types, refer to "See also".

### Value assignments for STRUCT data type or PLC data types

An entire structure can be assigned to another if the structures are identically organized and the data types as well as the names of the structural components match.

You can assign a tag, an expression or another structural element to an individual structural element.

### Value assignments for the ARRAY data type

An entire ARRAY can be assigned to another ARRAY if both the data types of the ARRAY elements as well as the ARRAY limits match.

You can assign a tag, an expression or another ARRAY element to an individual ARRAY element.

### Value assignments for the STRING data type

An entire STRING can be assigned to another STRING.

You can assign another STRING element to an individual STRING element.

### Value assignments for the ANY data type

You can assign a tag with the ANY data type only to the following objects:

- Input parameters or temporary local data of FBs that also have the data type ANY.
- Temporary local data of FCs that also have the data type ANY.

Note that you can only point to memory areas with "standard" access mode with the ANY pointer.

### Value assignments for the POINTER data type

You cannot use POINTER in value assignments in SCL.

### Examples

The following table shows examples for value assignments:

SCL	
"MyTag1" := "MyTag2";	(* Assignment of a tag*)
"MyTag1" := "MyTag2" * "MyTag3";	(* Assignment of an expression*)
"MyTag" := "MyFC" ();	(* Call for a function that assigns its function value to the "MyTag" tag*)
#MyStruct.MyStructElement := "MyTag";	(* Assignment of a tag to a structure element*)
#MyArray[2] := "MyTag";	(* Assignment of a tag to an ARRAY element*)
"MyTag" := #MyArray[1,4];	(* Assignment of an ARRAY element to a tag*)
#MyString[2] := #MyOtherString[5];	(* Assignment of a STRING element to another STRING element*)

## Settings for SCL

### Overview of the settings for SCL

#### Overview

The following tables show the settings you can make for SCL:

#### Editor settings

Group	Setting	Description
View	Keyword highlighting	Notation used to represent the keywords of the programming language. You can choose between uppercase and lowercase letters or a notation corresponding to the conventions of the Pascal programming language.

#### Default settings for new blocks

If you create new blocks, the following settings are set as default values. You can change these in the block properties at a later point in time.

Group	Setting	Description
Compile	Create extended status information	Allows all tags in a block to be monitored. The memory requirements of the program and execution times increase, however, with this option.
	Check ARRAY limits <sup>1)</sup>	Checks at runtime whether array indices are within the declared range for an ARRAY. If an array index exceeds the permissible range, the enable output ENO of the block is set to "0".
	Set ENO automatically	Checks at runtime whether errors occur in the processing of certain instructions. If a runtime error occurs, the enable output ENO of the block is set to "0".
<sup>1)</sup> For CPUs of the S7-300/400 series: When the ARRAY limits are violated, the enable output ENO is set to FALSE. For CPUs of the S7-1200/1500 series: When the ARRAY limits are violated, the enable output ENO is not set to FALSE. See "Addressing structured variables (Page 1248)" for error query options.		

#### See also

Changing the settings (Page 1548)

### Changing the settings

#### Procedure

To change the settings, follow these steps:

1. Select the "Settings" command in the "Options" menu.  
The "Settings" window is displayed in the work area.
2. In the area navigation, select the "PLC programming" group.
3. Change the settings.

#### Result

The change will be loaded directly, there is no need to save it explicitly.

#### See also

Overview of the settings for SCL (Page 1547)

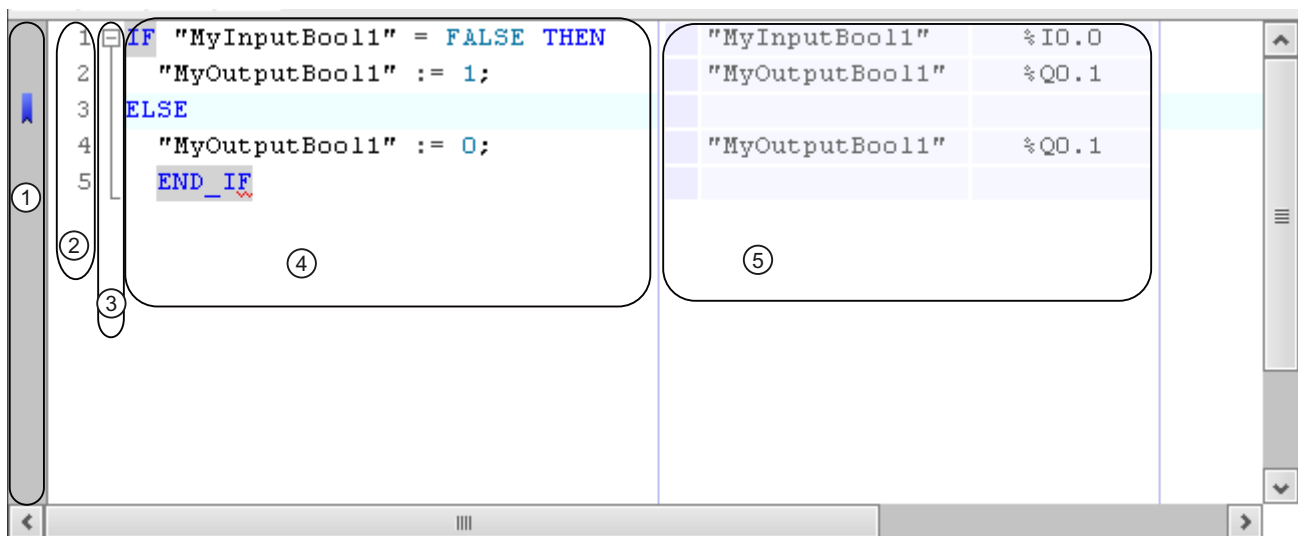

### The programming window of SCL

#### Overview of the programming window

#### Function

The programming window is the work area, where you enter the SCL program.

The following figure shows the programming window of SCL:

The programming window consists of the following sections:

Section	Meaning
① Sidebar	You can set bookmarks and breakpoints in the sidebar.
② Line numbers	The line numbers are displayed to the left of the program code.
③ Outline view	The outline view highlights related code sections.
④ Code area	You edit the SCL program in the code area.
⑤ Display of the absolute operands	This table shows the assignment of symbolic operands to absolute addresses.

## See also

Customizing the programming window (Page 1549)

Formatting SCL code (Page 1550)

Expanding and collapsing sections of code (Page 1551)

## Customizing the programming window

### Introduction

You can customize the appearance of the programming window and the program code in the following way:

- By setting the font, size and color
- By setting the tab spacing
- By displaying the line numbers
- By showing or hiding the absolute operands

### Setting the font, size and color

To set the font, size and color, follow these steps:

1. Select the "Settings" command in the "Options" menu.  
The "Settings" window is displayed in the work area.
2. Select the "General > Script/text editors" group.
3. Select the desired font and font size or choose a font color for the individual language elements.

### Setting the tab spacing

To provide a better overview of the program, lines are indented according to syntax. Define the depth of indentation with the tab spacing.

To set the tab spacing, follow these steps:

## 9.1 Creating the user program

1. Select the "Settings" command in the "Options" menu.  
The "Settings" window is displayed in the work area.
2. Select the "General > Script/text editors" group.
3. Set the tab spacing.

### Show line numbers

To display the line numbers, follow these steps:

1. Select the "Settings" command in the "Options" menu.  
The "Settings" window is displayed in the work area.
2. Select the "General > Script/text editors" group.
3. Select the "Show line numbers" option.

### Show or hide the absolute operands

You can show the assignment of symbolic and absolute operands in a table next to the program code, if required.

To hide or show the display of the absolute operands, follow these steps:

1. Click the "Absolute/symbolic operands" icon in the toolbar.  
The display of the absolute operands appears.
2. To move the display, click the table and drag it to the desired position while holding down the mouse button.
3. To change the width of the table, click on the right or left table border and drag it to the right or left while holding down the mouse button.

### See also

Overview of the programming window (Page 1548)

Formatting SCL code (Page 1550)

Expanding and collapsing sections of code (Page 1551)

## Formatting SCL code

### Introduction

To make the program clearer, you can indent or outdent individual lines manually or format code sections. Note the following information about formatting code sections:

- The type of formatting is based on the general settings for indents, but at least the line or the section is always indented. If you selected the setting "Smart", unnecessary spaces within the SCL instruction are also removed.
- Only syntactically correct code sections can be formatted.

- If you place the insertion point in the first or last line of an instruction for program control, for example in an IF instruction in the line with the "IF", the entire instruction is formatted.
- If you select text, only the selected text is formatted.

### Indenting or outdenting lines

To indent or outdent individual lines, follow these steps:

1. Click on the line you want to indent or outdent.
2. Press the "Indent text", "Outdent text" button into the toolbar of the programming editor.

---

#### Note

You can set the width of the indent in "Options > Settings".

---

### Formatting code sections

To format code sections, follow these steps:

1. Select the text that you want to format or place the insertion point in the appropriate line.
2. Select the "Format selected text automatically" button into the toolbar of the programming editor.

### See also

Overview of the programming window (Page 1548)

Customizing the programming window (Page 1549)

Expanding and collapsing sections of code (Page 1551)

Overview of the script and text editor settings (Page 243)

### Expanding and collapsing sections of code

#### Introduction

SCL instructions can span several lines. Examples for this are program control instructions or block calls.

These instructions are identified as follows:

- An outline view between the display line number and the program code marks the entire code section.
- When you select the opening keyword, the closing keyword is automatically highlighted.

## **Procedure**

To expand or collapse the code section, follow these steps:

1. Click the minus sign in the outline view.  
The code section closes.
2. Click the plus sign in the outline view.  
The code section opens.

## **See also**

Overview of the programming window (Page 1548)

Customizing the programming window (Page 1549)

Formatting SCL code (Page 1550)

## **Using bookmarks**

### **Basics of bookmarks**

### **Function**

You can use bookmarks to mark program locations in extensive programs so that you can find them quickly later if they need revising. Bookmarks are displayed in the sidebar of the programming window. You can navigate between multiple bookmarks within a block using menu commands.

Bookmarks are saved with the project and are therefore available for anyone who wants to edit the block. However, they are not loaded to a device.

Bookmarks are not evaluated when blocks are compared.

## **See also**

Setting bookmarks (Page 1552)

Navigating between bookmarks (Page 1553)

Deleting bookmarks (Page 1554)

## **Setting bookmarks**

### **Requirement**

The SCL block is open.

## Procedure

To set a bookmark, follow these steps:

1. Right-click on the desired line in the sidebar.
2. Select the "Bookmarks > Set" command in the shortcut menu.

Or:

1. Click on the line in which you want to place the bookmark.
2. Click the "Set/delete bookmark" button in the toolbar.

Or:

1. Hold down the <Ctrl> key.
2. Click on the line in the sidebar in which you want to place the bookmark.

## Result

A bookmark is placed in the program code.

## See also

Basics of bookmarks (Page 1552)

Navigating between bookmarks (Page 1553)

Deleting bookmarks (Page 1554)

## Navigating between bookmarks

### Requirement

Several bookmarks are set in a block.

### Procedure

To navigate between bookmarks, follow these steps:

1. Set the insertion cursor in the program code.
2. In the "Edit" menu, select the "Go to > Next bookmark" or "Go to > Previous bookmark" command.

Or:

1. Set the insertion cursor in the program code.
2. In the toolbar of the programming editor, click the "Go to next bookmark", "Go to previous bookmark" button.

Or:

1. Click in the sidebar.
2. Select the "Bookmarks > Next" or "Bookmarks > Previous" command in the shortcut menu.

## Result

The line with the bookmark is highlighted.

## See also

Basics of bookmarks (Page 1552)

Setting bookmarks (Page 1552)

Deleting bookmarks (Page 1554)

## Deleting bookmarks

You can delete individual bookmarks or all bookmarks from the block or the CPU.

### Deleting individual bookmarks

To delete an individual bookmark, follow these steps:

1. Right-click in the sidebar on the line in which you want to delete the bookmark.
2. Select the "Bookmarks > Remove" command in the shortcut menu.

Or:

1. Click on the line in which you want to delete the bookmark.
2. In the "Edit" menu, select the "Bookmarks > Remove" command.

Or:

1. Click on the line in which you want to delete the bookmark.
2. Click the "Set/delete bookmark" button in the toolbar.

### Deleting all bookmarks from the block

To delete all bookmarks from the block, follow these steps:

1. Right-click in the sidebar.
2. Select the "Bookmarks > Delete all from block" command in the shortcut menu.

Or:

1. In the "Edit" menu, select the "Bookmarks > Delete all from block" command.

## Entering SCL instructions

## Rules for SCL instructions

## Instructions in SCL

SCL recognizes the following types of instructions:

- Value assignments  
Value assignments are used to assign a tag a constant value, the result of an expression or the value of another tag.
- Instructions for program control  
Instructions for program control are used to implement program branches, loops or jumps.
- Additional instructions from the "Instructions" task card  
The "Instructions" task card offers a wide selection of standard instructions that you can use in your SCL program.
- Block calls  
Block calls are used to call up subroutines that have been placed in other blocks and to further process their results.

## Rules

You need to observe the following rules when entering SCL instructions:

- Instructions can span several lines.
- Each instruction ends with a semicolon (;).
- No distinction is made between upper and lower case.
- Comments serve only for documentation of the program. They do not affect the program execution.

## Examples

The following examples shows the various types of instructions:

```
SCL  
// Example of a value assignment  
"MyTag" := 0;  
// Example of a block call  
"MyDB"."MyFB" (ParamInput := 10);
```

## 9.1 Creating the user program

```
SCL  
// Example of a program control instruction  
WHILE "Counter" < 10 DO  
    "MyTAG" := "MyTag" + 2;  
END_WHILE;
```

### Entering SCL instructions manually

#### Requirement

An SCL block is open.

#### Procedure

To enter SCL instructions, follow these steps:

1. Enter the syntax of the instruction using the keyboard.  
You are supported by the auto-complete function when performing this task. It offers all the instructions and operands that are allowed at the current location.
2. Select the required instruction or the desired operand from the auto-complete function.  
If you select an instruction that requires specification of operands, placeholders for the operands are inserted into the program. The placeholders for the operands are highlighted in yellow. The first placeholder is selected.
3. Replace this placeholder with an operand.
4. Use the <TAB> key to navigate to all other placeholders and replace them with operands.

---

#### Note

You can also drag-and-drop a defined operand from the PLC tag table or from the block interface into the program. To replace an operand that has already been inserted, hover the mouse pointer briefly over the operand to be replaced before releasing the mouse button. This selects the operand and when you release the mouse button it is replaced by the new operand.

---

#### Result

The instruction is inserted.

The programming editor performs a syntax check. Incorrect entries are displayed in red and italics. In addition, you also receive a detailed error message in the inspector window.

#### See also

Using autocompletion in textual programming languages (Page 1430)

## Inserting SCL instructions using the "Instructions" task card

The "Instructions" task card offers a wide selection of instructions that you can use in your SCL program. The SCL-specific instructions for program control are available in the "Instructions" task card.

### Requirement

An SCL block is open.

### Procedure

To insert SCL instructions into a program using the "Instructions" task card, follow these steps:

1. Open the "Instructions" task card.
2. To insert the instruction, select one of the following steps:
  - Navigate to the SCL instruction you want to insert and drag-and-drop it to the required line in the program code. The insertion location is highlighted by a green rectangle.
  - Select the location in the program code where you want to insert the instruction and then double-click on the instruction you want to insert.

The instruction is inserted in the program. The placeholders for the operands are highlighted in yellow. The first placeholder is selected.

3. Replace this placeholder with an operand. You can also drag a tag from the interface or the PLC tag table with drag-and-drop to the placeholder.
4. Use the <TAB> key to navigate to all other placeholders and replace them with operands.

### Result

The instruction is inserted.

The programming editor performs a syntax check. Incorrect entries are displayed in red and italics. In addition, you also receive a detailed error message in the inspector window.

### See also

Using autocompletion in textual programming languages (Page 1430)

## Defining the data type of an SCL instruction

### Basic information on the data types of SCL instructions

#### Introduction

The SCL instructions that you employ for block programming use specific data types to calculate function values. Certain SCL instructions only support the use of a specific data type.

You cannot change the data type for these instructions. However, most of the SCL instructions support the use of different data types. We differentiate between the following two types of such instructions:

- Instructions for which the data type of the function value is determined by the data type of the input parameters. This is the case for most instructions.
- Instructions with default data type. The instructions listed in the following table are of this type.

You will have to change the default data type if this is incompatible with the data type of the input parameter used. You can always change the data type based on the following syntax: `_  
<data type>`

### SCL instructions with default data type

The following table lists the SCL instructions with default data types:

Instruction	Default data type
CEIL	DINT
DECO	DWORD
FLOOR	DINT
NORM_X	REAL
PEEK	BYTE
SCALE_X	INT
TRUNC	DINT
CONCAT	STRING

### See also

[Changing the data type of an SCL instruction \(Page 1558\)](#)

[Example for changing the data type of an SCL instruction \(Page 1559\)](#)

### Changing the data type of an SCL instruction

#### Procedure

Proceed as follows to insert an SCL instruction and change its data type:

1. Insert the instruction at the required point in the program using drag-and-drop.
2. Specify the operands for the instruction.  
The data type of the function value is specified based on the input parameters, or the default data type of the instruction is used.
3. Append the "`_  
<data type>`" string to the instruction name.  
"`<data type>`" represents the data type you need for the instruction.

**See also**

Basic information on the data types of SCL instructions (Page 1557)

Example for changing the data type of an SCL instruction (Page 1559)

**Modifying the data types of IEC timers and IEC counters**

IEC timers and IEC counters are internal system function blocks and require an instance data block. You can create the instance data blocks either as single or multi-instance. The data type of the instance data block is determined according to the associated instruction. For CPUs of the S7-1200 and S7-1500 series, you can, however execute the instructions with different data types, depending on your requirements.

If the newly set data type of the instance data block does not match the data type of the input parameter, an implicit conversion takes place if possible. If the conversion is not possible, you will receive an error message.

**Procedure**

To change the data type of an IEC timer or IEC-counter instance data block, proceed as follows:

1. Open the block in which you call the IEC timer or IEC counter.  
Depending on the instance type of the instance data block, there is a green-bordered box before (multi-instance) or after (single instance) the name of the instance data block.
2. Click the green-bordered box.  
A drop-down list box with the valid data types for the instance data block is opened.
3. Select the desired data type.

**Example for changing the data type of an SCL instruction****Changing the default data type of the "Decode" instruction (DECO)**

Data type DWORD is set as default if you insert the "Decode" instruction in the program.

```
"Tag_Result" := DECO(IN := "Tag_Value");
```

Modify the program code as follows to convert the data type from DWORD to BYTE:

```
"Tag_Result_BYTE" := DECO_BYTE(IN := "Tag_Value");
```

Basic information on the data types of SCL instructions (Page 1557)

Changing the data type of an SCL instruction (Page 1558)

## Displaying or hiding tag information

### Introduction

Regardless of whether the operands are represented in absolute or symbolic form, you can show and hide simple or hierarchical comments used to document global tags. This information is taken from the PLC tag table.

You can display the tag information either for all the blocks or for individually opened blocks. If you display the tag information for all the blocks, the tag information for all blocks currently opened and opened in future is shown.

You can hide the tag information at any time again. If you have hidden the tag information for all blocks, you can display it again for individual ones that you have opened.

If you select the display of tag information with hierarchical comments, the comments of the higher structure levels of structured tags will also be displayed. The display is in brackets after the comment of the tags; the comments of the individual levels are separated by a period. If there is no comment at a structure level for a tag, it is omitted in the display and this is recognizable because there are two periods.

### Displaying or hiding tag information for all blocks

Follow the steps below to display or hide the tag information for all blocks:

1. Select the "Settings" command in the "Options" menu.  
The "Settings" window is displayed in the work area.
2. In the area navigation, select the "PLC programming" group.
3. If you want to show the tag information, either select the "Expand" option in the "Tag information" drop-down list or the "Tag information with hierarchy" depending on whether you want to display simple or hierarchical comments.
4. If you want to hide the tag information, select the "Collapse" option in the "Tag information" drop-down list.  
The tag information is displayed or hidden for all blocks. When you open further blocks, the tag information is displayed or hidden depending on the selected setting.

### Displaying or hiding tag information for an opened block

Follow the steps below to display or hide the tag information for an opened block:

1. If you want to show the tag information, either select the "Show tag information" option in the "Shows the tag information" drop-down list or the "Tag information with hierarchy" depending on whether you want to display simple or hierarchical comments.
2. If you want to hide the tag information, select the "Hide tag information" option in the "Hides tag information" drop-down list.  
The tag information is displayed or hidden.

## Using Favorites in SCL

### Adding SCL instructions to the Favorites

#### Requirement

- A block is open.
- The multipane mode is set for the "Instructions" task card or the Favorites are also displayed in the editor.

#### Procedure

To add SCL instructions to the Favorites, follow these steps:

1. Open the "Instructions" task card.
2. Maximize the "Basic instructions" pane.
3. Navigate in the "Basic instructions" pane to the instruction that you want to add to the Favorites.
4. Drag-and-drop the instruction into the "Favorites" pane or into the Favorites area in the program editor.

---

#### Note

To additionally display the Favorites in the program editor, click the "Display favorites in the editor" button in the program editor toolbar.

---

#### See also

Overview of the program editor (Page 1412)

Inserting SCL instructions using Favorites (Page 1561)

Removing SCL instructions from the Favorites (Page 1562)

### Inserting SCL instructions using Favorites

#### Requirement

- A block is open.
- Favorites are available.

## Procedure

To insert an instruction into a program using Favorites, follow these steps:

1. Drag-and-drop the desired instruction from Favorites to the desired position.

Or:

1. Select the position in the program where you want to insert the instruction.
2. In the Favorites, click on the instruction you want to insert.

---

### Note

To additionally display the Favorites in the program editor, click the "Display favorites in the editor" button in the program editor toolbar.

---

## See also

Overview of the program editor (Page 1412)

Adding SCL instructions to the Favorites (Page 1561)

Removing SCL instructions from the Favorites (Page 1562)

## Removing SCL instructions from the Favorites

### Requirement

A code block is open.

### Procedure

To remove instructions from Favorites, follow these steps:

1. Right-click on the instruction you want to remove.
2. Select the "Remove instruction" command in the shortcut menu.

---

### Note

To additionally display the Favorites in the program editor, click the "Display favorites in the editor" button in the program editor toolbar.

---

## See also

## Insert block calls in SCL

### Basic information on the block call in SCL

### Calling function blocks

#### Syntax of a call

The following syntax is used to call a function block as a single or multi-instance:

- Single instance:
  - If the function block originates from the project:  
`<DBName> (Parameter list)`
  - If the function block originates from the "Instructions" task card:  
`<DB name>.<Instruction name> (Parameter list)`
- Multi-instance  
`<#Instance name> (Parameter list)`

#### Calling as single instance or multi-instance

Function blocks can be called either as a single instance or a multi-instance.

- Calling as a single instance  
The called function block stores its data in a data block of its own.
- Calling as a multi-instance  
The called function block stores its data in the instance data block of the calling function block.

For additional information on the types of calls, refer to "See also".

#### Parameter list

If you call another code block from a SCL block, you can supply the formal parameters of the called block with actual parameters.

The specification of the parameters has the form of a value assignment. This value assignment enables you to assign values (actual parameters) to the parameters you have defined in the called block.

The formal parameters of the called code block are listed in brackets directly after the call. Input and in-out parameters have the assignment identifier ":", output parameters have the

assignment identifier "=>". A placeholder placed after the parameter shows the required data type and the type of the parameter.

### Rules for supplying parameters

The following rules apply to supplying parameters:

- Constants, tags and expressions can be used as actual parameters.
- The assignment order is not of importance.
- The data types of formal and actual parameters must match.
- The individual assignments are separated by commas.
- If the called block has only one parameter, it is sufficient to specify the actual parameter in the brackets. The formal parameter need not be specified.

### See also

Manually inserting block calls (Page 1568)

Inserting block calls with drag-and-drop (Page 1569)

Examples for calling a function block in SCL (Page 1566)

### Calling functions

#### Syntax of a call

The following syntax is used to call a function:

```
<Function name> (Parameter list); //Standard call  
<Operand>:=<Function name> (Parameter list); // Call in an expression
```

#### Function value

Functions that provide a return value can be used in any expression in place of an operand. For this reason, the return value is also known as the "function value" in SCL.

The call options of functions depend on whether the function returns a function value to the calling block.

The function value is defined in the RET\_VAL parameter. If the RET\_VAL parameter is of the VOID data type, then the function will not return a value to the calling block. If the RET\_VAL parameter has another data type, then the function returns a function value of this data type.

In SCL, all data types are permitted for the RET\_VAL parameter except ANY, ARRAY, STRUCT and VARIANT, as well as the parameter types TIMER and COUNTER.

## Call options

There are two possibilities for calling functions in SCL:

- Standard call for functions with and without a function value  
With a standard call, the results of the function is made available as an output and in-out parameter.
- Call in an expression for functions with a function value  
Functions that return a function value can be used in any expression in place of an operand, for example, a value assignment.  
The function calculates the function value, which has the same name as the function and returns it to the calling block. There the value replaces the function call.  
Following the call, the results of the function is made available as a function value or as an output and in-out parameter.

## Parameter list

If you call another code block from a SCL block, you need to supply the formal parameters of the called block with actual parameters.

The specification of the parameters has the form of a value assignment. This value assignment enables you to assign values (actual parameters) to the parameters you have defined in the called block.

The formal parameters of the called code block are listed in brackets directly after the call. Input and in-out parameters have the assignment identifier ":", output parameters have the assignment identifier "=>". A gray placeholder placed after the parameter shows the required data type and the type of the parameter.

## Rules for supplying parameters

The following rules apply to supplying parameters to functions:

- All parameters of the function must be supplied.
- The assignment order is not of importance.
- Constants, tags and expressions can be used as actual parameters.
- The data types of formal and actual parameters must match.
- The individual assignments are separated by commas.
- If the called block has only one parameter, it is sufficient to specify the actual parameter in the brackets. The formal parameter need not be specified.
- When you call functions in SCL, you cannot use the release mechanism via EN. Use an IF statement instead to call functions conditionally.

- Examples for calling functions in SCL (Page 1567)

## Examples for calling a function block in SCL

### Calling as a single instance

The following example shows the call of an FB as a single instance:

```
SCL  
// Call as a single instance  
"MyDB" (MyInput:=10, MyInout:= "Tag1");
```

### Result

After the call is executed, the value determined for the "MyInout" in/out parameter is available in "Tag1" in the "MyDB" data block.

### Calling as a multi-instance

The following example shows the call of an FB as a multi-instance:

```
SCL  
// Call as a multi-instance  
"MyFB" (MyInput:= 10, MyInout:= "Tag1");
```

### Result

After the "MyFB" block is executed, the value determined for the "MyInout" in-out parameter is made available in "Tag1" in the data block of the calling code block.

### See also

- Calling function blocks (Page 1563)
- Manually inserting block calls (Page 1568)
- Inserting block calls with drag-and-drop (Page 1569)

## Examples for calling functions in SCL

### Standard call

The following example shows a standard function call:

```
SCL  
// Standard function call  
"MyFC" (MyInput := 10, MyInOut := "Tag1");
```

### Result

After the "MyFC" block is executed, the value determined for the "MyInOut" in/out parameter is available in "Tag1" in the calling block and needs to be further processed there.

### Call in a value assignment

The following example shows a function call in a value assignment:

```
SCL  
(*Call in a value assignment, a function value was defined for "MyFC" *)  
#MyOperand := "MyFC" (MyInput1 := 3, MyInput2 := 2, MyInput3 := 8.9,  
MyInOut := "Tag1");
```

### Result

The function value of "MyFC" is transferred to "#MyOperand".

### Call in an arithmetic expression

The following example shows a function call in an arithmetic expression:

```
SCL  
(*Call in a mathematical expression, a function value was defined for  
"MyFC" *)  
#MyOperand := "Tag2" + "MyFC" (MyInput1 := 3, MyInput2 := 2, MyInput3 :=  
8.9);
```

### Result

The function value of "MyFC" will be added to "Tag2" and the result will be transferred to "MyOperand".

## See also

Calling functions (Page 1564)

Manually inserting block calls (Page 1568)

Inserting block calls with drag-and-drop (Page 1569)

## Manually inserting block calls

You can insert calls for functions (FCs) and function blocks (FBs).

### Inserting a call for a function (FC)

Proceed as follows to insert a function call:

1. Enter the function name.
2. Confirm your entry with the Return key.  
The syntax for the function call including the parameter list is added to the SCL program. The placeholders for the actual parameters are highlighted in yellow. The first placeholder is selected.
3. Replace this placeholder with an actual parameter. You can also drag a tag from the interface or the PLC tag table with drag-and-drop to the placeholder.
4. Use the <TAB> key to navigate to all other placeholders and replace them with actual parameters.

### Inserting a call for a function block (FB)

To insert a call for a function block (FB), follow these steps:

1. Enter the name of the function block.
2. Confirm your entry with the Return key.  
The "Call options" dialog opens.
3. In the dialog, specify whether you want to call the block as a single or multi-instance.
  - If you click the "Single instance" button, in the "Name" field enter a name for the data block to be assigned to the call.
  - If you click the "Multi-instance" button, in the "Name in the interface" field enter a name of the tag with which the called function block is to be entered as a static tag in the interface of the calling block.
4. Confirm your entries with "OK".  
The syntax for the function block call including the parameter list is added to the SCL program. The placeholders for the actual parameters are highlighted in yellow. The first placeholder is selected.
5. Replace this placeholder with an actual parameter. You can also drag a tag from the interface or the PLC tag table with drag-and-drop to the placeholder.
6. Use the <TAB> key to navigate to all other placeholders and replace them with actual parameters.

## Result

The block call is inserted.

If you specify an instance data block that does not exist when calling a function block, it is created.

## See also

Updating block calls (Page 1570)

Expanding and reducing the parameter list (Page 1571)

Using autocompletion in textual programming languages (Page 1430)

## Inserting block calls with drag-and-drop

You can insert calls for existing functions (FC) and function blocks (FB) using a drag-and-drop operation from the project tree.

## Requirement

The function to be called (FC) or the function block (FB) to be called is present.

## Inserting a call for a function (FC)

To insert a function call using drag-and-drop, follow these steps:

1. Drag the function from the project tree into the program.  
The syntax for the function call including the parameter list is added to the SCL program. The placeholders for the actual parameters are highlighted in yellow. The first placeholder is selected.
2. Replace this placeholder with an actual parameter. You can also drag a tag from the interface or the PLC tag table with drag-and-drop to the placeholder.
3. Use the <TAB> key to navigate to all other placeholders and replace them with actual parameters.

## Inserting a call for a function block (FB)

To insert a call for a function block (FB) using drag-and-drop, follow these steps:

1. Drag the function block from the project tree and drop it into the program.  
The "Call options" dialog opens.
2. In the dialog, specify whether you want to call the block as a single or multi-instance.
  - If you click the "Single instance" button, in the "Name" field enter a name for the data block to be assigned to the call.
  - If you click the "Multi-instance" button, in the "Name in the interface" field enter a name of the tag with which the called function block is to be entered as a static tag in the interface of the calling block.

3. Confirm your entries with "OK".  
The syntax for the function block call including the parameter list is added to the SCL program. The placeholders for the actual parameters are highlighted in yellow. The first placeholder is selected.
4. Replace this placeholder with an actual parameter. You can also drag a tag from the interface or the PLC tag table with drag-and-drop to the placeholder.
5. Use the <TAB> key to navigate to all other placeholders and replace them with actual parameters.

## Result

The block call is inserted.

If you specify an instance data block that does not exist when calling a function block, it is created.

## See also

Updating block calls (Page 1570)

Expanding and reducing the parameter list (Page 1571)

Using autocompletion in textual programming languages (Page 1430)

## Updating block calls

If interface parameters of a called block are changed, the block call can no longer be executed correctly. You can avoid such inconsistent block calls by updating the block calls.

You have two options to update the block calls:

- Explicit updating in the program editor.  
The inconsistencies within the open block are displayed and can be updated.
- Implicit updating during compilation.  
All block calls in the program as well as the used PLC data types will be updated.

## Update blocks in the program editor

To update a block call within a block, follow these steps:

1. Open the block in the program editor.
2. Click "Update inconsistent block calls" in the toolbar.  
Inconsistent calls are displayed.
3. Correct the inconsistencies.

### Update block calls during compilation

Proceed as follows to update all block calls and uses of PLC data types during compilation implicitly:

1. Open the project tree.
2. Select the "Program blocks" folder.
3. Select the command "Compile > Software (rebuild all blocks)" in the shortcut menu.

### See also

Manually inserting block calls (Page 1568)

Inserting block calls with drag-and-drop (Page 1569)

### Expanding and reducing the parameter list

In SCL, if you call blocks or insert instructions that are system-internal function blocks, the syntax and the parameter list with the placeholders for the actual parameters are inserted in the SCL program. To make the program code easier to read, the unused optional parameters are removed from the parameter list when you edit other instructions. You can restore these at any time. You can also explicitly reduce the parameter list when you have finished assigning the parameters.

#### Expanding the parameter list

To expand the parameter list, follow these steps:

1. Right-click in the block call or the instruction.
2. Select the "Expand parameter list" command from the shortcut menu or press the key combination <Ctrl+Shift+Space bar>. The parameter list is displayed in full again.

#### Reducing the parameter list

To reduce the parameter list, follow these steps:

1. Right-click in the block call or the instruction.
2. Select the "Reduce parameter list" command from the shortcut menu or press the key combination <Ctrl+Shift+Space bar>. All unused optional parameters are hidden.

### See also

Entering SCL instructions manually (Page 1556)

Inserting SCL instructions using the "Instructions" task card (Page 1557)

Manually inserting block calls (Page 1568)

Inserting block calls with drag-and-drop (Page 1569)

## Inserting comments

### Commenting program code

You have various options for commenting SCL programs:

- Line comment  
A line comment starts with "//" and extends to the end of the line.
- Comment section  
A comment section is started with "(\*" and completed by "\*)". It can span several lines.

### Inserting a line comment

To insert line comments, follow these steps:

1. Type "//" at the position where you want to place the comment. This does not have to be the beginning of the line.
2. Enter the comment text.

### Inserting a comment section

To insert a comment section, follow these steps:

1. Type "(\*" at the position where you want to place the comment. This does not have to be the beginning of the line.
2. Enter the comment text.
3. Complete the comment with "\*)".

### Disabling one or more lines with comments

To disable program code with comments, follow these steps:

1. Select the code lines you want to comment out.
2. Click the "Comment selection" button in the editor.  
"//" is inserted at the beginning of the line in the selected lines. The code that follows is interpreted as a comment. If lines already containing a line comment are disabled, "//" is inserted as well. If these lines are enabled again, the original comments are retained.

### Enabling comment lines

To enable lines that have been commented out to be enabled as code again, proceed as follows:

1. Select the code lines you want to enable.
2. Click the "Remove comment" button in the editor.  
The "//" mark for line comments at the beginning of the line is removed.

## Example

The following code contains comment sections and line comments

```
(*****  
  A description of the instructions that follow can be placed here  
*****)  
IF "MyVal1" > 0 THEN //No division by 0  
  "MyReal" := "MyVal2" (* input value *) / "MyVal1" (* measured value *);  
END_IF;  
//Data type conversion  
"MyInt" := REAL_TO_INT("MyReal");
```

## Editing SCL instructions

### Selecting instructions

You can select individual instructions or all instructions of a block.

### Requirement

An SCL block is open.

### Selecting individual instructions

To select individual instructions, follow these steps:

1. Set the insertion mark before the first character that you want to select.
2. Press and hold down the left mouse button.
3. Move the cursor to a position after the last character that you want to select.
4. Release the left mouse button.

### Selecting all the instructions of a program

To select all instructions, follow these steps:

1. In the "Edit" menu, select the "Select All" command or use the keyboard shortcut <Ctrl+A>.

---

#### Note

When you select the opening keyword of an instructing, the closing keyword is automatically highlighted.

---

## Copying, cutting and pasting instructions

### Copying an instruction

To copy an instruction, follow these steps:

1. Select the instruction you want to copy.
2. Select "Copy" in the shortcut menu.

### Cutting an instruction

To cut an instruction, follow these steps:

1. Select the instruction you want to cut.
2. Select the "Cut" command in the shortcut menu.

### Inserting an instruction from the clipboard

To insert an instruction from the clipboard, follow these steps:

1. Copy or cut an instruction.
2. Click on the position at which you want to insert the instruction.
3. Select "Paste" in the shortcut menu.

## Deleting instructions

### Requirement

An SCL block is open.

### Procedure

To delete an instruction, follow these steps:

1. Select the instruction you want to delete.
2. Select the "Delete" command in the shortcut menu.

## Eliminating syntax errors in the program

### Basic information on syntax errors

#### Syntax errors

Below are some examples of syntax errors:

- Missing separators or the use of too many separators
- Incorrect keyword spelling
- Incorrect jump label spelling/notation
- Notation which does not match the set mnemonics (for example, "I2.3" instead of "E2.3")
- The use of key words as operands

#### Identification of syntax errors

Syntax errors are underlined in red or appear in red type.

This identification allows you to recognise incorrect inputs at a glance and jump from error to error to eliminate them. Syntax errors are also listed in the "Info" tab of the inspector window with an error message.

#### See also

Finding syntax errors in the program (Page 1575)

### Finding syntax errors in the program

#### Procedure

To find syntax errors in the program, follow these steps:

1. Select the position in the program in which you wish to look for errors.
2. Click "Go to next error" in the toolbar.  
The first error after the position you have selected will be marked.

You can use "Go to next error" and "Go to previous error" in the toolbar to find and correct all errors in the block.

Or:

### 9.1 Creating the user program

1. Open the error list in the inspector window with "Info > Syntax".  
All syntax errors are listed in the table with a short description of the error.
2. If there are any errors, click on the blue question mark next to the error text to obtain information on eliminating the problem.
3. Double-click the error you want to correct.  
The corresponding error is highlighted.

#### See also

Basic information on syntax errors (Page 1575)

### Changing the programming language

#### Rules for changing the programming language

#### Rules

Observe the following rules if you want to change the programming language for a block:

- All CPU series:
  - You can only change the programming language of entire blocks. The programming language cannot be changed for individual networks.
  - You cannot switch blocks programmed in the programming languages SCL or GRAPH. In GRAPH blocks, however, you can change between LAD and FBD as network languages.
- S7-300/400:
  - You can only change between the programming languages LAD, FBD and STL.
  - You can create networks within a block using another programming language and then copy them into the desired block.
  - If the language of individual networks of the block cannot be changed, these networks is displayed in their original language.
- S7-1200/1500:
  - You can change between the programming languages LAD and FBD.
- S7-1500:
  - You can create STL networks within the LAD and FBD blocks. However, you cannot copy between STL and LAD/FBD.

## Change the programming language

### Procedure

To change the programming language, follow these steps:

1. Right-click the block in the project tree.
2. Select the "Properties" command in the shortcut menu.  
The dialog with the properties of the block opens.
3. Select the "General" entry in the area navigation.
4. Select the new programming language in the "Language" drop-down list.
5. Confirm your selection with "OK".

### See also

Rules for changing the programming language (Page 1576)

## Handling program execution errors

### Basics of error handling

#### Introduction

Program execution errors are programming or I/O access errors. You have a number of different options for responding to program execution errors depending on the CPU used.

#### Handling program execution errors in S7-300/400

You can program the program execution error OB (OB 85) for S7-300/400 CPUs. If a program execution error occurs and you do not use the program execution error OB, the CPU will switch to "STOP" mode.

You will find additional information about the program execution error OB in the description of the mode of operation of S7-300/400 CPUs.

### Handling program execution errors in S7-1200/1500

You can select the type of error handling for CPUs of the S7-1200 and S7-1500 series. You have the following two options:

- Use the CPU's global troubleshooting:
  - S7-1200: The CPU generates a diagnostic buffer entry and remains in "RUN" mode.
  - S7-1500: You can program the programming error OB (OB 121) and the I/O access error OB (OB 122) for S7-1500 CPUs. If no programming error OB exists in the CPU, the CPU switches to "STOP" mode when a programming error occurs. In the event of an I/O access error, the CPU always remains in "RUN" mode, regardless of whether the I/O access error OB is present.

Please note, however, that an existing I/O access or programming error OB is not called synchronously to the error. Therefore, depending on the selected priority, the execution of I/O access or programming error OBs may be delayed instead of taking place immediately when the error occurs. If other errors occur before execution of the I/O access or programming error OB is complete, no further I/O access or programming error OB is called. If you want to prevent I/O access or programming error OBs from being discarded, set the priority correspondingly high.

You can use the enable output ENO to detect I/O access and programming errors for the instructions "Read field" (FieldRead), "Write field" (FieldWrite) , "Read memory address" (PEEK) and "Write memory address" (POKE).

You can find more information about these error OBs in the description of the mode of operation of S7-1500 CPUs.
- You use separate local error handling. Local error handling is error handling within a block. Local error handling has the following advantages:
  - The error information is stored in the system memory, which you can query and evaluate.
  - You can use the error information to program a response in the block to the error that has occurred.
  - Programmed error evaluation and error reactions do not interrupt the program cycle.
  - The system performance is not unnecessarily burdened by the local error handling. If no errors occur, programmed error analyses and reactions are not executed.

Local error handling applies only to blocks for which it has been set explicitly. If local error handling is set for a block, no global error handling is conducted for errors in this block.

---

#### Note

Note the following information:

- All memory access errors and I/O access errors must be captured either by global or local error handling.
  - If the parameters of an instruction do not cause any memory access errors, you can query the associated ENO.
-

- Querying and fixing errors in the program code (Page 227)

## Local error handling

### Principles of local error handling

#### Introduction

Local error handling makes it possible to query the occurrence of errors within a block and evaluate the associated error information. You can set local error handling for organization blocks (OBs), function blocks (FBs), and functions (FCs). If local error handling is enabled, the system reaction is ignored.

Local error handling applies only to blocks for which it has been set explicitly. The local error handling setting is not assumed by a calling block, nor is it transferred to called blocks. For higher-level blocks and lower-level blocks, the system settings still apply provided dedicated error handling has not been programmed for these blocks.

#### General procedure for local error handling

When errors occur while a block is being executed with local error handling, a predefined response is initiated based on the following error types:

- Write errors: These errors are ignored, and program execution simply continues.
- Read errors: Program execution continues with the substitute value "0".
- Execution errors: Execution of the instruction is aborted. Program execution resumes with the next instruction.

Information about the first error that occurs is stored in the system memory. This information can be queried and output with an instruction (GET\_ERROR or GET\_ERR\_ID). Error information is output in a format that can undergo additional processing. You can use additional instructions to analyze error information and program a reaction to the error based.

When information about the first error is queried, the error memory space in the system memory is enabled. Then, when additional errors occur, information about the next error is output.

#### Instructions for local error handling

You can use the following instructions for local error handling:

- GET\_ERROR: Get error locally
- GET\_ERR\_ID: Get error ID locally

The instructions differ in the amount of error information that is output with each one. For additional information on the instructions, refer to "See also".

**See also**

- GET\_ERROR: Get error locally (Page 2302)
- GET\_ERR\_ID: Get error ID locally (Page 2022)
- GET\_ERR\_ID: Get error ID locally (Page 2306)
- GET\_ERROR: Get error locally (Page 2019)

**Error output priorities**

**Overview of the priorities**

In local error handling, information about the first error that occurred is displayed. If multiple errors occur at the same time while an instruction is being executed, these errors are displayed according to their priority. The following table shows the priority of different types of errors.

Priority	Error type
1	Error in the program code
2	Missing reference
3	Invalid range
4	DB does not exist
5	Operands are not compatible
6	Width of specified area is not sufficient
7	Timers or counters do not exist
8	No write access to a DB
9	I/O error
10	Instruction does not exist
11	Block does not exist
12	Invalid nesting depth

The highest priority is 1 and the lowest priority is 12.

**See also**

- GET\_ERROR: Get error locally (Page 2302)
- GET\_ERR\_ID: Get error ID locally (Page 2022)
- GET\_ERR\_ID: Get error ID locally (Page 2306)
- GET\_ERROR: Get error locally (Page 2019)

## Enabling local error handling for a block

### Introduction

Local error handling is enabled for a block if you insert one of the following instructions in a network.

- GET\_ERROR: Get error locally
- GET\_ERR\_ID: Get error ID locally

For additional information on the instructions, refer to "See also".

If local error handling is enabled for a block, the system reactions for this block are ignored.

### Requirement

- The block is open.
- Die "Instructions" task card is open.

### Procedure

To enable local error handling for a block, proceed as follows:

1. Navigate to the "Basic instructions" pane of the "Instructions" task card.
2. Open the "Program Control" folder.
3. Drag the instruction "Get error locally" (GET\_ERROR) or "Get error ID locally" (GET\_ERR\_ID) to the required network.

### Result

Local error handling is enabled for the open block. The "Handle errors within block" check box is selected in the Inspector window under "Properties > Attributes". This setting cannot be edited in the Inspector window. Local error handling can be deactivated by deleting the inserted instructions on local error handling.

### See also

### 9.1.4.3 Programming data blocks

#### Basic principles for programming of data blocks

A data block (DB) is used to save the values that are written during execution of the program.

In contrast to the code block, the data block contains only tag declarations. It contains no networks or instructions. The tag declarations define the structure of the data block.

### Types of data blocks

There are two types of data blocks:

- **Global data blocks**  
The global data block is not assigned to a code block. You can access the values of a global data block from any code block. A global data block contains only static tags.  
The structure of the global data block can be freely defined. In the declaration table for data blocks, you declare the data elements that are to be contained in the global data block.
- **Instance data blocks**  
The instance data block is assigned directly to a function block (FB). The structure of an instance data block cannot be freely defined, but is instead determined by the interface declaration of the function block. The instance data block contains exactly those block parameters and tags that are declared there.  
However, you can define instance-specific values in the instance data block, for example, start values for the declared tags.

### ARRAY data blocks (S7-1500)

ARRAY data blocks are global data blocks that consist of an ARRAY. This ARRAY can be based on any data type. For example, an ARRAY of a PLC data type (UDT) is possible. The DB contains no other elements besides the ARRAY. Because of their flat structure, ARRAY data blocks facilitate access to the ARRAY elements and their transfer to called blocks.

The "Move operations" section of the "Instructions" task card offers options for addressing of ARRAY DBs.

### PLC data types as a template for global data blocks

PLC data types can be used as templates for the creation of global data blocks with identical data structures. You create the structure as PLC data type only once and then generate the required data blocks by assigning the PLC data type.

### System data types as a template for global data blocks

System data types can also be used as templates for creating global data blocks with identical data structure. System data types already have a pre-defined structure. You insert the system data type in the program only once and then generate additional data blocks with an identical structure by assigning the system data type.

## Access modes

There are two different modes of accessing data values in data blocks:

- Data blocks with optimized access (only S7-1200)  
Data blocks with optimized access have no fixed defined structure. In the declaration, the data elements are assigned only a symbolic name and no fixed address within the block. You access the data values in these block via symbolic names. The "Optimized block access" attribute is always enabled for ARRAY data blocks.
- Data blocks with standard access (all CPU families)  
Data blocks with standard access have a fixed structure. In the declaration, the data elements are assigned both a symbolic name and a fixed address within the block. You can access the data values in these blocks via symbolic names or the address. ARRAY data blocks with standard access are not possible.

## Retentivity of data values

To prevent data loss in the event of power failure, you can store the data values in a retentive memory area.

## See also

Creating data blocks (Page 1392)

Global data blocks (DB) (Page 1206)

Instance data blocks (Page 1207)

## Structure of the declaration table for data blocks

### Structure of the declaration table for data blocks

The figure below shows the structure of the declaration table for data blocks. The display will vary depending on type of block and type of access.

	Name	Data type	Start value	Retain	Visible in HMI	Comment
	▼ Input					
	■ MyInput1	Bool	false	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	
	▼ Output					
	■ MyOutput1	Byte	0	<input type="checkbox"/>	<input checked="" type="checkbox"/>	
	▼ InOut					
	▼ Static					

## Display of instance-specific values

In instance data blocks, you can apply the already defined values from the interface of the assigned function block or define instance-specific start values. Values that are applied from the function block cannot be edited. You can replace the grayed-out values with instance-specific values. Values that were already changed instance specific are not grayed out.

**Meaning of the columns**

The following table shows the meaning of the individual columns. You can show or hide the columns as required. The number of columns displayed varies depending on the CPU series.

Column	Explanation
	Symbol you can click to move or copy the tag. You can, for example, drag-and-drop the tag into a program and use it there as operand.
Name	Name of the tags.
Data type	Data type of the tags.
Offset	Relative address of the tags. The column is only visible in data blocks with standard access.
Default value	Default value of the tag in the interface of a higher-level code block or in a PLC data type. The values contained in the "Default value" column can only be changed in the higher-level code block or PLC data type. The values are only displayed in the data block.
Start value	Value that the tag should assume at startup. The default values defined in a code block are used as start values during the creation of the data block. You can then replace these adopted values with instance-specific start values. Specification of an start value is optional. If you do not specify any value, the tag assumes the default value at startup. If a default is not defined either, the default value valid for the data type is used. For example, the value "FALSE" is specified as standard for BOOL.
Monitor value	Current data value in the CPU. This column only appears if an online connection is available and you click "Monitor".
Snapshot	Shows values that were loaded from the device.
Retentivity	Marks the tag as retentive. The values of retentive tags are retained even after the power supply is switched off.
Visible in HMI	Shows whether the tag is visible by default in the HMI selection list.
Accessible from HMI	Shows whether HMI can access this tag during runtime.
Setting value	Setting values are the values that will probably have to be fine tuned during commissioning. After commissioning, the values of these tags can be transferred to the offline program as start values and stored there.
Comment	Comment to document the tags.

Basic information on start values (Page 1591)

## Creating data blocks

### Requirement

The "Program blocks" folder in the project tree is open.

### Procedure

To create a data block, follow these steps:

1. Double-click the "Add new block" command.  
The "Add new block" dialog box opens.
2. Click the "Data block (DB)" button.
3. Select the type of the data block. You have the following options available to you:
  - To create a global data block, select the list entry "Global DB".
  - To create an ARRAY data block, select the "ARRAY DB" entry in the list.
  - To create an instance data block, select the function block to which you want to assign the instance data block from the list. The list contains only the function blocks that were previously created for the CPU.
  - To create a data block based on a PLC data type, select the PLC data type from the list. The list contains only the PLC data types that were previously created for the CPU.
  - To create a data block based on a system data type, select the system data type from the list. The list contains only those system data types that have already been inserted to program blocks in the CPU.
4. Enter a name for the data block.
5. Enter the properties of the new data block.
6. If you have selected an ARRAY DB as the data block type, enter the ARRAY data type and the high limit for the ARRAY.  
You can change the high limit for the ARRAY at any time in the property window of the created block. The ARRAY data type cannot be changed subsequently.
7. To enter additional properties of the new data block, click "Additional information".  
An area with further input fields is displayed.
8. Enter all the properties you require.
9. Activate the "Add new and open" check box if the block does not open as soon as it is created.
10. Confirm your entry with "OK".

### Result

The new data block is created. You can find the data block in the project tree in the "Program blocks" folder.

## Updating data blocks

### Introduction

Changes in the interface of a function block or a PLC data type can lead to the corresponding data blocks becoming inconsistent. These inconsistencies are marked in red in the declaration table and at the call point of the block. To remedy these inconsistencies, the data blocks must be updated.

You have three options to update block calls:

- Explicit updating in the declaration table for data blocks.  
The data block is updated. Changes from the interface of the assigned function block and changes to the used PLC data types are applied.
- Explicit updating in the program editor.  
The block calls in the open block will be updated. The associated instance data block is also adjusted in the process.
- Implicit updating during compilation.  
All block calls in the program as well as the used PLC data types and the corresponding instance data blocks are updated.

### Explicit Updating in the Declaration Table for Data Blocks

To explicitly update an individual data block, follow these steps:

1. Open the data block.
2. Select "Update interface" in the shortcut menu.

### Explicit Updating in the Program Editor

To update all block calls or a specific call within a block, follow these steps:

1. Open the block in the program editor.
2. Right-click on the instruction with the block call.
3. Select the "Update" command in the shortcut menu.
4. The "Interface update" dialog opens. This dialog shows the differences between the block interface in use and the changed interface of the called block.
5. If you want to update the block call, click "OK". To cancel the update, click "Cancel".

## Implicit Updating during Compilation

To implicitly update all block calls and uses of PLC data types as well as the instance data blocks during the compiling, follow these steps:

1. Open the project tree.
2. Select the "Program blocks" folder.
3. Select the command "Compile > Software (rebuild all blocks)" in the shortcut menu.

## See also

Changing the properties of tags in instance data blocks (Page 1598)

## Extending data blocks

### Description

In order to enable the editing of PLC programs that have already been commissioned and that are running without error on a system, CPUs of the S7-1500 series and most CPUs of the S7-1200 V4 series support the option of extending global data blocks during runtime.

You can download the modified blocks without setting the CPU to STOP and without affecting the values of already loaded tags.

This is a simple means of implementing program changes. This load process (download without reinitialization) will not have a negative impact on the controlled process.

### Principle of operation

Each data block is always assigned a default memory reserve. The memory reserve is not used initially. Activate the memory reserve if you decide on loading interface changes after having compiled and downloaded the block. All tags that you subsequently declare will be saved to the memory reserve. A subsequent download has no impact on the values of tags that have already been loaded.

If you decide to review your program at a later time while the plant is not in operation, you are also provided an option of reworking the memory layout of individual or several blocks in a single pass. With this action, you move all tags from the reserve area to the regular area. The memory reserve is now cleared and made available for further interface extensions.

### Requirements

This "Download without reinitialization" function is available if the following requirements are met:

- The project is in the "TIA Portal V12" format or a higher version.
- You are working with a CPU that supports "Download without reinitialization".
- The blocks were created in LAD, FBD, STL, or SCL.

### 9.1 Creating the user program

- The blocks were created by the user, i.e. they are not included with the blocks delivered in your package.
- These blocks are assigned the optimized access attribute.

#### Basic steps

Perform the following steps if you want to extend the data block and then load the block without re-initialization.

1. All blocks have a default memory reserve of 100 bytes. You can adapt this memory reserve to suit your requirements.
2. Activate the memory reserve.
3. Extend the block interface.
4. Compile the block.
5. Download the block to the CPU as usual.

#### Reference

For more information on the various steps, refer to chapter "Loading blocks (S7-1200/1500)".

#### Creating a data structure for global data blocks

#### Declaring tags of elementary data type

#### Requirement

A global data block is open.

---

#### Note

You cannot change the structure of instance data blocks and of data blocks based on a PLC data type directly, since the structures of these blocks are defined by the respective function block or the PLC data type.

The type of the data block is entered in the block properties.

---

#### Procedure

To declare a tag of the elementary data type, follow these steps:

1. Enter a tag name in the "Name" column.
2. In the "Data type" column, click the button for the data type selection.  
A list of the permissible data types is opened.
3. Select the desired data type.

4. Optional: Change the properties of the tags that are displayed in the other columns.
5. Repeat steps 1 to 4 for all tags that are to be declared.

### See also

- Displaying and editing block properties (Page 1406)
- Declaring tags of the ARRAY data type (Page 1589)
- Declaring tags of STRUCT data type (Page 1590)
- Editing tables (Page 284)

### Declaring tags of the ARRAY data type

#### Requirement

A global data block is open.

#### Procedure

To declare a tag of the ARRAY data type, follow these steps:

1. Enter a tag name in the "Name" column.
2. Enter the "Array" data type in the "Data type" column. You will be supported by autocompletion in this step.  
The "Array" dialog opens.
3. In the "Data type" text box, specify the data type of the array elements.
4. In the "ARRAY limits" text box, specify the high and low limit for each dimension.  
Example of a one-dimensional ARRAY:  
[0..3]  
Example of a three-dimensional ARRAY:  
[0..3, 0..15, 0..33]
5. Confirm your entry.
6. Optional: Change the properties of the tags that are displayed in the other columns.

The tag is created but remains collapsed. To expand the ARRAY, click the triangle in front of the tag. Not that you cannot expand very large ARRAYS for reasons of clarity.

### Entering start values of ARRAY elements

To set default start values for the individual elements of an ARRAY, follow these steps:

1. Click the triangle in front of the ARRAY data type tags.  
The ARRAY opens and the individual ARRAY elements are shown in separate rows.
2. Enter the required value in the "Start value" column.

## Declaring tags of STRUCT data type

### Requirement

A global data block is open.

### Procedure

To declare a tag of the STRUCT data type, follow these steps:

1. Enter a tag name in the "Name" column.
2. Enter "Struct" in the "Data type" column. You will be supported by autocompletion during input.  
An empty, indented row is inserted after the new tag.
3. Insert the first structural element in the first empty row.  
An additional empty row is inserted after the element.
4. Select a data type for the structure element.
5. Optional: Change the properties of the structural element that is displayed in the other columns of the block interface.
6. Repeat the step 4 to 7 for all additional structure elements.  
It is not necessary to end the structure explicitly. The structure ends with the last element that is entered.
7. To insert a new tag after the structure, leave a blank row after the end of the structure and then start the new tag in the second empty row.

### Result

The tag of STRUCT data type is created.

## Enter start values of structure elements

To set default start values for the individual elements of a structure, follow these steps:

1. Click the triangle in front of the STRUCT data type tags.  
The structure opens and the individual structure elements are shown in separate rows.
2. Enter the required value in the "Start value" column.

### See also

STRUCT (Page 1297)

## Declaring tags based on a PLC data type

### Requirements

- A global data block is open.
- A PLC data type is declared in the current CPU.

### Procedure

To declare a tag based on a PLC data type, follow these steps:

1. Enter a tag name in the "Name" column.
2. Enter the PLC data type in the "Data type" column. You will be supported by autocompletion during input.
3. Optional: Change the properties of the tags that are displayed in the other columns of the table.

### Result

The tag is created.

### See also

Layout of the block interface (Page 1433)

## Define start values

### Basic information on start values

#### Definition of "Start value"

The start value of a tag is a value defined by you which the tag assumes after a CPU startup.

The retentive tags have a special status. Their values take the defined start value only after a "cold restart". After a "warm restart", they retain their values and are not reset to the start value.

#### Definition of "Default value"

The structure of the data blocks can be derived from higher-level elements.

- An instance data block is based, for example, on the interface of a higher-level code block.
- A global data block can be based on a predefined PLC data type.

In this case you can define a default value for each tag in the higher-level element. These default values are used as start values during the creation of the data block. You can then replace these values with instance-specific start values in the data block.

Specification of an start value is optional. If you do not specify any value, the tag assumes the default value at startup. If a default is not defined either, the default value valid for the data type is used. For example, the value "FALSE" is specified as standard for BOOL.

### See also

Define start values (Page 1592)

Structure of the declaration table for data blocks (Page 1583)

Declaring local tags and constants in the block interface (Page 1439)

Applying values from the online program as start values (Page 1607)

### Define start values

#### Define start values

To define the start values for the tags of a data block, follow these steps:

1. Open the data block.  
The "Default value" column shows the default values that were defined for the tags in the interface of a higher-level code block or in a PLC data type.
2. Click the "Expanded mode" button to show all elements of structured data types.
3. Enter the desired start values in the "Start value" column. The value must match the data type of the tag and should not exceed the range of the data type.  
The start values are defined. The tag takes the defined value at startup, provided it was not declared as retentive.

#### Resetting a tag to the default value

To reset a tag for which you have defined a start value to the default value, follow these steps:

1. Select a modified value in the table.
2. Delete the value.  
The default value is entered. The default value is displayed.

## Resetting all tags to the default value

To reset to the default value all tags for which you have defined an start value, follow these steps:

1. Select the "Reset start values" icon in the toolbar.  
The default values are transferred to the "Start value" column. Write-protected start values are not overwritten.

## See also

Basic information on start values (Page 1591)

Applying values from the online program as start values (Page 1607)

## Loading changed values

### Introduction

To apply the changed start values from the offline program to the online program, you must load the changes. The following cases must be distinguished:

- Loading changed start values of non-retentive tags
- Loading changed start values of retentive tags
- Loading changed start values of setting values

### Requirement

The start values in the offline program were changed.

### Procedure

To load changed start values of non-retentive tags, follow these steps:

1. Select the blocks to be loaded in the project tree.
2. Select the "Download to device > Software (only changes)" command from the shortcut menu.  
The blocks are compiled and loaded.  
The start values of the newly defined tags are placed in the load memory of the CPU. The program runs with the new start values at the next transition from STOP to RUN.

To load changed start values of retentive tags, follow these steps:

1. Select the blocks to be loaded in the project tree.
2. Select the "Compile > Software (rebuild all blocks)" command in the shortcut menu.
3. In the "Online" menu, select the "Download and reset PLC program" command.  
The online blocks are deleted and replaced with the new blocks. This reinitializes all tags, including the retentive tags.

Information about loading changed setting values and general information about loading can be found under "See also".

**See also**

Initializing setting values in the online program (Page 1606)

**Setting retentivity**

**Retentivity of tags in data blocks**

**Retentive behavior**

To prevent data loss in the event of power failure, you can mark the data as retentive. This data is stored in a retentive memory area. The options for setting the retentivity depend on the type of data block and the type of block access that is set.

**See also**

Setting retentivity in an instance data block (Page 1594)

Setting retentivity in a global data block (Page 1595)

**Setting retentivity in an instance data block**

**Introduction**

In an instance data block, the editability of the retentive behavior depends on the type of access of the higher-level function block:

- **Function block with standard access**  
You can define the instance data both as retentive or non-retentive. Individual retentivity settings are not possible for individual tags.
- **Function block with optimized access**  
In the instance data block, you can define the retentivity settings of the tags that are selected in the block interface with "Set in IDB". With these tags also, you cannot individually set the retentive behavior for each tag. The retentivity setting has an impact on all tags that are selected in the block interface with "Set in IDB".

### Setting Retentivity for Standard Access

To centrally set the retentivity of all tags in the data block with standard access, follow these steps:

1. Open the instance data block.
2. Select the check box in the "Retain" column of a tag.  
All tags are defined as retentive.
3. To reset the retentivity setting for all tags, clear the check box in the "Retain" column of a tag.  
All tags will be defined as non-retentive.

### Setting Retentivity for Optimized Access

To set the retentive behavior of the tags that are selected with "Set in IDB" in data blocks with optimized access, follow these steps:

1. Open the instance data block.
2. Select the check box in the "Retain" column of a tag.  
All tags selected with "Set in IDB" in the data block interface are defined as retentive.
3. To reset the retentivity setting for the tags, clear the check box in the "Retain" column of a tag.  
All tags selected with "Set in IDB" in the data block interface will be defined as non-retentive.

### See also

Basics of block access (Page 1209)

Retentivity of tags in data blocks (Page 1594)

### Setting retentivity in a global data block

#### Introduction

In a global data block, the editability of the retentive behavior depends on the type of access:

- Global data block with standard access  
You can define the data both as retentive or non-retentive. Individual retentivity settings are not possible for individual tags.
- Global data block with optimized access  
You can individually define the retentivity settings of the tags. For tags with structured data types, retentivity settings are transferred for all tag elements.

### Setting Retentivity for Standard Access

To centrally set the retentivity of all tags in the data block with standard access, follow these steps:

1. Open the global data block.
2. Select the check box in the "Retain" column of a tag.  
All tags are defined as retentive.
3. To reset the retentivity setting for all tags, clear the check box in the "Retain" column of a tag.  
All tags are defined as non-retentive.

### Setting Retentivity for Optimized Access

To individually set the retentivity of all tags in data blocks with optimized access, follow these steps:

1. Open the global data block.
2. In the "Retain" column, select the check box for the tags for which you want to set a retentive behavior.  
The selected tag is defined as retentive.
3. To reset the retentivity setting for the tags, clear the check box in the "Retain" column of a tag.  
All selected tags are defined as non-retentive.

### See also

Basics of block access (Page 1209)

Retentivity of tags in data blocks (Page 1594)

### Editing the properties of tags in data blocks

#### Properties of the tags in data blocks

#### Properties

The following table provides an overview of the properties of tags in data blocks:

Group	Property	Description
General	Name	Name of the tags.
	Data type	Data type of the tags.

Group	Property	Description
	Default value	Default value of the tag in the interface of a higher-level code block or in a PLC data type. The values contained in the "Default value" column can only be changed in the higher-level code block or PLC data type. The values are only displayed in the data block.
	Start value	Value that the tag should assume at CPU startup. The default values defined in a code block are used as start values during the creation of the data block. You can then replace these adopted values with instance-specific start values. Specification of an start value is optional. If you do not specify any value, the tag assumes the default value at startup. If a default is not defined either, the default value valid for the data type is used. For example, the value "FALSE" is specified as standard for BOOL.
	Comment	Comment on the tag.
Attributes	Retain	Marks the tag as retentive. The values of retentive tags are retained even after the power supply is switched off. This attribute is only available in the interface of the function block with optimized access.
	Accessible from HMI	Indicates whether the tag can be used in HMI. When the attribute is set, you have read or write access to the tag from the HMI. When the attribute is not set, you cannot access the tag from the HMI. Please note, however, that you cannot implement general access protection for the tag with the "Accessible from HMI" attribute. Read or write access from other applications is possible even if the attribute is not enabled.
	Visible in HMI	Shows whether the tag is visible by default in the HMI selection list.
	Hidden parameter	Indicates whether the tag should be hidden for the block call. This is only possible if you have specified a valid predefined actual parameter beforehand.
	Predefined actual parameter	Defines a parameter that is to be used as actual parameter during the block call.
	Visible	Indicates whether a parameter is visible in CFC.
	Configurable	Indicates whether a parameter is configurable in CFC.
	For test	Indicates whether a parameter is registered for the CFC test mode.
	Interconnectable	Indicates whether a parameter is interconnectable in CFC.
	Enable tag readback	Indicates whether a parameter is relevant for the "Read back chart" function in CFC.
	Enumeration texts	Assigns a parameter to an enumeration in CFC.
	Engineering unit	Assigns a parameter to a unit in CFC.
	Low limit	Defines the low limit for the parameter in CFC.
High limit	Defines the high limit for the parameter in CFC.

## Changing the properties of tags in instance data blocks

### Instance-specific tag properties

Two options are available for defining the tag properties:

- The tag properties are applied from the interface of the assigned function block. Properties that are applied from the function block are displayed grayed out in the columns of the declaration table. The "Name" and "Data type" properties are always applied.
- You define instance-specific properties. You can change some properties instance specific. Changeable values are, for example, "Comment" or "Visible in HMI". Properties that were changed instance specific are not grayed out in the columns of the declaration table. The instance-specific changes are retained, even if the interface of the higher-level function block is changed and the instance data blocks are subsequently updated.

### Editing properties of an element in the declaration table

To edit the properties of an element, follow these steps:

1. Open the instance data block.
2. Select the required element in the table.
3. Change the entries in the columns.

### Editing properties of several elements in the declaration table

You can also simultaneously set or reset the "Retain", "Visible in HMI", "Accessible in HMI" and "Setpoint" columns for one or more selected elements.

To change one of these properties for several elements, follow these steps:

1. Open the data block.
2. Hold down the CTRL key.
3. In the required column, select each of the table cells whose value you want to change.
4. Select the "Set <property>" or "Reset <property>" command in the shortcut menu.

### **Editing properties in the properties window**

To edit the properties of an individual tag, follow these steps:

1. Select a tag in the table.
2. Select the "Properties" command in the shortcut menu.  
The properties window opens. It shows the properties of the tag in the "General" and "Attributes" areas.
3. Select the required area in the area navigation.
4. Change the entries in the text boxes.

### **Reset individual properties to the default value.**

To reset individual tag properties to the value that was defined as default in the function block, follow these steps:

1. Select an instance-specific, modified value in the table.
2. Delete the value.  
The instance-specific value will be deleted and the default value from the interface of the function block entered. The default value is displayed grayed out.

### **See also**

Updating data blocks (Page 1586)

Properties of the tags in data blocks (Page 1596)

## **Changing the properties of tags in global data blocks**

### **Introduction**

Two options are available for defining the tag properties:

- The tag properties are applied from the PLC data type.  
Properties that are applied from the PLC data type are shown grayed out in the columns of the declaration table. The "Name" and "Data type" properties are always applied.
- You define specific properties.  
You can change some properties in the global data block. Changeable values are, for example, "Comment" or "Visible in HMI". Properties that were changed are not grayed out in the columns of the declaration table. The changes are retained, even if the PLC data type changes and the global data block is subsequently updated.

### **Editing properties of an element in the declaration table**

To edit the properties of an element, follow these steps:

1. Open the global data block.
2. Select the required element in the table.
3. Change the entries in the columns.

### Editing properties of several elements in the declaration table

You can also simultaneously set or reset the "Retain", "Visible in HMI", "Accessible in HMI" and "Setpoint" columns for one or more selected elements.

To change one of these properties for several elements, follow these steps:

1. Open the data block.
2. Hold down the CTRL key.
3. In the required column, select each of the table cells whose value you want to change.
4. Select the "Set <property>" or "Reset <property>" command in the shortcut menu.

### Editing properties in the properties window

To edit the properties of an individual tag, follow these steps:

1. Select a tag in the table.
2. Select the "Properties" command in the shortcut menu.  
The properties window opens. It shows the properties of the tag in the "General" and "Attributes" areas.
3. Select the required area in the area navigation.
4. Change the entries in the text boxes.

### Reset individual properties to the default value.

To reset individual tag properties to the value that was defined as default in the PLC data type, follow these steps:

1. Select a modified value in the table.
2. Delete the value.  
The default value from the PLC data type is entered. The default value is displayed grayed out.

Properties of the tags in data blocks (Page 1596)

### Editing the declaration table for data blocks

#### Inserting table rows

#### Procedure

Proceed as follows to insert a row above the selected row:

1. Select the row in front of which you want to insert a new row.
2. Click the "Insert row" button on the toolbar of the table.

## **Result**

A new row is inserted above the selected row.

## **See also**

Editing tables (Page 284)

## **Inserting table rows**

### **Procedure**

Proceed as follows to insert a row below the selected row:

1. Select the row below which you want to insert a new row.
2. Click the "Add row" button on the table toolbar.

## **Result**

A new empty row will be inserted below the selected row.

## **See also**

Editing tables (Page 284)

## **Deleting tags**

### **Requirements**

A global data block is open.

### **Procedure**

To delete a tag, follow these steps:

1. Select the row with the tag to be deleted. You can also select several rows by clicking on them one after the other while holding down the <Ctrl> key or by pressing and holding down <Shift> and clicking on the first and last row.
2. Select the "Delete" command in the shortcut menu.

---

**Note**

You cannot directly change the structure of instance data blocks and of global data blocks based on a PLC data type, since the structures of these blocks are defined in the higher-level object.

The type of the data block is entered in the block properties.

See also: Displaying and editing block properties (Page 1406)

---

**See also**

Editing tables (Page 284)

**Automatically filling in successive cells**

You can load the contents of one or several table cells into the cells below, automatically filling in the successive cells.

If you automatically fill in cells in the "Name" column, a consecutive number will be appended to each name. For example, "Motor" will become "Motor\_1".

You can define individual or more cells as well as entire rows as source area.

If less rows exist in the open table than you want to fill, then you will first have to insert additional empty rows.

**Requirement**

- The table is open.
- Sufficient declaration rows are available.

**Procedure**

To automatically fill in successive cells, follow these steps:

1. Select the cells to be loaded.
2. Click the "Fill" symbol in the bottom right corner of the cell.  
The mouse pointer is transformed into a crosshair.
3. Keep the mouse button pressed and drag the mouse pointer downwards over the cells that you want to fill in automatically.
4. Release the mouse button.  
The cells are filled in automatically.
5. If entries are already present in the cells that are to be automatically filled in, a dialog appears. In this dialog you can indicate whether you want to overwrite the existing entries or insert new rows for the new tags.

## Show and hide table columns

You can show or hide the columns in a table as needed.

### Procedure

To show or hide table columns, follow these steps:

1. Click a column header.
2. Select the "Show/Hide" command in the shortcut menu.  
The selection of available columns is displayed.
3. To show a column, select the column's check box.
4. To hide a column, clear the column's check box.

## Editing tags with external editors

To edit individual tags in external editors outside the TIA portal, you can export or import these tags using copy & paste. However, you cannot copy structured tags to an editor.

### Requirement

The data block and an external editor are opened.

### Procedure

To export and re-import individual tags by drag-and-drop operation, follow these steps:

1. Select one or more tags.
2. Select "Copy" in the shortcut menu.
3. Switch to the external editor and paste the copied tags.
4. Edit the tags as required.
5. Copy the tags in the external editor.
6. Switch back to the declaration table.
7. Select "Paste" in the shortcut menu.

## Monitoring data values online

### Monitoring data values in data blocks online

You can monitor the current data values of the tags in the CPU directly in the declaration table.

### Requirement

- An online connection is available.
- The data block has been loaded to the CPU.

9.1 Creating the user program

- The program execution is active (CPU in "RUN").
- The data block is open.

**Procedure**

To monitor the data values, proceed as follows:

1. Start monitoring by clicking the "Monitor all" button.  
The additional "Monitor value" column is displayed in the table. This shows the current data values.  
See also: Structure of the declaration table for data blocks (Page 1583)
2. End the monitoring by clicking the "Monitor all" button again.

**Displaying data values loaded from the device**

During the loading of a data block from a device, the current tag values are also loaded. You can display these values.

**Requirement**

A data block was loaded from the device.

**Procedure**

To display the current values, follow these steps:

1. Open the data block.
2. Click a column header.
3. In the shortcut menu, select the "Show/hide columns" command.  
The selection of available columns is displayed.
4. Select the check box in the "Snapshot" column.

**Result**

The current values will be applied in the "Snapshot" column.

---

**Note**

If you subsequently change the structure of the data block, the display of the current values gets lost. The "Snapshot" column will then be empty.

---

## Setting data values during commissioning

### Basic information on adjusting data values during commissioning

#### Introduction

During commissioning of a plant, data values have to be frequently adjusted in order to optimally adapt the program to the general operating conditions on site. The declaration table for data blocks offers the following functions for this purpose:

- Initialize data values in "RUN" mode  
This function enables you to change data values online in order to quickly determine the optimum tag values.
- Transfer tag values from the online program to the offline program as start values  
When you have determined the optimum tag values, you can apply these as start values in the offline program. This allows you to ensure that the program starts with the optimized values the next time it is loaded.

To use the function, first define specific tags as "Setting values" in the program. Setting values are the values that will probably have to be fine tuned during commissioning.

#### Marking data as values that can be set

You can mark specific tags in the program as "Setting values". Setting values are the values that will probably have to be fine tuned during commissioning.

#### Rules

You can mark tags as "Setting value" in the following block types:

- In function blocks (FB), but only in the "Static" section
- in global data blocks (DB)
- in PLC data types (UDT)  
In the case of PLC data types (UDT), however, the setting is only effective, if the UDT is used in the "Static" section of a function block or data block.

It is not possible to define setting values in the following block types:

- In data blocks based on a PLC data type, and in instance data blocks. These inherit the setting from the higher-level FB or UDT.
- You cannot mark tags as a "Setting value" in ARRAY data blocks.
- You also cannot mark tags as a "Setting value" at the call point of a multi-instance. You have to make the setting in the interface of the function block that is called as multiple instance.
- You cannot change the "Setting value" marking in know-how-protected blocks. To do so, you must first remove the know-how protection.

## Requirement

A function block, a global data block or a PLC data type (UDT) is open.

## Procedure

To mark a tag as "Setting value", follow these steps:

1. Select a tag from the "Static" section.
2. Select the check box in the "Setting value" column.
  - You cannot define the higher-level element of a structure or a PLC data type as "Setting value". You have to make the setting for the lower-level elements individually.
  - In the case of ARRAYS, you can only mark the higher-level element as "Setting value". The lower-level elements inherit the setting.
  - For ARRAYS of STUCT, you can only mark the elements below the first structure as setting values. The elements of other structures inherit the setting.

## Result

The tags are marked as setting values. During commissioning, these tags can be initialized online. You do not need to set the CPU to "STOP" mode; it can remain in "RUN". In addition, the current tag values can be transferred as start values to the offline program and saved there.

## Initializing setting values in the online program

### Basics on initializing setting values

You can initialize all tags marked as a "Setting value" with new values in the online program. At the same time, the start values will be loaded from the offline program to the online program. The CPU remains in "RUN" mode. All tags that are marked as a setting value are initialized once at the next cycle control point. This applies both to retentive and non-retentive tags. The program execution is then continued with the new tag values.

 <b>DANGER</b>
<b>Danger when changing tag values</b>
Changing the tag values while the plant is operating can cause serious damage to property or injury to persons if there are functional disturbances or program errors!
Make sure that no dangerous situations can arise before you re-initialize the setting values.

## Requirement

- An online connection to the CPU exists.
- The structure of the data block is identical offline and online.
- One or more tags are marked as a "Setting value".

## Procedure

To initialize all setting values of the data block, follow these steps:

1. Open a global data block or an instance data block.
2. Enter the desired values in the "Start value" column. The start values must correspond to the indicated data type.
3. Click the "Initialize setting values" button.

## Result

The setting values in the online program are initialized with the start values from the offline program at the next cycle control point.

The maximum number of tags that can be initialized is dependent on the CPU. If too many setting values are marked, an alarm informs you about this. In this case, you can insert the tags in a watch table and initialize them using the "Modify" function in the watch table. Alternatively, you can also load the entire data block. For more information on this, refer to "See also".

## See also

Loading changed values (Page 1593)

## Applying values from the online program as start values

In order to apply tag values from the online program to the offline program as start values, first create a snapshot of the tag values from the online program. You can then apply them to the offline program. Note that the values from the snapshot are always copied. There is no check to determine whether all values originate from the same cycle.

Write-protected start values are not overwritten.

You have the following basic options for applying the values:

- Applying the values of an open data block  
You can apply all values or only the values of the tags marked as a "setting value" as start values in an open data block.
- Applying the values of multiple blocks in the project tree  
You can either apply all setting values or all retentive values as start values in the project tree.

## Requirement

- An online connection to the CPU is available.
- As least one data block has been loaded to the CPU.

## Procedure

In order to apply all values or only the values of the tags marked as a "setting value" in a data block, follow these steps:

1. Open the data block.
2. Start monitoring by clicking the "Monitor all" button.  
The "Monitor value" column is displayed in the table. This shows the current data values.
3. On the toolbar, click "Snapshot of monitored values".  
The latest monitored values will be applied in the "Snapshot" column.
4. Click one of the following buttons on the toolbar:
  - "Apply setting values from the snapshot as start values"
  - "Apply all values from the snapshot as start values"

The values from the "Snapshot" column are applied to the "Start value" column.

To apply the monitored values of multiple data blocks in the project tree, follow these steps:

1. Select the blocks in the project tree.
2. Select the "Snapshot of the monitored values" command in the shortcut menu.  
The current monitored values of all selected blocks will be applied in the "Snapshot" column.  
An alarm is shown in the Inspector window after the operation is complete.
3. Then select one of the following commands in the shortcut menu:
  - "Apply monitor values as start values > Only setpoints"
  - "Apply monitor values as start values > Only retain values"

The values from the "Snapshot" column are applied to the "Start value" column.

## Result

The new start values are stored in the offline program.

---

### Note

#### Applying values of individual tags

You can also transfer the values of individual tags that were not marked as a setting value beforehand from the "Snapshot" column to the "Start values" column. Use the "Copy" and "Paste" commands from the shortcut menu to copy the values and insert them in the "Start value" column. Note that only the values that are currently located in the visible area of the table are copied.

---

#### 9.1.4.4 Programming PLC data types

##### Basics of PLC data types

##### Description

PLC data types are data structures that you define and that can be used multiple times within the program. The structure of a PLC is made up of several components, each of which can contain different data types. You define the type of components during the declaration of the PLC data type.

You can create up to 65534 PLC data types for a CPU of the S7-1200 or S7-1500 series. Each of these PLC data types can include up to 252 components.

PLC data types can be used for the following applications:

- PLC data types can be used as data types for variables in the variable declaration of logic blocks or in data blocks.
- PLC data types can be used as templates for the creation of global data blocks with identical data structures.
- PLC data types can be used in S7-1200 and S7-1500 as a template for the creation of structured PLC tags.

##### See also

Creating PLC data types (Page 1610)

##### Structure of the declaration table for PLC data types

##### Structure of the declaration table for PLC data types

The figure below shows the structure of the declaration table for PLC data types.

	Name	Data type	Default value	Visible in HMI	Comment
	Motor	Bool	false	<input checked="" type="checkbox"/>	
	▼ MyTag1	Struct		<input checked="" type="checkbox"/>	
	■ Element1	Bool	false	<input checked="" type="checkbox"/>	
	■ Element2	Bool	false	<input checked="" type="checkbox"/>	
	MyTag2	Bool  	false	<input checked="" type="checkbox"/>	<input type="text"/>

### Meaning of the columns

The following table shows the meaning of the individual columns. You can show or hide the columns as required. The number of columns displayed varies depending on the CPU series.

Column	Explanation
	Symbol you can click to move or copy the tag.
Name	Name of the tags.
Data type	Data type of the tags.
Default value	Value with which you predefine the tag in the declaration of the PLC data type. Specification of the default value is optional. If you do not specify any value the predefined value for the indicated data type is used. For example, the value "false" is predefined for BOOL.
Visible in HMI	Shows whether the tag is visible by default in the HMI selection list.
Accessible from HMI	Shows whether HMI can access this tag during runtime.
Setting value	Setting values are the values that will probably have to be fine tuned during commissioning. After commissioning, the values of these tags can be transferred to the offline program as start values and stored there.
Comment	Comment to document the tags.

### See also

Creating PLC data types (Page 1610)

Show and hide table columns (Page 1617)

### Creating PLC data types

#### Requirement

The "PLC data types" folder opens in the project tree.

#### Procedure

To create a PLC data type, proceed as follows:

1. In the "PLC data types" folder, click the "Add new data type" command.  
A new declaration table for creating a PLC data type will be created and opened.
2. Select the PLC data type and select the "Rename" command in the shortcut menu.
3. Enter the name of the PLC data type.

#### Result

The new PLC data type is created. You can find the PLC data type in the project tree in the "PLC data types" folder.

## See also

Structure of the declaration table for PLC data types (Page 1609)  
Basics of PLC data types (Page 1609)

## Delete PLC data types

### Requirement

The PLC data type you want to delete is not open.

### Procedure

To delete a PLC data type, follow these steps:

1. In the project tree, open the "PLC data types" folder.
2. Select the PLC data type to be deleted. You can also select several PLC data types by clicking on them one after the other while holding down the <Ctrl> key or by pressing and holding down <Shift> and clicking on the first and last data type.
3. Select the "Delete" command in the shortcut menu.

---

### Note

If you delete a PLC data type, the blocks that use the data type will become inconsistent. These inconsistencies are marked in red in the block used. To remedy these inconsistencies, the data blocks have to be updated.

---

## Programming the structure of PLC data types

### Declaring tags of elementary data type

#### Requirement

A PLC data type is open.

## Procedure

To declare a tag, follow these steps:

1. Enter a tag name in the "Name" column.
2. Enter the required data type in the "Data type" column. You will be supported by autocompletion during input.
3. Optional: Change the properties of the tags that are displayed in the other columns.
4. Repeat steps 1 to 3 for all tags that are to be declared.

## See also

Editing tables (Page 284)

## Declaring tags of the ARRAY data type

### Requirement

A PLC data type is open.

## Procedure

To declare a tag of the ARRAY data type, follow these steps:

1. Enter a tag name in the "Name" column.
2. Enter the "Array" data type in the "Data type" column. You will be supported by autocompletion in this step.  
The "Array" dialog opens.
3. In the "Data type" text box, specify the data type of the array elements.
4. In the "ARRAY limits" text box, specify the high and low limit for each dimension.  
Example of a one-dimensional ARRAY:  
[0..3]  
Example of a three-dimensional ARRAY:  
[0..3, 0..15, 0..33]
5. Confirm your entry.
6. Optional: Change the properties of the tags that are displayed in the other columns.

---

### Note

You cannot define specific default values for ARRAY elements. You can, however, assign them start values at the usage point in the data block.

---

## See also

Structure of the declaration table for PLC data types (Page 1609)

## Declaring tags of STRUCT data type

### Requirements

A PLC data type is open.

### Procedure

To declare a tag of the STRUCT data type, follow these steps:

1. Enter a tag name in the "Name" column.
2. Enter "Struct" in the "Data type" column. You will be supported by autocompletion during input.  
An empty, indented row is inserted after the new tag.
3. Insert the first structural element in the first empty row.  
An additional empty row is inserted after the element.
4. Select a data type for the structure element.
5. Optional: Change the properties of the structural element that is displayed in the other columns.
6. Repeat steps 3 to 5 for all additional structure elements.  
It is not necessary to end the structure explicitly. The structure ends with the last element that is entered.
7. To insert a new tag after the structure, leave a blank row after the end of the structure and then start the new tag in the second empty row.

### Result

The tag of STRUCT data type is created.

### See also

STRUCT (Page 1297)

Structure of the declaration table for PLC data types (Page 1609)

## Declaring tags based on a different PLC data type

### Requirements

- A global data block is open.
- A PLC data type is declared in the current CPU.

### Procedure

To declare a tag based on a different PLC data type, follow these steps:

1. Enter a tag name in the "Name" column.
2. Enter the PLC data type in the "Data type" column. You will be supported by autocompletion during input.

### Result

The tag is created.

---

#### Note

You define the default values of tags within a PLC data type when the PLC data type is created. You cannot change these values at the point of use of the PLC data type.

---

### See also

Basics of PLC data types (Page 1609)

Structure of the declaration table for PLC data types (Page 1609)

### Editing tag properties in PLC data types

### Properties of tags in PLC data types

### Properties

The following table gives an overview of tag properties in PLC data types:

Group	Property	Description
General	Name	Name of the tags.
	Data type	Data type of the tags.
	Default value	Default value of the tag in the interface of a higher-level code block or in a PLC data type. The values contained in the "Default value" column can only be changed in the higher-level code block or PLC data type. The values are only displayed in the data block.
	Start value	Not relevant in PLC data types
	Comment	Comment on the tag.
Attributes	Retain	Not relevant in PLC data types
	Visible	Indicates whether a parameter is visible in CFC.
	Configurable	Indicates whether a parameter is configurable in CFC.

Group	Property	Description
	For test	Indicates whether a parameter is registered for the CFC test mode.
	Interconnectable	Indicates whether a parameter is interconnectable in CFC.

Changing the properties of tags in PLC data types (Page 1615)

Basics of PLC data types (Page 1609)

Structure of the declaration table for PLC data types (Page 1609)

## Changing the properties of tags in PLC data types

### Editing general properties in the declaration table

To edit the general properties of one or more tags, follow these steps:

1. Open the PLC data type.
2. Change the entries in the columns.

### Editing detailed properties in the properties window

To edit the detailed properties of an individual tag, follow these steps:

1. Select a tag in the table.
2. Select the "Properties" command in the shortcut menu.  
The inspector window shows the properties of the tag in the "General" and "Attributes" areas.
3. Select the required area in the area navigation.
4. Change the entries in the text boxes.

## See also

Updating the block interface (Page 1445)

Updating data blocks (Page 1586)

## Editing the declaration table for PLC data types

### Inserting table rows

#### Procedure

Proceed as follows to insert a row above the selected row:

1. Select the row in front of which you want to insert a new row.
2. Click the "Insert row" button on the toolbar of the table.

#### Result

A new row is inserted above the selected row.

### Inserting table rows

#### Procedure

Proceed as follows to insert a row below the selected row:

1. Select the row below which you want to insert a new row.
2. Click the "Add row" button on the table toolbar.

#### Result

A new empty row will be inserted below the selected row.

### Deleting tags

#### Procedure

Follow the steps below to delete elements:

1. Select the row with the element to be deleted. You can also select several rows by clicking on them one after the other while holding down the <Ctrl> key or by pressing and holding down <Shift> and clicking on the first and last row.
2. Select the "Delete" command in the shortcut menu.

#### See also

### Automatically filling in successive cells

You can load the contents of one or several table cells into the cells below, automatically filling in the successive cells.

If you automatically fill in cells in the "Name" column, a consecutive number will be appended to each name. For example, "Motor" will become "Motor\_1".

You can define individual or more cells as well as entire rows as source area.

If less rows exist in the open table than you want to fill, then you will first have to insert additional empty rows.

### Requirement

- The table is open.
- Sufficient declaration rows are available.

### Procedure

To automatically fill in successive cells, follow these steps:

1. Select the cells to be loaded.
2. Click the "Fill" symbol in the bottom right corner of the cell.  
The mouse pointer is transformed into a crosshair.
3. Keep the mouse button pressed and drag the mouse pointer downwards over the cells that you want to fill in automatically.
4. Release the mouse button.  
The cells are filled in automatically.
5. If entries are already present in the cells that are to be automatically filled in, a dialog appears. In this dialog you can indicate whether you want to overwrite the existing entries or insert new rows for the new tags.

### Show and hide table columns

You can show or hide the columns in a table as needed.

### Procedure

To show or hide table columns, follow these steps:

1. Click a column header.
2. Select the "Show/Hide" command in the shortcut menu.  
The selection of available columns is displayed.
3. To show a column, select the column's check box.
4. To hide a column, clear the column's check box.

#### 9.1.4.5 Using external source files

##### Basics of using external source files

##### Function

The textual programming languages STL and SCL allow you to enter the program code in any ASCII editor and save it as an external source file. This enables you to perform a range of tasks, for example:

- Declaring tags
- Specify block properties
- Programming blocks

You can import these source files to your project and use them to generate blocks. You can generate a number of different blocks from one source file. Observe the following special features when generating blocks from a source file:

- A block that exists under the same name in the project will be overwritten.
- Always name organization blocks according to their type, e.g., "Main" or "Cyclic interrupt" so that the event assignment is retained. If you are using multiple organization blocks of the same type, you can add underscores and numbers to the name, e.g., "Main\_2" or "Main\_2\_1".
- If a block was programmed with its absolute block number instead of a symbolic name in the source file and this number is already assigned by a block in the project, the new generated block is initially assigned the next free symbolic name.
- If you have not explicitly defined the access mode for a block in the external source file, the block access mode is set depending on the CPU series used:
  - Blocks generated for a CPU of the S7-1200/1500 series are assigned "optimized" access mode by default.
  - Blocks generated for a CPU of the S7-300/400 product range are assigned "standard" access mode by default.

Organization blocks are the exception in this case, as they are always assigned the "standard" access mode by default, regardless of the CPU series. You have the option of changing the block access mode manually.

- It is possible that not all comments from the source file will be applied in the block.
- If you use absolute addressing in the external source file, a symbolic tag is created for each absolute address during the generation of the block. The names of these tags are made up of "Tag\_" and a time stamp. This may result in relatively long tag names, which you can change manually if required.
- If you are using instructions in a different version in the external source file than in the target device, this may result in compilation errors. Correct the respective instructions in this case and start the compilation process once again. You can also select a different version for the target device.

You also have the option of saving existing blocks as external source files.

**See also**

- Rules for programming external source files (Page 1619)
- Saving blocks as external source files (Page 1620)
- Inserting external source files (Page 1621)
- Opening and editing external source files (Page 1621)
- Generating blocks from external source files (Page 1622)

**Rules for programming external source files**

An external source file basically consists of continuous text. To compile the source into blocks, certain structures and syntax rules must however be adhered to.

**Syntax rules**

The syntax of the instructions in external source files is very similar to that in the creation of user programs in the program editor with STL or SCL. Note, however, the following additional syntax rules:

- **Block call**  
When calling a block, transfer the parameters in the defined order in the ASCII editor. If you do not, the comment assignments for these lines may not match.  
Enter the parameters in brackets. The individual parameters are separated by a comma.
- **Upper or lower case**  
The program editor generally disregards upper or lower case. Jump labels are an exception to this. Character string entries are also case-sensitive ("STRING" data type). Keywords are displayed in upper case. For compilation purposes, however, case is disregarded; you can therefore specify keywords in upper or lower case or a mixture of the two.
- **Semicolon**  
Mark the end of every instruction and every tag declaration with a semicolon. You can enter several instructions per line.
- **Forward slashes**  
Begin every comment with two forward slashes (//) and end the comment with the <Enter> key.

**See also**

- Basics of using external source files (Page 1618)
- Saving blocks as external source files (Page 1620)
- Inserting external source files (Page 1621)
- Opening and editing external source files (Page 1621)
- Generating blocks from external source files (Page 1622)

### Saving blocks as external source files

Depending on the programming language used for the block, you have the following options for storing blocks as external source files:

- STL and SCL: copy a block as text
- SCL: generate external source file from one or more blocks

### Copying a block as text

To copy a block as text and export it to an external source file, follow these steps:

1. In the project tree, right-click on the block you want to export to an external source file.
2. Select the "Copy as text" command in the shortcut menu.
3. Open an external text editor.
4. Paste the copied text from the clipboard.
5. Save the file with one of the following file name extensions:
  - ".scl" if you wish to generate a source file for SCL
  - ".stl" if you wish to generate a source file for STL

### Generating an external source file from SCL blocks

To generate an external source file from SCL blocks, follow these steps:

1. In the project tree or in the overview window, select the SCL blocks from which you want to generate an external source file.
2. Select the "Generate source from blocks" command from the shortcut menu. The "Generate source from blocks" dialog opens.
3. Specify a path and a name for the external source.
4. Click "OK".

You can also generate an external source file from an open SCL block. To do this, follow these steps:

1. Click on the "Generate source from block" button in the programming editor. The "Generate source from blocks" dialog opens.
2. Specify a path and a name for the external source.
3. Click "OK".

### Result

The block has been saved as an external source file. You can include this source file in a project in the TIA portal and use it to generate other blocks. However, please note that you can use STL source files only in S7-300/400/1500 CPUs.

## See also

- Basics of using external source files (Page 1618)
- Rules for programming external source files (Page 1619)
- Inserting external source files (Page 1621)
- Opening and editing external source files (Page 1621)
- Generating blocks from external source files (Page 1622)

## Inserting external source files

### Requirement

- An external source file is available and complies with the syntax and structure rules.
- The "External source files" folder is open in the project tree.

### Procedure

Follow these steps to insert an external source file:

1. Double-click on the "Add new external file" command.  
The "Open" dialog box is opened.
2. Navigate to and select existing external source files.
3. Confirm your selection with "Open".

### Result

The new source file will be added to the "External source files" folder.

## See also

- Basics of using external source files (Page 1618)
- Rules for programming external source files (Page 1619)
- Saving blocks as external source files (Page 1620)
- Opening and editing external source files (Page 1621)
- Generating blocks from external source files (Page 1622)

## Opening and editing external source files

By linking the files with the file name extensions ".stl" and ".scl" to an editor you will be able to open and edit external source files with these formats directly. Use Notepad as editor because other text editors may not let you open several sources at the same time.

This means you do not need to insert the external source files again after editing.

### Linking files with the file name extensions ".stl" and ".scl" file types to an editor

Proceed as follows to link files with the file name extensions ".stl" and ".scl" to an editor:

1. Open Windows Explorer.
2. Right-click on an STL file.
3. Select "Properties" in the shortcut menu.  
The "Properties" dialog box opens.
4. Click "Change" in the "File type" area on the "General" tab.  
The "Open with" dialog box opens.
5. Select the text editor you want to link to the ".stl" file type.
6. Confirm your selection with "OK".
7. Close the "Properties" dialog with "OK".
8. Repeat steps 2 to 7 with an SCL file.

### Opening and editing an external source file

To open an external source file, follow these steps:

1. Open the "External source files" folder in the project tree.
2. Double-click on the external source file you want to open.  
The external source file will open in the linked editor and can be edited.

Rules for programming external source files (Page 1619)

Saving blocks as external source files (Page 1620)

Inserting external source files (Page 1621)

Generating blocks from external source files (Page 1622)

### Generating blocks from external source files

#### Requirement

- The "External source files" folder is open in the project tree.
- An external source file is available.

#### Procedure

To generate blocks from an external source file, follow these steps:

1. Open the external source file from which you wish to generate blocks.
2. Select the "Generate blocks from source" command in the "Edit" menu.

3. A prompt will appear telling you any existing blocks will be overwritten.
4. Confirm the safety prompt with "Yes".

## Result

The external source file blocks will be generated and inserted in the "Program blocks" folder in the project tree. In the event of errors, information about the errors which have occurred will be displayed in the inspector window. This information, however, relates to the external source file and not to the block generated.

## 9.1.5 Comparing PLC programs

### 9.1.5.1 Basic information on comparing PLC programs

#### Introduction to comparing PLC programs

#### Function

You can compare the following objects of a PLC program in order to detect any differences:

- Code blocks with other code blocks
- Data blocks with other data blocks
- PLC tags of a PLC tag table with the PLC tags of another PLC tag table
- PLC data types with other PLC data types

### Types and levels of comparison

Two different basic types of comparison can be used:

- **Online/offline comparison:**  
The objects in the project are compared with the objects of the corresponding device. An online connection to the device is necessary for this comparison.
- **Offline/offline comparison:**  
The objects of two devices either within a project or from different projects or libraries are compared. No online connection is required for this comparison.

Please note that you cannot carry out an unlimited number of comparisons at the same time, but only one comparison per comparison type (online/offline or offline/offline).

You can choose between the following levels of comparison depending on how in-depth an object comparison you require:

- Compare editor
- Detailed comparison

When you start a comparison, you will first receive an overview in the compare editor. For some comparison objects, you can then start a detailed comparison in which the objects compared will be opened side-by-side, each in its own program editor instance. Any differences will be highlighted.

The table below gives an overview of the types and levels of comparison you can apply for each object:

Object	Online/offline		Offline/offline	
	Compare editor	Detailed comparison	Compare editor	Detailed comparison
LAD block	X	X	X	X
FBD block	X	X	X	X
STL block <sup>1</sup>	X	X	X	X
SCL block	X	X <sup>3 4</sup>	X	X
GRAPH block <sup>2</sup>	X	X <sup>4</sup>	X	X <sup>5</sup>
Global data block	X	X	X	X
Instance data block	X	X	X	X
PLC tags	-	-	X	X
PLC data type	X <sup>4</sup>	X <sup>4</sup>	X	X

Legend:  
X: available  
-: not available  
<sup>1</sup>: STL is not available for S7-1200  
<sup>2</sup>: GRAPH is not available for S7-1200  
<sup>3</sup>: not for S7-1200 prior to version 2.0  
<sup>4</sup>: not for S7-300/400  
<sup>5</sup>: only comparable with a GRAPH block from the same CPU family

**Note****Please note the following:**

- You cannot perform a detailed comparison for know-how protected blocks.
  - If the detail comparison detects differences only with respect to the data types of local tags, with offline being an interrupt data type (C\_ALARM C\_ALARM\_S C\_ALARM\_8 C\_ALARM\_8P C\_ALARM\_T C\_AR\_SEND C\_NOTIFY C\_NOTIFY\_8P) and online a DWORD, this difference is not marked as such.
  - You cannot run a detailed comparison for types and master copies from libraries.
-

Carrying out offline/offline comparisons (Page 332)

Using the compare editor (Page 333)

**Comparison of code blocks****Introduction**

The blocks to be compared in a code block comparison are assigned for comparison on the basis of the following criteria:

- Online/offline comparison: Addresses, e.g. FB100
- Offline/offline comparison: Symbolic names of the blocks

The comparison involves an evaluation of the block time stamps. The results are displayed as an overview in the comparison editor. You can then use actions to define what is to be done about the differences. You can also start detailed comparisons for the individual blocks. The versions of a block compared are opened beside each other and the differences are highlighted.

For the comparison of code blocks, both the block interfaces and the individual networks are compared. Any differing tag names are also determined. All comments and other block attributes are excluded from an online/offline comparison.

If the block interface changes, the time stamp of the code block interface will also change. This change means a change in the time stamp of the program code. The first step in comparing block interfaces is therefore a comparison of the program code time stamps. If these time stamps are the same, it is assumed that the interfaces are the same. If the time stamps of the interfaces differ, the next step is to compare the data types of the interfaces, section by section.

Multiple instances and PLC data types are included in the comparison. If the data types in the sections are the same, the start values of the tags are compared. All differences are displayed.

When networks are compared, first inserted or deleted networks are detected. Then the other networks are compared. Instructions are the same if the operator and operand are the same. The first difference in each instruction is displayed. However, several differences per network can be displayed.

Carrying out an online/offline comparison (Page 332)

Carrying out offline/offline comparisons (Page 332)

Using the compare editor (Page 333)

## Comparison of data blocks

### Introduction

The blocks to be compared in a data block comparison are assigned for comparison on the basis of the following criteria:

- Online/offline comparison: Addresses, e.g. DB100
- Offline/offline comparison: Symbolic names of the blocks

The first step in data block comparison is comparing the time stamps of the data block. If these time stamps are the same, it is assumed that the data structures are the same. If the time stamps differ, the structures are then compared until the first difference is found. If the data structures in the sections are the same, the initial and current values of the tags are then compared. All differences are displayed. Any differing tag names are also determined. Comments and PLC data type structures used in the data block are not included in the comparison.

Carrying out an online/offline comparison (Page 332)

Carrying out offline/offline comparisons (Page 332)

Using the compare editor (Page 333)

## Comparing PLC tags and PLC data types

### Introduction

The device PLC tag tables and the device PLC data types will also be shown in the comparison editor if you carry out an offline/offline comparison. The PLC tag tables and the PLC data types will be matched by name and you will receive the following information:

- Status: A symbol shows whether the PLC tags/PLC data types are identical or differ.
- Missing PLC tag tables / PLC data types: You can see at a glance whether the PLC tag tables / PLC data types are available in both devices.

You obtain the following information with an online/offline comparison of CPUs of the S7-1200/1500 series:

- PLC tags: A symbol shows whether the PLC tags are identical or differ. Because PLC tag tables are not downloaded to the device during loading, they cannot be displayed during an online/offline comparison.
- PLC data types: You receive the status symbol for each PLC data type. You can see at a glance whether the PLC data types are available in both devices.

### 9.1.5.2 Comparing blocks

#### Comparing blocks in the compare editor

You have the following options for comparing blocks in the compare editor:

- Online/offline comparison  
The blocks in the project are compared with the blocks of the selected device.
- Automatic offline/offline comparison  
All blocks of the selected devices are compared offline.
- Manual offline/offline comparison  
The selected blocks of the devices are compared offline.

### Carrying out an online/offline comparison of blocks

To perform an online/offline comparison, follow these steps:

1. In the project tree, select a device that allows online/offline comparison.
2. Select the "Compare > Offline/online" command in the shortcut menu.
3. If you have not already established an online connection to this device, the "Go online" dialog opens. In this case, set all the necessary parameters for the connection and click "Connect".  
The online connection is established and the compare editor opens.
4. Open the "Program blocks" folder.  
You can identify the status based on the symbols in the status and action area. You can define certain actions depending on the status of the objects. Note, however, that you can only perform actions in one direction in a synchronization action.

### Carrying out an automatic offline/offline comparison of blocks

To perform an automatic offline/offline comparison of blocks, follow these steps:

1. Select a device in the project tree that allows offline/offline comparison.
2. Select the "Compare > Offline/offline" command in the shortcut menu.  
The compare editor opens and the selected device is displayed in the left area.
3. Drag-and-drop an additional device to the drop area of the right pane. The device to be compared can originate from the same project, a reference project or the library.
4. Open the "Program blocks" folder.  
You can identify the status of the objects based on the symbols in the status and action area. You can define certain actions depending on the status of the objects. When you select an object, the object's properties and the corresponding object of the assigned device are clearly shown in the properties comparison.

You can drag any other device to the drop area at any time to perform further comparisons.

### Carrying out a manual offline/offline comparison of blocks

To perform a manual offline/offline comparison of blocks, follow these steps:

1. Select a device in the project tree that allows offline/offline comparison.
2. Select the "Compare > Offline/offline" command in the shortcut menu.  
The compare editor opens and the selected device is displayed in the left area.
3. Drag-and-drop an additional device to the drop area of the right pane. The device to be compared can originate from the same project, a reference project or the library.
4. In the status and action area, click on the button for switching between automatic and manual comparison.
5. Select the objects that you want to compare.  
The properties comparison is displayed. You can identify the status of the objects based on the symbols. You can define certain actions depending on the status of the objects.

You can drag any other device to the drop area at any time to perform further comparisons.

## Performing detailed block comparisons

### Starting a detailed comparison

You can start a detailed comparison for blocks. The versions of a block compared are opened beside each other and the differences highlighted.

---

#### Note

Please note the following:

- For blocks that are created in the programming language SCL, the detail comparison is not available for S7-1200 series CPUs with a version older than 2.0.
  - You can only start the detailed comparison with the compare editor for blocks created in the GRAPH programming language.
- 

### Starting detailed comparisons using the compare editor

To start a detailed comparison for a block using the compare editor, follow these steps:

1. First, perform an online/offline or an offline/offline comparison.  
The compare editor opens.
2. In the compare editor, select the block for which you want to perform a detailed comparison.
3. Click the "Start detailed comparison" button in the toolbar.

### Starting detailed comparisons in the program editor

For the comparison type online/offline, you can start the detailed comparison directly in the programming editor. To do this, follow these steps:

1. Open the block for which you wish to carry out a detailed comparison.
2. Establish an online connection.  
See also: Go online and Go offline

---

#### Note

Please note that the block must be available online in order for you to be able to start the detailed comparison for the block within the programming editor.

---

3. Click the "Detailed comparison" button in the toolbar.
4. Confirm the dialog for closing the block with "Yes".

## Result

One instance of the program editor will be opened for each version of the block compared and the two instances are displayed side by side. Any differences will be highlighted.

If there are structural differences for GRAPH blocks, the comparison results are only displayed up to the first structural difference in the sequence view.

## Visualization of the comparison result

### Visualization of the comparison result for LAD/FBD

#### Introduction

The detailed comparison allows you to identify the exact places where versions of a block differ. The following color coding allows you to find these places as quickly as possible:

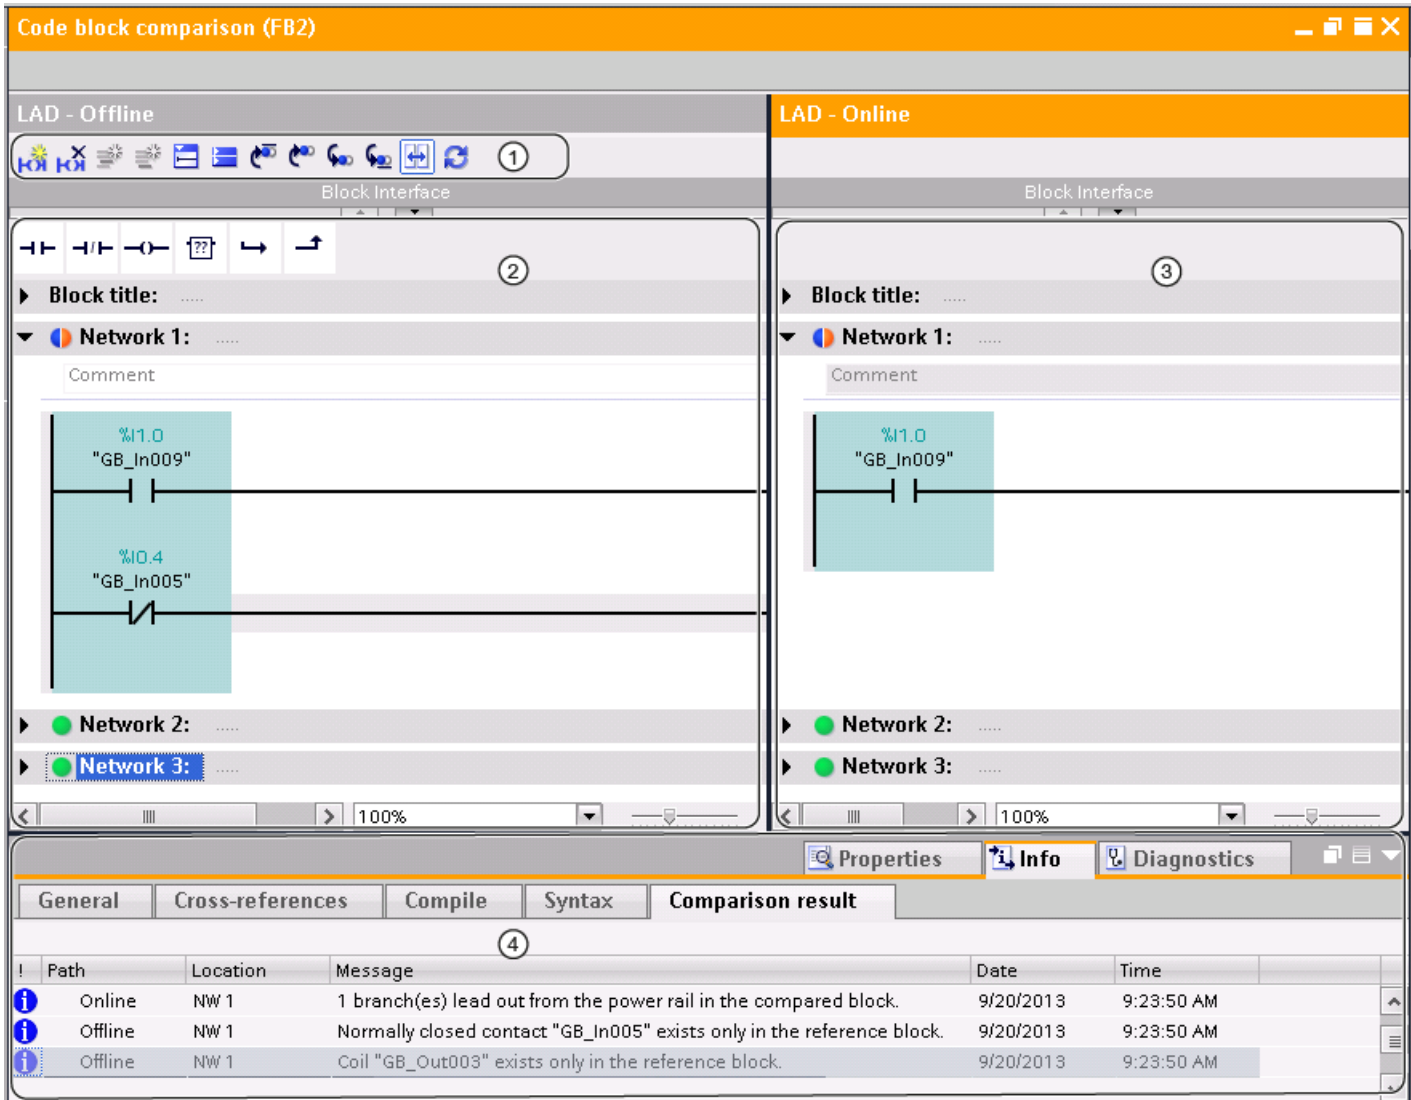

- The lines where there are differences are highlighted in gray.
- Differing operands and instructions are highlighted in green.
- If the number of networks differs, pseudo-networks are added to allow the display of identical networks to be synchronized. These pseudo-networks are highlighted in gray and contain the text "No corresponding network found" in the title bar of the network. Pseudo-networks cannot be edited.

For the sake of clarity, not all the differences are highlighted but rather the first difference of an operation in each case. For example, if all the inputs in an instruction with multiple inputs are different in the offline and online versions of the block, only the first input is highlighted as a difference. You can resolve this difference and update the comparison list. The next input will then be highlighted as a difference.

The number of differences highlighted within a network therefore depends on the number of instructions.

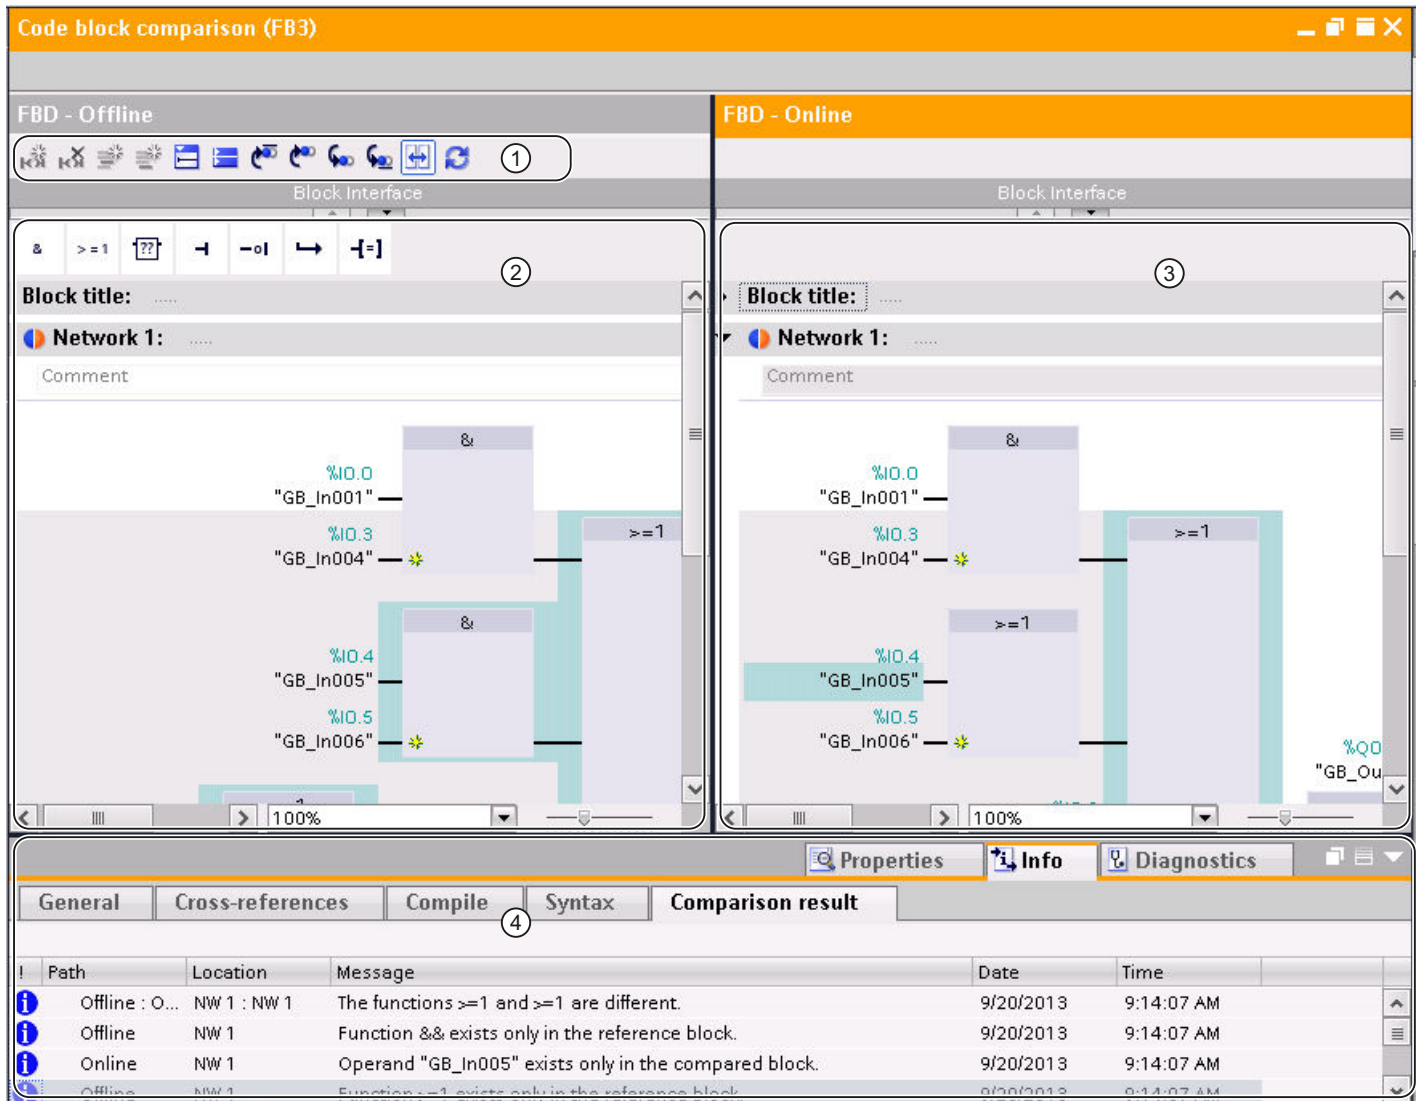

### Structure of the detailed comparison

The following figure shows an example of the online/offline detailed comparison for the LAD programming language:

- ① Toolbar of the detailed comparison for LAD
- ② Reference block
- ③ Compared block
- ④ Comparison result in the Inspector window

The following figure shows an example of the online/offline detailed comparison for the FBD programming language:

- ① Toolbar of the detailed comparison for FBD
- ② Reference block
- ③ Compared block
- ④ Comparison result in the Inspector window

**Note**

Display of the symbolic names of the online version of the block is only possible for S7-1200 and S7-1500.

### **Toolbar of the detailed comparison**

With the toolbar, you can access the following functions:

- General functions
  - Insert network
  - Delete network
  - Insert row
  - Add row
  - Open all networks
  - Close all networks
- Comparison-specific functions
  - Position on first difference
  - Position on previous difference
  - Position on next difference
  - Position on last difference
  - Synchronize scrolling between editors
  - Update comparison results

### **Reference block**

The reference block is displayed in the left window. In an online/offline comparison, the reference block is the offline version of the block.

### **Compared block**

The compared block is displayed in the right window. In an online/offline comparison, the compared block is the online version of the block.

### **Comparison result in the Inspector window**

The differences are displayed in the form of a table in the "Info > Comparison result" tab of the Inspector window. Double-click on a row to navigate to the corresponding difference in the block.

## Visualization of the comparison result for SCL

### Introduction

The detailed comparison allows you to identify the exact places where versions of a block differ. The following color coding allows you to find these places as quickly as possible:

- The lines where there are differences are highlighted in gray.
- Differing operands and instructions are highlighted in green.

---

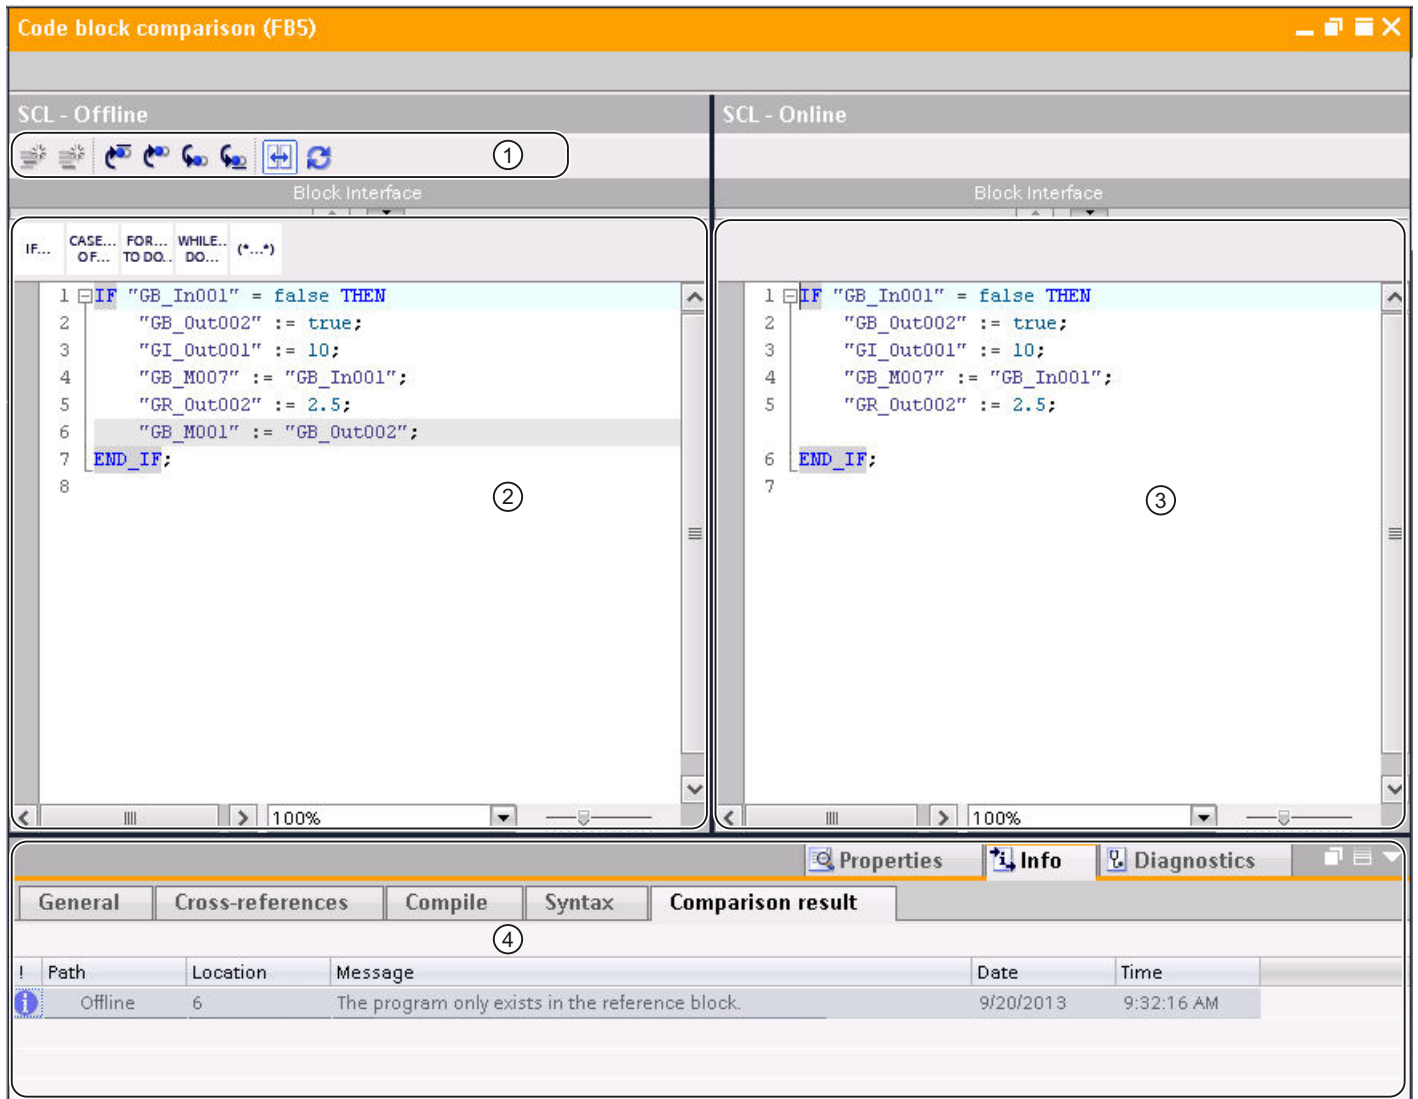

#### **Note**

The online/offline detailed comparison is not available for the CPU families S7-300/400 and for S7-1200 with a version less than 2.0.

---

### Structure of the detailed comparison

The following figure shows an example of the online/offline detailed comparison for the SCL programming language:

- ① Toolbar of the detailed comparison for SCL
- ② Reference block
- ③ Compared block
- ④ Comparison result in the Inspector window

#### Note

The display of the symbolic name of the online version of the block is only possible for S7-1200 and S7-1500.

### Toolbar of the detailed comparison

With the toolbar, you can access the following functions:

- General functions
  - Insert row
  - Add row
- Comparison-specific functions
  - Position on first difference
  - Position on previous difference
  - Position on next difference
  - Position on last difference

- ⑥ Comparison result in the Inspector window

The following figure shows an example for the sequence view with an online/offline detailed comparison for the GRAPH programming language:

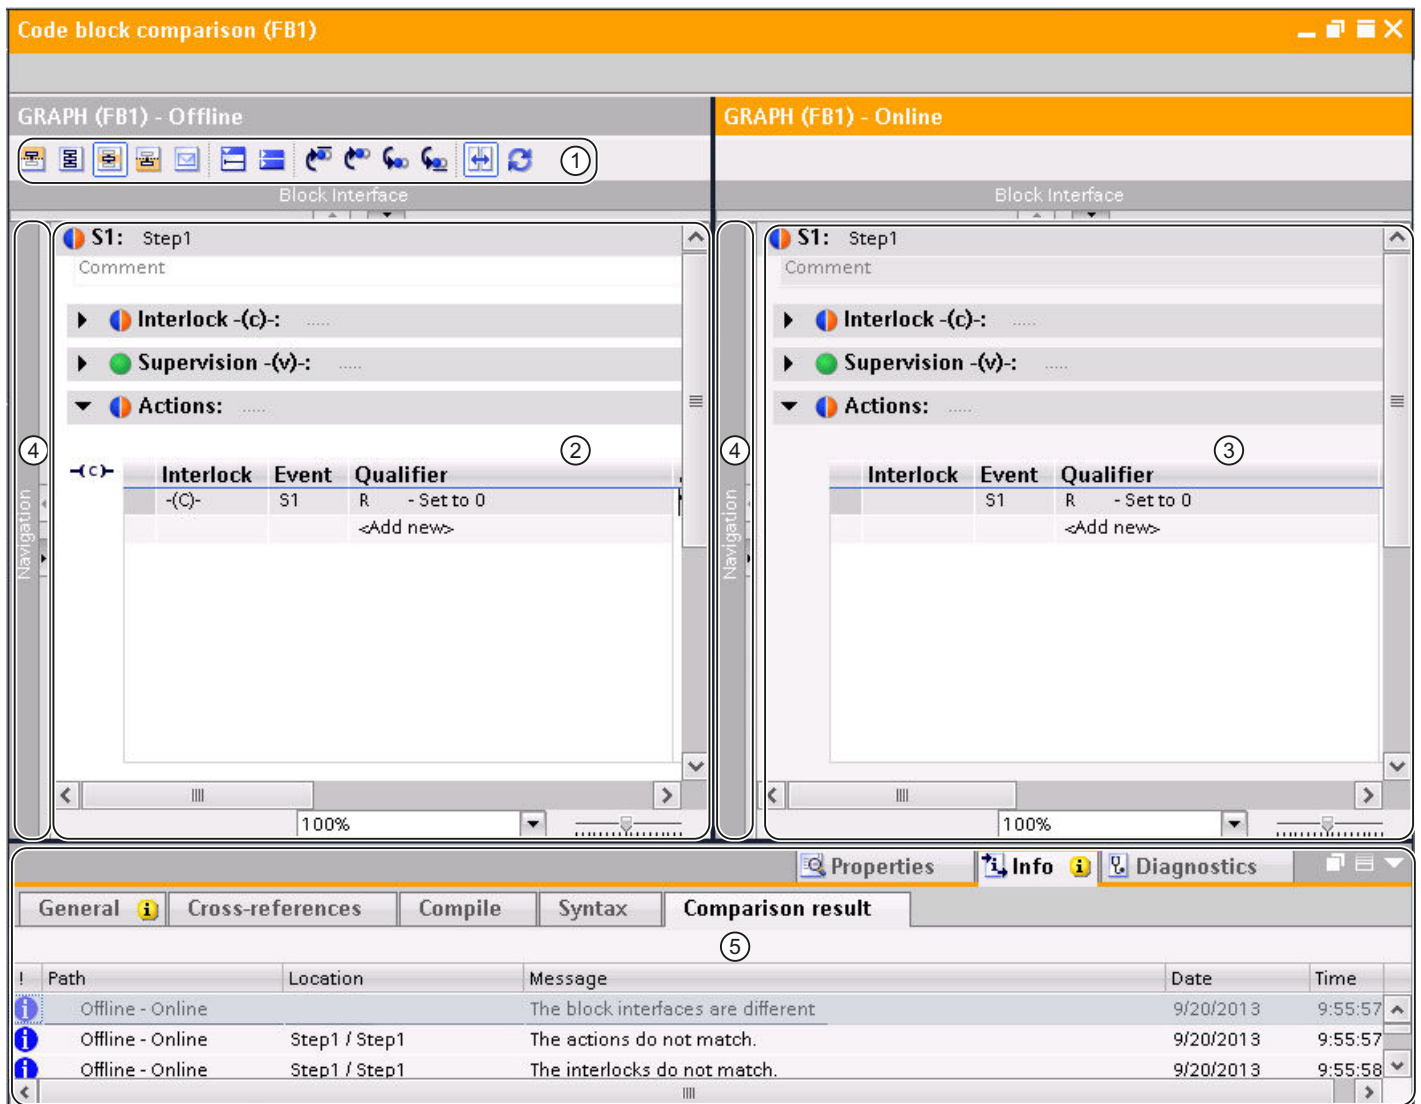

- ① Toolbar of the detailed comparison for GRAPH
- ② Reference block
- ③ Compared block
- ④ Dividers

⑤ Comparison result in the Inspector window

**Note**

If there are structural differences between the blocks, the comparison results are only displayed up to the first structural difference in the sequence view.

The following figure shows an example for the single step view with an online/offline detailed comparison for the GRAPH programming language:

① Toolbar of the detailed comparison for GRAPH

② Reference block

③ Compared block

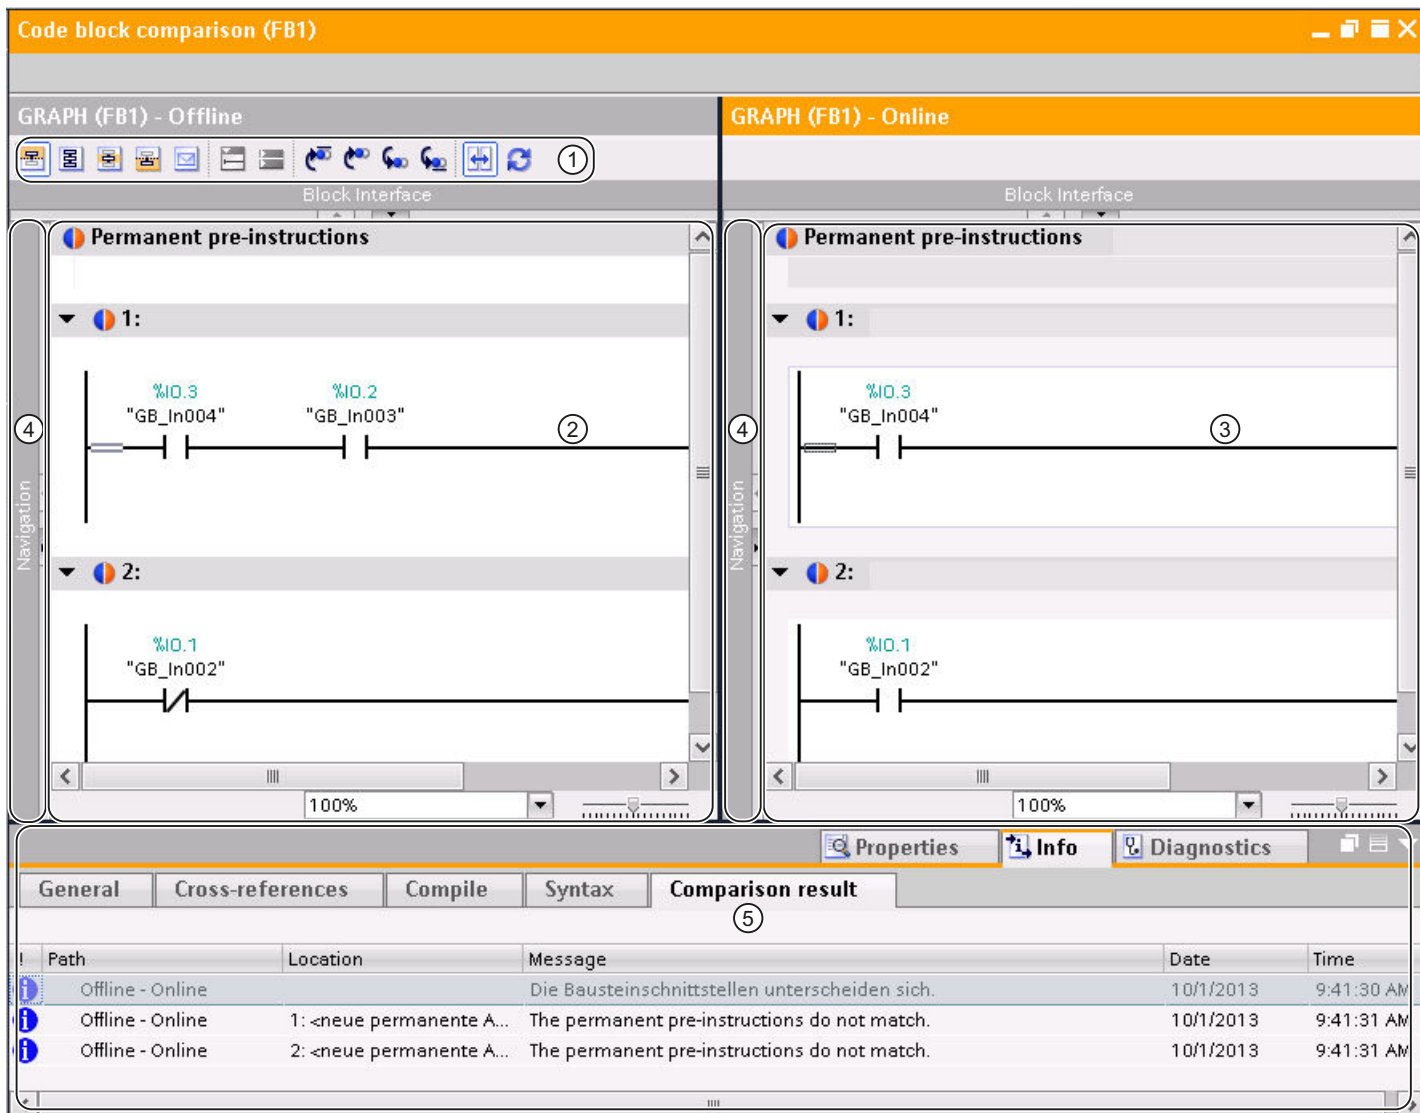

④ Dividers

⑤ Comparison result in the Inspector window

**Note**

The result of the comparison refers to the complete network Differences within the networks are not identified.

The following figure shows an example for the view of permanent instructions with an online/offline detailed comparison for the GRAPH programming language:

① Toolbar of the detailed comparison for GRAPH

② Reference block

③ Compared block

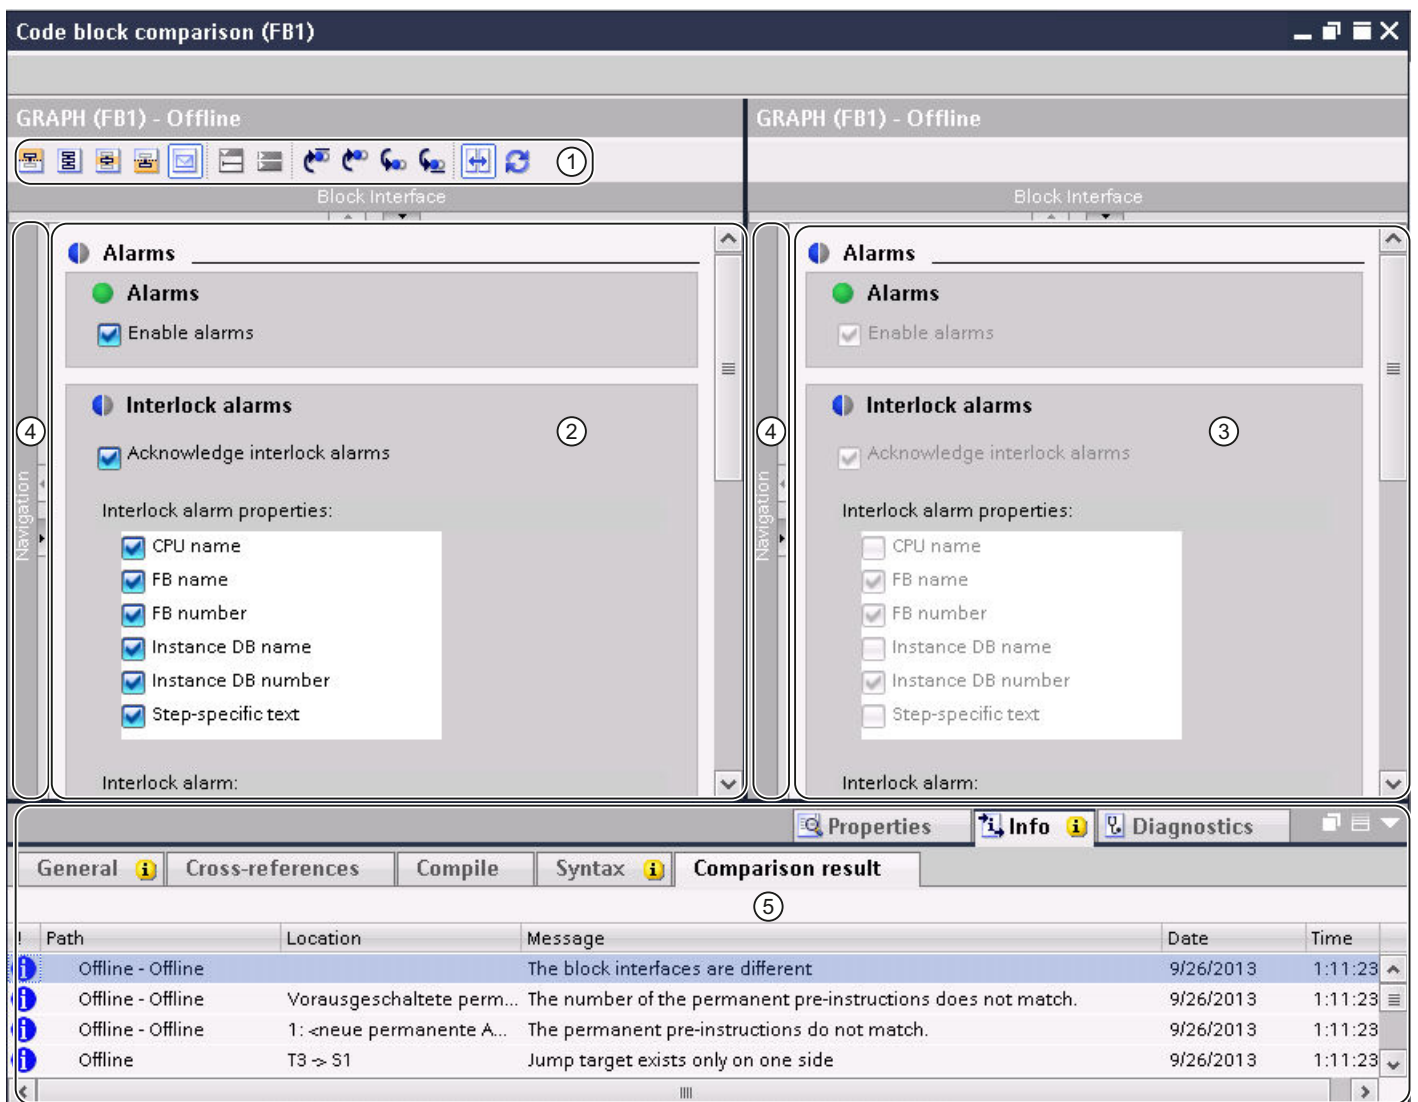

④ Dividers

⑤ Comparison result in the Inspector window

**Note**

The result of the comparison refers to the complete network Differences within the networks are not identified.

The following figure shows an example for the alarm view with an online/offline detailed comparison for the GRAPH programming language:

① Toolbar of the detailed comparison for GRAPH

② Reference block

③ Compared block

④ Dividers

⑤ Comparison result in the Inspector window

## Toolbars

With the toolbar of the detailed comparison, you can access the following functions:

- General functions
  - Change to permanent pre-instructions
  - Change to sequence view
  - Change to single step view
  - Change to permanent post-instructions
  - Change to alarm view
  - Open all networks
  - Close all networks
- Comparison-specific functions
  - Position on first difference
  - Position on previous difference
  - Position on next difference
  - Position on last difference
  - Synchronize scrolling between editors
  - Update comparison results

The navigation has its own toolbar with the following functions:

- Zoom in or zoom out of elements within the navigation
- Synchronize navigation

## Reference block

The reference block is displayed in the left window. In an online/offline comparison, the reference block is the offline version of the block.

## Compared block

The compared block is displayed in the right window. In an online/offline comparison, the compared block is the online version of the block.

## Dividers

You can click the dividers to toggle quickly between the navigation and the current view.

## Comparison result in the Inspector window

The differences are displayed in the form of a table in the "Info > Comparison result" tab of the Inspector window. Double-click on a row to navigate to the corresponding difference in the block.

## See also

- Changing blocks during detailed comparison (Page 1647)
- Updating comparison results (Page 1648)

## Navigating in the detailed comparison

### Requirement

You have run a detailed comparison.

### Navigate to the differences

To navigate to a difference between the two blocks, follow these steps:

1. Open the list of results for the detailed comparison under "Info > Comparison result" in the Inspector window.
2. Double-click a difference.  
The difference is selected in both editors.

Or:

1. Click one of the following navigation buttons on the toolbar:
  - Position on first difference  
Navigates to the first difference in the block, and displays the difference in both editors.
  - Position on previous difference  
Navigates to the previous difference starting from the current position, and displays the difference in both editors.
  - Position on next difference  
Navigates to the next difference starting from the current position, and displays the difference in both editors.
  - Position on last difference  
Navigates to the last difference in the block, and displays the difference in both editors.

### Switching off/on the synchronization of the vertical scrolling between the editors

The scrolling for both editors is synchronized to ensure that the corresponding networks are visible parallel to each other during vertical scrolling. You can switch this mode off and on. To do this, follow these steps:

1. To switch off synchronized scrolling, click the "Synchronize scrolling between editors" button in the toolbar.
2. To switch on synchronized scrolling again, click the "Synchronize scrolling between editors" button one more time in the toolbar.

Changing blocks during detailed comparison (Page 1647)

Updating comparison results (Page 1648)

### Changing blocks during detailed comparison

#### Changing offline blocks

You can change offline blocks that serve as a reference block of the comparison at any time. The compared block, on the other hand, is write protected and cannot be changed.

#### Changing online blocks

You cannot change online blocks.

### See also

- Carrying out an online/offline comparison (Page 332)

- Navigating in the detailed comparison (Page 1646)
- Updating comparison results (Page 1648)

### Updating comparison results

As soon as you change an object, the comparison results are no longer valid and must be updated.

### Requirement

You have run a detailed comparison.

### Procedure

- To update the comparison results, follow these steps:
1. Click "Update the comparison result" in the toolbar.

### See also

### 9.1.5.3 Comparing PLC tags

You have the following options for comparing PLC tags:

- Automatic offline/offline comparison in the compare editor  
The PLC tag tables of the selected devices are compared offline.
- Manual offline/offline comparison in the compare editor  
The selected PLC tag tables of the devices are compared offline.
- Detailed comparison  
Use the detailed comparison to determine differences within the PLC tag tables.

#### Performing automatic offline/offline comparison in the compare editor

To perform an automatic offline/offline comparison of PLC tag tables, follow these steps:

1. Select a device in the project tree that allows offline/offline comparison.
2. Select the "Compare > Offline/offline" command in the shortcut menu.  
The compare editor opens and the selected device is displayed in the left area.
3. Drag-and-drop an additional device to the drop area of the right pane. The device to be compared can originate from the same project, a reference project or the library.
4. Open the "PLC tags" folder.  
You can identify the status of the PLC tag tables based on the symbols in the status and action area. You can define certain actions depending on the status.

You can drag any other device to the drop area at any time to perform further comparisons.

#### Performing manual offline/offline comparison in the compare editor

To perform a manual offline/offline comparison of PLC tag tables, follow these steps:

1. Select a device in the project tree that allows offline/offline comparison.
2. Select the "Compare > Offline/offline" command in the shortcut menu.  
The compare editor opens and the selected device is displayed in the left area.
3. Drag-and-drop an additional device to the drop area of the right pane. The device to be compared can originate from the same project, a reference project or the library.
4. In the status and action area, click on the button for switching between automatic and manual comparison.
5. Select the PLC tag tables that you want to compare.  
The properties comparison is displayed. You can identify the status based on the symbols.

You can drag any other device to the drop area at any time to perform further comparisons.

## Running a detailed comparison

To start a detailed comparison for a PLC tag table, follow these steps:

1. Perform an automatic or manual offline/offline comparison.
2. For an automatic offline/offline comparison in the compare editor, select the PLC tag table for which you want to run a detailed comparison. Note that two PLC tag tables must be selected for comparison for a manual offline/offline comparison.
3. Click the "Start detailed comparison" button in the toolbar.  
A separate compare editor opens. All existing PLC tags of the selected PLC tag tables are displayed depending on the settings of the compare editor. User and system constants are not shown, however. You can identify the status of the PLC tags based on the symbols. You can define certain actions depending on the status of the PLC tags.

## See also

Introduction to comparing PLC programs (Page 1623)

Using the compare editor (Page 333)

Comparing PLC data types (Page 1650)

### 9.1.5.4 Comparing PLC data types

You have the following options for comparing PLC data types:

- Online/offline comparison (S7-1200/1500 only)  
The PLC data types in the project are compared with the PLC data types of the selected device.
- Automatic offline/offline comparison in the compare editor  
The PLC data types of the selected devices are compared offline.
- Manual offline/offline comparison in the compare editor  
The selected PLC data types of the devices are compared offline.
- Detailed comparison  
Use the detailed comparison to determine differences between PLC data types.

## Performing online/offline comparison of PLC data types

To perform an online/offline comparison, follow these steps:

1. In the project tree, select a device that allows online/offline comparison.
2. Select the "Compare > Offline/online" command in the shortcut menu.  
If you have not already established an online connection to this device, the "Go online" dialog opens. In this case, set all the necessary parameters for the connection and click "Connect".  
The online connection is established and the compare editor opens.
3. Open the "PLC data types" folder.  
You can identify the status based on the symbols in the status and action area. When you select an object, the properties of the PLC data type and the corresponding PLC data type of the assigned device are displayed in the properties comparison.

### Performing automatic offline/offline comparison in the compare editor

To perform an automatic offline/offline comparison of PLC tag tables, follow these steps:

1. Select a device in the project tree that allows offline/offline comparison.
2. Select the "Compare > Offline/offline" command in the shortcut menu.  
The compare editor opens and the selected device is displayed in the left area.
3. Drag-and-drop an additional device to the drop area of the right pane. The device to be compared can originate from the same project, a reference project or the library.
4. Open the "PLC data types" folder.  
You can identify the status of the PLC tag tables based on the symbols in the status and action area. You can define certain actions depending on the status.

You can drag any other device to the drop area at any time to perform further comparisons.

### Performing manual offline/offline comparison in the compare editor

To perform a manual offline/offline comparison of PLC data types, follow these steps:

1. Select a device in the project tree that allows offline/offline comparison.
2. Select the "Compare > Offline/offline" command in the shortcut menu.  
The compare editor opens and the selected device is displayed in the left area.
3. Drag-and-drop an additional device to the drop area of the right pane. The device to be compared can originate from the same project, a reference project or the library.
4. In the status and action area, click on the button for switching between automatic and manual comparison.
5. Select the PLC data types that you want to compare.  
The properties comparison is displayed. You can identify the status based on the symbols.

You can drag any other device to the drop area at any time to perform further comparisons.

### Running a detailed comparison

To start a detailed comparison for a PLC data type, follow these steps:

1. Perform an offline/offline comparison. You can also perform an online/offline comparison for CPUs of the S7-1200/1500 series.
2. For an automatic offline/offline comparison in the compare editor, select the PLC data type for which you want to run a detailed comparison. Note that two PLC data types must be selected for comparison with a manual offline/offline comparison.
3. Click the "Start detailed comparison" button in the toolbar.  
The two PLC data types are opened next to each other so that you can easily identify the differences.

## 9.1.6 Compiling and downloading blocks

### 9.1.6.1 Compiling blocks

#### Basic information on compiling blocks

#### Introduction

A user program must first be compiled before the CPU can execute it. You need to recompile your program each time you make a change.

The following procedures take place during compilation:

- The user program is checked for syntax errors.
- Unneeded instructions are removed from the user program.
- All the block calls within the compiled blocks are checked. In case of changes to the interface of called blocks, errors will be shown in the "Compilation" tab of the information window. You have to correct these errors first.
- The blocks must be numbered uniquely in the user program. If more than one block has the same number, the blocks with number conflicts are renumbered automatically during compilation. A block will not be renumbered in the following cases:
  - The block was selected either individually or as part of a multiselection for the compilation.
  - The block is know-how protected.
  - The number assignment is set to "manual" in the properties of the block.

Number conflicts that cannot be resolved by automatic renumbering must be corrected manually. Note the messages in the Inspector window for this. You can only correct know-how-protected blocks manually if you know the password since the blocks must then be recompiled.

- Finally, the user program is compiled into a code that can be read by the CPU.

## Compilation methods

You can start compilation in the following windows or editors:

- Compiling blocks in the project tree  
Serves to compile individual blocks or the simultaneous compilation of one or several blocks in the "Program blocks" folder.
- Compiling blocks in the program editor  
This is intended for compilation of a single open block.
- Compiling blocks in the call or dependency structure  
Used to compile individual blocks.  
See also: Call structure (Page 1684), Dependency structure (Page 1691)

## Compilation options

If you are compiling blocks in project tree, you have further options:

- Software (changes only)  
All program changes of the selected blocks are compiled. If you have selected a block folder, all program changes to the blocks contained in the folder are compiled.
- Software (compile all blocks)  
All blocks are compiled. This is recommended for the first compilation and after major revisions.
- Software (reset memory reserve)  
All tags declared in the reserve area of the interface of selected blocks are moved to the standard area of the interface. Memory reserve is now available for further interface extensions.

---

### Note

This option is only available for CPUs of the S7-1500 and S7-1200 V4 series.

---

## Consistency check

Changing the interfaces of blocks called or PLC data types used can result in inconsistencies between calling blocks and called blocks or between the PLC data types and the global data blocks which use these PLC data types.

To avoid such inconsistencies in the user program, the system performs an automatic consistency check before each compilation process. The time stamps are compared and compilation is then either carried out or canceled depending on the results of the comparison.

- The calling block can only be compiled if the time stamps of the interfaces of the called blocks are older than those of the calling block.
- A global data block based on a PLC data type can only be compiled correctly if the time stamp of the global data block is newer than the time stamp of the PLC data type used.
- The instance data block can only be compiled correctly if the interface time stamps for the interface of the instance data block are identical to those of the assigned function block.

If the compilation process is cancelled, an alarm is displayed in the inspector window. Update the block calls in the relevant blocks and the PLC data types in the global data blocks and then

## 9.1 Creating the user program

restart compilation. The consistency check also finds know-how protected blocks which cannot be compiled. The corresponding messages will also be shown in the inspector window.

If you start loading immediately instead of first compiling, the blocks selected will be automatically compiled and the block call and global data blocks implicitly updated. Please note the following differences between the CPU families:

- S7-1200/1500: All blocks affected are loaded to ensure no inconsistencies can arise.
- S7-300/400: Only the block selected is loaded.

Updating block calls in FBD (Page 1518)

Compiling project data (Page 321)

### Compiling blocks in the project tree

You can compile one block, multiple blocks or all of the blocks in the project tree.

For CPUs of the S7-1500 and S7-1200 V4 series, you can also reset the memory layout of blocks with memory reserve by running a compilation. For more information on memory reserve, refer to chapter "Loading blocks (S7-1200/1500) > Loading block changes without reinitialization".

### Requirement

The project tree is open.

### Compiling one or more blocks in the project tree

To compile multiple blocks in the project tree, follow these steps:

1. Open the "Program blocks" folder in project tree.
2. Select the blocks you want to compile.
3. Select the "Compile > Software (only changes)" command from the shortcut menu.

## Compiling all blocks in the project tree

To compile all blocks in the "Program blocks" folder in project tree, follow these steps:

1. Select the "Program blocks" folder in the project tree.
2. You can select one of two different options for the compilation:
  - If you want to compile only the changes since the last compilation, select the "Compile > Software (only changes)" command in the shortcut menu.
  - If you want to compile all blocks completely, select the "Compile > Software (compile all blocks)" command in the shortcut menu.

## Resetting memory layout (S7-1500/S7-1200 V4)

Proceed as follows to reset the memory layout of blocks:

1. Select the "Program blocks" folder, or specific blocks in this folder.
2. Select the "Compile > Software (Reset memory reserve)" command from the shortcut menu.

## Result

The code for the blocks will be generated if the consistency check has been successful. Instance data blocks generated by the system which are no longer needed will be deleted.

The message under "Info > Compilation" in the inspector window reports whether the compilation was successful.

## See also

Basic information on compiling blocks (Page 1652)

Compiling blocks in the program editor (Page 1655)

Correcting compilation errors (Page 1656)

Finding syntax errors in the program (Page 1575)

## Compiling blocks in the program editor

---

### Note

Note that the block is recompiled even if you have not made any changes and the time stamp of the block is modified.

---

## Requirement

The block to be compiled is open.

## Procedure

To compile a block in the program editor, follow these steps:

1. Right-click in the instruction window of the programming editor.
2. Select the "Compile" command in the shortcut menu.

## Result

The code for the block is generated. Instance data blocks generated by the system which are no longer needed will be deleted.

The message under "Info > Compilation" in the inspector window reports whether the compilation was successful.

## See also

Basic information on compiling blocks (Page 1652)

Compiling blocks in the project tree (Page 1654)

Correcting compilation errors (Page 1656)

## Correcting compilation errors

In the Inspector window in "Info > Compile", you can see whether any compilation was successful or whether errors were detected in the program. If errors occur, you will need to correct them and then start the compilation again.

## Procedure

To correct errors following compilation, follow these steps:

1. Open the error list in the Inspector window with "Info > Compile".
2. If there is one, click on the blue question mark next to the error text for information on remedying errors.
3. Double-click the error you want to correct.  
The corresponding error is highlighted.
4. Correct the error.
5. Restart compilation.

Compiling blocks in the program editor (Page 1655)

Compiling blocks in the project tree (Page 1654)

## 9.1.6.2 Downloading blocks

### Introduction to downloading blocks

#### Downloading blocks to device

So that the CPU can execute the user program, the program must first be compiled and then downloaded to the device. The following options are available for downloading:

- Downloading blocks to the program editor  
You can load a single open block in the program editor.
- Downloading blocks to the project tree  
You can download several or all of the blocks in the block folder via the project tree.

During the loading operation, all information that is required for the reconstruction of the program, including symbolic information such as the names and comments for code and data blocks, is also loaded in the current project language. If you change the project language, you must therefore re-load the program.

The symbolic information is not loaded to the work memory, but rather to the load memory.

After the data has been loaded from a device, the symbolic information is available again in your program, which increases the readability of your program code. Please note, however, that loading to and from a device is not a substitute for storing data in an offline project, as watch tables or multi-language capability of projects cannot be reproduced by loading to and from a device.

After loading from a device, you can only display all data from know-how-protected blocks by entering the correct password.

---

**Note**

To avoid inconsistencies between calling and called blocks, all blocks affected are compiled and loaded after each global change, such as a change in the block interface.

---

---

**Note****S7-1200 Version 1.0**

If you download an element of your project to the CPU, for example a program block, a data block or the hardware configuration, the CPU runs a cold restart the next time it changes to RUN mode. Apart from deleting the inputs, initializing the outputs and deleting the non-retentive memory, cold restart also deletes the retentive memory areas. All subsequent changes from STOP to RUN are warm restarts in which the retentive memory is not deleted.

---

---

**Note****S7-1500**

The load memory of S7-1500 series CPUs is on the SIMATIC memory card. Therefore, a SIMATIC memory card absolutely must be inserted in order to operate the CPU.

---

### Uploading blocks from device

You can load the blocks of a device to your project. This is necessary, for example, if you want to edit blocks that only exist in this device. You have the option of loading either all available blocks (organization blocks, function blocks, functions and data blocks) and global PLC tags or individual blocks to the project.

### Uploading blocks from or downloading blocks to a memory card

Memory cards are plug-in cards used with an S7-1200 series CPU, for example, to replace the load memory of a device. In the case of S7-1500 series CPUs, they contain the load memory. Only Siemens SD cards can be used for devices of the S7-1200 and S7-1500 product range.

To use a memory card as load memory, you must download the user program or individual blocks to a memory card. You can just as well upload blocks from a memory card back into the project.

---

#### Note

##### S7-1200

Note the following when uploading to or downloading from a memory card:

- If the CPU contains no previous program and you insert an empty memory card in the CPU the program will be loaded from the PG/PC to the memory card and not to the CPU.
  - If you insert an empty memory card prior to the startup of the CPU, the program that is on the CPU will be transferred automatically to the memory card. The program on the CPU will then be deleted.
  - If you insert a memory card with a program in the CPU prior to the startup of the CPU and the CPU already contains a program, the program on the memory card will be executed and not the program on the CPU. The program on the CPU will be deleted.
- 

### Loading GRAPH function blocks

If you load a GRAPH function block together with its instance data block, the processing of the sequencer starts over at the initial step. As a result, problems may occur when synchronizing the sequencer with the process. You can avoid these problems by switching off the sequencer before loading.

### Loading block changes without reinitialization

It often proves necessary to edit or expand a PLC program that was already commissioned and that is running on the plant without error. Such operations should be performed without causing any major interruptions of current operations.

S7-1500 therefore offers the option of extending the interfaces of function or data blocks during runtime and loading the modified blocks without setting the CPU to STOP or affecting the value of tags that are already loaded. This is a simple means of implementing program changes. This load process (download without reinitialization) will not have a negative impact on the controlled process.

## Effects of a load operation on the tag values of a data blocks

When data blocks are downloaded to a device in STOP mode, the next transition of the device to RUN affects the current tag values as follows:

- Tags not marked as being retentive retain their defined start values.
- Retentive tags of the S7-1200 only retain their values if the following conditions are met:
  - You loaded the data block by means of "Download to device > Software (changes only)".
  - You made no changes to the DB structure.

Otherwise the retentive tags will also retain their defined start values.

- Retentive tags of the S7-1500 only retain their values if the following conditions are met:
  - You loaded the data block by means of "Download to device > Software (changes only)".
  - You made no changes to the structure of the data block or modified it within the memory reserve.

Otherwise the retentive tags will also retain their defined start values.

## Loading blocks with synchronization

In team engineering, it is possible for several users to work on one project with several engineering systems at the same time and access one S7-1500 CPU. To ensure consistency within the shared project, it is necessary to synchronize the changed data prior to loading so that nothing gets overwritten unintentionally.

If differences are determined between the online and offline data management within the shared project during loading that were caused by a different engineering system, automatic synchronization of the data to be loaded is offered during loading.

In this case, the "Synchronization" dialog displays the data to be synchronized with the current status (online-offline comparison) and the possible actions.

The following options are available for synchronization:

Application case	Recommendation	Synchronization
One or more blocks on the CPU (online) are more recent than in the engineering system (offline).	These blocks should be downloaded from the CPU to the engineering system before loading.	Automatic synchronization is possible: The blocks in the engineering system are updated prior to loading.
One or more new blocks have been created and exist only in the CPU (online).	These blocks should be downloaded from the CPU to the engineering system before loading.	Automatic synchronization is possible: The new blocks are added prior to the download in the engineering system.
One or more blocks on the CPU have been deleted.	The blocks should also be deleted prior to the download in the engineering system.	Automatic synchronization is not possible. The blocks deleted on the CPU should be manually deleted in the offline project in the engineering system.

9.1 Creating the user program

Application case	Recommendation	Synchronization
One or more blocks on the CPU and in the engineering system are different. This is the case when a different user has changed blocks to which you have also made corrections and has already downloaded them to the CPU.	These blocks with competing changes must be adapted manually. You decide in this case which changes you are going to accept. If the blocks on the CPU are to be retained, you should accept these blocks prior to download from the CPU to your engineering system. If the blocks that you have changed are to be applied, you can continue with the download without synchronization.	Automatic synchronization is not possible: The affected blocks on the CPU or in the engineering system must be adapted manually. One of the existing block versions (online or offline) will be overwritten in the process.
There are differences in the hardware configuration on the CPU (online) and in the engineering system (offline).	Differences in the hardware configuration must be adapted manually. You decide in this case which hardware configuration you are going to accept. If the existing hardware configuration on the CPU is to be retained, you should apply these in your engineering system prior to loading. If you want to apply the changed hardware configuration, you can continue with the download without synchronization.	Automatic synchronization is not possible: The hardware configuration must be adapted manually. One of the existing hardware configurations (online or offline) will be overwritten in the process.

You can use the "Force download to device" command to download blocks without synchronization, if desired.

**Downloading blocks in the "RUN" operating mode to the device**

**Basics on downloading blocks in the "RUN" operating mode**

When you download modified blocks to the device, it is not always necessary to switch the device to the "STOP" operating mode. Prior to a download operation, the Engineering System checks whether the device must be stopped before downloading. The result of this check is displayed in the "Load preview" dialog. If it is necessary to change to the "STOP" operating mode, you cannot continue the download process until you have set the appropriate option.

**Note**

Actual parameters are not overwritten by a download process in the "RUN" operating mode. Changes to the actual parameters will not become effective until the next time you change the operating mode from "STOP" to "RUN".

The following table shows the actions after which you can execute the download process in the "RUN" operating mode:

Action	Download in "RUN" operating mode possible	
	S7-1200	S7-1500
Downloading individual blocks	Yes	Yes
Downloading all blocks	No	No
Adding or deleting OBs	No	Yes
Adding or deleting DBs, FCs or FBs	Yes	Yes
Changing block interfaces for FBs	No	Only within the memory reserve
Changing block interfaces for FCs	Yes	Yes
Changing the structure of a DB or an instance DB	No	Only within the memory reserve
Changing the hardware configuration	No	No
Changing the retentivity settings of bit memories and DBs	No	No
Changing the program code of FC, FB or OB	Yes	Yes
Changing the attributes of OBs	Yes	Yes
Adding comments	Yes	Yes
Adding input, output or bit memory areas	Yes	Yes
Changing tag names	Yes	Yes
Maximum number of blocks that can be downloaded for the device used in "RUN" not exceeded	Yes	Yes

### See also

Downloading blocks from program editor to device (Page 1661)

Downloading blocks from the project tree to the device (Page 1663)

Downloading project data to a device (Page 325)

### Downloading blocks from program editor to device

#### Requirement

The block to be downloaded is open.

## Procedure

To download a block from the program editor to the device, follow these steps:

1. Right-click in the instruction window of the programming editor.
2. Select the "Download to device" command in the shortcut menu.
  - If you have not already established an online connection, the "Extended download to device" dialog opens. In this case, set all parameters required for the connection and click "Load". You have the option of showing all compatible devices by selecting the corresponding option and clicking the "Start search" command. You can also open the "Extended download to device" dialog explicitly via the "Online" menu.  
See also: Go online and Go offline
  - If you have already specified an online connection, then the project data is compiled if necessary and the "Load preview" dialog opens. This dialog displays messages and proposes actions necessary for loading.
3. Check the messages and, where necessary, enable the actions in the "Action" column.

---

### Note

#### Actions

Performing the proposed actions during ongoing plant operation can cause serious damage to property or injury to persons if there are functional faults or program errors.

Make sure that no dangerous situations can arise before you start the actions.

---

As soon as downloading becomes possible, the "Load" button is enabled.

4. Click "Load".

If there is a need for synchronization, the system automatically displays the "Synchronization" dialog. This dialog displays messages and suggests actions that are needed for the synchronization. You have the option of performing these actions or forcing the download without synchronization by clicking "Force download to device". If you have performed the suggested actions, you will be asked whether you want to continue with the download. Click "Continue download" in order to download the block. The "Load results" dialog then opens and shows you the status and the actions after the download operation.
5. If you want to start the modules again directly after downloading, select the "Start all" check box.
6. To close the "Load results" dialog box, click "Finish".

## Result

The code for the block will be downloaded to the device. If the changes affect additional blocks, these will be compiled and also downloaded to the device. Blocks that only exist online in the device are deleted. Existing CPU data blocks are retained, however. Inconsistencies between the blocks in the user program are avoided by loading all blocks affected and deleting the unneeded blocks in the device.

The messages under "Info > General" in the Inspector window show whether the downloading process was successful.

Downloading project data to a device (Page 325)

Downloading blocks in the "RUN" operating mode to the device (Page 1660)

**Downloading blocks from the project tree to the device**

In the project tree you can download one block, multiple blocks or all blocks to a device.

**Downloading one or more blocks from the project tree to the device**

To download one block or multiple blocks to the device from the project tree, follow these steps:

1. Open the "Program blocks" folder in project tree.
2. Select the blocks you want to download.
3. Select the "Download to device > Software (only changes)" command from the shortcut menu.
  - If you have not already established an online connection, the "Extended download to device" dialog opens. In this case, set all parameters required for the connection and click "Load". You have the option of showing all compatible devices by selecting the corresponding option and clicking the "Start search" command. You can also open the "Extended download to device" dialog explicitly via the "Online" menu.  
See also: Go online and Go offline
  - If you have already specified an online connection, then the project data is compiled if necessary and the "Load preview" dialog opens. This dialog displays messages and proposes actions necessary for loading.
4. Check the messages and, where necessary, enable the actions in the "Action" column.

---

**Note**

Performing the proposed actions during ongoing plant operation can cause serious damage to property or injury to persons if there are functional faults or program errors.

Make sure that no dangerous situations can arise before you start the actions.

---

As soon as downloading becomes possible, the "Load" button is enabled.

5. Click "Load".

If there is a need for synchronization, the system automatically displays the "Synchronization" dialog. This dialog displays messages and suggests actions that are needed for the synchronization. You have the option of performing these actions or forcing the download without synchronization by clicking "Force download to device". If you have performed the suggested actions, you will be asked whether you want to continue with the download. Click "Continue download" in order to download the block. The "Load results" dialog then opens and shows you the status and the actions after the download operation.
6. If you want to start the modules again directly after downloading, select the "Start all" check box.
7. To close the "Load results" dialog box, click "Finish".

### Downloading blocks from the project tree to the device

To download all blocks in the "Program blocks" folder to the device from the project tree, follow these steps:

1. Select the "Program blocks" folder in the project tree.
2. Select the "Download to device" submenu in the shortcut menu.
3. If you only want to download the changes since the last download, select the "Software (only changes)" option. If all blocks are to be fully loaded and all values are to be reset to their start values, select "Download PLC program to the device and reset".
  - If you have not already established an online connection, the "Extended download to device" dialog opens. In this case, set all parameters required for the connection and click "Load". You have the option of showing all compatible devices by selecting the corresponding option and clicking the "Start search" command. You can also open the "Extended download to device" dialog explicitly via the "Online" menu.  
See also: Go online and Go offline
  - If you have already specified an online connection, then the project data is compiled if necessary and the "Load preview" dialog opens. This dialog displays messages and proposes actions necessary for loading.
4. Check the messages and, where necessary, enable the actions in the "Action" column.

---

#### Note

Performing the proposed actions during ongoing plant operation can cause serious damage to property or injury to persons if there are functional faults or program errors.

Make sure that no dangerous situations can arise before you start the actions.

---

As soon as downloading becomes possible, the "Load" button is enabled.

5. Click "Load".

If there is a need for synchronization, the system automatically displays the "Synchronization" dialog. This dialog displays messages and suggests actions that are needed for the synchronization. You have the option of performing these actions or forcing the download without synchronization by clicking "Force download to device". If you have performed the suggested actions, you will be asked whether you want to continue with the download. Click "Continue download" in order to download the block. The "Load results" dialog then opens and shows you the status and the actions after the download operation.
6. If you want to start the modules again directly after downloading, select the "Start all" check box.
7. To close the "Load results" dialog box, click "Finish".

### Result

The code for the blocks is downloaded to the device. If the changes affect additional blocks, these will be compiled and also downloaded to the device. Blocks that only exist online in the device are deleted. Inconsistencies between the blocks in the user program are avoided by loading all blocks affected and deleting the unneeded blocks in the device.

The messages under "Info > General" in the Inspector window show whether the downloading process was successful.

Downloading project data to a device (Page 325)

Downloading blocks in the "RUN" operating mode to the device (Page 1660)

**Uploading blocks from device**

You can load either all blocks or individual blocks from a device into your project.

---

**Note**

Note the following information:

- Please note that when you load individual blocks, no tags or other required blocks to which you may refer are loaded together with the individual blocks. During the loading operation, reference to tags and blocks are reassigned where possible based on the names. After the loading operation, check whether these assignments are correct.
  - S7-1500: When GRAPH function blocks are loaded from a device to your project, the step-specific alarm texts for the interlock and supervision alarms are not loaded.
- 

**Requirement**

The online and offline versions of a block to be loaded are different or the blocks only exists online.

**Uploading all blocks from a device**

To upload all blocks from a device, follow these steps:

1. Establish an online connection with the device from which you want to upload the blocks.  
See also: Establishing and terminating an online connection
2. In the project tree, select the device folder from which you want to upload blocks.
3. In the "Online" menu, select the "Upload from device" command.  
The "Upload preview" dialog box opens. This dialog displays alarms and proposes actions necessary for loading.
4. Check the alarms and, where necessary, enable the actions in the "Action" column.  
The "Upload from device" button will be enabled as soon as uploading becomes possible.
5. Click on the "Upload from device" button.  
The load is executed.

**Uploading individual blocks from a device**

To upload individual blocks from a device, follow these steps:

1. Establish an online connection with the device from which you want to upload the blocks.  
See also: Establishing and terminating an online connection
2. In the project tree, select the blocks that you want to upload from the device.

### 9.1 Creating the user program

3. In the "Online" menu, select the "Upload from device" command.  
The "Upload preview" dialog box opens. This dialog displays alarms and proposes actions necessary for loading.
4. Check the alarms and, where necessary, enable the actions in the "Action" column.  
The "Upload from device" button will be enabled as soon as uploading becomes possible.
5. Click on the "Upload from device" button.  
The load is executed.

#### Result

The blocks will be uploaded from the device to the project. You can edit them as normal, recompile them and download them to the device again.

### Downloading blocks to a memory card

#### Requirement

- The memory card is marked as a program card.
- The "Program blocks" folder of the memory card is open.

#### Procedure

To download blocks to a memory card, follow these steps:

1. Open the "Program blocks" folder of the device in the project tree.
2. Select the blocks you want to download to the memory card.
3. Drag the blocks in project tree to the "Program blocks" folder of the memory card.  
The "Load preview" dialog opens. This dialog displays messages and proposes actions necessary for loading.
4. Check the messages and, where necessary, enable the actions in the "Action" column.
5. As soon as downloading becomes possible, the "Load" button is enabled.
6. Click the "Load" button.  
If there is a need for synchronization, the system automatically displays the "Synchronization" dialog. This dialog displays messages and suggests actions that are needed for the synchronization. You have the option of performing these actions or forcing the download without synchronization by clicking "Force download to device". If you have performed the suggested actions, you will be asked whether you want to continue with the download. Click "Continue download" in order to download the block. The "Load results" dialog then opens and shows you the status and the actions after the download operation.
7. Click "Finish".

#### Result

The block is downloaded to the memory card. If the changes affect additional blocks, these will also be downloaded to the memory card. Blocks that exist only on the memory card are deleted.

Inconsistencies between the blocks in the user program are avoided by downloading all affected blocks and the deleting of the non-required blocks on the memory card.

The messages under "Info > General" in the Inspector window show whether the downloading process was successful.

### See also

Uploading blocks from a memory card (Page 1667)

Accessing memory cards (Page 382)

### Uploading blocks from a memory card

You can only upload all blocks from one memory card back into your project.

### Requirement

The memory card is displayed.

See also: Accessing memory cards (Page 382)

### Procedure

To upload blocks from a memory card to your project, follow these steps:

1. In the project tree, drag the folder of the memory card to the folder of the device in the project.  
The "Upload preview" dialog box opens. This dialog displays alarms and proposes actions necessary for loading.
2. Check the alarms and, where necessary, enable the actions in the "Action" column.  
The "Upload from device" button will be enabled as soon as uploading becomes possible.
3. Click on the "Upload from device" button.

### See also

Downloading blocks to a memory card (Page 1666)

### Switching off the sequencer prior to loading a GRAPH DB

You can specify the switching off of the sequencer prior to loading an instance data block either globally or during the load operation.

### Globally switching off the sequencer

To switch off the sequencer globally for each loading operation of an instance data block, follow these steps:

1. Select the "Settings" command in the "Options" menu.  
The "Settings" window is displayed in the work area.
2. Select the "PLC programming > GRAPH" group in the area navigation.
3. Select the "Turn off sequence before downloading DB" check box.  
For future loading operations, the sequencer is switched off prior to loading of the instance data block.

### Switching off the sequencer during the loading operation

To switch off the sequencer during the loading operation, follow these steps:

1. Load the GRAPH function block to the device.  
During the loading operation, the "Load preview" dialog opens. This dialog displays alarms and suggests the required actions for loading. If the instance data block must be loaded together with the GRAPH function block, the "Load preview" dialog suggests the action "Turn off sequence before downloading the DB".
2. Select the "Turn off sequence before downloading DB" check box.

## 9.1.7 Protecting blocks

### 9.1.7.1 Protecting blocks

#### Introduction

You can use a password to protect one or more blocks of the OB, FB, FC type and global data blocks from unauthorized access. Note the following particularities:

- You can not manually protect instance data blocks; they depend on the know-how protection of the assigned FB. This means that when you create an instance data block for a know-how protected FB, the instance data block also receives this know-how protection. This is independent of whether you explicitly create the instance data block or if it is created by a block call.
- The know-how protection acts as write protection in global blocks and in instance data blocks.
- You cannot provide ARRAY data blocks with know-how protection.

If a block is know-how protected, only the following data is readable without the correct password:

- Interface parameters Input, Output, InOut, Return, Static
- Block title
- Block comment

- Block properties
- Tags of global data blocks without specification of the location of use

The following actions can be performed with a know-how protected block:

- Copying and deleting
- Calling in a program
- Online/offline comparison
- Load

The code of the block, on the other hand, is protected from unauthorized reading and modification. For S7-1200/1500 CPUs, you can also set up copy protection which binds execution of the block to the CPU, or to the SD card with the defined serial number.

---

**Note**

Note the following information:

- S7-1200 version 1.0 and S7-300/400 (only GRAPH and SCL blocks): If you download a know-how-protected block to a device, no restore information is loaded along with it. This means that you cannot open a know-how-protected block again even with the correct password if you upload it from the device.
  - Only the non-protected data is compared in offline-online comparison of know-how protected blocks.
  - You will no longer be able to access the block if you do not have the password.
  - If you add a know-how-protected block to a library, the master copy created will also be know-how protected.
  - For S7-1500, you can select the "Block can be used as know-how protected library item" check box in the block properties to obtain the information on whether or not the block can be used as protected library item. For this purpose, the block cannot use any tags from the operand areas Output (Q), Input (I), Bit memory (M), Timer function (T) or Count function (C), and cannot access data blocks.
  - Cross references to used tags, bit memories, inputs and outputs in know-how protected blocks are not displayed even after the correct password is entered..
  - If you change the number of a block, the loadable binary component of the block is out of date. This means that the block must be recompiled before loading it to a device. For know-how-protected blocks, this is only possible with the correct password. Keep this in mind particularly if you want to copy a know-how-protected block to another device in which there is already a block with the same number.
  - Always pass on a project that includes know-how-protected blocks as a project archive or library archive. In this way, you ensure that the know-how protection cannot be bypassed.
  - If you wish to assign know-how protection to several blocks using multiple selection, no instance data block can be included in the selection. Otherwise, it will not be possible to set know-how protection.
  - You cannot change the know-how protection settings for an open, know-how protected block.
-

Archiving global libraries (Page 405)

### 9.1.7.2 Setting up and removing block copy protection

For S7-1200 /1500 CPUs, you can set up copy protection which binds execution of the block to a specific CPU or SD card. The block can then only be executed if it is in the device with the set serial number.

It is important that you also know-how-protect any block for which you have set up copy protection. If you do not, anyone can reset the copy protection.

---

#### Note

S7-1500 and S7-1200 V2.2 and higher: If you download a copy protected block to a device that does not match the specified serial number, the entire download operation will be rejected. This means that blocks without copy protection, too, will not be downloaded.

---

### Setting up copy protection

To set up copy protection for a block, follow these steps:

1. Open the block you wish to copy-protect.
2. Open the "Properties" tab in the inspector window.
3. Select "Protection" in the area navigation in the inspector window.
4. Select either "Bind to serial number of the CPU" or "Bind to serial number of the memory card" from the drop-down list in the "Copy protection" area.
5. Enter the serial number of the CPU or the memory card for a S7-1500 CPU. You can either enter the serial number directly for a S7-1200 CPU or enable the option "Serial number inserted when downloading to a device or memory card" if the serial number is to be inserted automatically during loading.
6. You can now set up the know-how protection for the block in the "Know-how protection" area, if the block does not already have know-how protection.

## Removing copy protection

To remove copy protection, follow these steps:

1. Open the block for which you wish to remove copy protection.
2. Open the "Properties" tab in the inspector window.
3. Select "Protection" in the area navigation in the inspector window.
4. Select "No binding" in the drop-down list in the "Copy protection" area.

Changing a password (Page 1674)

### 9.1.7.3 Setting up block know-how protection

You can set up know-how protection for blocks in the devices in your project.

## Procedure

To set up block know-how protection, follow these steps:

1. Select the blocks with no know-how protection which you want to protect.
2. Select the command "Know-how protection" in the "Edit" menu.  
The "Know-how protection" dialog will open.
3. Click "Define".  
The "Define password" dialog box opens.
4. Enter a password in the "New" field.
5. Enter the same password in the "Confirm" field.
6. Confirm your entries with "OK".
7. Close the "Know-how protection" dialog by clicking on "OK".

## Result

The blocks selected will be know-how-protected. Know-how protected blocks are marked with a lock in the project tree. The password entered is valid for all blocks selected.

## See also

- Protecting blocks (Page 1668)
- Setting up and removing block copy protection (Page 1670)
- Opening know-how protected blocks (Page 1672)
- Printing know-how protected blocks (Page 1673)
- Removing block know-how protection (Page 1674)
- Changing a password (Page 1674)

### 9.1.7.4 Opening know-how protected blocks

You can only open multiple know-how protected blocks at once if they are protected with the same password.

## Procedure

To open a know-how protected block, follow these steps:

1. Double-click on the block you wish to open.  
The "Access protection" dialog will open.
2. Enter the password for the know-how protected block.
3. Confirm your entry with "OK".

## Result

The know-how protected block will open provided you have entered the correct password. However, the block will remain know-how protected. If you copy the block or add it to a library, for example, the copies will also be know-how protected.

Once you have opened the block, you can edit the program code and the block interface of the block for as long as the block or TIA portal is open. The password must be entered again the next time the block is opened. If you close the "Access protection" dialog with "Cancel", the block will open but the block code will not be displayed and you will not be able to edit the block.

## See also

- Protecting blocks (Page 1668)

- Printing know-how protected blocks (Page 1673)
- Removing block know-how protection (Page 1674)
- Changing a password (Page 1674)

### 9.1.7.5 Printing know-how protected blocks

You can only print complete know-how protected blocks if they have been opened with the correct password. If you print a closed block or if the block was not opened with the correct password, only the non-protected block data will be printed.

#### Procedure

To print a know-how protected block in full, follow these steps:

1. Open the know-how protected block you wish to print.  
See also: Opening know-how protected blocks (Page 1672)
2. Select the "Print" command in the "Project" menu.  
The "Print" dialog will open.
3. Select the printer in the "Name" field.
4. Click "Advanced" to modify the Windows printer settings.
5. Select the documentation information set in the "Document information" drop-down list that you want to use for the frame layout.
6. Under "Print objects/area" select whether you want to print all objects or the complete area, or only a selection.
7. Under "Properties" select the print scope.
  - Select "All" to print the complete block.
  - Choose "Visible" to print all the information within the block that is visible on the screen.
  - Select "Compact" to print a shortened form of the block.
8. Click "Preview" to generate a print preview in advance.  
A print preview is created in the work area.
9. Click "Print" to start the printout.

Removing block know-how protection (Page 1674)  
Changing a password (Page 1674)

### 9.1.7.6 Changing a password

#### Procedure

To change the password, follow these steps:

1. Select the know-how protected blocks for which you want to change the password.

---

**Note**

You can only change the password for several blocks at once if all blocks selected have the same password.

---

2. Select the command "Know-how protection" in the "Edit" menu.  
The "Know-how protection" dialog will open.
3. Click the "Change" button.
4. Enter the old password in the "Old" field.
5. Enter the new password in the "New" field.
6. Enter the new password again in the "Confirm" field.
7. Confirm your entries with "OK".
8. Close the "Know-how protection" dialog by clicking on "OK".

Removing block know-how protection (Page 1674)

### 9.1.7.7 Removing block know-how protection

#### Procedure

To remove block know-how protection, follow these steps:

1. Select the blocks for which you want to remove know-how protection.

---

**Note**

You can only remove know-how protection for several blocks at once if all blocks selected have the same password.

---

2. Select the command "Know-how protection" in the "Edit" menu.  
The "Know-how protection" dialog will open.

3. Deactivate the check box "Hide code (know-how protection)".
4. Enter the password.
5. Confirm your entries with "OK".

## Result

Know-how protection will be disabled for the blocks selected.

## 9.2 Displaying program information

### 9.2.1 Overview of available program information

#### Program information

The program information of a user program contains the view specified in the following table.

View	Application
Assignment list (Page 1676)	Provides an overview of the address bits for the I, Q, and M memory areas already allocated within the user program.  Also indicates if an address has been allocated by access from an S7 program or if the address has been assigned to a SIMATIC S7 module.
Call structure (Page 1684)	Shows the call structure of the blocks within the user program and provides an overview of the blocks used and their relationships.

View	Application
Dependency structure (Page 1691)	Shows the list of blocks used in the user program. A block is shown at the first level and blocks that call or use this block are indented below it. In contrast to the call structure, instance blocks are listed separately.
Resources (Page 1696)	Shows the hardware resources of the CPU for objects (OB, FC, FB, DB, user-defined data types and PLC tags), for CPU memory areas and for the existing I/O modules.

### Displaying several views simultaneously

You can generate and display several views for one or more user programs to facilitate testing and changing your user program.

Displaying multiple views, for example, enables you to:

- Display all program information for a user program next to one another
- Compare different user programs

## 9.2.2 Displaying an assignment list

### 9.2.2.1 Introduction to the assignment list

#### Program information in the assignment list

The assignment list shows if an address has been allocated by access from an S7 program or if the address has been assigned to a SIMATIC S7 module. It is therefore an important basis for locating errors or changes in the user program.

In the assignment list, you have a CPU-specific overview of which bit is used in which byte of the memory areas listed below:

- Input (I)
- Output (O)
- Bit memory (M)
- Timer (T)
- Counter (C)
- I/O (P)

#### Display of the assignment list

The assignment list of inputs, outputs, and bit memory is displayed in several separate work windows.

## Filters

You can filter the display within the assignment list. You can use predefined filters or create your own.

## Displaying cross-reference information

You have the option of displaying cross-reference information for selected addresses in the assignment list.

You can display the cross-references for a selected address in the Inspector window using the "Cross-reference information" shortcut menu command. The command "Tools > Cross-references" allows you to also open the cross-reference list for the selected object.

## Displaying the PLC tag table

You can open the PLC tag table from the assignment list and edit the properties of the tags used.

To do this select an address of the assignment list and select the "Open editor" command in the shortcut menu.

## Enabling the display of retentivity

You can enable and disable the display of the retentive state of bit memory by selecting the "Hide/show retain area" toolbar button.

## See also

Symbols in the assignment list (Page 1678)

Layout of the assignment list (Page 1677)

### 9.2.2.2 Layout of the assignment list

#### Layout of the assignment list

Depending on the CPU, the assignment list is displayed in several work windows with the following operands.

For S7-300/400 CPUs:

- Inputs
- Outputs
- Bit memory
- Timers
- Counters

For S7-1200 CPUs:

- Inputs
- Outputs
- Bit memory

**Displaying inputs, outputs, bit memory, timers and counters**

It shows all operands used and their assignment in the S7 program.

For all displayed operands, each line in the assignment list is dedicated to a byte of the memory area, in which the corresponding eight bits from 7 to 0 are labeled according to their access. In conclusion, a "bar" indicates if access is made by a byte (B), word (W) or double word (D).

You can find an explanation of the symbols in the assignment list here. (Page 1678)

**See also**

Introduction to the assignment list (Page 1676)

**9.2.2.3 Symbols in the assignment list**

**Meaning of the symbols in the assignment list**

The following table shows the meaning of the symbols in the assignment list:

Symbol	Meaning
	Indicates the address assignment in the selected state.
	Indicates the address assignment in the non-selected state.
	Indicates that a pointer start address and a tag address access the same address range and that they are selected.
	Indicates that a pointer start address and a tag address access the same address range and that they are not selected.
	Indicates the pointer assignment in the selected state.
	Indicates the pointer assignment in the non-selected state.
	Indicates that the byte is in use with byte access and the corresponding tag is selected. The shortcut menu allows you to display cross-reference information for the selected variables as well as the PLC tag table.
	Indicates that the byte is in use with byte access and the corresponding tag is not selected.
	Indicates that the byte is in use with word access and the corresponding tag is selected. The shortcut menu allows you to display cross-reference information for the selected variables as well as the PLC tag table.
	Indicates that the byte is in use with word access and the corresponding tag is not selected.

Symbol	Meaning
	Indicates that the byte is in use with double word access and the corresponding tag is selected. The shortcut menu allows you to display cross-reference information for the selected variables as well as the PLC tag table.
	Indicates that the byte is in use with double word access and the corresponding tag is not selected.
Background color: gray	Indicates that a byte is in use with byte, word or double word access and that the address is also in use by the hardware. The gray background color indicates overlapping memory access.
Background color: yellow	Indicates that the address is not in use by the hardware.
	Indicates that the memory area has been defined as system memory.
	Indicates that the memory area has been defined as clock memory.

**See also**

Layout of the assignment list (Page 1677)

Introduction to the assignment list (Page 1676)

**9.2.2.4 Displaying an assignment list****Requirement**

A project has been created with programmed blocks.

**Procedure**

Proceed as follows to display the assignment list:

1. Select the "Program blocks" folder or one or more of the blocks it contains.
2. Select the "Assignment list" command in the "Tools" menu.

**Result**

The assignment list for the selected program is displayed.

**View options in the assignment list**

Refer to view respective view options that are set to display the desired information in the assignment list.

## See also

Setting the view options for the assignment list (Page 1680)

Layout of the assignment list (Page 1677)

### 9.2.2.5 Setting the view options for the assignment list

#### Introduction

The following view options are available for the assignment list:

- **Used addresses:**  
When this check box is activated, the addresses, I/Os and pointers used in the program are displayed.
- **Free hardware addresses:**  
When this check box is activated, only the free hardware addresses are displayed.

#### Requirement

- A project has been created with programmed blocks.
- The assignment list is open.

#### Procedure

Proceed as follows to set the view options for the assignment list:

1. Click on the arrow of the  symbol ("View options") in the task bar.  
The view options for the assignment list are opened. Check marks are set in front of the activated view options.
2. If you want to activate or deactivate a view option, click on the respective check box and set or remove the check mark.

#### Result

The view options are set and the desired information is displayed in the assignment list.

### 9.2.2.6 Filter options in the assignment list

#### Filter settings

You can define your own filter settings for the assignment list. The following options are available for defining filters:

- Display all addresses of the address areas specified.
- Display of single, defined addresses from the selected address area, for example, "0" and "200".
- Display of complete areas from the selected address area, for example, "0 - 256".

The following table provides an overview of all available options:

Selection in the	Selection	Symbol	Meaning
Address area	All CPU-dependent displayed addresses (I, O, M, T, C) can be activated as they are by default, or individual address areas can be activated.	Check box is activated	Only the activated address areas (I, O, M, T, C) are shown in the assignment list.
Filter area	Show assignment for all addresses	*	Displays the assignment of all addresses of the enabled address areas (I, Q, M).
	Show assignment for selected addresses, for example, for the inputs "IB 0" and "IB 256"	0;256 Separate individual addresses and areas by a semicolon.	Assignments of selected addresses for the activated address areas (I) are shown.
	Show assignment for selected areas, for example, for the inputs "IB 0 to IB 100" and "IB 200 to IB 256".	0-100;200-256 Contiguous areas should be connected by a hyphen.	Assignments of selected areas for the activated address areas (I) are shown.

### 9.2.2.7 Defining filters for assignment list

#### Requirement

- A project has been created with programmed blocks.
- The assignment list is open.

#### Defining filter

Proceed as follows to define a filter for the assignment list:

1. Click on the  symbol ("Filter") in the task bar.  
The "Assignment List Filter" dialog opens.
2. Click on the  symbol ("Create new filter") in the task bar.  
A new filter is created with the name "Filter\_1". The check boxes for all addresses (inputs, outputs, memory bits, timers and counters) are activated by default for the filter.

3. If you want to change the name of the filter, click on the drop-down list in the task bar and enter a new filter name.
4. Deactivate the check boxes of addresses that are not to be affected by the filter.
5. Enter one of the following options in the filter area of the activated address:
  - Show all addresses used = "\*"
  - Show single, defined addresses, for example, IB 0" and IB 25 = "0.25". Individual addresses and address areas are separated by commas or semicolons.
  - Show complete address areas, for example, IB 0 to IB 256 = "0-256". Complete address areas should be connected by a hyphen.
6. Confirm your entries with "OK".  
The newly defined filter is shown in the task bar of the assignment list under the specified name.

### Delete filter

Proceed as follows to delete a filter:

1. Click on the  symbol ("Filter") in the task bar.  
The filter dialog for the assignment list opens.
2. In the drop-down list of the task bar, select the filter you want to delete.
3. Click on the  symbol ("Delete selected filter") in the task bar.  
The selected filter is deleted.

### See also

Filter options in the assignment list (Page 1681)

Displaying an assignment list (Page 1679)

Introduction to the assignment list (Page 1676)

### 9.2.2.8 Filtering an assignment list

#### Requirement

- A project has been created with programmed blocks.
- The assignment list is open.

#### Procedure

1. Click on the arrow on the drop-down list.  
The available filter are displayed.
2. Select the desired filter.

**Result**

The assignment list is filtered according to the settings of the selected filter.

---

**Note**

The filter settings are saved when the project is closed.

---

**9.2.2.9 Defining retentive memory areas for bit memories****Introduction**

In the assignment list you can define the width of the retentive memory area for bit memories. The content of tags which are addressed in retentive memory is retained after power off and at the STOP to RUN transition after power on.

The display of retentive bit memories can be enabled and disabled in the assignment list. If their display is enabled, retentive bit memories are identified by an icon in the "Address" column.

**Requirement**

The assignment list is open.

**Procedure**

Proceed as follows to define the width of the retentive memory area for bit memories:

1. Click "Retain" in the toolbar.  
The "Retain memory" dialog will open.
2. Starting at the count of 0, define the width of the retentive memory area by entering the last byte of this area in the input field. Watch out for any addresses of tags already assigned to the retentive area.
3. Load the block to the target system. Select the "Program blocks" folder in the Project tree and select the "Download to device" submenu in the shortcut menu.

**Result**

The width of the retentive memory area is defined. If enabled in the assignment list, an icon will indicate the retentive state of all tags in the "Address" column.

### 9.2.2.10 Enabling the display of retentive bit memories

#### Introduction

In the assignment list you can enable and disable the display of retentive bit memories. The retentive bit memories are identified by means of an icon in the "Address" column if the display of retentivity is enabled.

#### Requirement

The assignment list is open.

#### Procedure

Proceed as follows to enable and disable the display of retentive bit memories:

1. Click "Display/hide retentivity" in the toolbar.

#### Result

The retentive tags are identified by means of an icon in the "Address" column of the bit memory area if the display of retentivity is enabled. The icons in the "Address" column are hidden if the display of retentivity is disabled.

## 9.2.3 Displaying the call structure

### 9.2.3.1 Introduction to the call structure

#### Call structure

The call structure describes the call hierarchy of the block within an S7 program.

It provides an overview of:

- The blocks used
- Jumps to the places of use of the blocks
- Relationships between blocks
- Local data requirements of the blocks
- Status of the blocks

## Information in the call structure

Displaying the call structure provides you with a list of the blocks used in the user program. The first level of the call structure is highlighted in color and shows the blocks that are not called by any other block in the program. Organization blocks are always shown on the first level of the call structure. Functions, function blocks and data blocks are only shown on the first level if they are not called by an organization block. When a block calls other blocks or functions, they are listed indented under the calling block. Instructions and blocks are shown in the call structure only if they are called by a block.

## View options

The following view options are available for the call structure:

- **Show conflicts only:**  
When this check box is activated, only the conflicts within the call structure are displayed.
- **Group multiple calls together:**  
When this check box is activated, several block calls are grouped together. The number of block calls is displayed in the "Call frequency" column. The links to the various call locations are offered in a drop-down list in the "Details" column.

## Displaying the block calls

You can display the block calls in a block by clicking on the arrow in front of the block title. To display the call information of all blocks, click on the "Expand list" icon in the toolbar.

You can hide the total overview by clicking the "Collapse list" icon.

## Displaying cross-reference information

You can display the cross-reference information for a block in the Inspector window by right-clicking on the relevant block and selecting the "Cross-reference information" command from the shortcut menu.

To open the "Cross-references" view, click the "Cross-references" command in the shortcut menu.

## Displaying blocks in the program editor

You can open the program editor and edit blocks there from the call structure.

To do this select the required block in the call structure and select the "Open editor" command in the shortcut menu.

### Displaying deleted blocks

The rows belonging to deleted blocks are identified by an icon.

---

**Note**

Please note that any existing local data can only be displayed or updated after compiling a block.

---

### See also

Symbols in the call structure (Page 1686)

### 9.2.3.2 Symbols in the call structure

#### Meaning of the symbols in the call structure

The following table shows the meaning of the symbols in the call structure:

Symbol	Meaning
	Indicates an organization block (OB).
	Indicates a function block (FB).
	Indicates a function (FC).
	Indicates a data block (DB).
	Indicates that the block is declared as a multiinstance.
	The object has an interface dependency to an object connected to the left.
	Indicates that the block needs to be compiled again.
	Indicates that the data block needs to be compiled again.
	Indicates that the object is not available.
	Indicates that the interface causes a time stamp conflict.
	Indicates that the variable causes a time stamp conflict.
	Indicates that the block is not called directly or indirectly from an OB.
	Indicates that an object has know-how protection.

Symbol	Meaning
	Indicates that the block is normally called recursively.
	Indicates that a tag declaration in the interface has a recursive dependency: <ul style="list-style-type: none"> <li>Scenario 1: FB1 calls FB2 and this then calls FB1. The instance data blocks of these FBs have a recursion in the interface.</li> <li>Scenario 2: A multiple instance FB uses the instance DB of its parent FB as a global DB.</li> </ul>

### 9.2.3.3 Layout of the call structure

#### Layout of the call structure

The view of the call structure consists of the following columns:

Column	Content/meaning
Call structure	Shows an overview of the blocks called If the viewing option "Group multiple calls together" is enabled, several block calls are grouped together and the "Number of calls" column is displayed.
Call type (!)	Shows the type of call, for example recursive block call.
Address	Shows the absolute address of the block. With a function block, the absolute address of the corresponding instance data block is also shown.
Call frequency	Indicates the number of multiple calls of blocks.
Details	Shows the network or interface of the calling block. All information are offered as a link in this column. With this link, you can jump to the location of the block call in the program editor. If the viewing option "Group multiple calls together" option is enabled, the calls are grouped together and are available as links in a drop-down list.
Local data (in path)	Indicates the local data requirement of the full path. Blocks with optimized access have higher local data requirements because the information for the symbolic addressing is stored with them. Please note that any existing local data can only be displayed or updated after compiling a block.
Local data (for blocks)	Show the local data requirements of the block. Blocks with optimized access have higher local data requirements because the information for the symbolic addressing is stored with them. Please note that any existing local data can only be displayed or updated after compiling a block.

**See also**

Symbols in the call structure (Page 1686)

Introducing the consistency check in the call structure (Page 1689)

**9.2.3.4 Displaying the call structure**

**Requirement**

A project has been created with blocks.

**Procedure**

Proceed as follows to display the call structure:

1. Select the "Program blocks" folder or one or more of the blocks it contains.
2. Select the "Call structure" command in the "Tools" menu.

**Result**

The call structure for the selected program is displayed.

---

**Note**

Please note that any existing local data can only be displayed or updated after compiling a block.

---

**See also**

Setting the view options for the call structure (Page 1689)

### 9.2.3.5 Setting the view options for the call structure

#### Introduction

The following view options are available for the call structure:

- **Show conflicts only:**  
Only the blocks causing conflicts within the call structure are displayed if this check box is activated.  
The following blocks cause conflicts:
  - Blocks executing any calls with older or newer code time stamps.
  - Blocks calling a block with modified interface.
  - Blocks using a tag with modified address and/or data type.
  - Block called neither directly, nor indirectly by an OB.
  - Blocks calling a block which no longer exists.
- **Group multiple calls together:**  
When this viewing option is enabled, several block calls and data block accesses are grouped together. The number of block calls is displayed in the "Call frequency" column. The links to the various call locations are offered in a drop-down list in the "Details" column.

#### Requirement

- A project has been created with programmed blocks.
- The call structure is open.

#### Procedure

Proceed as follows to set the view options for the call structure:

1. Click on the arrow of the  symbol ("View options") in the task bar.  
The view options for the call structure opens. Check marks are set in front of the activated view options.
2. If you want to activate or deactivate a view option, click on the respective check box and set or remove the check mark.

#### Result

The view options are set and the required information is displayed in the call structure.

### 9.2.3.6 Introducing the consistency check in the call structure

#### Consistency check

Changing the time stamp of a block during or after the program is generated can lead to time stamp conflicts, which in turn cause inconsistencies among the blocks that are calling and being called.

### Using the consistency check

The "Consistency check" function is used to visualize inconsistencies when time stamp conflicts occur. When the consistency check is performed, the inconsistent blocks are shown in the call structure and marked with the corresponding symbols.

- Most time stamp and interface conflicts can be rectified by recompiling the blocks.
- If compilation fails to clear up inconsistencies you can use the link in the "Details" column to go to the source of the problem in the program editor and manually eliminate any inconsistencies.
- The blocks marked in red must be recompiled.

### See also

Symbols in the call structure (Page 1686)

#### 9.2.3.7 Checking block consistency in the call structure

##### Requirement

- A project has been created with programmed blocks.
- The call structure is open.

##### Procedure

Proceed as follows to check the block consistency:

1. Click on the  symbol ("Consistency check") in the task bar.  
The block consistency is checked. Blocks found to be inconsistent are marked accordingly by a symbol.
2. If a block is inconsistent, click on the arrow in front of the block title in the call structure.  
The inconsistent blocks are displayed. The exact problem locations are listed as links in the "Details" column.
3. Click on the respective link in the "Details" column to jump to the location in the block requiring correction.
4. Check and correct the inconsistencies in the blocks.
5. Recompile the blocks by selecting the required blocks and clicking on the command "Compile" in the shortcut menu.
6. Download the corrected blocks to the target system by clicking the command "Download to device" in the shortcut menu.

## Result

The block consistency is checked. The inconsistencies in the blocks are corrected. The corrected blocks are loaded to the target system.

## See also

Symbols in the call structure (Page 1686)

## 9.2.4 Displaying the dependency structure

### 9.2.4.1 Introduction to the dependency structure

#### Introduction

The dependency structure shows the dependencies each block has to other blocks in the program.

#### Information in the dependency structure

Displaying the dependency structure provides you with a list of the blocks used in the user program. A block is shown at the far left and blocks that call or use this block are indented below it.

The dependency structure also shows the status of the individual blocks using symbols.

Objects causing a time stamp conflict and perhaps leading to an inconsistency in the program are marked with various symbols.

The dependency structure is an extension of the cross-reference list for objects.

#### View options

The following view options are available for the dependency structure:

- **Show conflicts only:**  
When this check box is activated, only the conflicts within the dependency structure are displayed.
- **Group multiple calls together:**  
When this check box is activated, several block calls are grouped together. The number of block calls is shown numerically in the "Dependency structure" column. The links to the various call locations are offered in a drop-down list in the "Details" column.

#### Displaying the dependency structure

Clicking on the arrow in front of the block title displays the blocks that call or use this block. To display the dependencies of all blocks,

click the "Expand list" icon in the toolbar.

You can hide the total overview by clicking the "Collapse list" icon.

### Displaying cross-reference information

You can display the cross-reference information for a block in the Inspector window by right-clicking on the respective block and selecting the "Display Usage" command from the shortcut menu.

### Displaying blocks in the program editor

You can open the program editor and edit blocks there from the dependency structure. To do this select the required block in the dependency structure and select the "Open editor" command in the shortcut menu.

#### 9.2.4.2 Layout of the dependency structure

##### Layout of the dependency structure

The view of the dependency structure consists of the following columns:

Column	Content/meaning
Dependency	It indicates the dependencies between each block and the other blocks in the program.
Call type (!)	Shows the type of call, for example recursive block call.
Address	Shows the absolute address of the block.
Call frequency	Indicates the number of multiple calls of blocks.
Details	Shows the network or interface of the called block. All information are offered as a link in this column. With this link, you can jump to the location of the block call in the program editor. If the viewing option "Group multiple calls together" option is enabled, the calls are grouped together and are available as links in a drop-down list.

##### See also

Symbols in the dependency structure (Page 1693)

### 9.2.4.3 Symbols in the dependency structure

#### Meaning of the symbols in the dependency structure

The following table shows the meaning of the symbols in the dependency structure:

Symbol	Meaning
	Indicates an organization block (OB).
	Indicates a function block (FB).
	Indicates a function (FC).
	Indicates a data block (DB).
	The object has an interface dependency to an object connected to the left.
	Indicates that the block needs to be compiled again.
	Indicates that the data block needs to be compiled again.
	Indicates that there is an inconsistency with this object.
	Indicates that an object has know-how protection.
	Indicates that a tag declaration in the interface has a recursive dependency: <ul style="list-style-type: none"> <li>Scenario 1: FB1 calls FB2 and this then calls FB1. The instance data blocks of these FBs have a recursion in the interface.</li> <li>Scenario 2: A multiple instance FB uses the instance DB of its parent FB as a global DB.</li> </ul>

### 9.2.4.4 Displaying the dependency structure

#### Requirement

A project has been created with programmed blocks.

#### Procedure

Proceed as follows to display the dependency structure:

1. Select the block folder or one or more of the blocks contained therein.
2. Select the "Dependency structure" command in the "Tools" menu.

#### Result

The dependency structure for the selected program is displayed.

## See also

Setting the view options for the dependency structure (Page 1694)

### 9.2.4.5 Setting the view options for the dependency structure

#### Introduction

The following view options are available for the dependency structure:

- **Show conflicts only:**  
When this check box is activated, only the conflicts within the dependency structure are displayed.  
The following blocks cause conflicts:
  - Blocks executing any calls with older or newer code time stamps.
  - Blocks called by a block with modified interface.
  - Blocks using a tag with modified address and/or data type.
  - Block called neither directly, nor indirectly by an OB.
- **Group multiple calls together:**  
When this check box is activated, several block calls are grouped together. The number of block calls is shown in the relevant column. The links to the various call locations are offered in a drop-down list in the "Details" column.

#### Requirement

- A project has been created with programmed blocks.
- The dependency structure is open.

#### Procedure

Proceed as follows to set the view options for the dependency structure:

1. Click on the arrow of the  symbol ("View options") in the task bar.  
The view options for the dependency structure are opened. Check marks are set in front of the activated view options.
2. If you want to activate or deactivate a view option, click on the respective check box and set or remove the check mark.

#### Result

The view options are set and the required information is displayed in the dependency structure.

### 9.2.4.6 Introducing the consistency check in the dependency structure

#### Consistency check

Changing the time stamp of a block during or after the program is generated can lead to time stamp conflicts, which in turn cause inconsistencies among the blocks that are calling and being called.

#### Using the consistency check

The "Consistency check" function is used to visualize inconsistencies. When the consistency check is performed, the inconsistent blocks are shown in the dependency structure and marked with the corresponding symbols.

- Most time stamp and interface conflicts can be rectified by recompiling the blocks.
- If compilation fails to clear up inconsistencies you can use the link in the "Details" column to go to the source of the problem in the program editor and manually eliminate any inconsistencies.
- The blocks marked in red must be recompiled.

#### See also

Layout of the dependency structure (Page 1692)

### 9.2.4.7 Checking block consistency in the dependency structure

#### Requirement

- A project has been created with programmed blocks.
- The dependency structure is open.

#### Procedure

Proceed as follows to check the block consistency:

1. Click on the  symbol ("Consistency check") in the task bar.  
The block consistency is checked. Blocks found to be inconsistent are marked accordingly by a symbol.
2. If a block is inconsistent, click on the arrow in front of the block title in the dependency structure.  
The inconsistent blocks are displayed. The exact problem locations are listed as links in the "Details" column.
3. Check and correct the inconsistencies in the blocks.

## 9.2 Displaying program information

4. Recompile the blocks by selecting the required blocks and clicking on the command "Compile" in the shortcut menu.
5. Download the corrected blocks to the target system by clicking the command "Download to device" in the shortcut menu.

### Result

The block consistency is checked. The inconsistencies in the blocks are corrected. The corrected blocks are loaded to the target system.

### See also

Symbols in the dependency structure (Page 1693)

## 9.2.5 Displaying CPU resources

### 9.2.5.1 Introducing resources

#### Introduction

The "Resources" tab indicates the hardware resources of the configured CPU for:

- the used programming objects,
- the assignment of the different memory areas within the CPU and
- the assigned inputs and outputs of the existing input and output modules.

#### Information provided in the "Resources" tab

The resources tab provides an overview of the hardware resources. The display in this tab depends on the CPU which you are using. The following information is displayed:

- the programming objects used in the CPU (e.g. OB, FC, FB, DB, data types and PLC tags)
- the memory areas available on the CPU (load memory, work memory - divided into code work memory and data work memory depending on the CPU -, retentive memory), their maximum size and utilization by the programming objects stated above
- the I/O of modules which can be configured for the CPU (I/O modules, digital input modules, digital output modules, analog input modules, and analog output modules), including the I/O already in use.

#### Display of the maximum available load memory

The maximum size of available load memory can be selected from a drop-down list box in the "Total" row of the "Load memory" column.

### Display of the maximum available work memory

The maximum size of available work memory is displayed in the "Work memory" column or in the "Code work memory" and "Data work memory" columns in the "Total" row.

### Display of the maximum available retentive memory

The maximum size of available retentive memory can be selected from a drop-down list box in the "Total" row of the "Retentive memory" column.

---

#### Note

##### Retentive memory data

All bit memories and data blocks specified as retentive will be integrated in the calculation of the retentive data.

---

### Updating the display in the "Resources" tab

Click the "Update view" toolbar button to update the display of objects.

### Benefits of the display in the "Resources" tab

The "Resources" tab of the program information dialog provides a detailed list of all objects and of the corresponding memory area used.

The tab also indicates shortage of resources and helps to avoid such states.

Blocks which are not compiled can be identified as their size is indicated by a question mark.

### See also

Layout of the "Resources" tab (Page 1698)

Displaying resources (Page 1699)

Selecting the maximum load memory available (Page 1700)

9.2.5.2 Layout of the "Resources" tab

Layout of the "Resources" tab in the program information

The view of the "Resources" tab consists of the following columns:

Column	Content/meaning
Objects	The "Details" area provides an overview of the programming objects available in the CPU, including their memory assignments.
Load memory	Displays the maximum load memory resources of the CPU as a percentage and as absolute value. The values displayed under "Total" provide information on the maximum memory available in the load memory. The values displayed under "Used" provide information on the memory actually used in the load memory. If a value is displayed in red, the available memory capacity has been exceeded.
Work memory or code and data work memory	Displays the maximum work memory resources of the CPU as a percentage and as absolute value. The work memory depends on the CPU and is divided into "Code work memory" and "Data work memory" for a CPU from the S7-400 or S7-1500 series, for example. The values displayed under "Total" provide information on the maximum memory available in the work memory. The values displayed under "Used" provide information on the memory space actually used in the work memory. If a value is displayed in red, the available memory capacity has been exceeded.
Retentive memory	Displays the maximum resources for retentive memory in the CPU as a percentage and as absolute value. The values displayed under "Total" provide information on the maximum memory available in the retentive memory. The values displayed under "Used" provide information on the memory actually used in the retentive memory. If a value is displayed in red, the available memory capacity has been exceeded.

Column	Content/meaning
I/O	Displays the I/Os which are available on the CPU, including their module-specific availability in the next columns. The values displayed at "Configured" provide information about the maximum number of I/O available. The values displayed under "Used" provide information on the actually used inputs and outputs.
DI / DQ / AI / AQ	Displays the number of configured and used inputs/outputs: DI = Digital inputs DQ = Digital outputs AI = Analog inputs AQ = Analog outputs The values displayed at "Configured" provide information about the maximum number of I/O available. The values displayed under "Used" provide information on the actually used inputs and outputs.

**See also**

Displaying resources (Page 1699)

Selecting the maximum load memory available (Page 1700)

Introducing resources (Page 1696)

**9.2.5.3 Displaying resources****Requirement**

A project with programmed blocks has been created.

**Procedure**

Proceed as follows to display the resources of the respective CPU memory areas:

1. Select the block folder below the relevant CPU, or one or several of the blocks contained therein.
2. Select the "Resources" command in the "Tools" menu.

**Result**

The memory resources of the assigned CPU are displayed.

#### 9.2.5.4 Selecting the maximum load memory available

##### Requirement

A project with programmed blocks has been created.

##### Procedure

Proceed as follows to display the available maximum of load memory resources:

1. Select the block folder below the relevant CPU, or one or several of the blocks contained therein.
2. Select the "Resources" command in the "Tools" menu.
3. In the dialog that is displayed, open the drop-down list in the "Total" field of the "Load memory" column by clicking the icon.
4. Select a corresponding value for the CPU used by clicking it in the drop-down list box.

##### Result

The "Total" field displays the selected maximum memory resources.

---

##### Note

##### Display of maximum memory resources

If a value is displayed in red for the maximum memory resources, the available memory capacity has been exceeded.

In this case, adapt the memory capacity as described above.

---

## 9.3 Displaying cross-references

### 9.3.1 General information about cross references

#### Introduction

The cross-reference list provides an overview of the use of operands and tags within the user program.

## Uses of cross-references

The cross-reference list offers you the following advantages:

- When creating and changing a program, you retain an overview of the operands, tags and block calls you have used.
- From the cross-references, you can jump directly to the point of use of operands and tags.
- During a program test or when troubleshooting, you are informed of the following:
  - Which operand is processed by which command in which block.
  - Which tag is used in which picture.
  - Which block is called by which other block.
  - Cross-reference information for subordinate and higher-level structures.
- As part of the project documentation, the cross-references provide a comprehensive overview of all operands, memory areas, blocks, tags and pictures used.

## See also

Structure of the cross-reference list (Page 1701)

Displaying the cross-reference list (Page 1702)

Displaying cross-references in the Inspector window (Page 1704)

## 9.3.2 Structure of the cross-reference list

### Views of the cross-reference list

There are two views of the cross-reference list. The difference between the two views is in the objects displayed in the first column:

- Used by:  
Display of the referenced objects. Here, you can see where the object is used.
- Used:  
Display of the referencing objects. Here, you can see the users of the object.

The assigned tool tips provide additional information about each object.

### Structure of the cross-reference list

The cross-reference list has the following structure:

Column	Content/meaning
Object	Name of the object that uses the lower-level objects or that is being used by the lower-level objects.
Number	Number of uses
Point of use	Each point of use, for example, network

Column	Content/meaning
Property	Special properties of referenced objects, for example, the tag names in multi-instance declarations.
as	Shows additional information about the object, e.g., that an instance DB is used as template or as multiple instance.
Access	Type of access, whether access to the operand is read access (R) and/or write access (W).
Address	Address of the operand
Type	Information on the type and language used to create the object
Path	Path of object in project tree

Depending on the installed products, additional columns or different columns are displayed for the cross-references.

### Settings in the cross-reference list

You can make the following settings using the buttons in the toolbar of the cross-reference list:

- Update cross-reference list  
Updates the current cross-reference list.
- Making settings for the cross-reference list  
Here, you select check boxes to specify whether all used, all unused, all defined or all undefined objects will be displayed. If the "Undefined objects" option is enabled, references to previously deleted objects are also displayed.
- Collapse entries  
Reduces the entries in the current cross-reference list by closing the lower-level objects.
- Expand entries  
Expands the entries in the current cross-reference list by opening the low-level objects.

### Sorting in the cross-reference list

You can sort the entries in the "Object" column, including other product-specific columns, in ascending or descending order. To do this, click on the relevant column title.

### See also

General information about cross references (Page 1700)

Displaying the cross-reference list (Page 1702)

## 9.3.3 Displaying the cross-reference list

### Requirements

You have created a project.

## Introduction

There are several ways of displaying cross-references depending on whether you are in the Portal view or in the Project view and which object you have selected in the project tree.

In the Portal view, you can only display cross-references for the entire CPU; in the Project view, you can, for example, display cross-references for the following objects:

- "PLC tags" folder
- "PLC data types" folder
- "Program blocks" folder
- "Tags and connections" folder
- Individual tags
- Individual PLC data types
- Individual blocks
- Technological objects
- Watch tables

## Displaying cross-references

Proceed as follows to display cross-references:

1. Select the required action in the Portal view, for example "PLC programming" and the "Show cross-references" command or select one of the objects listed above in the Project view and select the "Cross-references" command in the "Tools" menu.  
The cross-reference list is displayed.
2. Click the "Used by" button to display where the objects shown in the cross-reference list are used.
3. Click the "Uses" button to view the users of the objects displayed in the cross-reference list.
4. You can perform the following actions using the buttons in the toolbar:
  - Update cross-reference list
  - Making settings for the cross-reference list
  - Collapse entries
  - Expand entries
5. You can sort the entries in the "Object" and "Address" columns in ascending or descending order by clicking on the relevant column title.
6. To go to the point of use of the object, click on the displayed link.

## See also

General information about cross references (Page 1700)

Structure of the cross-reference list (Page 1701)

### 9.3.4 Displaying cross-references in the Inspector window

#### Introduction

The Inspector window displays cross-reference information about an object you have selected in the "Info > Cross-references" tab. This tab displays the instances where a selected object is being used and the other objects using it.

The Inspector window also includes blocks which are only available online in the cross-references.

You can use the "Show overlapping access..." shortcut menu command to also have overlapping access across block borders displayed for selected objects.

#### Structure

The Inspector window displays the cross-reference information in tabular format. Each column contains specific and detailed information on the selected object and its application. The table below shows the additional information listed in the "Info > Cross-reference" tab:

Column	Meaning
Object	Name of the object that uses the lower-level objects or that is being used by the lower-level objects.
Number	Number of uses
Point of use	Each location of use, for example, network
Property	Special properties of referenced objects, for example, the tag name in multi-instance declarations
as	Shows additional information about the object, e.g., that an instance DB is used as template or as multiple instance.
Access	Access mode Shows whether the operand is accessed by a read (R) and/or write (W) operation.
Address	Address of the operand
Monitor value	This column will only be displayed when the program editor is open.
Type	Information about the type and language used to create the object
Path	Path of object in project tree

Depending on the installed products, additional columns or different columns are displayed for the cross-references.

## 9.4 Testing the user program

### 9.4.1 Basics of testing the user program

#### Functions

You have the option of testing the running of your user program on the device. You can then monitor signal states and values of tags and can assign values to tags to simulate certain situations in the running of the program.

#### Requirement

There must be an executable program loaded on the device.

#### Test options

The following test options are available:

- **Testing with program status**  
The program status allows you to monitor the running of the program. You can display the values of operands and the results of logic operations (RLO) allowing you to recognize and fix logical errors in your program.
- **Testing in single step mode (S7-300/400 only)**  
You can test blocks you created in STL or SCL in the single step mode. You do this by setting breakpoints in the program code at which program execution stops. You can then continue to run the program one step at a time. Within a CPU, you can test either with program status or in single step mode. You cannot, however, use both test options at the same time within a CPU.
- **Testing with the watch table**  
With the watch table, you can monitor and modify the current values of individual tags in the user program or on a CPU. You can assign values to individual tags for testing and run the program in a variety of different situations. You can also assign fixed values to the I/O outputs of a CPU in STOP mode, for example to check the wiring.
- **Testing with the force table**  
With the force table, you can monitor and force the current values of individual tags in the user program or on a CPU. When you force, you overwrite individual tags with specified values. This allows you to test your user program and run through various situations. When forcing, make sure that you keep to the necessary safety measures for forcing (Page 1758)!

Introduction to testing with program status (Page 1706)

Introduction to testing with the watch table (Page 1713)

Introduction for testing with the force table (Page 1740)

## 9.4.2 Testing with program status

### 9.4.2.1 Introduction to testing with program status

#### Program Status function

If you display the program status, you can monitor the execution of the program. This provides you with an overview of the values of the individual operands and the results of the logic operations and you can check whether the components of the automation system are correctly controlled.

The display of the program execution in the program status can differ slightly, depending on the CPU family used.

#### Testing with program status for S7-300/400

During testing with program status, the CPU cycle time can become extended in test mode because the recording of all test data can deviate from the duration of the programmed instructions due to the CPU capacity and therefore not run in realtime.

During the execution of the following test functions an alarm indicating the danger of a time-out is displayed once for each online session.

- During testing with call conditions
- During testing with breakpoints

You can only perform these test functions after you have acknowledged the alarm.

---

#### Note

With older CPUs from the S7-300/400 CPU family, you will need to change the operating response using the hardware configuration and then download the hardware configuration to the device. You have the option to set the "Process operation" or "Test operation" operating response.

---

#### Restrictions with the "Program status" function

The monitoring of loops can increase the cycle time significantly, depending in each case on the number of tags to be monitored and on the actual number of loops processed.

To ensure that the cycle time is influenced as little as possible, the "Program status" function is restricted as follows:

- The status display of a programmed loop is stopped at the return point.

 <b>WARNING</b>
<b>Testing with program status</b>
A test with the "Program status" function can cause serious damage to property or injury to persons if there are functional disturbances or program errors.
Make sure that no dangerous situations can arise before you conduct a test with the "Program status" function.

### 9.4.2.2 Switching test with program status on/off

You can monitor all blocks by switching on the program status of the block. This function is available to you for all code blocks, regardless of the programming language used. For blocks that were programmed with LAD or FBD, you can also enable the program status from a specific position or for a specific selection. You can switch on the program status for an open block directly, or open a block from the calling block and view the program status.

---

#### Note

The resources for testing with program status are limited. If there are not enough resources for the current test, earlier tests will be terminated.

---

#### Requirement

The identical block exists in the device.

#### Switching the program status on or off directly in the block

To switch the program status for a block on or off directly in the block, follow these steps:

1. Open the block for which you wish to switch on the program status.
2. Click the "Monitoring on/off" button in the toolbar.  
If you have not already established an online connection, the "Go online" dialog opens. In this dialog, you can establish an online connection.  
See also: Establishing and terminating an online connection
3. Click the "Monitoring on/off" button in the toolbar again to switch the program status off.

#### Switching on or off program status starting at a specific point in a network

To start the program status for LAD and FBD at a specific point, follow these steps:

1. Open the block for which you wish to switch on the program status.
2. Click the "Monitoring on/off" button in the toolbar.
3. Right-click on the tag you want program status to start from.

4. Select "Modify > "Monitor from here" in the shortcut menu.
5. Click the "Monitoring on/off" button in the toolbar again to switch the program status off.

### Switching on or off program status for selected tags

To start the program status for LAD and FBD for selected tags, follow these steps:

1. Open the block for which you wish to switch on the program status.
2. Click the "Monitoring on/off" button in the toolbar.
3. Select the tags for which you want to start the program status.
4. Select "Modify > Monitor selection" in the shortcut menu.
5. Click the "Monitoring on/off" button in the toolbar again to switch the program status off.

### Switching on program status from the calling block

To switch on the program status for a block from the calling block (e.g. OB1), follow these steps:

1. Open the calling block.
2. Right-click on the block call.
3. Select the command "Open and monitor" in the shortcut menu.  
The block will open in the program editor. An online connection is established and the program status is displayed.

---

#### Note

If the calling block is programmed in SCL and the called block is an FB, the FB is opened with "Open and monitor". To monitor the FB, you then need to switch on the program status directly in the FB.

---

## Result

If you enable the display of the program status, an online connection is established and the program status is displayed. When you turn off the display of the program status, you can terminate the online connection at the same time.

The call path of the block is shown under the block interface. For S7-300/400 and S7-1500 CPUs, you can change the call condition if required using the button on the right edge.

### 9.4.2.3 Editing blocks during the program test

If you edit blocks while the test with program status is still running, online monitoring will be interrupted and you will be able to edit the block offline. If the block is not available offline in the project, you will first have to load it from the device to the project. After editing the block, you will also have to compile and download it again.

## Procedure

To edit blocks while the test with program status is still running, follow these steps:

1. Edit the block as necessary.  
The test with program status is interrupted and the block is switched offline assuming it exists offline.
2. If the block does not exist offline, load it to the project from the device.
3. Compile the block.  
See also: Auto-Hotspot
4. Download the block to the device.  
See also: Auto-Hotspot

## Result

The block now contains your modifications both online and offline. The online connection is re-established and testing with program status continues.

### 9.4.2.4 Modifying tags in the program status

While testing with the program status, you have the option of modifying tags to the following values once and immediately:

- Modify to 1  
Modifies tags of the "Bool" data type to the value "True".
- Modify to 0  
Modifies tags of the "Bool" data type to the value "False"
- Modify operand  
You can enter a modify value for tags that do not belong to the "Bool" data type.

Note that you cannot modify peripheral inputs, for example, via TagName:P.

## Procedure

To modify tags during testing with the program status, proceed as follows:

1. Right-click on the tag you want to modify.
2. Select one of the following commands in the shortcut menu:
  - "Modify > Modify to 1"
  - "Modify > Modify to 0"
  - "Modify > Modify operand"
3. If you select "Modify operand", the "Modify operand" dialog opens. Enter the value you require in the "Modify value" box and confirm with "OK".

### 9.4.2.5 Switching display formats in the program status

#### Introduction

The display formats for tags are generally displayed in "integer" form. In the program status, you have the option of switching the current display format by means of the shortcut menu. The possible display formats for a tag are offered in a list. This is useful, for example, when you need a hexadecimal display in order to search for a hexadecimal error code.

#### Procedure

To switch the display format, follow these steps:

1. Open the desired block in the programming editor.
2. Switch on the program status by clicking "Monitoring on/off" in the toolbar.  
If you have not already established an online connection, the "Go online" dialog opens. In this dialog, you can establish an online connection.
3. Select the tags for which you want to start the program status.
4. Select "Modify > Monitor selection" in the shortcut menu to start monitoring this tag.
5. Select the desired tag at the corresponding block output and then select the desired display format in the shortcut menu, for example, "Modify > Display format > Hexadecimal".

#### Result

The display format for the selected tag is shown in hexadecimal form.

---

#### Note

##### Switching the display format in the program status

Please note that it is not possible to switch the display format for unconnected outputs, as no monitoring value is output in this case.

---

### 9.4.2.6 Examples of program status display

#### Program status display for LAD programs

#### Displays in program status

The display of the program status is updated cyclically.

The following figure shows an example of the program status display for LAD:

### Representation of the program status

You can recognize the status of individual instructions and lines of a network quickly based on the color and type of lines and symbols. The following table shows the relationship between representation and status:

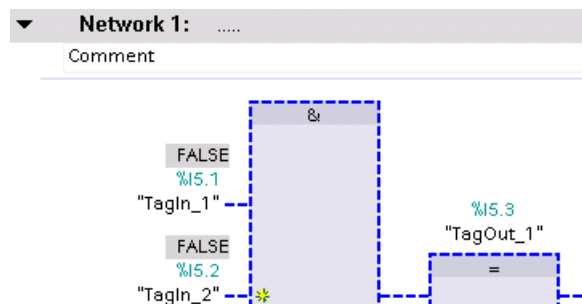

Representation	Status
Green solid	Satisfied
Blue dashed	Not satisfied
Gray solid	Unknown or not executed
Black	Not interconnected
Parameter in a frame with a saturation of 100 %	Value is current
Parameter in a frame with a saturation of 50 %	Value originates from an earlier cycle. The point in the program was not executed in the current cycle.

### Program status display for FBD programs

#### Displays in program status

The display of the program status is updated cyclically.

The following figure shows an example of the program status display for FBD:

### Representation of the program status

You can recognize the status of individual instructions and lines of a network quickly based on the color and type of lines and symbols. The following table shows the relationship between representation and status:

Representation	Status
Green solid	Satisfied
Blue dashed	Not satisfied
Gray solid	Unknown or not executed
Black	Not interconnected
Parameter in a frame with a saturation of 100 %	Value is current
Parameter in a frame with a saturation of 50 %	Value originates from an earlier cycle. The point in the program was not executed in the current cycle.

The values of the operands are displayed above the relevant operand name in a gray box.

**Note**

**Program status display for outputs which are not interconnected**

Please note that a monitor value cannot be displayed for outputs which are not interconnected.

### Program status display for SCL programs

#### Displays in program status

The display of the program status is updated cyclically and shown in a table. The table is displayed immediately beside the SCL program and you can see the program status for each line of the program. The table contains the following information:

- Tag names
- Value

You can move the table to the left or right at any time.

The following figure shows an example of the program status display for SCL:

1	IF "TagIn_1"	"TagIn_1"	FALSE
2	THEN "TagIn_2" :=1;	"TagIn_2"	TRUE
3	END_IF;		
4	IF "TagIn_2" = false	"TagIn_2"	FALSE
5	THEN "TagIn_3" :=1;	"TagIn_3"	TRUE
6	END_IF;		
7			

In the first column, you can see the name of the tag for which the current value is being displayed. If the line includes the "IF", "WHILE" or "REPEAT" instruction, the result of the instruction is displayed in the line as "True" or "False". If the line contains more than one tag, the value of the first tag is displayed. In both cases, all tags of these lines are displayed with

their values in a separate list as soon as you select a line. If you place the cursor in a tag in the program code, this is shown in bold face in the list. You can also display the other tags of a line explicitly by clicking the arrow right located in front of lines containing more than one tag.

If the code of the line is not executed, the tag name is displayed in the values table in gray text.

The current values of the tags are displayed in the last column. If no values can be displayed for a tag, the line has a yellow background and three question marks are shown. In this case, select the "Create extended status information" check box in the properties of the block and download the block to the device again. All values are then displayed.

## 9.4.3 Testing with the watch table

### 9.4.3.1 Introduction to testing with the watch table

#### Overview

The following functions are available in the watch table:

- **Monitoring tags**  
This displays the current values of the individual tags of a user program or a CPU on the programming device or PC.
- **Modifying tags**  
You can use this function to assign specific values to the individual tags of a user program or CPU. Modifying is also possible with Test with program status .
- **"Enable peripheral outputs" and "Modify now"**  
These two functions enable you to assign specific values to individual peripheral outputs of a CPU in STOP mode. You can also use them to check your wiring.

#### Monitoring and modifying tags

The following tags can be monitored and modified:

- Inputs, outputs, and bit memory
- Contents of data blocks
- I/O

#### Possible applications

The advantage of the watch table is that a variety of test environments can be stored. This enables you to reproduce tests during commissioning or for service and maintenance purposes.

**See also**

- Creating and editing watch tables (Page 1717)
- Layout of the watch table (Page 1714)
- Basic mode and expanded mode in the watch table (Page 1715)
- Icons in the watch table (Page 1716)

**9.4.3.2 Layout of the watch table**

**Introduction**

A watch table contains the tags you defined for the entire CPU. A "Watch and force tables" folder is automatically generated for each CPU created in the project. You create a new watch table in this folder by selecting the "Add new Watch table" command.

**Layout of the watch table**

The columns displayed in the watch table depend on the mode you are working in: basic mode or expanded mode.

The following additional columns are shown in expanded mode:

- Monitor with trigger
- Modify with trigger

The names of the columns can also be changed dynamically based on the action.

**Meaning of the columns**

The following table shows the meaning of the individual columns in basic mode and expanded mode:

Mode	Column	Meaning
Basic mode		Identifier column
	Name	Name of the inserted tag
	Address	Address of the inserted tag
	Display format	Selected display format
	Monitor value	Values of the tags, depending on the selected display format.
	Modify value	Value with which the tag is modified.
		Select the tag to be modified by clicking the corresponding check box.
The following additional columns are shown in expanded mode:	Comment	Comment for documentation of the tags
	Monitor with trigger	Display of selected monitoring mode
	Modify with trigger	Display of selected modify mode

## See also

Icons in the watch table (Page 1716)

### 9.4.3.3 Basic mode and expanded mode in the watch table

#### Difference between basic mode and expanded mode in the watch table

Depending on the mode specified, the watch table displays different columns and column headings that can be used to perform different actions.

You will find a detailed list of the columns in Layout of the watch table (Page 1714).

#### Switching between basic mode and expanded mode

You have the following options of toggling between the basic and expanded mode:

- Click the icon "Show/hide advanced setting columns". Click this icon again to return to the basic mode.  
Or:
- Activate the check box for the "Expanded Mode" command in the "Online" menu. Deactivate this check box to return to the basic mode.

#### Functionality in expanded mode

The following functionality is only possible in expanded mode:

- Monitor with trigger
- Modify with trigger
- Enable peripheral outputs
- Monitoring peripheral inputs
- Controlling peripheral outputs

NOTICE
<p><b>Danger of a time-out while monitoring peripheral inputs and controlling peripheral outputs</b></p> <p>Note that the monitoring of peripheral inputs and the controlling of peripheral outputs in the watch table can result in a time-out.</p> <p>The CPU assumes the "STOP" mode.</p>

## See also

Setting the monitoring and modify mode (Page 1728)

9.4.3.4 Icons in the watch table

Meaning of the icons

The following table shows the meaning of the icons in the watch table:

Icon	Meaning
	Identifies a table inside the project tree as a watch table.
	Shows information in the identifier column.
	Inserts a row before the selected row.
	Inserts a row after the selected row.
	Modifies the addresses of all selected tags immediately and once. This command is executed once and as quickly as possible without reference to a defined trigger point in the user program.
	Modifies the addresses of all selected tags with reference to a defined trigger point in the user program.
	Disables the command output disable of the peripheral outputs. You can then modify the peripheral outputs when the CPU is in STOP mode.
	Displays all columns of expanded mode. If you click this icon again, the columns of expanded mode will be hidden.
	Displays all modify columns. If you click this icon again, the modify columns will be hidden.
	Starts monitoring of the visible tags in the active watch table. The default setting for the monitoring mode in basic mode is "permanent". In expanded mode, you can set defined trigger points for the monitoring of tags.
	Starts monitoring of the visible tags in the active watch table. This command is executed immediately and the tags are monitored once.
	Displays the check box for the selection of tags to be modified.
	Indicates that the value of the selected tag has been modified to "1".
	Indicates that the value of the selected tag has been modified to "0".
	Indicates that the address is being used multiple times.
	Indicates that the substitute value is being used. Substitute values are values that are output to the process in case of signal output module faults or are used instead of a process value in the user program in case of signal input module faults. The substitute values can be assigned by the user (e.g., retain old value).
	Indicates that the address is blocked because it is already being modified.
	Indicates that the address cannot be modified.
	Indicates that the address cannot be monitored.
	Indicates that an address is being forced.
	Indicates that an address is being partly forced.

Icon	Meaning
	Indicates that an associated I/O address is being fully or partly forced.
	Indicates that an address cannot be fully forced. Example: It is indeed possible to force the address QW0:P, but it is not possible to force the address QD0:P since this address area is eventually not available on the CPU.
	Indicates that a syntax error occurred.
	Indicates that the address is selected but at the moment e.g. has not yet been modified.

Layout of the watch table (Page 1714)

### 9.4.3.5 Creating and editing watch tables

#### Creating a watch table

##### Introduction

The watch table allows you to monitor and modify tags in the user program. Once you have created a watch table, you can save it, duplicate it, and print it and use it again and again to monitor and modify tags.

##### Requirement

A project is open.

##### Procedure

To create a watch table, follow these steps:

1. Click "Project view" in the status bar.  
The project view is displayed.
2. In the project tree, double-click the CPU for which you want to create a watch table.
3. Double-click the "Watch and force tables" folder and then the "Add new watch table" command.  
A new watch table is added.
4. In the "Name" column or in the "Address" column, enter the name or the absolute address for the tags that you want to monitor or modify.
5. You can select a display format from the drop-down list in the "Display format" column if you want to change this default setting.
6. Now decide whether you want to monitor or modify the entered tags and, if applicable, enter the desired values for modifying.

## Opening a watch table

### Requirement

A watch table has been created.

### Procedure

To open a watch table, follow these steps:

1. Open the "Watch and force tables" folder below the desired CPU.
2. Double-click on the required watch table in the folder.

### Result

The selected watch table opens.

## Copying and pasting a watch table

### Requirement

A watch table has been created.

### Procedure

To copy a watch table, follow these steps:

1. Right-click the watch table that you want to copy.
2. In the context menu, select "Copy".
3. In the project tree, open the folder structure for the CPU in which you want to paste the copied watch table.
4. Right-click on the "Watch and force tables" folder.
5. In the context menu, select "Paste".
6. Alternatively, you can select the entire contents of the watch table and Drag & Drop it onto another watch table.

### Result

A copy of the selected watch table is placed in the "Watch and force tables" folder of the relevant CPU.

## Saving a watch table

### Prerequisite

A watch table has been created.

### Procedure

To save a watch table, follow these steps:

1. In the project tree select the watch table you want to save.
2. If you wish to change the preset name of the table, select the "Rename" command in the context menu and enter a new name for the table.
3. In the "Project" menu, select "Save". Note that this save operation will save the entire project.

### Result

The contents of the watch table and the project are saved.

---

#### Note

You can reuse saved watch tables to monitor and modify tags when retesting your program.

---

### 9.4.3.6 Entering tags in the watch table

#### Basic information on entering tags in the watch table

##### Recommended procedure

- Select the tags whose values you want to monitor or modify, and enter them in the watch table.
- When entering tags into the watch table, please note that these tags must be previously defined in the PLC tag table.
- When entering tags, work from the outside to the inside. This means that you start by entering the tags for the inputs in the watch table. Then, you enter the tags that are affected by the inputs or that affect the outputs. Finally, you enter the tags for the outputs.

##### Example of filling out a watch table

- Enter the absolute address to be monitored or modified in the "Address" column.
- Enter the symbolic name for the tag in the "Name" column.

- Select the display format you require from the drop-down list in the "Display format" column, if you do not want to use the default setting.
- Now decide whether you want to monitor or modify the entered tags. Enter the desired values for modifying as well as a comment in the corresponding columns of the watch table.

**Create comment row**

If required, you can create a comment row by entering the string "/" in the "Name" column.

**Syntax check**

When you enter the tags in the watch table, the syntax of each cell is checked when you exit the cell. Incorrect entries are marked in red.

**Note**

When you place the mouse pointer in a cell marked in red, brief information is displayed with additional notes on the error.

**See also**

Permitted operands for the watch table (Page 1720)

Permissible modify values for the watch table (Page 1721)

**Permitted operands for the watch table**

**Permissible operands for the watch table**

The following table shows the operands that are permitted for the watch table:

Permitted operand	Example of data type	Example (International mnemonics)
Input/output/bit memory	BOOL	I1.0, Q1.7, M10.1 I0.0:P; Q0.0:P
Input/output/bit memory	BYTE	IB1/QB10/MB100 IB1:P; QB1:P
Input/output/bit memory	WORD	IW1; QW10; MW100 IW2:P; QW3:P
Input/output/bit memory	DWORD	ID4; QD10; MD100 ID2:P; QD1:P
Timers	TIMER	T1
Counters	COUNTER	C1
Data block	BOOL	DB1.DBX1.0
Data block	BYTE	DB1.DBB1

Permitted operand	Example of data type	Example (International mnemonics)
Data block	WORD	DB1.DBW1
Data block	DWORD	DB1.DBD1

**Note**

Please observe the following notes to work with the watch table.

- You cannot enter "DB0..." because it is used by the system!
- Peripheral outputs can be modified but not monitored.
- Peripheral inputs can be monitored but not modified.

**NOTICE**

**Danger of a time-out while monitoring peripheral inputs and controlling peripheral outputs**

Note that the monitoring of peripheral inputs and the controlling of peripheral outputs in the watch table can result in a time-out.

The CPU assumes the "STOP" mode.

**See also**

Basic information on entering tags in the watch table (Page 1719)

**Permissible modify values for the watch table**

**Entry of modify values in the watch table**

The following table shows the operands that are permitted for the entry of modify values in the watch table:

Table 9-14 Bit operands

Possible bit operands	Example for permitted modify values
I1.0	True
M1.7	False
Q1.0	0
Q1.1:P	1
DB1.DBX1.1	2#0
M1.6	2#1

9.4 Testing the user program

Table 9-15 Byte operands

Possible byte operands	Example for permitted modify values
IB1	2#00110011
MB12	B#16#1F
QB10	1F
QB11:P	'a'
DB1.DBB1	10

Table 9-16 Word operands

Possible word operands	Example for permitted modify values
IW1	2#0011001100110011
MW12	W#16#ABCD
MW14	ABCD
QW10	B#(12, 34)
QW12:P	12345
DB1.DBW1	'ab'
MW16	S5T#9s_340ms
MW18	C#123
MW9	D#2006-12-31

Table 9-17 Double word operands

Possible double word operands	Example for permitted modify values
ID1	2#00110011001100110011001100110011
QD10	Dw#16#abcdef10
QD12:P	ABCDEF10
DB1.DBD2	b#(12,34,56,78)
MD8	L#-12
MD12	L#12
MD16	123456789
MD20	123456789
MD24	T#12s345ms
MD28	Tod#1:2:34.567
MD32	P#e0.0

Table 9-18 Timers

Possible operands of the "Timer" type	Permitted control values	Explanation
T1	0 ms	Time value in milliseconds (ms)
T12	20 ms	Time value in milliseconds (ms)
T14	12345 ms	Time value in milliseconds (ms)
T16	S5t#12s340ms	Time value 12s 340 ms

Table 9-19 Counters

Possible operands of the "Counter" type	Permitted control values
C1	0
C14	20
C16	C#123

### Notes on timers and counters

- Timers

---

#### Note

Modifying a timer influences only the value, not the status. Timer T1 can be modified to the value "0", but the result of logic operation for A T1 is not changed.

The time sequences "s5t" and "s5time" can be written in both lower-case and upper-case characters.

---

- Counter

---

#### Note

Modifying a counter influences only the value, not the status. Counter C1 can be changed to the value "0", but the result of the logic operation for A C1 is not changed.

---

### Overview of the display formats

#### Display formats in the watch table

The display format you select specifies the representation of a tag value.

When entering the address a display format is automatically preset. If you want to change this, you can select a display format from the drop-down list in the "Display formats" column. The drop-down list only offers the display formats which are valid for this data type. The display format that appears first in the list is the pre-selected format.

#### Example

The following table shows the 32-bit data types permitted for all CPU families in the watch table and their possible display formats:

Data type	Possible display formats
BOOL	Bool, Hex, BCD, Octal, Bin, Dec, Dec+/-
BYTE	Hex, BCD, Octal, Bin, Dec, Dec+/-, Character
WORD	Hex, BCD, Octal, Bin, Dec, Dec+/-, Dec_Sequence, Character, Unicode_Character, SIMATIC_Timer, Date, Counter
DWORD	Hex, BCD, Octal, Bin, Dec, Dec+/-, Dec_Sequence, Character, Unicode_Character, Floating-point number, Time of day, Timer, Pointer

Data type	Possible display formats
SINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character
INT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, SIMATIC_Timer, Counter, Date
DINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, Floating-point number, Time of day, Timer, Pointer
USINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character
UINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, SIMATIC_Timer, Counter, Date
UDINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, Floating-point number, Time of day, Timer, Pointer
REAL	Floating-point number, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Time of day, Timer, Pointer
DATE	Date, Dec, Hex, BCD, Bin
TIME_OF_DAY	Time of day, Dec, Hex, BCD, Bin
TIME	Timer, Hex, BCD, Bin
DATE_AND_TIME	Date and time,
TIMER	SIMATIC_Timer, Hex, BCD, Bin
CHAR	Character, Hex, BCD, Octal, Bin, Dec, Dec+/-
WCHAR	Unicode_Character, Character, Hex, BCD, Octal, Bin, Dec, Dec+/-
STRING	Character string
WSTRING	Unicode_character string
POINTER	Pointer, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Floating-point number, Time of day, Timer, Block number
COUNTER	Counter, Hex, BCD, Bin
S5TIME	SIMATIC_Timer, Hex, BCD, Bin

For the S7-1200 CPU family, all 32-bit data types are permitted (see table above), as well as the 64-bit data type LREAL with the following possible display formats:

Data type	Possible display formats
LREAL	In a project created with TIA Portal < V12: Floating-point number Note: The display of LREAL is limited to 13 digits plus exponent.
LREAL	In a project created with TIA Portal >= V12: Floating-point number, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Time of day, Timer, Date and time Note: The display of LREAL is limited to 13 digits plus exponent.

For the S7-1500 CPU family, in addition to 32-bit data types, the 64-bit data types listed in the table are also permitted with the following possible display formats:

Data type	Possible display formats
LWORD	Hex, Octal, BCD, Bin, Character, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Floating-point number, Time of day, Timer, Date and time
LINT	Dec+/-, Dec, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, Time of day, Timer, Date and time
ULINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, Time of day, Timer, Date and time
LREAL	Floating-point number, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Time of day, Timer, Date and time
LTIME	Timer, Dec+/-, Dec, Hex
LTOD	Time of day, Dec, Hex, BCD, Bin
LDT	Date and time, Dec, Hex

For more information, refer to the description of the valid data types.

---

#### Note

##### Rounding of floating-point numbers

In the watch table, floating-point numbers are stored as binary numbers in IEEE format. Because not every floating point number (real, longreal) that can be displayed on the user interface can be mapped to the IEEE format, there is a possibility that floating-point numbers will be rounded. If a rounded floating-point number in the watch table is copied and, in turn, inserted in another input field, the rounding may cause a slight difference.

---

---

#### Note

##### Only symbolic addressing is possible

In the watch table, LongDataTypes such as LWORD or LREAL can only be addressed symbolically.

---

## Selecting the display format for tags

### Procedure

To select the display format of the tags, follow these steps:

1. Enter the desired address in the watch table.
2. Click the desired cell in the "Display format" column, and open the drop-down list. The permissible display formats are shown in the drop-down list.
3. Select the desired display format from the drop-down list.

---

#### Note

If the selected display format cannot be applied, then the last selected display format will be displayed automatically.

---

## Creating and editing comment lines

### Basic principles of comment lines

In addition to the row related comments in the comment column, you can now also create complete comment lines to enhance the structure of the watch table.

The contents of the comment line are stored in the "Languages & Resources" folder in the "Project texts" tab and can be compiled in other project languages.

### Creating comment lines

To create comment lines, follow these steps:

1. Open the watch table and enter the required addresses.
2. To create a comment line, enter the character string "/" in the "Name" column. No comment lines can be created in the other columns.
3. Enter the required comment in the comment line. The entered comment is shown in green.
4. To show all comments you entered, double-click "Project texts" in the project tree under "Languages & Resources".
5. If you are working in multi-lingual projects and want your comment to be translated into other languages, you can set the project languages required in addition to the editing language in the project tree under "Languages & Resources > Project languages".

## Deleting comment lines

To delete comment lines, follow these steps:

1. Open a watch table containing comment lines.
2. Delete the entire comment including the introductory string "//", if you no longer required this.
3. Alternatively, delete only the introductory string "//". In this case the existing comment is retained and is displayed in the "Comment" column in the watch table.

---

### Note

#### Deleting comment lines

When you delete comment lines the project languages and any existing translations for these comments are also deleted.

---

### 9.4.3.7 Monitoring tags in the watch table

#### Introduction to monitoring tags in the watch table

##### Introduction

The watch table allows you to monitor the tags of the configured input and output modules in the CPU, depending on the monitoring and modify mode (Page 1728) selected. To monitor tags, an online connection to the CPU must exist.

<b>NOTICE</b>
<b>Danger of a time-out while monitoring peripheral inputs</b>
Note that the monitoring of peripheral inputs can result in a time-out. The CPU assumes the "STOP" mode.

### Options for monitoring tags

The following options are available for monitoring tags:

- Monitor now  
This command starts the monitoring of the visible tags in the active watch table immediately and once only.
- Monitor all  
This command starts the monitoring of all visible tags in the active watch table, depending on the selected watch mode:
  - In basic mode, the monitoring mode is set to "permanent" by default.
  - In expanded mode, you can specify defined trigger points for the monitoring of tags.

---

#### Note

If the monitoring mode is changed while in expanded mode and then a switch is made to basic mode, the monitoring mode set before will also be applied in basic mode.

---

### CPU-specific limitations when monitoring tags

The following CPU-specific differences exist:

- CPU S7-300/400:  
CPUs from this family can only monitor the first 30 characters of a string.
- CPU S7-1200/1500:  
CPUs from this family can monitor a string up to the total size of 254 characters.

### Setting the monitoring and modify mode

#### Introduction

By selecting the monitoring and modify mode, you specify the trigger point and the duration of the tag monitoring in the watch table and the force table.

#### Possible monitoring and modify modes (duration of monitoring or modifying)

The following monitoring and modifying modes are available:

- Permanent
- Once only, at start of scan cycle
- Once only, at end of scan cycle
- Permanently, at start of scan cycle
- Permanently, at end of scan cycle

- Once only, at transition to STOP
- Permanently, at transition to STOP

### Special features when using "Permanent" mode

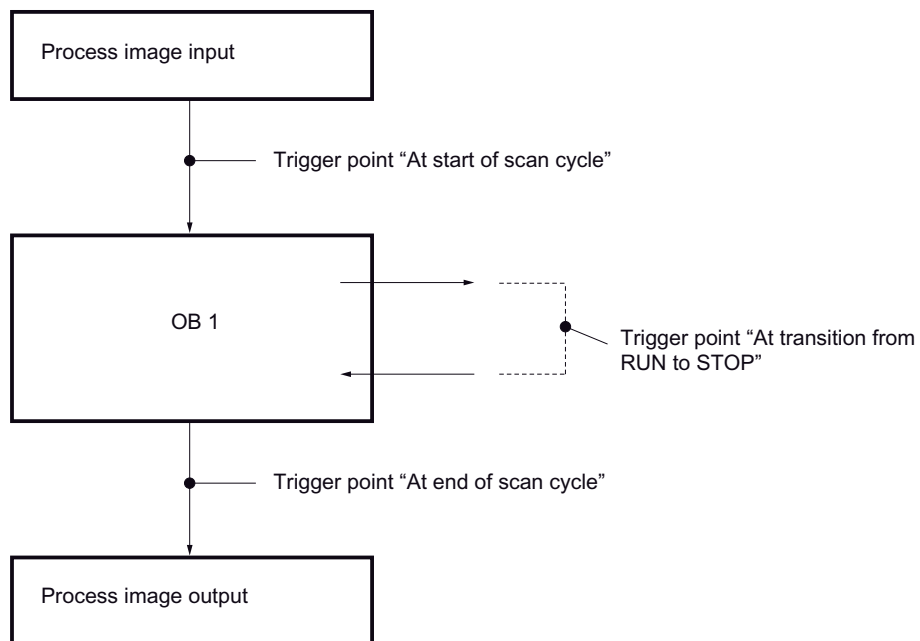

The "Permanent" mode is executed differently for the monitoring and modifying of tags.

- Monitoring: The inputs are monitored at the end of the cycle and the outputs at the start of the cycle.
- Modifying: The inputs are monitored at the start of the cycle and the outputs at the end of the cycle.

### Selecting the trigger point

The trigger points "Beginning of scan cycle", "End of scan cycle", and "Switch to stop" specify the time at which the tags are to be read from the CPU or updated in the CPU.

The following diagram shows the position of these trigger points:

### Position of the trigger points

From the position of the trigger points, it follows that:

- Modifying of inputs is only appropriate at the beginning of the scan cycle (corresponding to the beginning of the user program OB 1), because otherwise the process image input is updated again after modifying and is thus overwritten.
- Modifying of outputs is only appropriate at the end of the scan cycle (corresponding to the end of the user program OB 1), because otherwise the process image output can be overwritten by the user program.
- The modified value is displayed in the "Monitor value" column, provided that monitoring is active and the modified value is not overwritten by the user program.

### Monitoring of tags

When tags are being modified, the following applies to the trigger points:

- If you have specified the modify mode as "once only", you will receive a message if the selected tags cannot be modified.
- In "permanent" modify mode, you do not receive a message.

### Note regarding the "Modify now" command

You can modify the values of selected tags immediately using the "Online > Modify >Modify now" command. This command is executed once only and as quickly as possible without reference to a defined position (trigger point) in the user program. This function is used mainly for modifying when the CPU is in STOP mode.

### "Monitor all" command for tags

#### Introduction

The "Monitor all" command allows you to start monitoring the visible tags in the active watch table. The default setting for the monitoring mode in basic mode of the watch table is "permanent". In expanded mode, you can specify defined trigger points for the monitoring of tags. In this case, the tags are monitored with reference to the specified trigger points.

<b>NOTICE</b>
<b>Danger of a time-out while monitoring peripheral inputs</b>
Note that the monitoring of peripheral inputs can result in a time-out. The CPU assumes the "STOP" mode.

## Requirements

- A watch table has been created.
- An online connection to the CPU exists.

## Procedure

To execute the "Monitor all" command, follow these steps:

1. Enter the tags to be monitored and the corresponding addresses in the watch table.
2. Switch to expanded mode by clicking the icon "Show/hide advanced setting columns" in the toolbar.
3. If you want to change the default monitoring mode for a tag, click the appropriate cell in the "Monitor with trigger" column and select the desired monitoring mode from the drop-down list.
4. Click the "Monitor all" icon in the toolbar.

## Result

The tags of the active watch table are monitored using the monitoring mode selected.

## See also

Icons in the watch table (Page 1716)

Basic mode and expanded mode in the watch table (Page 1715)

## "Monitor now" command for tags

### Introduction

The "Monitor now" command starts the monitoring of tags immediately without reference to defined trigger points. The tag values are read out once only and displayed in the watch table.

<b>NOTICE</b>
<b>Danger of a time-out while monitoring peripheral inputs</b>
Note that the monitoring of peripheral inputs can result in a time-out.
The CPU assumes the "STOP" mode.

### Requirements

- A watch table has been created.
- An online connection to the CPU exists.

### Procedure

To execute the "Monitor now" command, follow these steps:

1. Enter the tags to be monitored and the corresponding addresses in the watch table.
2. Click the "Monitor now" icon in the toolbar.

### Result

The tags of the active watch table are monitored immediately and once only.

## 9.4.3.8 Modifying tags in the watch table

### Introduction to modifying tags

#### Introduction

The watch table allows you to modify the tags of the configured input and output modules in the CPU, depending on the monitoring and modify mode (Page 1728) selected. To monitor the tags, an online connection to the CPU must exist.

 <b>DANGER</b>
<b>Danger when modifying:</b>
Serious personal injury and material damage can result from changes in the tags or addresses during plant operation in the event of malfunctions or program errors! Make sure that dangerous conditions cannot occur before you execute the "Modify" function.

**NOTICE**

**Danger of a time-out while controlling peripheral outputs**

Note that the controlling of peripheral outputs in the watch table can result in a time-out.  
The CPU assumes the "STOP" mode.

**Options for modifying tags**

The following options are available for modifying tags:

- **Modify to "0"**  
This command modifies the selected address to the modify value "0".
- **Modify to "1"**  
This command modifies the selected address to the modify value "1".
- **Modify once only and immediately**  
This command modifies all selected addresses in the active watch table "once only and immediately".
- **Modify with trigger**  
This command modifies all selected addresses in the active watch table using the monitoring and modify mode (Page 1728) selected.  
The "Modify with trigger" function is only available in expanded mode. You will not receive a message indicating whether or not the selected addresses were actually modified with the specified value. You should use the "Modify once only and immediately" function if you require such a confirmation.
- **Enable peripheral outputs**  
This command disables the command output disable.  
This function can only be executed in expanded mode, when the CPU is in STOP and the option Force (Page 1757) of tags is not enabled. If desired, deactivate this function in the force table.

---

**Note**

**When modifying, note the following:**

Modifying can **not** be undone.

---

## Modify tags to "0"

### Introduction

You can assign one-time values to tags independent of the monitoring and modify mode and modify them. The modify command is executed as fast as possible, similar to a "Trigger now" command, without reference to a defined position in the user program.

#### DANGER

##### **Danger when modifying:**

Serious personal injury and material damage can result from changes in the tags or addresses during plant operation in the event of malfunctions or program errors!  
Make sure that dangerous conditions cannot occur before you execute the "Modify" function.

#### NOTICE

##### **Danger of a time-out while controlling peripheral outputs**

Note that the controlling of peripheral outputs in the watch table can result in a time-out.  
The CPU assumes the "STOP" mode.

### Requirements

- A watch table has been created.
- An online connection to the CPU exists.

### Procedure

To modify tags to "0", follow these steps:

1. Enter the desired address in the watch table.
2. Select the "Online > Modify > Modify to 0" command in order to modify the selected address with the specified value.

### Result

The selected address is modified to "0".

---

#### **Note**

**When modifying, note the following:**

Modifying can **not** be undone!

---

## Modify tags to "1"

### Introduction

You can assign one-time values to tags independent of the monitoring and modify mode and modify them. The modify command is executed as fast as possible, similar to a "Trigger now" command, without reference to a defined position in the user program.

 <b>DANGER</b>
<b>Danger when modifying:</b> Serious personal injury and material damage can result from changes in the tags or addresses during plant operation in the event of malfunctions or program errors! Make sure that dangerous conditions cannot occur before you execute the "Modify" function.

<b>NOTICE</b>
<b>Danger of a time-out while controlling peripheral outputs</b> Note that the controlling of peripheral outputs in the watch table can result in a time-out. The CPU assumes the "STOP" mode.

### Requirements

- A watch table has been created.
- An online connection to the CPU exists.

### Procedure

To modify tags to "1", follow these steps:

1. Enter the desired address in the watch table.
2. Select the "Online > Modify > Modify to 1" command in order to modify the selected address with the specified value.

### Result

The selected address is modified to "1".

---

**Note**  
**When modifying, note the following:**  
Modifying can **not** be undone!

---

## "Modify now" command for tags

### Introduction

You can assign one-time values to tags independent of the monitoring and modify mode and modify them immediately. The modify command is executed as fast as possible, similar to a "Trigger now" command, without reference to a defined position in the user program.

#### **DANGER**

##### **Danger when modifying:**

Serious personal injury and material damage can result from changes in the tags or addresses during plant operation in the event of malfunctions or program errors!  
Make sure that dangerous conditions cannot occur before you execute the "Modify" function.

#### **NOTICE**

##### **Danger of a time-out while controlling peripheral outputs**

Note that the controlling of peripheral outputs in the watch table can result in a time-out.  
The CPU assumes the "STOP" mode.

### Requirements

- A watch table has been created.
- An online connection to the CPU exists.

### Procedure

To modify tags immediately, follow these steps:

1. Enter the desired addresses and modify values in the watch table.
2. Select the addresses to be modified by selecting the check boxes for modifying in the column after the "Modify value".  
A yellow triangle appears behind the selected check box, indicating that the address is now selected for modifying but has not yet been modified.
3. Select the "Online > Modify > Modify once and now" command in order to immediately modify the selected address once only with the specified value.

## Result

The selected addresses are modified immediately and once only.

---

### Note

**When modifying, note the following:**

Modifying can **not** be undone!

---

## "Modify with trigger" command for tags

### Introduction

You can assign values to addresses dependent on the defined monitoring and modify mode and modify them. The modify command is executed as specified in the monitoring and modify mode, with reference to the defined trigger position in the user program.

 <b>DANGER</b>
<b>Danger when modifying:</b> Serious personal injury and material damage can result from changes in the tags or addresses during plant operation in the event of malfunctions or program errors! Make sure that dangerous conditions cannot occur before you execute the "Modify" function.

<b>NOTICE</b>
<b>Danger of a time-out while controlling peripheral outputs</b> Note that the controlling of peripheral outputs in the watch table can result in a time-out. The CPU assumes the "STOP" mode.

## Requirements

- A watch table has been created.
- An online connection to the CPU exists.
- The watch table has to be in expanded mode.

## Procedure

To modify tags "with trigger", follow these steps:

1. Enter the desired addresses and modify values in the watch table.
2. Select the addresses to be modified by selecting the check boxes for modifying in the column after the "Modify value".  
A yellow triangle appears behind the selected check box, indicating that the address is now selected for modifying but has not yet been modified.
3. Switch to expanded mode using the icon "Show/hide advanced settings columns" in the toolbar or the "Online > Expanded mode" command.  
The "Monitor with trigger" and "Modify with trigger" columns are displayed.
4. In the "Modify with trigger" column, select the desired modify mode from the drop-down list box. The following options are available:
  - Permanent
  - Permanently, at start of scan cycle
  - Once only, at start of scan cycle
  - Permanently, at end of scan cycle
  - Once only, at end of scan cycle
  - Permanently, at transition to STOP
  - Once only, at transition to STOP
5. Start modifying using the "Online > Modify > Modify with trigger" command.
6. Confirm the prompt with "Yes" if you want to start modifying with trigger.

## Result

The selected tags are modified using the selected monitoring and modify mode. The yellow triangle is no longer displayed.

---

### Note

**When modifying, note the following:**

Modifying can **not** be undone!

---

## Enable peripheral outputs

### Introduction

The "Enable peripheral outputs" function deactivates the command output disable of the peripheral outputs. You can then modify the peripheral outputs when the CPU is in STOP mode. This function is available in the watch table in "Expanded mode" only.

 <b>DANGER</b>	
<b>Danger when enabling the peripheral outputs:</b>	
Attention, the enabling of the peripheral outputs can cause serious personal injury and material damage!	
Make certain that dangerous conditions cannot occur before you execute the "Enable peripheral outputs" function.	

### Prerequisites

- A watch table has been created.
- An online connection to the CPU exists.
- The CPU is in STOP mode before you can enable the peripheral outputs.
- The watch table has to be in expanded mode.
- The option Force (Page 1757) of tags must not be enabled.

---

#### Note

##### "Enable peripheral outputs" function

- This function is possible only in STOP mode. The function is exited by an operating state change of the CPU and by the termination of the online connection.
  - While the function is enabled, forcing is not possible.
- 

### Procedure

To enable the peripheral outputs in STOP mode, follow these steps:

1. Enter the desired addresses and modify values in the watch table.
2. Select the addresses to be modified by selecting the check boxes for modifying in the column after the "Modify value".  
A yellow triangle appears behind the selected check box, indicating that the address is now selected for modifying but has not yet been modified.
3. Switch to expanded mode using the icon "Show/hide advanced settings columns" in the toolbar or the "Online > Expanded mode" command.  
The "Monitor with trigger" and "Modify with trigger" columns are displayed.

4. Change the relevant CPU to STOP using the operator panel.
5. Right-click to open the shortcut menu and select "Enable peripheral outputs".
6. Confirm the prompt with "Yes" if you want to unlock the command output disable for the peripheral outputs.
7. Modify the peripheral outputs using the "Online > Modify > Modify now" command.

## Result

The peripheral outputs are modified with the selected modify values. The yellow triangle is no longer displayed.

## Enabling the peripheral outputs

The "Enable peripheral outputs" function remains active until:

- The "Enable peripheral outputs" command is deactivated again via the shortcut menu or via the "Online > Modify > Enable peripheral outputs" command.
- The CPU is no longer in STOP mode.
- The online connection is terminated.

---

### Note

When modifying, note the following:

Modifying can **not** be undone!

---

## 9.4.4 Testing with the force table

### 9.4.4.1 Introduction for testing with the force table

#### Overview

You can use the force table to assign permanent values to individual tags of the user program. This action is referred to as "forcing".

The following functions are available in the force table:

- **Monitoring tags**  
This displays the current values of the individual tags of a user program or a CPU on the programming device or PC. Tags can be monitored with or without a trigger condition.
- **Forcing tags**  
This function lets you assign a permanent value to individual peripheral tags of the user program.

## Monitoring and forcing tags

The monitoring and forcing of tags is always dependent on the operand scope of the CPU used.

The following tags can be monitored:

- Inputs, outputs, and bit memories
- Contents of data blocks
- Peripheral inputs

The following tags can be forced:

- Peripheral inputs
- Peripheral outputs

## Example

- Independent of the CPU used, only I/O can be forced, such as: "Tag\_1":P or "QW0:P" or "IW0:P". Note that "Tag\_1":P must not be the symbolic name of a bit memory.

## Possible applications

One advantage of the force table is that you can simulate different test environments and overwrite tags in the CPU with a permanent value. This enables you to intervene in the ongoing process for regulating purposes.

## See also

Layout of the force table (Page 1742)

Basic mode and expanded mode in the force table (Page 1743)

Icons in the force table (Page 1744)

Open and edit force table (Page 1745)

### 9.4.4.2 Safety precautions when forcing tags

#### Safety precautions when forcing tags

Because the forcing function allows you to intervene permanently in the process, observance of the following notices is essential:

 <b>DANGER</b>
<p><b>Prevent personal injury and material damage!</b></p> <p>Note that an incorrect action when executing the "Force" function can:</p> <ul style="list-style-type: none"><li>• Harm persons or pose a health hazard.</li><li>• Cause damage to machinery or the entire plant.</li></ul>

 <b>CAUTION</b>
<p><b>Prevent personal injury and material damage!</b></p> <ul style="list-style-type: none"><li>• Before you start the "Force" function, you should ensure that no one else is currently executing this function on the same CPU.</li><li>• Forcing can only be stopped by clicking the "Stop forcing" icon or using the "Online &gt; Force &gt; Stop forcing" command. Closing the active force table does <b>not</b> stop the forcing!</li><li>• Forcing can <b>not</b> be undone!</li><li>• Review the differences between "modifying tags" (Page 1732) and "forcing tags" (Page 1757).</li><li>• If a CPU does not support the "Force" function, the relevant icons cannot be selected.</li><li>• If the function "Enable peripheral outputs" is active on your CPU, then forcing is <b>not</b> possible on this CPU. If desired, deactivate this function in the watch table.</li></ul>

### 9.4.4.3 Layout of the force table

#### Introduction

In the force table, enter the CPU-wide tags that you have defined and selected and which are to be forced in the allocated CPU. Only peripheral inputs and peripheral outputs can be forced.

For each CPU created in the project, a force table will automatically be created in the "Watch and force tables" folder. Only one force table can be allocated to a CPU. This force table displays all the addresses forced in the allocated CPU.

### Layout of the force table

The columns displayed in the force table depend on the mode you are working in: basic mode or expanded mode.

In expanded mode the "Monitor with trigger" column is also displayed.

### Meaning of the columns

The following table shows the meaning of the individual columns in basic mode and expanded mode:

Mode	Column	Meaning
Basic mode	<b>i</b>	Identification column
	Name	Name of the inserted tag
	Address	Address of the inserted tag
	Display format	Selected display format
	Monitor value	Values of the tags, dependent on the selected display format.
	Force value	Value with which the tag is forced.
	<b>F</b> ("Force")	Select the tag to be forced by activating the corresponding check box.
Comment	Comment for documentation of the tags	
The following additional column is shown in expanded mode:	Monitor with trigger	Display of selected monitoring mode

### See also

Icons in the force table (Page 1744)

Basic mode and expanded mode in the force table (Page 1743)

#### 9.4.4.4 Basic mode and expanded mode in the force table

#### Difference between basic mode and expanded mode in the force table

In expanded mode the "Monitor with trigger" column is also displayed in the force table.

You will find a detailed list of the columns under Layout of the force table (Page 1742).

### Switching between basic mode and expanded mode

You have the following options of toggling between the basic and expanded mode:

- Click the icon "Show/hide advanced setting columns". Click this icon again to return to the basic mode.  
Or:
- Activate the check box for the "Expanded mode" command in the "Online" menu. Deactivate this check box to return to the basic mode.

### Functionality in expanded mode

The following functionality is only possible in expanded mode:

- Monitor with trigger
- Monitor peripheral inputs

#### 9.4.4.5 Icons in the force table

### Meaning of the icons

The following table shows the meaning of the icons in the force table:

Icon	Meaning
	Identifies a table inside the project tree as a force table.
	Identification column
	Inserts a row before the selected row.
	Inserts a row after the selected row.
	Displays all columns of expanded mode. If you click this icon again, the columns of the expanded mode will be hidden.
	Starts forcing for all addresses of the selected tags. If forcing is already running, the previous action is replaced without interruption.
	Stops forcing of addresses in the force table.
	Starts monitoring of the visible tags in the force table. The default setting for monitoring in basic mode is "permanent". In expanded mode an additional column is shown and you can set certain trigger points for monitoring tags.
	Starts monitoring of the visible tags in the force table. This command is executed immediately and the tags are monitored once.
	Displays the check box for the selection of tags to be forced.
	Indicates that an address cannot be forced.
	Indicates that an address cannot be fully forced. Example: It is possible to force the address QW0:P, but it is not possible to force the address QD0:P because this address area is potentially not available on the CPU.

Icon	Meaning
	Indicates that an address cannot be monitored.
	Indicates that an address is being forced.
	Indicates that an address is being partly forced.
	Indicates that the associated peripheral address is being forced.
	Indicates that a syntax error occurred.
	Indicates that the address is selected but has not been forced yet.

Layout of the force table (Page 1742)

### 9.4.4.6 Open and edit force table

#### Display force table

#### Introduction

You cannot create a new force table; one force table already exists for each CPU. It is permanently allocated to this CPU and cannot be copied or duplicated.

#### Requirements

A project with an allocated CPU has to be open.

#### Displaying a force table

The force table is always displayed below a CPU in the "Watch and force tables" folder.

#### Open force table

#### Requirements

A project with an allocated CPU must be created.

#### Procedure

Proceed as follows to open a force table:

1. Open the "Watch and force tables" folder below the desired CPU.
2. Double-click the "Force table" in this folder.

### Result

The selected force table opens.

### Save force table

### Requirements

A project with an allocated CPU has been created.

### Procedure

Proceed as follows to save a force table:

1. Enter the desired changes in the force table.
2. Select the "Save" command in the "Project" menu or click the "Save project" icon in the toolbar. Note that this save operation will save the entire project.

### Result

The contents of the force table and the associated project are saved.

---

#### Note

You cannot rename a force table.

---

#### 9.4.4.7 Entering tags in the force table

### Basic principles for entering tags in the force table

#### Recommended procedure

Select the tags whose values you want to monitor or force, and enter them in the force table.

When entering tags in the force table, please note that these tags must be previously defined in the PLC tag table.

#### Example of filling out a force table

- You can enter the absolute address that is to be forced or monitored in the "Address" column or you can enter the symbolic name of the tag in the "Name" column.
- Select the display format you require from the drop-down list in the "Display format" column, if you do not want to use the default setting.

- Now you have to decide whether you want to monitor or force the entered tags. Enter the required force value and a comment in the appropriate columns of the force table.
- Note that only peripheral inputs and peripheral outputs can be forced and review the Safety precautions when forcing tags (Page 1758).

### Create comment line

If required, you can create a comment row by entering the string "/" in the "Name" column.

### Syntax check

When you enter tags in the force table, the syntax of each cell will be checked when you exit the cell. Incorrect entries are marked in red.

---

#### Note

When you place the mouse pointer in a cell marked in red, brief information is displayed with additional notes on the error.

---

### Permitted operands for the force table

#### Permitted operands for the force table

The following table shows the operands that are permitted for forcing in the force table:

Permitted operand	Example of data type	Example (International mnemonics)
Peripheral input/peripheral output	BOOL	I0.0:P; Q0.0:P
Peripheral input/peripheral output	BYTE	IB1:P; QB1:P
Peripheral input/peripheral output	WORD	IW2:P; QW3:P
Peripheral input/peripheral output	DWORD	ID2:P; QD1:P

The following table shows the operands that are permitted for monitoring in the force table:

Permitted operand	Example of data type	Example (International mnemonics)
Input/output/bit memory	BOOL	I1.0, Q1.7, M10.1 I0.0:P
Input/output/bit memory	BYTE	IB1/QB10/MB100 IB1:P
Input/output/bit memory	WORD	IW1; QW10; MW100 IW2:P

Permitted operand	Example of data type	Example (International mnemonics)
Input/output/bit memory	DWORD	ID4; QD10; MD100 ID2:P
Timers	TIMER	T1
Counters	COUNTER	C1
Data block	BOOL	DB1.DBX1.0
Data block	BYTE	DB1.DBB1
Data block	WORD	DB1.DBW1
Data block	DWORD	DB1.DBD1

**Note**

You cannot enter "DB0..." because it is used by the system!

**Permitted force values for the force table**

**Entering force values in the force table**

The following table shows the operands that are permitted for entering force values in the force table:

Table 9-20 Bit operands

Possible bit operands	Example for permitted force values
I1.0:P	True
I1.1:P	False
Q1.0P	0
Q1.1:P	1
I2.0:P	2#0
I2.1:P	2#1

Table 9-21 Byte operands

Possible byte operands	Example for permitted force values
IB1:P	2#00110011
IB2:P	B#16#1F
QB14:P	1F
QB10:P	'a'
IB3:P	10

Table 9-22 Word operands

Possible word operands	Example for permitted force values
IW0:P	2#0011001100110011
IW2:P	W#16#ABCD
QW10:P	ABCD
QW12:P	B#(12, 34)
IW4:P	'ab'
IW6:P	12345
IW8:P	S5T#9S_340ms
IW10:P	C#123
IW12:P	D#2006-12-31

Table 9-23 Double word operands

Possible double word operands	Example for permitted force values
ID0:P	2#00110011001100110011001100110011
ID4:P	1.2
QD10:P	1.234.e4
QD14:P	Dw#16#abcdef10
ID8:P	16#ABCDEF10
ID12:P	b#(12,34,56,78)
ID16:P	L#-12
ID20:P	L#12
ID24:P	123456789
ID28:P	123456789
ID32:P	T#12s345ms
ID36:P	Tod#14:20:40.645
ID40:P	P#e0.0

## Overview of the display formats

### Display formats in the force table

The display format you select specifies the representation of a tag value.

When entering the address a display format is automatically preset. If you want to change this, you can select a display format from the drop-down list in the "Display formats" column. The drop-down list only offers the display formats which are valid for this data type. The display format that appears first in the list is the pre-selected format.

**Example**

The following table shows the 32-bit data types permitted for all CPU families in the force table and their possible display formats:

Data type	Possible display formats
BOOL	Bool, Hex, BCD, Octal, Bin, Dec, Dec+/-
BYTE	Hex, BCD, Octal, Bin, Dec, Dec+/-, Character
WORD	Hex, BCD, Octal, Bin, Dec, Dec+/-, Dec_Sequence, Character, SIMATIC_Timer, Date, Unicode_Character, Counter
DWORD	Hex, BCD, Octal, Bin, Dec, Dec+/-, Dec_Sequence, Character, Floating-point number, Time of day, Timer, Pointer, Unicode_Character
SINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character
INT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, SIMATIC_Timer, Counter, Date
DINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, Floating-point number, Time of day, Timer, Pointer
USINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character
UINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, SIMATIC_Timer, Counter, Date
UDINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, Floating-point number, Time of day, Timer, Pointer
REAL	Floating-point number, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Time of day, Timer, Pointer
DATE	Date, Dec, Hex, BCD, Bin
TIME_OF_DAY	Time of day, Dec, Hex, BCD, Bin
TIME	Timer, Hex, BCD, Bin
DATE_AND_TIME	Date and time,
TIMER	SIMATIC_Timer, Hex, BCD, Bin
CHAR	Character, Hex, BCD, Octal, Bin, Dec, Dec+/-
WCHAR	Unicode_Character, Character, Hex, BCD, Octal, Bin, Dec, Dec+/-
STRING	Character string
WSTRING	Unicode_character string
POINTER	Pointer, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Floating-point number, Time of day, Timer, Number
COUNTER	Counter, Hex, BCD, Bin
S5TIME	SIMATIC_Timer, Hex, BCD, Bin

For the S7-1200 CPU family, all 32-bit data types are permitted (see table above), as well as the 64-bit data type LREAL with the following possible display formats:

Data type	Possible display formats
LREAL	In a project created with TIA Portal < V12: Floating-point number Note: The display of LREAL is limited to 13 digits plus exponent.
LREAL	In a project created with TIA Portal >= V12: Floating-point number, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Time of day, Timer, Date and time Note: The display of LREAL is limited to 13 digits plus exponent.

For the S7-1500 CPU family, in addition to 32-bit data types, the 64-bit data types listed in the table are also permitted with the following possible display formats:

Data type	Possible display formats
LWORD	Hex, Octal, BCD, Bin, Character, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Floating-point number, Time of day, Timer, Date and time
LINT	Dec+/-, Dec, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, Time of day, Timer, Date and time
ULINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, Time of day, Timer, Date and time
LREAL	Floating-point number, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Time of day, Timer, Date and time
LTIME	Timer, Dec+/-, Dec, Hex
LTOD	Dec, Hex, BCD, Bin, Time of day
LDT	Dec, Hex, Date and time

For more information, refer to the description of the valid data types.

#### Note

##### Rounding of floating-point numbers

In the force table, floating-point numbers are stored as binary numbers in IEEE format. Because not every floating point number (real, longreal) that can be displayed on the user interface can be mapped to the IEEE format, there is a possibility that floating-point numbers will be rounded. If a rounded floating-point number in the force table is copied and, in turn, inserted in another input field, the rounding may cause a slight difference.

---

**Note**

**Only symbolic addressing is possible**

In the force table, LongDataTypes such as LWORD or LREAL can only be addressed symbolically.

---

## Selecting the display format for tags

### Procedure

To select the display format of the tags, follow these steps:

1. Enter the desired address in the force table.
2. Click the desired cell in the "Display format" column, and open the drop-down list. The permitted display formats are shown in the drop-down list.
3. Select the desired display format from the drop-down list.

---

**Note**

If the selected display format cannot be applied, then the last selected display format will be displayed automatically.

---

## Creating and editing comment lines

### Basic principles of comment lines

In addition to the row-related comments in the comment column, you can now also create complete comment lines to enhance the structure of the force table.

The contents of the comment line are stored in the "Languages & Resources" folder in the "Project texts" tab and can be compiled in other project languages.

### Creating comment lines

To create comment lines, follow these steps:

1. Open the force table and enter the required addresses.
2. To create a comment line, enter the character string "/" in the "Name" column. No comment lines can be created in the other columns.

3. Enter the required comment in the comment line. The entered comment is shown in green.
4. To show all comments you entered, double-click "Project texts" in the project tree under "Languages & Resources".
5. If you are working in multi-lingual projects and want your comment to be translated into other languages, you can set the project languages required in addition to the editing language in the project tree under "Languages & Resources > Project languages".

### **Deleting comment lines**

To delete comment lines, follow these steps:

1. Open a force table containing comment lines.
2. Delete the entire comment including the introductory string "//", if you no longer require this.
3. Alternatively, delete only the introductory string "//". In this case the existing comment is retained and is displayed in the "Comment" column in the force table.

---

#### **Note**

##### **Deleting comment lines**

When you delete comment lines the project languages and any existing translations for these comments are also deleted.

---

### **9.4.4.8 Monitoring tags in the force table**

#### **Introduction to monitoring tags in the force table**

##### **Introduction**

Use the force table to monitor the tags of the configured input and output modules in the CPU, dependent on the monitoring mode (Page 1754) you have selected. An online connection to the CPU must exist to monitor tags.

### Options for monitoring tags

The following options are available for monitoring tags:

- Monitor all  
This command starts the monitoring of all visible tags in the active force table, dependent on the selected monitoring mode:
  - In basic mode, the monitoring mode is set to "permanent" by default.
  - In expanded mode, you can specify defined trigger points for the monitoring of tags.

---

#### Note

If the monitoring mode is changed while in expanded mode and then a switch is made to basic mode, the monitoring mode set before will also be applied in basic mode.

---

- Monitor now  
This command starts the monitoring of the visible tags in the active force table immediately and once only.

### CPU-specific limitations when monitoring tags

The following CPU-specific differences exist:

- CPU S7-300/400:  
CPUs from this family can only monitor the first 30 characters of a string.
- CPU S7-1200:  
CPUs from this family can monitor a string up to the total size of 254 characters.

### Setting the monitoring mode in the force table

#### Introduction

By selecting the monitoring mode, you specify the trigger point and the duration of tag monitoring in the force table.

#### Possible monitoring mode (duration of monitoring)

The following selection options are available:

- Permanent
- Once only, at start of scan cycle
- Once only, at end of scan cycle
- Permanently, at start of scan cycle
- Permanently, at end of scan cycle
- Once only, at transition to STOP
- Permanently, at transition to STOP

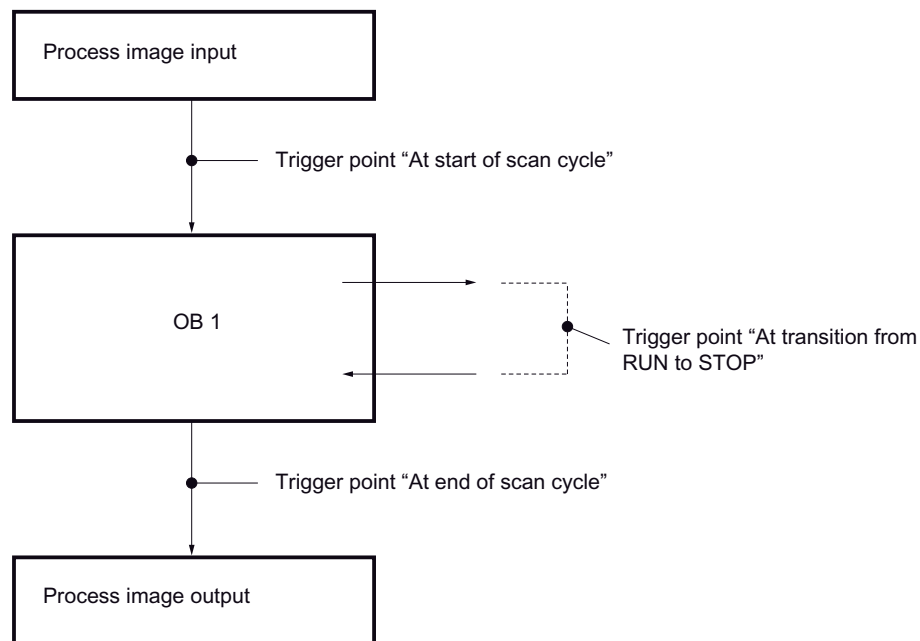

## Special features when using "Permanent" mode

The "Permanent" mode is executed as follows for the monitoring of tags: The inputs are monitored at the end of the cycle and the outputs at the start of the cycle.

## Selecting the trigger point

The trigger points "Beginning of scan cycle", "End of scan cycle", and "Switch to stop" specify the time at which the tags are to be read from the CPU or updated in the CPU.

The following diagram shows the position of these trigger points:

## "Monitor all" command for tags

### Introduction

Use the "Monitor all" command to start monitoring the visible tags in the active force table. In basic mode of the force table, the default setting for the monitoring mode is "permanent". In expanded mode, you can specify defined trigger points for the monitoring of tags. In this case, the tags are monitored with reference to the specified trigger points.

### Requirements

An online connection to the CPU exists.

### Procedure

To execute the "Monitor all" command, follow these steps:

1. Enter the tags to be monitored and the corresponding addresses in the force table.
2. Switch to expanded mode by clicking the icon "Show/hide advanced setting columns" in the toolbar.
3. If you want to change the default monitoring mode for a tag, click the appropriate cell in the "Monitor with trigger" column and select the desired monitoring mode from the drop-down list.
4. Click the "Monitor all" icon in the toolbar.

### Result

The tags of the active force table will be monitored using the set monitoring mode.

### "Monitor now" command for tags

#### Introduction

The "Monitor now" command starts the monitoring of tags immediately without reference to defined trigger points. The tag values are read out only once and displayed in the force table.

#### Requirements

An online connection to the CPU exists.

### Procedure

To execute the "Monitor now" command, follow these steps:

1. Enter the tags to be monitored and the corresponding addresses in the force table.
2. Click the "Monitor now" icon in the toolbar.

### Result

The tags of the active force table are monitored immediately and once only.

#### 9.4.4.9 Forcing tags in the force table

### Introduction to forcing tags

#### Introduction

You can use the force table to assign permanent values to individual tags of the user program. This action is referred to as forcing. Only peripheral inputs and peripheral outputs can be forced.

To use the forcing function, you must have an online connection to the CPU and the utilized CPU must support this functionality.

If you open a force table in the "Watch and force tables" folder below a CPU, all values forced in the allocated CPU will be displayed in this force table, provided that an online connection to the CPU exists.

#### Possible applications

By permanently assigning defined values to tags, you can specify defined default settings for your user program and, thus, test the programmed functions. Forcing is possible in basic mode and in expanded mode (Page 1743).

#### Caution when forcing tags

Before forcing, you must review the safety precautions (Page 1758) for this procedure.

 <b>DANGER</b>	
<b>Prevent personal injury and material damage!</b>	
Note that an incorrect action when executing the "Force" function can:	
<ul style="list-style-type: none"><li>• Harm persons or pose a health hazard.</li><li>• Cause damage to machinery or the entire plant.</li></ul>	

#### Options for forcing tags

The following options are available for forcing tags:

- Force to "0"  
This command forces the selected address in the CPU to the force value "0".
- Force to "1"  
This command forces the selected address in the CPU to the force value "1".
- Force all  
This command starts the forcing of enabled addresses in the active force table or replaces an existing force job without interruption.
- Stop forcing  
This command stops the forcing of all addresses in the active force table.

### Constraints when forcing tags

Note the following constraints when forcing:

- Forcing is always dependent on the operand scope of the CPU used.
- In principle, only peripheral inputs and peripheral outputs can be forced.
- If the function "Enable peripheral outputs" is active on your CPU, then forcing is not possible. If desired, deactivate this function in the watch table.

### Unique aspects when forcing tags

Note that forcing of tags will overwrite values in the CPU and will continue even after the online connection to the CPU is terminated.

- **Stop forcing**  
Terminating the online connection is not sufficient to stop the forcing operation! To stop forcing, you must select the "Online > Force > Stop forcing" command. Only then will the tags that are visible in the active force table no longer be forced.
- **Stop forcing of individual tags**  
The "Online > Force > Stop forcing" command always applies to all tags displayed in the force table. To stop forcing individual tags, you must clear the check mark for forcing of these tags in the force table and restart forcing using the "Online > Force > Force all" command.

### Safety precautions when forcing tags

### Safety precautions when forcing tags

Because the forcing function allows you to intervene permanently in the process, observance of the following notices is essential:

 <b>DANGER</b>
<b>Prevent personal injury and material damage!</b>
Note that an incorrect action when executing the "Force" function can:
<ul style="list-style-type: none"><li>• Harm persons or pose a health hazard.</li><li>• Cause damage to machinery or the entire plant.</li></ul>

 **CAUTION**

**Prevent personal injury and material damage!**

- Before you start the "Force" function, you should ensure that no one else is currently executing this function on the same CPU.
- Forcing can only be stopped by clicking the "Stop forcing" icon or using the "Online > Force > Stop forcing" command. Closing the active force table does **not** stop the forcing!
- Forcing can **not** be undone!
- Review the differences between "modifying tags" (Page 1732) and "forcing tags" (Page 1757).
- If a CPU does not support the "Force" function, the relevant icons cannot be selected.
- If the function "Enable peripheral outputs" is active on your CPU, then forcing is **not** possible on this CPU. If desired, deactivate this function in the watch table.

## Force tags to "0"

### Introduction

You can use the force function to assign permanent values to individual tags of a user program.

### Caution when forcing tags

Before forcing, you must review the safety precautions when forcing tags (Page 1758).

 **DANGER**

**Prevent personal injury and material damage!**

Note that an incorrect action when executing the "Force" function can:

- Pose a risk to the life or health of persons.
- Cause damage to machinery or the entire plant.

### Requirements

- An online connection to the CPU exists.
- The utilized CPU supports the force function.
- The "Enable peripheral outputs" function is **not** enabled on the CPU on which the tags are to be forced. If desired, deactivate this function in the watch table.

## Procedure

To force tags to "0", follow these steps:

1. Open the force table.
2. Enter the desired address in the force table.
3. Select the "Online > Force> Force to 0" command in order to force the selected address with the specified value.
4. Confirm the next dialog with "Yes".

## Result

The selected address is forced to "0". The yellow triangle is no longer displayed. A red "F" is displayed in the first column, for example, indicating that the tag is being forced.

## Stop forcing

To stop forcing, follow these steps:

1. Open the force table.
2. Select the "Online > Force > Stop forcing" command.
3. Confirm the next dialog with "Yes".

## Result

Forcing of the selected values is stopped. The red "F" in the first column is no longer displayed. The yellow triangle reappears behind the check box again to indicate that the address is selected for forcing but is not being forced at the moment.

---

### Note

#### When forcing, note the following:

- Forcing **cannot** be undone!
  - Terminating the online connection does **not** stop the forcing!
  - To stop forcing, the forced address must be visible in the active force table.
- 

## Force tags to "1"

### Introduction

You can use the force function to assign permanent values to individual tags of a user program.

## Caution when forcing tags

Before forcing, you must review the safety precautions when forcing tags (Page 1758).

 <b>DANGER</b>
<b>Prevent personal injury and material damage!</b>
Note that an incorrect action when executing the "Force" function can:
<ul style="list-style-type: none"><li>• Endanger the life or health of personnel</li><li>• Cause damage to machinery or the entire plant.</li></ul>

## Requirements

- An online connection to the CPU exists.
- The utilized CPU supports the force function.
- The "Enable peripheral outputs" function is **not** enabled on the CPU on which the tags are to be forced. If desired, deactivate this function in the watch table.

## Procedure

To force tags to "1", follow these steps:

1. Open the force table.
2. Enter the desired address in the force table.
3. Select the "Online > Force > Force to 1" command in order to force the selected address with the specified value.
4. Confirm the next dialog with "Yes".

## Result

The selected address is forced to "1". The yellow triangle is no longer displayed. A red "F" is displayed in the first column, for example, indicating that the tag is being forced.

## Stop forcing

To stop forcing, follow these steps:

1. Open the force table.
2. Select the "Online > Force > Stop forcing" command.
3. Confirm the next dialog with "Yes".

## Result

Forcing of the selected values is stopped. The red "F" in the first column is no longer displayed. The yellow triangle reappears behind the check box again to indicate that the address is selected for forcing but is not being forced at the moment.

---

### Note

#### When forcing, note the following:

- Forcing **cannot** be undone!
  - Terminating the online connection does **not** stop the forcing!
  - To stop forcing, the forced address must be visible in the active force table.
- 

## "Force all" command for tags

### Introduction

You can use the force function to assign permanent values to individual tags of a user program.

If forcing is already active, this forcing operation is replaced without interruption by the "Online > Force > Force all" command. Any forced addresses that are not selected will no longer be forced.

### Caution when forcing tags

Before forcing, you must review the safety precautions when forcing tags (Page 1758).

 <b>DANGER</b>
<b>Prevent personal injury and material damage!</b>
Note that an incorrect action when executing the "Force" function can:
<ul style="list-style-type: none"><li>• Pose a risk to the life or health of persons.</li><li>• Cause damage to machinery or the entire plant.</li></ul>

### Requirements

- An online connection to the CPU exists.
- The utilized CPU supports the force function.
- The "Enable peripheral outputs" function is **not** enabled on the CPU on which the tags are to be forced. If desired, deactivate this function in the watch table.

## Procedure

To force tags with the "Online > Force > Force all" command, follow these steps:

1. Open the force table.
2. Enter the desired addresses and force values in the force table.
3. Select the addresses to be forced by selecting the check boxes for forcing in the column after the "Force value".  
A yellow triangle appears behind the selected check box, indicating that the address is selected for forcing but is not being forced at the moment.
4. Select the "Online > Force > Force all" command in order to force the selected addresses with the specified values.
5. Confirm the next dialog with "Yes".

## Result

The selected addresses are forced to the specified values. The yellow triangle is no longer displayed. A red "F" is displayed in the first column, for example, indicating that the tag is being forced.

## Stop forcing

To stop forcing, follow these steps:

1. Open the force table.
2. Select the "Online > Force > Stop forcing" command.
3. Confirm the next dialog with "Yes".

## Result

Forcing of the selected addresses is stopped. The red "F" in the first column is no longer displayed. The yellow triangle reappears behind the check box again to indicate that the address is selected for forcing but is not being forced at the moment.

---

### Note

**When forcing, note the following:**

- Forcing **cannot** be undone!
  - Terminating the online connection does **not** stop the forcing!
  - To stop forcing, the forced address must be visible in the active force table.
-

### 9.4.4.10 Stop forcing tags

#### Stop forcing all tags

##### Introduction

Note the following before you stop forcing tags:

- Stopping forcing **cannot** be undone!
- Terminating the online connection does **not** stop the forcing!
- To stop forcing, the forced address must be visible in the active force table.

##### Caution when forcing tags

Before forcing, you must review the safety precautions when forcing tags (Page 1758).

 <b>DANGER</b>
<b>Prevent personal injury and material damage!</b>
Note that an incorrect action when stopping the "Force" function can:
<ul style="list-style-type: none"><li>• Pose a risk to the life or health of persons.</li><li>• Cause damage to machinery or the entire plant.</li></ul>

##### Requirements

- Tags are forced in a force table.
- An online connection to the CPU exists.
- The utilized CPU supports the force function.
- The "Enable peripheral outputs" function is not enabled on the CPU on which the tags are to be forced. If desired, deactivate this function in the watch table.

##### Procedure

Proceed as follows to stop **forcing all tags** :

1. Open the force table.
2. Select the "Online > Force > Stop forcing" command in order to stop forcing the displayed addresses.
3. Confirm the "Stop forcing" dialog with "Yes".

## Result

The forcing of all tags is stopped. The red "F" in the first column is no longer displayed. The yellow triangle reappears behind the check box again to indicate that the address is flagged for forcing but is not being forced at the moment.

## Stop forcing individual tags

### Introduction

Note the following before you stop forcing tags:

- Stopping forcing **cannot** be undone!
- Terminating the online connection does **not** stop the forcing!
- To stop forcing, the forced address must be visible in the active force table.

### Caution when forcing tags

Before forcing, you must review the safety precautions when forcing tags (Page 1742).

 <b>DANGER</b>
<p><b>Prevent personal injury and material damage!</b></p> <p>Note that an incorrect action when stopping the "Force" function can:</p> <ul style="list-style-type: none"><li>• Pose a risk to the life or health of persons.</li><li>• Cause damage to machinery or the entire plant.</li></ul>

### Requirements

- Tags are forced in a force table.
- An online connection to the CPU exists.
- The utilized CPU supports the force function.
- The "Enable peripheral outputs" function is not enabled on the CPU on which the tags are to be forced. If desired, deactivate this function in the watch table.

### Procedure

Proceed as follows to stop **forcing individual tags** :

1. Open the force table.
2. Deactivate the check boxes for the addresses that are no longer to be forced.
3. Reselect the "Online > Force" command.

## Result

Forcing of the disabled addresses will be stopped. The red "F" in the first column is no longer displayed. The yellow triangle reappears behind the check box again to indicate that the address is flagged for forcing but is not being forced at the moment.

## 9.5 Using Team Engineering

### 9.5.1 Exchanging data with Inter Project Engineering (IPE)

#### 9.5.1.1 Basics of Inter Project Engineering (IPE)

##### Introduction to Inter Project Engineering (IPE)

The functionality of Inter Project Engineering, hereinafter referred to as IPE, is used to exchange the controller data in a source project between different projects with the help of a device proxy.

You can then transfer this data to other projects, for visualization in HMI, for example, and use it there for further configuration.

Inter Project Engineering gives you a simple way of providing controller data from a PLC programming across multiple projects for an HMI configuration.

Using the object "Device Proxy Data", you exchange controller data across multiple projects consistently and easily without redundant configuration overheads.

This makes it possible for HMI project engineers to work on a project without the hardware configuration having to be present in their project. This means they can work on the PLC project and on the HMI project at the same time.

You can exchange the following controller data between projects via the device proxy:

- Program blocks
- Technological objects
- PLC tags
- PLC alarms

The following data is automatically included in the exchange:

- Controller interfaces
- Configured communication processors and communication modules

This automatic data exchange ensures that the interfaces and the configured communication processors and modules are transferred along with the data you selected. This data is required to allow you to continue working consistently and without problems in your target project.

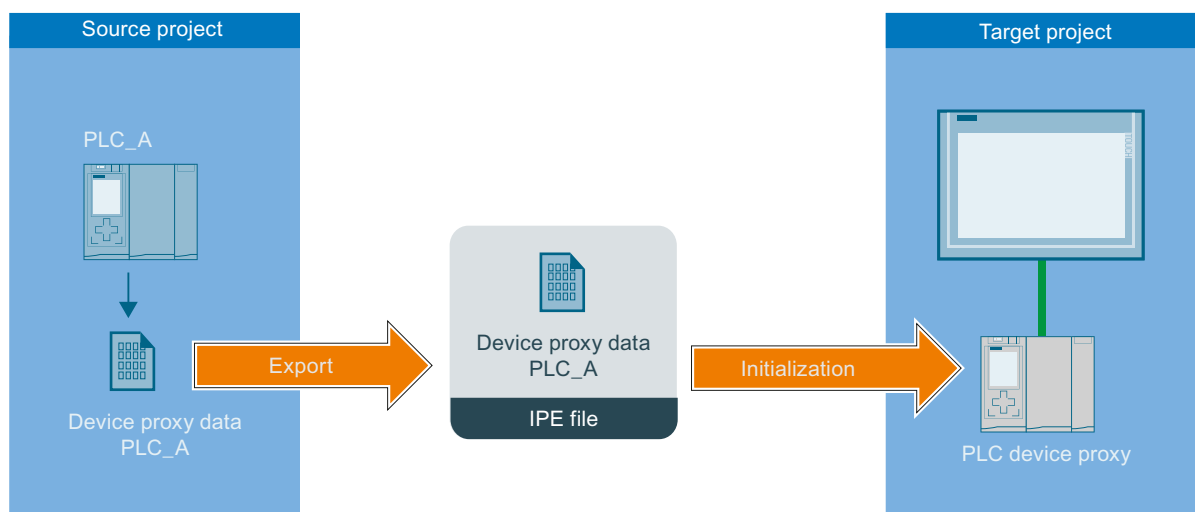

## Cross-project data exchange

The following options are available for cross-project data exchange with Inter Project Engineering:

- Exchanging controller data via IPE file
- Exchanging controller data via project file

### Exchanging controller data via IPE file

The figure below shows cross-project data exchange via an IPE file.

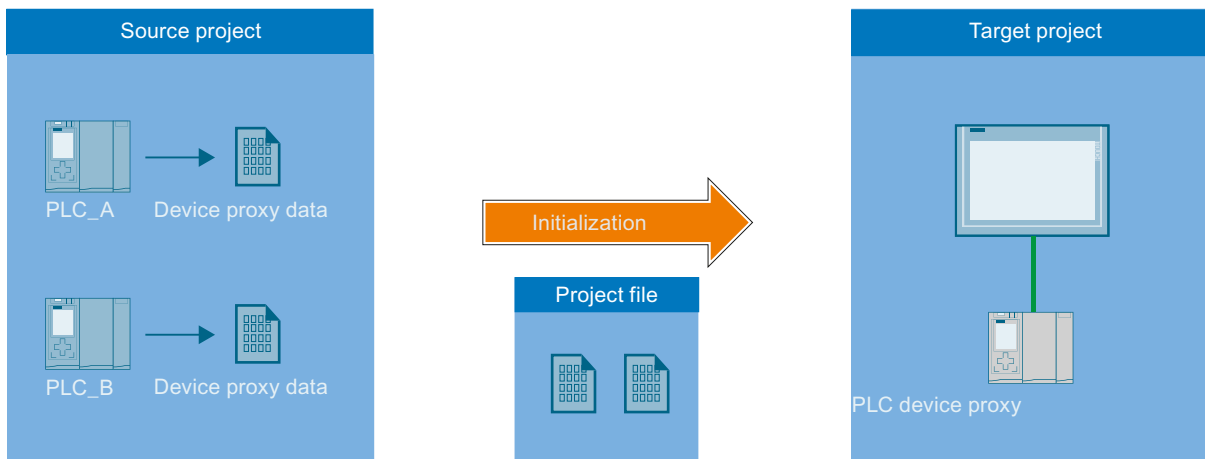

The PLC controller data from the source project is transferred to the PLC in the target project via the object "Device Proxy Data".

Controller data that is exchanged via an IPE file must originate from TIA Portal Projects V13 or higher.

### Exchanging controller data via a project file

The figure below shows cross-project data exchange via a project file.

The PLC controller data from the source project is transferred to the PLC in the target project via a project file.

You can easily transfer and continue to use controller data from older TIA Portal projects as well as STEP 7 Classic projects that are not integrated in TIA Portal in your current TIA Portal projects.

### 9.5.1.2 Requirements for Inter Project Engineering (IPE)

#### Software and hardware requirements

To use the functionality of Inter Project Engineering, the minimum software and hardware requirements for the installation of TIA Portal V13 or higher must be met.

The following requirements also apply:

- You have installed TIA Portal V13 or higher and the "SIMATIC STEP 7 Professional" software package.
- You are using a CPU of the S7-1200/1500 or S7-300/400 series.
- The same software version must be installed on all involved controllers.

#### Requirements for IPE

The requirements for accepting controller data from projects are as follows:

- You have created a project with hardware configuration and PLC data that can be transferred to another project.
- You have made sure that the project is consistent before you transfer the controller data by means of the device proxy data.
- You are familiar with the defined procedures for Inter Project Engineering.

#### Notes on compatibility mode

The functions for Inter Project Engineering are not available in compatibility mode.

### 9.5.1.3 Procedure for working with Inter Project Engineering (IPE)

#### Exchanging controller data across projects

You can use the functionality of Inter Project Engineering to exchange existing controller data between different projects with the help of a device proxy and to continue using this data in another project. The device proxy provides you with a consistent and convenient way of exchanging data between projects without redundant configuration overheads.

#### Procedure for exchanging controller data via an IPE file

To exchange data via an IPE file, follow these steps:

1. Using TIA Portal V13 or higher, create a project with all required controller data and an executable user program.
2. Configure the hardware required for the project.
3. Compile the project to ensure consistency in your project.
4. In your project, create the object "Device Proxy Data" below the required CPU by clicking the corresponding command "Add device proxy data" in the "Device Proxy Data" folder.  
**Result:** The "Device Proxy Data" object has been created.
5. Select the required device proxy data in the project tree and double-click the object to open it in the editor.
6. Enter the required data for the device proxy data in the editor under "General" or apply the default setting. You can change the name and enter a comment for export of the controller data.  
In the "Define content" area of the editor select which of the existing controller data you wish to export as IPE file and click "Export device proxy data".
7. In the subsequent dialog, enter the name and storage location for the IPE file to be created and click "Save". You will be notified as soon as the export has been completed successfully.  
**Result:** The selected controller data are exported as IPE file.
8. In your target project, create a device proxy to be able to import the controller data contained in the IPE file. To do so, click the command "Add new device" and select the required device proxy in the dialog that opens.
9. Click the newly created device proxy and select the "Initialize device proxy" command from the shortcut menu.
10. Select the previously created IPE file to be used for the initialization, and confirm the selection in the following dialog with "OK". This starts the initialization.  
**Result:** The controller data from the source project contained in the IPE file is transferred to the device proxy in the target project.

After the successful exchange of controller data, you can continue with the configuration in your target project and, for example, connect PLC tags with HMI tags. The controller data can be updated as often as required when it is changed in the source project.

### Procedure for exchanging controller data via a project file

When exchanging controller data via a project file, device proxy data can either be predefined in the source project or it can be defined and selected from the target project.

Follow these steps to exchange data via a project file:

1. Using TIA Portal V13 or higher, create a project with all required controller data and an executable user program.
2. Configure the hardware required for the project.
3. Compile the project to ensure consistency in your project.
4. Open the TIA Portal project from which you want to import the controller data into the target project.
5. In your project, create the object "Device Proxy Data" below the required CPU by clicking the corresponding command "Add device proxy data" in the "Device Proxy Data" folder.  
**Result:** The "Device Proxy Data" object has been created.
6. Enter the required data for the device proxy data in the editor under "General" or apply the default setting. You can change the name and enter a comment for the device proxy data.
7. In the "Define content" area of the editor select which of the existing controller data you want to provide by means of the device proxy data.
8. Click "Save" to save the changes in the project.  
**Result:** You have successfully saved the selected controller data in your device proxy data.
9. In your target project, create a device proxy to import the controller data contained in the project file. To do so, click the command "Add new device" and select the required device proxy in the dialog that opens.
10. Click the newly created device proxy and select the "Initialize device proxy" command from the shortcut menu.
11. Select the previously created project file with the prepared device proxy data to be used for the initialization, and confirm the selection in the following dialog with "OK". This starts the initialization.  
**Result:** The controller data from the source project contained in the project file is transferred to the device proxy in the target project.

After the successful exchange of controller data, you can continue with the configuration in your target project and, for example, connect PLC tags with HMI tags. The controller data can be updated as often as required when it is changed in the source project.

### Procedure for updating already transferred controller data

#### System requirements for the update:

The following requirements must be met for updating already transferred controller data with the help of the already created "Device Proxy Data" object:

- You are using the same project for the update as for the previous transfer of the controller data.
- You are using the already created "Device Proxy Data" for transfer of the controller data.
- You have not made any changes to the hardware configuration or the communication interfaces in the meantime. You can add new hardware components.

**Updating procedure:**

1. Open the TIA Portal project from which you want to update the controller data in the target project.
2. Double-click the existing "Device Proxy Data" object and select under content which controller data you want to make available for the update.
3. Save the project or export the IPE file once again.
4. Open the required target project in the TIA Portal.
5. Click the existing device proxy in the target project and select the "Update device proxy" command from the shortcut menu.
6. Select the source which is to be used for the update, and confirm the selection.
7. In the following dialog, select under "Device" the CPU that was previously used as source, from which the controller data is to be re-imported.
8. Under "Defined device proxy data", select the required object and exit the dialog with "OK".
9. The update is then started and the selected device proxy data is transferred from the source project to the device proxy in the target project.

After the successful update of the controller data, you can continue with the configuration in your target object and, for example, connect PLC tags with HMI tags. The controller data can be updated as often as required when it is changed in the source project.

#### **9.5.1.4 Creating device proxy data**

##### **Creating device proxy data**

To create a device proxy data, follow these steps:

1. Open the folder "Device Proxy Data" below the CPU to which you want to create a device proxy data.
2. Click the command "Add new device proxy data".

##### **Result**

The new device proxy data is created and displayed in the project tree.

Exchange of controller data via IPE file (Page 1772)

### 9.5.1.5 Opening device proxy data

#### Opening device proxy data

To open a device proxy data in the editor, follow these steps:

1. Open the required "Device Proxy Data" with a double-click in the "Device Proxy Data" folder in the project tree below the CPU.

#### Result

The device proxy data is opened in the editor and displays the controller data assigned to it. You can either apply the defaults displayed in the editor or customize them as needed.

Procedure for working with Inter Project Engineering (IPE) (Page 1769)

### 9.5.1.6 Exchange of controller data via IPE file

#### Exchange of controller data via "IPE file"

To export the controller data of the higher-level CPU displayed in the device proxy data, follow these steps:

1. Open the TIA Portal project from which you want to import the controller data into the target project.
2. Compile the project to ensure consistency in your project.
3. In your project, create the object "Device Proxy Data" below the required CPU by clicking the corresponding command "Add Device Proxy Data" in the "Device Proxy Data" folder.  
**Result:** The "Device Proxy Data" object has been created.
4. Select the device proxy data in the project tree and double-click the object to open it in the editor.
5. Enter the required data for the device proxy data in the editor under "General" or apply the default setting. You can change the name and enter a comment.

6. In the "Define content" area of the editor select which of the existing controller data you want to provide by means of the device proxy data.
7. Click the command "Export device proxy data" to export.
8. In the subsequent dialog, enter the name and storage location for the data to be exported and click "Save". The ".ipe" format is automatically specified as file format for the device proxy data file during the export.

## Result

The selected device proxy data is exported and a progress bar for the export is displayed.

You receive a message as soon as the export is successfully completed.

The controller data of the selected CPU were stored in the saved ".ipe" file and can be conveniently forwarded, for example, by e-mail. The controller data can be imported in other devices without additional configuration, for example, for visualization and can be used further.

Opening device proxy data (Page 1772)

### 9.5.1.7 Exchange of controller data via project file

#### Exchange of controller data via a project file

When exchanging controller data via a project file, device proxy data must be predefined in the source project. To export the controller data of the higher-level CPU displayed in the device proxy data as project file, follow these steps:

1. Open the TIA Portal project from which you want to import the controller data into the target project.
2. Compile the project to ensure consistency in your project.
3. In your project, create the object "Device Proxy Data" below the required CPU by clicking the corresponding command "Add Device Proxy Data" in the "Device Proxy Data" folder.  
**Result:** The "Device Proxy Data" object has been created.
4. Select the device proxy data in the project tree and double-click the object to open it in the editor.
5. Enter the required data for the device proxy data in the editor under "General" or apply the default setting. You can change the name and enter a comment.

## 9.6 Programming examples

6. In the "Define content" area of the editor select which of the existing controller data you want to provide by means of the device proxy data.
7. Click "Save" to save the changes in the project.  
**Result:** You have successfully saved the selected controller data in your device proxy data.
8. Open the target project into which the controller data are to be imported. In your target project, create a device proxy to import the controller data contained in the project file. To do so, click the command "Add new device" and select the required device proxy in the dialog that opens.
9. Click "Save" to save the changes in the project.
10. Click the newly created device proxy and select the "Initialize device proxy" command from the shortcut menu.
11. Select the previously created project file with the prepared device proxy data to be used for the initialization, and confirm the selection in the following dialog with "OK".
12. In the following dialog, select the required CPU and select the prepared device proxy data. Confirm the dialog with "OK". This starts the initialization.  
**Result:** The controller data from the source project contained in the project file is transferred to the device proxy in the target project.

After the successful exchange of controller data, you can continue with the configuration in your target project and, for example, connect PLC tags with HMI tags. The controller data can be updated as often as required when it is changed in the source project.

## 9.6 Programming examples

### 9.6.1 LAD programming examples

#### 9.6.1.1 Example of controlling a conveyor belt

##### Controlling a conveyor belt

The following figure shows a conveyor belt that can be activated electrically. There are two pushbutton switches at the beginning of the conveyor belt: S1 for START and S2 for STOP.

There are also two pushbutton switches at the end of the conveyor belt: S3 for START and S4 for STOP. It is possible to start and stop the conveyor belt from either end.

## Implementation

The following table shows the definition of the tags used:

Name	Data type	Description
StartSwitch_Left (S1)	BOOL	Start switch on the left side of the conveyor belt
StopSwitch_Left (S2)	BOOL	Stop switch on the left side of the conveyor belt
StartSwitch_Right (S3)	BOOL	Start switch on the right side of the conveyor belt
StopSwitch_Right (S4)	BOOL	Stop switch on the right side of the conveyor belt
MOTOR_ON	BOOL	Turn on the conveyor belt motor

The following networks show the LAD programming for solving this task:

Network 1:

The conveyor belt motor is switched on when Start switch "S1" or "S3" is pressed.

Network 2:

The conveyor belt motor is switched off when Stop switch "S2" or "S4" is pressed.

9.6.1.2 Example of detecting the direction of a conveyor belt

Detecting the direction of a conveyor belt

The following figure shows a conveyor belt that is equipped with two photoelectric barriers (PEB1 and PEB2). The photoelectric barriers are designed to detect the direction in which an object is moving on the conveyor belt.

Implementation

The following table shows the definition of the tags used:

Name	Data type	Description
PEB1	BOOL	Photoelectric barrier 1
PEB2	BOOL	Photoelectric barrier 2
RIGHT	BOOL	Display during movement to right
LEFT	BOOL	Display during movement to left
CM1	BOOL	Edge bit memory 1
CM2	BOOL	Edge bit memory 2

The following networks show the LAD programming for solving this task:

Network 1:

If the signal state changes from "0" to "1" (positive edge) at photoelectric barrier "PEB1" and, at the same time, the signal state at "PEB2" is "0", the object on the belt is moving to the left.

Network 2:

If the signal changes from "0" to "1" (positive edge) at photoelectric barrier "PEB2" and, at the same time, the signal state at "PEB1" is "0", the object on the belt is moving to the right.

### 9.6.1.3 Example of detecting the fill level of a storage area

#### Detecting the fill level of a storage area

The following figure shows a system with two conveyor belts and a temporary storage area between them. Conveyor belt 1 delivers packages to the storage area. A photoelectric barrier at the end of conveyor belt 1 near the storage area detects how many packages are delivered to the storage area. Conveyor belt 2 transports packages from the temporary storage area to a loading dock onto which the packages are loaded for delivery to customers by truck. A photoelectric barrier at the storage area exit detects how many packages leave the storage area to be transported to the loading dock. Five display lamps indicate the capacity of the temporary storage area.

When a conveyor belt is restarted, the current count value is set to the number of packages available in the storage area.

**Implementation**

The following table shows the definition of the tags used:

Name	Data type	Description
PEB1	BOOL	Photoelectric barrier 1
PEB2	BOOL	Photoelectric barrier 2
RESET	BOOL	Reset counter
LOAD	BOOL	Set counter to value of "PV" parameter
STOCK	INT	Stock at restart
PACKAGECOUNT	INT	Number of packages in the storage area (current count value)
STOCK_PACKAGES	BOOL	Is set if the current count value is greater than or equal to the value of the tag "STOCK".
STOR_EMPTY	BOOL	Display lamp: Storage area empty
STOR_NOT_EMPTY	BOOL	Display lamp: Storage area not empty
STOR_50%_FULL	BOOL	Display lamp: Storage area 50% full
STOR_90%_FULL	BOOL	Display lamp: Storage area 90% full
STOR_FULL	BOOL	Display lamp: Storage area full
VOLUME_50	INT	Comparison value: 50 packages

Name	Data type	Description
VOLUME_90	INT	Comparison value: 90 packages
VOLUME_100	INT	Comparison value: 100 packages

The following networks show the LAD programming for activating the lamps:

Network 1:

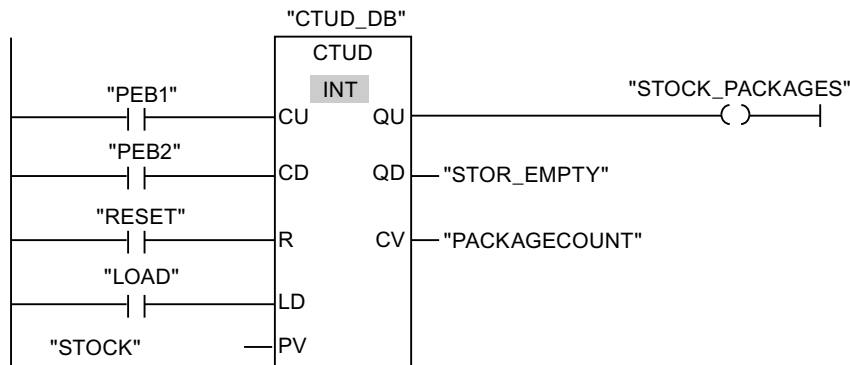

When a package is delivered to the storage area, the signal state at "PEB1" switches from "0" to "1" (positive signal edge). On a positive signal edge at "PEB1", the "Up" counter is enabled, and the current count value of "PACKAGECOUNT" is increased by one.

When a package is delivered from the storage area to the loading dock, the signal state at "PEB2" switches from "0" to "1" (positive signal edge). On a positive signal edge at "PEB2", the "Down" counter is enabled, and the current count value of "PACKAGECOUNT" is decreased by one.

If there are no packages in the storage area ("PACKAGECOUNT" = "0"), the "STOR\_EMPTY" tag is set to signal state "1", and the "Storage area empty" lamp is switched on.

The current count value can be reset to "0" if the "RESET" tag is set to signal state "1".

If the "LOAD" tag is set to signal state "1", the current count value is set to the value of the "STOCK" tag. If the current count value is greater than or equal to the value of the "STOCK" tag, the "STOCK\_PACKAGES" tag supplies the signal state "1".

Network 2:

As long as there are packages in the storage area, the "STOR\_NOT\_EMPTY" tag is set to signal state "1", and the "Storage area not empty" lamp is switched on.

Network 3:

If the number of packages in the storage area is greater than or equal to 50, the lamp for the "Storage area 50% full" message switches on.

9.6 Programming examples

Network 4:

If the number of packages in the storage area is greater than or equal to 90, the "Storage area 90% full" lamp switches on.

Network 5:

If the number of packages in the storage area reaches 100, the lamp for the "Storage area full" message switches on.

9.6.1.4 Example of controlling room temperature

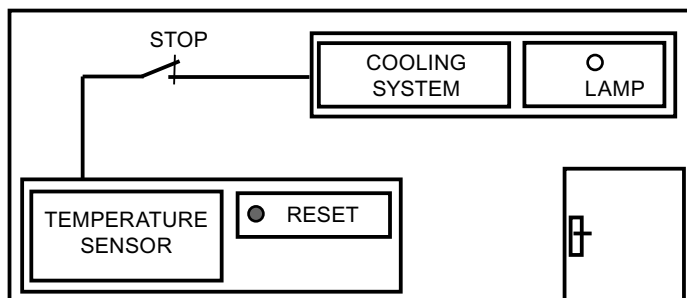

Controlling room temperature

In a cold room, the temperature must be maintained below zero degrees Celsius. Any temperature fluctuations are monitored by a sensor. If the temperature rises above zero degrees Celsius, the cooling system switches on for a preset time. The "Cooling system On" lamp is lit during this time.

The cooling system and the lamp are turned off if one of the following conditions is met:

- The sensor reports a temperature fall below zero degrees Celsius.
- The preset cooling time has elapsed.
- The pushbutton switch "STOP" has been pressed.

If the preset cooling time has expired and the temperature in the cold room is still too high, the cooling system can be restarted by means of the pushbutton switch "RESET".

## Implementation

The following table shows the definition of the tags used:

Name	Data type	Comment
Sensor	BOOL	Temperature sensor signal
RESET	BOOL	Restart
STOP	BOOL	The cooling system is switched off.
MaxCoolTime	TIME	Preset cooling time This tag is defined in the "DB_Cool" data block.
CurrCoolTime	TIME	Currently elapsed cooling time This tag is defined in the "DB_Cool" data block.
Cooling system	BOOL	The cooling system is switched on.
Lamp	BOOL	The lamp for the "Cooling system on" message is switched on.
TempVariable	BOOL	Temporary tag This tag stores the signal state of the IEC time TP.

The following network shows the LAD programming for controlling room temperature:

Network 1:

Network 2:

When the temperature in the cold room rises above zero degrees Celsius, the signal state at the "Sensor" operand switches from "0" to "1" (positive signal edge). In the case of a positive signal edge at the input IN of the time function, the preset cooling time is started and the "TempVariable" receives the signal state "1". The signal state "1" of the "TempVariable" has the result in network 2 that the cooling system as well as the display lamp are turned on. The outputs "Sensor", "Cooling system" and "Lamp" must be programmed in network 2, because you can program only one coil at output Q of the time function.

If the temperature in the cold room falls below zero degrees Celsius, the signal state of the sensor switches back to "0". This switches the cooling system and lamp off.

If the sensor does not signal a temperature drop, the cooling system and lamp are switched off after the preset cooling time has elapsed, at the latest. In this case, the cooling process can be restarted by pressing the "RESET" pushbutton switch. Pressing and releasing the pushbutton switch generates a new positive signal edge at input IN, which restarts the cooling system.

Using the pushbutton switch "STOP", the cooling system and the display lamp can be turned off at any time.

## 9.6.2 FBD programming examples

### 9.6.2.1 Example of controlling a conveyor belt

#### Controlling a conveyor belt

The following figure shows a conveyor belt that can be activated electrically. There are two pushbutton switches at the beginning of the conveyor belt: S1 for START and S2 for STOP. There are also two pushbutton switches at the end of the conveyor belt: S3 for START and S4 for STOP. It is possible to start and stop the conveyor belt from either end.

#### Implementation

The following table shows the definition of the tags used:

Name	Data type	Description
StartSwitch_Left (S1)	BOOL	Start switch on the left side of the conveyor belt
StopSwitch_Left (S2)	BOOL	Stop switch on the left side of the conveyor belt
StartSwitch_Right (S3)	BOOL	Start switch on the right side of the conveyor belt

Name	Data type	Description
StopSwitch_Right (S4)	BOOL	Stop switch on the right side of the conveyor belt
MOTOR_ON	BOOL	Turn on the conveyor belt motor

The following networks show the FBD programming for solving this task:

Network 1:

The conveyor belt motor is switched on when Start switch "S1" or "S3" is pressed.

Network 2:

The conveyor belt motor is switched off when stop switch "S2" or "S4" is pressed.

### 9.6.2.2 Example of detecting the direction of a conveyor belt

#### Detecting the direction of a conveyor belt

The following figure shows a conveyor belt that is equipped with two photoelectric barriers (PEB1 and PEB2). The photoelectric barriers are designed to detect the direction in which an object is moving on the conveyor belt.

### Implementation

The following table shows the definition of the tags used:

Name	Data type	Description
PEB1	BOOL	Photoelectric barrier 1
PEB2	BOOL	Photoelectric barrier 2
RIGHT	BOOL	Display during movement to right
LEFT	BOOL	Display during movement to left
CM1	BOOL	Edge bit memory 1
CM2	BOOL	Edge bit memory 2

The following networks show the FBD programming for solving this task:

Network 1:

If the signal state changes from "0" to "1" (positive edge) at photoelectric barrier "PEB1" and, at the same time, the signal state at "PEB2" is "0", the object on the belt is moving to the left.

Network 2:

If the signal changes from "0" to "1" (positive edge) at photoelectric barrier "PEB2" and, at the same time, the signal state at "PEB1" is "0", the object on the belt is moving to the right.

#### 9.6.2.3 Example of detecting the fill level of a storage area

##### Detecting the fill level of a storage area

The following figure shows a system with two conveyor belts and a temporary storage area between them. Conveyor belt 1 delivers packages to the storage area. A photoelectric barrier at the end of conveyor belt 1 near the storage area detects how many packages are delivered to the storage area. Conveyor belt 2 transports packages from the temporary storage area to a loading dock onto which the packages are loaded for delivery to customers by truck. A photoelectric barrier at the storage area exit detects how many packages leave the storage

area to be transported to the loading dock. Five display lamps indicate the capacity of the temporary storage area.

When a conveyor belt is restarted, the current count value is set to the number of packages available in the storage area.

## Implementation

The following table shows the definition of the tags used:

Name	Data type	Description
PEB1	BOOL	Photoelectric barrier 1
PEB2	BOOL	Photoelectric barrier 2
RESET	BOOL	Reset counter
LOAD	BOOL	Set counter to value of "CV" parameter
STOCK	INT	Stock at restart
PACKAGECOUNT	INT	Number of packages in the storage area (current count value)
STOCK_PACKAGES	BOOL	Is set if the current count value is greater than or equal to the value of the tag "STOCK".
STOR_EMPTY	BOOL	Display lamp: Storage area empty
STOR_NOT_EMPTY	BOOL	Display lamp: Storage area not empty
STOR_50%_FULL	BOOL	Display lamp: Storage area 50% full

Name	Data type	Description
STOR_90%_FULL	BOOL	Display lamp: Storage area 90% full
STOR_FULL	BOOL	Display lamp: Storage area full
VOLUME_50	INT	Comparison value: 50 packages
VOLUME_90	INT	Comparison value: 90 packages
VOLUME_100	INT	Comparison value: 100 packages

The following networks show the FBD programming for activating the lamps:

Network 1:

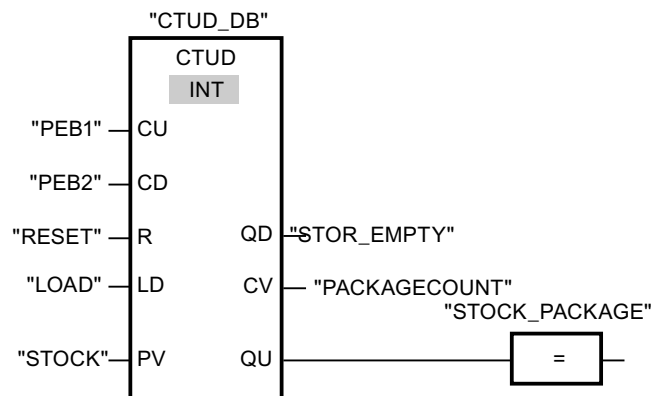

When a package is delivered to the storage area, the signal state at "PEB1" switches from "0" to "1" (positive signal edge). On a positive signal edge at "PEB1", the "Up" counter is enabled, and the current count value of "PACKAGECOUNT" is increased by one.

When a package is delivered from the storage area to the loading dock, the signal state at "PEB2" switches from "0" to "1" (positive signal edge). On a positive signal edge at "PEB2", the "Down" counter is enabled, and the current count value of "PACKAGECOUNT" is decreased by one.

If there are no packages in the storage area ("PACKAGECOUNT" = "0"), the "STOR\_EMPTY" tag is set to signal state "1", and the "Storage area empty" lamp is switched on.

The current count value can be reset to "0" if the "RESET" tag is set to signal state "1".

If the "LOAD" tag is set to signal state "1", the current count value is set to the value of the "STOCK" tag. If the current count value is greater than or equal to the value of the "STOCK" tag, the "STOCK\_PACKAGES" tag supplies the signal state "1".

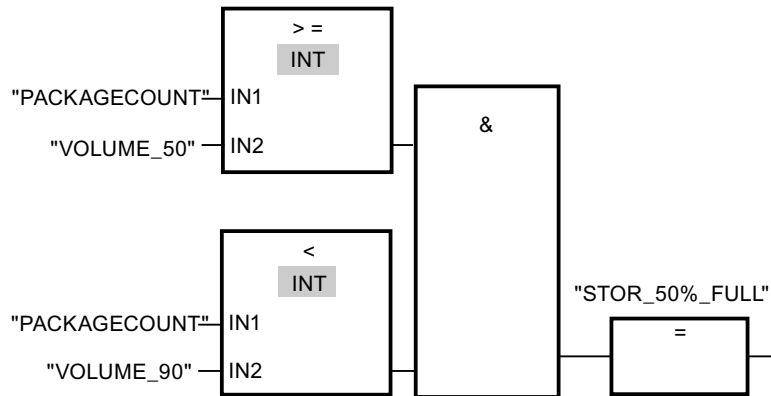

Network 2:

As long as there are packages in the storage area, the "STOR\_NOT\_EMPTY" tag is set to signal state "1", and the "Storage area not empty" lamp is switched on.

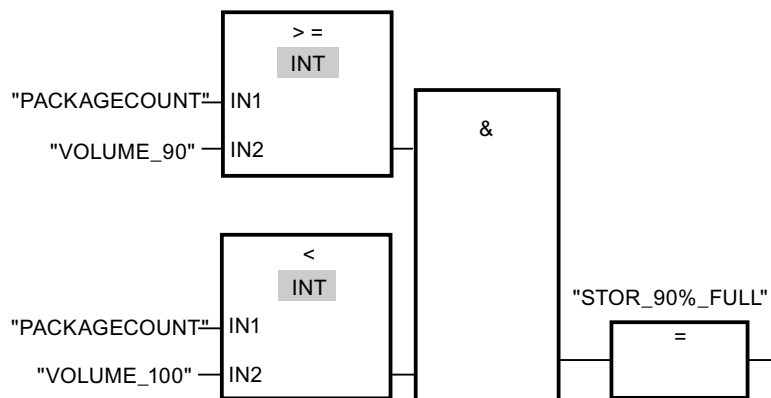

Network 3:

If the number of packages in the storage area is greater than or equal to 50, the lamp for the "Storage area 50% full" message switches on.

Network 4:

If the number of packages in the storage area is greater than or equal to 90, the "Storage area 90% full" lamp switches on.

Network 5:

If the number of packages in the storage area reaches 100, the lamp for the "Storage area full" message switches on.

#### 9.6.2.4 Example of controlling room temperature

##### Controlling room temperature

In a cold room, the temperature must be maintained below zero degrees Celsius. Any temperature fluctuations are monitored by a sensor. If the temperature rises above zero

degrees Celsius, the cooling system switches on for a preset time. The "Cooling system on" lamp is lit during this time.

The cooling system and the lamp are turned off if one of the following conditions is met:

- The sensor reports a temperature fall below zero degrees Celsius.
- The preset cooling time has elapsed.
- The pushbutton switch "Stop" has been pressed.

If the preset cooling time has expired and the temperature in the cold room is still too high, the cooling system can be restarted by means of the pushbutton switch "RESET".

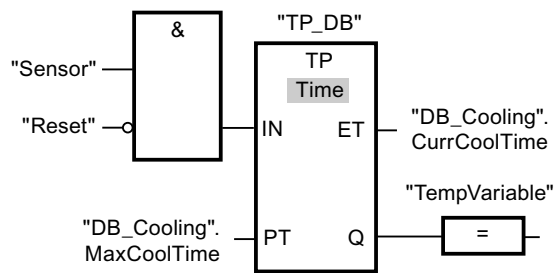

### Implementation

The following table shows the definition of the tags used:

Name	Data type	Comment
Sensor	BOOL	Temperature sensor signal
RESET	BOOL	Restart
STOP	BOOL	The cooling system is switched off.
MaxCoolTime	TIME	Preset cooling time This tag is defined in the "DB_Cool" data block.
CurrCoolTime	TIME	Currently elapsed cooling time This tag is defined in the "DB_Cool" data block.
Cooling system	BOOL	The cooling system is switched on.
Lamp	BOOL	The lamp for the "Cooling system on" message is switched on.
TempVariable	BOOL	Temporary tag This tag stores the signal state of the IEC time TP.

The following network shows the FBD programming for controlling room temperature:

Network 1:

Network 2:

When the temperature in the cold room rises above zero degrees Celsius, the signal state at the "Sensor" operand switches from "0" to "1" (positive signal edge). In the case of a positive signal edge at the input IN of the time function, the preset cooling time is started and the "TempVariable" receives the signal state "1". The signal state "1" of the "TempVariable" has the result in network 2 that the cooling system as well as the display lamp are turned on. The outputs "Sensor", "Cooling system" and "Lamp" must be programmed in network 2, because you can program only one coil at output Q of the time function.

If the temperature in the cold room falls below zero degrees Celsius, the signal state of the sensor switches back to "0". This switches the cooling system and lamp off.

If the sensor does not signal a temperature drop, the cooling system and lamp are switched off after the preset cooling time has elapsed, at the latest. In this case, the cooling process can be restarted by pressing the pushbutton switch "RESET". Pressing and releasing the pushbutton switch generates a new positive signal edge at input IN, which restarts the cooling system.

Using the pushbutton switch "STOP", the cooling system and the display lamp can be turned off at any time.

## 9.6.3 SCL programming examples

### 9.6.3.1 Example: Bit logic instructions

#### Controlling a conveyor belt

The following figure shows a conveyor belt that can be activated electrically. There are two pushbutton switches at the beginning of the conveyor belt: S1 for START and S2 for STOP.

There are also two pushbutton switches at the end of the conveyor belt: S3 for START and S4 for STOP. It is possible to start and stop the conveyor belt from either end.

**Implementation**

The following table shows the definition of the tags used:

Operand	Declaration	Data type	Description
StartSwitch_Left (S1)	Input	BOOL	Start switch on the left side of the conveyor belt
StopSwitch_Left (S2)	Input	BOOL	Stop switch on the left side of the conveyor belt
StartSwitch_Right (S3)	Input	BOOL	Start switch on the right side of the conveyor belt
StopSwitch_Right (S4)	Input	BOOL	Stop switch on the right side of the conveyor belt
MOTOR_ON	Output	BOOL	Turn on the conveyor belt motor
MOTOR_OFF	Output	BOOL	Turn off the conveyor belt motor

The following SCL program shows how to implement this task:

**SCL**

```

IF "StartSwitch_Left" OR "StartSwitch_Right" THEN
  "MOTOR_ON" := 1;
END_IF;
IF "StopSwitch_Left" OR "StopSwitch_Right" THEN
  "MOTOR_OFF" := 1;
END_IF;
    
```

The conveyor belt motor is switched on when start switch "StartSwitch\_Left" or "StartSwitch\_Right" is pressed. The conveyor belt motor is switched off when stop switch "StopSwitch\_Left" or "StopSwitch\_Right" is pressed.

### 9.6.3.2 Example of detecting the direction of a conveyor belt

#### Detecting the direction of a conveyor belt

The following figure shows a conveyor belt that is equipped with two photoelectric barriers (PEB1 and PEB2). The photoelectric barriers are designed to detect the direction in which an object is moving on the conveyor belt.

#### Implementation

The following table shows the definition of the tags used:

Name	Declaration	Data type	Description
Photoelectric barrier LS1	Input	BOOL	Photoelectric barrier 1
Photoelectric barrier LS2	Input	BOOL	Photoelectric barrier 2
RIGHT	Output	BOOL	Display for movement to the right
LEFT	Output	BOOL	Display for movement to the left

The following SCL program shows how to implement this example:

#### SCL

```

IF "LS1" = 1 AND NOT "LS2" = 0
THEN "LEFT" = 1;
IF "LS2" = 1 AND NOT "LS1" = 0
THEN "RIGHT" := 1;
IF "LS2" = 0
THEN "RIGHT" := 0;
IF "LS1" = 0
THEN "LEFT" = 0;

```

If the photoelectric barrier "PEB1" has signal state "1" and the photoelectric barrier "PEB2" has signal state "0" at the same time, the object on the belt is moving to the left. If the photoelectric barrier "PEB2" has signal state "1" and the photoelectric barrier "PEB1" has signal

state "0" at the same time, the object on the belt is moving to the right. The displays for a movement to the left or right will be turned off when the signal state at both photoelectric barriers is "0".

### 9.6.3.3 Example of detecting the fill level of a storage area

#### Detecting the fill level of a storage area

The following figure shows a system with two conveyor belts and a temporary storage area between them. Conveyor belt 1 delivers packages to the storage area. A photoelectric barrier at the end of conveyor belt 1 near the storage area detects how many packages are delivered to the storage area. Conveyor belt 2 transports packages from the temporary storage area to a loading dock onto which the packages are loaded for delivery to customers by truck. A photoelectric barrier at the storage area exit detects how many packages leave the storage area to be transported to the loading dock. Five display lamps indicate the capacity of the temporary storage area.

When a conveyor belt is restarted, the current count value is set to the number of packages available in the storage area.

#### Implementation

The following table shows the definition of the tags used:

Name	Declaration	Data type	Description
PEB1	Input	BOOL	Photoelectric barrier 1
PEB2	Input	BOOL	Photoelectric barrier 2
RESET	Input	BOOL	Reset counter

Name	Declaration	Data type	Description
LOAD	Input	BOOL	Set counter to value of "CV" parameter
STOCK	Input	INT	Stock at restart
PACKAGECOUNT	Output	INT	Number of packages in the storage area (current count value)
STOCK_PACKAGES	Output	BOOL	Is set if the current count value is greater than or equal to the value of the tag "STOCK".
STOR_EMPTY	Output	BOOL	Display lamp: Storage area empty
STOR_NOT_EMPTY	Output	BOOL	Display lamp: Storage area not empty
STOR_50%_FULL	Output	BOOL	Display lamp: Storage area 50% full
STOR_90%_FULL	Output	BOOL	Display lamp: Storage area 90% full
STOR_FULL	Output	BOOL	Display lamp: Storage area full
VOLUME_50	Input	INT	Comparison value: 50 packages
VOLUME_90	Input	INT	Comparison value: 90 packages
VOLUME_100	Input	INT	Comparison value: 100 packages

The following SCL program shows how to implement this example:

When a package is delivered to the storage area, the signal state at "PEB1" switches from "0" to "1" (positive signal edge). On a positive signal edge at "PEB1", the "Up" counter is enabled, and the current count value of "PACKAGECOUNT" is increased by one.

When a package is delivered from the storage area to the loading dock, the signal state at "PEB2" switches from "0" to "1" (positive signal edge). On a positive signal edge at "PEB2", the "Down" counter is enabled, and the current count value of "PACKAGECOUNT" is decreased by one.

If there are no packages in the storage area ("PACKAGECOUNT" = "0"), the "STOR\_EMPTY" tag is set to signal state "1", and the "Storage area empty" lamp is switched on.

The current count value can be reset to "0" if the "RESET" tag is set to signal state "1".

If the "LOAD" tag is set to signal state "1", the current count value is set to the value of the "STOCK" tag. If the current count value is greater than or equal to the value of the "STOCK" tag, the "STOCK\_PACKAGES" tag supplies the signal state "1".

```

SCL
"CTUD_DB".CTUD(CU := "PEB1",
               CD := "PEB2",
               R := "RESET",

```

```
SCL
LD := "LOAD",
PV := "STOCK",
QU := "STOCK_PACKAGES",
QD := "STOR_EMPTY",
CV := "PACKAGECOUNT");
```

As long as there are packages in the storage area, the "STOR\_NOT\_EMPTY" tag is set to signal state "1", and the "Storage area not empty" lamp is switched on.

```
SCL
"STOR_NOT_EMPTY" := NOT "STOR_EMPTY"
```

If the number of packages in the storage area is greater than or equal to 50, the lamp for the "Storage area 50% full" message switches on.

```
SCL
IF "PACKAGECOUNT" >= "VOLUME_50" THEN "STOR_50%_FULL" := 1;
IF "PACKAGECOUNT" <= "VOLUME_90" THEN "STOR_50%_FULL" := 1;
```

If the number of packages in the storage area is greater than or equal to 90, the "Storage area 90% full" lamp switches on.

```
SCL
IF "PACKAGECOUNT" >= "VOLUME_90" THEN "STOR_90%_FULL" := 1;
IF "PACKAGECOUNT" <= "VOLUME_100" THEN "STOR_90%_FULL" := 1;
```

If the number of packages in the storage area reaches 100, the lamp for the "Storage area full" message switches on.

```
SCL
IF "PACKAGECOUNT" >= "VOLUME_100" THEN "STOR_FULL" := 1;
```

## 9.7 References

### 9.7.1 General parameters of the instructions

#### 9.7.1.1 Meaning of the parameters REQ, RET\_VAL and BUSY with asynchronous instructions

##### Asynchronous instructions

For instructions that work asynchronously, the function is executed with several calls.

## Identification of the job

If you use asynchronous instructions to trigger a process interrupt, output control commands to DP slaves, start a data transfer, or abort a non-configured connection with one of the SFCs listed above and then call the same SFC again before the current job is completed, then the reaction of the SFC will depend on whether the second call involves the same job.

## Parameter REQ

The input parameter REQ (request) is used solely to start the job:

- If you call the instruction for a job that is not currently active, the job is started with REQ = 1 (case 1).
- If a particular job has been started and not yet completed and you call the instruction again to perform the same job (for example, in a cyclic interrupt OB), then REQ is not evaluated by the instruction (case 2).

## Parameter RET\_VAL and BUSY

The output parameters RET\_VAL and BUSY indicate the status of the job.

Pay attention to the note in section: Evaluating errors with output parameter RET\_VAL (Page 1796)

- In case 1 (first call with REQ=1), the input parameter will be entered in RET\_VALW#16#7001 if system resources are available and supply is correct. BUSY will be set.  
If the required system resources are currently being used or the input parameters have errors, the corresponding error code is entered in RET\_VAL and BUSY has the value 0.
- In case 2 (interim call) W#16#7002 will be entered in RET\_VAL (this corresponds to a warning: Job still being processed!), and BUSY will be set.
- The following applies to the last call for a job:
  - For instruction "DPNRM\_DG", the number of data in bytes will be entered as integer in RET\_VAL in case there are no errors in data transmission. BUSY has the value "0" in this case.  
If there is an error, then the error information will be entered in RET\_VAL and you should not evaluate BUSY in this case.
  - For all other instructions, "0" will be entered in RET\_VAL if the job was executed without errors and BUSY has the value "0" in this case. If there is an error, the error code is entered in RET\_VAL and BUSY has the value "0" in this case.

---

### Note

If the first and last call coincide, the reaction is the same for RET\_VAL and BUSY as described for the last call.

---

**Overview**

The following table provides you with an overview of the relationships explained above. In particular, it shows the possible values of the output parameters if the execution of the job is not completed after an instruction call has been completed.

**Note**

Following every call, you must evaluate the relevant output parameters in your program.

Relationship between call, REQ, RET\_VAL and BUSY during execution of a "running" job.

Number of the call	Type of call	REQ	RET_VAL	BUSY
1	First call	1	W#16#7001	1
			Error code	0
2 to (n - 1)	Intermediate call	irrelevant	W#16#7002	1
n	Last call	irrelevant	W#16#0000, if no errors have occurred.	0
			Error code if errors occurred	0

**9.7.1.2 Evaluating errors with output parameter RET\_VAL**

**Types of error information**

An executed instruction indicates in the user program whether or not the CPU was able to execute the function of the instruction successfully.

You can obtain information about any errors that occurred in two ways:

- In the BR bit of the status word
- in the output parameter RET\_VAL (return value).

**Note**

Before evaluating the output parameters specific to an instruction, you should always follow the steps below:

- First, evaluate the BR bit of the status word.
- Then check the output parameter RET\_VAL.

If the BR bit indicates that an error has occurred or if RET\_VAL contains a general error code, you should not evaluate the instruction-specific output parameters.

**Error information in the return value**

An instruction indicates that an error occurred during its execution by entering the value "0" in the binary result bit (BR) of the status word. Some instructions provide an additional error code at an output parameter known as the return value (RET\_VAL). If a general error is entered in the output parameter RET\_VAL (see below for explanation), this is only indicated by the value "0" in the BR bit of the status word.

The return value is of the data type integer (INT). The relationship of the return value to the value "0" indicates whether or not an error occurred during execution of the function.

CPU execution of the instruction	BR	Return value	Sign of the integer
With error(s)	0	less than "0"	negative (sign bit is "1")
Without error	1	greater than or equal to "0"	positive (sign bit is "0")

### Reacting to error information

There are two types of error codes in RET\_VAL:

- A general error code that all instructions can output and
- A specific error code that an instruction can output and which relates to its specific function.

You can write your program so that it reacts to the errors that occur during execution of an instruction. This way you prevent further errors occurring as a result of the first error.

### General and specific error information

The return value (RET\_VAL) of an instruction provides one of the two following types of error codes:

- A general error code that relates to errors that can occur in any instruction.
- A specific error code that relates only to the particular instruction.

Even though the data type of the output parameter RET\_VAL is an integer (INT), the error codes for the instruction are grouped according to hexadecimal values. If you want to examine a return value and compare the value with the error codes listed in this documentation, then display the error code in hexadecimal format.

The figure below shows the structure of a system function error code in hexadecimal format.

Error code, e.g. W#16#8081

If  $x = '0'$ , then you are dealing with a specific error code of an instruction. The specific error code is included in the description of the individual instruction.

If  $x > '0'$ , then you are dealing with a general error code of an instruction. In this case  $x$  is the number of the instruction parameter that has caused the error. The possible general error codes are listed in the following table.

Sign bit = 1 indicates that an error has occurred.

### General error information

The general error code indicates errors that can occur in all instructions. A general error code consists of the following two numbers:

- A parameter number from 1 to 111, where 1 indicates the first parameter of the called instruction, 2 the second parameter, and so forth.
- An event number from 0 to 127. The event number indicates that a synchronous error occurred.

The following table lists the codes for general errors and an explanation of each error.

#### Note

If a general error code was entered in RET\_VAL, then the following situations are possible:

- The action associated with the instruction may have been started or already completed.
- A specific instruction error may have occurred when the action was performed. As a result of a general error that occurred later, the specific error could, however, no longer be indicated.

### Specific error information

Some instructions have a return value that provides an error code specific for the instruction. A specific error code indicates errors that can occur only in specific instructions.

A specific error code consists of the following two numbers:

- An error class from 0 to 7.
- An error number from 0 to 15.

## General error codes

The following table explains the general error codes of a return value. The error code is shown in hexadecimal format. The letter x in each code number is simply a place holder and represents the number of the system function parameter that caused the error.

General error codes

Error code (W#16#...)	Explanation
8x7F	Internal error This error code indicates an internal error at parameter x.
8x01	Illegal syntax ID at an VARIANT parameter
8x22	Range length error when reading a parameter.
8x23	Range length error when writing a parameter. This error code indicates that the parameter x is located either entirely or partly outside the range of an address, or that the length of a bit range is not a multiple of 8 with an VARIANT parameter.
8x24	Range error when reading a parameter.
8x25	Range error when writing a parameter. This error code indicates that the parameter x is located in a range that is illegal for the system function. Refer to the descriptions of the individual functions for information about the illegal ranges.
8x26	The parameter contains a timer cell number that is too high. This error code indicates that the timer cell specified in parameter x does not exist.
8x27	The parameter contains a counter cell number that is too high (counter number error). This error code indicates that the counter cell specified in parameter x does not exist.
8x28	Alignment error when reading a parameter.
8x29	Alignment error when writing a parameter. This error code indicates that the reference to parameter x is an operand with bit address that is not equal to 0.
8x30	The parameter is located in a read-only global DB.
8x31	The parameter is located in a read-only instance DB. This error code indicates that parameter x is located in a read-only data block. If the data block was opened by the system function itself, the system function always returns the value W#16#8x30.

Error code (W#16#...)	Explanation
8x32	The parameter contains a DB number that is too high (DB number error).
8x34	The parameter contains an FC number that is too high (FC number error).
8x35	The parameter contains an FB number that is too high (FB number error). This error code indicates that parameter x contains a block number higher than the highest permitted number.
8x3A	The parameter contains the number of a DB that is not loaded.
8x3C	The parameter contains the number of an FC that is not loaded.
8x3E	The parameter contains the number of an FB that is not loaded.
8x42	An access error occurred while the system was attempting to read a parameter from the peripheral input area.
8x43	An access error occurred while the system was attempting to write a parameter to the peripheral output area.
8x44	Error in the nth (n > 1) read access after an error occurred.
8x45	Error in the nth (n > 1) write access after an error occurred. This error code indicates that access to the required parameter is denied.

## 9.7.2 Basic instructions

### 9.7.2.1 LAD

#### Bit logic operations

---| |---: Normally open contact

#### Description

The activation of the normally open contact depends on the signal state of the associated operand. When the operand has signal state "1", the normally open contact closes and the signal state at the output is set to the signal state of the input.

When the operand has signal state "0", the normally open contact is not activated and the signal state at the output of the instruction is reset to "0".

Two or more normally open contacts are linked bit-by-bit by AND when connected in series. With a series connection, power flows when all contacts are closed.

The normally open contacts are linked by OR when connected in parallel. With a parallel connection, power flows when one of the contacts is closed.

## Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
<Operand>	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Operand whose signal state is queried.

## Example

The following example shows how the instruction works:

The "TagOut" operand is set when one of the following conditions is fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The operand "TagIn\_3" has the signal state "1".

## See also

Overview of the valid data types (Page 1262)

## --- / |--: Normally closed contact

## Description

The activation of the normally closed contact depends on the signal state of the associated operand. When the operand has signal state "1", the normally closed contact opens and the signal state at the output of the instruction is reset to "0".

When the operand has signal state "0", the normally closed contact is not enabled and the signal state of the input is transferred to the output.

Two or more normally closed contacts are linked bit-by-bit by AND when connected in series. With a series connection, power flows when all contacts are closed.

The normally closed contacts are linked by OR when connected in parallel. With a parallel connection, power flows when one of the contacts is closed.

**Parameter**

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
<Operand>	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Operand whose signal state is queried.

**Example**

The following example shows how the instruction works:

The "TagOut" operand is set when one of the following conditions is fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The operand "TagIn\_3" has the signal state "0".

**See also**

Overview of the valid data types (Page 1262)

**--|NOT|--: Invert RLO**

**Description**

You use the "Invert RLO" instruction to invert the signal state of the result of logic operation (RLO). If the signal state is "1" at the input of the instruction, the output of the instruction has signal state "0". If the signal state is "0" at the input of the instruction, the output has the signal state "1".

## Example

The following example shows how the instruction works:

Operand "TagOut" is reset when one of the following conditions is fulfilled:

- The operand "TagIn\_1" has the signal state "1".
- The signal state of the operands "TagIn\_2" and "TagIn\_3" is "1".

## ---( )---: Assignment

### Description

You can use the "Assignment" instruction to set the bit of a specified operand. If the result of logic operation (RLO) at the input of the coil has signal state "1", the specified operand is set to signal state "1". If the signal state is "0" at the input of the coil, the bit of the specified operand is reset to "0".

The instruction does not influence the RLO. The RLO at the input of the coil is sent directly to the output.

### Parameter

The following table shows the parameters of the "Assignment" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Operand>	Output	BOOL	I, Q, M, D, L	Operand to which the RLO is assigned.

## Example

The following example shows how the instruction works:

The "TagOut\_1" operand is set when one of the following conditions is fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The signal state of the operand "TagIn\_3" is "0".

The "TagOut\_2" operand is set when one of the following conditions is fulfilled:

- Operands "TagIn\_1", "TagIn\_2", and "TagIn\_4" have signal state "1".
- The signal state of the "TagIn\_3" operand is "0" and the signal state of the "TagIn\_4" operand is "1".

**See also**

Overview of the valid data types (Page 1262)

**--( / )--: Negate assignment**

**Description**

The "Negate assignment" instruction inverts the result of logic operation (RLO) and assigns it to the specified operand. When the RLO at the input of the coil is "1", the operand is reset. When the RLO at the input of the coil is "0", the operand is set to signal state "1".

**Parameter**

The following table shows the parameters of the "Negate assignment" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Operand>	Output	BOOL	I, Q, M, D, L	Operand to which the RLO is assigned.

**Example**

The following example shows how the instruction works:

Operand "TagOut\_1" is reset when one of the following conditions is fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The signal state of the operand "TagIn\_3" is "0".

**See also**

Overview of the valid data types (Page 1262)

**---( R )---**: Reset output**Description**

You can use the "Reset output" instruction to reset the signal state of a specified operand to "0".

The instruction is only executed if the result of logic operation (RLO) at the input of the coil is "1". If power flows to the coil (RLO = "1"), the specified operand is reset to "0". If the RLO at the input of the coil is "0" (no signal flow to the coil), the signal state of the specified operand remains unchanged.

**Parameter**

The following table shows the parameters of the "Reset output" instruction:

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
<Operand>	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Operand that is reset when RLO = "1".

**Example**

The following example shows how the instruction works:

Operand "TagOut" is reset when one of the following conditions is fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The signal state of the operand "TagIn\_3" is "0".

**See also**

Overview of the valid data types (Page 1262)

**---( S )---**: Set output

**Description**

You can use the "Set output" instruction to set the signal state of a specified operand to "1". The instruction is only executed if the result of logic operation (RLO) at the input of the coil is "1". If power flows to the coil (RLO = "1"), the specified operand is set to "1". If the RLO at the input of the coil is "0" (no signal flow to the coil), the signal state of the specified operand remains unchanged.

**Parameter**

The following table shows the parameters of the "Set output" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Operand>	Output	BOOL	I, Q, M, D, L	Operand which is set with RLO = "1".

**Example**

The following example shows how the instruction works:

The "TagOut" operand is set when one of the following conditions is fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The signal state of the operand "TagIn\_3" is "0".

**See also**

Overview of the valid data types (Page 1262)

**SET\_BF: Set bit field**

**Description**

You use the instruction "Set bit field" to set multiple bits starting from a certain address. You determine the number of bits to be set using the value of <Operand1>. The address of the first bit to be set is defined by <Operand2>. If the value of <Operand1> is greater than the number of bits in a selected byte, then the bits of the next byte will be set. The bits remain set until they are explicitly reset, for example, by another instruction.

The instruction is only executed if the result of logic operation (RLO) at the input of the coil is "1". If the RLO at the input of the coil is "0", the instruction does not execute.

## Parameter

The following table shows the parameters of the "Set bit field" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Operand2>	Output	BOOL	I, Q, M In the case of a DB or an IDB, an element of an ARRAY[..] of BOOL	Pointer to the first bit to be set.
<Operand1>	Input	UINT	Constant	Number of bits to be set.

## Example

The following example shows how the instruction works:

If the operands "TagIn\_1" and "TagIn\_2" have the signal state "1", 5 bits are set starting at the address of the operand "MyDB".MyBoolArray[4]

## See also

Overview of the valid data types (Page 1262)

## RESET\_BF: Reset bit field

### Description

You use the "Reset bit field" instruction to reset several bits starting from a certain address.

You specify the number of bits to be reset using the value of <Operand1>. The address of the first bit to be reset is specified by <Operand2>. If the value of <Operand1> is greater than the number of bits in a selected byte, the bits of the next byte will be reset. The bits remain reset until they are explicitly set, for example, by another instruction.

The instruction is only executed if the result of logic operation (RLO) at the input of the coil is "1". If the RLO at the input of the coil is "0", the instruction does not execute.

**Parameter**

The following table shows the parameters of the "Reset bit field" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Operand2>	Output	BOOL	I, Q, M In the case of a DB or an IDB, an element of an ARRAY[..] of BOOL	Pointer to the first bit to be reset.
<Operand1>	Input	UINT	Constant	Number of bits to be reset.

**Example**

The following example shows how the instruction works:

If the operands "TagIn\_1" and "TagIn\_2" have the signal state "1", 5 bits are reset starting at the address of the operand "MyDB".MyBoolArray[4]

**See also**

Overview of the valid data types (Page 1262)

**SR: Set/reset flip-flop**

**Description**

Use the instruction "Set/reset flip-flop" to set or reset the bit of the specified operand, depending on the signal state of the inputs S and R1. If the signal state is "1" at input S and "0" at input R1, the specified operand is set to "1". If the signal state is "0" at input S and "1" at input R1, the specified operand will be reset to "0".

Input R1 takes priority over input S. When the signal state is "1" on both inputs S and R1, the signal state of the specified operand is reset to "0".

The instruction is not executed if the signal state at the two inputs S and R1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

## Parameter

The following table shows the parameters of the "Set/reset flip-flop" instruction:

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
S	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable setting
R1	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable resetting
<Operand>	InOut	BOOL	I, Q, M, D, L	I, Q, M, D, L	Operand that is set or reset.
Q	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Signal state of the operand

## Example

The following example shows how the instruction works:

The operands "TagSR" and "TagOut" are set when the following conditions are fulfilled:

- The operand "TagIn\_1" has the signal state "1".
- The operand "TagIn\_2" has the signal state "0".

The operands "TagSR" and "TagOut" are reset when one of the following conditions is fulfilled:

- The operand "TagIn\_1" has signal state "0" and the operand "TagIn\_2" has signal state "1".
- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".

## See also

Overview of the valid data types (Page 1262)

## RS: Reset/set flip-flop

### Description

You can use the "Reset/set flip-flop" instruction to reset or set the bit of a specified operand based on the signal state of the inputs R and S1. If the signal state is "1" at input R and "0" at input S1, the specified operand will be reset to "0". If the signal state is "0" at input R and "1" at input S1, the specified operand is set to "1".

Input S1 takes priority over input R. When the signal state is "1" at both inputs R and S1, the signal state of the specified operand is set to "1".

The instruction is not executed if the signal state at the two inputs R and S1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

**Parameter**

The following table shows the parameters of the "Reset/set flip-flop" instruction:

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
R	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable resetting
S1	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable setting
<Operand>	InOut	BOOL	I, Q, M, D, L	I, Q, M, D, L	Operand that is reset or set.
Q	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Signal state of the operand

**Example**

The following example shows how the instruction works:

The operands "TagRS" and "TagOut" are reset when the following conditions are fulfilled:

- The operand "TagIn\_1" has the signal state "1".
- The operand "TagIn\_2" has the signal state "0".

The operands "TagRS" and "TagOut" are set when one of the following conditions is fulfilled:

- The operand "TagIn\_1" has signal state "0" and the operand "TagIn\_2" has signal state "1".
- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".

**See also**

Overview of the valid data types (Page 1262)

**--|P|--: Scan operand for positive signal edge****Description**

You can use the "Scan operand for positive signal edge" instruction to determine if there is a "0" to "1" change in the signal state of a specified operand (<Operand1>). The instruction compares the current signal state of <Operand1> with the signal state of the previous scan that is saved in an edge memory bit (<Operand2>). If the instruction detects a change in the result of logic operation (RLO) from "0" to "1", there is a positive, rising edge.

If a positive edge is detected, the output of the instruction has the signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Specify the operand to be queried (<Operand1>) in the operand placeholder above the instruction. Specify the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

**Note**

The address of the edge memory bit must not be used more than once in the program, otherwise the bit memory is overwritten. This step influences the edge evaluation and the result is therefore no longer unique. The memory area of the edge memory bit must be located in a DB (static area for FB) or in the bit memory area.

**Parameter**

The following table shows the parameters of the "Scan operand for positive signal edge" instruction:

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
<Operand1>	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Signal to be scanned
<Operand2>	InOut	BOOL	I, Q, M, D, L	I, Q, M, D, L	Edge memory bit in which the signal state of the previous query is saved.

**Example**

The following example shows how the instruction works:

Operand "TagOut" is set when the following conditions are fulfilled:

- The operands "TagIn\_1", "TagIn\_2", and "TagIn\_3" have signal state "1".
- There is a rising edge at operand "TagIn\_4". The signal state of the previous scan is stored in the edge memory bit "Tag\_M".
- The signal state of the operand "TagIn\_5" is "1".

**See also**

Overview of the valid data types (Page 1262)

**--|N|--: Scan operand for negative signal edge**

**Description**

You can use the "Scan operand for negative signal edge" instruction to determine if there is a "1" to "0" change in the signal state of a specified operand (<Operand1>). The instruction compares the current signal state of <Operand1> with the signal state of the previous scan that is saved in an edge memory bit <Operand2>. If the instruction detects a change in the result of logic operation (RLO) from "1" to "0", there is a negative, falling edge.

If a negative signal edge is detected, the output of the instruction has the signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Specify the operand to be queried (<Operand1>) in the operand placeholder above the instruction. Specify the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

**Note**

The address of the edge memory bit must not be used more than once in the program, otherwise the bit memory is overwritten. This step influences the edge evaluation and the result is therefore no longer unique. The memory area of the edge memory bit must be located in a DB (static area for FB) or in the bit memory area.

**Parameter**

The following table shows the parameters of the "Scan operand for negative signal edge" instruction:

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
<Operand1>	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Signal to be scanned
<Operand2>	InOut	BOOL	I, Q, M, D, L	I, Q, M, D, L	Edge memory bit in which the signal state of the previous query is saved.

## Example

The following example shows how the instruction works:

Operand "TagOut" is set when the following conditions are fulfilled:

- The operands "TagIn\_1", "TagIn\_2", and "TagIn\_3" have signal state "1".
- There is a negative signal edge at operand "TagIn\_4". The signal state of the previous scan is stored in the edge memory bit "Tag\_M".
- The signal state of the operand "TagIn\_5" is "1".

## --(P)--: Set operand on positive signal edge

### Description

You can use the "Set operand on positive signal edge" instruction to set a specified operand (<Operand1>) when there is a "0" to "1" change in the result of logic operation (RLO). The instruction compares the current RLO with the RLO from the previous query, which is saved in the edge memory bit (<Operand2>). If the instruction detects a change in the RLO from "0" to "1", there is a positive signal edge.

When a positive signal edge is detected, <Operand1> is set to signal state "1" for one program cycle. In all other cases, the operand has the signal state "0".

Specify the operand to be set (<Operand1>) in the operand placeholder above the instruction. Specify the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

#### Note

The address of the edge memory bit must not be used more than once in the program, otherwise the bit memory is overwritten. This step influences the edge evaluation and the result is therefore no longer unique. The memory area of the edge memory bit must be located in a DB (static area for FB) or in the bit memory area.

**Parameter**

The following table shows the parameters of the "Set operand on positive signal edge" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Operand1>	Output	BOOL	I, Q, M, D, L	Operand which is set by a positive edge.
<Operand2>	InOut	BOOL	I, Q, M, D, L	Edge memory bit

**Example**

The following example shows how the instruction works:

Operand "TagOut" is set for one program cycle, when the signal state at the input of the coil switches from "0" to "1" (positive signal edge). In all other cases, the operand "TagOut" has the signal state "0".

**See also**

Overview of the valid data types (Page 1262)

**--(N)--: Set operand on negative signal edge**

**Description**

You can use the "Set operand on negative signal edge" instruction to set a specified operand (<Operand1>) when there is a "1" to "0" change in the result of logic operation (RLO). The instruction compares the current RLO with the RLO from the previous query, which is saved in the edge memory bit (<Operand2>). If the instruction detects a change in the RLO from "1" to "0", there is a negative edge.

When a negative signal edge is detected, <Operand1> is set to signal state "1" for one program cycle. In all other cases, the operand has the signal state "0".

Specify the operand to be set (<Operand1>) in the operand placeholder above the instruction. Specify the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

### Note

The address of the edge memory bit must not be used more than once in the program, otherwise the bit memory is overwritten. This step influences the edge evaluation and the result is therefore no longer unique. The memory area of the edge memory bit must be located in a DB (static area for FB) or in the bit memory area.

## Parameter

The following table shows the parameters of the "Set operand on negative signal edge" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Operand1>	Output	BOOL	I, Q, M, D, L	Operand which is set by a negative edge.
<Operand2>	InOut	BOOL	I, Q, M, D, L	Edge memory bit

## Example

The following example shows how the instruction works:

Operand "TagOut" is set for one program cycle, when the signal state at the input of the coil switches from "1" to "0" (negative signal edge). In all other cases, the operand "TagOut" has the signal state "0".

## See also

Overview of the valid data types (Page 1262)

## P\_TRIG: Scan RLO for positive signal edge

### Description

Use the "Scan RLO for positive signal edge" instruction to query a "0" to "1" change in the signal state of the result of logic operation (RLO). The instruction compares the current signal state of the RLO with the signal state of the previous query, which is saved in an edge memory

bit (<operand>). If the instruction detects a change in the RLO from "0" to "1", there is a positive signal edge.

If a positive edge is detected, the output of the instruction has the signal state "1". In all other cases, the signal state at the output of the instruction is "0".

**Note**

The address of the edge memory bit must not be used more than once in the program, otherwise the bit memory is overwritten. This step influences the edge evaluation and the result is therefore no longer unique. The memory area of the edge memory bit must be located in a DB (static area for FB) or in the bit memory area.

**Parameter**

The following table shows the parameters of the "Scan RLO for positive signal edge" instruction:

Parameter	Declaration	Data type	Memory area	Description
CLK	Input	BOOL	I, Q, M, D, L	Current RLO
<Operand>	InOut	BOOL	M, D	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	I, Q, M, D, L	Result of edge evaluation

**Example**

The following example shows how the instruction works:

The RLO of the previous query is saved in the edge memory bit "Tag\_M". If a "0" to "1" change is detected in the signal state of the RLO, the program jumps to jump label CAS1.

**See also**

Overview of the valid data types (Page 1262)

## N\_TRIG: Scan RLO for negative signal edge

### Description

Use the "Scan RLO for negative signal edge" instruction to query a "1" to "0" change in the signal state of the result of logic operation (RLO). The instruction compares the current signal state of the RLO with the signal state of the previous query, which is saved in an edge memory bit (<operand>). If the instruction detects a change in the RLO from "1" to "0", there is a negative edge.

If a negative signal edge is detected, the output of the instruction has the signal state "1". In all other cases, the signal state at the output of the instruction is "0".

### Note

The address of the edge memory bit must not be used more than once in the program, otherwise the bit memory is overwritten. This step influences the edge evaluation and the result is therefore no longer unique. The memory area of the edge memory bit must be located in a DB (static area for FB) or in the bit memory area.

### Parameter

The following table shows the parameters of the "Scan RLO for negative signal edge" instruction:

Parameters	Declaration	Data type	Memory area	Description
CLK	Input	BOOL	I, Q, M, D, L	Current RLO
<Operand>	InOut	BOOL	M, D	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	I, Q, M, D, L	Result of edge evaluation

### Example

The following example shows how the instruction works:

The RLO of the previous query is saved in the edge memory bit "Tag\_M". If a "1" to "0" change is detected in the signal state of the RLO, the program jumps to jump label CAS1.

**See also**

Overview of the valid data types (Page 1262)

**R\_TRIG: Set tag on positive signal edge**

**Description**

You can use the "Set tag on positive signal edge" instruction to set a specified tag in the instance DB when there is a "0" to "1" change in the result of logic operation (RLO). The instruction compares the current RLO at the input CLK with the RLO from the previous query, which is saved in the specified instance DB. If the instruction detects a change in the RLO from "0" to "1", there is a positive signal edge.

If a positive edge is detected, the tag in the instance DB is set to signal state "1" and the output Q returns the signal state "1" In all other cases, the signal state at the output of the instruction is "0".

When you insert the instruction in the program, the "Call options" dialog opens automatically. In this dialog you can specify whether the edge memory bit is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

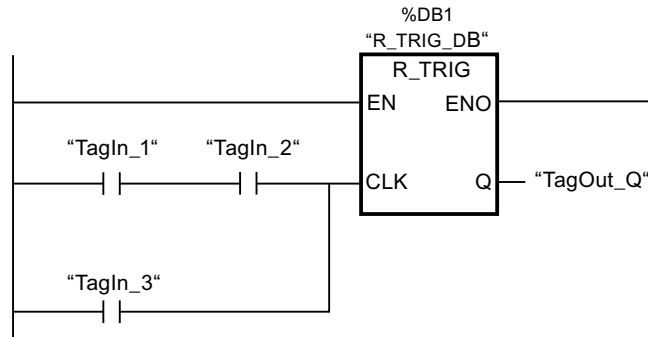

**Parameter**

The following table shows the parameters of the instruction "Set tag on positive signal edge":

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
CLK	Input	BOOL	I, Q, M, D, L or constant	Incoming signal, the edge of which is to be queried.
Q	Output	BOOL	I, Q, M, D, L	Result of edge evaluation

## Example

The following example shows how the instruction works:

The RLO of the preceding query is saved in the instance DB "R\_TRIG\_DB". If a change in the signal state of the RLO from "0" to "1" is detected in the operands "TagIn\_1" and "TagIn\_2" or in the operand "TagIn\_3", the output "TagOut\_Q" has signal state "1".

## See also

Overview of the valid data types (Page 1262)

## F\_TRIG: Set tag on negative signal edge

### Description

You can use the "Set tag on negative signal edge" instruction to set a specified tag in the instance DB when there is a "1" to "0" change in the result of logic operation (RLO). The instruction compares the current RLO at the input CLK with the RLO from the previous query, which is saved in the specified instance DB. If the instruction detects a change in the RLO from "1" to "0", there is a negative edge.

If a negative edge is detected, the tag in the instance DB is set to signal state "1" and the output Q returns the signal state "1". In all other cases, the signal state at the output of the instruction is "0".

When you insert the instruction in the program, the "Call options" dialog opens automatically. In this dialog you can specify whether the edge memory bit is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

### Parameter

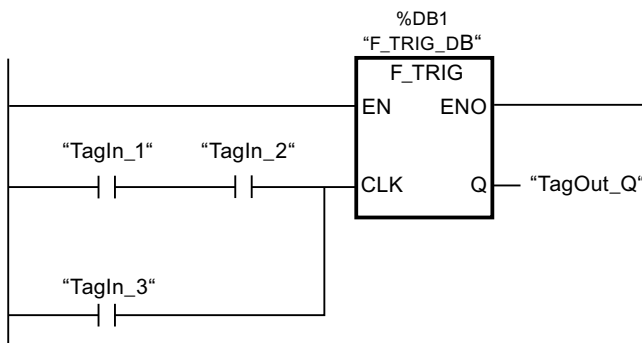

The following table shows the parameters of the instruction "Set tag on negative signal edge":

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output

Parameter	Declaration	Data type	Memory area	Description
CLK	Input	BOOL	I, Q, M, D, L or constant	Incoming signal, the edge of which is to be queried.
Q	Output	BOOL	I, Q, M, D, L	Result of edge evaluation

**Example**

The following example shows how the instruction works:

The RLO of the preceding query is saved in the instance DB "F\_TRIG\_DB". If a change is the signal state of the RLO from "1" to "0" is detected in the operands "TagIn\_1" and "TagIn\_2" or in the operand "TagIn\_3", the output "TagOut\_Q" has signal state "1".

**See also**

Overview of the valid data types (Page 1262)

**Timer operations**

**IEC Timers**

**TP: Generate pulse**

**Description**

You can use the "Generate pulse" instruction to set the output Q for a programmed duration. The instruction is started when the result of logic operation (RLO) at input IN changes from "0" to "1" (positive signal edge). The programmed time PT begins when the instruction starts. Output Q is set for the duration PT, regardless of the subsequent course of the input signal. Even if a new positive signal edge is detected, the signal state at the output Q is not affected as long as the PT time duration is running.

You can scan the current time value at the ET output. The time value starts at T#0s and ends when the value of duration PT is reached. When the duration PT is reached and the signal state at input IN is "0", the ET output is reset.

Each call of the "Generate pulse" instruction must be assigned to an IEC timer in which the instruction data is stored.

---

**Note**

If the timer is not called in the program because it is skipped, for example, the ET output returns a constant value as soon as the timer has expired.

---

**For S7-1200 CPU**

An IEC timer is a structure of the data type IEC\_TIMER or TP\_TIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TP\_TIME, TP\_LTIME or IEC\_TIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

**For S7-1500 CPU**

An IEC timer is a structure of the data type IEC\_TIMER, IEC\_LTIMER, TP\_TIME or TP\_LTIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER or IEC\_LTIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TP\_TIME, TP\_LTIME, IEC\_TIMER or IEC\_LTIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC timer is stored in its own data block (single instance) or as a local tag (multi-instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

The instruction data is updated both when the instruction is called and also each time the outputs Q or ET are accessed.

The execution of the "Generate pulse" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

**Parameters**

The following table shows the parameters of the "Generate pulse" instruction:

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
IN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, P	Start input
PT	Input	TIME	TIME, LTIME	I, Q, M, D, L or constant	I, Q, M, D, L, P or constant	Duration of the pulse The value of the PT parameter must be positive.
Q	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, P	Pulse output
ET	Output	TIME	TIME, LTIME	I, Q, M, D, L	I, Q, M, D, L, P	Current time value

For additional information on valid data types, refer to "See also".

**Pulse timing diagram**

The following figure shows the pulse timing diagram of the "Generate pulse" instruction:

**See also**

Overview of the valid data types (Page 1262)

## TON: Generate on-delay

### Description

You can use the "Generate on-delay" instruction to delay setting of the Q output by the programmed duration PT. The instruction is started when the result of logic operation (RLO) at input IN changes from "0" to "1" (positive signal edge). The programmed time PT begins when the instruction starts. When the duration PT expires, the output Q has the signal state "1". Output Q remains set as long as the start input is still "1". When the signal state at the start input changes from "1" to "0", the Q output is reset. The timer function is started again when a new positive signal edge is detected at the start input.

The current time value can be queried at the ET output. The time value starts at T#0s and ends when the value of duration PT is reached. The ET output is reset as soon as the signal state at the IN input changes to "0".

Each call of the "Generate on-delay" instruction must be assigned to an IEC timer in which the instruction data is stored.

---

#### Note

If the timer is not called in the program because it is skipped, for example, the ET output returns a constant value as soon as the timer has expired.

---

### For S7-1200 CPU

An IEC timer is a structure of the data type IEC\_TIMER or TON\_TIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TON\_TIME or IEC\_TIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

### For S7-1500 CPU

An IEC timer is a structure of the data type IEC\_TIMER, IEC\_LTIMER, TON\_TIME or TON\_LTIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER or IEC\_LTIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TON\_TIME, TON\_LTIME, IEC\_TIMER or IEC\_LTIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC timer is stored in its own data block (single instance) or as a local tag (multi-instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

The instruction data is updated both when the instruction is called and also each time the outputs Q or ET are accessed.

The execution of the "Generate on-delay" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

**Parameters**

The following table shows the parameters of the "Generate on-delay" instruction:

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
IN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, P	Start input
PT	Input	TIME	TIME, LTIME	I, Q, M, D, L or constant	I, Q, M, D, L, P or constant	Duration of the on-delay The value of the PT parameter must be positive.
Q	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, P	Output that is set when the time PT expires.
ET	Output	TIME	TIME, LTIME	I, Q, M, D, L	I, Q, M, D, L, P	Current time value

For additional information on valid data types, refer to "See also".

**Pulse timing diagram**

The following figure shows the pulse timing diagram of the "Generate on-delay" instruction:

**See also**

Overview of the valid data types (Page 1262)

**TOF: Generate off-delay****Description**

You can use the "Generate off-delay" instruction to delay resetting of the Q output by the programmed duration PT. The Q output is set when the result of logic operation (RLO) at input IN changes from "0" to "1" (positive signal edge). When the signal state at input IN changes back to "0", the programmed time PT starts. Output Q remains set as long as the duration PT is running. When duration PT expires, the Q output is reset. If the signal state at input IN changes to "1" before the PT time duration expires, the timer is reset. The signal state at the output Q continues to be "1".

The current time value can be queried at the ET output. The time value starts at T#0s and ends when the value of duration PT is reached. When the time duration PT expires, the ET output remains set to the current value until the IN input changes back to "1". If input IN switches to "1" before the duration PT has expired, the ET output is reset to the value T#0s.

Each call of the "Generate off-delay" instruction must be assigned to an IEC timer in which the instruction data is stored.

---

**Note**

If the timer is not called in the program because it is skipped, for example, the ET output returns a constant value as soon as the timer has expired.

---

**For S7-1200 CPU**

An IEC timer is a structure of the data type IEC\_TIMER or TOF\_TIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TOF\_TIME or IEC\_TIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

**For S7-1500 CPU**

An IEC timer is a structure of the data type IEC\_TIMER, IEC\_LTIMER, TOF\_TIME or TOF\_LTIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER or IEC\_LTIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TOF\_TIME, TOF\_LTIME, IEC\_TIMER or IEC\_LTIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC timer is stored in its own data block (single instance) or as a local tag (multi-instance) in the block interface. If you create a separate data block, you will find it

in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

The instruction data is updated both when the instruction is called and also each time the outputs Q or ET are accessed.

The execution of the "Generate off-delay" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

### Parameters

The following table shows the parameters of the "Generate off-delay" instruction:

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
IN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, P	Start input
PT	Input	TIME	TIME, LTIME	I, Q, M, D, L or constant	I, Q, M, D, L, P or constant	Duration of the off delay The value of the PT parameter must be positive.
Q	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, P	Output that is reset when the timer PT expires.
ET	Output	TIME	TIME, LTIME	I, Q, M, D, L	I, Q, M, D, L, P	Current time value

For additional information on valid data types, refer to "See also".

## Pulse timing diagram

The following figure shows the pulse timing diagram of the "Generate off-delay" instruction:

## See also

Overview of the valid data types (Page 1262)

## TONR: Time accumulator

### Description

The "Time accumulator" instruction is used to accumulate time values within a period set by the PT parameter. When the signal state at input IN changes from "0" to "1" (positive signal edge), the instruction executes and the duration PT starts. While the duration PT is running, the time values are accumulated that are recorded when the IN input has signal state "1". The accumulated time is written to output ET and can be queried there. When the duration PT expires, the output Q has the signal state "1". The Q parameter remains set to "1", even when the signal state at the IN parameter changes from "1" to "0" (negative signal edge).

The R input resets the outputs ET and Q regardless of the signal state at the start input.

Each call of the "Time accumulator" instruction must be assigned to an IEC timer in which the instruction data is stored.

## For S7-1200 CPU

An IEC timer is a structure of the data type IEC\_TIMER or TONR\_TIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TONR\_TIME or IEC\_TIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

### For S7-1500 CPU

An IEC timer is a structure of the data type IEC\_TIMER, IEC\_LTIMER, TONR\_TIME or TONR\_LTIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER or IEC\_LTIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TONR\_TIME, TONR\_LTIME, IEC\_TIMER or IEC\_LTIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC timer is stored in its own data block (single instance) or as a local tag (multi-instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

The instruction data is updated both when the instruction is called and also each time the outputs Q or ET are accessed.

The execution of the "Time accumulator" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

### Parameters

The following table shows the parameters of the "Time accumulator" instruction:

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
IN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, P	Start input
R	Input	BOOL	BOOL	I, Q, M, D, L or constant	I, Q, M, D, L, P or constant	Reset input
PT	Input	TIME	TIME, LTIME	I, Q, M, D, L or constant	I, Q, M, D, L, P or constant	Maximum duration of time recording The value of the PT parameter must be positive.
Q	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, P	Output that is set when the time PT expires.
ET	Output	TIME	TIME, LTIME	I, Q, M, D, L	I, Q, M, D, L, P	Accumulated time

For additional information on valid data types, refer to "See also".

## Pulse timing diagram

The following figure shows the pulse timing diagram of the "Time accumulator" instruction:

## See also

Overview of the valid data types (Page 1262)

## ---( TP )---: Start pulse timer

### Description

Use the "Start pulse timer" instruction to start an IEC timer with a specified duration as pulse. The IEC timer is started when the result of logic operation (RLO) changes from "0" to "1" (positive signal edge). The IEC timer runs for the specified duration regardless of any subsequent changes in the RLO. The run of the IEC timer is also not affected by the detection of a new positive signal edge. As long as the IEC timer is running, the querying of the timer status for "1" returns the signal state "1". When the IEC timer has expired, the timer status returns the signal state "0".

### Note

You can start and query the IEC timer at various execution levels, as each querying of the outputs Q or ET updates the IEC\_TIMER structure.

**For S7-1200 CPU**

The instruction "Start pulse timer" stores its data in a structure of the data type IEC\_TIMER or TP\_TIME. You can declare the structure as follows:

- Declaration of a data block of system data type IEC\_TIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TP\_LTIME or IEC\_TIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

**For S7-1500 CPU**

The instruction "Start pulse timer" stores its data in a structure of the data type IEC\_TIMER, IEC\_LTIMER, TP\_TIME or TP\_LTIME. You can declare the structure as follows:

- Declaration of a data block of system data type IEC\_TIMER or IEC\_LTIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TP\_TIME, TP\_LTIME, IEC\_TIMER or IEC\_LTIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

The instruction data is updated both when the instruction is called and also each time the assigned timer is accessed.

The current timer status is stored in the Q structure component of the IEC timer. You can use a normally open contact to query timer status for "1" or a normally closed contact for "0". The query on Q or ET (for example, "MyTimer".Q or "MyTimer".ET) updates the IEC\_TIMER structure.

The execution of the "Start pulse timer" instruction assumes a preceding logic operation. It can be placed only at the end of the network.

**Parameter**

The following table shows the parameters of the "Start pulse timer" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
<Time duration>	Input	TIME	TIME, LTIME	I, Q, M, D, L or constant	Duration with which the IEC timer runs.
<IEC timer>	InOut	IEC_TIMER, TP_TIME	IEC_TIMER, IEC_LTIMER, TP_TIME, TP_LTIME	D, L	IEC timer that is started.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The "Start pulse timer" instruction is executed when the signal state of the operand "Tag\_Input" changes from "0" to "1". The timer "DB1".MyIEC\_TIMER is started for the time stored in the operand "TagTime".

As long as the timer "DB1". MyIEC\_TIMER is running, the timer status ("DB1".MyIEC\_TIMER.Q) has signal state "1" and the operand "Tag\_Output" is set. When the IEC timer has expired, the signal state of the time status changes back to "0" and the "Tag\_Output" operand is reset.

## See also

Overview of the valid data types (Page 1262)

## ---( TON )---: Start on-delay timer

### Description

Use the "Start on-delay timer" instruction to start an IEC timer with a specified duration as on-delay. The IEC timer is started when the result of logic operation (RLO) changes from "0" to "1" (positive signal edge). The IEC timer runs for the specified time. The output returns the signal state "1" if the RLO at the input of the instruction has the signal state "1". If the RLO changes to "0" before the time expires, the IEC timer is reset. In this case, querying the timer status for "1" returns signal state "0". The IEC timer restarts when the next positive signal edge is detected at the input of the instruction.

#### Note

You can start and query the IEC timer at various execution levels, as each querying of the outputs Q or ET updates the IEC\_TIMER structure.

**For S7-1200 CPU**

The instruction "Start on-delay timer" stores its data in a structure of the data type IEC\_TIMER or TON\_TIME. You can declare the structure as follows:

- Declaration of a data block of system data type IEC\_TIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TON\_TIME or IEC\_TIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

**For S7-1500 CPU**

The "Start on-delay timer" instruction stores its data in a structure of the data type IEC\_TIMER, IEC\_LTIMER, TON\_TIME or TON\_LTIME. You can declare the structure as follows:

- Declaration of a data block of system data type IEC\_TIMER or IEC\_LTIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TON\_TIME, TON\_LTIME, IEC\_TIMER or IEC\_LTIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

The instruction data is updated both when the instruction is called and also each time the assigned timer is accessed.

The current timer status is stored in the ET structure component of the IEC timer. You can use a normally open contact to query timer status for "1" or a normally closed contact for "0". The query on Q or ET (for example, "MyTimer".Q or "MyTimer".ET) updates the IEC\_TIMER structure.

The execution of the "Start on-delay timer" instruction assumes a preceding logic operation. It can be placed only at the end of the network.

**Parameter**

The following table shows the parameters of the "Start on-delay timer" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
<Time duration>	Input	TIME	TIME, LTIME	I, Q, M, D, L or constant	Duration with which the IEC timer runs.
<IEC timer>	InOut	IEC_TIMER, TON_TIME	IEC_TIMER, IEC_LTIMER, TON_TIME, TON_LTIME	D, L	IEC timer that is started.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The "Start on-delay timer" instruction is executed when the signal state of the operand "Tag\_Input" changes from "0" to "1". The "MyIEC\_TIMER" timer is started for the time stored in the "TagTime" operand.

If the timer "MyIEC\_TIMER" has expired and the operand "Tag\_Input" has the signal state "1", querying the timer status ("MyIEC\_TIMER".Q) returns signal state "1" and the "Tag\_Output" operand is set. When the signal state of the operand "Tag\_Input" changes to "0", the querying of the timer status returns the signal state "0" and the operand "Tag\_Output" is reset.

## See also

Overview of the valid data types (Page 1262)

## ---( TOF )---: Start off-delay timer

### Description

Use the "Start off-delay timer" instruction to start an IEC timer with a specified duration as on-delay. The query of the timer status for "1" returns the signal state "0" if the result of logic operation (RLO) at the input of the instruction has the signal state "1". When the RLO changes from "1" to "0" (negative signal edge), the IEC timer starts with the specified time. The timer status remains at signal state "1" as long as the IEC timer is running. When the timer has run out and the RLO at the input of the instruction has the signal state "0", the timer status is set to the signal state "0". If the RLO changes to "1" before the time expires, the IEC timer is reset and the timer status remains at signal state "1".

### Note

You can start and query the IEC timer at various execution levels, as each querying of the outputs Q or ET updates the IEC\_TIMER structure.

**For S7-1200 CPU**

The instruction "Start off-delay timer" stores its data in a structure of the data type IEC\_TIMER or TOF\_TIME. You can declare the structure as follows:

- Declaration of a data block of system data type IEC\_TIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TOF\_TIME or IEC\_TIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

**For S7-1500 CPU**

The "Start off-delay timer" instruction stores its data in a structure of the data type IEC\_TIMER, IEC\_LTIMER, TOF\_TIME or TOF\_LTIME. You can declare the structure as follows:

- Declaration of a data block of system data type IEC\_TIMER or IEC\_LTIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TOF\_TIME, TOF\_LTIME, IEC\_TIMER or IEC\_LTIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

The instruction data is updated both when the instruction is called and also each time the assigned timer is accessed.

The current timer status is stored in the ET structure component of the IEC timer. You can use a normally open contact to query timer status for "1" or a normally closed contact for "0". The query on Q or ET (for example, "MyTimer".Q or "MyTimer".ET) updates the IEC\_TIMER structure.

The execution of the "Start off-delay timer" instruction assumes a preceding logic operation. It can be placed only at the end of the network.

**Parameters**

The following table shows the parameters of the "Start off-delay timer" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
<Time duration>	Input	TIME	TIME, LTIME	I, Q, M, D, L or constant	Duration with which the IEC timer runs.
<IEC timer>	InOut	IEC_TIMER, TOF_TIME	IEC_TIMER, IEC_LTIMER, TOF_TIME, TOF_LTIME	D, L	IEC timer that is started.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The "Start off-delay timer" instruction is executed when the signal state of the operand "Tag\_Input" changes from "1" to "0". The timer #MyIEC\_TIMER is started for the time stored in the operand "TagTime".

As long as timer #MyIEC\_TIMER is running, the query of the time status (#MyIEC\_TIMER.Q) returns the signal state "1" and operand "Tag\_Output" is set. If the timer has expired and the operand "Tag\_Input" has the signal state "0", the query of the timer status returns the signal state "0". If the signal state of the operand "Tag\_Input" changes to "1" before timer #MyIEC\_TIMER expires, the timer is reset. When the signal state of the operand "Tag\_Input" is "1", the query of the timer status returns the signal state "1".

## See also

Overview of the valid data types (Page 1262)

## ---( TONR )---: Time accumulator

### Description

You can use the "Time accumulator" instruction to record how long the signal is at the input of instruction "1". The instruction is started when the result of logic operation (RLO) changes from "0" to "1" (positive signal edge). The time is recorded as long as the RLO is "1". If the RLO changes to "0", the instruction is halted. If the RLO changes back to "1", the time recording is continued. The query of the timer status for "1" returns the signal state "1" if the recorded time exceeds the value of the specified duration and the RLO at the input of coil is "1".

The timer status and the currently expired timer can be reset to "0" using the "Reset timer" instruction.

---

### Note

You can start and query the IEC timer at various execution levels, as each querying of the outputs Q or ET updates the IEC\_TIMER structure.

---

**For S7-1200 CPU**

The "Time accumulator" instruction stores its data in a structure of the data type IEC\_TIMER or TONR\_TIME. You can declare the structure as follows:

- Declaration of a data block of system data type IEC\_TIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TONR\_TIME or IEC\_TIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

**For S7-1500 CPU**

The "Time accumulator" instruction stores its data in a structure of the data type IEC\_TIMER, IEC\_LTIMER, TONR\_TIME or TONR\_LTIME. You can declare the structure as follows:

- Declaration of a data block of system data type IEC\_TIMER or IEC\_LTIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TONR\_TIME, TONR\_LTIME, IEC\_TIMER or IEC\_LTIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

The instruction data is updated both when the instruction is called and also each time the assigned timer is accessed.

The current timer status is stored in the ET structure component of the IEC timer. You can use a normally open contact to query timer status for "1" or a normally closed contact for "0". The query on Q or ET (for example, "MyTimer".Q or "MyTimer".ET) updates the IEC\_TIMER structure.

The execution of the "Time accumulator" instruction requires a preceding logic operation. It can be placed only at the end of the network.

**Parameter**

The following table shows the parameters of the "Time accumulator" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
<Time duration>	Input	TIME	TIME, LTIME	I, Q, M, D, L or constant	Duration with which the IEC timer runs.
<IEC timer>	InOut	IEC_TIMER, TONR_TIME	IEC_TIMER, IEC_LTIMER, TONR_TIME, TONR_LTIME	D, L	IEC timer that is started.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The "Time accumulator" instruction executes on a positive signal edge in the RLO. The time is recorded as long as the operand "Tag\_Input" has the signal state "1".

If the recorded time exceeds the value of the operand "TagTime", then the query of the timer status ("MyIEC\_TIMER".Q) will return the signal state "1" and the operand "Tag\_Output" will be set.

## See also

Overview of the valid data types (Page 1262)

## ---( RT )---: Reset timer

### Description

You can use the "Reset timer" instruction to reset an IEC timer to "0". The instruction is only executed if the result of logic operation (RLO) at the input of the coil is "1". If current is flowing to the coil (RLO is "1"), the structure components of the timer in the specified data block are reset to "0". If the RLO at the input of the instruction is "0", the timer remains unchanged.

The instruction does not influence the RLO. The RLO at the input of the coil is sent directly to the output of the coil.

You assign the "Reset timer" instruction an IEC timer that has been declared in the program.

The instruction data is updated only when the instruction is called and not each time the assigned IEC timer is accessed. Querying the data is only identical from the call of the instruction to the next call of the instruction.

### Parameters

The following table shows the parameters of the "Reset timer" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
<IEC timer>	Output	IEC_TIMER, TP_TIME, TON_TIME, TOF_TIME, TONR_TIME	IEC_TIMER, IEC_LTIMER, TP_TIME, TP_LTIME, TON_TIME, TON_LTIME, TOF_TIME, TOF_LTIME, TONR_TIME, TONR_LTIME	D, L	IEC timer that is reset.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The "Generate on-delay" instruction executes when the signal state of the "Tag\_Input\_1" operand changes from "0" to "1". The timer stored in the "TON\_DB" instance data block starts running for the time duration specified by operand "Tag\_PT".

If operands "Tag\_Input\_2" and "Tag\_Input\_3" have the signal state "1", the "Reset timer" instruction is executed and the timer stored in the "TON\_DB" data block.

### See also

Overview of the valid data types (Page 1262)

### ---( PT )---: Load time duration

### Description

You can use the "Load time duration" instruction to set the time for an IEC timer. The instruction is executed in every cycle when the result of logic operation (RLO) at the input of the instruction

has the signal state "1". The instruction writes the specified time to the structure of the specified IEC timer.

**Note**

If the specified IEC timer is running while the instruction executes, the instruction overwrites the current time of the specified IEC timer. This can change the timer status of the IEC timer.

You assign an IEC timer declared in the program to the "Load time duration" instruction.

The instruction data is updated only when the instruction is called and each time the assigned IEC timer is accessed. The query on Q or ET (for example, "MyTimer".Q or "MyTimer".ET) updates the IEC\_TIMER structure.

**Parameter**

The following table shows the parameters of the "Load time duration" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
<Time duration>	Input	TIME	TIME, LTIME	I, Q, M, D, L or constant	Duration with which the IEC timer runs.
<IEC timer>	Output	IEC_TIMER, TP_TIME, TON_TIME, TOF_TIME, TONR_TIME	IEC_TIMER, IEC_LTIMER, TP_TIME, TP_LTIME, TON_TIME, TON_LTIME, TOF_TIME, TOF_LTIME, TONR_TIME, TONR_LTIME	D, L	IEC timer, the duration of which is set.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The "Generate on-delay" instruction executes when the signal state of the "Tag\_Input\_1" operand changes from "0" to "1". The IEC timer stored in the instance data block "TON\_DB" is started with the time duration that is specified by the operand "Tag\_PT".

The "Load time duration" instruction is executed when the operand "Tag\_Input\_2" has the signal state "1". The instruction writes the time duration "Tag\_PT\_2" in the instance data block "TON\_DB" and at the same time overwrites the value of the operand "Tag\_PT" within the data block. The signal state of the timer status may therefore change at the next query or when "MyTimer".Q or "MyTimer".ET are accessed.

Overview of the valid data types (Page 1262)

**SIMATIC Timers**

**S\_PULSE: Assign pulse timer parameters and start**

**Description**

The "Assign pulse timer parameters and start" instruction starts a programmed timer when a change from "0" to "1" (positive signal edge) is detected in the result of logic operation (RLO) at input S. The timer expires with the programmed duration (TV) as soon as the signal state at input S is "1". If the signal state at input S changes to "0" before the programmed duration expires, the timer is stopped. In this case, the signal state at output Q is "0".

The duration is made up internally of a time value and a time base and is programmed at parameter TV. When the instruction is started, the programmed time value is counted down towards zero. The time base indicates the time period with which the time value is changed. The current time value is output BI-coded at output BI and BCD-coded at output BCD.

If the timer is running and the signal state at input R changes to "1" then the current time value and the time base are also set to zero. If the timer is not running, the signal state "1" at the R input has no effect.

The "Assign pulse timer parameters and start" instruction requires a preceding logic operation for edge evaluation and can be placed within or at the end of the network.

The instruction data is updated at every access. It can therefore happen that the query of the data at the start of the cycle returns different values than at the end of the cycle.

---

**Note**

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

---

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

## Parameters

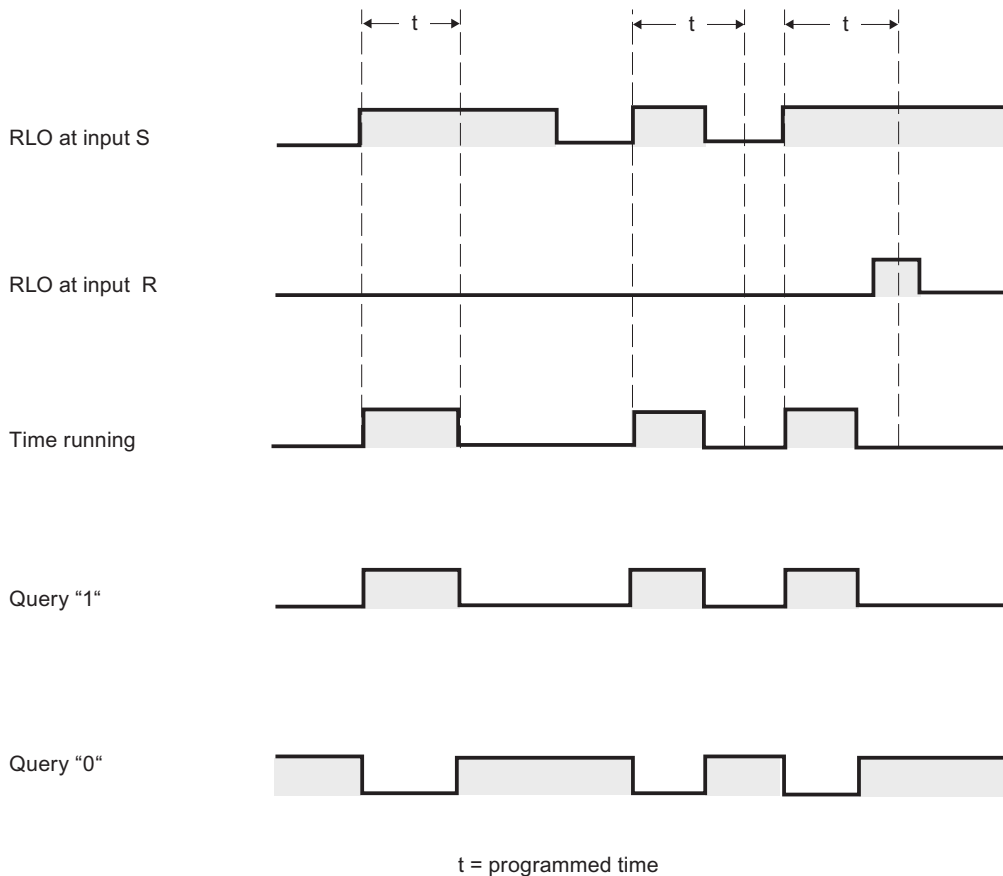

The following table shows the parameters of the instruction "Assign pulse timer parameters and start":

Parameter	Declaration	Data type	Memory area	Description
<Timer>	InOut/Input	TIMER	T	Time of the instruction The number of timers depends on the CPU.
S	Input	BOOL	I, Q, M, D, L	Start input
TV	Input	S5TIME, WORD	I, Q, M, D, L or constant	Preset time value
R	Input	BOOL	I, Q, M, T, C, D, L, P or constant	Reset input
BI	Output	WORD	I, Q, M, D, L, P	Current time value (BI-coded)
BCD	Output	WORD	I, Q, M, D, L, P	Current time value (BCD format)
Q	Output	BOOL	I, Q, M, D, L	Status of the timer

For additional information on valid data types, refer to "See also".

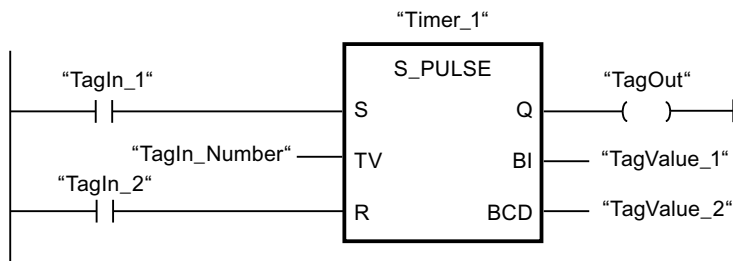

**Pulse timing diagram**

The following figure shows the pulse timing diagram of the instruction "Assign pulse timer parameters and start":

**Example**

The following example shows how the instruction works:

The timer "Timer\_1" is started when the signal state of the operand "TagIn\_1" changes from "0" to "1". The timer expires with the time value of the operand "TagIn\_Number" as long as the operand "TagIn\_1" has the signal state "1". If the signal state of the operand "TagIn\_1" changes from "1" to "0" before the timer expires, the timer "Timer\_1" is stopped. The operand "TagOut" is reset to "0" in this case.

The operand "TagOut" has the signal state "1" as long as the timer is running and the operand "TagIn\_1" has the signal state "1". When the timer expires or is reset, the operand "TagOut" is reset to "0".

Overview of the valid data types (Page 1262)

## S\_PEXT: Assign extended pulse timer parameters and start

### Description

The "Assign extended pulse timer parameters and start" instruction starts a programmed timer when a change from "0" to "1" (positive signal edge) is detected in the result of logic operation (RLO) at input S. The timer expires with the programmed duration (TV), even if the signal state at input S changes to "0". As long as the timer is running, the output Q has the signal state "1". When the timer expires, the output Q is reset to "0". If the signal state at input S changes from "0" to "1" while the timer is running, the timer is restarted with the duration programmed at input TV.

The duration is made up internally of a time value and a time base and is programmed at parameter TV. When the instruction is started, the programmed time value is counted down towards zero. The time base indicates the time period with which the time value is changed. The current time value is output BI-coded at output BI and BCD-coded at output BCD.

If the timer is running and the signal state at input R changes to "1" then the current time value and the time base are also set to zero. If the timer is not running, the signal state "1" at the R input has no effect.

The "Assign extended pulse timer parameters and start" instruction requires a preceding logic operation for edge evaluation and can be placed within or at the end of the network.

The instruction data is updated at every access. It can therefore happen that the query of the data at the start of the cycle returns different values than at the end of the cycle.

---

### Note

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

---

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

**Parameter**

The following table shows the parameters of the instruction "Assign extended pulse timer parameters and start":

Parameter	Declaration	Data type	Memory area	Description
<Timer>	InOut/Input	TIMER	T	Time of the instruction The number of timers depends on the CPU.
S	Input	BOOL	I, Q, M, D, L	Start input
TV	Input	S5TIME, WORD	I, Q, M, D, L or constant	Preset time value
R	Input	BOOL	I, Q, M, T, C, D, L, P or constant	Reset input
BI	Output	WORD	I, Q, M, D, L, P	Current time value (BI-coded)
BCD	Output	WORD	I, Q, M, D, L, P	Current time value (BCD format)
Q	Output	BOOL	I, Q, M, D, L	Status of the timer

For additional information on valid data types, refer to "See also".

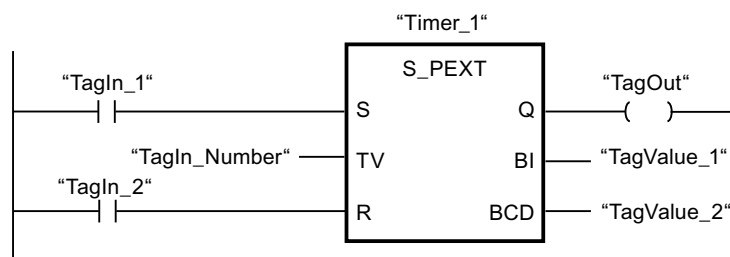

### Pulse timing diagram

The following figure shows the pulse timing diagram of the "Assign extended pulse timer parameters and start" instruction:

### Example

The following example shows how the instruction works:

The timer "Timer\_1" is started when the signal state of the operand "TagIn\_1" changes from "0" to "1". The timer expires with the time value of the operand "TagIn\_Number" without being affected by a negative edge at input S. If the signal state of the operand "TagIn\_1" changes from "0" to "1" before the timer expires, the timer is restarted.

The operand "TagOut" has the signal state "1" as long as the timer is running. When the timer expires or is reset, the operand "TagOut" is reset to "0".

Overview of the valid data types (Page 1262)

## S\_ODT: Assign on-delay timer parameters and start

### Description

The "Assign on-delay timer parameters and start" instruction starts a programmed timer when a change from "0" to "1" (positive signal edge) is detected in the result of logic operation (RLO) at input S. The timer expires with the programmed duration (TV) as soon as the signal state at input S is "1". If the timer expires correctly and input S still has signal state "1" then output Q returns signal state "1". If the signal state at input S changes from "1" to "0" while the timer is running, the timer is stopped. In this case, output Q is reset to signal state "0".

The duration is made up internally of a time value and a time base and is programmed at parameter TV. When the instruction is started, the programmed time value is counted down towards zero. The time base indicates the time period with which the time value is changed. The current time value is output BI-coded at output BI and BCD-coded at output BCD.

If the time is running and the signal state at input R changes from "0" to "1" then the current time value and the time base are also set to zero. In this case, the signal state at output Q is "0". The timer is reset if the signal state is "1" at the R input even if the timer is not running and the RLO at input S is "1".

Specify the timer of the instruction in the placeholder above the box. The timer must be declared with the data type TIMER.

The "Assign on-delay timer parameters and start" instruction requires a preceding logic operation for edge evaluation and can be placed within or at the end of the network.

The instruction data is updated at every access. It can therefore happen that the query of the data at the start of the cycle returns different values than at the end of the cycle.

---

### Note

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

---

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

## Parameter

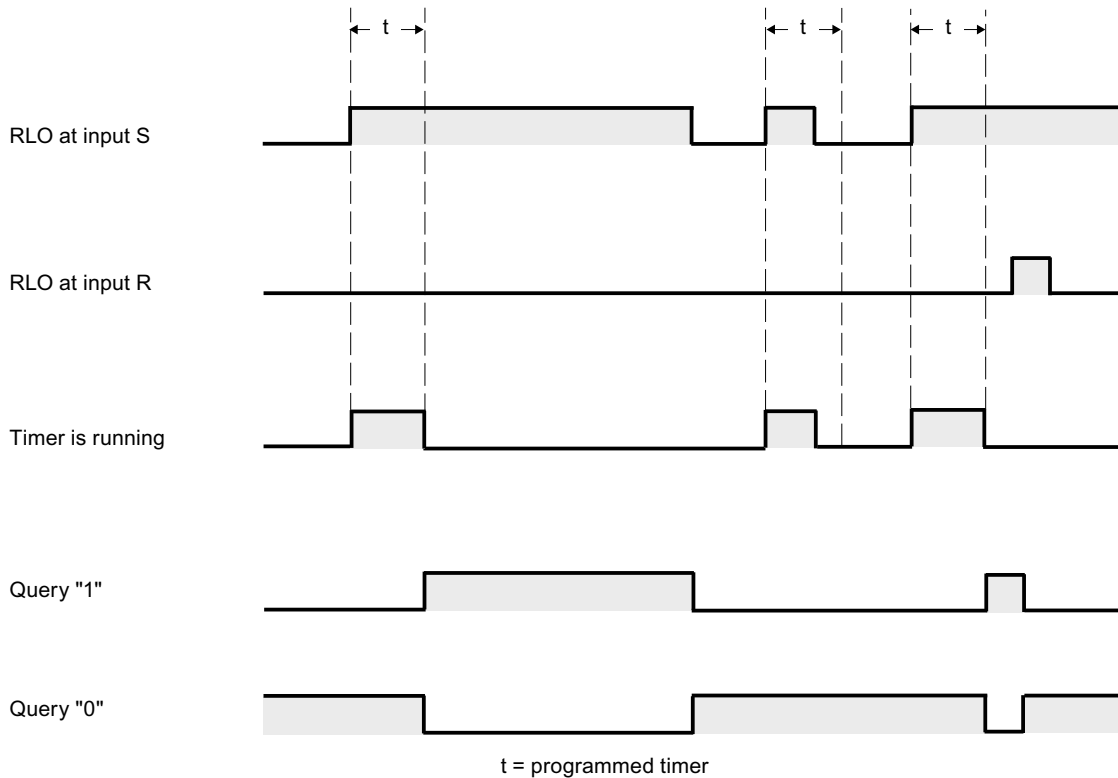

The following table shows the parameters of the "Assign on-delay timer parameters and start" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Timer>	InOut/Input	TIMER	T	Time of the instruction The number of timers depends on the CPU.
S	Input	BOOL	I, Q, M, D, L	Start input
TV	Input	S5TIME, WORD	I, Q, M, D, L or constant	Preset time value
R	Input	BOOL	I, Q, M, T, C, D, L, P or constant	Reset input
BI	Output	WORD	I, Q, M, D, L, P	Current time value (BI-coded)
BCD	Output	WORD	I, Q, M, D, L, P	Current time value (BCD format)
Q	Output	BOOL	I, Q, M, D, L	Status of the timer

For additional information on valid data types, refer to "See also".

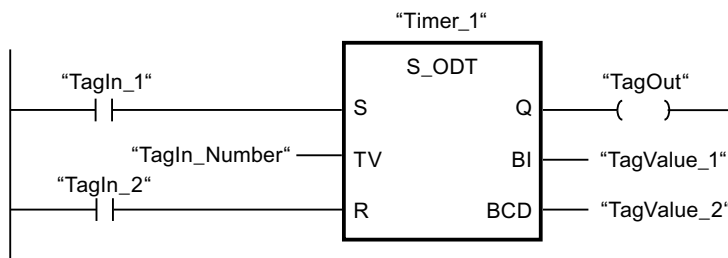

**Pulse timing diagram**

The following figure shows the pulse timing diagram of the "Assign on-delay timer parameters and start" instruction:

**Example**

The following example shows how the instruction works:

The timer "Timer\_1" is started when the signal state of the operand "TagIn\_1" changes from "0" to "1". The timer expires with the time value of the operand "TagIn\_Number". If the timer expires and the operand has the signal state "1", the operand "TagOut" is set to "1". If the signal state of the operand "TagIn\_1" changes from "1" to "0" before the timer expires, the timer is stopped. The operand "TagOut" has the signal state "0" in this case.

**See also**

Overview of the valid data types (Page 1262)

**S\_ODTS: Assign retentive on-delay timer parameters and start****Description**

The "Assign retentive on-delay timer parameters and start" instruction starts a programmed timer when a change from "0" to "1" (positive signal edge) is detected in the result of logic operation (RLO) at input S. The timer expires with the programmed duration (TV), even if the signal state at input S changes to "0". If the timer expires, the "Q" output returns signal state "1" regardless of the signal state at input "S". If the signal state at input S changes from "0" to "1" while the timer is running, the timer is restarted with the duration programmed at input (TV).

The duration is made up internally of a time value and a time base and is programmed at parameter TV. When the instruction is started, the programmed time value is counted down towards zero. The time base indicates the time period with which the time value is changed. The current time value is output BI-coded at output BI and BCD-coded at output BCD.

Signal state "1" at input R resets the current time value and time base to "0" regardless of the signal state at start input S. In this case, the signal state at output Q is "0".

The "Assign retentive on-delay timer parameters and start" instruction requires a preceding logic operation for edge evaluation and can be placed within or at the end of the network.

The instruction data is updated at every access. It can therefore happen that the query of the data at the start of the cycle returns different values than at the end of the cycle.

**Note**

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

**Parameter**

The following table shows the parameters of the "Assign retentive on-delay timer parameters and start" instruction:

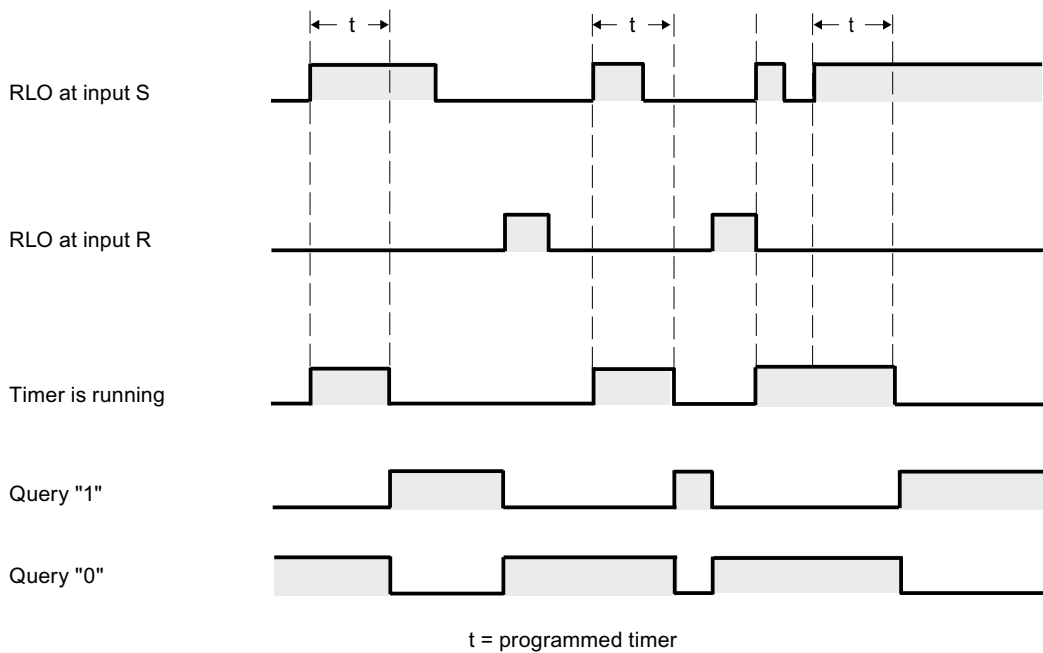

Parameter	Declaration	Data type	Memory area	Description
<Timer>	InOut/Input	TIMER	T	Time of the instruction The number of timers depends on the CPU.
S	Input	BOOL	I, Q, M, D, L	Start input

Parameter	Declaration	Data type	Memory area	Description
TV	Input	S5TIME, WORD	I, Q, M, D, L or constant	Preset time value
R	Input	BOOL	I, Q, M, T, C, D, L, P or constant	Reset input
BI	Output	WORD	I, Q, M, D, L, P	Current time value (BI-coded)
BCD	Output	WORD	I, Q, M, D, L, P	Current time value (BCD format)
Q	Output	BOOL	I, Q, M, D, L	Status of the timer

For additional information on valid data types, refer to "See also".

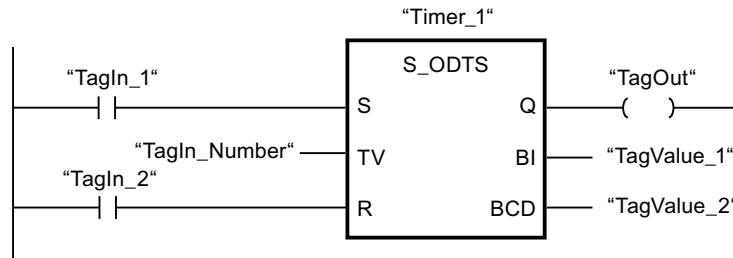

### Pulse timing diagram

The following figure shows the pulse timing diagram of the "Assign retentive on-delay timer parameters and start" instruction:

## Example

The following example shows how the instruction works:

The timer "Timer\_1" is started when the signal state of the operand "TagIn\_1" changes from "0" to "1". The timer expires with the time value of the operand "TagIn\_Number", even if the signal state of the operand "TagIn\_1" changes to "0". When the timer expires, the operand "TagOut" is set to "1". If the signal state of the operand "TagIn\_1" changes from "0" to "1" while the timer is running, the timer is restarted.

Overview of the valid data types (Page 1262)

## S\_OFFDT: Assign off-delay timer parameters and start

### Description

The "Assign off-delay timer parameters and start" instruction starts a programmed timer when a change from "1" to "0" (negative signal edge) is detected in the result of logic operation (RLO) at input S. The timer expires with the programmed duration (TV). As long as the timer is running or input S returns signal state "1", then output Q has signal state "1". When the timer expires and the signal state at input S is "0", output Q is reset to the signal state "0". If the signal state at input S changes from "0" to "1" while the timer is running, the timer is stopped. The timer is only restarted after a falling signal edge is detected at input S.

The duration is made up internally of a time value and a time base and is programmed at parameter TV. When the instruction is started, the programmed time value is counted down towards zero. The time base indicates the time period with which the time value is changed. The current time value is output BI-coded at output BI and BCD-coded at output BCD.

Signal state "1" at input R resets the current time value and time base to "0". In this case, the signal state at output Q is "0".

The "Assign off-delay timer parameters and start" instruction requires a preceding logic operation for edge evaluation and can be placed within or at the end of the network.

The instruction data is updated at every access. It can therefore happen that the query of the data at the start of the cycle returns different values than at the end of the cycle.

**Note**

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

**Parameter**

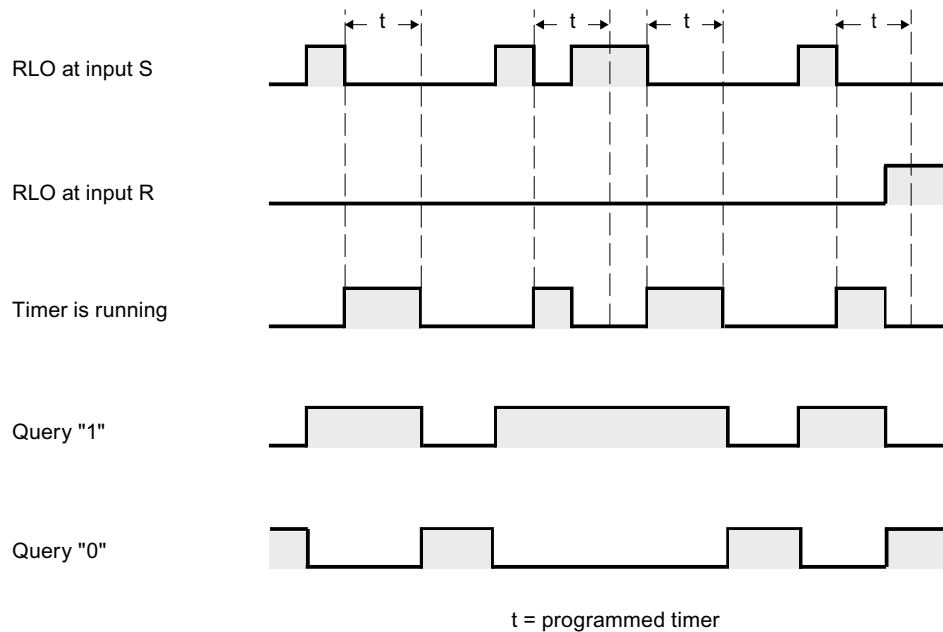

The following table shows the parameters of the "Assign off-delay timer parameters and start" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Timer>	InOut/Input	TIMER	T	Time of the instruction The number of timers depends on the CPU.
S	Input	BOOL	I, Q, M, D, L	Start input
TV	Input	S5TIME, WORD	I, Q, M, D, L or constant	Preset time value
R	Input	BOOL	I, Q, M, T, C, D, L, P or constant	Reset input
BI	Output	WORD	I, Q, M, D, L, P	Current time value (BI-coded)
BCD	Output	WORD	I, Q, M, D, L, P	Current time value (BCD format)
Q	Output	BOOL	I, Q, M, D, L	Status of the timer

For additional information on valid data types, refer to "See also".

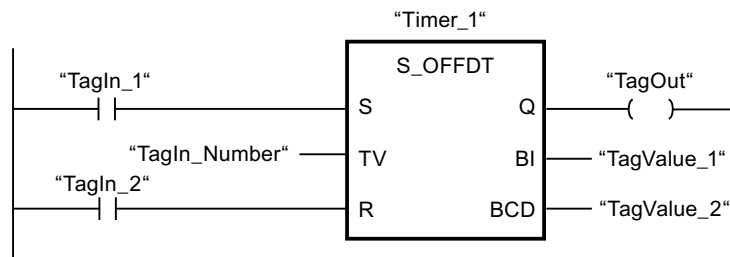

## Pulse timing diagram

The following figure shows the pulse timing diagram of the "Assign off-delay timer parameters and start" instruction:

## Example

The following example shows how the instruction works:

The timer "Timer\_1" is started when the signal state of the operand "TagIn\_1" changes from "1" to "0". The timer expires with the time value of the operand "TagIn\_Number". The operand "TagOut" is set to "1" when the timer is running and when the operand "TagIn\_1" has the signal state "0". If the signal state of the operand "TagIn\_1" changes from "0" to "1" while the timer is running, the timer is reset.

Overview of the valid data types (Page 1262)

---( SP ): Start pulse timer

**Description**

The "Start pulse timer" instruction starts a programmed timer when a change from "0" to "1" (positive signal edge) is detected in the result of logic operation (RLO). The time runs with the specified duration as long as the RLO has the signal state "1". As long as the timer is running, the querying of the timer status for "1" returns the signal state "1". If there is a change from "1" to "0" in the RLO before the time value has elapsed, the timer stops. In this case, the querying of the timer status for "1" returns the signal state "0".

The duration is made up internally of a time value and a time base. When the instruction is started, the programmed time value is counted down towards zero. The time base indicates the time period with which the time value is changed.

The "Start pulse timer" instruction requires a preceding logic operation for edge evaluation and can only be placed at the right side of the network.

**Note**

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

**Parameters**

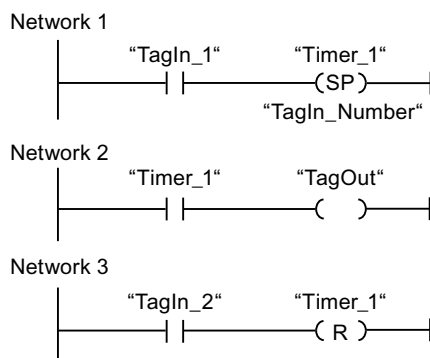

The following table shows the parameters of the "Start pulse timer" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Time duration>	Input	S5TIME, WORD	I, Q, M, D, L or constant	Duration with which the timer expires.
<Timer>	InOut/Input	TIMER	T	Timer which is started. The number of timers depends on the CPU.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The timer "Timer\_1" is started when the signal state of the operand "TagIn\_1" changes from "0" to "1". The timer expires with the time value of the operand "TagIn\_Number" as long as the signal state of the operand "TagIn\_1" is "1". If the signal state of the operand "TagIn\_1" changes from "1" to "0" before the timer expires, the timer is stopped. As long as the timer is running, the operand "TagOut" has the signal state "1". A signal state change of the operand "TagIn\_1" from "0" to "1" resets the timer, which stops the timer and sets the current time value to "0".

Overview of the valid data types (Page 1262)

## ---( SE ): Start extended pulse timer

### Description

The "Start extended pulse timer" instruction starts a programmed timer when a change from "0" to "1" (positive signal edge) is detected in the result of logic operation (RLO). The timer expires with the specified duration, even if the RLO changes to the signal state "0". As long as the timer is running, the querying of the timer status for "1" returns the signal state "1". If the RLO changes from "0" to "1" while the timer is running, the timer is restarted with the programmed duration. The querying of the timer status for "1" returns the signal state "0" when the timer expires.

The duration is made up internally of a time value and a time base. When the instruction is started, the programmed time value is counted down towards zero. The time base indicates the time period with which the time value is changed.

The "Start extended pulse timer" instruction requires a preceding logic operation for edge evaluation and can only be placed at the right side of the network.

**Note**

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

**Parameter**

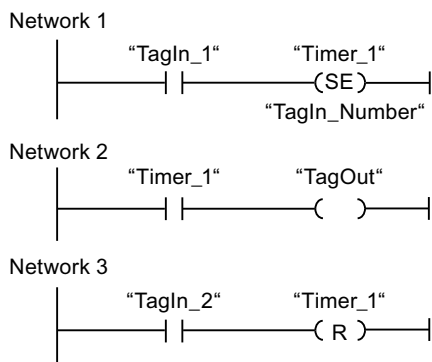

The following table shows the parameters of the "Start extended pulse timer" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Time duration>	Input	S5TIME, WORD	I, Q, M, D, L or constant	Duration with which the timer expires.
<Timer>	InOut/Input	TIMER	T	Timer which is started. The number of timers depends on the CPU.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The timer "Timer\_1" is started when the signal state of the operand "TagIn\_1" changes from "0" to "1". The timer expires with the time value of the operand "TagIn\_Number" without being affected by a negative edge in the RLO. As long as the timer is running, the operand "TagOut" has the signal state "1". If the signal state of the operand "TagIn\_1" changes from "0" to "1" before the timer expires, the timer is restarted.

Overview of the valid data types (Page 1262)

**---( SD ): Start on-delay timer****Description**

The "Start on-delay timer" instruction starts a programmed timer when a change from "0" to "1" (positive signal edge) is detected in the result of logic operation (RLO). The timer runs for the specified duration as long as the RLO is "1". If the timer expires and the RLO still has the signal state "1", the query of the timer status for "1" returns the signal state "1". If the RLO changes from "1" to "0" while the timer is running, the timer is stopped. In this case, the querying of the timer status for "1" returns the signal state "0".

The duration is made up internally of a time value and a time base. When the instruction is started, the programmed time value is counted down towards zero. The time base indicates the time period with which the time value is changed.

The "Start on-delay timer" instruction requires a preceding logic operation for edge evaluation and can only be placed at the right side of the network.

**Note**

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

**Parameter**

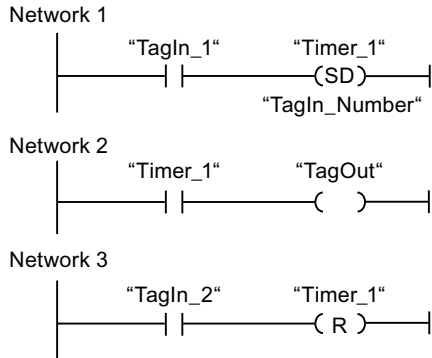

The following table shows the parameters of the "Start on-delay timer" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Time duration>	Input	S5TIME, WORD	I, Q, M, D, L or constant	Duration with which the timer expires.
<Timer>	InOut/Input	TIMER	T	Timer which is started. The number of timers depends on the CPU.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The timer "Timer\_1" is started when the signal state of the operand "TagIn\_1" changes from "0" to "1". The timer expires with the time value of the operand "TagIn\_Number". If the timer expires and the RLO has the signal state "1", the operand "TagOut" is set to "1". If the signal state of the operand "TagIn\_1" changes from "1" to "0" before the timer expires, the timer is stopped. If the signal state of the operand "TagIn\_2" is "1", the timer "Timer\_1" is reset, which stops the timer and sets the current time value to "0".

**See also**

Overview of the valid data types (Page 1262)

**---( SS ): Start retentive on-delay timer**

**Description**

The "Start retentive on-delay timer" instruction starts a programmed timer when a change from "0" to "1" (positive signal edge) is detected in the result of logic operation (RLO). The timer expires with the specified duration, even if the RLO changes to the signal state "0". When the timer expires, the querying of the timer status for "1" returns the signal state "1". After expiry of the timer, the timer can only be restarted if it is explicitly reset.

The duration is made up internally of a time value and a time base. When the instruction is started, the programmed time value is counted down towards zero. The time base indicates the time period with which the time value is changed.

The "Start retentive on-delay timer" instruction requires a preceding logic operation for edge evaluation and can only be placed at the right side of the network.

---

**Note**

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

---

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

## Parameters

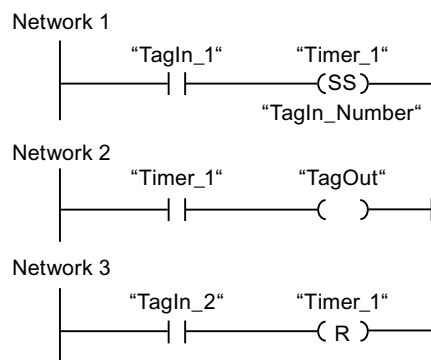

The following table shows the parameters of the "Start retentive on-delay timer" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Time duration>	Input	S5TIME, WORD	I, Q, M, D, L or constant	Duration with which the timer expires.
<Timer>	InOut/Input	TIMER	T	Timer which is started. The number of timers depends on the CPU.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The timer "Timer\_1" is started when the signal state of the operand "TagIn\_1" changes from "0" to "1". The timer expires with the time value of the operand "TagIn\_Number". When the timer expires, the operand "TagOut" is set to "1". If the signal state of the operand "TagIn\_1" changes from "0" to "1" while the timer is running, the timer is restarted. If the signal state of the operand "TagIn\_2" is "1", the timer "Timer\_1" is reset, which stops the timer and sets the current time value to "0".

Overview of the valid data types (Page 1262)

**---( SF ): Start off-delay timer**

**Description**

The "Start off-delay timer" instruction starts a programmed timer when a change from "1" to "0" (negative signal edge) is detected in the result of logic operation (RLO). The timer expires with the specified duration. As long as the timer is running, the querying of the timer status for "1" returns the signal state "1". If the RLO changes from "0" to "1" while the timer is running, the timer is reset. The timer is always restarted when the RLO changes from "1" to "0".

The duration is made up internally of a time value and a time base. When the instruction is started, the programmed time value is counted down towards zero. The time base indicates the time period with which the time value is changed.

The "Start off-delay timer" instruction requires a preceding logic operation for edge evaluation and can only be placed at the right side of the network.

**Note**

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

**Parameter**

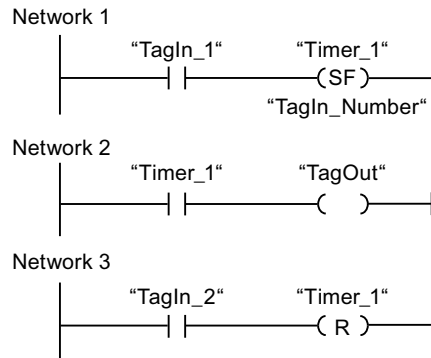

The following table shows the parameters of the "Start off-delay timer" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Time duration>	Input	S5TIME, WORD	I, Q, M, D, L or constant	Duration with which the timer expires.
<Timer>	InOut/Input	TIMER	T	Timer which is started. The number of timers depends on the CPU.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The timer "Timer\_1" is started when the signal state of the operand "TagIn\_1" changes from "1" to "0". The timer expires with the time value of the operand "TagIn\_Number". As long as the timer is running, the operand "TagOut" is set to "1". If the signal state of the operand "TagIn\_1" changes from "1" to "0" while the timer is running, the timer is restarted. If the signal state of the operand "TagIn\_2" is "1", the timer "Timer\_1" is reset, which stops the timer and sets the current time value to "0".

## Counter operations

### IEC Counters

#### CTU: Count up

### Description

You can use the "Count up" instruction to increment the value at output CV. When the signal state at the CU input changes from "0" to "1" (positive signal edge), the instruction is executed and the current counter value at the CV output is incremented by one. When the instruction executes for the first time, the current counter value at the CV output is set to zero. The counter is incremented each time a positive signal edge is detected, until it reaches the high limit for the specified data type at output CV. When the high limit is reached, the signal state at the CU input no longer has an effect on the instruction.

You can scan the counter status at the Q output. The signal state at the Q output is determined by the PV parameter. If the current counter value is greater than or equal to the value of the PV parameter, the Q output is set to signal state "1". In all other cases, the Q output has signal state "0".

The value at the CV output is reset to zero when the signal state at input R changes to "1". As long as the R input has the signal state "1", the signal state at the CU input has no effect on the instruction.

**Note**

Only use a counter at a single point in the program to avoid the risk of counting errors.

Each call of the "Count up" instruction must be assigned to an IEC counter in which the instruction data is stored. An IEC counter is a structure with one of the following data types:

**For S7-1200 CPU**

Data block of system data type IEC_<Counter> (Shared DB)	Local tag
<ul style="list-style-type: none"> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> </ul>	<ul style="list-style-type: none"> <li>• CTU_SINT / CTU_USINT</li> <li>• CTU_INT / CTU_UINT</li> <li>• CTU_DINT / CTU_UDINT</li> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> </ul>

**For S7-1500 CPU**

Data block of system data type IEC_<Counter> (Shared DB)	Local tag
<ul style="list-style-type: none"> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> <li>• IEC_LCOUNTER / IEC_ULCOUNTER</li> </ul>	<ul style="list-style-type: none"> <li>• CTU_SINT / CTU_USINT</li> <li>• CTU_INT / CTU_UINT</li> <li>• CTU_DINT / CTU_UDINT</li> <li>• CTU_LINT / CTU_ULINT</li> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> <li>• IEC_LCOUNTER / IEC_ULCOUNTER</li> </ul>

You can declare an IEC counter as follows:

- Declaration of a data block of system data type IEC\_<Counter> (for example, "MyIEC\_COUNTER")
- Declaration as a local tag of the type CTU\_<Data type> or IEC\_<Counter> in the "Static" section of a block (for example #MyIEC\_COUNTER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC counter is stored in its own data block (single instance) or as a local tag (multi-instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

If you create the IEC counter in a separate data block (single instance), the instance data block is created by default with "optimized block access" and the individual tags defined as retentive. For additional information on setting retentivity in a instance data block, refer to "See also".

If you create the IEC counter as local tag (multi-instance) in a function block with "optimized block access", this is defined as retentive in the block interface.

The execution of the "Count up" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

## Parameters

The following table lists the parameters of the "Count up" instruction:

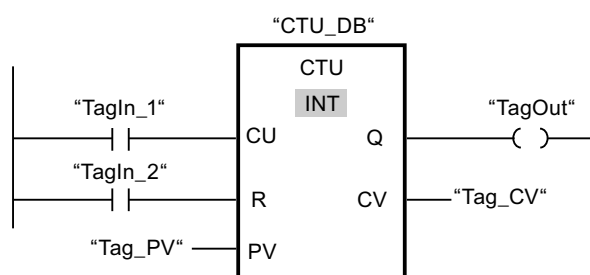

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
CU	Input	BOOL	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Count input
R	Input	BOOL	I, Q, M, D, L, P or constant	I, Q, M, T, C, D, L, P or constant	Reset input
PV	Input	Integers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Value at which the output Q is set.
Q	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Counter status
CV	Output	Integers, CHAR, DATE	I, Q, M, D, L, P	I, Q, M, D, L, P	Current counter value

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

When the signal state of the "TagIn\_1" operand changes from "0" to "1", the "Count up" instruction executes and the current counter value of the "Tag\_CV" operand is incremented by one. With each additional positive signal edge, the counter value is incremented until the high limit of the data type (INT = 32767) is reached.

The value of the PV parameter is adopted as the limit for determining the "TagOut" output. The "TagOut" output has signal state "1" as long as the current counter value is greater than

or equal to the value of the "Tag\_PV" operand. In all other cases, the "TagOut" output has signal state "0".

**See also**

- Overview of the valid data types (Page 1262)
- Setting the retentivity of local tags (Page 1449)
- Setting retentivity in an instance data block (Page 1594)

**CTD: Count down**

**Description**

You can use the "Count down" instruction to decrement the value at output CV. When the signal state at the CD input changes from "0" to "1" (positive signal edge), the instruction is executed and the current counter value at the CV output is decremented by one. When the instruction executes the first time, the counter value of the CV parameter is set to the value of the PV parameter. Each time a positive signal edge is detected, the counter value is decremented until it reaches the low limit of the specified data type. When the low limit is reached, the signal state at the CD input no longer has an effect on the instruction.

You can scan the counter status at the Q output. If the current counter value is less than or equal to zero, the Q output is set to signal state "1". In all other cases, the Q output has signal state "0".

The value at the CV output is set to the value of the PV parameter when the signal state at the LD input changes to "1". As long as the LD input has the signal state "1", the signal state at the CD input has no effect on the instruction.

**Note**

Only use a counter at a single point in the program to avoid the risk of counting errors.

Each call of the "Count down" instruction must be assigned an IEC counter in which the instruction data is stored. An IEC counter is a structure with one of the following data types:

**For S7-1200 CPU**

Data block of system data type IEC_<Counter> (Shared DB)	Local tag
<ul style="list-style-type: none"> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> </ul>	<ul style="list-style-type: none"> <li>• CTD_SINT / CTD_USINT</li> <li>• CTD_INT / CTD_UINT</li> <li>• CTD_DINT / CTD_UDINT</li> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> </ul>

## For S7-1500 CPU

Data block of system data type IEC_<Counter> (Shared DB)	Local tag
<ul style="list-style-type: none"> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> <li>• IEC_LCOUNTER / IEC_ULCOUNTER</li> </ul>	<ul style="list-style-type: none"> <li>• CTD_SINT / CTD_USINT</li> <li>• CTD_INT / CTD_UINT</li> <li>• CTD_DINT / CTD_UDINT</li> <li>• CTD_LINT / CTD_ULINT</li> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> <li>• IEC_LCOUNTER / IEC_ULCOUNTER</li> </ul>

You can declare an IEC counter as follows:

- Declaration of a data block of system data type IEC\_<Counter> (for example, "MyIEC\_COUNTER")
- Declaration as a local tag of the type CTD\_<Data type> or IEC\_<Counter> in the "Static" section of a block (for example #MyIEC\_COUNTER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC counter is stored in its own data block (single instance) or as a local tag (multi-instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

If you create the IEC counter in a separate data block (single instance), the instance data block is created by default with "optimized block access" and the individual tags defined as retentive. For additional information on setting retentivity in a instance data block, refer to "See also".

If you create the IEC counter as local tag (multi-instance) in a function block with "optimized block access", this is defined as retentive in the block interface.

The execution of the "Count down" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

## Parameters

The following table lists the parameters of the "Count down" instruction:

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
CD	Input	BOOL	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Count input
LD	Input	BOOL	I, Q, M, D, L, P or constant	I, Q, M, T, C, D, L, P or constant	Load input
PV	Input	Integers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Value at which the output Q is set.

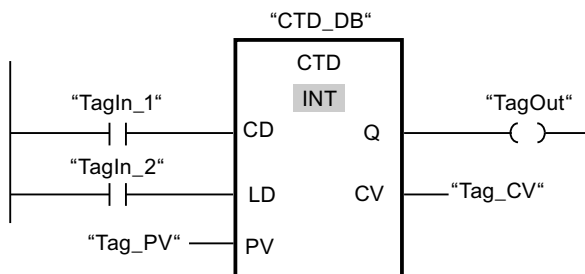

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
Q	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Counter status
CV	Output	Integers, CHAR, DATE	I, Q, M, D, L, P	I, Q, M, D, L, P	Current counter value

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

When the signal state of the "TagIn\_1" operand changes from "0" to "1", the "Count down" instruction executes and the value at the "Tag\_CV" output is decremented by one. With each additional positive signal edge, the counter value is decremented until the low limit of the specified data type (INT = -32768) is reached.

The "TagOut" output has signal state "1" as long as the current counter value is less than or equal to zero. In all other cases, the "TagOut" output has signal state "0".

### CTUD: Count up and down

#### Description

You can use the "Count up and down" instruction to increment and decrement the counter value at the CV output. If the signal state at the CU input changes from "0" to "1" (positive signal edge), the current counter value is incremented by one and stored at the CV output. If the signal state at the CD input changes from "0" to "1" (positive signal edge), the counter value at the CV output is decremented by one. If there is a positive signal edge at the CU and CD inputs in one program cycle, the current counter value at the CV output remains unchanged.

The counter value can be incremented until it reaches the high limit of the data type specified at the CV output. When the high limit is reached, the counter value is no longer incremented on a positive signal edge. When the low limit of the specified data type is reached, the counter value is not decremented any further.

When the signal state at the LD input changes to "1", the counter value at the CV output is set to the value of the PV parameter. As long as the LD input has the signal state "1", the signal state at the CU and CD inputs has no effect on the instruction.

The counter value is set to zero when the signal state at the R input changes to "1". As long as the R input has the signal state "1", a change in the signal state of the CU, CD and LD inputs has no effect on the "Count up and down" instruction.

You can scan the current status of the up counter at the QU output. If the current counter value is greater than or equal to the value of the PV parameter, the QU output is set to signal state "1". In all other cases, the QU output has signal state "0".

You can scan the current status of the down counter at the QD output. If the current counter value is less than or equal to zero, the QD output is set to signal state "1". In all other cases, the QD output has signal state "0".

---

#### Note

Only use a counter at a single point in the program to avoid the risk of counting errors.

---

Each call of the "Count up and down" instruction must be assigned an IEC counter in which the instruction data is stored. An IEC counter is a structure with one of the following data types:

#### For S7-1200 CPU

Data block of system data type IEC_<Counter> (Shared DB)	Local tag
<ul style="list-style-type: none"> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> </ul>	<ul style="list-style-type: none"> <li>• CTUD_SINT / CTUD_USINT</li> <li>• CTUD_INT / CTUD_UINT</li> <li>• CTUD_DINT / CTUD_UDINT</li> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> </ul>

For S7-1500 CPU

Data block of system data type IEC_<Counter> (Shared DB)	Local tag
<ul style="list-style-type: none"> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> <li>• IEC_LCOUNTER / IEC_ULCOUNTER</li> </ul>	<ul style="list-style-type: none"> <li>• CTUD_SINT / CTUD_USINT</li> <li>• CTUD_INT / CTUD_UINT</li> <li>• CTUD_DINT / CTUD_UDINT</li> <li>• CTUD_LINT / CTUD_ULINT</li> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> <li>• IEC_LCOUNTER / IEC_ULCOUNTER</li> </ul>

You can declare an IEC counter as follows:

- Declaration of a data block of system data type IEC\_<Counter> (for example, "MyIEC\_COUNTER")
- Declaration as a local tag of the type CTUD\_<Data type> or IEC\_<Counter> in the "Static" section of a block (for example #MyIEC\_COUNTER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC counter is stored in its own data block (single instance) or as a local tag (multi-instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

If you create the IEC counter in a separate data block (single instance), the instance data block is created by default with "optimized block access" and the individual tags defined as retentive. For additional information on setting retentivity in a instance data block, refer to "See also".

If you create the IEC counter as local tag (multi-instance) in a function block with "optimized block access", this is defined as retentive in the block interface.

The execution of the "Count up and down" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

Parameters

The following table lists the parameters of the "Count up and down" instruction:

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
CU	Input	BOOL	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Count up input
CD	Input	BOOL	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Count down input
R	Input	BOOL	I, Q, M, D, L, P or constant	I, Q, M, T, C, D, L, P or constant	Reset input
LD	Input	BOOL	I, Q, M, D, L, P or constant	I, Q, M, T, C, D, L, P or constant	Load input

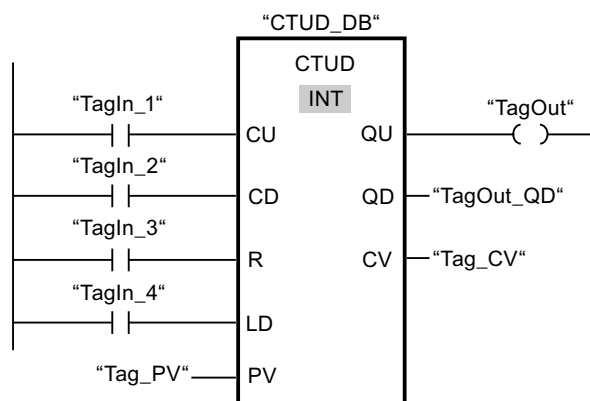

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
PV	Input	Integers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Value at which the output QU is set.
QU	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Status of the up counter
QD	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Status of the down counter
CV	Output	Integers, CHAR, DATE	I, Q, M, D, L, P	I, Q, M, D, L, P	Current counter value

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

If the signal state at the "TagIn\_1" or "TagIn\_2" input changes from "0" to "1" (positive signal edge), the "Count up and down" instruction is executed. When there is a positive signal edge at the "TagIn\_1" input, the current counter value is incremented by one and stored at the "Tag\_CV" output. When there is a positive signal edge at the "TagIn\_2" input, the counter value is decremented by one and stored at the "Tag\_CV" output. When there is a positive signal edge at the CU input, the counter value is incremented until it reaches the high limit of 32767. If input CD has a positive signal edge, the counter value is decremented until it reaches the low limit of INT = -32768.

The "TagOut" output has signal state "1" as long as the current counter value is greater than or equal to the value at the "Tag\_PV" input. In all other cases, the "TagOut" output has signal state "0".

The "TagOut\_QD" output has signal state "1" as long as the current counter value is less than or equal to zero. In all other cases, the "TagOut\_QD" output has signal state "0".

## SIMATIC Counters

### S\_CUD: Assign parameters and count up / down

#### Description

You can use the "Assign parameters and count up / down" instruction to increment or decrement the value of a counter. If the signal state at the CU input changes from "0" to "1" (positive signal edge), the current counter value is incremented by one. If the signal state at the CD input changes from "0" to "1" (positive signal edge), the counter value is decremented by one. The current counter value is output as a hexadecimal value at output CV and BCD-coded at output CV\_BCD. If there is a positive signal edge at the CU and CD inputs in one program cycle, the counter value remains unchanged.

The counter value can be incremented until the high limit of "999" is reached. When the high limit value is reached, the counter value is no longer incremented on a positive signal edge. When the low limit "0" is reached, the counter value is not decremented any further.

When the signal state at input S changes from "0" to "1", the counter value is set to the value of the PV parameter. If the counter is set and if RLO is "1" at the inputs CU and CD, the counter counts accordingly in the next scan cycle, even if no change in the signal edge was detected.

The counter value is set to zero when the signal state at the R input changes to "1". As long as the R input has the signal state "1", processing of the signal state of the CU, CD and S inputs has no effect on the counter value.

The signal state at output Q is "1" if the counter value is greater than zero. If the counter value is equal to zero, output Q has the signal state "0".

---

#### Note

Only use a counter at a single point in the program to avoid the risk of counting errors.

---

The "Assign parameters and count up / down" instruction requires a preceding logic operation for edge evaluation and can be placed within or at the end of the network.

## Parameters

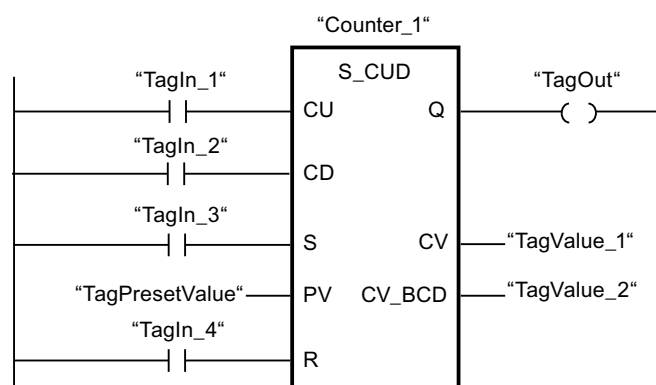

The following table shows the parameters of the "Assign parameters and count up / down" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Counter>	InOut/Input	COUNTER	C	Counter of the instruction The number of counters depends on the CPU.
CU	Input	BOOL	I, Q, M, D, L	Count up input
CD	Input	BOOL	I, Q, M, D, L, T, C or constant	Count down input
S	Input	BOOL	I, Q, M, D, L, T, C or constant	Input for presetting counter
PV	Input	WORD	I, Q, M, D, L or constant	Preset counter value (C#0 to C#999)
R	Input	BOOL	I, Q, M, D, L, T, C or constant	Reset input
BI	Output	WORD, S5TIME, DATE	I, Q, M, D, L	Current counter value (hexadecimal)
CV_BCD	Output	WORD, S5TIME, DATE	I, Q, M, D, L	Current counter value (BCD format)
Q	Output	BOOL	I, Q, M, D, L	Status of the counter

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

If the signal state at the "TagIn\_1" or "TagIn\_2" input changes from "0" to "1" (positive signal edge), the "Assign parameters and count up / down" instruction is executed. When there is a

positive signal edge at the "TagIn\_1" input and the current counter value is less than "999", the counter value is incremented by one. When there is a positive signal edge at the "TagIn\_2" input and the current counter value is greater than "0", the counter value is decremented by one.

When the signal state at input "TagIn\_3" changes from "0" to "1", the counter value is set to the value of the operand "TagPresetValue". The counter value is reset to "0" when the "TagIn\_4" operand has signal state "1".

The current counter value is saved as a hexadecimal value in the operand "TagValue\_1" and BCD-coded in the operand "TagValue\_2".

The "TagOut" output has the signal state "1" as long as the current counter value is not equal to "0".

## S\_CU: Assign parameters and count up

### Description

You can use the "Assign parameters and count up" instruction to increment the value of a counter. If the signal state at the CU input changes from "0" to "1" (positive signal edge), the current counter value is incremented by one. The current counter value is output as a hexadecimal value at output CV and BCD-coded at output CV\_BCD. The counter value can be incremented until the limit of "999" is reached. When the limit is reached, the counter value is no longer incremented on a positive signal edge.

When the signal state at input S changes from "0" to "1", the counter value is set to the value of the PV parameter. If the counter is set and if RLO at input CU is "1", the counter will count accordingly in the next scan cycle, even when no change has been detected in the signal edge.

The counter value is set to zero when the signal state at the R input changes to "1". As long as the R input has the signal state "1", processing of the signal state of the CU and S inputs has no effect on the counter value.

The signal state at output Q is "1" if the counter value is greater than zero. If the counter value is equal to zero, output Q has the signal state "0".

---

### Note

Only use a counter at a single point in the program to avoid the risk of counting errors.

---

The "Assign parameters and count up" instruction requires a preceding logic operation for edge evaluation and can be placed within or at the end of the network.

## Parameter

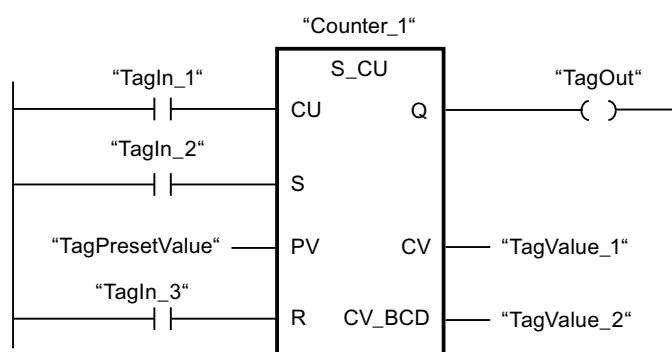

The following table shows the parameters of the "Assign parameters and count up" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Counter>	InOut/Input	COUNTER	C	Counter of the instruction The number of counters depends on the CPU.
CU	Input	BOOL	I, Q, M, D, L	Count up input
S	Input	BOOL	I, Q, M, D, L, T, C or constant	Input for presetting counter
PV	Input	WORD	I, Q, M, D, L or constant	Preset counter value (C#0 to C#999)
R	Input	BOOL	I, Q, M, D, L, T, C or constant	Reset input
CV	Output	WORD, S5TIME, DATE	I, Q, M, D, L	Current counter value (hexadecimal)
CV_BCD	Output	WORD, S5TIME, DATE	I, Q, M, D, L	Current counter value (BCD format)
Q	Output	BOOL	I, Q, M, D, L	Status of the counter

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

When the signal state at the "TagIn\_1" input changes from "0" to "1" (positive signal edge) and the current counter value is less than "999", the counter value is incremented by one. When the signal state at input "TagIn\_2" changes from "0" to "1", the counter value is set to the value of the operand "TagPresetValue". The counter value is reset to "0" when the "TagIn\_3" operand has signal state "1".

The current counter value is saved as a hexadecimal value in the operand "TagValue\_1" and BCD-coded in the operand "TagValue\_2".

The "TagOut" output has the signal state "1" as long as the current counter value is not equal to "0".

**See also**

Overview of the valid data types (Page 1262)

**S\_CD: Assign parameters and count down**

**Description**

You can use the "Assign parameters and count down" instruction to decrement the value of a counter. If the signal state at the CD input changes from "0" to "1" (positive signal edge), the counter value is decremented by one. The current counter value is output as a hexadecimal value at output CV and BCD-coded at output CV\_BCD. The counter value is decremented until the low limit of "0" is reached. When the low limit is reached, the counter value is no longer decremented on a positive signal edge.

When the signal state at input S changes from "0" to "1", the counter value is set to the value of the PV parameter. If the counter is set and if RLO at input CD is "1", the counter will count accordingly in the next scan cycle, even when no change has been detected in the signal edge.

The counter value is set to zero when the signal state at the R input changes to "1". As long as the R input has the signal state "1", processing of the signal state of the CD and S inputs has no effect on the counter value.

The signal state at output Q is "1" if the counter value is greater than zero. If the counter value is equal to zero, output Q has the signal state "0".

---

**Note**

Only use a counter at a single point in the program to avoid the risk of counting errors.

---

The "Assign parameters and count down" instruction requires a preceding logic operation for edge evaluation and can be placed within or at the end of the network.

## Parameter

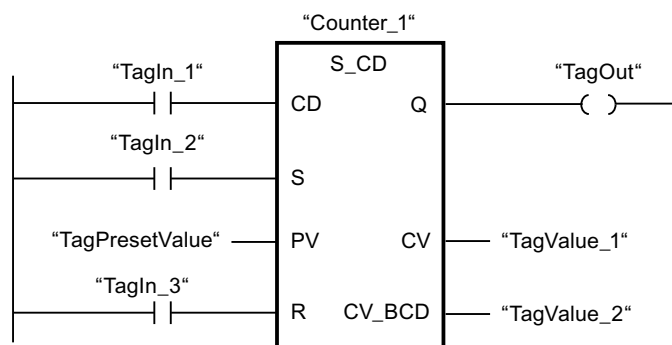

The following table shows the parameters of the "Assign parameters and count down" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Counter>	InOut/Input	COUNTER	C	Counter of the instruction The number of counters depends on the CPU.
CD	Input	BOOL	I, Q, M, D, L or constant	Count down input
S	Input	BOOL	I, Q, M, D, L, T, C or constant	Input for presetting counter
PV	Input	WORD	I, Q, M, D, L or constant	Preset counter value (C#0 to C#999)
R	Input	BOOL	I, Q, M, D, L, T, C or constant	Reset input
CV	Output	WORD, S5TIME, DATE	I, Q, M, D, L	Current counter value (hexadecimal)
CV_BCD	Output	WORD, S5TIME, DATE	I, Q, M, D, L	Current counter value (BCD format)
Q	Output	BOOL	I, Q, M, D, L	Status of the counter

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

When the signal state at the "TagIn\_1" input changes from "0" to "1" (positive signal edge) and the current counter value is greater than "0", the counter value is decremented by one. When the signal state at input "TagIn\_2" changes from "0" to "1", the counter value is set to the value of the operand "TagPresetValue". The counter value is reset to "0" when the "TagIn\_3" operand has signal state "1".

The current counter value is saved as a hexadecimal value in the operand "TagValue\_1" and BCD-coded in the operand "TagValue\_2".

The "TagOut" output has the signal state "1" as long as the current counter value is not equal to "0".

**See also**

Overview of the valid data types (Page 1262)

**---( SC ): Set counter value**

**Description**

You can use the "Set counter value" instruction to set the value of a counter. The instruction is executed when the result of logic operation (RLO) at the input changes from "0" to "1". When the instruction is executed, the counter is set to the specified counter value.

The "Set counter value" instruction needs a preceding logic operation for the edge evaluation and can only be placed on the right edge of the network.

**Parameter**

The following table lists the parameters of the "Set counter value" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Count value>	Input	WORD	I, Q, M, D, L or constant	Value with which the counter is preset in the BCD format. (C#0 to C#999)
<Counter>	InOut/Input	COUNTER	C	Counter that is preset.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

the counter "Counter\_1" starts with the value "100" when the signal state of the "TagIn" operand changes from "0" to "1".

**See also**

Overview of the valid data types (Page 1262)

**---( CU ): Count up****Description**

With the "Count up" instruction you can increment the value of the specified counter by one if there is a positive signal edge in the result of logic operation (RLO). The counter value can be incremented until the limit of "999" is reached. When the limit is reached, the counter value is no longer incremented on a positive signal edge.

The "Count up" instruction requires a preceding logic operation for edge evaluation and can only be placed at the right side of the network.

**Parameter**

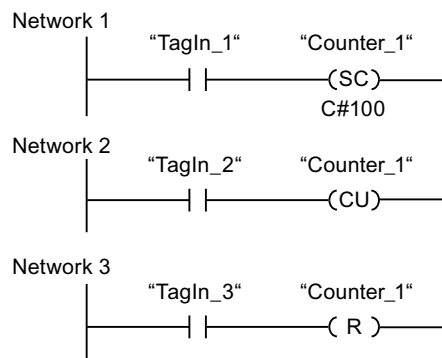

The following table shows the parameters of the "Count up" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Counter>	InOut/Input	COUNTER	C	Counter whose value is incremented.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

When the signal state of the "TagIn\_1" operand changes from "0" to "1" (positive signal edge), the counter "Counter\_1" is preset with the value "100".

The value of the counter "Counter\_1" is incremented by one when the signal state of the operand "TagIn\_2" changes from "0" to "1".

When the operand "TagIn\_3" has the signal state "1", the value of the counter "Counter\_1" is reset to "0".

**See also**

Overview of the valid data types (Page 1262)

**---( CD ): Count down**

**Description**

With the "Count down" instruction you can increment the value of the specified counter by one if there is a positive signal edge in the result of logic operation (RLO). The counter value can be decremented until the limit of "0" is reached. When the limit is reached, the counter value is no longer changed on a positive signal edge.

The "Count down" instruction requires a preceding logic operation for edge evaluation and can only be placed at the right side of the network.

**Parameter**

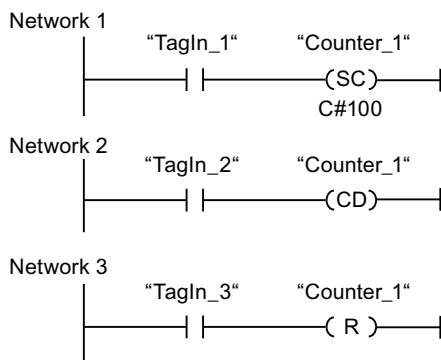

The following table shows the parameters of the "Count down" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Counter>	InOut/Input	COUNTER	C	Counter whose value is decremented.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

When the signal state of the "TagIn\_1" operand changes from "0" to "1" (positive signal edge), the counter "Counter\_1" is preset with the value "100".

The value of the counter "Counter\_1" is decremented by one when the signal state of the operand "TagIn\_2" changes from "0" to "1".

When the operand "TagIn\_3" has the signal state "1", the value of the counter "Counter\_1" is reset to "0".

**See also**

Overview of the valid data types (Page 1262)

**Comparator operations****CMP ==: Equal****Description**

You can use the "Equal" instruction to determine if a first comparison value (<Operand1>) is equal to a second comparison value (<Operand2>).

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0". The RLO of the instruction is logically combined with the RLO of the entire rung as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Specify the first comparison value (<Operand1>) at the operand placeholder above the instruction. Specify the second comparison value (<Operand2>) at the operand placeholder below the instruction.

The individual characters are compared by means of their code (for example, 'a' is greater than 'A') during the comparison of the strings. The comparison is performed from left to right. The first character to be different decides the result of the comparison.

The following table lists examples of string comparisons:

<Operand1>	<Operand2>	RLO of the instruction
'AA'	'AA'	1
'Hello World'	'HelloWorld'	0
'AA'	'aa'	0

You can also use the "Equal" instruction to compare individual characters of a string. The number of the character to be compared is specified in square brackets next to the operand name. "MyString[2]", for example, compares the second character of the "MyString" string.

If IEC check is enabled, the operands to be compared must be of the same data type. If IEC check is not enabled, the width (length) of the operands must be the same. When floating-point numbers are compared, the operands to be compared must have the same data type regardless of the setting for the IEC Check.

**Note****Comparison of floating-point numbers**

If you want to compare the data types REAL or LREAL, instead of the instruction "CMP ==: Equal", use the instruction "IN\_RANGE: Value within range".

**Note**

**Comparison of the data type PORT**

To be able to compare the operands of the PORT data type with the "Equal" instruction, you need to select the WORD data type from the drop-down list of the instructions box.

**Parameters**

The following table lists the parameters of the "Equal" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
<Operand1>	Input	Bit strings, integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Bit strings, integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	First comparison value
<Operand2>	Input	Bit strings, integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Bit strings, integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	Second value to compare

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The condition of the comparison instruction is fulfilled if "Tag\_Value1" = "Tag\_Value2".

**See also**

Overview of the valid data types (Page 1262)

**CMP <>: Not equal****Description**

You can use the "Not equal" instruction to determine if a first comparison value (<Operand1>) is not equal to a second comparison value (<Operand2>).

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0". The RLO of the instruction is logically combined with the RLO of the entire rung as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Specify the first comparison value (<Operand1>) at the operand placeholder above the instruction. Specify the second comparison value (<Operand2>) at the operand placeholder below the instruction.

The individual characters are compared by means of their code (for example, 'a' is greater than 'A') during the comparison of the strings. The comparison is performed from left to right. The first character to be different decides the result of the comparison.

The following table lists examples of string comparisons:

<Operand1>	<Operand2>	RLO of the instruction
'AA'	'aa'	1
'Hello World'	'HelloWorld'	1
'AA'	'AA'	0

You can also use the "Not equal" instruction to compare individual characters of a string. The number of the character to be compared is specified in square brackets next to the operand name. "MyString[2]", for example, compares the second character of the "MyString" string.

If IEC check is enabled, the operands to be compared must be of the same data type. If IEC check is not enabled, the width (length) of the operands must be the same. If the floating-point numbers are being compared, the operands to be compared must be of the same data type regardless of the IEC check setting.

**Note****Comparison of the data type PORT**

To be able to compare the operands of the PORT data type with the "Not equal" instruction, you need to select the WORD data type from the drop-down list of the instructions box.

### Parameters

The following table lists the parameters of the "Not equal" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
<Operand1>	Input	Bit strings, integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Bit strings, integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	First comparison value
<Operand2>	Input	Bit strings, integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Bit strings, integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	Second value to compare

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The condition of the comparison instruction is fulfilled if "Tag\_Value1" <> "Tag\_Value2".

### See also

Overview of the valid data types (Page 1262)

**CMP >=: Greater or equal****Description**

You can use the "Greater or equal" instruction to determine if a first comparison value (<Operand1>) is greater than or equal to a second comparison value (<Operand2>). Both values to be compared must be of the same data type.

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0". The RLO of the instruction is logically combined with the RLO of the entire rung as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Specify the first comparison value (<Operand1>) at the operand placeholder above the instruction. Specify the second comparison value (<Operand2>) at the operand placeholder below the instruction.

The individual characters are compared by means of their code (for example, 'a' is greater than 'A') during the comparison of the strings. The comparison is performed from left to right. The first character to be different decides the result of the comparison. If the left part of the longer string is identical to the shorter string, the longer string is considered greater.

The following table lists examples of string comparisons:

<Operand1>	<Operand2>	RLO of the instruction
'BB'	'AA'	1
'AAA'	'AA'	1
'Hello World'	'Hello World'	1
'Hello World'	'HelloWorld'	0
'AA'	'aa'	0
'AAA'	'a'	0

You can also use the "Greater or equal" instruction to compare individual characters of a string. The number of the character to be compared is specified in square brackets next to the operand name. "MyString[2]", for example, compares the second character of the "MyString" string.

When time values are compared, the RLO of the instruction is "1" if the point of time at <Operand1> is greater (more recent) than or equal to the point of time at <Operand2>.

### Parameters

The following table lists the parameters of the "Greater or equal" instruction:

Parameters	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
<Operand1>	Input	Integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	First comparison value
<Operand2>	Input	Integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	Second value to compare

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The condition of the comparison instruction is fulfilled if "Tag\_Value1" >= "Tag\_Value2".

## CMP <=: Less or equal

### Description

You can use the "Less or equal" instruction to determine if a first comparison value (<Operand1>) is less than or equal to a second comparison value (<Operand2>). Both values to be compared must be of the same data type.

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0". The RLO of the instruction is logically combined with the RLO of the entire rung as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Specify the first comparison value (<Operand1>) at the operand placeholder above the instruction. Specify the second comparison value (<Operand2>) at the operand placeholder below the instruction.

The individual characters are compared by means of their code (for example, 'a' is greater than 'A') during the comparison of the strings. The comparison is performed from left to right. The first character to be different decides the result of the comparison. If the left part of the longer string is identical to the shorter string, the shorter string is considered smaller.

The following table lists examples of string comparisons:

<Operand1>	<Operand2>	RLO of the instruction
'AA'	'aa'	1
'AAA'	'a'	1
'Hello World'	'Hello World'	1
'HelloWorld'	'Hello World'	0
'BB'	'AA'	0
'AAA'	'AA'	0

You can also use the "Less or equal" instruction to compare individual characters of a string. The number of the character to be compared is specified in square brackets next to the operand name. "MyString[2]", for example, compares the second character of the "MyString" string.

When time values are compared, the RLO of the instruction is "1" if the point of time at <Operand1> is less (less recent) than or equal to the point of time at <Operand2>.

### Parameters

The following table lists the parameters of the "Less or equal" instruction:

Parameters	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
<Operand1>	Input	Integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	First comparison value
<Operand2>	Input	Integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	Second value to compare

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The condition of the comparison instruction is fulfilled if "Tag\_Value1" <= "Tag\_Value2".

### See also

Overview of the valid data types (Page 1262)

**CMP >: Greater than****Description**

You can use the "Greater than" instruction to determine if a first comparison value (<Operand1>) is greater than a second comparison value (<Operand2>). Both values to be compared must be of the same data type.

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0". The RLO of the instruction is logically combined with the RLO of the entire rung as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Specify the first comparison value (<Operand1>) at the operand placeholder above the instruction. Specify the second comparison value (<Operand2>) at the operand placeholder below the instruction.

The individual characters are compared by means of their code (for example, 'a' is greater than 'A') during the comparison of the strings. The comparison is performed from left to right. The first character to be different decides the result of the comparison. If the left part of the longer string is identical to the shorter string, the longer string is considered greater.

The following table lists examples of string comparisons:

<Operand1>	<Operand2>	RLO of the instruction
'BB'	'AA'	1
'AAA'	'AA'	1
'AA'	'aa'	0
'AAA'	'a'	0

You can also use the "Greater than" instruction to compare individual characters of a string. The number of the character to be compared is specified in square brackets next to the operand name. "MyString[2]", for example, compares the second character of the "MyString" string.

When time values are compared, the RLO of the instruction is "1" if the point of time at <Operand1> is greater (more recent) than the point of time at <Operand2>.

### Parameters

The following table lists the parameters of the "Greater than" instruction:

Parameters	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
<Operand1>	Input	Integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	First comparison value
<Operand2>	Input	Integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	Second value to compare

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The condition of the comparison instruction is fulfilled if "Tag\_Value1" > "Tag\_Value2".

### See also

Overview of the valid data types (Page 1262)

**CMP <: Less than****Description**

You can use the "Less than" instruction to determine if a first comparison value (<Operand1>) is less than a second comparison value (<Operand2>). Both values to be compared must be of the same data type.

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0". The RLO of the instruction is logically combined with the RLO of the entire rung as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Specify the first comparison value (<Operand1>) at the operand placeholder above the instruction. Specify the second comparison value (<Operand2>) at the operand placeholder below the instruction.

The individual characters are compared by means of their code (for example, 'a' is greater than 'A') during the comparison of the strings. The comparison is performed from left to right. The first character to be different decides the result of the comparison. If the left part of the longer string is identical to the shorter string, the shorter string is considered smaller.

The following table lists examples of string comparisons:

<Operand1>	<Operand2>	RLO of the instruction
'AA'	'aa'	1
'AAA'	'a'	1
'BB'	'AA'	0
'AAA'	'AA'	0

You can also use the "Less than" instruction to compare individual characters of a string. The number of the character to be compared is specified in square brackets next to the operand name. "MyString[2]", for example, compares the second character of the "MyString" string.

When time values are compared, the RLO of the instruction is "1" if the point of time at <Operand1> is less (less recent) than the point of time at <Operand2>.

### Parameters

The following table lists the parameters of the "Less than" instruction:

Parameters	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
<Operand1>	Input	Integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	First comparison value
<Operand2>	Input	Integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	Second value to compare

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The condition of the comparison instruction is fulfilled if "Tag\_Value1" < "Tag\_Value2".

## IN\_RANGE: Value within range

### Description

You can use the "Value within range" instruction to determine if the value at the VAL input is within a specific value range.

You specify the limits of the value range with the MIN and MAX inputs. The "Value within range" instruction compares the value at the VAL input with the values of the MIN and MAX inputs and sends the result to the box output. If the value at the VAL input fulfills the comparison  $\text{MIN} \leq \text{VAL}$  or  $\text{VAL} \leq \text{MAX}$ , the box output has the signal state "1". If the comparison is not fulfilled, the box output has the signal state "0".

If the box input has the signal state "0", the "Value within range" instruction is not executed.

The comparison function can only execute if the values to be compared are of the same data type and the box input is interconnected.

### Parameters

The following table shows the parameters of the "Value within range" instruction:

Parameter	Declaration	Data type	Memory area	Description
Box input	Input	BOOL	I, Q, M, D, L	Result of the previous logic operation
MIN	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Low limit of the value range
VAL	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Comparison value
MAX	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	High limit of the value range
Box output	Output	BOOL	I, Q, M, D, L	Result of the comparison

You can select the data type for the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also":

### Example

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The value of the operand "Tag\_Value" is within the value range that is specified by the current values of the operands "Tag\_Min" and "Tag\_Max" ( $MIN \leq VAL$  or  $VAL \leq MAX$ ).
- The operand "TagIn\_3" has the signal state "1".

**See also**

Overview of the valid data types (Page 1262)

**OUT\_RANGE: Value outside range**

**Description**

You can use the "Value outside range" instruction to determine if the value at the VAL input is outside a specific value range.

You specify the limits of the value range with the MIN and MAX inputs. The "Value outside range" instruction compares the value at the VAL input with the values of the MIN and MAX inputs and sends the result to the box output. If the value at the VAL input fulfills the comparison  $MIN > VAL$  or  $VAL > MAX$ , the box output has the signal state "1". The box output also has the signal state "1" if a specified operand with the REAL data type shows an invalid value.

The box output returns the signal state "0", if the value at input VAL does not satisfy the  $MIN > VAL$  or  $VAL > MAX$  condition.

If the box input has the signal state "0", the "Value outside range" instruction is not executed.

The comparison function can only execute if the values to be compared are of the same data type and the box input is interconnected.

**Parameters**

The following table shows the parameters of the "Value outside range" instruction:

Parameter	Declaration	Data type	Memory area	Description
Box input	Input	BOOL	I, Q, M, D, L	Result of the previous logic operation
MIN	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Low limit of the value range
VAL	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Comparison value
MAX	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	High limit of the value range
Box output	Output	BOOL	I, Q, M, D, L	Result of the comparison

You can select the data type for the instruction from the "<???"> drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operands "Tag\_In\_1" and "Tag\_In\_2" have signal state "1".
- The value of the operand "Tag\_Value" is outside the value range that is specified by the values of the operands "Tag\_Min" and "Tag\_Max" ( $MIN > VAL$  or  $VAL > MAX$ ).
- The operand "Tag\_In\_3" has the signal state "1".

## See also

Overview of the valid data types (Page 1262)

## ---I OK I---: Check validity

### Description

You can use the "Check validity" instruction to check if the value of an operand (<operand>) is a valid floating-point number. The query is started in each program cycle when the signal state at the input of the instruction is "1".

The output of the instruction has signal state "1" when the value of the operand is a valid floating-point number at the time of the query and the input of the instruction has signal state "1". In all other cases, the signal state at the output of the "Check validity" instruction is "0".

You can use the "Check validity" instruction together with the EN mechanism. If you connect the instruction box to an EN enable input, the enable input is set only when the result of the validity query of the value is positive. You can use this function to ensure that an instruction is enabled only when the value of the specified operand is a valid floating-point number.

**Parameters**

The following table shows the parameters of the "Check validity" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Operand>	Input	Floating-point numbers	I, Q, M, D, L	Value to be queried.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

When the values of the operands "Tag\_Value1" and "Tag\_Value2" show valid floating-point numbers, the "Multiply" (MUL) instruction is activated and the ENO output is set. During the execution of the "Multiply" (MUL) instruction, the value of the operand "Tag\_Value1" is multiplied with the value of the operand "Tag\_Value2". The product of the multiplication is then stored in the operand "Tag\_Result". If the instruction is executed without errors, the ENO and "TagOut" outputs are set to signal state "1".

**See also**

Overview of the valid data types (Page 1262)

**----I NOT\_OK I----: Check invalidity**

**Description**

You can use the "Check invalidity" instruction to check if the value of an operand (<operand>) is an invalid floating-point number. The query is started in each program cycle when the signal state at the input of the instruction is "1".

The output of the instruction has signal state "1" when the value of the operand is an invalid floating-point number at the time of the query and the input of the instruction has signal state "1". In all other cases, the signal state at the output of the "Check invalidity" instruction is "0".

## Parameters

The following table shows the parameters of the "Check invalidity" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Operand>	Input	Floating-point numbers	I, Q, M, D, L	Value to be queried.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

When the value of operand "TagIn\_Value" is an invalid floating-point number, the "Move value" (MOVE) instruction will not be executed. The "TagOut" output is reset to signal state "0".

## VARIANT instructions

### EQ\_Type: Compare data type for EQUAL with the data type of a tag

#### Description

You can use the "Compare data type for EQUAL with the data type of a tag" instruction to query the data type of a tag to which a VARIANT points. You compare the data type of the tag (<Operand1>) to the data type of a tag (<Operand2>) that you have declared in the block interface to determine if they are "Equal".

<Operand1> must have the VARIANT data type. <Operand2> can be an elementary data type or a PLC data type.

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0". The RLO of the instruction is logically combined with the RLO of the entire rung as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Specify <Operand1> at the operand placeholder above the instruction. Specify <Operand2> at the operand placeholder below the instruction.

### Parameters

The following table lists the parameters of the "Compare data type for EQUAL with the data type of a tag" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand1>	Input	VARIANT	L	First operand
<Operand2>	Input	Bit strings, integers, floating-point numbers, timers, date and time, character strings, ARRAY, PLC data types	I, Q, M, D, L	Second operand

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The condition of the comparison instruction is fulfilled, i.e. the "#Tag\_Operand1" operand is equal to "Tag\_Operand2".

### See also

Overview of the valid data types (Page 1262)

### NE\_Type: Compare data type for UNEQUAL with the data type of a tag

#### Description

You can use the "Compare data type for EQUAL with the data type of a tag" instruction to query the data type of a tag to which a VARIANT points. You compare the data type of the tag (<Operand1>) to the data type of a tag (<Operand2>) that you have declared in the block interface to determine if they are "Not equal".

<Operand1> must have the VARIANT data type. <Operand2> can be an elementary data type or a PLC data type.

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0". The RLO of the instruction is logically combined with the RLO of the entire rung as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Specify <Operand1> at the operand placeholder above the instruction. Specify <Operand2> at the operand placeholder below the instruction.

## Parameters

The following table lists the parameters of the "Compare data type for UNEQUAL with the data type of a tag" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand1>	Input	VARIANT	L	First operand
<Operand2>	Input	Bit strings, integers, floating-point numbers, timers, date and time, character strings, ARRAY, PLC data types	I, Q, M, D, L	Second operand

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The condition of the comparison instruction is fulfilled, i.e. the "#Tag\_Operand1" operand is not equal to "Tag\_Operand2".

## See also

Overview of the valid data types (Page 1262)

## EQ\_ElemType: Compare element data type for EQUAL with the data type of a tag

### Description

You can use the "Compare element data type for EQUAL with the data type of a tag" instruction to query the data type of a tag to which a VARIANT points. You compare the data type of the tag (<Operand1>) to the data type of a tag (<Operand2>) that you have declared in the block interface to determine if they are "Equal".

<Operand1> must have the VARIANT data type. <Operand2> can be an elementary data type or a PLC data type.

If the data type of the VARIANT tag (<Operand1>) is an ARRAY, the data type of the ARRAY elements is compared.

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0". The RLO of the instruction is logically combined with the RLO of the entire rung as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Specify <Operand1> at the operand placeholder above the instruction. Specify <Operand2> at the operand placeholder below the instruction.

### Parameters

The following table lists the parameters of the "Compare element data type for EQUAL with the data type of a tag" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand1>	Input	VARIANT	L	First operand
<Operand2>	Input	Bit strings, integers, floating-point numbers, timers, date and time, character strings, ARRAY, PLC data types	I, Q, M, D, L	Second operand

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The condition of the comparison instruction is fulfilled, i.e. the "#Tag\_Operand1" operand is equal to "Tag\_Operand2".

### See also

Overview of the valid data types (Page 1262)

## NE\_ElemType: Compare element data type for UNEQUAL with the data type of a tag

### Description

You can use the "Compare element data type for UNEQUAL with the data type of a tag" instruction to query the data type of a tag to which a VARIANT points. You compare the data type of the tag (<Operand1>) to the data type of a tag (<Operand2>) that you have declared in the block interface to determine if they are "Not equal".

<Operand1> must have the VARIANT data type. <Operand2> can be an elementary data type or a PLC data type.

If the data type of the VARIANT tag (<Operand1>) is an ARRAY, the data type of the ARRAY elements is compared.

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0". The RLO of the instruction is logically combined with the RLO of the entire rung as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Specify <Operand1> at the operand placeholder above the instruction. Specify <Operand2> at the operand placeholder below the instruction.

### Parameters

The following table lists the parameters of the "Compare element data type for UNEQUAL with the data type of a tag" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand1>	Input	VARIANT	L	First operand
<Operand2>	Input	Bit strings, integers, floating-point numbers, timers, date and time, character strings, ARRAY, PLC data types	I, Q, M, D, L	Second operand

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The condition of the comparison instruction is fulfilled, i.e. the "#Tag\_Operand1" operand is not equal to "Tag\_Operand2".

**See also**

Overview of the valid data types (Page 1262)

**IS\_NULL: Compare for EQUALS ZERO**

**Description**

You can use the instruction "Compare for EQUALS ZERO" to query whether the VARIANT does not point to an object.

The <Operand> must have the VARIANT data type.

**Note**

**VARIANT tag points to an ANY pointer**

If the VARIANT tag points to an ANY pointer, the instruction always returns the result RLO = "0" even if the ANY pointer is ZERO.

**Parameters**

The following table lists the parameters of the "Compare for EQUALS ZERO" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Input	VARIANT	L	Operand that is compared for EQUAL ZERO

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The condition of the comparison instruction is fulfilled, i.e. the "#Tag\_Operand" operand does not point to an object.

### See also

Overview of the valid data types (Page 1262)

## NOT\_NULL: Compare for UNEQUALS ZERO

### Description

You can use the instruction "Compare for UNEQUALS ZERO" to query whether the VARIANT points to an object.

The <Operand> must have the VARIANT data type.

#### Note

#### VARIANT tag points to an ANY pointer

If the VARIANT tag points to an ANY pointer, the instruction always returns the result RLO = "1" even if the ANY pointer is ZERO.

### Parameters

The following table lists the parameters of the "Compare for UNEQUALS ZERO" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Input	VARIANT	L	Operand that is compared for NOT EQUAL ZERO

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The condition of the comparison instruction is fulfilled, i.e. the "#Tag\_Operand" operand points to an object.

**See also**

Overview of the valid data types (Page 1262)

**IS\_ARRAY: Check for ARRAY**

**Description**

You can use the instruction "Check for ARRAY" to query whether the VARIANT points to a tag of the ARRAY data type.

The <Operand> must have the VARIANT data type.

**Parameters**

The following table lists the parameters of the "Check for ARRAY" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Input	VARIANT	L	Operand that is query for ARRAY

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The condition of the comparison instruction is fulfilled, i.e. the "#Tag\_VARIANTToArray" operand has the ARRAY data type.

**See also**

Overview of the valid data types (Page 1262)

## Math functions

### CALCULATE: Calculate

#### Description

The "Calculate" instruction is used to define and execute an expression for the calculation of mathematical operations or complex logic operations depending on the selected data type.

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box. Depending on the data type selected, you can combine the functions of certain instructions to perform a complex calculation. The expression to be calculated is specified via a dialog you can open via the "Calculator" icon at the top of the instruction box. The expression can contain names of input parameters and the syntax of the instructions. Operand names and operand addresses cannot be specified.

In its initial state, the instruction box contains at least 2 inputs (IN1 and IN2). The number of inputs can be extended. The inserted inputs are numbered in ascending order in the box.

The values of the inputs are used to execute the specified expression. Not all of the defined inputs have to be used in the expression. The result of the instruction is transferred to the output OUT.

---

#### Note

If one of the mathematical operations fails in the expression, no result is transferred to the output OUT and the enable output ENO returns the signal state "1".

---

If you use inputs in the expression that are not available in the box, they are inserted automatically. This requires that there are no gaps in the numbering of the inputs to be newly defined in the expression. For example, you cannot use the IN4 input in the expression unless the IN3 input has been defined.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The result of the "Calculate" instruction is outside the range permitted for the data type specified at the OUT output.
- A floating-point number has an invalid value.
- An error occurred during execution of one of the instructions in the expression.

The following table shows the instructions that can be executed together in the expression of the instruction "Calculate", depending on the selected data type:

Data type	Instruction	Syntax	Example
Bit strings	AND: AND logic operation	AND	IN1 AND IN2 OR IN3
	OR: OR logic operation	OR	
	XOR: EXCLUSIVE OR logic operation	XOR	
	INV: Create ones complement	NOT	
	SWAP: Swap <sup>1)</sup>	SWAP	

Data type	Instruction	Syntax	Example
Integers	ADD: Add	+	(IN1 + IN2) * IN3;
	SUB: Subtract	-	(ABS(IN2)) *
	MUL: Multiply	*	(ABS(IN1))
	DIV: Divide	/	
	MOD: Return remainder of division	MOD	
	INV: Create ones complement	NOT	
	NEG: Create twos complement	-(in1)	
	ABS: Form absolute value	ABS( )	
Floating-point numbers	ADD: Add	+	((SIN(IN2) * SIN(IN2)
	SUB: Subtract	-	+ (SIN(IN3) *
	MUL: Multiply	*	SIN(IN3)) / IN3));
	DIV: Divide	/	(SQR(SIN(IN2)) +
	EXPT: Exponentiate	**	(SQR(COS(IN3)) /
	ABS: Form absolute value	ABS( )	IN2))
	SQR: Form square	SQR( )

	ACOS: Form arcosine value	ACOS( )	
	ATAN: Form arctangent value	ATAN( )	
	NEG: Create twos complement	-(in1)	
	TRUNC: Truncate numerical value	TRUNC( )	
	ROUND: Round numerical value	ROUND( )	
CEIL: Generate next higher integer from floating-point number	CEIL( )		
FLOOR: Generate next lower integer from floating-point number	FLOOR( )		

<sup>1)</sup> Not possible for data type BYTE.

### Parameters

The following table shows the parameters of the "Calculate" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output

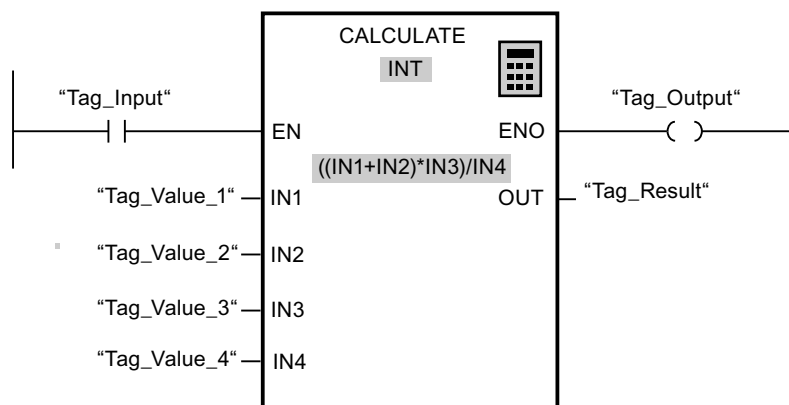

Parameters	Declaration	Data type	Memory area	Description
IN1	Input	Bit strings, integers, floating-point numbers	I, Q, M, D, L, P or constant	First available input
IN2	Input	Bit strings, integers, floating-point numbers	I, Q, M, D, L, P or constant	Second available input
INn	Input	Bit strings, integers, floating-point numbers	I, Q, M, D, L, P or constant	Additionally inserted inputs
OUT	Output	Bit strings, integers, floating-point numbers	I, Q, M, D, L, P	Output to which the end result is to be transferred.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN1	Tag_Value_1	4
IN2	Tag_Value_2	4
IN3	Tag_Value_3	3
IN4	Tag_Value_4	2
OUT	Tag_Result	12

If the "Tag\_Input" input has the signal state "1", the "Calculate" instruction is executed. The value of operand "Tag\_Value\_1" is added to the value of operand "Tag\_Value\_2". The sum is multiplied with the value of operand "Tag\_Value\_3". The product is divided by the value of operand "Tag\_Value\_4". The quotient is transferred as end result to the operand "Tag\_Result" at the OUT output of the instruction. If the instruction is executed without errors, the enable output ENO and operand "Tag\_Output" are set to "1".

- Inserting additional inputs and outputs in LAD elements (Page 1486)
- Removing inputs and outputs (Page 1487)
- Basics of the EN/ENO mechanism (Page 1357)

**ADD: Add**

**Description**

You can use the "Add" instruction to add the value at input IN1 and the value at input IN2 and query the sum at output OUT (OUT := IN1+IN2).

In its initial state, the instruction box contains at least 2 inputs (IN1 and IN2). The number of inputs can be extended. The inserted inputs are numbered in ascending order in the box. When the instruction is executed, the values of all available input parameters are added. The sum is stored at the OUT output.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The enable input EN has the signal state "0".
- The result of the instruction is outside the range permitted for the data type specified at the OUT output.
- A floating-point number has an invalid value.

**Parameters**

The following table shows the parameters of the "Add" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN1	Input	Integers, floating-point numbers	I, Q, M, D, L, P or constant	First number to be added
IN2	Input	Integers, floating-point numbers	I, Q, M, D, L, P or constant	Second number to be added
INn	Input	Integers, floating-point numbers	I, Q, M, D, L, P or constant	Optional input values that are added.
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L, P	Sum

You can select the data type for the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also":

## Example

The following example shows how the instruction works:

If operand "TagIn" has the signal state "1", the "Add" instruction is executed. The value of operand "Tag\_Value1" is added to the value of operand "Tag\_Value2". The result of the addition is stored in operand "Tag\_Result". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

## SUB: Subtract

### Description

You can use the "Subtract" instruction to subtract the value at input IN2 from the value at input IN1 and query the difference at output OUT ( $OUT := IN1 - IN2$ ).

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The result of the instruction is outside the range permitted for the data type specified at the OUT output.
- A floating-point number has an invalid value.

### Parameters

The following table shows the parameters of the "Subtract" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN1	Input	Integers, floating-point numbers	I, Q, M, D, L, P or constant	Minuend

Parameter	Declaration	Data type	Memory area	Description
IN2	Input	Integers, floating-point numbers	I, Q, M, D, L, P or constant	Subtracting
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L, P	Difference

You can select the data type for the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

If operand "TagIn" has the signal state "1", the "Subtract" instruction is executed. The value of operand "Tag\_Value2" is subtracted from the value of operand "Tag\_Value1". The result of the subtraction is stored in operand "Tag\_Result". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

**See also**

- Overview of the valid data types (Page 1262)

- Selecting a data type (Page 1471)

**MUL: Multiply**

**Description**

You can use the "Multiply" instruction to multiply the value at input IN1 with the value at input IN2 and query the product at output OUT (OUT := IN1\*IN2).

The number of inputs can be expanded in the instruction box. The added inputs are numbered in ascending order in the box. When the instruction is executed, the values of all available input parameters are multiplied. The product is stored at the OUT output.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- The result is outside the range permitted for the data type specified at output OUT.
- A floating-point number has an invalid value.

## Parameters

The following table shows the parameters of the "Multiply" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN1	Input	Integers, floating-point numbers	I, Q, M, D, L, P or constant	Multiplier
IN2	Input	Integers, floating-point numbers	I, Q, M, D, L, P or constant	Number being multiplied
INn	Input	Integers, floating-point numbers	I, Q, M, D, L, P or constant	Optional input values that can be multiplied.
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L, P	Product

You can select the data type for the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

If operand "TagIn" has the signal state "1", the "Multiply" instruction is executed. The value of operand "Tag\_Value1" is multiplied by the value of operand "Tag\_Value2". The result of the multiplication is stored in operand "Tag\_Result". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

## DIV: Divide

### Description

You can use the "Divide" instruction to divide the value at input IN1 by the value at input IN2 and query the quotient at output OUT (OUT := IN1/IN2).

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The result of the instruction is outside the range permitted for the data type specified at the OUT output.
- A floating-point number has an invalid value.

### Parameters

The following table shows the parameters of the "Divide" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN1	Input	Integers, floating-point numbers	I, Q, M, D, L, P or constant	Dividend
IN2	Input	Integers, floating-point numbers	I, Q, M, D, L, P or constant	Divisor
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L, P	Quotient value

You can select the data type for the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

If operand "TagIn" has the signal state "1", the "Divide" instruction is executed. The value of operand "Tag\_Value1" is divided by the value of operand "Tag\_Value2". The division result is stored in operand "Tag\_Result". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

**MOD: Return remainder of division****Description**

You can use the "Return remainder of division" instruction to divide the value at input IN1 by the value at input IN2 and query the remainder of division at output OUT.

**Parameters**

The following table shows the parameters of the "Return remainder of division" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN1	Input	Integers	I, Q, M, D, L, P or constant	Dividend
IN2	Input	Integers	I, Q, M, D, L, P or constant	Divisor
OUT	Output	Integers	I, Q, M, D, L, P	Remainder of division

You can select the data type for the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

If operand "TagIn" has the signal state "1", the "Return remainder of division" instruction is executed. The value of operand "Tag\_Value1" is divided by the value of operand "Tag\_Value2". The remainder is stored in operand "Tag\_Result". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

**See also**

- Overview of the valid data types (Page 1262)

- Selecting a data type (Page 1471)

**NEG: Create twos complement**

**Description**

You can use the "Create twos complement" instruction to change the sign of the value at the IN input and query the result at the OUT output. If there is a positive value at input IN, for example, the negative equivalent of this value is sent to output OUT.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The result of the instruction is outside the range permitted for the data type specified at the OUT output.
- A floating-point number has an invalid value.

**Parameters**

The following table shows the parameters of the "Create twos complement" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
EN	Input	BOOL	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	Enable output
IN	Input	SINT, INT, DINT, floating-point numbers	SINT, INT, DINT, LINT, floating-point numbers	I, Q, M, D, L, P or constant	Input value
OUT	Output	SINT, INT, DINT, floating-point numbers	SINT, INT, DINT, LINT, floating-point numbers	I, Q, M, D, L, P	Twos complement of the input value

You can select the data type for the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

If operand "TagIn" has the signal state "1", the "Create two's complement" instruction is executed. The sign of the value at input "TagIn\_Value" is changed and the result is provided at "TagOut\_Value" output. If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

## See also

## INC: Increment

### Description

You can use the "Increment" instruction to change the value of the operand at the IN/OUT parameter to the next higher value and query the result. The "Increment" instruction is only started when the signal state at the EN enable input is "1". If no overflow error occurs during the execution, the ENO enable output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- A floating-point number has an invalid value.

### Parameters

The following table shows the parameters of the "Increment" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN/OUT	InOut	Integers	I, Q, M, D, L	Value to be incremented.

You can select the data type for the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

If operands "TagIn\_1" and "TagIn\_2" have the signal state "1", the value of operand "Tag\_InOut" is incremented by one and the "TagOut" output is set.

**See also**

- Overview of the valid data types (Page 1262)
- Basics of the EN/ENO mechanism (Page 1357)

**DEC: Decrement**

**Description**

You can use the "Decrement" instruction to change the value of the operand at the IN/OUT parameter to the next lower value and query the result. The "Decrement" instruction is only started when the signal state at the EN enable input is "1". If the range of values of the selected data type is not exceeded during processing, the ENO output also has the signal state "1".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- A floating-point number has an invalid value.

**Parameter**

The following table shows the parameters of the "Decrement" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN/OUT	InOut	Integers	I, Q, M, D, L	Value to be decremented.

You can select the data type for the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

If operands "TagIn\_1" and "TagIn\_2" have the signal state "1", the value of operand "Tag\_InOut" is decremented by one and the "TagOut" output is set.

## See also

Overview of the valid data types (Page 1262)

## ABS: Form absolute value

### Description

You can use the "Form absolute value" instruction to calculate the absolute value of the value specified at input IN. The result of the instruction is sent to the OUT output and can be queried there.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- A floating-point number has an invalid value.

### Parameters

The following table shows the parameters of the "Form absolute value" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
EN	Input	BOOL	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	Enable output
IN	Input	SINT, INT, DINT, floating-point numbers	SINT, INT, DINT, LINT, floating-point numbers	I, Q, M, D, L, P or constant	Input value
OUT	Output	SINT, INT, DINT, floating-point numbers	SINT, INT, DINT, LINT, floating-point numbers	I, Q, M, D, L, P	Absolute value of the input value

You can select the data type for the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	TagIn_Value	-6.234
OUT	TagOut_Value	6.234

If operand "TagIn" has the signal state "1", the "Form absolute value" instruction is executed. The instruction calculates the absolute value of the value at input "TagIn\_Value" and sends the result to output "TagOut\_Value". If the instruction is executed without errors, the "TagOut" output is set.

**See also**

- Overview of the valid data types (Page 1262)
- Basics of the EN/ENO mechanism (Page 1357)

**MIN: Get minimum**

**Description**

The "Get minimum" instruction compares the values at the available inputs and writes the lowest value to the OUT output. The number of inputs can be expanded at the instruction box by additional inputs. The inputs are numbered in ascending order in the box.

A minimum of two and a maximum of 100 inputs must be specified for the execution of the instruction.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- Enable input EN has the signal state "0".
- The implicit conversion of the data types fails during execution of the instruction.
- A floating-point number has an invalid value.

## Parameters

The following table shows the parameters of the "Get minimum" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
EN	Input	BOOL	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	Enable output
IN1	Input	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	First input value
IN2	Input	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	Second input value
INn	Input	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	Additionally inserted inputs whose values are to be compared
OUT	Output	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P	Result

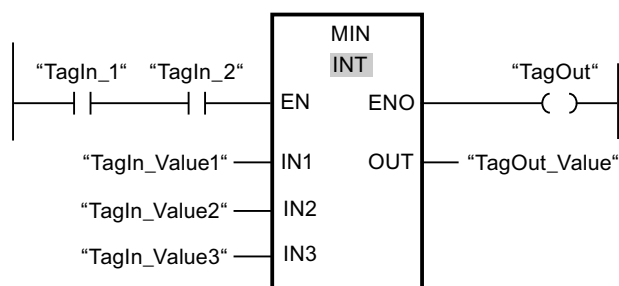

The data types TOD, LTOD, DATE, and LDT can only be used if the IEC test is not enabled.

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN1	TagIn_Value1	12222
IN2	TagIn_Value2	14444
IN3	TagIn_Value3	13333
OUT	TagOut_Value	12222

If the "TagIn\_1" and "TagIn\_2" operands have signal state "1", the "Get minimum" instruction is executed. The instruction compares the values of the specified operands and copies the lowest value ("TagIn\_Value1") to output "TagOut\_Value". If the instruction is executed without errors, the "TagOut" output is set.

**See also**

Overview of the valid data types (Page 1262)

Inserting additional inputs and outputs in LAD elements (Page 1486)

Basics of the EN/ENO mechanism (Page 1357)

**MAX: Get maximum**

**Description**

The "Get maximum" instruction compares the values at the available inputs and writes the highest value to the OUT output. The number of inputs can be expanded at the instruction box by additional inputs. The inputs are numbered in ascending order in the box.

A minimum of two and a maximum of 100 inputs must be specified for the execution of the instruction.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- Enable input EN has the signal state "0".
- The implicit conversion of the data types fails during execution of the instruction.
- A floating-point number has an invalid value.

**Parameters**

The following table shows the parameters of the "Get maximum" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
EN	Input	BOOL	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	Enable output

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
IN1	Input	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	First input value
IN2	Input	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	Second input value
INn	Input	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	Additionally inserted inputs whose values are to be compared
OUT	Output	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P	Result

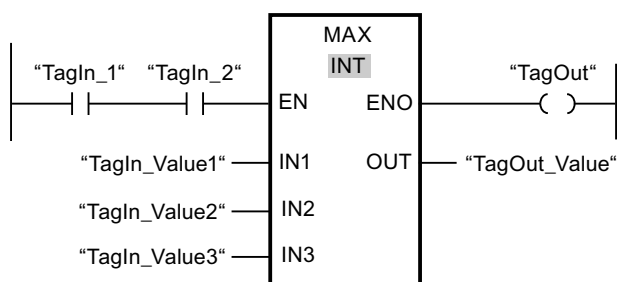

The data types TOD, LTOD, DATE, and LDT can only be used if the IEC test is not enabled.

You can select the data type of the instruction from the "<???"> drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN1	TagIn_Value1	12222
IN2	TagIn_Value2	14444

Parameter	Operand	Value
IN3	TagIn_Value3	13333
OUT	TagOut_Value	14444

If the "TagIn\_1" and "TagIn\_2" operands have signal state "1", the "Get maximum" instruction is executed. The instruction compares the values of the specified operands and copies the highest value ("TagIn\_Value2") to output "TagOut\_Value". If the instruction is executed without errors, the "TagOut" output is set.

**See also**

Overview of the valid data types (Page 1262)

Inserting additional inputs and outputs in LAD elements (Page 1486)

Removing inputs and outputs (Page 1487)

Basics of the EN/ENO mechanism (Page 1357)

**LIMIT: Set limit value**

**Description**

You can use the "Set limit value" instruction to limit the value at input IN to the values at the inputs MN and MX. If the value at the IN input meets the condition  $MN \leq IN \leq MX$ , it is copied to the OUT output. If the condition is not fulfilled and the input value IN is below the low limit MN, the output OUT is set to the value of the MN input. If the MX high limit is exceeded, the OUT output is set to the value of the MX input.

If the value at the MN input is greater than at the MX input, the result is undefined and the enable output ENO is "0".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- Enable input EN has the signal state "0".
- The specified tags are not of the same data type.
- An operand has an invalid value.
- The value at the MN input is greater than the value of the MX input.

**Parameters**

The following table shows the parameters of the "Set limit value" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
EN	Input	BOOL	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	Enable output

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
MN	Input	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	Low limit
IN	Input	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	Input value
MX	Input	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	High limit
OUT	Output	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P	Result

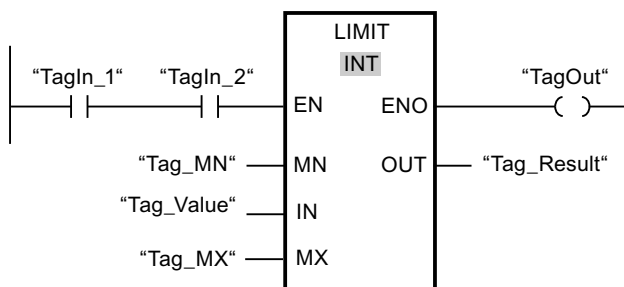

The data types TOD, LTOD, DATE, and LDT can only be used if the IEC test is not enabled.

You can select the data type of the instruction from the "<???"> drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
MN	Tag_MN	12000
IN	Tag_Value	8000

Parameter	Operand	Value
MX	Tag_MX	16000
OUT	Tag_Result	12000

If operands "TagIn\_1" and "TagIn\_2" have the signal state "1", the "Set limit value" instruction is executed. The value of operand "Tag\_Value" is compared with the values of operands "Tag\_MN" and "Tag\_MX". Since the value of operand "Tag\_Value" is less than the low limit, the value of operand "Tag\_MN" is copied to the "Tag\_Result" output. If the instruction is executed without errors, the "TagOut" output is set.

**See also**

- Overview of the valid data types (Page 1262)
- Basics of the EN/ENO mechanism (Page 1357)

**SQR: Form square**

**Description**

You can use the "Form square" instruction to square the value at the IN input and query the result at the OUT output.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The value at the IN input is not a valid floating-point number.

**Parameters**

The following table shows the parameters of the "Form square" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	Input value
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	Square of the input value

You can select the data type for the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	Tag_Value	5.0
OUT	Tag_Result	25.0

If operand "TagIn" has the signal state "1", the "Form square" instruction is executed. The instruction squares the value of operand "Tag\_Value" and sends the result to the "Tag\_Result" output. If the instruction is executed without errors, the "TagOut" output is set.

## SQRT: Form square root

### Description

You can use the "Form square root" instruction to find the square root of the value at the IN input and query the result at the OUT output. The instruction outputs a positive result if the input value is greater than zero. If input values are less than zero, the OUT output returns an invalid floating-point number. If the value at input IN is "0", then the result is also "0".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The value at the IN input is not a valid floating-point number.
- The value at the IN input is negative.

### Parameters

The following table shows the parameters of the "Form square root" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output

Parameter	Declaration	Data type	Memory area	Description
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	Input value
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	Square root of the input value

You can select the data type for the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	Tag_Value	25.0
OUT	Tag_Result	5.0

If operand "TagIn" has the signal state "1", the "Form square root" instruction is executed. The instruction finds the square root of the value of operand "Tag\_Value" and stores the result in the "Tag\_Result" output. If the instruction is executed without errors, the "TagOut" output is set.

**LN: Form natural logarithm**

**Description**

You can use the "Form natural logarithm" instruction to calculate the natural logarithm to base e (e = 2.718282) of the value at input IN. The result is sent to the OUT output and can be queried there. The instruction outputs a positive result if the input value is greater than zero. If input values are less than zero, the OUT output returns an invalid floating-point number.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The enable input EN has the signal state "0".
- The value at the IN input is not a valid floating-point number.
- The value at the IN input is negative.

## Parameters

The following table shows the parameters of the "Form natural logarithm" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	Input value
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	Natural logarithm of the input value

You can select the data type for the instruction from the "<???"> drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

If operand "TagIn" has the signal state "1", the "Form natural logarithm" instruction is executed. The instruction forms the natural logarithm of the value at the "Tag\_Value" input and stores the result in the "Tag\_Result" output. If the instruction is executed without errors, the "TagOut" output is set.

## EXP: Form exponential value

### Description

You can use the "Form exponential value" instruction to calculate the exponent from the base e ( $e = 2.718282$ ) and the value specified at input IN. The result is provided at output OUT and can be queried there ( $OUT = e^{IN}$ ).

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The enable input EN has the signal state "0".
- The value at the IN input is not a valid floating-point number.

### Parameters

The following table shows the parameters of the "Form exponential value" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	Input value
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	Exponential value of input value IN

You can select the data type for the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

If operand "TagIn" has the signal state "1", the "Form exponential value" instruction is executed. The instruction calculates the exponent from base e and the value of operand "Tag\_Value" and sends the result to the "Tag\_Result" output. If the instruction is executed without errors, the "TagOut" output is set.

## SIN: Form sine value

### Description

Use the "Form sine value" instruction to calculate the sine of the angle. The size of the angle is specified in radians at the IN input. The result of the instruction is sent to the OUT output and can be queried there.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The value at the IN input is not a valid floating-point number.

### Parameters

The following table shows the parameters of the "Form sine value" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	Size of angle in radians
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	Sine of the specified angle

You can select the data type for the instruction from the "<???"> drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	Tag_Value	+1.570796 ( $\pi/2$ )
OUT	Tag_Result	1.0

If operand "TagIn" has the signal state "1", the "Form sine value" instruction is executed. The instruction calculates the sine of the angle specified at the "Tag\_Value" input and stores the

result in the "Tag\_Result" output. If the instruction is executed without errors, the "TagOut" output is set.

**See also**

- Overview of the valid data types (Page 1262)

**COS: Form cosine value**

**Description**

Use the "Form cosine value" instruction to calculate the cosine of the angle. The size of the angle is specified in radians at the IN input. The result of the instruction is sent to the OUT output and can be queried there.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The value at the IN input is not a valid floating-point number.

**Parameters**

The following table shows the parameters of the "Form cosine value" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	Size of angle in radians
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	Cosine of the specified angle

You can select the data type for the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	Tag_Value	+1.570796 ( $\pi/2$ )
OUT	Tag_Result	0

If operand "TagIn" has the signal state "1", the "Form cosine value" instruction is executed. The instruction calculates the cosine of the angle specified at the "Tag\_Value" input and stores the result in the "Tag\_Result" output. If the instruction is executed without errors, the "TagOut" output is set.

## See also

## TAN: Form tangent value

### Description

Use the "Form tangent value" instruction to calculate the tangent of the angle. The size of the angle is specified in radians at the IN input. The result of the instruction is sent to the OUT output and can be queried there.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The value at the IN input is not a valid floating-point number.

### Parameters

The following table shows the parameters of the "Form tangent value" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	Size of angle in radians
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	Tangent of the specified angle

You can select the data type for the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	Tag_Value	+3.141593 ( $\pi$ )
OUT	Tag_Result	0

If operand "TagIn" has the signal state "1", the "Form tangent value" instruction is executed. The instruction calculates the tangent of the angle specified at the "Tag\_Value" input and stores the result in the "Tag\_Result" output. If the instruction is executed without errors, the "TagOut" output is set.

**See also**

- Overview of the valid data types (Page 1262)

**ASIN: Form arcsine value**

**Description**

You can use the "Form arcsine value" instruction to calculate the size of the angle from the arcsine value specified at input IN, which corresponds to this value. Only valid floating-point numbers within the range -1 to +1 can be specified at the IN input. The calculated angle size is output in radians at the OUT output and can range in value from  $-\pi/2$  to  $+\pi/2$ .

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The value at the IN input is not a valid floating-point number.
- The value at the IN input is outside the permitted value range (-1 to +1).

## Parameters

The following table shows the parameters of the "Form arcsine value" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	Sine value
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	Size of angle in radians

You can select the data type for the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	Tag_Value	1.0
OUT	Tag_Result	+1.570796 ( $\pi/2$ )

If operand "TagIn" has the signal state "1", the "Form arcsine value" instruction is executed. The instruction calculates the size of the angle corresponding to the sine value at the "Tag\_Value" input. The result of the instruction is stored in the "Tag\_Result" output. If the instruction is executed without errors, the "TagOut" output is set.

## ACOS: Form arccosine value

### Description

You can use the "Form arccosine value" instruction to calculate the size of the angle from the cosine value specified at input IN, which corresponds to this value. Only valid floating-point numbers within the range -1 to +1 can be specified at the IN input. The calculated angle size is output in radians at the OUT output and can range in value from 0 to  $\pi$ .

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The value at the IN input is not a valid floating-point number.
- The value at the IN input is outside the permitted value range (-1 to +1).

### Parameters

The following table shows the parameters of the "Form arccosine value" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	Cosine value
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	Size of angle in radians

You can select the data type for the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	Tag_Value	0
OUT	Tag_Result	+1.570796 ( $\pi/2$ )

If operand "TagIn" has the signal state "1", the "Form arccosine value" instruction is executed. The instruction calculates the size of the angle corresponding to the cosine value at the "Tag\_Value" input. The result of the instruction is stored in the "Tag\_Result" output. If the instruction is executed without errors, the "TagOut" output is set.

## See also

Overview of the valid data types (Page 1262)

## ATAN: Form arctangent value

### Description

You can use the "Form arctangent value" instruction to calculate the size of the angle from the tangent value specified at input IN, which corresponds to this value. Only valid floating-point numbers may be specified at the IN input. The calculated angle size is output in radians at the OUT output and can range in value from  $-\pi/2$  to  $+\pi/2$ .

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The value at the IN input is not a valid floating-point number.

### Parameters

The following table shows the parameters of the "Form arctangent value" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	Tangent value
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	Size of angle in radians

You can select the data type for the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	Tag_Value	1.0
OUT	Tag_Result	+0.785398 ( $\pi/4$ )

If operand "TagIn" has the signal state "1", the "Form arctangent value" instruction is executed. The instruction calculates the size of the angle corresponding to the tangent value at the "Tag\_Value" input. The result of the instruction is stored in the "Tag\_Result" output. If the instruction is executed without errors, the "TagOut" output is set.

**See also**

- Overview of the valid data types (Page 1262)
- Basics of the EN/ENO mechanism (Page 1357)

**FRAC: Return fraction**

**Description**

You can use the "Return fraction" instruction to determine the decimal places of the value at the IN input. The result of the query is stored at the OUT output and can be queried there. If, for example, the IN input has the value 123.4567, the OUT output returns the value 0.4567.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The value at input IN is not a valid floating-point number.

## Parameters

The following table shows the parameters of the "Return fraction" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	Value, whose decimal places are to be determined.
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	Decimal places of the value at the IN input

You can select the data type for the instruction from the "<???"> drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	Tag_Value	2.555
OUT	Tag_Result	0.555

If operands "TagIn\_1" and "TagIn\_2" have the signal state "1", the "Return fraction" instruction is started. The decimal places from the value of operand "Tag\_Value" are copied to operand "Tag\_Result". If the instruction is executed without errors, the ENO output has the signal state "1" and the "TagOut" output is set.

## See also

Overview of the valid data types (Page 1262)

Basics of the EN/ENO mechanism (Page 1357)

## EXPT: Exponentiate

### Description

You can use the "Exponentiate" instruction to raise the value at the IN1 input to a power specified with the value at the IN2 input. The result of the instruction is provided at the OUT output and can be queried there ( $OUT = IN1^{IN2}$ ).

The IN1 input can only be assigned valid floating-point numbers. Integers can also be assigned to the IN2 input.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- Errors occur during execution of the instruction, for example, an overflow occurs.

### Parameters

The following table shows the parameters of the "Exponentiate" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN1	Input	Floating-point numbers	I, Q, M, D, L, P or constant	Base value
IN2	Input	Integers, floating-point numbers	I, Q, M, D, L, P or constant	Value with which the base value is exponentiated
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	Result

You can select the data type for the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

If operands "TagIn\_1" and "TagIn\_2" have the signal state "1", the "Exponentiate" instruction is started. The value of operand "Tag\_Value1" is raised to a power specified with the value of operand "Tag\_Value2". The result is stored in the "Tag\_Result" output. If the instruction is

executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

## See also

## Move operations

### MOVE: Move value

#### Description

You use the "Move value" instruction to transfer the content of the operand at the IN input to the operand at the OUT1 output. The transfer is always made in the direction of ascending address.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The data type at the IN parameter does not correspond to the specified data type at the OUT1 parameter.

The following table lists the possible transfers for the S7-1200 CPU series:

<sup>1)</sup> You can also use the "Move value" instruction to transfer individual characters of a string to operands of the CHAR or WCHAR data type. The number of the character to be transferred is specified in square brackets next to the operand name. "MyString[2]", for example, transfers the second character of the "MyString" string. It is also possible to transfer from operands of the data type CHAR to the individual characters of a string. You can also replace a specific character of a string with the character of another string.

<sup>2)</sup> Transferring entire arrays (ARRAY) is possible only when the array components of the operands at input IN and at output OUT1 are of the same data type.

If the bit length of the data type at input IN exceeds the bit length of the data type at output OUT1, the higher-order bits of the source value are lost. If the bit length of the data type at input IN is less than the bit length of the data type at output OUT1, the higher-order bits of the destination value will be overwritten with zeros.

In its initial state, the instruction box contains 1 output (OUT1). The number of outputs can be extended. The added outputs are numbered in ascending order on the box. During the execution of the instruction, the content of the operand at the input IN is transferred to all available outputs. The instruction box cannot be extended if structured data types (DTL, STRUCT, ARRAY) or characters of a string are transferred.

You can also use the "Move block" (MOVE\_BLK) and "Move block uninterruptible" (UMOVE\_BLK) instructions to move operands of the ARRAY data type. You can move operands of the STRING data type with the instruction "Move character string" (S\_MOVE).

## Parameter

The following table lists the parameters of the "Move value" instruction:

Parameters	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
EN	Input	BOOL	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	Enable output
IN	Input	Bit strings, integers, floating-point numbers, DATE, TIME, TOD, DTL, CHAR, STRUCT, ARRAY, IEC data types, PLC data type (UDT)	Bit strings, integers, floating-point numbers, DATE, DT, LDT, S5TIME, TIME, LTIME, TOD, LTOD, DTL, CHAR, STRUCT, ARRAY, TIMER, COUNTER, IEC data types, PLC data type (UDT)	I, Q, M, D, L or constant	Source value
OUT1	Output	Bit strings, integers, floating-point numbers, DATE, TIME, TOD, DTL, CHAR, STRUCT, ARRAY, IEC data types, PLC data type (UDT)	Bit strings, integers, floating-point numbers, DATE, DT, LDT, S5TIME, TIME, LTIME, TOD, LTOD, DTL, CHAR, STRUCT, ARRAY, TIMER, COUNTER, IEC data types, PLC data type (UDT)	I, Q, M, D, L	Operands to which in the source value is transferred.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	TagIn_Value	0011 1111 1010 1111
OUT1	TagOut_Value	0011 1111 1010 1111

If the operand "TagIn" has the signal state "1", the "Move value" instruction is executed. The instruction copies the contents of operand "TagIn\_Value" to operand "TagOut\_Value" and sets output "TagOut" to signal state "1".

**Deserialize: Deserialize**

**Description**

You can use the "Deserialize" instruction to convert the sequential representation of a PLC data type (UDT) back to a PLC data type and to fill its entire contents.

The memory area in which the sequential representation of a PLC data type is located must have the ARRAY of BYTE data type and be declared with standard access. Make sure that there is enough memory space prior to the conversion.

The instruction enables you can convert multiple sequential representations of converted PLC data types back to their original state step-by-step.

#### Note

If you only want to convert back a single sequential representation of a PLC data type (UDT), you can also direct the instruction "TRCV: Receive data via communication connection".

## Parameters

The following table lists the parameters of the "Deserialize" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
SRC_ARRAY	Input	VARIANT	I, Q, D, L	Global data block in which the generated data stream is stored
DEST_VARIABLE	InOut	VARIANT	I, Q, D, L	Tag in which the returned converted PLC data type (UDT) is stored
POS	InOut	DINT	I, Q, M, D, L	Number of bytes that the converted PLC data types use. The POS parameter is calculated zero-based.
RET_VAL	Output	INT	I, Q, M, D, L	Error information

For additional information on valid data types, refer to "See also".

## RET\_VAL parameter

The following table shows the meaning of the values of the RET\_VAL parameter:

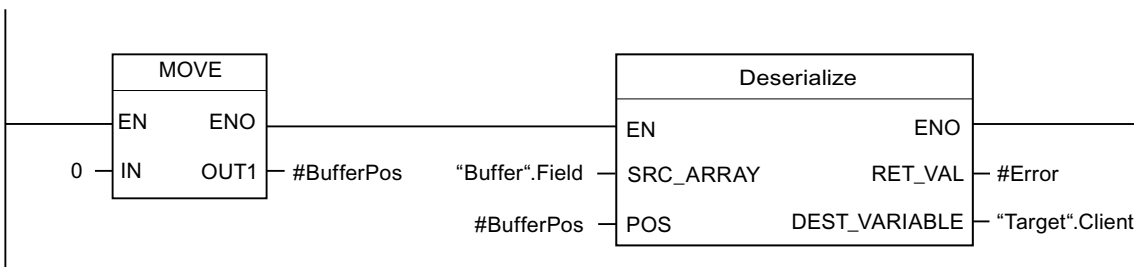

Error code* (W#16#...)	Explanation
0000	No error
80B0	The memory areas for the SRC_ARRAY and DEST_VARIABLE parameters overlap.
8136	The data block at the DEST_VARIABLE parameter is not a block with standard access.
8150	The VARIANT data type at the SRC_ARRAY parameter contains no value.
8151	Code generation error at the SRC_ARRAY parameter
8153	There is not enough free memory available at the SRC_ARRAY parameter.
8250	The VARIANT data type at the DEST_VARIABLE parameter contains no value.
8251	Code generation error at the DEST_VARIABLE parameter
8254	Invalid data type in the DEST_VARIABLE parameter.

Error code* (W#16#...)	Explanation
8382	The value at the POS parameter is outside the limits of the array.
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

**Example**

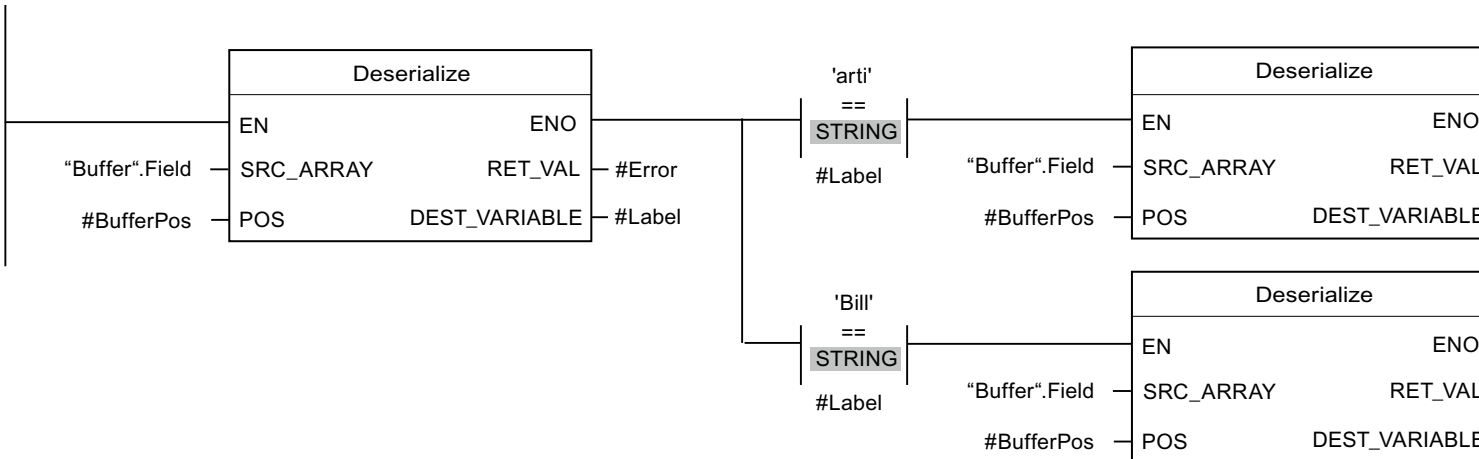

The following example shows how the instruction works:

Network 1:

The "Move value" instruction copies the value "0" to the "#BufferPos" operand. The "Deserialize" instruction deserializes the sequential representation of the customer data from the "Buffer" data block and writes it to the "Target" data block. The number of bytes that show the converted customer data is stored in the "#BufferPos" operand.

Network 2:

The "Deserialize" instruction deserializes the sequential representation of the separator sheet, which was saved with the sequential representation after the customer data, from the "Buffer" data block and writes the characters to the "#Label" operand. The characters are compared using comparison instructions "arti" and "Bill". If the comparison for "arti" = TRUE, then this is article data that has been deserialized and written to the "Target" data block. If the comparison for "Bill" = TRUE, then this is billing data that has been deserialized and written to the "Target" data block.

The following table lists the declaration of the operands:

Operand	Data type	Declaration
DeliverPos	INT	In the "Input" section of the block interface
BufferPos	DINT	In the "Temp" section of the block interface
Error	INT	In the "Temp" section of the block interface
Label	STRING[4]	In the "Temp" section of the block interface

The following table lists the declarations of the PLC data types:

Name the PLC data types	Name	Data type
Article	Number	DINT
	Declaration	STRING
	Colli	INT
Client	Title	INT
	First name	STRING[10]
	Surname	STRING[10]

The following table lists the declaration of the data blocks:

Name of the data blocks	Name	Data type
Target	Client	"Client" (PLC data type)
	Article	Array[0..] of "Article" (PLC data type)
	Bill	Array[0..10] of INT
Buffer	Field	Array[0..294] of BYTE

## See also

Basics of the EN/ENO mechanism (Page 1357)

PLC data types (Page 1306)

Inserting additional inputs and outputs in LAD elements (Page 1486)

## Serialize: Serialize

### Description

You can use the "Serialize" instruction to convert several PLC data types (UDT) to a sequential representation without losing parts of their structure.

You can use the instruction to cache multiple structured data from your program in a buffer, which is preferably in a global data block, and send it to another CPU. The memory area in which the converted PLC data types must be stored must have the ARRAY of BYTE data type and be declared with standard access. Make sure that there is enough memory space prior to the conversion.

The operand at the POS parameter contains information about how many bytes the converted PLC data types occupy.

**Note**

If you want to send a single PLC data type (UDT), you can directly call the instruction "TSEND: Send data via communication connection".

**Parameters**

The following table lists the parameters of the "Serialize" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
SRC_VARIABLE	Input	VARIANT	I, Q, D, L	PLC data type (UDT) that is converted to sequential representation.
DEST_ARRAY	InOut	VARIANT	I, Q, D, L	Data block in which the generated data stream is stored.
POS	InOut	DINT	I, Q, M, D, L	Number of bytes that the converted PLC data types use. The POS parameter is calculated zero-based.
RET_VAL	Output	INT	I, Q, M, D, L	Error information

For additional information on valid data types, refer to "See also".

**RET\_VAL parameter**

The following table shows the meaning of the values of the RET\_VAL parameter:

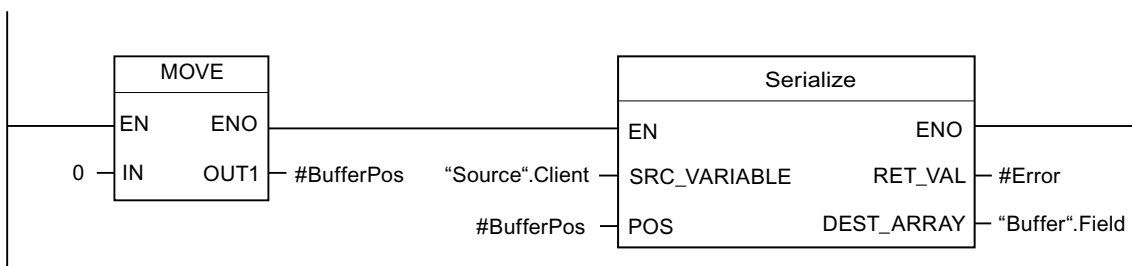

Error code* (W#16#...)	Explanation
0000	No error
80B0	The memory areas for the SRC_VARIABLE and DEST_ARRAY parameters overlap.
8150	The VARIANT data type at the SRC_VARIABLE parameter contains no value.
8152	Code generation error at the SRC_VARIABLE parameter
8236	The data block at the DEST_ARRAY parameter is not a block with standard access.
8250	The VARIANT data type at the DEST_ARRAY parameter contains no value.
8252	Code generation error at the DEST_ARRAY parameter
8253	There is not enough free memory available at the DEST_ARRAY parameter.
8254	Invalid data type in the DEST_ARRAY parameter.

Error code* (W#16#...)	Explanation
8382	The value at the POS parameter is outside the limits of the array.
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

### Example

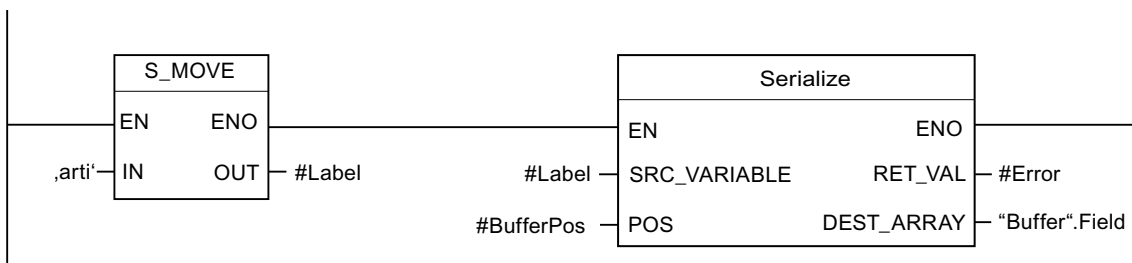

The following example shows how the instruction works:

Network 1:

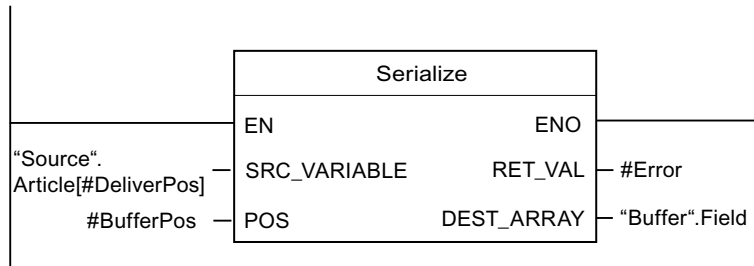

The "Move value" instruction copies the value "0" to the "#BufferPos" operand. The "Serialize" instruction serializes the customer data from the "Source" data block and writes it in sequential representation to the "Buffer" data block. The number of bytes occupied by the sequential representation is stored in the "#BufferPos" operand.

Network 2:

A kind of separator sheet is inserted now to later make it easier to deserialize the sequential representation. The "Move string" instruction copies the "arti" characters to the "#Label" operand. The "Serialize" instruction writes these characters after the customer data to the "Buffer" data block. The number of bytes that the characters need in addition to the number already stored are added to the "#BufferPos" operand.

Network 3:

The "Serialize" instruction serializes the data of a specific article, which is calculated in runtime, from the "Source" data block and writes it in sequential representation to the "Buffer" data block after the "arti" characters.

The following table lists the declaration of the operands:

Operand	Data type	Declaration
DeliverPos	INT	In the "Input" section of the block interface
BufferPos	DINT	In the "Temp" section of the block interface
Error	INT	In the "Temp" section of the block interface
Label	STRING[4]	In the "Temp" section of the block interface

The following table lists the declarations of the PLC data types:

Name the PLC data types	Name	Data type
Article	Number	DINT
	Declaration	STRING
	Colli	INT
Client	Title	INT
	First name	STRING[10]
	Surname	STRING[10]

The following table lists the declaration of the data blocks:

Name of the data blocks	Name	Data type
Source	Client	"Client" (PLC data type)
	Article	Array[0..10] of "Article" (PLC data type)
Buffer	Field	Array[0..294] of BYTE

## FieldRead: Read field

### Description

You can use the "Read field" instruction to read out a specific component from the field specified at input MEMBER and transfer its content to the tag at output VALUE. You specify the index of the field component to be read at input INDEX. Specify the first component of the field from which reading is to occur at input MEMBER.

The data types of the field component at input MEMBER and the tags at output VALUE must correspond to the data type of the instruction "Read field".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The field component specified at input INDEX is not defined in the field specified at output MEMBER.
- Errors such as an overflow occur during execution.

### Parameters

The following table shows the parameters of the "Read field" instruction:

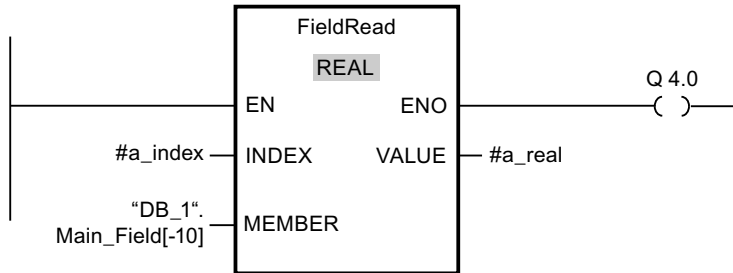

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
EN	Input	BOOL	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	Enable output
INDEX	Input	DINT	DINT	I, Q, M, D, L, P or constant	Index of field component whose content is read out
MEMBER	Input	Binary numbers, integers, floating-point numbers, TIME, DATE, TOD and CHAR as components of an ARRAY tag	Binary numbers, integers, floating-point numbers, timers, DATE, TOD, LTOD and CHAR as components of an ARRAY tag	D, L	First component of the field from which reading occurs.
VALUE	Output	Bit strings, integers, floating-point numbers, TIME, DATE, TOD and CHAR	Bit strings, integers, floating-point numbers, timers, DATE, TOD, LTOD and CHAR	I, Q, M, D, L, P	Operand to which the content of the field component is transferred

You can select the data type for the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Tag	Value
INDEX	a_index	4
MEMBER	"DB_1".Main_Field[-10]	First component of the "Main_Field[-10..10] of REAL" field in the "DB_1" data block
VALUE	a_real	Component with index 4 of the "Main_Field[-10..10] of REAL" field

The field component with index 4 is read from the "Main\_Field[-10...10] of REAL" field and written to the "a\_real" tag. The field component to be read is specified by the value at input INDEX.

**See also**

- Overview of the valid data types (Page 1262)
- Basics of the EN/ENO mechanism (Page 1357)

**FieldWrite: Write field**

**Description**

The "Write field" instruction is used to transfer the content of the tag at the VALUE input to a specific component of the field at the MEMBER output. You use the value at the INDEX input to specify the index of the field component that is described. At the MEMBER output, enter the first component of the field which is to be written to.

The data types of the field component specified at the MEMBER output and the tags at the VALUE input have to match the data type of the "Write field" instruction.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The field component specified at the input INDEX is not defined in the field specified at the output MEMBER.
- Errors such as an overflow occur during execution.

## Parameters

The following table shows the parameters of the "Write field" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
EN	Input	BOOL	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	Enable output
INDEX	Input	DINT	DINT	I, Q, M, D, L, P or constant	Index of the field component that is being written with the content of VALUE.
VALUE	Input	Bit strings, integers, floating-point numbers, TIME, DATE, TOD and CHAR	Bit strings, integers, floating-point numbers, timers, DATE, TOD, LTOD and CHAR	I, Q, M, D, L, P or constant	Operand whose content is copied.
MEMBER	Output	Binary numbers, integers, floating-point numbers, TIME, DATE, TOD and CHAR as components of an ARRAY tag	Binary numbers, integers, floating-point numbers, timers, DATE, TOD, LTOD and CHAR as components of an ARRAY tag	D, L	First component of the field to which the content of VALUE is written.

You can select the data type for the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
INDEX	a_index	4
VALUE	a_real	10.54
MEMBER	"DB_1".Main_Field[-10]	First component of the "Main_Field[-10..10] of REAL" field in the "DB_1" data block

The value "10.54" of the "a\_real" tag is written to the field component with index 4 of the "Main\_Field[-10..10] of REAL" field. The index of the field component to which the content of the tag "a\_real" is transferred is specified by the value at the input INDEX.

**See also**

- Overview of the valid data types (Page 1262)
- Basics of the EN/ENO mechanism (Page 1357)

**MOVE\_BLK: Move block**

**Description**

You can use the "Move block" instruction to move the content of a memory area (source area) to another memory area (destination area). The number of elements to be moved to the destination area is specified at input COUNT. The width of the elements to be moved is defined by the width of the element at the IN input.

The instruction can only be executed if the source area and the destination area are of the same data type.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- More data is copied than is made available at the IN input or OUT output.

When a Array of BOOL is copied, the enable output ENO for an overflow is set to "1" until the byte limit of the ARRAY structure is exceeded. If the byte limit of the ARRAY structure is exceeded by the value at the COUNT input, the ENO enable output is reset to "0".

## Parameters

The following table lists the parameters of the "Move block" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
EN	Input	BOOL	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	Enable output
IN <sup>1)</sup>	Input	Binary numbers, integers, floating-point numbers, TIME, DATE, CHAR, TOD	Binary numbers, integers, floating-point numbers, timers, DATE, TOD, LTOD	D, L	The first element of the source area that is being copied
COUNT	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	I, Q, M, D, L, P or constant	Number of elements to be copied from the source area to the destination area.
OUT <sup>1)</sup>	Output	Binary numbers, integers, floating-point numbers, TIME, DATE, CHAR, TOD	Binary numbers, integers, floating-point numbers, timers, DATE, TOD, LTOD	D, L	The first element of the destination area to which the contents of the source area are being copied

<sup>1)</sup> The specified data types can only be used as elements of an ARRAY structure.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	a_array[2]	The data type of the a_array operand is Array [0..5] of INT. It consists of six elements of data type INT.
COUNT	Tag_Count	3
OUT	b_array[1]	The data type of the b_array operand is Array [0..6] of INT. It consists of seven elements of data type INT.

If operands "TagIn\_1" and "TagIn\_2" have the signal state "1", the "Move block" instruction is executed. Starting from the third element, the instruction selects three INT elements from the #a\_array tag and copies their contents to the #b\_array output tag, beginning with the second element. If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

**See also**

Overview of the valid data types (Page 1262)

Basics of the EN/ENO mechanism (Page 1357)

Inserting additional inputs and outputs in LAD elements (Page 1486)

**MOVE\_BLK\_VARIANT: Move block**

**Description**

You can use the "Move block" instruction to move the content of a memory area (source area) to another memory area (destination area). You can copy elements of an array to another array of the same data type. The size (number of elements) of the source and destination array may be different. You can copy several elements within an array or individual elements.

If you are using the instruction, the array must not yet be known at the time the block is created, as the source and the destination are transferred using VARIANT.

The counting at the parameters SRC\_INDEX and DEST\_INDEX always starts with the low limit "0", regardless of the later declaration of the array.

If the VARIANT pointer (source or destination) is of the data type BOOL, it must be addressed absolutely and the length specified must be divisible by 8; otherwise the instruction is not executed.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- More data is copied than is made available.

## Parameters

The following table lists the parameters of the "Move block" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
SRC	Input	VARIANT (array or single element)	L	Source block from which to copy
COUNT	Input	UDINT	I, Q, M, D, L or constant	Number of elements which are copied  Set the value at the parameter COUNT to "1", if no Array is specified at the parameter SRC or the parameter DEST.
SRC_INDEX	Input	DINT	I, Q, M, D, L or constant	<ul style="list-style-type: none"> <li>The SRC_INDEX parameter is calculated zero-based. If an Array is specified at parameter SRC, the integer at the SRC_INDEX parameter specifies the first element within the source area from which copying is to take place. This is independent of the declared array limits.</li> <li>If no Array is set at the SRC parameter or only an individual element of an array is specified, assign the SRC_INDEX parameter the value "0".</li> </ul>

Parameter	Declaration	Data type	Memory area	Description
DEST_INDEX	Input	DINT	I, Q, M, D, L or constant	<ul style="list-style-type: none"> <li>The DEST_INDEX parameter is calculated zero-based. If an Array is specified at the DEST parameter, the integer at the DEST_INDEX parameter specifies the first element within the destination area to which copying is to take place. This is independent of the declared array limits.</li> <li>If no Array is specified at the DEST parameter, assign the DEST_INDEX parameter the value "0".</li> </ul>
DEST	Output	VARIANT	L	Destination area into which the contents of the source block are copied.
RET_VAL	Output	INT	I, Q, M, D, L	Error information: If an error occurs during the execution of the instruction, an error code is output at the RET_VAL parameter.

For additional information on valid data types, refer to "See also".

### RET\_VAL parameter

The following table lists the meaning of the values of the RET\_VAL parameter:

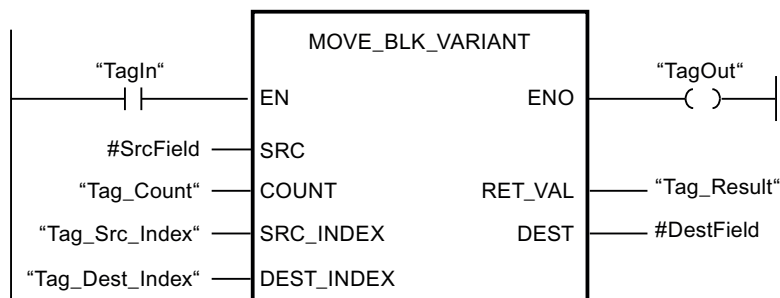

Error code* (W#16#...)	Explanation
0000	No error
80B4	Data types do not correspond
8151	Access to the SRC parameter is not possible.
8152	The operand at the SRC parameter is not typed.
8153	Code generation error at the SRC parameter
8154	The operand at the SRC parameter has the data type BOOL.
8281	The COUNT parameter has an invalid value

Error code* (W#16#...)	Explanation
8382	The value at the SRC_INDEX parameter is outside the limits of the VARIANT.
8383	The value at the SRC_INDEX parameter is outside the high limit of the array.
8482	The value at the DEST_INDEX parameter is outside the limits of the VARIANT.
8483	The value at the DEST_INDEX parameter is outside the high limit of the array.
8534	The DEST parameter is write protected
8551	Access to the DEST parameter is not possible.
8552	The operand at the DEST parameter is not typed.
8553	Code generation error at the DEST parameter
8554	The operand at the DEST parameter has the data type BOOL.

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

### Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
SRC	#SrcField	The local operand #SrcField uses a UDT that was still unknown at the time when the block was programmed. (Array [0 to 10] of "MOVE_UDT")
COUNT	Tag_Count	2
SRC_INDEX	Tag_Src_Index	3
DEST_INDEX	Tag_Dest_Index	3
DEST	#DestField	The local operand #DestField uses a UDT that was still unknown at the time when the block was programmed. (Array [10 to 20] of "MOVE_UDT")

If the operand "TagIn" has the signal state "1", the "Move block" instruction is executed. 2 elements are copied from the source area into the destination area beginning with the fourth element of the array of UDT. The copies are inserted in the array of UDT beginning with the fourth element. If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

## UMOVE\_BLK: Move block uninterruptible

### Description

You can use the "Move block uninterruptible" instruction to move the content of a memory area (source area) to another memory area (destination area). The number of elements to be moved to the destination area is specified with the COUNT parameter. The width of the elements to be moved is defined by the width of the element at the IN input.

The instruction can only be executed if the source area and the destination area have the same data type.

---

#### Note

The copy operation cannot be interrupted by other operating system activities. This is why the interrupt reaction times of the CPU increase during the execution of the "Move block uninterruptible" instruction.

---

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- More data is copied than is made available at the IN input or OUT output.

When a Array of BOOL is copied, the enable output ENO for an overflow is set to "1" until the byte limit of the ARRAY structure is exceeded. If the byte limit of the ARRAY structure is exceeded by the value at the COUNT input, the ENO enable output is reset to "0".

You can use the "Move block uninterruptible" instruction to move a maximum of 16 KB. Note the CPU-specific restrictions for this.

## Parameters

The following table shows the parameters of the "Move block uninterruptible" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
EN	Input	BOOL	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	Enable output
IN <sup>1)</sup>	Input	Binary numbers, integers, floating-point numbers, TIME, DATE, CHAR, TOD	Binary numbers, integers, floating-point numbers, timers, DATE, TOD, LTOD	D, L	The first element of the source area that is being copied
COUNT	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	I, Q, M, D, L, P or constant	Number of elements to be moved from the source area to the destination area.
OUT <sup>1)</sup>	Output	Binary numbers, integers, floating-point numbers, TIME, DATE, CHAR, TOD	Binary numbers, integers, floating-point numbers, timers, DATE, TOD, LTOD	D, L	The first element of the destination area to which the contents of the source area are being copied

<sup>1)</sup> The specified data types can only be used as elements of an ARRAY structure.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	a_array[2]	The data type of the a_array operand is Array [0..5] of INT. It consists of six elements of data type INT.
COUNT	Tag_Count	3
OUT	b_array[1]	The data type of the b_array operand is Array [0..6] of INT. It consists of seven elements of data type INT.

If operands "TagIn\_1" and "TagIn\_2" have the signal state "1", the "Move block uninterruptible" instruction is executed. Starting from the third element, the instruction selects three INT elements from the #a\_array tag and copies their contents to the #b\_array output tag, beginning with the second element. The copy operation cannot be interrupted by other operating system activities. If the instruction is executed without errors, the ENO output has the signal state "1" and the "TagOut" output is set.

Basics of the EN/ENO mechanism (Page 1357)

Inserting additional inputs and outputs in LAD elements (Page 1486)

**FILL\_BLK: Fill block**

**Description**

You can use the "Fill block" instruction to fill a memory area (destination area) with the value of the IN input. The destination area is filled starting from the address specified at the OUT output. The number of repeated copy operations is specified with the COUNT parameter. When the instruction is executed, the value at the IN input is selected and copied to the destination area as often as specified by the value in the COUNT parameter.

The instruction can only be executed if the source area and the destination area are of the same data type.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- More data is copied than is made available at the IN input or OUT output.

When a Array of BOOL is copied, the enable output ENO for an overflow is set to "1" until the byte limit of the ARRAY structure is exceeded. If the byte limit of the ARRAY structure is exceeded by the value at the COUNT input, the ENO enable output is reset to "0".

## Parameters

The following table shows the parameters of the "Fill block" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
EN	Input	BOOL	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	Enable output
IN <sup>1)</sup>	Input	Binary numbers, integers, floating-point numbers, TIME, DATE, TOD, CHAR	Binary numbers, integers, floating-point numbers, timers, DATE, CHAR, TOD, LTOD	I, Q, M, D, L, P or constant	Element used to fill the destination area
COUNT	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	I, Q, M, D, L, P or constant	Number of repeated move operations
OUT <sup>2)</sup>	Output	Binary numbers, integers, floating-point numbers, TIME, DATE, TOD, CHAR	Binary numbers, integers, floating-point numbers, timers, DATE, CHAR, TOD, LTOD	D, L	Address in destination area from which filling starts.
<sup>1)</sup> The specified data types can also be used as elements of an ARRAY structure. <sup>2)</sup> The specified data types can only be used as elements of an ARRAY structure.					

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	a_array[2]	The data type of the a_array operand is Array [0..5] of INT. It consists of six elements of data type INT.
COUNT	Tag_Count	3
OUT	b_array[1]	The data type of the b_array operand is Array [0..6] of INT. It consists of seven elements of data type INT.

If operands "TagIn\_1" and "TagIn\_2" have the signal state "1", the "Fill block" instruction is executed. The instruction copies the third element (#a\_array[2]) of the #a\_array tag three times to the #b\_array output tag. If the instruction is executed without errors, the ENO and "TagOut" enable outputs are set to signal state "1".

Basics of the EN/ENO mechanism (Page 1357)

Inserting additional inputs and outputs in LAD elements (Page 1486)

**UFILL\_BLK: Fill block uninterruptible**

**Description**

You can use the "Fill block uninterruptible" instruction to fill a memory area (destination area) with the value of the IN input without interruption. The destination area is filled starting from the address specified at the OUT output. The number of repeated copy operations is specified with the COUNT parameter. When the instruction is executed, the value at the IN input is selected and copied to the destination area as often as specified by the value in the COUNT parameter.

The instruction can only be executed if the source area and the destination area have the same data type.

**Note**

The copy operation cannot be interrupted by other operating system activities. This is why the alarm reaction times of the CPU increase during the execution of the "Fill block uninterruptible" instruction.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- More data is copied than is made available at the IN input or OUT output.

When a Array of BOOL is copied, the enable output ENO for an overflow is set to "1" until the byte limit of the ARRAY structure is exceeded. If the byte limit of the ARRAY structure is exceeded by the value at the COUNT input, the ENO enable output is reset to "0".

You can use the "Fill block uninterruptible" instruction to move a maximum of 16 KB. Note the CPU-specific restrictions for this.

## Parameters

The following table shows the parameters of the "Fill block uninterruptible" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
EN	Input	BOOL	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	Enable output
IN <sup>1)</sup>	Input	Binary numbers, integers, floating-point numbers, TIME, DATE, CHAR, TOD	Binary numbers, integers, floating-point numbers, timers, DATE, CHAR, TOD, LTOD	I, Q, M, D, L, P or constant	Element used to fill the destination area.
COUNT	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	I, Q, M, D, L, P or constant	Number of repeated move operations
OUT <sup>2)</sup>	Output	Binary numbers, integers, floating-point numbers, TIME, DATE, CHAR, TOD	Binary numbers, integers, floating-point numbers, timers, DATE, CHAR, TOD, LTOD	D, L	Address in destination area from which filling begins.

<sup>1)</sup> The specified data types can also be used as elements of an ARRAY structure.  
<sup>2)</sup> The specified data types can only be used as elements of an ARRAY structure.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	a_array[2]	The data type of the a_array operand is Array [0..5] of INT. It consists of six elements of data type INT.
COUNT	Tag_Count	3
OUT	b_array[1]	The data type of the b_array operand is Array [0..6] of INT. It consists of seven elements of data type INT.

If operands "TagIn\_1" and "TagIn\_2" have the signal state "1", the "Fill block uninterruptible" instruction is executed. The instruction copies the third element (#a\_array[2]) of the #a\_array tag three times to the #b\_array output tag. The copy operation cannot be interrupted by other operating system activities. If the instruction is executed without errors, the ENO and "TagOut" enable outputs are set to signal state "1".

**SWAP: Swap**

**Description**

You can use the "Swap" instruction to change the order of the bytes at input IN and query the result at output OUT.

The following figure shows how the bytes of an operand of the DWORD data type are swapped using the "Swap" instruction:

### Parameter

The following table lists the parameters of the "Swap" instruction:

Parameters	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
EN	Input	BOOL	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	Enable output
IN	Input	WORD, DWORD	WORD, DWORD, LWORD	I, Q, M, D, L or, P constant	Operand whose bytes are swapped.
OUT	Output	WORD, DWORD	WORD, DWORD, LWORD	I, Q, M, D, L, P	Result

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	TagIn_Value	0000 1111 0101 0101
OUT	TagOut_Value	0101 0101 0000 1111

If operand "TagIn" has the signal state "1", the "Swap" instruction is executed. The order of the bytes is changed and stored in operand "TagOut\_Value".

**ARRAY DB instructions**

**ReadFromArrayDB: Read from array data block**

**Description**

You can use the "Read from array data block" instruction to read data from an array DB and write them to a destination area.

An array DB is a data block which consists of exactly one array of [data type]. The elements of the array can be UDT data type or any other elementary data type. The counting of the array always starts with the low limit "0", regardless of the later declaration of the array.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- If an error occurs during the execution of the instruction.

**Parameters**

The following table shows the parameters of the "Read from array data block" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
DB	Input	DB_ANY	I, Q, M, D, L	Data block that is read
INDEX	Input	DINT	I, Q, M, D, L, P or constant	Element that is read

Parameter	Declaration	Data type	Memory area	Description
VALUE	Output	VARIANT	L	Value that is read and output
RET_VAL	Output	INT	I, Q, M, D, L, P	Error information: If an error occurs during the execution of the instruction, an error code is output at the RET_VAL parameter.

For additional information on valid data types, refer to "See also".

### RET\_VAL parameter

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
80B4	Data types do not correspond
80B5	Copying process was interrupted
8132	The data block does not exist or is too short
8133	The data block is located in the load memory
8134	The data block is write protected
8135	The array DB contains invalid values
8154	The data type is not correctly declared
8282	The value at the INDEX parameter is outside the limits of the array.
8350	The VARIANT data type contains no value
8352	Code generation error
8353	Code generation error

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

### Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
DB	ArrayDB	The data type of the ArrayDB operand is Array [0 to 10] of INT.
INDEX	ArrayDB.THIS[2]	Third element of the "ArrayDB"
VALUE	TargetField[10].Data2[1]	The data type of the TargetField operand is Array [10 to 20] of "MOVE_UDT".

If the "TagIn1" operand has the signal state "1", the "Read from the ARRAY data block" instruction is executed. The third element is read from "ArrayDB" and written to the "TargetField[10].Data2[1]" operand. If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

**See also**

Overview of the valid data types (Page 1262)

**WriteToArrayDB: Write to array data block**

**Description**

You can use the "Write to array data block" instruction to write data to an array DB.

An array DB is a data block which consists of exactly one array of [data type]. The elements of the array can be UDT data type or any other elementary data type. The counting of the array always starts with the low limit "0", regardless of the later declaration of the array.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- If an error occurs during the execution of the instruction.

**Parameters**

The following table shows the parameters of the "Write to array data block" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
DB	Input	DB_ANY	I, Q, M, D, L	Data block to which data is written

Parameter	Declaration	Data type	Memory area	Description
INDEX	Input	DINT	I, Q, M, D, L, P or constant	Element in the DB to which data is written
VALUE	Input	VARIANT	L	Value to be written
RET_VAL	Output	INT	I, Q, M, D, L, P	Error information: If an error occurs during the execution of the instruction, an error code is output at the RET_VAL parameter.

For additional information on valid data types, refer to "See also".

### RET\_VAL parameter

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
80B4	Data types do not correspond
80B5	Copying process was interrupted
8132	The data block does not exist or is too short
8133	The data block is located in the load memory
8134	The data block is write protected
8135	The DB is not an array data block.
8282	The value at the INDEX parameter is outside the limits of the array.
8350	The VARIANT data type contains no value
8352	Code generation error
8353	Code generation error
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
DB	ArrayDB	The data type of the ArrayDB operand is Array [0 to 10] of INT.
INDEX	ArrayDB.THIS[2]	Third element of the "ArrayDB"
VALUE	SourceField[1].Data1[6]	The data type of the SourceField operand is Array [0 to 10] of "MOVE_UDT".

If the "TagIn1" operand has the signal state "1", the "Write to the ARRAY data block" instruction is executed. From the "SourceField" operand, the "Data1[6]" element from the second element is written to the "ArrayDB". The third element is written to the "ArrayDB". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

**ReadFromArrayDBL: Read from array data block in load memory**

**Description**

You can use the "Read from array data block in load memory" instruction to read data from an array DB in load memory.

An array DB is a data block which consists of exactly one array of [data type]. The elements of the array can be UDT data type or any other elementary data type. The counting of the array always starts with the low limit "0", regardless of the later declaration of the array.

If the array DB is marked with the "Only store in load memory" block attribute, it is only stored in load memory.

The instruction is executed when a positive signal edge is detected at the REQ parameter. The BUSY parameter then has the signal state "1". The instruction is terminated if a negative

signal edge is detected at the BUSY parameter. The DONE parameter has the signal state "1" for one program cycle and the read value is output at the VALUE parameter within this cycle. With all other program cycles, the value at the VALUE parameter is not changed.

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multi-instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

---

#### Note

The array DB must be located in a data block with the block property "Optimized".

---

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- If an error occurs during the execution of the instruction.

## Parameters

The following table lists the parameters of the "Read from array data block in load memory" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
REQ	Input	BOOL	I, Q, M, D, L or constant	REQ = "1": Starting with the reading of the array DB
DB	Input	DB_ANY	I, Q, M, D, L	Data block that is read
INDEX	Input	DINT	I, Q, M, D, L, P or constant	Element that is read
BUSY	Output	BOOL	I, Q, M, D, L	BUSY = "1": The array DB is still being read
DONE	Output	BOOL	I, Q, M, D, L	DONE = "1": The instruction was executed successfully

Parameter	Declaration	Data type	Memory area	Description
VALUE	InOut	VARIANT	D, L	Value that is read and output
ERROR	Output	INT	I, Q, M, D, L, P	Error information: If an error occurs during the execution of the instruction, an error code is output at the ERROR parameter.

For additional information on valid data types, refer to "See also".

### ERROR parameter

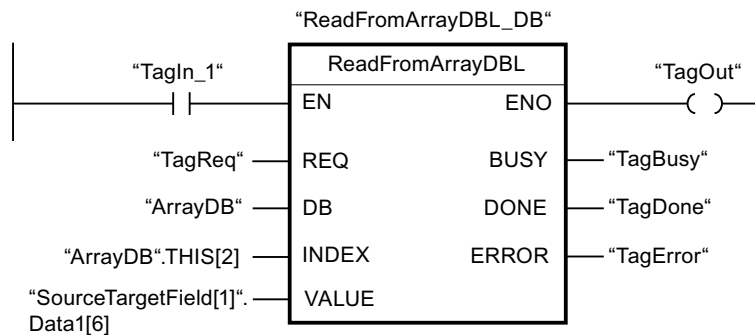

The following table shows the meaning of the values of the ERROR parameter:

Error code* (W#16#...)	Explanation
0000	No error
80B4	Data types do not correspond
80B5	Copying process was interrupted
80C3	Too many concurrent calls
8132	The data block does not exist or is too short
8133	The data block is not located in the load memory
8134	The data block is write protected
8135	The DB is not an array data block.
8282	The value at the INDEX parameter is outside the limits of the array.
8350	The VARIANT data type contains no value
8352	Code generation error
8353	Code generation error
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

You can find descriptions of the error codes triggered by the instructions "READ\_DBL: Read from data block in the load memory" and "WRIT\_DBL: Write to data block in the load memory" under "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
REQ	TagReq	BOOL
DB	ArrayDB	The data type of the ArrayDB operand is Array [0 to 10] of INT.
INDEX	ArrayDB.THIS[2]	Third element of the "ArrayDB"
VALUE	SourceTargetField[1].Data1[6]	The data type of the SourceTargetField operand is Array [0 to 10] of "MOVE_UDT".
BUSY	TagBusy	BOOL
DONE	TagDone	BOOL

If the "TagIn1" operand has the signal state "1" and a positive edge is detected at the "TagReq" operand, the "Read from ARRAY data block in load memory" instruction is executed. The third element is read from "ArrayDB" and written to the "SourceTargetField[1].Data1[6]" operand. As soon as a negative signal edge is detected at the "TagBusy" operand, the instruction is terminated and the value at the VALUE parameter is no longer changed. If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set. After the instruction has been processed, the "TagDone" operand the signal state "1".

## WriteToArrayDBL: Write to array data block in load memory

### Description

You can use the "Write to array data block in load memory" instruction to write data to an array DB in load memory.

An array DB is a data block which consists of exactly one array of [data type]. The elements of the array can be UDT data type or any other elementary data type. The counting of the array always starts with the low limit "0", regardless of the later declaration of the array.

If the array DB is marked with the "Only store in load memory" block attribute, it is only stored in load memory.

The instruction is executed when a positive signal edge is detected at the REQ parameter. The BUSY parameter then has the signal state "1". If a negative signal edge is detected at the BUSY parameter, the instruction is terminated and the value at the VALUE parameter is written to the data block. The DONE parameter then has the signal state "1" for one program cycle.

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multi-instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

---

### Note

The array DB must be located in a data block with the block property "Optimized".

---

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- If an error occurs during the execution of the instruction.

### Parameters

The following table lists the parameters of the "Write to array data block in load memory" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
REQ	Input	BOOL	I, Q, M, D, L or constant	REQ = "1": Start writing into the array DB
DB	Input	DB_ANY	D	Data block to which data is written
INDEX	Input	DINT	I, Q, M, D, L, P or constant	Element in the DB to which data is written

Parameter	Declaration	Data type	Memory area	Description
VALUE	Input	VARIANT	D, L	Value to be written
BUSY	Output	BOOL	I, Q, M, D, L	BUSY = "1": The array DB is still being written
DONE	Output	BOOL	I, Q, M, D, L	DONE = "1": The instruction was executed successfully
ERROR	Output	INT	I, Q, M, D, L, P	Error information: If an error occurs during the execution of the instruction, an error code is output at the ERROR parameter.

For additional information on valid data types, refer to "See also".

## ERROR parameter

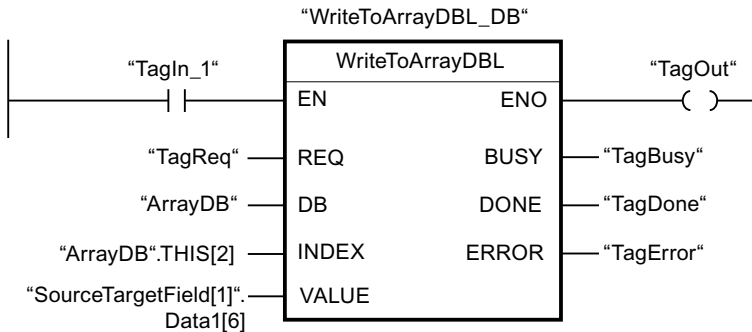

The following table shows the meaning of the values of the ERROR parameter:

Error code* (W#16#...)	Explanation
0000	No error
80B4	Data types do not correspond
80B5	Copying process was interrupted
80C3	Too many concurrent calls
8132	The data block does not exist or is too short
8133	The data block is not located in the load memory
8134	The data block is write protected
8135	The DB is not an array data block.
8282	The value at the INDEX parameter is outside the limits of the array.
8350	The VARIANT data type contains no value
8352	Code generation error
8353	Code generation error
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

You can find descriptions of the error codes triggered by the instructions "READ\_DBL: Read from data block in the load memory" and "WRIT\_DBL: Write to data block in the load memory" under "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
REQ	TagReq	BOOL
DB	ArrayDB	The data type of the ArrayDB operand is Array [0 to 10] of INT.
INDEX	ArrayDB.THIS[2]	Third element of the "ArrayDB"
VALUE	SourceTargetField[1].Data1[6]	The data type of the SourceTargetField operand is Array [0 to 10] of "MOVE_UDT".
BUSY	TagBusy	BOOL
DONE	TagDone	BOOL

If the "TagIn1" operand has the signal state "1" and a positive edge is detected at the "TagReq" operand, the "Write to ARRAY data block in load memory" instruction is executed. As soon as a negative signal edge is detected at the "TagBusy" operand, the instruction is terminated and the value at the VALUE parameter is written in the third element in the "ArrayDB". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set. After the instruction has been processed, the "TagDone" operand the signal state "1".

## VARIANT instructions

### VariantGet: Read out VARIANT tag value

#### Description

You can use the "Read out VARIANT tag value" instruction to read the value of the tag that points to the VARIANT at the SRC parameter, and write it to the tag at the DST parameter.

The SRC parameter must have the same VARIANT data type. Any data type except for VARIANT can be specified at the DST parameter.

The data type of the tag at the DST parameter must match the data type to which the VARIANT points.

---

#### Note

The tag to which the VARIANT at parameter SRC points must be a PLC data type.

To copy structures and ARRAYS, you can use the "MOVE\_BLK\_VARIANT: Move block" instruction. For additional information, refer to "See also".

---

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The data types do not correspond. (No value is transferred.)

#### Parameter

The following table lists the parameters of the "Read out VARIANT tag value" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
SRC	Input	VARIANT	L	Tag to be read
DST	Output	Bit strings, integers, floating-point numbers, timers, date and time, character strings, ARRAY	I, Q, M, D, L	Result of the instruction

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

If the "TagIn" operand has the signal state "1", the "Read out VARIANT tag value" instruction is executed. The value of the tag to which the VARIANT at the "#TagIn\_Source" operand points, is read and written to the "TagOut\_Dest" operand.

**See also**

- Overview of the valid data types (Page 1262)
- Basics of the EN/ENO mechanism (Page 1357)
- VARIANT (Page 1303)
- MOVE\_BLK\_VARIANT: Move block (Page 1954)
- Inserting additional inputs and outputs in LAD elements (Page 1486)

**VariantPut: Write VARIANT tag value**

**Description**

You can use the "Write VARIANT tag value" instruction to write the value of the tag at the SRC parameter and to the tag at the DST parameter to which the VARIANT points.

The DST parameter must have the same VARIANT data type. Any data type except for VARIANT can be specified at the SRC parameter.

The data type of the tag at the SRC parameter must match the data type to which the VARIANT points.

---

**Note**

The tag to which the VARIANT at parameter DST points must be a PLC data type.

---

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The data types do not correspond. (No value is transferred.)

## Parameters

The following table lists the parameters of the "Write VARIANT tag value" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
SRC	Input	Bit strings, integers, floating-point numbers, timers, date and time, character strings, ARRAY	I, Q, M, D, L	Tag to be read
DST	Input	VARIANT	L	Result of the instruction

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

If the "TagIn" operand has the signal state "1", the "Write VARIANT tag value" instruction is executed. The value of the "TagIn\_Source" operand is written to the tag to which the VARIANT at the "#TagIn\_Dest" operand points.

## See also

Overview of the valid data types (Page 1262)

Basics of the EN/ENO mechanism (Page 1357)

VARIANT (Page 1303)

Inserting additional inputs and outputs in LAD elements (Page 1486)

## CountOfElements: Get number of ARRAY elements

### Description

You can use the "Get number of ARRAY elements" instruction to query how many ARRAY elements a tag pointing to an VARIANT has.

If it is a one-dimensional ARRAY, the difference between the high and low limit +1 is output as a result. If it is a multi-dimensional ARRAY, the product of all dimensions is output as the result.

The IN parameter must have the same VARIANT data type.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The VARIANT tag is not an ARRAY. (The result is "0".)

If the VARIANT points to an ARRAY of BOOL, the fill elements are also included in the count. (For example, 8 is returned for an ARRAY[0..1] of BOOL)

### Parameters

The following table lists the parameters of the "Get number of ARRAY elements" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	VARIANT	L	Tag to be queried
RET_VAL	Output	UDINT	I, Q, M, D, L	Result of the instruction

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

If the "TagIn" operand has the signal state "1", the "Get number of ARRAY elements" instruction is executed. The number of ARRAY elements of the tag to which the VARIANT at the "#TagIn\_Source" operand points is read and output at the "TagOut\_RetVal" operand.

## Other

### BLKMOV: Move block

#### Description

You can use the "Move block" instruction to move the content of a memory area (source area) to another memory area (destination area). The move operation takes place in the direction of ascending addresses. You use VARIANT to define the source and destination area.

#### Note

The tags of the instruction can only be used in data blocks in which the "Optimized block access" attribute is not set. If the tag with the retentivity setting "Set in IDB" has been declared, you can also use the tags "with optimized access".

The following figure shows the principle of the move operation:

#### Consistency of the source data and the target data

Make sure that the source data remain unchanged during the execution of the "Move block" instruction. Otherwise the consistency of the target data cannot be ensured.

#### Interruptibility

There is no limit to the nesting depth.

### Memory areas

You can use the "Move block" instruction to move the following memory areas:

- Areas of a data block
- Bit memory
- Process image of the inputs
- Process image of the outputs

### General rules for moving

The source and destination area must not overlap. If the source and destination area have different lengths, only the length of the smaller area will be moved.

If the source area is less than the destination area, the entire source area will be written to the destination area. The remaining bytes of the destination area remain unchanged.

If the destination area is less than the source area, the entire destination area will be written. The remaining bytes of the source area are ignored.

If a block of data type BOOL is moved, the tag must be addressed absolutely and the specified length of the area must be divisible by 8, otherwise the instruction cannot be executed.

### Rules for moving character strings

You can use the "Move block" instruction to also move source and destination areas of the STRING data type. If only the source area is STRING data type, the characters will be moved that are actually contained in the character string. Information on the actual and maximum length is also written to the destination area. If the source and destination area are each STRING data type, the current length of the character string in the destination area is set to the number of actually moved characters.

If you want to move the information on the maximum and actual length of a character string, specify the areas in bytes to the SRCBLK and DSTBLK parameters.

### Parameters

The following table lists the parameters of the "Move block" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
SRCBLK	Input	VARIANT	L, P	Specifies the memory area to be moved (source area).

Parameter	Declaration	Data type	Memory area	Description
RET_VAL	Output	INT	I, Q, M, D, L, P	Error information: If an error occurs during the execution of the instruction, an error code is output at the RET_VAL parameter.
DSTBLK	Output	VARIANT	L, P	Specifies the memory area to which the block is to be moved (destination area).

## RET\_VAL parameter

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
8152	The WSTRING, WCHAR and BOOL data types are not supported.
8092	The source or target area is only available in the load memory.
General error information	See also: "GET_ERR_ID: Get error ID locally"

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

## See also

Overview of the valid data types (Page 1262)

Basics of the EN/ENO mechanism (Page 1357)

GET\_ERR\_ID: Get error ID locally (Page 2022)

Inserting additional inputs and outputs in LAD elements (Page 1486)

## UBLKMOV: Move block uninterruptible

### Description

You can use the "Move block uninterruptible" instruction to move the content of a memory area (source area) to another memory area (destination area). The move operation takes place in the direction of ascending addresses. You use VARIANT to define the source and destination area.

The move operation cannot be interrupted by other operating system activities. As a result the alarm reaction time of the CPU can increase during the execution of the "Move block uninterruptible" instruction.

---

**Note**

The tags of the instruction can only be used in data blocks in which the "Optimized block access" attribute is not set. If the tag with the retentivity setting "Set in IDB" has been declared, you can also use the tags "with optimized access".

---

## Memory areas

You can use the "Move block uninterruptible" instruction to move the following memory areas:

- Areas of a data block
- Bit memory
- Process image of the inputs
- Process image of the outputs

## General rules for moving

The source and destination area must not overlap during the execution of the "Move block uninterruptible" instruction. If the source area is less than the destination area, the entire source area will be written to the destination area. The remaining bytes of the destination area remain unchanged.

If the destination area is less than the source area, the entire destination area will be written. The remaining bytes of the source area are ignored.

If a source or destination area defined as a formal parameter is less than a destination or source area specified on the SRCBLK or DSTBLK parameter, no data is transferred.

If a block of data type BOOL is moved, the tag must be addressed absolutely and the specified length of the area must be divisible by 8, otherwise the instruction cannot be executed.

You can use the "Move block uninterruptible" instruction to move a maximum of 16 KB. Note the CPU-specific restrictions for this.

## Rules for moving character strings

You can use the "Move block uninterruptible" instruction to also move source and destination areas of the STRING data type. If only the source area is STRING data type, the characters will be moved that are actually contained in the character string. Information on the actual and maximum length are not written in the destination area. If the source and destination area are each STRING data type, the current length of the character string in the destination area is set to the number of actually moved characters. If areas of the data type STRING are moved, you have to specify "1" as area length.

## Parameters

The following table shows the parameters of the "Move block uninterruptible" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
SRCBLK	Input	VARIANT	L, P	Specifies the memory area to be moved (source area).
RET_VAL	Output	INT	I, Q, M, D, L, P	Error information: If an error occurs during the execution of the instruction, an error code is output at the RET_VAL parameter.
DSTBLK	Output	VARIANT	L, P	Specifies the memory area to which the block is to be moved (destination area).

## RET\_VAL parameter

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
8152	The WSTRING, WCHAR and BOOL data types are not supported.
8091	The source area is in a data block that is not relevant for program execution.
General error information	See also: "GET_ERR_ID: Get error ID locally"

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

## See also

Inserting additional inputs and outputs in LAD elements (Page 1486)

## FILL: Fill block

### Description

You can use the "Fill block" instruction to fill a memory area (destination area) with the content of another memory area (source area). The "Fill block" instruction moves the content of the

source area to the destination area until the destination area is completely written. The move operation takes place in the direction of ascending addresses.

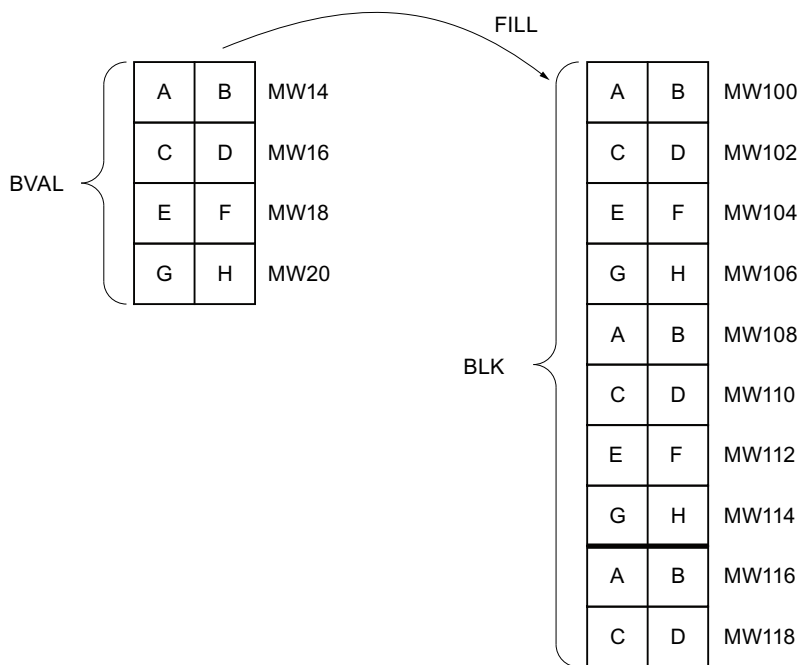

You use VARIANT to define the source and destination area.

**Note**

The tags of the instruction can only be used in data blocks in which the "Optimized block access" attribute is not set. If the tag with the retentivity setting "Set in IDB" has been declared, you can also use the tags "with optimized access".

For blocks with the "Optimized block access" attribute, you can use the instruction "FILL\_BLK: Fill block" instruction.

The following figure shows the principle of the move operation:

Example: The contents of the range MW100 to MW118 are to be preassigned with the contents of the memory words MW14 to MW20.

**Consistency of the source data and the target data**

Please note that during execution of the instruction "Fill block" that the source data remain unchanged, otherwise the consistency of the target data is not ensured.

**Memory areas**

You can use the "Fill block" instruction to move the following memory areas:

- Areas of a data block
- Bit memory

- Process image of the inputs
- Process image of the outputs

### General rules for moving

The source and destination area must not overlap. If the destination block to be preset is not an integer multiple of the length of the input parameter BVAL, the destination block is nevertheless written up to the last byte.

If the destination area to be preset is smaller than the source area, the function only copies as much data as can be written to the destination area.

If the destination or source area actually present is smaller than the assigned memory area for the source or destination block (BVAL BLK parameters), no data is transferred.

If the ANY pointer (source or destination) is of the data type BOOL, it must be addressed absolutely and the length specified must be divisible by 8; otherwise the instruction is not executed.

If the destination block is of data type STRING, the instruction describes the entire string including the administration information.

### Parameters

The following table shows the parameters of the "Fill block" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
BVAL	Input	VARIANT	L, P	Specification of the memory area (source area) with the content used to fill the destination area at the BLK parameter.
RET_VAL	Output	INT	I, Q, M, D, L, P	Error information: If an error occurs during the execution of the instruction, an error code is output at the RET_VAL parameter.
BLK	Output	VARIANT	L, P	Specification of the memory area that is filled with the content of the source area.

### RET\_VAL parameter

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
8152	The WSTRING, WCHAR and BOOL data types are not supported.

Error code* (W#16#...)	Explanation
General error information	See also: "GET_ERR_ID: Get error ID locally"
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

**See also**

- Overview of the valid data types (Page 1262)
- Basics of the EN/ENO mechanism (Page 1357)
- GET\_ERR\_ID: Get error ID locally (Page 2022)
- Inserting additional inputs and outputs in LAD elements (Page 1486)

**Conversion operations**

**CONVERT: Convert value**

**Description**

The "Convert value" instruction reads the content of the IN parameter and converts it according to the data types selected in the instruction box. The converted value is sent to the output OUT. For information on possible conversions, refer to the "Explicit conversion" section at "See also".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- Errors such as an overflow occur during execution.

**Parameters**

The following table shows the parameters of the "Convert value" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Bit strings, integers, floating-point numbers, CHAR, BCD16, BCD32	I, Q, M, D, L, P or constant	Value to be converted.
OUT	Output	Bit strings, integers, floating-point numbers, CHAR, BCD16, BCD32	I, Q, M, D, L, P	Result of the conversion

You can select the data type for the instruction from the "<???">" drop-down list of the instruction box.

Bit strings (BYTE, WORD, DWORD, LWORD) cannot be selected in the instruction box. If you specify an operand of data type BYTE, WORD, DWORD or LWORD at a parameter of the instruction, it is interpreted according to the data type of the input or output parameter. Data type BYTE is then interpreted as USINT, WORD as UINT, DWORD as UDINT, and LWORD as LINT, for example.

---

#### Note

For S7-1500 CPU: The data types DWORD and LWORD can be selected, if REAL or LREAL is selected as IN data type.

---

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

If operand "TagIn" has the signal state "1", the content of operand "TagIn\_Value" is read and converted to an integer (32-bit). The result is stored in operand "TagOut\_Value". The output "TagOut" is set to "1" if the instruction was executed without errors.

### See also

Overview of the valid data types (Page 1262)

Explicit conversion of CHAR (Page 1355)

### ROUND: Round numerical value

#### Description

You can use the "Round numerical value" instruction to round the value at input IN to the nearest integer. The instruction interprets the value at input IN as a floating-point number and converts this to an integer of data type DINT. If the input value is exactly between an even and odd number, the even number is selected. The result of the instruction is sent to the OUT output and can be queried there.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The enable input EN has the signal state "0".
- Errors such as an overflow occur during execution.

### Parameters

The following table shows the parameters of the "Round numerical value" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	Input value to be rounded.
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L, P	Result of rounding

You can select the data type for the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value	
IN	TagIn_Value	1.50000000	-1.50000000
OUT	TagOut_Value	2	-2

If operand "TagIn" has the signal state "1", the "Round numerical value" instruction is executed. The floating-point number at input "TagIn\_Value" is rounded to the nearest even integer and sent to output "TagOut\_Value". If the instruction is executed without errors, the "TagOut" output is set.

### See also

Overview of the valid data types (Page 1262)

## CEIL: Generate next higher integer from floating-point number

### Description

You can use the "Generate next higher integer from floating-point number" instruction to round the value at input IN to the next higher integer. The instruction interprets the value at the IN input as a floating-point number and converts this number to the next higher integer. The result of the instruction is sent to the OUT output and can be queried there. The output value can be greater than or equal to the input value.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The enable input EN has the signal state "0".
- Errors such as an overflow occur during execution.

### Parameters

The following table shows the parameters of the "Generate next higher integer from floating-point number" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	Input value
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L, P	Result with next higher integer

You can select the data type for the instruction from the "<???"> drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value	
IN	TagIn_Value	0.50000000	-0.50000000
OUT	TagOut_Value	1	0

If operand "TagIn" has the signal state "1", the "Generate next higher integer from floating-point number" instruction is executed. The floating-point number at the "TagIn\_Value" input is rounded to the next higher integer and sent to the "TagOut\_Value" output. If the instruction is executed without errors, the "TagOut" output is set.

**See also**

Overview of the valid data types (Page 1262)

**FLOOR: Generate next lower integer from floating-point number**

**Description**

You can use the "Generate next lower integer from floating-point number" instruction to round the value at input IN to the next lower integer. The instruction interprets the value at input IN as a floating-point number and converts this to the next lower integer. The result of the instruction is sent to the OUT output and can be queried there. The output value can be less than or equal to the input value.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The enable input EN has the signal state "0".
- Errors such as an overflow occur during execution.

**Parameters**

The following table shows the parameters of the "Generate next lower integer from floating-point number" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	Input value
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L, P	Result with next lower integer

You can select the data type for the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value	
IN	TagIn_Value	0.50000000	-0.50000000
OUT	TagOut_Value	0	-1

If operand "TagIn" has the signal state "1", the "Generate next lower integer from floating-point number" instruction is executed. The floating-point number at input "TagIn\_Value" is rounded to the next lower integer and sent to output "TagOut\_Value". If the instruction is executed without errors, the "TagOut" output is set.

## See also

Overview of the valid data types (Page 1262)

## TRUNC: Truncate numerical value

### Description

You can use the "Truncate numerical value" instruction to form an integer from the value at the IN input. The value at the IN input is interpreted as a floating-point number. The instruction selects only the integer part of the floating-point number and sends this to the OUT output without decimal places.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN input has the signal state "0".
- Errors such as an overflow occur during execution.

### Parameters

The following table shows the parameters of the "Truncate numerical value" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L or constant	Input value
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L	Integer part of the input value

You can select the data type for the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value	
IN	TagIn_Value	1.50000000	-1.50000000
OUT	TagOut_Value	1	-1

If operand "TagIn" has the signal state "1", the "Truncate numerical value" instruction is executed. The integer part of the floating-point number at the "TagIn\_Value" input is converted to an integer and sent to the "TagOut\_Value" output. If the instruction is executed without errors, the "TagOut" output is set.

### See also

Overview of the valid data types (Page 1262)

## SCALE\_X: Scale

### Description

You can use the "Scale" instruction to scale the value at the VALUE input by mapping it to a specified value range. When the "Scale" instruction is executed, the floating-point value at the VALUE input is scaled to the value range that was defined by the MIN and MAX parameters. The result of the scaling is an integer, which is stored in the OUT output.

The following figure shows an example of how values can be scaled:

The "Scale" instruction works with the following equation:

$$\text{OUT} = [\text{VALUE} * (\text{MAX} - \text{MIN})] + \text{MIN}$$

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The value at the MIN input is greater than or equal to the value at the MAX input.
- The value of a specified floating-point number is outside the range of the normalized numbers according to IEEE-754.
- An overflow occurs.
- The value at the VALUE input is NaN (Not a Number = result of an invalid arithmetic operation).

---

### Note

For more information on the converting of analog values, refer to the respective manual.

---

### Parameters

The following table shows the parameters of the "Scale" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
MIN	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Low limit of the value range
VALUE	Input	Floating-point numbers	I, Q, M, D, L or constant	Value to be scaled. If you enter a constant, you must declare it.
MAX	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	High limit of the value range
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L	Result of scaling

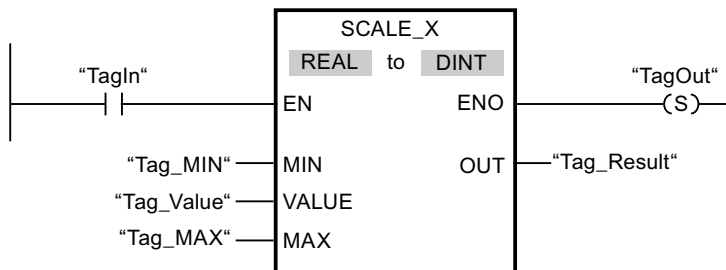

You can select the data type for the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

For additional information on declaring constants, refer to "See also".

### Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
MIN	Tag_MIN	10
VALUE	Tag_Value	0.5
MAX	Tag_MAX	30
OUT	Tag_Result	20

If operand "TagIn" has the signal state "1", the "Scale" instruction is executed. The value at the "Tag\_Value" input is scaled to the range of values defined by the values at the "Tag\_MIN" and "Tag\_MAX" inputs. The result is stored in the "Tag\_Result" output. If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

## See also

Overview of the valid data types (Page 1262)

NORM\_X: Normalize (Page 1997)

Declaring global constants (Page 1378)

## NORM\_X: Normalize

### Description

You can use the instruction "Normalize" to normalize the value of the tag at the VALUE input by mapping it to a linear scale. You can use the MIN and MAX parameters to define the limits of a value range that is applied to the scale. The result at the OUT output is calculated and stored as a floating-point number depending on the location of the value to be normalized within this value range. If the value to be normalized is equal to the value at the MIN input, the OUT output has the value "0.0". If the value to be normalized is equal to the value at input MAX, output OUT returns the value "1.0".

The following figure shows an example of how values can be normalized:

The "Normalize" instruction works with the following equation:

$$\text{OUT} = (\text{VALUE} - \text{MIN}) / (\text{MAX} - \text{MIN})$$

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The value at the MIN input is greater than or equal to the value at the MAX input.
- The value of a specified floating-point number is outside the range of the normalized numbers according to IEEE-754.
- The value at the VALUE input is NaN (result of an invalid arithmetic operation).

**Note**

For more information on the converting of analog values, refer to the respective manual.

**Parameter**

The following table shows the parameters of the "Normalize" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
MIN <sup>1)</sup>	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Low limit of the value range
VALUE <sup>1)</sup>	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Value to be normalized.
MAX <sup>1)</sup>	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	High limit of the value range
OUT	Output	Floating-point numbers	I, Q, M, D, L	Result of the normalization

<sup>1)</sup> If you use constants in these three parameters, you only need to declare one of them.

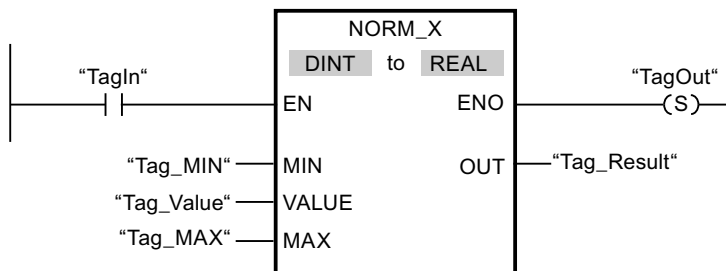

You can select the data type for the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

For additional information on declaring constants, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
MIN	Tag_MIN	10
VALUE	Tag_Value	20

Parameter	Operand	Value
MAX	Tag_MAX	30
OUT	Tag_Result	0.5

If operand "TagIn" has the signal state "1", the "Normalize" instruction is executed. The value at the "Tag\_Value" input is mapped to the range of values that were defined by the values at the "Tag\_MIN" and "Tag\_MAX" inputs. The tag value at the "Tag\_Value" input is normalized to the defined value range. The result is stored as a floating-point number in the "Tag\_Result" output. If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

## See also

Overview of the valid data types (Page 1262)

SCALE\_X: Scale (Page 1995)

Declaring global constants (Page 1378)

## Other

### SCALE: Scale

#### Description

Use the "Scale" instruction to convert the integer at the IN parameter into a floating-point number, which can be scaled in physical units between a low limit value and a high limit value. You can use the LO\_LIM and HI\_LIM parameters to specify the low limit and high limit of the value range to which the input value is scaled. The result of the instruction is output on the OUT parameter.

The "Scale" instruction works with the following equation:

$$\text{OUT} = [((\text{FLOAT}(\text{IN}) - \text{K1}) / (\text{K2} - \text{K1})) * (\text{HI\_LIM} - \text{LO\_LIM})] + \text{LO\_LIM}$$

The values of the constants "K1" and "K2" are determined by the signal state on the BIPOLAR parameter. The following signal states are possible on the BIPOLAR parameter:

- Signal state "1": It is assumed that the value at the IN parameter is bipolar and in a value range between -27648 and 27648. In this case the "K1" constant has the value "-27648.0" and the "K2" constant the value "+27648.0".
- Signal state "0": It is assumed that the value at the IN parameter is unipolar and in a value range between 0 and 27648. In this case the "K1" constant has the value "0,0" and the "K2" constant the value "+27648.0".

When the value at the IN parameter is greater than the value of the constant "K2", the result of the instruction is set to the value of the high limit (HI\_LIM) and an error is output.

When the value at the IN parameter is less than the value of the constant "K1", the result of the instruction is set to the value of the low limit value (LO\_LIM) and an error is output.

When the indicated low limit value is greater than the high limit value (LO\_LIM > HI\_LIM), the result is scaled in reverse proportion to the input value.

**Parameter**

The following table shows the parameters of the "Scale" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	INT	I, Q, M, D, L, P or constant	Input value to be scaled.
HI_LIM	Input	REAL	I, Q, M, D, L, P or constant	High limit
LO_LIM	Input	REAL	I, Q, M, D, L, P or constant	Low limit
BIPOLAR	Input	BOOL	I, Q, M, D, L or constant	Indicates if the value at IN parameter is to be interpreted as bipolar or unipolar. The parameter can assume the following values: 1: Bipolar 0: Unipolar
OUT	Output	REAL	I, Q, M, D, L, P	Result of the instruction
RET_VAL	Output	WORD	I, Q, M, D, L, P	Error information

**Parameter RET\_VAL**

The following table shows the meaning of the values of the RET\_VAL parameter:

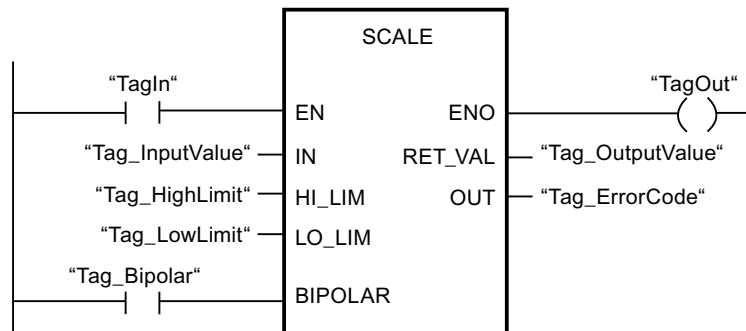

Error code* (W#16#...)	Explanation
0000	No error
0008	The value of the IN parameter is greater than the value of the constant "K2" or less than the value of the constant "K1"
General error information	See also: "GET_ERR_ID: Get error ID locally"

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	Tag_InputValue	22
HI_LIM	Tag_HighLimit	100.0
LO_LIM	Tag_LowLimit	0.0
BIPOLAR	Tag_Bipolar	1
OUT	Tag_OutputValue	50.03978588
RET_VAL	Tag_ErrorCode	W#16#0000

## UNSCALE: Unscale

### Description

The "Unscale" instruction is used to unscale the floating-point number on the IN parameter into physical units between a low limit and a high limit and convert it into an integer. You can use the LO\_LIM and HI\_LIM parameters to specify the low limit and high limit of the value range to which the input value is unscaled. The result of the instruction is output on the OUT parameter.

The "Unscale" instruction works with the following equation:

$$\text{OUT} = [ ((\text{IN} - \text{LO\_LIM}) / (\text{HI\_LIM} - \text{LO\_LIM})) * (\text{K2} - \text{K1}) ] + \text{K1}$$

The values of the constants "K1" and "K2" are determined by the signal state on the BIPOLAR parameter. The following signal states are possible on the BIPOLAR parameter:

- Signal state "1": It is assumed that the value at the IN parameter is bipolar and in a value range between -27648 and 27648. In this case the "K1" constant has the value "-27648.0" and the "K2" constant the value "+27648.0".
- Signal state "0": It is assumed that the value at the IN parameter is unipolar and in a value range between 0 and 27648. In this case the "K1" constant has the value "0.0" and the "K2" constant the value "+27648.0".

When the value at the IN parameter is greater than the value of the constant "HI\_LIM", the result of the instruction is set to the value of the constant (K2) and an error is output.

When the value at the IN parameter is less than the value of the constant of the low limit (LO\_LIM), the result of the instruction is set to the value of the constant (K1) and an error is output.

## Parameters

The following table shows the parameters of the "Unscale" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Input	BOOL	I, Q, M, D, L	Enable output
IN	Input	REAL	I, Q, M, D, L, P or constant	Input value to be unscaled to an integer value.
HI_LIM	Input	REAL	I, Q, M, D, L, P or constant	High limit
LO_LIM	Input	REAL	I, Q, M, D, L, P or constant	Low limit
BIPOLAR	Input	BOOL	I, Q, M, D, L or constant	Indicates if the value at IN parameter is to be interpreted as bipolar or unipolar. The parameter can assume the following values: 1: Bipolar 0: Unipolar
OUT	Output	INT	I, Q, M, D, L, P	Result of the instruction
RET_VAL	Output	WORD	I, Q, M, D, L, P	Error information

## Parameter RET\_VAL

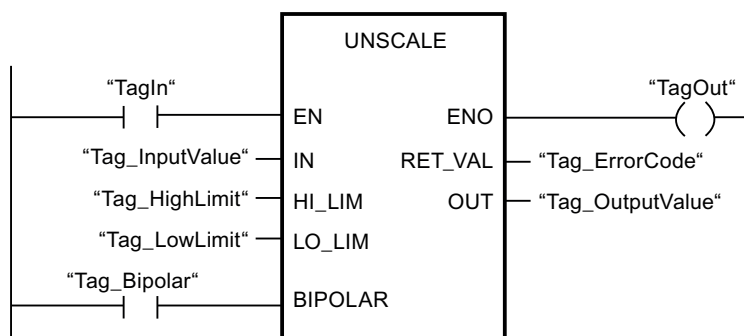

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
0008	The value of the IN parameter is greater than the value of the high limit (HI_LIM) or less than the value of the low limit (LO_LIM).
General error information	See also: "GET_ERR_ID: Get error ID locally"

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	Tag_InputValue	50.03978588
HI_LIM	Tag_HighLimit	100.0
LO_LIM	Tag_LowLimit	0.0
BIPOLAR	Tag_Bipolar	1
OUT	Tag_OutputValue	22
RET_VAL	Tag_ErrorCode	W#16#0000

### Program control operations

#### ---( JMP ): Jump if RLO = 1

#### Description

You can use the "Jump if RLO = 1" instruction to interrupt the linear execution of the program and resume it in another network. The destination network must be identified by a jump label (LABEL). The name of this jump label is specified in the placeholder above the instruction.

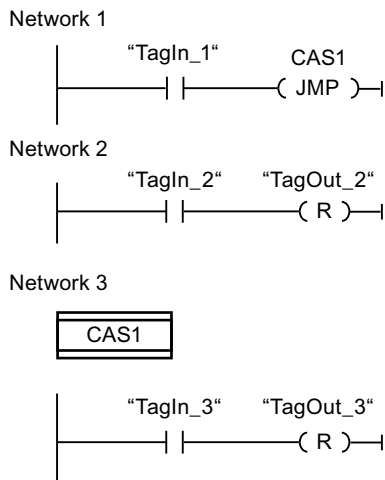

The specified jump label must be in the same block in which the instruction is executed. The name you specify can only occur once in the block. Only one jumping coil is permitted within a network.

If the result of logic operation (RLO) at the input of the instruction is "1", the jump to the network identified by the specified jump label is executed. The jump direction can be towards higher or lower network numbers.

If the condition at the input of the instruction is not fulfilled (RLO = 0), execution of the program continues in the next network.

#### Example

The following example shows how the instruction works:

If operand "TagIn\_1" has the signal state "1", the "Jump if RLO = 1" instruction is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. If the "TagIn\_3" input has the signal state "1", the "TagOut\_3" output is set.

## ---( JMPN ): Jump if RLO = 0

### Description

You can use the instruction "Jump if RLO = 0" to interrupt the linear execution of the program and resume it in another network, when the result of logic operation at the input of the instruction is "0". The destination network must be identified by a jump label (LABEL). The name of this jump label is specified in the placeholder above the instruction.

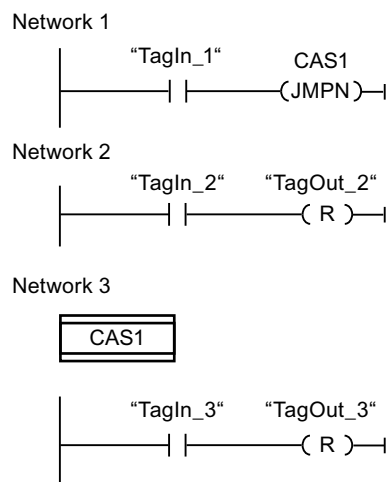

The specified jump label must be in the same block in which the instruction is executed. The name you specify can only occur once in the block. Only one jumping coil is permitted within a network.

If the result of logic operation (RLO) at the input of the instruction is "0", the jump to the network identified by the specified jump label is executed. The jump direction can be towards higher or lower network numbers.

If the result of logic operation at the input of the instruction is "1", execution of the program continues in the next network.

### Example

The following example shows how the instruction works:

If operand "TagIn\_1" has the signal state "0", the "Jump if RLO = 0" instruction is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. If the "TagIn\_3" input has the signal state "1", the "TagOut\_3" output is set.

### See also

Overview of the valid data types (Page 1262)

## LABEL: Jump label

### Description

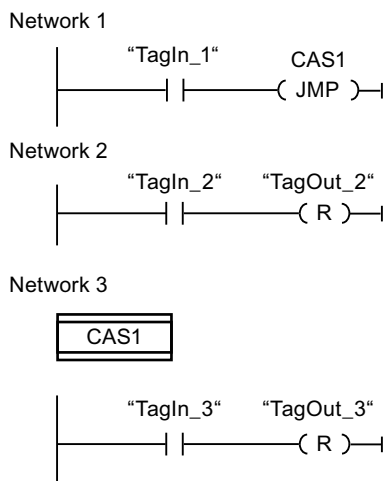

You can use a jump label to identify a destination network, in which the program execution should resume when a jump is executed.

The jump label and the instruction in which the jump label is specified must be located in the same block. The name of a jump label can only be assigned once in a block. You can declare up to 32 jump labels when you use a CPU S7-1200 and a maximum of 256 jump labels when you use a CPU S7-1500.

Only one jump label can be placed in a network. Each jump label can jump to several locations.

### Example

The following example shows how the instruction works:

If operand "TagIn\_1" has the signal state "1", the "Jump if RLO = 1" instruction is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. If the "TagIn\_3" input has the signal state "1", the "TagOut\_3" output is set.

### See also

Removing inputs and outputs (Page 1487)

## JMP\_LIST: Define jump list

### Description

You can use the "Define jump list" instruction to define several conditional jumps and continue the program execution in a specific network depending on the value of the K parameter.

You define the jumps with jump labels (LABEL), which you specify at the outputs of the instruction box. The number of outputs can be expanded in the instruction box. You can declare up to 32 outputs when you use a CPU S7-1200 and a maximum of 99 outputs when you use a CPU S7-1500.

The numbering of the outputs begins with the value "0" and continues in ascending order with each new output. Only jump labels can be specified at the outputs of the instruction. Instructions or operands cannot be specified.

The value of the K parameter specifies the number of the output and thus the jump label where the program execution is to be resumed. If the value in the K parameter is greater than the number of available outputs, the program execution is resumed in the next network of the block.

The "Define jump list" instruction is only executed if the signal state is "1" at the EN enable input.

### Parameter

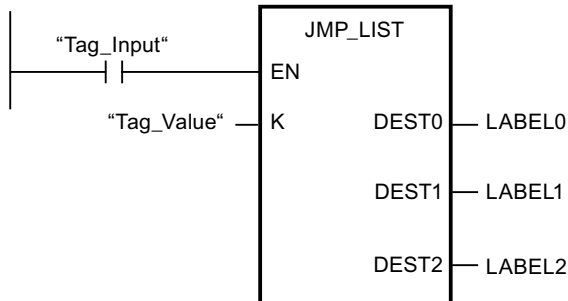

The following table shows the parameters of the "Define jump list" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
K	Input	UINT	I, Q, M, D, L or constant	Specifies the number of the output and thus the jump that is to be made.
DEST0	-	-	-	First jump label
DEST1	-	-	-	Second jump label
DESTn	-	-	-	Optional jump labels

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand/Jump label	Value
K	Tag_Value	1
Dest0	LABEL0	Jump to the network that is identified with the jump label "LABEL0".
Dest1	LABEL1	Jump to the network that is identified with the jump label "LABEL1".
Dest2	LABEL2	Jump to the network that is identified with the jump label "LABEL2".

If operand "Tag\_Input" has the signal state "1", the "Define jump list" instruction is executed. The program execution is resumed according to the value of operand "Tag\_Value" in the network that is identified with the jump label "LABEL1".

**See also**

- Overview of the valid data types (Page 1262)

- Removing inputs and outputs (Page 1487)

**SWITCH: Jump distributor**

**Description**

You can use the "Jump distributor" instruction to define multiple program jumps to be executed depending on the result of one or more comparison instructions.

You specify the value to be compared in the K parameter. This value is compared with the values that are provided by the various inputs. You can select the comparison method for each individual input. The availability of the various comparison instructions depends on the data type of the instruction.

The following table shows the comparison instructions that are available depending on the selected data type:

Data type		Instruction	Syntax
S7-1200	S7-1500		
Bit strings	Bit strings	Equal	==
		Not equal	<>
Integers, floating-point numbers, TIME, DATE, TOD	Integers, floating-point numbers, TIME, LTIME, DATE, TOD, LTOD, LDT	Equal	==
		Not equal	<>
		Greater or equal	>=
		Less or equal	<=
		Greater than	>
		Less than	<

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box. If you select a comparison instruction and the data type of the instruction is not yet defined, the "<???">" drop-down list only offers the data types that are permitted for the selected comparison instruction.

Execution of the instruction begins with the first comparison and runs until a comparison condition is met. If a comparison condition is met, the subsequent comparison conditions are not considered. If none of the specified comparison conditions are met, the jump at the ELSE output is executed. If no program jump is defined at the ELSE output, execution of the program continues in the next network.

The number of outputs can be expanded in the instruction box. The numbering of the outputs begins with the value "0" and continues in ascending order with each new output. Specify jump labels (LABEL) at the outputs of the instruction. Instructions or operands cannot be specified at the outputs of the instruction.

An input is automatically inserted for each additional output. The jump programmed at an output is executed if the comparison condition of the corresponding input is fulfilled.

## Parameters

The following table shows the parameters of the "Jump distributor" instruction:

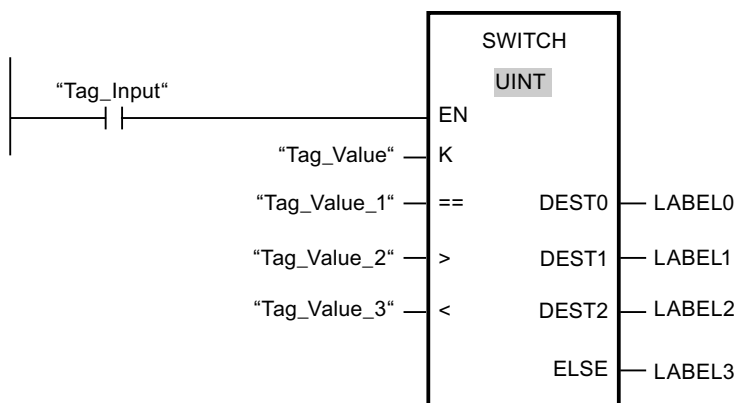

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
EN	Input	BOOL	BOOL	I, Q, M, D, L	Enable input
K	Input	UINT	UINT	I, Q, M, D, L or constant	Specifies the value to be compared.
<Comparison values>	Input	Bit strings, integers, floating-point numbers, TIME, DATE, TOD	Bit strings, integers, floating-point numbers, TIME, LTIME, DATE, TOD, LTOD, LDT	I, Q, M, D, L or constant	Input value with which the value of the K parameter is compared.

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
DEST0	-	-	-	-	First jump label
DEST1	-	-	-	-	Second jump label
DEST(n)	-	-	-	-	Optional jump labels(n = 2 to 99)
ELSE	-	-	-	-	Program jump that is executed when none of the comparison conditions are fulfilled.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand/Jump label	Value
K	Tag_Value	23
==	Tag_Value_1	20
>	Tag_Value_2	21
<	Tag_Value_3	19
Dest 0	LABEL0	Jump to jump label "LABEL0", if the value of the K parameter equals 20.
Dest 1	LABEL1	Jump to jump label "LABEL1" if the value of the K parameter is greater than 21.

Parameters	Operand/Jump label	Value
Dest 2	LABEL2	Jump to jump label "LABEL2", if the value of the K parameter is less than 19.
ELSE	LABEL 3	Jump to jump label "LABEL3", if the none of the comparison conditions are fulfilled.

If the operand "Tag\_Input" changes to signal state "1", the instruction "Jump distributor" is executed. The execution of the program is continued in the network that is identified with the jump label "LABEL1".

### --(RET): Return

#### Description

You can use the "Return" instruction to stop the execution of a block. The results is three types through which the block processing can be completed.

- Without call of the "Return" instruction  
The block is exited after execution of the last network. The ENO of the function call is set to the signal state "1".
- Call of the "Return" instruction with preceding logic operation (see example)  
If the left connector has the signal state "1", the block will be exited. The ENO of the function call corresponds to the operand.
- Call of the "Return" instruction without previous logic operation  
The block is exited. The ENO of the function call corresponds to the operand.

---

#### Note

Only one jumping coil may be used in a network ("Return", "Jump if RLO=1", "Jump if RLO=0").

---

If the result of logic operation (RLO) at the input of the "Return" instruction is "1", program execution is terminated in the currently called block and resumed after the call function in the calling block (for example, in the calling OB). The status (ENO) of the call function is determined by the parameter of the instruction. This can assume the following values:

- RLO
- TRUE/FALSE
- <Operand>

To set the parameter values, double-click the instruction and select the corresponding value in the drop-down list.

The following table shows the status of the call function if the "Return" instruction is programmed in a network within the called block:

RLO	Parameter value	ENO of the call function
1	RLO	1
	TRUE	1
	FALSE	0
	<Operand>	<Operand>
0	RLO	The program execution continues in the next network of the called block.
	TRUE	
	FALSE	
	<Operand>	

If an OB is completed, another block will be selected and started or executed by the priority class system:

- If the program cycle OB was completed, it will be restarted.
- If an OB is completed that has interrupted another block (for example, an alarm OB), then the interrupted block (for example, program cycle OB) will be executed.

### Parameters

The following table shows the parameters of the "Return" instruction:

Parameter	Declaration	Data type	Memory area	Description
Status of the calling function with RLO = 1:				
RLO	-	-		Is set to the signal status of the RLO.
TRUE	-	-		1
FALSE	-	-		0
<Operand>	Input	BOOL	I, Q, M, D, L	Signal state of the specified operand

### Example

The following example shows how the instruction works:

If operand "TagIn" has the signal state "1", the "Return" instruction is executed. Program execution is terminated in the called block and continues in the calling block. The ENO enable output of the call function is reset to signal state "0".

## See also

Overview of the valid data types (Page 1262)

## Runtime control

### ENDIS\_PW: Limit and enable password legitimation

#### Description

You use the "Limit and enable password legitimation" instruction to specify whether configured passwords may be legitimated or not for the CPU. You can prevent legitimated connections, even when the correct password is known.

When you call the command and the REQ parameter has the signal state "0", only the currently set state is displayed at the output parameters. If changes are made to the input parameters, these changes are not transferred to the output parameters.

If the instruction is called and REQ parameter has the signal state "1", the signal state is applied from the input parameters (F\_PWD, FULL\_PWD, R\_PWD, HMI\_PWD). FALSE means that legitimation per password is not permitted; TRUE means the password can be used.

Disable or enabling of the passwords can be allowed or prohibited individually. For example, all passwords can be prohibited, except the fail-safe password. You can thus limit access options to a small user group. The output parameters (F\_PWD\_ON, FULL\_PWD\_ON, R\_PWD\_ON, HMI\_PWD\_ON) always show the current status of the password use, regardless of the REQ parameter.

Non-configured passwords must have the TRUE signal state at the input and return the TRUE signal state at the output. The fail-safe password can only be configured for an F-CPU and, therefore, must always be interconnected with the TRUE signal state in a standard CPU. If the instruction return an error, the call remains without effect, i.e. the previous lock remains in force.

Disabled passwords can be enabled again under the following conditions:

- The CPU is reset to its factory settings.
- The front panel of the S7-1500 CPU supports a dialog that allows you to navigate to the appropriate menu in which the passwords can be enabled again.
- When you call the "Limit and enable password legitimation" instruction, the input parameter of the desired password has the signal state "1".
- Set the operating mode switch to STOP. The restriction to password legitimation is re-established as soon as the switch is set back to RUN.
- Inserting an empty memory card (transfer card or program card) into S7-1200 CPU.
- The transition from POWER OFF to POWER ON disables the protection in the S7-1200 CPU. The "Limit and enable password legitimation" instruction must be called again in the program (e.g. in the startup OB).

---

**Note**

The "Limit and enable password legitimation" instruction blocks access to the HMI system, if the HMI password has not been enabled.

---

**Note**

Existing legitimized connections retain their access rights and you cannot use the "Limit and enable password legitimation" instruction to restrict them.

---

### Preventing accidental lockout out with an S7-1500 CPU

The same setting can be made on the front panel of the S7-1500 CPU and the CPU saves the most recent setting.

To prevent accidental lockout, the protection can be disabled by setting the mode selector to STOP with an S7-1500 CPU. The protection is automatically enabled again by setting mode selector to RUN without having to call the "Limit and enable password legitimation" instruction again or taking additional actions on the front panel.

### Preventing accidental lockout with an S7-1200 CPU

The protection for POWER OFF - POWER ON is disabled because a S7-1200 CPU has no operating mode switch. As a result it is possible and advisable to use certain program sequences within your program to prevent an accidental lockout.

To do this, program a time control using either a cyclic interrupt OB or a timer in the main OB (OB 1). This provides you with the option to call the "Limit and enable password legitimation" instruction again without delay in the corresponding OB (e.g. OB 1 or OB 35) after a transition from POWER OFF - POWER ON. Call the instruction in the startup OB (OB 100) in order to keep as short as possible the time window in which the application is not active and thus ensure that no restrictions exist in the password legitimation. This procedure offers you the largest possible protection against unauthorized access.

If an unintended lockout occurs you can skip the call in the startup OB (for example, by querying an input parameter) and have the set time (for example 10 seconds to 1 minute), to establish a connection to the CPU before the lock becomes active again.

If you have set no timer in your program code and are locked out, insert an empty transfer card or empty program card into the CPU. The empty transfer card or program card deletes the internal load memory of the CPU. You must then load the user program again from STEP 7 in the CPU.

### Procedure for lost passwords with an S7-1200 CPU

If you have lost the password for a password-protected S7-1200 CPU, delete the password-protected program with an empty transfer card or program card. The empty transfer card or

program card deletes the internal load memory of the CPU. You can then load a new user program from STEP 7 Basic in the CPU.

 **WARNING**

**Inserting empty transfer card**

When you insert a transfer card in a CPU during runtime, the CPU goes to STOP mode. If operating states are unstable, controllers may fail and thus cause the uncontrolled operation of the controlled devices. This leads to an unforeseen operation of the automation system which can cause deadly or serious injuries and/or damage to property.

After you remove the transfer card the content of the transfer card is in the internal load memory. Make sure at this point that the card contains no program.

 **WARNING**

**Inserting empty program card**

When you insert a program card in a CPU during runtime, the CPU goes to STOP mode. If operating states are unstable, controllers may fail and thus cause the uncontrolled operation of the controlled devices. This leads to an unforeseen operation of the automation system which can cause deadly or serious injuries and/or damage to property.

Make sure that the program card is empty. The internal load memory is copied to the empty program card. The internal load memory is empty after the removal of the formerly empty program card.

You must remove the transfer card or program card before you put the CPU into RUN mode.

### Effects of password use on the operating modes

The following table shows what effects the password use by means of the "Limit and enable password legitimation" instruction has on the operating modes and the corresponding user actions.

Action	Password protection by means of the instruction
Basic state after <ul style="list-style-type: none"> <li>Operating mode switch to STOP</li> <li>Reset memory manually (PG, switch, change of MC (Motion Control))</li> <li>Reset to factory setting</li> </ul>	Not activated (no restrictions)
Basic state after POWER ON	<ul style="list-style-type: none"> <li>S7-1200-CPU: the lock is disabled and the instruction must be called again in the program (in the startup OB, for example).</li> <li>S7-1500 CPU: Enabled (if a lock was activated before POWER OFF). The option of not allowing passwords is retentive.</li> </ul>
Operating mode transition RUN/STARTUP/HOLD -> STOP (by terminating the instruction, an error or communication) or STOP -> STARTUP/RUN/HOLD	Activated Passwords still cannot be used.

### Parameters

The following table shows the parameters of the "Limit and enable password legitimation" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
REQ	Input	BOOL	I, Q, M, D, L or constant	When the REQ parameter has the signal state "0", the currently set signal state of the passwords is queried.
F_PWD	Input	BOOL	I, Q, M, D, L or constant	Read/write access including fail-safe <ul style="list-style-type: none"> <li>F_PWD = "0": Do not allow password</li> <li>F_PWD = "1": Allow password</li> </ul>
FULL_PWD	Input	BOOL	I, Q, M, D, L or constant	Read/write access <ul style="list-style-type: none"> <li>FULL_PWD = "0": Do not allow password</li> <li>FULL_PWD = "1": Allow password</li> </ul>
R_PWD	Input	BOOL	I, Q, M, D, L or constant	Read access <ul style="list-style-type: none"> <li>R_PWD = "0": Do not allow password</li> <li>R_PWD = "1": Allow password</li> </ul>
HMI_PWD	Input	BOOL	I, Q, M, D, L or constant	HMI access <ul style="list-style-type: none"> <li>HMI_PWD = "0": Do not allow password</li> <li>HMI_PWD = "1": Allow password</li> </ul>

Parameter	Declaration	Data type	Memory area	Description
F_PWD_ON	Output	BOOL	I, Q, M, D, L	Read/write access including fail-safe <ul style="list-style-type: none"> <li>F_PWD_ON = "0": Password not allowed</li> <li>F_PWD_ON = "1": Password allowed</li> </ul>
FULL_PWD_ON	Output	BOOL	I, Q, M, D, L	Read/write access status <ul style="list-style-type: none"> <li>FULL_PWD_ON = "0": Password not allowed</li> <li>FULL_PWD_ON = "1": Password allowed</li> </ul>
R_PWD_ON	Output	BOOL	I, Q, M, D, L	Read-access status <ul style="list-style-type: none"> <li>R_PWD_ON = "0": Password not allowed</li> <li>R_PWD_ON = "1": Password allowed</li> </ul>
HMI_PWD_ON	Output	BOOL	I, Q, M, D, L	HMI-access status <ul style="list-style-type: none"> <li>HMI_PWD_ON = "0": Password not allowed</li> <li>HMI_PWD_ON = "1": Password allowed</li> </ul>
RET_VAL	Output	WORD	I, Q, M, D, L	Error information

For additional information on valid data types, refer to "See also".

### RET\_VAL parameter

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
8090	The "Limit and enable password legitimation" instruction is not supported
80D0	The password for fail-safe is not configured. With standard CPUs, the signal state must be TRUE.
80D1	The read/write access is not configured
80D2	The read access is not configured
80D3	The HMI access is not configured
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

### See also

Overview of the valid data types (Page 1262)

Basics of the EN/ENO mechanism (Page 1357)

## RE\_TRIGR: Restart cycle monitoring time

### Description

You can use the "Restart cycle monitoring time" instruction to restart the cycle time monitoring of the CPU. The maximum cycle time then starts over again for the duration you have set in the CPU configuration.

The instruction "Restart cycle monitoring time" can be called regardless of the priority in all blocks.

If the instruction is called in a block with a higher priority, such as a hardware interrupt, diagnostic error interrupt, or cyclic interrupt, the instruction is not executed and the ENO enable output is set to signal state "0".

The instruction "Restart cycle monitoring time" can be called a maximum of 10 times in a program cycle.

### Parameter

The "Restart cycle monitoring time" instruction has no parameters.

### See also

Overview of the valid data types (Page 1262)

Basics of the EN/ENO mechanism (Page 1357)

## STP: Exit program

### Description

You use the "Exit program" instruction to set the CPU to STOP mode and therefore to terminate the execution of the program. The effects of changing from RUN to STOP depend on the CPU configuration.

When the result of logic operation (RLO) at the input of the instruction is "1", the CPU changes to STOP mode and program execution is terminated. The signal state at the output of the instruction is not evaluated.

When the RLO is "0" at the input of the instruction, then the instruction will not be executed.

### Parameters

The "Exit program" instruction has no parameters.

### See also

Overview of the valid data types (Page 1262)

## GET\_ERROR: Get error locally

### Description

The "Get error locally" instruction is used to query the occurrence of errors within a block. This is usually to access error. If the system reports an error during the processing of the block, detailed information is stored in the operand at the ERROR output for the first error to occur during the execution of the block since the last execution of the instruction.

Only operands of the "ErrorStruct" system data type can be specified at the ERROR output. The "ErrorStruct" system data type specifies the exact structure in which the information about the error is stored. Using additional instructions, you can evaluate this structure and program an appropriate response. If several errors occur in the block, the error information about the next error to occur in the instruction is output only after the first error that occurred has been remedied.

---

#### Note

The ERROR output is only changed if error information is present. To set the output back to "0" after handling an error, you have the following options:

- Declare the tag in the "Temp" section of the block interface.
  - Reset the tag to "0" before calling the instruction.
  - Query the enable output ENO.
- 

The enable output ENO of the instruction "Get error locally" instruction is set only if the enable input EN returns signal state "1" and error information is present. If one of these conditions is not fulfilled, the remaining program execution is not affected by the "Get error locally" instruction.

You can find an example of how you can implement the instruction in combination with other troubleshooting options under "See also".

---

#### Note

The "Get error locally" instruction enables local error handling within a block. If "Get error locally" is inserted in the program code of a block, any predefined system reactions are ignored if errors occur.

---

### Parameters

The following table lists the parameters of the "Get error locally" instruction:

Parameter	Declaration	Data type	Memory area	Description
ERROR	Output	ErrorStruct	D, L	Error information

**Data type "ErrorStruct"**

The following table lists the structure of the "ErrorStruct" data type:

Structure component		Data type	Description
ERROR_ID		WORD	Error ID
FLAGS		BYTE	Shows if an error occurred during a block call. 16#01: Error during a block call 16#00: No error during a block call
REACTION		BYTE	Default reaction: 0: Ignore (write error) 1: Continue with substitute value "0" (read error) 2: Skip instruction (system error)
CODE_ADDRESS		CREF	Information about the address and type of block
	BLOCK_TYPE	BYTE	Type of block where the error occurred: 1: OB 2: FC 3: FB
	CB_NUMBER	UINT	Number of the code block
	OFFSET	UDINT	Reference to the internal memory
MODE		BYTE	Information about the address of an operand
OPERAND_NUMBER		UINT	Operand number of the machine command
POINTER_NUMBER_LOCATION		UINT	(A) Internal pointer
SLOT_NUMBER_SCOPE		UINT	(B) Storage area in internal memory
DATA_ADDRESS		NREF	Information about the address of an operand
	AREA	BYTE	(C) Memory area: L: 16#40 – 4E, 86, 87, 8E, 8F, C0 – CE I: 16#81 Q: 16#82 M: 16#83 DB: 16#84, 85, 8A, 8B Range violations for a directly editable tag of data type DINT: 16#04
	DB_NUMBER	UINT	(D) Number of the data block
	OFFSET	UDINT	(E) Relative address of the operand

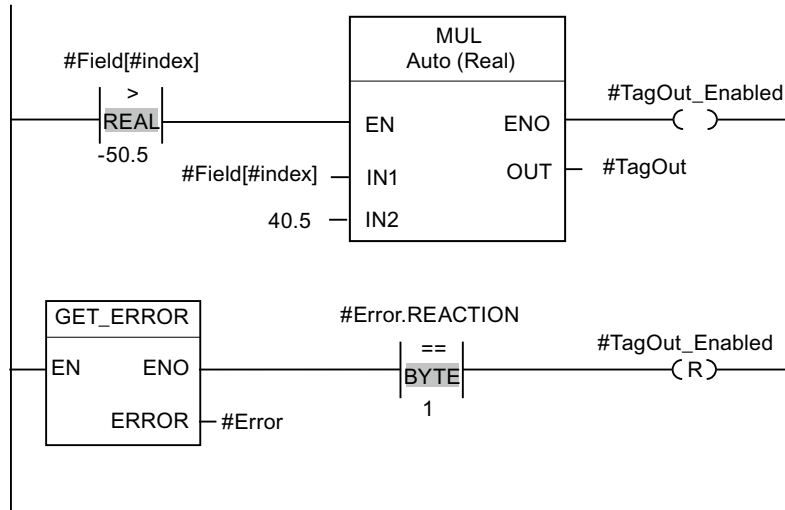

**Structure component "ERROR\_ID"**

The following table lists the values that can be output at the structure component "ERROR\_ID":

ID* (hexadecimal)	ID* (decimal)	Description
0	0	No error
2503	9475	Invalid pointer
2520	9504	Invalid STRING
2522	9506	Read error: Operand outside the valid range
2523	9507	Write error: Operand outside the valid range
2524	9508	Read error: Invalid operand
2525	9509	Write error: Invalid operand
2528	9512	Read error: Data alignment
2529	9513	Write error: Data alignment
252C	9516	Invalid pointer
2530	9520	Write error: Data block
2533	9523	Invalid pointer used
2538	9528	Access error: DB does not exist
2539	9529	Access error: Wrong DB used
253A	9530	Global data block does not exist
253C	9532	Faulty information or the function does not exist
253D	9533	System function does not exist
253E	9534	Faulty information or the function block does not exist
253F	9535	System block does not exist
2550	9552	Access error: DB does not exist
2551	9553	Access error: Wrong DB used
2575	9589	Error in the program nesting depth
2577	9591	The block property "Parameter passing via registers" is not selected.
2576	9590	Error in the local data distribution
25A0	9632	Internal error in TP
25A1	9633	Tag is write-protected
25A2	9634	Invalid numerical value of tag
2942	10562	Read error: Input
2943	10563	Write error: Output
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".		

**Example**

The following example shows how the instruction works:

An error occurred accessing the "#Field[#index]" tag. The enable output ENO of the "Multiply" instruction and the "#TagOut\_Enabled" operand have signal state "1" despite the read/access error and the multiplication is performed with the value "0.0". If this error scenario occurs, it is recommended to program the "Get error locally" instruction after the "Multiply" instruction to get the error. The error information supplied by the "Get error locally" instruction is evaluated with the comparison instruction "Equal". If the "#Error.REACTION" structure component has the value "1", this involves a read/access error and the "#TagOut\_Enabled" output is reset.

**See also**

Overview of the valid data types (Page 1262)

Querying and fixing errors in the program code (Page 227)

**GET\_ERR\_ID: Get error ID locally**

**Description**

The "Get error ID locally" instruction is used to query the occurrence of errors within a block. This is usually to access error. If the system reports during the block processing errors within the block execution since the last execution of the instruction, the error ID of the first error that occurred in the tag is stored at the ID output.

Only operands of the WORD data type can be specified at the ID output. If several errors occur in the block, the error ID of the next error to occur in the instruction is output only after the first error that occurred has been remedied.

---

#### Note

The ID output is only changed if error information is present. To set the output back to "0" after handling an error, you have the following options:

- Declare the tag in the "Temp" section of the block interface.
  - Reset the tag to "0" before calling the instruction.
  - Query the enable output ENO.
- 

The enable output ENO of the instruction "Get error ID locally" instruction is set only if the enable input EN returns signal state "1" and error information is present. If one of these conditions is not fulfilled, the remaining program execution is not affected by the "Get error ID locally" instruction.

You can find an example of how you can implement the instruction in combination with other troubleshooting options under "See also".

---

#### Note

The "Get error ID locally" instruction enables local error handling within a block. If the "Get error ID locally" instruction is inserted in the program code of a block, any predefined system reactions are ignored if errors occur.

---

## Parameters

The following table lists the parameters of the "Get error ID locally" instruction:

Parameter	Declaration	Data type	Memory area	Description
ID	Output	WORD	I, Q, M, D, L	Error ID

## ID parameter

The following table lists the values that can be output at the ID parameter:

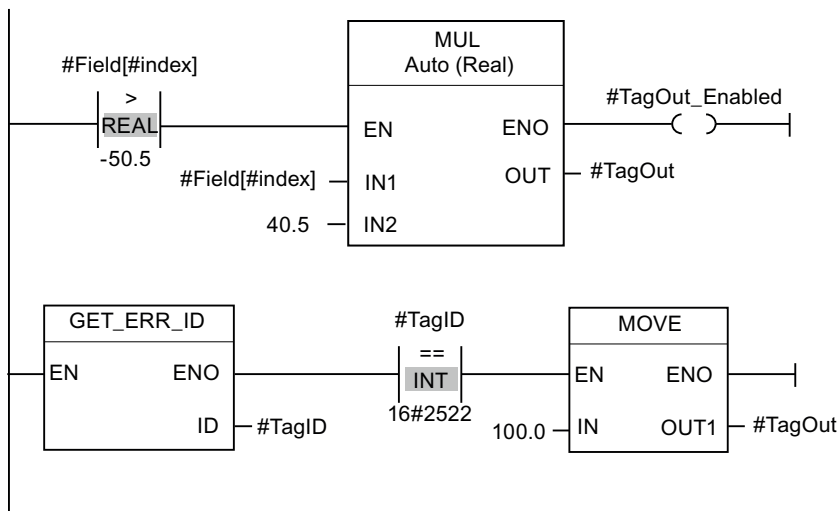

ID* (hexadecimal)	ID* (decimal)	Description
0	0	No error
2503	9475	Invalid pointer
2520	9504	Invalid STRING
2522	9506	Read error: Operand outside the valid range
2523	9507	Write error: Operand outside the valid range
2524	9508	Read error: Invalid operand
2525	9509	Write error: Invalid operand

ID* (hexadecimal)	ID* (decimal)	Description
2528	9512	Read error: Data alignment
2529	9513	Write error: Data alignment
252C	9516	Invalid pointer
2530	9520	Write error: Data block
2533	9523	Invalid pointer used
2538	9528	Access error: DB does not exist
2539	9529	Access error: Wrong DB used
253A	9530	Global data block does not exist
253C	9532	Faulty information or the function does not exist
253D	9533	System function does not exist
253E	9534	Faulty information or the function block does not exist
253F	9535	System block does not exist
2550	9552	Access error: DB does not exist
2551	9553	Access error: Wrong DB used
2575	9589	Error in the program nesting depth
2576	9590	Error in the local data distribution
2577	9591	The block property "Parameter passing via registers" is not selected.
25A0	9632	Internal error in TP
25A1	9633	Tag is write-protected
25A2	9634	Invalid numerical value of tag
2942	10562	Read error: Input
2943	10563	Write error: Output

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

**Example**

The following example shows how the instruction works:

An error occurred accessing the "#Field[#index]" tag. The enable output ENO of the "Multiply" instruction and the "#TagOut\_Enabled" operand have signal state "1" despite the read/access error and the multiplication is performed with the value "0.0". If this error scenario occurs, it is recommended to program the "Get error ID locally" instruction after the "Multiply" instruction to get the error. The error information supplied by the "Get error ID locally" instruction is evaluated with the comparison instruction "Equal". If the operand "#TagID" returns the ID 2522, this involves a read/access error and the value "100.0" is written to the "#TagOut" output.

## INIT\_RD: Initialize all retain data

### Description

You can use the "Initialize all retain data" instruction to reset the retain data of all data blocks, bit memories and SIMATIC timers and counters at the same time. The instruction can only be executed within a startup OB because the execution would exceed the program cycle duration.

### Parameter

The following table shows the parameters of the "Initialize all retain data" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
REQ	Input	BOOL	I, Q, M, D, L, T, C or constant	If the input "REQ" has the signal state "1", all retain data are reset.
RET_VAL	Output	INT	I, Q, M, D, L	Error information: If an error occurs during execution of the instruction, an error code is output at the RET_VAL parameter.

For additional information on valid data types, refer to "See also".

### Parameters RET\_VAL

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
80B5	The instruction cannot be executed because it was not programmed within a startup OB.
General error information	See also: "GET_ERR_ID: Get error ID locally"
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

### Example

The following example shows how the instruction works:

If the operands "TagIn\_1" and "Tag\_REQ" have signal state "1", the instruction is executed. The retain data of all data blocks, bit memories and SIMATIC timers and counters are reset. If the instruction is executed without errors, the ENO enable output has the signal state "1".

### WAIT: Configure time delay

#### Description

The "Configure time delay" instruction is used to halt the execution of the program for a set period of time. You indicate the period of time in microseconds on the WT parameter of the instruction.

You can configure time delays of up to 32767 microseconds (µs). The smallest possible delay time depends on the respective CPU and corresponds to the execution time of the "Configure time delay" instruction.

The execution of the instruction can be interrupted by higher priority events.

The "Configure time delay" instruction supplies no error information.

## Parameters

The following table shows the parameters of the "Configure time delay" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
WT	Input	INT	I, Q, M, D, L, P or constant	Time delay in microseconds ( $\mu$ s)

## RUNTIME: Measure program runtime

### Description

The "Measure program runtime" instruction is used to measure the runtime of the entire program, individual blocks or command sequences.

If you want to measure the runtime of your entire program, call the instruction "Measure program runtime" in OB1. Measurement of the runtime is started with the first call and the output RET\_VAL returns the runtime of the program after the second call. The measured runtime includes all CPU processes that can occur during the program execution, for example, interruptions caused by higher-level events or communication. The instruction "Measure program runtime" reads an internal counter of the CPU and write the value to the IN-OUT parameter MEM. The instruction calculates the current program runtime according to the internal counter frequency and writes it to output RET\_VAL.

If you want to measure the runtime of individual blocks or individual command sequences, you need three separate networks. Call the instruction "Measure program runtime" in an individual network within your program. You set the starting point of the runtime measurement with this first call of the instruction. Then you call the required program block or the command sequence in the next network. In another network, call the "Measure program runtime" instruction a second time and assign the same memory to the IN-OUT parameter MEM as you did during the first call of the instruction. The "Measure program runtime" instruction in the third network reads an internal CPU counter and calculates the current runtime of the program block or the command sequence according to the internal counter frequency and writes it to the output RET\_VAL.

The Measure program runtime" instruction uses an internal high-frequency counter to calculate the time. If the counter overruns, the instruction returns values  $\leq 0.0$ . Ignore these runtime values.

**Note**

The runtime of a command sequence cannot be determined exactly, because the sequence of instructions within a command sequence is changed during optimized compilation of the program.

**Parameter**

The following table lists the parameters of the "Measure program runtime" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
MEM	InOut	LREAL	M, D, L	Saves the starting point of the runtime measurement.
RET_VAL	Output	LREAL	I, Q, M, D, L	Returns the measured runtime in seconds

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works based on the runtime calculation of a program block:

Network 1:

Network 2:

Network 3:

When the "TagIn1" operand in network 1 has the signal state "1", the instruction is executed. The starting point for the runtime measurement is set with the first call of the instruction and buffered as reference for the second call of the instruction in the "TagMemory" operand.

The "Best\_before\_date" program block FB1 is called in network 2.

When the FB1 program block has been executed and the "TagIn1" operand has the signal state "1", the instruction in network 3 is executed. The second call of the instruction calculates the runtime of the program block and writes the result to the output RET\_VAL.

## Word logic operations

### AND: AND logic operation

#### Description

You can use the "AND logic operation" instruction to combine the value at the IN1 input and the value at the IN2 input bit-by-bit by AND logic and query the result at the OUT output.

When the instruction is executed, bit 0 of the value at the IN1 input and bit 0 of the value at the IN2 input are logically ANDed. The result is stored in bit 0 of output OUT. The same logic operation is executed for all other bits of the specified values.

The number of inputs can be expanded in the instruction box. The added inputs are numbered in ascending order in the box. When the instruction is executed, the values of all available input parameters are combined with AND logic (ANDed). The result is stored in the OUT output.

The result bit has signal state "1" only when both of the bits in the logic operation also have signal state "1". If one of the two bits of the logic operation has signal state "0", the corresponding result bit is reset.

#### Parameters

The following table shows the parameters of the "AND logic operation" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output

Parameter	Declaration	Data type	Memory area	Description
IN1	Input	Bit strings	I, Q, M, D, L, P or constant	First value for logic operation
IN2	Input	Bit strings	I, Q, M, D, L, P or constant	Second value for logic operation
INn	Input	Bit strings	I, Q, M, D, L, P or constant	Other inputs whose values are logically combined.
OUT	Output	Bit strings	I, Q, M, D, L, P	Result of the instruction

You can select the data type for the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN1	Tag_Value1	0101 0101 0101 0101
IN2	Tag_Value2	0000 0000 0000 1111
OUT	Tag_Result	0000 0000 0000 0101

If operand "TagIn" has the signal state "1", the "AND logic operation" instruction is executed. The value of operand "Tag\_Value1" and the value of operand "Tag\_Value2" are ANDed. The result is mapped bit-for-bit and output in operand "Tag\_Result". The ENO enable output and the "TagOut" output are set to signal state "1".

## OR: OR logic operation

### Description

You can use the "OR logic operation" instruction to combine the value at the IN1 input and the value at the IN2 input bit-by-bit by OR logic and query the result at the OUT output.

When the instruction is executed, bit 0 of the value at the IN1 input and bit 0 of the value at the IN2 input are combined by OR logic operation. The result is stored in bit 0 of output OUT. The same logic operation is executed for all bits of the specified tags.

The number of inputs can be expanded in the instruction box. The added inputs are numbered in ascending order in the box. When the instruction is executed, the values of all available input parameters are combined with OR logic (ORed). The result is stored in the OUT output.

The result bit has signal state "1" when at least one of the two bits in the logic operation has the signal state "1". If both of the bits of the logic operation have signal state "0", the corresponding result bit is reset.

### Parameters

The following table shows the parameters of the "OR logic operation" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN1	Input	Bit strings	I, Q, M, D, L, P or constant	First value for logic operation
IN2	Input	Bit strings	I, Q, M, D, L, P or constant	Second value for logic operation
INn	Input	Bit strings	I, Q, M, D, L, P or constant	Other inputs whose values are logically combined.
OUT	Output	Bit strings	I, Q, M, D, L, P	Result of the instruction

You can select the data type for the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN1	Tag_Value1	0101 0101 0101 0101
IN2	Tag_Value2	0000 0000 0000 1111
OUT	Tag_Result	0101 0101 0101 1111

If operand "TagIn" has the signal state "1", the "OR logic operation" instruction is executed. The value of operand "Tag\_Value1" and the value of operand "Tag\_Value2" are ORed. The result is mapped bit-for-bit and output in operand "Tag\_Result". The ENO enable output and the "TagOut" output are set to signal state "1".

**See also**

- Overview of the valid data types (Page 1262)
- Inserting additional inputs and outputs in LAD elements (Page 1486)
- Removing inputs and outputs (Page 1487)

**XOR: EXCLUSIVE OR logic operation**

**Description**

You can use the "EXCLUSIVE OR logic operation" instruction to combine the value at the IN1 input and the value at the IN2 input bit-by-bit by EXCLUSIVE OR logic and query the result at the OUT output.

When the instruction is executed, bit 0 of the value at the IN1 input and bit 0 of the value at the IN2 input are combined by EXCLUSIVE OR logic operation. The result is stored in bit 0 of output OUT. The same logic operation is executed for all other bits of the specified value.

The number of inputs can be expanded in the instruction box. The added inputs are numbered in ascending order in the box. When the instruction is executed, the values of all available input parameters are combined with EXCLUSIVE OR logic. The result is stored in the OUT output.

The result bit has signal state "1" when one of the two bits in the logic operation has the signal state "1". If both of the bits of the logic operation have signal state "1" or "0", the corresponding result bit is reset.

## Parameters

The following table shows the parameters of the "EXCLUSIVE OR logic operation" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN1	Input	Bit strings	I, Q, M, D, L, P or constant	First value for logic operation
IN2	Input	Bit strings	I, Q, M, D, L, P or constant	Second value for logic operation
INn	Input	Bit strings	I, Q, M, D, L, P or constant	Other inputs whose values are logically combined.
OUT	Output	Bit strings	I, Q, M, D, L, P	Result of the instruction

You can select the data type for the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN1	Tag_Value1	0101 0101 0101 0101
IN2	Tag_Value2	0000 0000 0000 1111
OUT	Tag_Result	0101 0101 0101 1010

If operand "TagIn" has the signal state "1", the "EXCLUSIVE OR logic operation" instruction is executed. The value of operand "Tag\_Value1" and the value of operand "Tag\_Value2" are combined by EXCLUSIVE OR logic. The result is mapped bit-for-bit and output in operand "Tag\_Result". The ENO enable output and the "TagOut" output are set to signal state "1".

## See also

Basics of the EN/ENO mechanism (Page 1357)

### INV: Create ones complement

#### Description

You can use the "Create ones complement" instruction to invert the signal state of the bits at the IN input. When the instruction is processed, the value at the IN input and a hexadecimal template (W#16#FFFF for 16-bit numbers or DW#16#FFFF FFFF for 32-bit numbers) are combined by EXCLUSIVE OR logic. This inverts the signal state of the individual bits that are then stored at output OUT.

#### Parameters

The following table shows the parameters of the "Create ones complement" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Bit strings, integers	I, Q, M, D, L, P or constant	Input value
OUT	Output	Bit strings, integers	I, Q, M, D, L, P	Ones complement of the value at input IN

You can select the data type for the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

#### Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value	
IN	TagIn_Value	W#16#000F	W#16#7E
OUT	TagOut_Value	W#16#FFF0	W#16#81

If operand "TagIn" has the signal state "1", the "Create ones complement" instruction is executed. The instruction inverts the signal state of the individual bits at input TagIn\_Value and writes the result to output "TagOut\_Value". The ENO enable output and the "TagOut" output are set to signal state "1".

## See also

Overview of the valid data types (Page 1262)

Basics of the EN/ENO mechanism (Page 1357)

## DECO: Decode

### Description

You can use the "Decode" instruction to set a bit in the output value specified by the input value.

The "Decode" instruction reads the value at the IN input and sets the bit in the output value whose bit position corresponds to the read value. The other bits in the output value are filled with zeroes. When the value at the IN input is greater than 31, a modulo 32 instruction is executed.

### Parameters

The following table shows the parameters of the "Decode" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	UINT	I, Q, M, D, L, P or constant	Position of the bit in the output value which is set.
OUT	Output	Bit strings	I, Q, M, D, L, P	Output value

You can select the data type for the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following figure shows how the instruction works using specific operand values:

If operand "TagIn" has the signal state "1", the "Decode" instruction is executed. The instruction reads bit number "3" from the value of the operand "TagIn\_Value" at the input and sets the third bit to the value of the operand "TagOut\_Value" at the output.

If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

**See also**

- Overview of the valid data types (Page 1262)
- Basics of the EN/ENO mechanism (Page 1357)

**ENCO: Encode**

**Description**

You can use the "Encode" instruction to read the bit number of the least significant bit in the input value and to send it to the OUT output.

The "Encode" instruction selects the least significant bit of the value at the IN input and writes its bit number to the tag in the OUT output.

**Parameters**

The following table shows the parameters of the "Encode" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output

Parameter	Declaration	Data type	Memory area	Description
IN	Input	Bit strings	I, Q, M, D, L, P or constant	Input value
OUT	Output	INT	I, Q, M, D, L, P	Output value

You can select the data type for the instruction from the "<???"> drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following figure shows how the instruction works using specific operand values:

If operand "TagIn" has the signal state "1", the "Encode" instruction is executed. The instruction selects the least significant bit at the "TagIn\_Value" input and writes bit position "3" to the tag in the "TagOut\_Value" output.

If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

## See also

Overview of the valid data types (Page 1262)

Basics of the EN/ENO mechanism (Page 1357)

## SEL: Select

### Description

Depending on a switch (G input), the "Select" instruction selects one of the inputs, IN0 or IN1 and copies its content to the OUT output. When the G input has the signal state "0", the value at the IN0 input is moved. When the G input has the signal state "1", the value at the IN1 input is moved to the OUT output.

All tags at all parameters must have the same data type.

**Parameters**

The following table shows the parameters of the "Select" instruction:

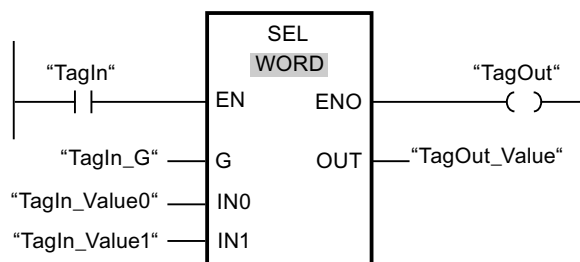

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
EN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
G	Input	BOOL	BOOL	I, Q, M, D, L or constant	I, Q, M, D, L, T, C or constant	Switch
IN0	Input	Bit strings, integers, floating-point numbers, TIME, TOD, CHAR, DATE	Bit strings, integers, floating-point numbers, timers, TOD, LTOD, LDT, CHAR, DATE	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	First input value
IN1	Input	Bit strings, integers, floating-point numbers, TIME, TOD, CHAR, DATE	Bit strings, integers, floating-point numbers, timers, TOD, LTOD, LDT, CHAR, DATE	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Second input value
OUT	Output	Bit strings, integers, floating-point numbers, TIME, TOD, CHAR, DATE	Bit strings, integers, floating-point numbers, timers, TOD, LTOD, LDT, CHAR, DATE	I, Q, M, D, L, P	I, Q, M, D, L, P	Result

You can select the data type for the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value	
G	TagIn_G	0	1
IN0	TagIn_Value0	W#16#0000	W#16#4C
IN1	TagIn_Value1	W#16#FFFF	W#16#5E
OUT	TagOut_Value	W#16#0000	W#16#5E

If operand "TagIn" has the signal state "1", the "Select" instruction is executed. Based on the signal state at the "TagIn\_G" input, the value at the "TagIn\_Value0" or "TagIn\_Value1" input is selected and copied to the "TagOut\_Value" output. If the instruction is executed without errors, enable output ENO has the signal state "1" and the "TagOut" output is set.

### MUX: Multiplex

#### Description

You can use the "Multiplex" instruction to copy the content of a selected input to the OUT output. The number of selectable inputs of the instruction box can be expanded. You can declare a maximum of 32 inputs.

The inputs are automatically numbered in the box. Numbering starts at IN0 and continues consecutively with each new input. You use the K parameter to define the input whose content is to be copied to the OUT output. If the value of the K parameter is greater than the number of available inputs, the content of the ELSE parameter is copied to the OUT output and the ENO enable output is assigned the signal state "0".

The "Multiplex" instruction can only be executed, when the tags in all inputs and in the OUT output have the same data type. The K parameter is an exception, since only integers can be specified for it.

The ENO enable output is reset if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The value of the K parameter is greater than the number of available inputs.
- Errors occurred during execution of the instruction.

Parameters

The following table shows the parameters of the "Multiplex" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
EN	Input	BOOL	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	Enable output
K	Input	Integers	Integers	I, Q, M, D, L, P or constant	Specifies the input whose content is to be copied. <ul style="list-style-type: none"> <li>• If K = 0 =&gt; Parameter IN0</li> <li>• If K = 1 =&gt; Parameter IN1, etc.</li> </ul>
IN0	Input	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	First input value
IN1	Input	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	Second input value
INn	Input	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	Optional input values

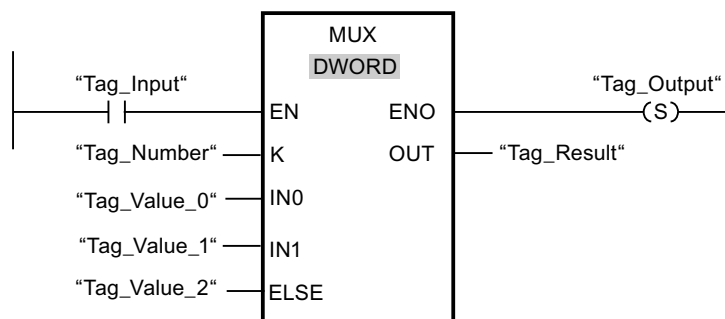

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
ELSE	Input	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	Specifies the value to be copied when $K > n$ .
OUT	Output	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P	Output to which the value is to be copied.

You can select the data type for the instruction from the "<???"> drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
K	Tag_Number	1
IN0	Tag_Value_0	DW#16#00000000
IN1	Tag_Value_1	DW#16#003E4A7D
ELSE	Tag_Value_2	DW#16#FFFF0000
OUT	Tag_Result	DW#16#003E4A7D

If operand "Tag\_Input" has the signal state "1", the "Multiplex" instruction is executed. Depending on the value of the operand "Tag\_Number", the value at input "Tag\_Value\_1" is copied and assigned to the operand at output "Tag\_Result". If the instruction is executed without errors, the "ENO" and "Tag\_Output" enable outputs are set.

**See also**

**DEMUX: Demultiplex**

**Description**

You can use the "Demultiplex" instruction to copy the content of the IN input to the selected output. The number of selectable outputs can be expanded in the instruction box. The outputs are automatically numbered in the box. Numbering starts at OUT0 and continues consecutively with each new output. You use the K parameter to define the output to which the content of the IN input is to be copied. The other outputs are not changed. If the value of the parameter K is greater than the number of available outputs, then the content of input IN in the parameter ELSE and the enable output ENO will be assigned to the signal state "0".

The "Demultiplex" instruction can only be executed if the tags in the IN input and in all outputs have the same data type. The K parameter is an exception, since only integers can be specified for it.

The ENO enable output is reset if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The value of the K parameter is greater than the number of available outputs.
- Errors occurred during execution of the instruction.

**Parameters**

The following table shows the parameters of the "Demultiplex" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
EN	Input	BOOL	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	Enable output
K	Input	Integers	Integers	I, Q, M, D, L, P or constant	Specifies the output to which the input value (IN) is copied. <ul style="list-style-type: none"> <li>• If K = 0 =&gt; Parameter OUT0</li> <li>• If K = 1 =&gt; Parameter OUT1, etc.</li> </ul>

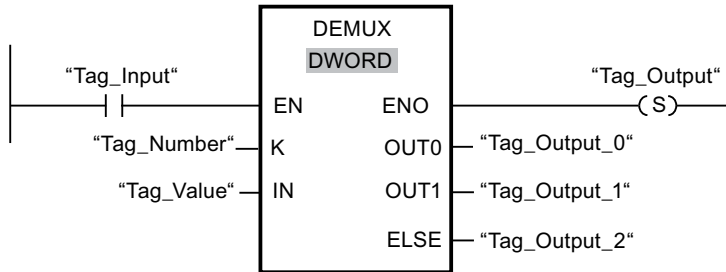

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
IN	Input	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	Input value
OUT0	Output	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P	First output
OUT1	Output	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P	Second output
OUTn	Output	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P	Optional outputs
ELSE	Output	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P	Output to which the input value (IN) at K > n is copied.

You can select the data type for the instruction from the "<???">" drop-down list of the instruction box.

For additional information on available data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following tables show how the instruction works using specific operand values:

Table 9-24 Input values of the "Demultiplex" instruction before network execution

Parameter	Operand	Values	
K	Tag_Number	1	4
IN	Tag_Value	DW#16#FFFFFFFF	DW#16#003E4A7D

Table 9-25 Output values of the "Demultiplex" instruction after network execution

Parameter	Operand	Values	
OUT0	Tag_Output_0	Unchanged	Unchanged
OUT1	Tag_Output_1	DW#16#FFFFFFFF	Unchanged
ELSE	Tag_Output_2	Unchanged	DW#16#003E4A7D

If the "Tag\_Input" input has the signal state "1", the "Demultiplex" instruction is executed. Depending on the value of operand "Tag\_Number", the value at the IN input is copied to the corresponding output.

**Shift and rotate**

**SHR: Shift right**

**Description**

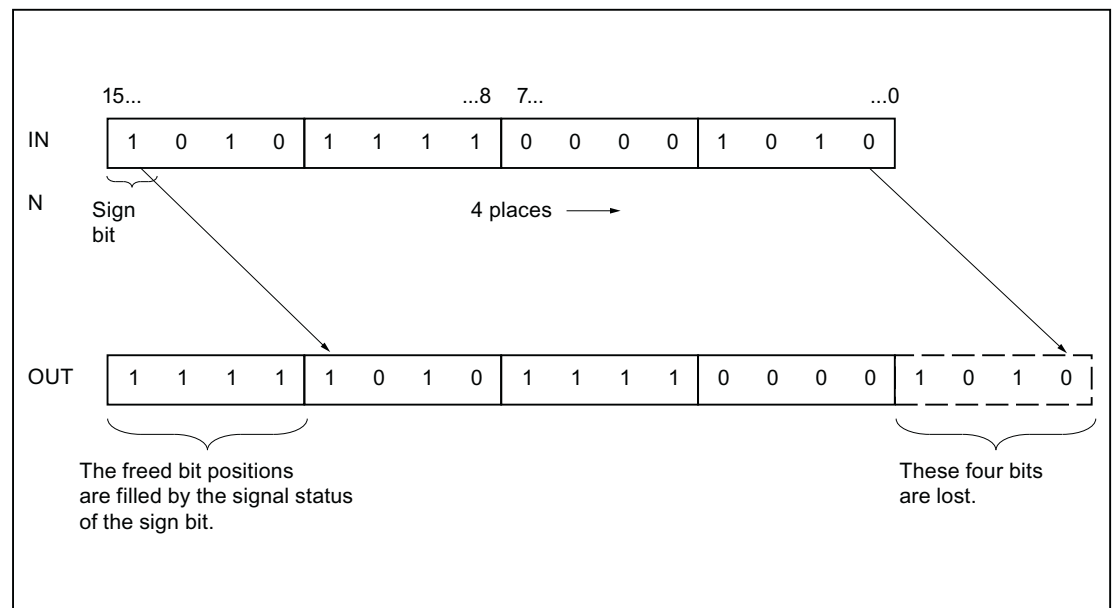

You can use the "Shift right" instruction to rotate the content of the operand at the input IN bit-by-bit to the right and query the result at the OUT output. You use the N parameter to specify the number of bit positions by which the specified value is to be shifted.

When the value at the N parameter is "0", the value at the IN input is copied to the operand at the OUT output.

When the value at the N parameter is greater than the number of available bit positions, the operand value at the IN input is shifted by the available number of bit positions to the right.

In the case of unsigned values, the freed bit positions in the left area of the operand are filled with zeroes when shifting occurs. If the specified value has a sign, the free bit positions are filled with the signal state of the sign bit.

The following figure show how the content of an operand of integer data type is shifted four bit positions to the right:

## Parameters

The following table shows the parameters of the "Shift right" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
EN	Input	BOOL	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	Enable output
IN	Input	Bit strings, integers	Bit strings, integers	I, Q, M, D, L or constant	Value to be shifted
N	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	I, Q, M, D, L or constant	Number of bit positions by which the value is shifted
OUT	Output	Bit strings, integers	Bit strings, integers	I, Q, M, D, L	Result of the instruction

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	TagIn_Value	0011 1111 1010 1111
N	Tag_Number	3
OUT	TagOut_Value	0000 0111 1111 0101

If operand "TagIn" has the signal state "1", the "Shift right" instruction is executed. The content of operand "TagIn\_Value" is shifted three bit positions to the right. The result is sent to the "TagOut\_Value" output. If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

**See also**

- Overview of the valid data types (Page 1262)

**SHL: Shift left**

**Description**

You can use the "Shift left" instruction to rotate the content of the operand at the IN input bit-by-bit to the left and query the result at the OUT output. You use the N parameter to specify the number of bit positions by which the specified value is to be shifted.

When the value at the N parameter is "0", the value at the IN input is copied to the operand at the OUT output.

When the value at the N parameter is greater than the number of available bit positions, the operand value at the IN input is shifted by the available number of bit positions to the left.

The bit positions in the right part of the operand freed by shifting are filled with zeros.

The following figure shows how the content of an operand of the WORD data type is shifted by six bit positions to the left:

## Parameters

The following table shows the parameters of the "Shift left" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
EN	Input	BOOL	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	Enable output
IN	Input	Bit strings, integers	Bit strings, integers	I, Q, M, D, L or constant	Value to be shifted
N	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	I, Q, M, D, L or constant	Number of bit positions by which the value is shifted
OUT	Output	Bit strings, integers	Bit strings, integers	I, Q, M, D, L	Result of the instruction

You can select the data type of the instruction from the "<???"> drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	TagIn_Value	0011 1111 1010 1111
N	Tag_Number	4
OUT	TagOut_Value	1111 1010 1111 0000

If operand "TagIn" has the signal state "1", the "Shift left" instruction is executed. The content of operand "TagIn\_Value" is shifted four bit positions to the left. The result is sent to the "TagOut\_Value" output. If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

**ROR: Rotate right**

**Description**

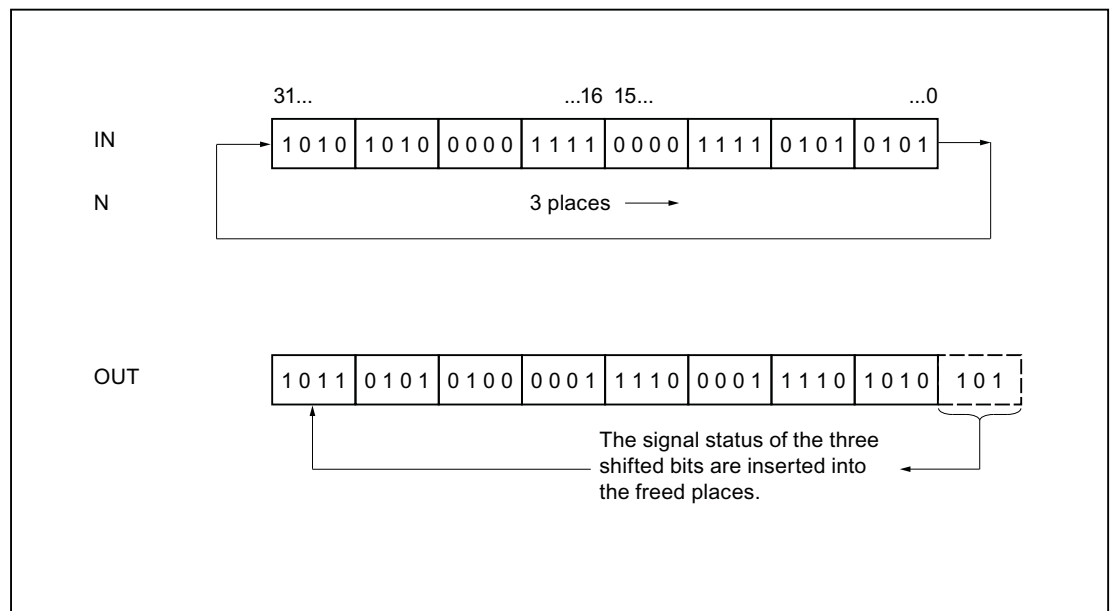

You can use the "Rotate right" instruction to rotate the content of the operand at the IN input bit-by-bit to the right and query the result at the OUT output. You use the N parameter to specify the number of bit positions by which the specified value is to be rotated. The bit positions freed by rotating are filled with the bit positions that are pushed out.

When the value at the N parameter is "0", the value at the IN input is copied to the operand at the OUT output.

When the value at the N parameter is greater than the number of available bit positions, the operand value at the IN input is nevertheless rotated by the specified number of bit positions.

The following figure shows how the content of an operand of DWORD data type is rotated three positions to the right:

## Parameters

The following table shows the parameters of the "Rotate right" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
EN	Input	BOOL	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	Enable output
IN	Input	Bit strings, integers	Bit strings, integers	I, Q, M, D, L or constant	Value to be rotated
N	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	I, Q, M, D, L or constant	Number of bit positions by which the value is rotated
OUT	Output	Bit strings, integers	Bit strings, integers	I, Q, M, D, L	Result of the instruction

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	TagIn_Value	0000 1111 1001 0101
N	Tag_Number	5
OUT	TagOut_Value	1010 1000 0111 1100

If operand "TagIn" has the signal state "1", the "Rotate right" instruction is executed. The content of operand "TagIn\_Value" is rotated five bit positions to the right. The result is sent to the "TagOut\_Value" output. If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

**See also**

- Overview of the valid data types (Page 1262)

**ROL: Rotate left**

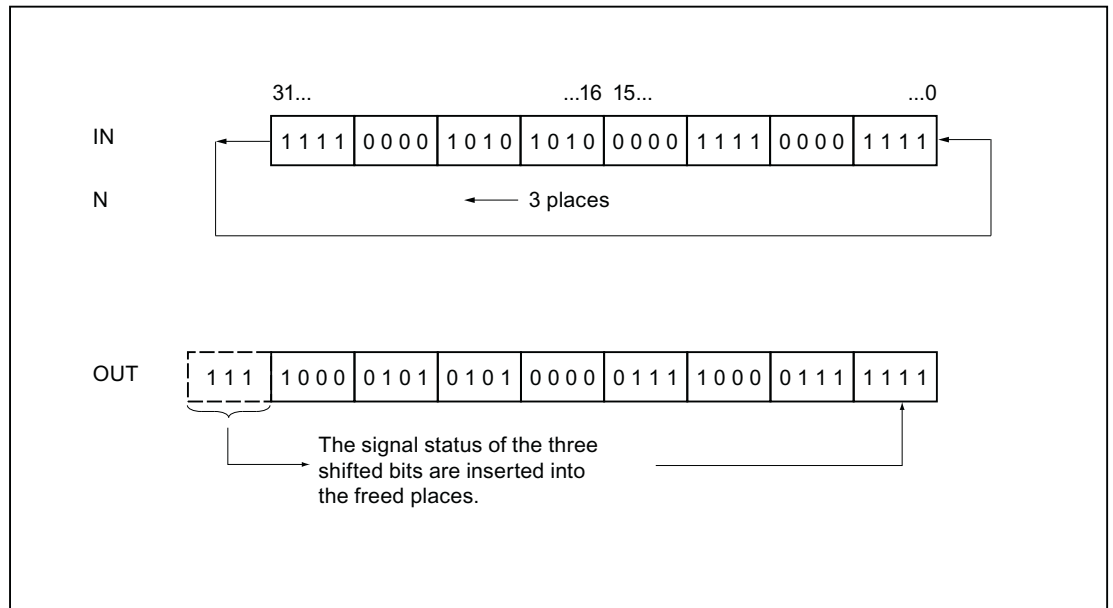

**Description**

You can use the "Rotate left" instruction to rotate the content of the operand at the IN input bit-by-bit to the left and query the result at the OUT output. You use the N parameter to specify the number of bit positions by which the specified value is to be rotated. The bit positions freed by rotating are filled with the bit positions that are pushed out.

When the value at the N parameter is "0", the value at the IN input is copied to the operand at the OUT output.

When the value at the N parameter is greater than the number of available bit positions, the operand value at the IN input is nevertheless rotated by the specified number of bit positions.

The following figure shows how the content of an operand of DWORD data type is rotated three positions to the left:

## Parameters

The following table shows the parameters of the "Rotate left" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
EN	Input	BOOL	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	Enable output
IN	Input	Bit strings, integers	Bit strings, integers	I, Q, M, D, L or constant	Value to be rotated
N	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	I, Q, M, D, L or constant	Number of bit positions by which the value is rotated
OUT	Output	Bit strings, integers	Bit strings, integers	I, Q, M, D, L	Result of the instruction

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	TagIn_Value	1010 1000 1111 0110
N	Tag_Number	5
OUT	TagOut_Value	0001 1110 1101 0101

If the "TagIn" input has the signal state "1", the "Rotate left" instruction is executed. The content of operand "TagIn\_Value" is rotated five bit positions to the left. The result is sent to the "TagOut\_Value" output. If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

**Additional instructions**

**DRUM: Implement sequencer**

**Description**

You can use the "Implement sequencer" instruction to assign the programmed values of the OUT\_VAL parameter of the corresponding step to the programmed output bits (OUT1 to OUT16) and the output word (OUT\_WORD). The specific step must thereby satisfy the conditions of the programmed enable mask on the S\_MASK parameter while the instruction remains at this step. The instruction advances to the next step if the event for the step is true and the programmed time for the current step elapses or if the value at the JOG parameter changes from "0" to "1". The instruction is reset if the signal state on the RESET parameter changes to "1". The current step is hereby equated to the preset step (DSP).

The amount of time spent on a step is determined by the product of the preset timebase (DTBP) and the preset counter value (S\_PRESET) for each step. At the start of a new step, this calculated value is loaded into the DCC parameter, which contains the time remaining for the current step. If, for example the value of the DTBP parameter is "2" and the preset value for the first step is "100" (100 ms), the DCC parameter has the value "200" (200 ms).

A step can be programmed with a timer value, an event or both. Steps that have an event bit and the timer value "0" advance to the next step as soon as the signal state of the event bit is "1". Steps that are programmed only with a timer value start the time immediately. Steps that are programmed with an event bit and a timer value greater than "0" start the time when the signal state of the event bit is "1". The event bits are initialized with a signal state of "1".

When the sequencer is on the last programmed step (LST\_STEP) and the time for this step has expired, the signal state on the Q parameter is set to "1"; otherwise it is set to "0". When the parameter Q is set, the instruction remains on the step until it is reset.

In the configurable mask (S\_MASK) you can selected the separate bits in the output word (OUT\_WORD) and set or reset the output bits (OUT1 to OUT16) by means of the output values (OUT\_VAL). If a bit of the configurable mask is in the signal state "1", the value OUT\_VAL sets or resets the corresponding bit. If the signal state of a bit of the configurable mask is "0", the corresponding bit is left unchanged. All the bits of the configurable mask for all 16 steps are initialized with a signal state of "1".

The output bit at the OUT1 parameter corresponds to the least significant bit of the output word (OUT\_WORD). The output bit at the OUT16 parameter corresponds to the most significant bit of the output word (OUT\_WORD).

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multi-instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

## Parameters

The following table shows the parameters of the "Implement sequencer" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
RESET	Input	BOOL	I, Q, M, D, L or constant	The signal state "1" indicates the reset condition.
JOG	Input	BOOL	I, Q, M, D, L or constant	When the signal state changes from "0" to "1", the instruction advances to the next step.
DRUM_EN	Input	BOOL	I, Q, M, D, L or constant	The signal state "1" causes the sequencer to advance based on the event and time criteria.
LST_STEP	Input	BYTE	I, Q, M, D, L or constant	Number of the last programmed step.

Parameter	Declaration	Data type	Memory area	Description
EVENT(i), 1 ≤ i ≤ 16	Input	BOOL	I, Q, M, D, L or constant	Event bit (i); Initial signal state is "1".
OUT(j), 1 ≤ j ≤ 16	Output	BOOL	I, Q, M, D, L	Output bit (j)
Q	Output	BOOL	I, Q, M, D, L	The signal state "1" indicates that the time for the last step has elapsed.
OUT_WORD	Output	WORD	I, Q, M, D, L, P	Word address to which the sequencer writes the output values.
ERR_CODE	Output	WORD	I, Q, M, D, L, P	Error information
JOG_HIS	Static	BOOL	I, Q, M, D, L	JOG parameter history bit
EOD	Static	BOOL	I, Q, M, D, L or constant	The signal state "1" indicates that the time for the last step has elapsed.
DSP	Static	BYTE	I, Q, M, D, L, P or constant	Preset step of the sequencer
DSC	Static	BYTE	I, Q, M, D, L, P or constant	Current step of the sequencer
DCC	Static	DWORD	I, Q, M, D, L, P or constant	Current numerical value of the sequencer
DTBP	Static	WORD	I, Q, M, D, L, P or constant	Preset timebase of the sequencer
PREV_TIME	Static	DWORD	I, Q, M, D, L or constant	Previous system time
S_PRESET	Static	ARRAY of WORD	I, Q, M, D, L or constant	Preset count for each step [1 to 16] where 1 clock pulse = 1 ms.
OUT_VAL	Static	ARRAY of BOOL	I, Q, M, D, L or constant	Output values for each step [1 to 16, 0 to 15].
S_MASK	Static	ARRAY of BOOL	I, Q, M, D, L or constant	Configurable mask for each step [1 to 16, 0 to 15]. Initial signal states are "1".

For additional information on valid data types, refer to "See also".

## Parameters ERR\_CODE

The following table shows the meaning of the values of the ERR\_CODE parameter:

ERR_CODE*	Explanation
W#16#0000	No error
W#16#000B	The value at the LST_STEP parameter is less than 1 or greater than 16.
W#16#000C	The value at the DSC parameter is less than 1 or greater than the value of the LST_STEP parameter.
W#16#000D	The value at the DSP parameter is less than 1 or greater than the value of the LST_STEP parameter.
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

## DCAT: Discrete control-timer alarm

### Description

The instruction "Discrete control-timer alarm" is used to accumulate the time from the point at which the CMD parameter issued the command to open or close. The time is accumulated until the preset time (PT) is exceeded or the information is received that the device was opened or closed (O\_FB or C\_FB) within the specified time. If the preset time is exceeded before the information on the opening or closing of the device is received, the corresponding alarm is activated. If the signal state of the command input changes state before the preset time, the time is restarted.

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multi-instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

The "Discrete control-timer alarm" instruction has the following reactions to the input conditions:

- When the signal state of the CMD parameter changes from "0" to "1", the signal states of the parameters Q, CMD\_HIS, ET (only if ET < PT), OA and CA are influenced as follows:
  - The parameters Q and CMD\_HIS are set to "1".
  - The parameters ET, OA and CA are reset to "0".
- When the signal state of the parameter CMD changes from "1" to "0", the parameters Q, ET (only if ET < PT), OA, CA and CMD\_HIS are reset to "0".

- When the signal state of the parameters CMD and CMD\_HIS is "1" and the parameter O\_FB is set to "0", the time difference (ms) since the last execution of the instruction is added to the value at the parameter ET. If the value of the parameter ET exceeds the value of the parameter PT, the signal state on the parameter OA is set to "1". If the value of the ET parameter does not exceed the value of the parameter PT, the signal state on the parameter OA is reset to "0". The value at the parameter CMD\_HIS is reset to the value of the parameter CMD.
- If the signal state of the CMD, CMD\_HIS and O\_FB parameters are set to "1" and the parameter C\_FB has the value "0", the signal state of the parameter OA is set to "0". The value of the parameter ET is set to the value of the parameter PT. If the signal state of the O\_FB parameter changes to "0", the alarm is set the next time the instruction is executed. The value of the parameter CMD\_HIS is set to the value of the parameter CMD.
- If the parameters CMD, CMD\_HIS and C\_FB have the value "0", the time difference (ms) since the last execution of the instruction is added to the value of the parameter ET. If the value of the ET parameter exceeds the value of the parameter PT, the signal state of the parameter CA is reset to "1". If the value at the parameter PT is not exceeded, the parameter CA has the signal state "0". The value of the parameter CMD\_HIS is set to the value of the parameter CMD.
- If the parameters CMD, CMD\_HIS and O\_FB have the signal state "0" and the parameter C\_FB is set to "1", the parameter CA is set to "0". The value of the parameter ET is set to the value of the parameter PT. If the signal state of the C\_FB parameter changes to "0", the alarm is set the next time the instruction is executed. The value of the parameter CMD\_HIS is set to the value of the parameter CMD.
- If the parameters O\_FB and C\_FB simultaneously have the signal state "1", the signal states of both alarm outputs are set to "1".

The "Discrete control-timer alarm" instruction returns no error information.

## Parameters

The following table shows the parameters of the "Discrete control-timer alarm" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
CMD	Input	BOOL	I, Q, M, D, L or constant	The signal state "0" indicates a "close" command. The signal state "1" indicates the "open" command.
O_FB	Input	BOOL	I, Q, M, D, L or constant	Feedback input when opening
C_FB	Input	BOOL	I, Q, M, D, L or constant	Feedback input when closing
Q	Output	BOOL	I, Q, M, D, L	Shows the status of the parameter CMD
OA	Output	BOOL	I, Q, M, D, L	Alarm output when opening

Parameter	Declaration	Data type	Memory area	Description
CA	Output	BOOL	I, Q, M, D, L	Alarm output when closing
ET	Static	DINT	D, L or constant	Currently elapsed time, where one clock pulse = 1 ms
PT	Static	DINT	D, L or constant	Preset timer value, where one clock pulse = 1 ms
PREV_TIME	Static	DWORD	D, L or constant	Previous system time
CMD_HIS	Static	BOOL	D, L or constant	CMD history bit

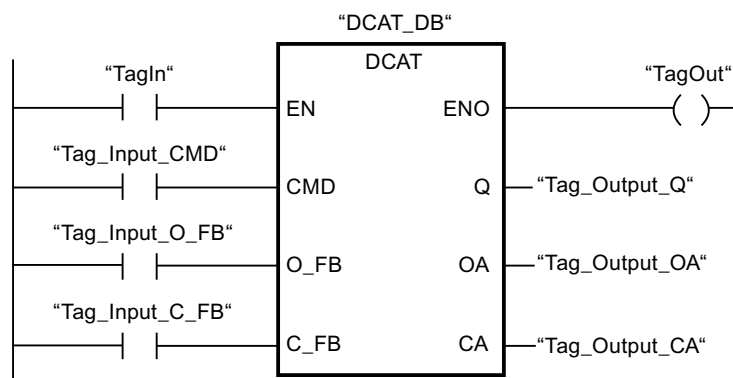

For additional information on valid data types, refer to "See also".

### Example

In the following example the parameter CMD changes from "0" to "1". After the execution of the instruction the parameter Q is set to "1" and the two alarm outputs OA and CA have the signal state "0". The parameter CMD\_HIS of the instance data block is set to the signal state "1" and the parameter ET is reset to "0".

### Note

You can initialize static parameters in the data block.

The following tables show how the instruction works using specific values.

### Before processing

In this example, the following values are used for the input and output parameters:

Parameter	Operand	Value
CMD	Tag_Input_CMD	TRUE
O_FB	Tag_Input_O_FB	FALSE
C_FB	Tag_Input_C_FB	FALSE
Q	Tag_Output_Q	FALSE
OA	Tag_Output_OA	FALSE
CA	Tag_Output_CA	FALSE

The following values are saved in the instance data block "DCAT\_DB" of the instruction:

Parameter	Address	Value
ET	DBD4	L#12
PT	DBD8	L#222
CMD_HIS	DBX16.0	FALSE

**After processing**

The following values are written to the output parameters after the instruction has been executed:

Parameter	Operand	Value
Q	Tag_Output_Q	TRUE
OA	Tag_Output_OA	FALSE
CA	Tag_Output_CA	FALSE

The following values are saved in the instance data block "DCAT\_DB" of the instruction:

Parameter	Address	Value
ET	DBD4	L#0
CMD_HIS	DBX16.0	TRUE

**See also**

**MCAT: Motor control-timer alarm**

**Description**

The instruction "Motor control-timer alarm" is used to accumulate the time from the point in time as of which one of the command inputs (open or close) is activated. The time is accumulated until the preset time is exceeded or the relevant feedback input indicates that the device has executed the requested operation within the specified time. If the preset time is exceeded before the feedback is received, the corresponding alarm is triggered.

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multi-instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

**Execution of the "Motor control-timer alarm" instruction**

The following table shows the reactions of the "Motor control-timer alarm" instruction to the various input conditions:

Input parameters								Output parameters								
ET	O_H IS	C_H IS	O_C MD	C_C MD	S_C MD	O_F B	C_F B	OO	CO	OA	CA	ET	O_H IS	C_H IS	Q	Status
X	1	1	X	X	X	X	X	0	0	1	1	PT	0	0	0	Alarm
X	X	X	X	X	X	1	1	0	0	1	1	PT	0	0	0	Alarm
X	X	X	X	X	1	X	X	0	0	0	0	X	0	0	1	Stop
X	X	X	1	1	X	X	X	0	0	0	0	X	0	0	1	Stop
X	0	X	1	0	0	X	X	1	0	0	0	0	1	0	1	Start opening
<PT	1	0	X	0	0	0	X	1	0	0	0	INC	1	0	1	Open
X	1	0	X	0	0	1	0	0	0	0	0	PT	1	0	1	Opened
>=PT	1	0	X	0	0	0	X	0	0	1	0	PT	1	0	0	Opening alarm
X	X	0	0	1	0	X	X	0	1	0	0	0	0	1	1	Start closing
<PT	0	1	0	X	0	X	0	0	1	0	0	INC	0	1	1	Close
X	0	1	0	X	0	0	1	0	0	0	0	PT	0	1	1	Closed
>=PT	0	1	0	X	0	X	0	0	0	0	1	PT	0	1	0	Closing alarm
X	0	0	0	0	0	X	X	0	0	0	0	X	0	0	1	Stopped
Legend:																
INC		Add the time difference (ms) since the last processing of the FB to ET														
PT		PT is set to the same value as ET														
X		Cannot be used														
<PT		ET < PT														
>=PT		ET >= PT														
If the input parameters O_HIS and C_HIS both have the signal state "1", they are immediately set to signal state "0". In this case, the last row in the table (X) mentioned above is valid. Because it is therefore no longer possible to check whether the input parameters O_HIS and C_HIS have the signal state "1", the output parameters are set as follows in this case:																
OO = FALSE																
CO = FALSE																
OA = FALSE																
CA = FALSE																
ET = PT																
Q = TRUE																

The "Motor control-timer alarm" instruction returns no error information.

**Parameters**

The following table shows the reactions of the "Motor control-timer alarm" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
O_CMD	Input	BOOL	I, Q, M, D, L or constant	"Open" command input
C_CMD	Input	BOOL	I, Q, M, D, L or constant	"Close" command input
S_CMD	Input	BOOL	I, Q, M, D, L or constant	"Stop" command input
O_FB	Input	BOOL	I, Q, M, D, L or constant	Feedback input when opening
C_FB	Input	BOOL	I, Q, M, D, L or constant	Feedback input when closing
OO	Output	BOOL	I, Q, M, D, L	"Open" output
CO	Output	BOOL	I, Q, M, D, L	"Close" output
OA	Output	BOOL	I, Q, M, D, L	Alarm output when opening
CA	Output	BOOL	I, Q, M, D, L	Alarm output when closing
Q	Output	BOOL	I, Q, M, D, L	The signal state "0" indicates an error condition.
ET	Static	DINT	D, L or constant	Currently elapsed time, where one clock pulse = 1 ms
PT	Static	DINT	D, L or constant	Preset timer value, where one clock pulse = 1 ms
PREV_TIME	Static	DWORD	D, L or constant	Previous system time
O_HIS	Static	BOOL	D, L or constant	"Open" history bit
C_HIS	Static	BOOL	D, L or constant	"Close" history bit

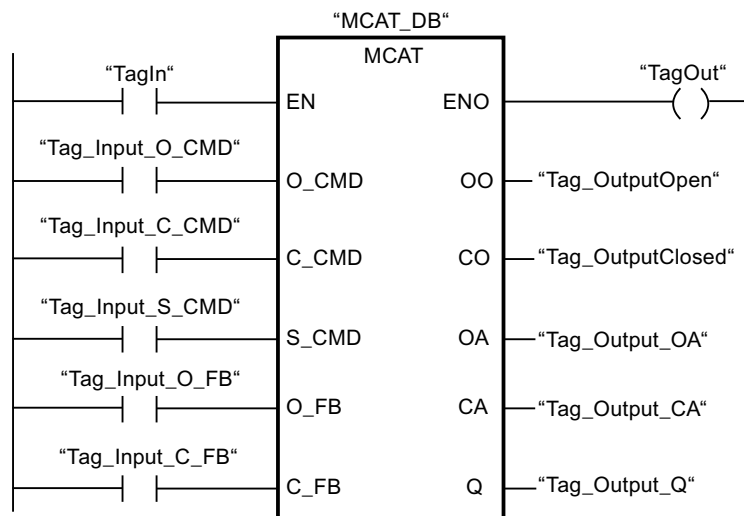

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

**Note**

You can initialize static parameters in the data block.

The following tables show how the instruction works using specific values.

#### Before processing

In this example, the following values are used for the input and output parameters:

Parameter	Operand	Value
O_CMD	Tag_Input_O_CMD	TRUE
C_CMD	Tag_Input_C_CMD	FALSE
S_CMD	Tag_Input_S_CMD	FALSE
O_FB	Tag_Input_O_FB	FALSE
C_FB	Tag_Input_C_FB	FALSE
OO	Tag_OutputOpen	FALSE
CO	Tag_OutputClosed	FALSE
OA	Tag_Output_OA	FALSE
CA	Tag_Output_CA	FALSE
Q	Tag_Output_Q	FALSE

The following values are saved in the instance data block "MCAT\_DB" of the instruction:

Parameter	Address	Value
ET	DBD4	L#2
PT	DBD8	L#22
O_HIS	DBX16.0	TRUE
C_HIS	DBX16.1	FALSE

#### After processing

The following values are written to the output parameters after the instruction has been executed:

Parameter	Operand	Value
OO	Tag_OutputOpen	TRUE
CO	Tag_OutputClosed	FALSE
OA	Tag_Output_OA	FALSE
CA	Tag_Output_CA	FALSE
Q	Tag_Output_Q	TRUE

The following values are saved in the instance data block "MCAT\_DB" of the instruction:

Parameter	Address	Value
ET	DBD4	L#0
O_HIS	DBX16.0	TRUE
CMD_HIS	DBX16.1	FALSE

**IMC: Compare input bits with the bits of a mask**

**Description**

The instruction "Compare input bits with the bits of a mask" is used to compare the signal state of up to 16 programmed input bits (IN\_BIT0 to IN\_BIT15) with the corresponding bits of a mask. Up to 16 steps with masks can be programmed. The value of the IN\_BIT0 parameter is compared with the value of the mask CMP\_VAL[x,0], with "x" indicating the step number. On the CMP\_STEP parameter, you specify the step number of the mask that is used for the comparison. All programmed values are compared in the same manner. Unprogrammed input bits or unprogrammed bits of the mask have the default signal state FALSE.

If a match is found in the comparison, the signal state of the OUT parameter is set to "1". Otherwise, the OUT parameter is set to "0".

If the value of the CMP\_STEP parameter is greater than 15, the instruction is not executed. An error message is output at the ERR\_CODE parameter.

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multi-instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

## Parameters

The following table shows the parameters of the "Compare input bits with the bits of a mask" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN_BIT0	Input	BOOL	I, Q, M, D, L or constant	Input bit 0 is compared with bit 0 of the mask.
IN_BIT1	Input	BOOL	I, Q, M, D, L or constant	Input bit 1 is compared with bit 1 of the mask.
IN_BIT2	Input	BOOL	I, Q, M, D, L or constant	Input bit 2 is compared with bit 2 of the mask.
IN_BIT3	Input	BOOL	I, Q, M, D, L or constant	Input bit 3 is compared with bit 3 of the mask.
IN_BIT4	Input	BOOL	I, Q, M, D, L or constant	Input bit 4 is compared with bit 4 of the mask.
IN_BIT5	Input	BOOL	I, Q, M, D, L or constant	Input bit 5 is compared with bit 5 of the mask.
IN_BIT6	Input	BOOL	I, Q, M, D, L or constant	Input bit 6 is compared with bit 6 of the mask.
IN_BIT7	Input	BOOL	I, Q, M, D, L or constant	Input bit 7 is compared with bit 7 of the mask.
IN_BIT8	Input	BOOL	I, Q, M, D, L or constant	Input bit 8 is compared with bit 8 of the mask.
IN_BIT9	Input	BOOL	I, Q, M, D, L or constant	Input bit 9 is compared with bit 9 of the mask.
IN_BIT10	Input	BOOL	I, Q, M, D, L or constant	Input bit 10 is compared with bit 10 of the mask.
IN_BIT11	Input	BOOL	I, Q, M, D, L or constant	Input bit 11 is compared with bit 11 of the mask.
IN_BIT12	Input	BOOL	I, Q, M, D, L or constant	Input bit 12 is compared with bit 12 of the mask.
IN_BIT13	Input	BOOL	I, Q, M, D, L or constant	Input bit 13 is compared with bit 13 of the mask.
IN_BIT14	Input	BOOL	I, Q, M, D, L or constant	Input bit 14 is compared with bit 14 of the mask.
IN_BIT15	Input	BOOL	I, Q, M, D, L or constant	Input bit 15 is compared with bit 15 of the mask.
CMP_STEP	Input	BYTE	I, Q, M, D, L, P or constant	The step number of the mask used for the comparison.
OUT	Output	BOOL	I, Q, M, D, L	The signal state "1" indicates that a match was found. The signal state "0" indicates that a match was found.

Parameter	Declaration	Data type	Memory area	Description
ERR_CODE	Output	WORD	I, Q, M, D, L, P	Error information
CMP_VAL	Static	ARRAY OF WORD	I, Q, M, D, L or constant	Comparison masks [0 to 15, 0 to 15]: The first number of the index is the step number and the second number is the bit number of the mask.

For additional information on valid data types, refer to "See also".

### Parameters ERR\_CODE

The following table shows the meaning of the values of the ERR\_CODE parameter:

Error code* (W#16#...)	Explanation
0000	No error
000A	The value at the CMP_STEP parameter is greater than 15.

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

### SMC: Compare scan matrix

#### Description

The "Compare scan matrix" instruction is used to compare the signal state of up to 16 programmed input bits (IN\_BIT0 to IN\_BIT15) with the corresponding bits of the comparison masks for each step. Processing starts at step 1 and is continued until the last programmed step (LAST) or until a match is found. The input bit of the IN\_BIT0 parameter is compared with the value of the mask CMP\_VAL[x,0], with "x" indicating the step number. All programmed values are compared in the same manner. If a match is found the signal state of the OUT parameter is set to "1" and the step number with the matching mask is written in the OUT\_STEP parameter. Unprogrammed input bits or unprogrammed bits of the mask have the default signal state FALSE. If more than one step has a matching mask, only the first one found is indicated in the OUT\_STEP parameter. If no match is found, the signal state of the OUT parameter is set to "0". In this case the value at the OUT\_STEP parameter is greater by "1" than the value of the LAST parameter.

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multi-instance) in the block interface. If you create a separate data

block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

## Parameters

The following table shows the parameters of the "Compare scan matrix" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN_BIT0	Input	BOOL	I, Q, M, D, L or constant	Input bit 0 is compared with bit 0 of the mask.
IN_BIT1	Input	BOOL	I, Q, M, D, L or constant	Input bit 1 is compared with bit 1 of the mask.
IN_BIT2	Input	BOOL	I, Q, M, D, L or constant	Input bit 2 is compared with bit 2 of the mask.
IN_BIT3	Input	BOOL	I, Q, M, D, L or constant	Input bit 3 is compared with bit 3 of the mask.
IN_BIT4	Input	BOOL	I, Q, M, D, L or constant	Input bit 4 is compared with bit 4 of the mask.
IN_BIT5	Input	BOOL	I, Q, M, D, L or constant	Input bit 5 is compared with bit 5 of the mask.
IN_BIT6	Input	BOOL	I, Q, M, D, L or constant	Input bit 6 is compared with bit 6 of the mask.
IN_BIT7	Input	BOOL	I, Q, M, D, L or constant	Input bit 7 is compared with bit 7 of the mask.
IN_BIT8	Input	BOOL	I, Q, M, D, L or constant	Input bit 8 is compared with bit 8 of the mask.
IN_BIT9	Input	BOOL	I, Q, M, D, L or constant	Input bit 9 is compared with bit 9 of the mask.
IN_BIT10	Input	BOOL	I, Q, M, D, L or constant	Input bit 10 is compared with bit 10 of the mask.
IN_BIT11	Input	BOOL	I, Q, M, D, L or constant	Input bit 11 is compared with bit 11 of the mask.
IN_BIT12	Input	BOOL	I, Q, M, D, L or constant	Input bit 12 is compared with bit 12 of the mask.
IN_BIT13	Input	BOOL	I, Q, M, D, L or constant	Input bit 13 is compared with bit 13 of the mask.
IN_BIT14	Input	BOOL	I, Q, M, D, L or constant	Input bit 14 is compared with bit 14 of the mask.
IN_BIT15	Input	BOOL	I, Q, M, D, L or constant	Input bit 15 is compared with bit 15 of the mask.
OUT	Output	BOOL	I, Q, M, D, L	The signal state "1" indicates that a match was found. The signal state "0" indicates that no match was found.
ERR_CODE	Output	WORD	I, Q, M, D, L, P	Error information

Parameter	Declaration	Data type	Memory area	Description
OUT_STEP	Output	BYTE	I, Q, M, D, L, P	Contains the step number with the matching mask or the step number which is greater by "1" than the value of the LAST parameter, provided no match is found.
LAST	Static	BYTE	I, Q, M, D, L, P or constant	Specifies the step number of the last step to be scanned for a matching mask.
CMP_VAL	Static	ARRAY OF WORD	I, Q, M, D, L or constant	Comparison masks [0 to 15, 0 to 15]: The first number of the index is the step number and the second number is the bit number of the mask.

For additional information on valid data types, refer to "See also".

### Parameters ERR\_CODE

The following table shows the meaning of the values of the ERR\_CODE parameter:

Error code* (W#16#...)	Explanation
0000	No error
000E	The value at the LAST parameter is greater than 15.

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

### See also

Basics of the EN/ENO mechanism (Page 1357)

### LEAD\_LAG: Lead and lag algorithm

#### Description

The "Lead and lag algorithm" instruction is used to process signals with an analog tag. The gain value at the GAIN parameter must be greater than zero. The result of the instruction "Lead and lag algorithm" is calculated using the following equation:

$$OUT = \left[ \frac{LG\_TIME}{LG\_TIME + SAMPLE\_T} \right] PREV\_OUT + GAIN \left[ \frac{LD\_TIME + SAMPLE\_T}{LG\_TIME + SAMPLE\_T} \right] IN - GAIN \left[ \frac{LD\_TIME}{LG\_TIME + SAMPLE\_T} \right] * PREV\_IN$$

The "Lead and lag algorithm" instruction supplies plausible results only when processing is in fixed program cycles. The same units must be specified for the LD\_TIME, LG\_TIME, and

SAMPLE\_T parameters. At  $LG\_TIME > 4 + SAMPLE\_T$ , the instruction approaches the following function:

$$OUT = GAIN * ((1 + LD\_TIME * s) / (1 + LG\_TIME * s)) * IN$$

When the value of the GAIN parameter is less than or equal to zero, the calculation is not performed and an error information is output on the ERR\_CODE parameter.

You can use the "Lead and lag algorithm" instruction in conjunction with loops as a compensator in dynamic feed-forward control. The instruction consists of two operations. The "Lead" operation shifts the phase of the OUT output so that the output leads the input. The "Lag" operation, on the other hand, shifts the output so that the output lags behind the input. Because the "Lag" operation is equivalent to an integration, it can be used as a noise suppressor or as a low-pass filter. The "Lead" operation is equivalent to a differentiation and can therefore be used as a high-pass filter. The two operations together (Lead and Lag) result in the output phase lagging behind the the input at lower frequencies and leading it at higher frequencies. This means that the "Lead and lag algorithm" instruction can be used as a band pass filter.

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

## Parameters

The following table shows the parameters of the "Lead and lag algorithm" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	REAL	I, Q, M, D, L, P or constant	The input value of the current sample time (cycle time) to be processed. Constants can also be specified on the IN parameter.
SAMPLE_T	Input	INT	I, Q, M, D, L, P or constant	Sample time Constants can also be specified on the SAMPLE_T parameter.
OUT	Output	REAL	I, Q, M, D, L	Result of the instruction
ERR_CODE	Output	WORD	I, Q, M, D, L	Error information
LD_TIME	Static	REAL	I, Q, M, D, L, P or constant	Lead time in the same unit as sample time.

Parameter	Declaration	Data type	Memory area	Description
LG_TIME	Static	REAL	I, Q, M, D, L, P or constant	Lag time in in the same unit as sample time.
GAIN	Static	REAL	I, Q, M, D, L, P or constant	Gain as % / % (the ratio of the change in output to a change in input as a steady state).
PREV_IN	Static	REAL	I, Q, M, D, L, P or constant	Previous input
PREV_OUT	Static	REAL	I, Q, M, D, L, P or constant	Previous output

For additional information on valid data types, refer to "See also".

### Parameter ERR\_CODE

The following table shows the meaning of the values of the ERR\_CODE parameter:

Error code* (W#16#...)	Explanation
0000	No error
0009	The value at the GAIN parameter is less than or equal to zero.

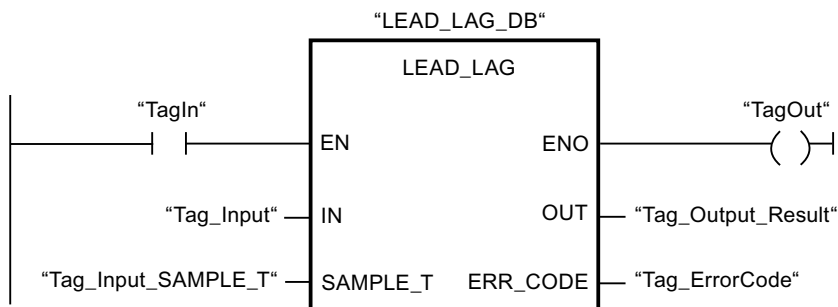

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For additional information on toggling display formats, refer to "See also".

### Example

The following example shows how the instruction works:

#### Note

You can initialize static parameters in the data block.

The following table shows how the instruction works using specific operand values:

#### Before processing

In this example the following values are used for the input parameters:

Parameter	Operand	Value
IN	Tag_Input	2.0
SAMPLE_T	Tag_InputSampleTime	10

The following values are saved in the instance data block "LEAD\_LAG\_DB" of the instruction:

Parameter	Address	Value
LD_TIME	DBD12	2.0
LG_TIME	DBD16	2.0
GAIN	DBD20	1.0
PREV_IN	DBD24	6.0
PREV_OUT	DBD28	6.0

#### After processing

The following values are written to the output parameters after the instruction has been executed:

Parameter	Operand	Value
OUT	Tag_Output_Result	2.0

The following values are saved in the instance data block "LEAD\_LAD\_DB" of the instruction:

Parameter	Operand	Value
PREV_IN	DBD24	2.0
PREV_OUT	DBD28	2.0

### SEG: Create bit pattern for seven-segment display

#### Description

The instruction "Create bit pattern for seven-segment display" is used to convert each of the four hexadecimal digits of the specified source word (IN) into an equivalent bit pattern for a seven-segment display. The result of the instruction is output in the double word on the OUT parameter.

The following relation exists between the hexadecimal digits and the assignment of the 7 segments (a, b, c, d, e, f, g):

Input digit (Binary)	Assignment of the segments - g f e d c b a	Display (Hexadecimal)	Seven-segment display
0000	00111111	0	
0001	00000110	1	
0010	01011011	2	
0011	01001111	3	
0100	01100110	4	
0101	01101101	5	
0110	01111101	6	
0111	00000111	7	
1000	01111111	8	
1001	01100111	9	
1010	01110111	A	
1011	01111100	B	
1100	00111001	C	
1101	01011110	D	
1110	01111001	E	
1111	01110001	F	

**Parameter**

The following table shows the parameters of the "Create bit pattern for seven-segment display" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	WORD	I, Q, M, D, L, P or constant	Source word with four hexadecimal digits
OUT	Output	DWORD	I, Q, M, D, L, P	Bit pattern for the seven-segment display

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value	
Hexadecimal	Binary		
IN	Tag_Input	W#16#1234	0001 0010 0011 0100
OUT	Tag_Output	DW#16065B4F66	000 00110 0101 1011 0100 1111 0110 0110 Display: 1234

## BCDCPL: Create tens complement

### Description

You can use the "Create tens complement" instruction to create the tens complement of a seven-digit BCD number specified in the IN parameter. This instruction uses the following mathematical formula to calculate:

10000000 (as BCD)

– 7-digit BCD value

-----

Tens complement (as BCD)

### Parameters

The following table shows the parameters of the "Create tens complement" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output

Parameter	Declaration	Data type	Memory area	Description
IN	Input	Bit strings	I, Q, M, D, L, P or constant	7-digit BCD number
ERR_CODE	Output	DWORD	I, Q, M, D, L, P	Result of the instruction

**Example**

The following example shows how the instruction works:

The following table shows how the instruction functions using specific values:

Parameter	Operand	Value*
IN	Tag_Input	DW#16#01234567
ERR_CODE	Tag_Output	DW#16#08765433

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

**See also**

**BITSUM: Count number of set bits**

**Description**

The "Count number of set bits" instruction is used to count the number of bits of an operand that is set to the signal state "1". The operand whose bits are to be counted is specified on the IN parameter. The result of the instruction is output on the RET\_VAL parameter.

**Parameters**

The following table shows the parameters of the "Count number of set bits" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output

Parameter	Declaration	Data type	Memory area	Description
IN	Input	DWORD	I, Q, M, D, L, P or constant	Operand whose set bits are counted
RET_VAL	Output	INT	I, Q, M, D, L, P	Number of bits to be set

## Example

The following example shows how the instruction works:

The following table shows how the instruction functions using specific values:

Parameter	Operand	Value*
IN	Tag_Input	DW#16#12345678
RET_VAL	Tag_Output	W#16#000D (13 Bits)

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For additional information on toggling display formats, refer to "See also".

### 9.7.2.2 FBD

## Bit logic operations

### &: AND logic operation

## Description

You can use the instruction "AND logic operation" to query the signal states of two or more specified operands and evaluate them according to the AND truth table.

If the signal state of all the operands is "1", then the condition is fulfilled and the instruction returns the result "1". If the signal state of one of the operands is "0", then the condition is not fulfilled and the instruction generates the result "0".

**Parameters**

The following table shows the parameters of the instruction "AND logic operation":

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
<Operand>	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	The operand indicates the bit whose signal state will be queried.

**Example**

The following example shows how the instruction works:

Output "TagOut" is set, when the signal state of the operands "TagIn\_1" and "TagIn\_2" is "1" and reset when the state of the operands "TagIn\_1" and "TagIn\_2" is "0".

**See also**

- Adding additional inputs and outputs to FBD elements (Page 1527)
- Insert input (Page 2078)

**AND truth table**

**Results of the logic operation**

The following table shows the results that arise from the AND logic operation of two operands:

Signal state of the first operand	Signal state of the second operand	Result of the logic operation
1	1	1
0	1	0

Signal state of the first operand	Signal state of the second operand	Result of the logic operation
1	0	0
0	0	0

## See also

&: AND logic operation (Page 2073)

Overview of the valid data types (Page 1262)

## >=1: OR logic operation

### Description

You can use the instruction "OR logic operation" to query the signal states of two or more specified operands and evaluate them according to the OR truth table.

If the signal state of one of the operands is "1", then the condition is fulfilled and the instruction returns the result "1". If the signal state of all the operands is "0", then the condition is not fulfilled and the instruction generates the result "0".

### Parameters

The following table shows the parameters of the instruction "OR logic operation":

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
<Operand>	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	The operand indicates the bit whose signal state will be queried.

### Example

The following example shows how the instruction works:

Output "TagOut" is set, when the signal state of the operands "TagIn\_1" or "TagIn\_2" is "1".

**See also**

- OR truth table (Page 2076)

- Overview of the valid data types (Page 1262)
- Insert input (Page 2078)

**OR truth table**

**Results of the logic operation**

The following table shows the results that arise from the OR logic operation of two operands:

Signal state of the first operand	Signal state of the second operand	Result of the logic operation
1	0	1
0	1	1
1	1	1
0	0	0

**See also**

- >=1: OR logic operation (Page 2075)
- Overview of the valid data types (Page 1262)

**X: EXCLUSIVE OR logic operation**

**Description**

You can use the instruction "EXCLUSIVE OR logic operation" to query the result of a signal state query according to the EXCLUSIVE OR truth table.

With an instruction "EXCLUSIVE OR logic operation", the signal state is "1" when the signal state of one of the two specified operands is "1". When more than two operands are queried, the common RLO is "1" if an odd number of the queried operands returns the result "1".

## Parameters

The following table shows the parameters of the instruction "EXCLUSIVE OR logic operation":

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
<Operand>	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	The operand indicates the bit whose signal state will be queried.

## Example

The following example shows how the instruction works:

Output "TagOut" is set when the signal state of the operands "TagIn\_1" and "TagIn\_2" is "1". When both operands return the signal state "1" or "0", the output "TagOut" is reset.

Insert input (Page 2078)

## EXCLUSIVE OR truth table

### Results of the logic operation

The following table shows the results that arise from the EXCLUSIVE OR logic operation of two operands:

Signal state of the first operand	Signal state of the second operand	Result of the logic operation
1	0	1
0	1	1
1	1	0
0	0	0

The following table shows the results that arise from the EXCLUSIVE OR logic operation of three operands:

Signal state of the first operand	Signal state of the second operand	Signal state of the third operand	Result of the logic operation
1	0	0	1
0	1	1	0
0	1	0	1
1	0	1	0
0	0	1	1
1	1	0	0
1	1	1	1
0	0	0	0

**See also**

X: EXCLUSIVE OR logic operation (Page 2076)

Overview of the valid data types (Page 1262)

**Insert input**

**Description**

The "Insert input" instruction is used to add an input to the box of one of the following instructions:

- "AND logic operation"
- "OR logic operation"
- "EXCLUSIVE OR logic operation"

You can query the signal state of several operands by the extension of an instruction box.

**Parameters**

The following table shows the parameters of the instruction "Insert input":

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
<Operand>	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	The operand indicates the bit whose signal state will be queried.

## Example

The following example shows how the instruction works:

The box of the instruction "AND logic operation" was extended by an additional input at which the signal state of the operand "TagIn\_3" is queried. The output "TagOut" is set, when the signal state of the operands "TagIn\_1", "TagIn\_2" and "TagIn\_3" returns the signal state "1".

Overview of the valid data types (Page 1262)

## Invert RLO

## Description

You use the "Invert RLO" instruction to invert the signal state of the result of logic operation (RLO).

## Example

The following example shows how the instruction works:

The output "TagOut" is set when the following conditions are fulfilled:

- The input "TagIn\_1" and/or "TagIn\_2" has signal state "0".
- The input "TagIn\_3" and/or "TagIn\_4" has signal state "0" or the input "TagIn\_5" has signal state "1".

## See also

Overview of the valid data types (Page 1262)

## =: Assignment

### Description

You can use the instruction "Assignment" to set the bit of a specified operand. If the result of logic operation (RLO) at the box input has the signal state "1", the specified operand is set to signal state "1". If the signal state at the box input is "0", the bit of the specified operand is reset to "0".

The instruction does not influence the RLO. The RLO at the box input is assigned directly to the operand above the assignment box.

### Parameters

The following table shows the parameters of the instruction "Assignment":

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Output	BOOL	I, Q, M, D, L	Operand to which the RLO is assigned.

### Example

The following example shows how the instruction works:

The operand "TagOut" is set at the output of the "Assignment" instruction when one of the following conditions is fulfilled:

- The inputs "TagIn\_1" and "TagIn\_2" have the signal state "1".
- The signal state at the input "TagIn\_3" is "0".

### See also

Overview of the valid data types (Page 1262)

Example of detecting the fill level of a storage area (Page 1784)

Example of controlling room temperature (Page 1787)

## /=: Negate assignment

### Description

The instruction "Negate assignment" inverts the result of logic operation (RLO) and assigns this to the operand above the box. If the RLO at the input of the box is "1", the binary operand is reset. If the RLO at the input of the box is "0", the operand is set to signal state "1".

### Parameters

The following table shows the parameters of the instruction "Negate assignment":

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Output	BOOL	I, Q, M, D, L	Operand to which the negated RLO is assigned.

### Example

The following example shows how the instruction works:

The operand "TagOut" is reset when the following conditions are fulfilled:

- The operand "TagIn\_1" or "TagIn\_2" has the signal state "1".
- The operand "TagIn\_3" has the signal state "0".

### See also

Overview of the valid data types (Page 1262)

## R: Reset output

### Description

You can use the "Reset output" instruction to reset the signal state of a specified operand to "0".

The instruction is only executed if the result of logic operation (RLO) at the box input is "1". If the box input has the signal state "1", the specified operand is reset to "0". If there is an RLO of "0" at the box input, the signal state of the specified operand remains unchanged.

**Parameters**

The following table shows the parameters of the "Reset output" instruction:

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
<Operand>	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Operand that is reset if RLO = "1".

**Example**

The following example shows how the instruction works:

Operand "TagOut" is reset when one of the following conditions is fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The operand "TagIn\_3" has the signal state "0".

**See also**

- Example of controlling a conveyor belt (Page 1782)
- Example of detecting the direction of a conveyor belt (Page 1783)
- Overview of the valid data types (Page 1262)

**S: Set output**

**Description**

You can use the instruction "Set output" to set the signal state of a specified operand to "1". The instruction is only executed if the result of logic operation (RLO) at the box input is "1". If the box input has the signal state "1", the specified operand is set to "1". If there is an RLO of "0" at the box input, the signal state of the specified operand remains unchanged.

## Parameters

The following table shows the parameters of the instruction "Set output":

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Output	BOOL	I, Q, M, D, L	Operand which is set with RLO = "1".

## Example

The following example shows how the instruction works:

The "TagOut" operand is set when one of the following conditions is fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The operand "TagIn\_3" has the signal state "0".

## See also

Overview of the valid data types (Page 1262)

## SET\_BF: Set bit field

### Description

You can use the instruction "Set bit field" to set multiple bits starting from a certain address.

You can use the input N to define the number of bits to be set. The address of the first bit to be set is defined by (<Operand>). If the value of the N input is greater than the number of bits in a selected byte, the bits of the next byte are set. The bits remain set until they are explicitly reset, for example, by another instruction.

### Parameters

The following table shows the parameters of the instruction "Set bit field":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
N	Input	UINT	Constant	Constant	Number of bits to be set
<Operand>	Output	BOOL	I, Q, M In the case of a DB or an IDB, an element of an ARRAY[..] of BOOL	I, Q, M In the case of a DB or an IDB, an element of an ARRAY[..] of BOOL	Pointer to the first bit to be set.

### Example

The following example shows how the instruction works:

If the operands "TagIn\_1" and "TagIn\_2" have the signal state "1", 5 bits are set starting at the address of the operand "MyDB".MyBoolArray[4].

### See also

Overview of the valid data types (Page 1262)

### RESET\_BF: Reset bit field

#### Description

You can use the instruction "Reset bit field" to reset several bits starting from a certain address.

You can use the value of the N input to define the number of bits to be reset. The address of the first bit to be reset is defined by (<Operand>). If the value of the input N is greater than the number of bits in a selected byte, the bits of the next byte are reset. The bits remain reset until they are explicitly set, for example, by another instruction.

## Parameters

The following table shows the parameters of the instruction "Reset bit field":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
N	Input	UINT	Constant	Constant	Number of bits to be reset.
<Operand>	Output	BOOL	I, Q, M In the case of a DB or an IDB, an element of an ARRAY[..] of BOOL	I, Q, M In the case of a DB or an IDB, an element of an ARRAY[..] of BOOL	Pointer to the first bit to be reset.

## Example

The following example shows how the instruction works:

If the operands "TagIn\_1" and "TagIn\_2" have the signal state "1", 5 bits are reset starting at the address of the operand "MyDB".MyBoolArray[4].

## See also

Overview of the valid data types (Page 1262)

## SR: Set/reset flip-flop

### Description

You can use the instruction "Set/reset flip-flop" to set or reset the bit of a specified operand based on the signal state of the inputs S and R1. If the signal state is "1" at input S and "0" at input R1, the specified operand is set to "1". If the signal state is "0" at input S and "1" at input R1, the specified operand will be reset to "0".

Input R1 takes priority over input S. When the signal state is "1" on both inputs S and R1, the signal state of the specified operand is reset to "0".

The instruction is not executed if the signal state at the two inputs S and R1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

**Parameters**

The following table shows the parameters of the instruction "Set/reset flip-flop":

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
S	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable setting
R1	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable resetting
<Operand>	InOut	BOOL	I, Q, M, D, L	I, Q, M, D, L	Operand that is set or reset
Q	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Signal state of the operand

**Example**

The following example shows how the instruction works:

The operands "TagSR" and "TagOut" are set when the following conditions are fulfilled:

- The operand "TagIn\_1" has the signal state "1".
- The operand "TagIn\_2" has the signal state "0".

The operands "TagSR" and "TagOut" are reset when one of the following conditions is fulfilled:

- The operand "TagIn\_1" has signal state "0" and the operand "TagIn\_2" has signal state "1".
- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".

**See also**

Overview of the valid data types (Page 1262)

## RS: Reset/set flip-flop

### Description

You can use the instruction "Reset/set flip-flop" to reset or set the bit of a specified operand based on the signal state of the inputs R and S1. If the signal state is "1" at input R and "0" at input S1, the specified operand will be reset to "0". If the signal state is "0" at input R and "1" at input S1, the specified operand is set to "1".

Input S1 takes priority over input R. When the signal state is "1" at both inputs R and S1, the signal state of the specified operand is set to "1".

The instruction is not executed if the signal state at the two inputs R and S1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

### Parameters

The following table shows the parameters of the instruction "Reset/set flip-flop":

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
R	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable resetting
S1	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable setting
<Operand>	InOut	BOOL	I, Q, M, D, L	I, Q, M, D, L	Operand that is reset or set.
Q	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Signal state of the operand

### Example

The following example shows how the instruction works:

The operands "TagRS" and "TagOut" are reset when the following conditions are fulfilled:

- The operand "TagIn\_1" has the signal state "1".
- The operand "TagIn\_2" has the signal state "0".

The operands "TagRS" and "TagOut" are set when the following conditions are fulfilled:

- The operand "TagIn\_1" has signal state "0" and the operand "TagIn\_2" has signal state "1".
- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".

**See also**

Overview of the valid data types (Page 1262)

**P: Scan operand for positive signal edge**

**Description**

You can use the instruction "Scan operand for positive signal edge" to determine whether there is a "0" to "1" change in the signal state of a specified operand (<Operand1>). The instruction compares the current signal state of <Operand1> with the signal state of the previous scan, which is saved in an edge memory bit (<Operand2>). If the instruction detects a change in the result of logic operation (RLO) from "0" to "1", there is a positive, rising edge.

If a rising edge is detected, the output of the instruction has the signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Specify the operand to be queried (<Operand1>) in the operand placeholder above the instruction. Specify the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

---

**Note**

The address of the edge memory bit must not be used more than once in the program, otherwise the memory bit is overwritten. This would influence edge evaluation and the result would no longer be unequivocal. The memory area of the edge memory bit has to be located in a DB (static area for FB) or in the bit memory area.

---

**Parameters**

The following table shows the parameters of the "Scan operand for positive signal edge" instruction:

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
<Operand1>	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Signal to be scanned
<Operand2>	InOut	BOOL	I, Q, M, D, L	I, Q, M, D, L	Edge memory bit in which the signal state of the previous query is saved.

## Example

The following example shows how the instruction works:

Output "TagOut" is set when the following conditions are fulfilled:

- There is a rising edge at input "TagIn\_1".
- The signal state of the operand "TagIn\_2" is "1".

## See also

Overview of the valid data types (Page 1262)

Example of detecting the direction of a conveyor belt (Page 1783)

## N: Scan operand for negative signal edge

### Description

You can use the instruction "Scan operand for negative signal edge" to determine whether there is a "1" to "0" change in the signal state of a specified operand (<Operand1>). The instruction compares the current signal state of <Operand1> with the signal state of the previous scan, which is saved in an edge memory bit (<Operand2>). If the instruction detects a change in the result of logic operation (RLO) from "1" to "0", there is a negative, falling edge.

If a falling edge is detected, the output of the instruction has the signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Specify the operand to be queried (<Operand1>) in the operand placeholder above the instruction. Specify the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

---

#### Note

The address of the edge memory bit must not be used more than once in the program, otherwise the memory bit is overwritten. This would influence edge evaluation and the result would no longer be unequivocal. The memory area of the edge memory bit has to be located in a DB (static area for FB) or in the bit memory area.

---

### Parameters

The following table shows the parameters of the "Scan operand for negative signal edge" instruction:

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
<Operand1>	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Signal to be scanned
<Operand2>	InOut	BOOL	I, Q, M, D, L	I, Q, M, D, L	Edge memory bit in which the signal state of the previous query is saved.

### Example

The following example shows how the instruction works:

Output "TagOut" is set when the following conditions are fulfilled:

- There is a falling edge at input "TagIn\_1".
- The signal state of the operand "TagIn\_2" is "1".

### See also

Overview of the valid data types (Page 1262)

### P=: Set operand on positive signal edge

#### Description

You can use the instruction "Set operand on positive signal edge" to set a specified operand (<Operand2>) when there is a "0" to "1" change in the result of logic operation (RLO). The instruction compares the current RLO with the RLO from the previous query, which is saved in the edge memory bit (<Operand1>). If the instruction detects a change in the result of logic operation (RLO) from "0" to "1", there is a positive, rising edge.

When a positive edge is detected, <Operand2> is set to signal state "1" for one program cycle. In all other cases, the operand has the signal state "0".

You specify the operand (<Operand2>) to be set in the operand placeholder above the instruction. Specify the edge memory bit (<Operand1>) in the operand placeholder below the instruction.

### Note

The address of the edge memory bit must not be used more than once in the program, otherwise the memory bit is overwritten. This would influence edge evaluation and the result would no longer be unequivocal. The memory area of the edge memory bit has to be located in a DB (static area for FB) or in the bit memory area.

## Parameters

The following table shows the parameters of the instruction "Set operand on positive signal edge":

Parameter	Declaration	Data type	Memory area	Description
<Operand2>	Output	BOOL	I, Q, M, D, L	Operand which is set when there is a positive signal edge.
<Operand1>	InOut	BOOL	I, Q, M, D, L	Edge memory bit

## Example

The following example shows the parameters of the instruction:

The "TagOut" output is set for one program cycle, when the signal state at the input of the instruction box switches from "0" to "1" (positive signal edge). In all other cases, the "TagOut" output has signal state "0".

## See also

Overview of the valid data types (Page 1262)

## N=: Set operand on negative signal edge

### Description

You can use the instruction "Set operand on negative signal edge" to set a specified operand (<Operand1>) when there is a "1" to "0" change in the result of logic operation (RLO). The instruction compares the current RLO with the RLO from the previous query, which is saved

in the edge memory bit (<Operand2>). If the instruction detects a change in the result of logic operation (RLO) from "1" to "0", there is a negative, falling edge.

When a negative edge is detected, <Operand1> is set to signal state "1" for one program cycle. In all other cases, the operand has the signal state "0".

You specify the operand (<Operand1>) to be set in the operand placeholder above the instruction. Specify the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

**Note**

The address of the edge memory bit must not be used more than once in the program, otherwise the memory bit is overwritten. This would influence edge evaluation and the result would no longer be unequivocal. The memory area of the edge memory bit has to be located in a DB (static area for FB) or in the bit memory area.

**Parameters**

The following table shows the parameters of the instruction "Set operand on negative signal edge":

Parameter	Declaration	Data type	Memory area	Description
<Operand1>	Output	BOOL	I, Q, M, D, L	Operand which is set when there is a negative signal edge.
<Operand2>	InOut	BOOL	I, Q, M, D, L	Edge memory bit

**Example**

The following example shows how the instruction works:

The operand "TagOut" is set for one program cycle if the signal state at the input of the instruction box changes from "1" to "0" (negative signal edge). In all other cases, the operand "TagOut" has the signal state "0".

**See also**

Overview of the valid data types (Page 1262)

## P\_TRIG: Scan RLO for positive signal edge

### Description

Use the instruction "Scan RLO for positive signal edge" to query a "0" to "1" change in the signal state of the result of logic operation (RLO). The instruction compares the current signal state of the RLO with the signal state of the previous query, which is saved in an edge memory bit (<Operand>). If the instruction detects a change in the result of logic operation (RLO) from "0" to "1", there is a positive, rising edge.

If a rising edge is detected, the output of the instruction has the signal state "1". In all other cases, the signal state at the output of the instruction is "0".

### Note

The address of the edge memory bit must not be used more than once in the program, otherwise the memory bit is overwritten. This would influence edge evaluation and the result would no longer be unequivocal. The memory area of the edge memory bit has to be located in a DB (static area for FB) or in the bit memory area.

### Parameters

The following table shows the parameters of the instruction "Scan RLO for positive signal edge":

Parameter	Declaration	Data type	Memory area	Description
CLK	Input	BOOL	I, Q, M, D, L	Current RLO
<Operand>	InOut	BOOL	M, D	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	I, Q, M, D, L	Result of edge evaluation

### Example

The following example shows how the instruction works:

The RLO of the preceding bit logic operation is saved in the edge memory bit "Tag\_M". If a "0" to "1" change is detected in the signal state of the RLO, the program jumps to jump label CAS1.

**See also**

Overview of the valid data types (Page 1262)

**N\_TRIG: Scan RLO for negative signal edge**

**Description**

Use the instruction "Scan RLO for negative signal edge" to query a "1" to "0" change in the signal state of the result of logic operation (RLO). The instruction compares the current signal state of the RLO with the signal state of the previous query saved in the edge memory bit (<Operand>). If the instruction detects a change in the result of logic operation (RLO) from "1" to "0", there is a negative, falling edge.

If a falling edge is detected, the output of the instruction has the signal state "1". In all other cases, the signal state at the output of the instruction is "0".

**Note**

The address of the edge memory bit must not be used more than once in the program, otherwise the memory bit is overwritten. This would influence edge evaluation and the result would no longer be unequivocal. The memory area of the edge memory bit has to be located in a DB (static area for FB) or in the bit memory area.

**Parameters**

The following table shows the parameters of the instruction "Scan RLO for negative signal edge":

Parameter	Declaration	Data type	Memory area	Description
CLK	Input	BOOL	I, Q, M, D, L	Current RLO
<Operand>	InOut	BOOL	M, D	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	I, Q, M, D, L	Result of edge evaluation

**Example**

The following example shows how the instruction works:

The RLO of the preceding bit logic operation is saved in the edge memory bit "Tag\_M". If a "1" to "0" change is detected in the signal state of the RLO, the program jumps to jump label CAS1.

## See also

Overview of the valid data types (Page 1262)

## R\_TRIG: Set tag on positive signal edge

### Description

You can use the "Set tag on positive signal edge" instruction to set a specified tag in the instance DB when there is a "0" to "1" change in the result of logic operation (RLO). The instruction compares the current RLO at the input CLK with the RLO from the previous query, which is saved in the specified instance DB. If the instruction detects a change in the result of logic operation (RLO) from "0" to "1", there is a positive, rising edge.

If a positive edge is detected, the tag in the instance DB is set to signal state "1" and the output Q returns the signal state "1" In all other cases, the signal state at the output of the instruction is "0".

When you insert the instruction in the program, the "Call options" dialog opens automatically. In this dialog you can specify whether the edge memory bit is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find this in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

### Parameters

The following table shows the parameters of the instruction "Set tag on positive signal edge":

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
CLK	Input	BOOL	I, Q, M, D, L or constant	I, Q, M, D, L, T, C or constant	Incoming signal, the edge of which is to be queried.
Q	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Result of edge evaluation

**Example**

The following example shows how the instruction works:

The RLO of the preceding query is saved in the instance DB "R\_TRIG\_DB". If a change in the signal state of the RLO from "0" to "1" is detected in the operands "TagIn\_1" and "TagIn\_2" or in the operand "TagIn\_3", the output "TagOut" has signal state "1".

**See also**

Overview of the valid data types (Page 1262)

**F\_TRIG: Set tag on negative signal edge**

**Description**

You can use the "Set tag on negative signal edge" instruction to set a specified tag in the instance DB when there is a "1" to "0" change in the result of logic operation (RLO). The instruction compares the current RLO at the input CLK with the RLO from the previous query, which is saved in the specified instance DB. If the instruction detects a change in the result of logic operation (RLO) from "1" to "0", there is a negative, falling edge.

If a negative edge is detected, the tag in the instance DB is set to signal state "1" and the output Q returns the signal state "1" In all other cases, the signal state at the output of the instruction is "0".

When you insert the instruction in the program, the "Call options" dialog opens automatically. In this dialog you can specify whether the edge memory bit is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find this in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

**Parameters**

The following table shows the parameters of the instruction "Set tag on negative signal edge":

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
CLK	Input	BOOL	I, Q, M, D, L or constant	I, Q, M, D, L, T, C or constant	Incoming signal, the edge of which is to be queried.
Q	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Result of edge evaluation

## Example

The following example shows how the instruction works:

The RLO of the preceding query is saved in the instance DB "F\_TRIG\_DB". If a change in the signal state of the RLO from "1" to "0" is detected in the operands "TagIn\_1" and "TagIn\_2" or in the operand "TagIn\_3", the output "TagOut" has signal state "1".

Overview of the valid data types (Page 1262)

## Timer operations

### IEC Timers

#### TP: Generate pulse

## Description

You can use the instruction "Generate pulse" to set output Q for the duration PT. The instruction is started when the result of logic operation (RLO) at input IN changes from "0" to "1" (positive signal edge). The configured time duration PT begins when the instruction starts. Output Q is set for the time duration PT, regardless of the subsequent course of the input signal (positive edge). Even when a new positive signal edge is detected, the signal state of the Q output is not affected as long as the PT duration is running.

The current time value can be queried at the output ET. The time value starts at T#0s and ends when the value of the time duration PT is reached. If the configured time duration PT is reached and the signal state at input IN is "0", the ET output is reset.

Each call of the "Generate pulse" instruction must be assigned an IEC Timer in which the instruction data is stored.

---

**Note**

If the timer is not called in the program because it is skipped, for example, output ET returns a constant value as soon as the timer has expired.

---

### For S7-1200 CPU

An IEC Timer is a structure of the data type IEC\_TIMER or TP\_TIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TP\_TIME or IEC\_TIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

### For S7-1500 CPU

An IEC Timer is a structure of the data type IEC\_TIMER, IEC\_LTIMER, TP\_TIME or TP\_LTIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER or IEC\_LTIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TP\_TIME, TP\_LTIME, IEC\_TIMER or IEC\_LTIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC Timer is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find this in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

The instruction data is updated both when the instruction is called and also each time the outputs Q or ET are accessed.

The execution of the "Generate pulse" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

## Parameters

The following table shows the parameters of the "Generate pulse" instruction:

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
IN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C, P	Start input
PT	Input	TIME	TIME, LTIME	I, Q, M, D, L or constant	I, Q, M, D, L, P or constant	Duration of the pulse. The value of the PT parameter must be positive.
Q	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, P	Pulse output
ET	Output	TIME	TIME, LTIME	I, Q, M, D, L	I, Q, M, D, L, P	Current time value

For additional information on valid data types, refer to "See also".

Example of controlling room temperature (Page 1787)

## TON: Generate on-delay

### Description

You can use the instruction "Generate on-delay" to delay setting of the Q output by the time configured with the PT time. The instruction is started when the result of logic operation (RLO) at input IN changes from "0" to "1" (positive signal edge). The programmed time PT begins when the instruction starts. When the duration PT expires, output Q has the signal state "1". Output Q remains set as long as the start input is still "1". When the signal state at the start input changes from "1" to "0", the Q output is reset. The timer function is started again when a new positive signal edge is detected at the start input.

The current time value can be queried at the output ET. The time value starts at T#0s and ends when the value of the time duration PT is reached. The ET output is reset as soon as the signal state at the IN input changes to "0".

Each call of the "Generate on-delay" instruction must be assigned an IEC Timer in which the instruction data is stored.

---

#### Note

If the timer is not called in the program because it is skipped, for example, output ET returns a constant value as soon as the timer has expired.

---

### For S7-1200 CPU

An IEC Timer is a structure of the data type IEC\_TIMER or TON\_TIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TON\_TIME or IEC\_TIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

### For S7-1500 CPU

An IEC Timer is a structure of the data type IEC\_TIMER, IEC\_LTIMER, TON\_TIME or TON\_LTIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER or IEC\_LTIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TON\_TIME, TON\_LTIME, IEC\_TIMER or IEC\_LTIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC Timer is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, it is saved to the "Program resources" folder in the "Program blocks > System blocks" path of the project tree. For additional information on this topic, refer to "See also".

The instruction data is updated both when the instruction is called and also each time the outputs Q or ET are accessed.

The execution of the "Generate on-delay" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

## Parameters

The following table shows the parameters of the "Generate on-delay" instruction:

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
IN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C, P	Start input
PT	Input	TIME	TIME, LTIME	I, Q, M, D, L or constant	I, Q, M, D, L, P or constant	Duration of the on delay. The value of the PT parameter must be positive.
Q	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, P	Output that is set when the time PT expires.
ET	Output	TIME	TIME, LTIME	I, Q, M, D, L	I, Q, M, D, L, P	Current time value

For additional information on valid data types, refer to "See also".

## Pulse timing diagram

The following figure shows the pulse timing diagram of the "Generate on-delay" instruction:

## See also

Overview of the valid data types (Page 1262)

## TOF: Generate off-delay

### Description

You can use the "Generate off-delay" instruction to delay setting of the Q output by the time configured with the PT time. The output Q is set when the result of logic operation (RLO) at input IN changes from "0" to "1" (positive signal edge). When the signal state at input IN changes back to "0" (positive signal edge), the configured time duration PT starts. Output Q remains set as long as the time duration PT is running. When the PT time duration expires, the Q output is reset. If the signal state at input IN changes to "1" before the PT time duration expires, the timer is reset. The signal state at the output Q will continue to be "1".

The current time value can be queried at the output ET. The time value starts at T#0s and ends when the value of the time duration PT is reached. When the time duration PT expires, the ET output remains set to the current value until input IN changes back to "1". If input IN changes to "1" before the time duration PT has expired, the ET output is reset to the value T#0s.

Each call of the "Generate off-delay" instruction must be assigned to an IEC Timer in which the instruction data is stored.

---

### Note

If the timer is not called in the program because it is skipped, for example, output ET returns a constant value as soon as the timer has expired.

---

### For S7-1200 CPU

An IEC Timer is a structure of the data type IEC\_TIMER or TOF\_TIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TOF\_TIME or IEC\_TIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

### For S7-1500 CPU

An IEC Timer is a structure of the data type IEC\_TIMER, IEC\_LTIMER, TOF\_TIME or TOF\_LTIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER or IEC\_LTIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TOF\_TIME, TOF\_LTIME, IEC\_TIMER or IEC\_LTIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC Timer is stored in its own data block (single instance) or as a local

tag (multiple instance) in the block interface. If you create a separate data block, you will find this in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

The instruction data is updated both when the instruction is called and also each time the outputs Q or ET are accessed.

The execution of the "Generate off-delay" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

## Parameters

The following table shows the parameters of the "Generate off-delay" instruction:

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
IN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C, P	Start input
PT	Input	TIME	TIME, LTIME	I, Q, M, D, L or constant	I, Q, M, D, L, P or constant	Duration of the off delay  The value of the PT parameter must be positive.
Q	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, P	Output that is reset when the timer PT expires.
ET	Output	TIME	TIME, LTIME	I, Q, M, D, L	I, Q, M, D, L, P	Current time value

For additional information on valid data types, refer to "See also".

### Pulse timing diagram

The following figure shows the pulse timing diagram of the "Generate off-delay" instruction:

### See also

Overview of the valid data types (Page 1262)

### TONR: Time accumulator

#### Description

The instruction "Time accumulator" is used to accumulate time values within a period set by the parameter PT. The instruction is executed and the configured time duration PT is started when the result of logic operation (RLO) at input IN changes from "0" to "1" (positive edge). While the time set at PT is running, the time values are accumulated that are recorded at signal state "1" at input IN. The accumulated time is written to output ET and can be queried there. When the current time value PT is reached, the output Q has the signal state "1". Output Q remains set at "1", even when the signal state at input IN changes to "0".

The R input resets the outputs ET and Q regardless of the signal state at the start input.

Each call of the "Time accumulator" instruction must be assigned to an IEC Timer in which the instruction data is stored.

### For S7-1200 CPU

An IEC Timer is a structure of the data type IEC\_TIMER or TONR\_TIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TONR\_TIME or IEC\_TIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

## For S7-1500 CPU

An IEC Timer is a structure of the data type IEC\_TIMER, IEC\_LTIMER, TONR\_TIME or TONR\_LTIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER or IEC\_LTIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TONR\_TIME, TONR\_LTIME, IEC\_TIMER or IEC\_LTIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC Timer is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find this in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

The instruction data is updated both when the instruction is called and also each time the outputs Q or ET are accessed.

The execution of the "Time accumulator" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

## Parameters

The following table shows the parameters of the "Time accumulator" instruction:

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
IN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C, P	Start input
R	Input	BOOL	BOOL	I, Q, M, D, L or constant	I, Q, M, D, L, P or constant	Reset input
PT	Input	TIME	TIME, LTIME	I, Q, M, D, L or constant	I, Q, M, D, L, P or constant	Maximum duration of time recording. The value of the PT parameter must be positive.
Q	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, P	Output that is set when the time PT expires.
ET	Output	TIME	TIME, LTIME	I, Q, M, D, L	I, Q, M, D, L, P	Current time value

For additional information on valid data types, refer to "See also".

### Pulse timing diagram

The following figure shows the pulse timing diagram of the "Time accumulator" instruction:

### See also

Overview of the valid data types (Page 1262)

### TP: Start pulse timer

#### Description

Use the instruction "Start pulse timer" to start an IEC Timer with a specified duration as pulse. The IEC Timer is started when the result of logic operation (RLO) changes from "0" to "1" (positive signal edge). The IEC Timer runs for the specified time duration regardless of the subsequent course of the RLO. The expiry of the IEC Timer is also not affected by the detection of a new rising edge. As long as the IEC Timer is running, the querying of the timer status for "1" returns the signal state "1". When the IEC Timer has expired, the timer status returns the signal state "0".

---

#### Note

The start and the query of the IEC Timer may be on different expiry levels as each query of the outputs Q or ET updates the IEC\_TIMER structure.

---

### For S7-1200 CPU

The instruction "Start pulse timer" stores its data in a structure of the data type IEC\_TIMER or TP\_TIME. You can declare the structure as follows:

- Declaration of a data block of system data type IEC\_TIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TP\_TIME or IEC\_TIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

### For S7-1500 CPU

The instruction "Start pulse timer" stores its data in a structure of the data type IEC\_TIMER, IEC\_LTIMER, TP\_TIME or TP\_LTIME. You can declare the structure as follows:

- Declaration of a data block of system data type IEC\_TIMER or IEC\_LTIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TP\_TIME, TP\_LTIME, IEC\_TIMER or IEC\_LTIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

The instruction data is updated both when the instruction is called and also each time the specified timer is accessed.

The current timer status is saved in the structure components Q of the IEC Timer. You can query the timer status with the help of a binary logic operation. The query for Q or ET (e. g. "MyTimer".Q or "MyTimer".ET) updates the IEC\_TIMER structure.

The execution of the instruction "Start pulse timer" assumes a preceding logic operation. It can be placed only at the end of the network.

### Parameters

The following table shows the parameters of the instruction "Start pulse timer":

Parameters	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
VALUE	Input	TIME	TIME, LTIME	I, Q, M, D, L or constant	Duration with which the IEC Timer runs.
<IEC Timer>	InOut	IEC_TIMER, TP_TIME	IEC_TIMER, IEC_LTIMER, TP_TIME, TP_LTIME	D, L	IEC Timer which is started.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The instruction "Start pulse timer" is executed when the signal state of the operand "Tag\_Input" changes from "0" to "1". The timer "DB1".MyIEC\_TIMER is started for the time stored in the operand "TagTime".

As long as the timer "DB1".MyIEC\_TIMER is running, the timer status ("DB1".MyIEC\_TIMER.Q) has signal state "1" and the operand "Tag\_Output" is set. When the IEC Timer has expired, the signal state of the time status changes back to "0" and the "Tag\_Output" operand is reset.

**See also**

Overview of the valid data types (Page 1262)

**TON: Start on-delay timer**

**Description**

Use the "Start on-delay timer" instruction to start an IEC Timer with a specified duration as on-delay. The IEC Timer is started when the result of logic operation (RLO) changes from "0" to "1" (positive signal edge). The IEC Timer runs for the specified time duration. The output returns the signal state "1" if the RLO at the input of the instruction has the signal state "1". If the RLO changes to "0" before the end of the timer, the running IEC Timer is reset. The query of the timer status for "1" returns the signal state "0". The IEC Timer restarts when the next rising signal edge is detected at the input of the instruction.

**Note**

The start and the query of the IEC Timer may be on different expiry levels as each query of the outputs Q or ET updates the IEC\_TIMER structure.

### For S7-1200 CPU

The instruction "Start on-delay timer" stores its data in a structure of the data type IEC\_TIMER or TON\_TIME. You can declare the structure as follows:

- Declaration of a data block of system data type IEC\_TIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TON\_TIME or IEC\_TIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

### For S7-1500 CPU

The "Start on-delay timer" instruction stores its data in a structure of the data type IEC\_TIMER, IEC\_LTIMER, TON\_TIME or TON\_LTIME. You can declare the structure as follows:

- Declaration of a data block of system data type IEC\_TIMER or IEC\_LTIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TON\_TIME, TON\_LTIME, IEC\_TIMER or IEC\_LTIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

The instruction data is updated both when the instruction is called and also each time the specified timer is accessed.

The current timer status is saved in the structure components ET of the IEC Timer. You can query the timer status with the help of a binary logic operation. The query for Q or ET (e. g. "MyTimer".Q or "MyTimer".ET) updates the IEC\_TIMER structure.

The execution of the "Start on-delay timer" instruction assumes a preceding logic operation. It can be placed only at the end of the network.

### Parameters

The following table shows the parameters of the instruction "Start on-delay timer":

Parameters	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
VALUE	Input	TIME	TIME, LTIME	I, Q, M, D, L or constant	Duration with which the IEC Timer runs.
<IEC Timer>	InOut	IEC_TIMER, TON_TIME	IEC_TIMER, IEC_LTIMER, TON_TIME, TON_LTIME	D, L	IEC Timer which is started.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The "Start on-delay timer" instruction is executed when the signal state of the operand "Tag\_Input" changes from "0" to "1". The "MyIEC\_TIMER" timer is started for the time stored in the "Tag\_TIME" operand.

If the timer "MyIEC\_TIMER" has expired and the operand "Tag\_Input" has the signal state "1", querying the timer status ("MyIEC\_TIMER".Q) returns signal state "1" and the "Tag\_Output" operand is set. When the signal state of the operand "Tag\_Input" changes to "0", the querying of the timer status returns the signal state "0" and the operand "Tag\_Output" is reset.

**See also**

Overview of the valid data types (Page 1262)

**TOF: Start off-delay timer**

**Description**

Use the "Start off-delay timer" instruction to start an IEC Timer with a specified duration as off-delay. The query of the timer status for "1" returns the signal state "0" if the result of the logic operation (RLO) at the input of the instruction has the signal state "1". When the RLO changes from "1" to "0" (negative signal edge), the IEC Timer starts with the specified time duration. The timer status remains at signal state "1" as long as the IEC Timer is running. When the timer has run out and the RLO at the input of the instruction has the signal state "0", the timer status is set to the signal state "0". If the RLO changes to "1" before the end of the timer, the running IEC Timer is reset and the timer status remain at the signal state "1".

**Note**

The start and the query of the IEC Timer may be on different expiry levels as each query of the outputs Q or ET updates the IEC\_TIMER structure.

### For S7-1200 CPU

The instruction "Start off-delay timer" stores its data in a structure of the data type IEC\_TIMER or TOF\_TIME. You can declare the structure as follows:

- Declaration of a data block of system data type IEC\_TIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TOF\_TIME or IEC\_TIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

### For S7-1500 CPU

The "Start off-delay timer" instruction stores its data in a structure of the data type IEC\_TIMER, IEC\_LTIMER, TOF\_TIME or TOF\_LTIME. You can declare the structure as follows:

- Declaration of a data block of system data type IEC\_TIMER or IEC\_LTIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TOF\_TIME, TOF\_LTIME, IEC\_TIMER or IEC\_LTIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

The instruction data is updated both when the instruction is called and also each time the specified timer is accessed.

The current timer status is saved in the structure components ET of the IEC Timer. You can query the timer status with the help of a binary logic operation. The query for Q or ET (e. g. "MyTimer".Q or "MyTimer".ET) updates the IEC\_TIMER structure.

The execution of the "Start off-delay timer" instruction assumes a preceding logic operation. It can be placed only at the end of the network.

### Parameters

The following table shows the parameters of the instruction "Start off-delay timer":

Parameters	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
VALUE	Input	TIME	TIME, LTIME	I, Q, M, D, L or constant	Duration with which the IEC Timer runs.
<IEC Timer>	InOut	IEC_TIMER, TOF_TIME	IEC_TIMER, IEC_LTIMER, TOF_TIME, TOF_LTIME	D, L	IEC Timer which is started.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The "Start off-delay timer" instruction is executed when the signal state of the operand "Tag\_Input" changes from "1" to "0". The #MyIEC\_TIMER timer is started for the time stored in the operand "Tag\_TIME".

As long as timer #MyIEC\_TIMER is running, the query of the time status (#MyIEC\_TIMER.Q) returns the signal state "1" and operand "Tag\_Output" is set. If the timer has expired and the operand "Tag\_Input" has the signal state "0", the query of the timer status returns the signal state "0". If the signal state of the operand "Tag\_Input" changes to "1" before timer #MyIEC\_TIMER expires, the timer is reset. When the signal state of the operand "Tag\_Input" is "1", the query of the timer status returns the signal state "1".

**See also**

Overview of the valid data types (Page 1262)

**TONR: Time accumulator**

**Description**

You can use the "Time accumulator" instruction to record how long the signal is at the input of instruction "1". The instruction is started when the result of logic operation (RLO) changes from "0" to "1" (positive signal edge). The time is recorded as long at the RLO is "1". If the RLO changes to "0", the instruction is halted. If the RLO changes back to "1", the time recording is continued. The query of the timer status for "1" returns the signal state "1" if the recorded time exceeds the value of the specified time duration and the RLO at the input of coil is "1".

The timer status and the currently expired timer can be reset to "0" using the "Reset timer" instruction.

**Note**

The start and the query of the IEC Timer may be on different expiry levels as each query of the outputs Q or ET updates the IEC\_TIMER structure.

### For S7-1200 CPU

The "Time accumulator" instruction stores its data in a structure of the data type IEC\_TIMER or TONR\_TIME. You can declare the structure as follows:

- Declaration of a data block of system data type IEC\_TIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TONR\_TIME or IEC\_TIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

### For S7-1500 CPU

The "Time accumulator" instruction stores its data in a structure of the data type IEC\_TIMER, IEC\_LTIMER, TONR\_TIME or TONR\_LTIME. You can declare the structure as follows:

- Declaration of a data block of system data type IEC\_TIMER or IEC\_LTIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TONR\_TIME, TONR\_LTIME, IEC\_TIMER or IEC\_LTIMER in the "Static" section of a block (for example, #MyIEC\_TIMER)

The instruction data is updated both when the instruction is called and also each time the specified timer is accessed.

The current timer status is saved in the structure components ET of the IEC Timer. You can query the timer status with the help of a binary logic operation. The query for Q or ET (e. g. "MyTimer".Q or "MyTimer".ET) updates the IEC\_TIMER structure.

The execution of the "Time accumulator" instruction requires a preceding logic operation. It can be placed only at the end of the network.

### Parameters

The following table shows the parameters of the "Time accumulator" instruction:

Parameters	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
VALUE	Input	TIME	TIME, LTIME	I, Q, M, D, L or constant	Duration with which the IEC Timer runs.
<IEC Timer>	InOut	IEC_TIMER, TONR_TIME	IEC_TIMER, IEC_LTIMER, TONR_TIME, TONR_LTIME	D, L	IEC Timer which is started.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The "Time accumulator" instruction is executed if there is a positive signal edge in the RLO. The time is recorded as long as the operand "Tag\_Input" has the signal state "1".

If the recorded time exceeds the value of the operand "Tag\_TIME", then the query of the timer status ("MyIEC\_TIMER".Q) will return the signal state "1" and the operand "Tag\_Output" will be set.

**See also**

Overview of the valid data types (Page 1262)

RT: Reset timer (Page 2114)

**RT: Reset timer**

**Description**

You can use the "Reset timer" instruction to reset an IEC Timer to "0". You specify the IEC Timer to be reset by entering the name of the data block that contains the structure of the IEC Timer in the placeholder above the instruction.

The instruction is only executed if the result of logic operation (RLO) at the box input is "1". When the instruction is executed the structure components of the IEC Timer are reset to "0" in the specified data block. If the RLO at box input is "0", the instruction is not executed.

The instruction does not influence the RLO. The RLO at the box input is transferred directly to the box output.

You must assign a IEC Timer declared in the program to the "Reset timer" instruction.

The instruction data is updated only when the instruction is called and not each time the assigned IEC Timer is accessed. The query of the data is only identical from the call of the instruction to the next call of the instruction.

## Parameters

The following table shows the parameters of the instruction "Reset timer":

Parameters	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
<IEC Timer>	InOut	IEC_TIMER, TP_TIME, TON_TIME, TOF_TIME, TONR_TIME	IEC_TIMER, IEC_LTIMER, TP_TIME, TP_LTIME, TON_TIME, TON_LTIME, TOF_TIME, TOF_LTIME, TONR_TIME, TONR_LTIME	D, L	IEC Timer, which is reset.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The "Generate on-delay" instruction executes when the signal state of the "Tag\_Input\_1" operand changes from "0" to "1". The IEC Timer stored in the instance data block "TON\_DB" is started with the time duration that is specified by the operand "Tag\_PT".

If the operands "Tag\_Input\_2" and "Tag\_Input\_3" have the signal state "1", the "Reset timer" instruction is executed and the IEC Timer stored in the data block "TON\_DB" is reset.

## See also

Overview of the valid data types (Page 1262)

**PT: Load time duration**

**Description**

Use the "Load time duration" instruction to set the time duration of an IEC Timer. The instruction is executed in every cycle when the result of logic operation (RLO) at the input of the instruction has the signal state "1". The instruction writes the specified time duration to the structure of the specified IEC Timer.

**Note**

If the specified IEC Timer is running during the execution, the instruction overwrites the current time duration of the specified IEC Timer. As a result, the timer status of the IEC Timer can change.

You must assign a IEC Timer declared in the program to the "Load time duration" instruction. The instruction data is updated when the instruction is called and each time the assigned IEC Timer is accessed. The query for Q or ET (e. g. "MyTimer".Q or "MyTimer".ET) updates the IEC\_TIMER structure.

**Parameters**

The following table shows the parameters of the instruction "Load time duration":

Parameters	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
PT	Input	TIME	TIME, LTIME	I, Q, M, D, L or constant	Time duration
<IEC Timer>	InOut	IEC_TIMER, TP_TIME, TON_TIME, TOF_TIME, TONR_TIME	IEC_TIMER, IEC_LTIMER, TP_TIME, TP_LTIME, TON_TIME, TON_LTIME, TOF_TIME, TOF_LTIME, TONR_TIME, TONR_LTIME	D, L	IEC Timer, the duration of which is set.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The "Generate on-delay" instruction executes when the signal state of the "Tag\_Input\_1" operand changes from "0" to "1". The IEC Timer stored in the instance data block "TON\_DB" is started with the time duration that is specified by the operand "Tag\_PT".

The "Load time duration" instruction is executed when the operand "Tag\_Input\_2" has the signal state "1". The instruction writes the time duration "Tag\_PT\_2" in the instance data block "TON\_DB" and at the same time overwrites the value of the operand "Tag\_PT" within the data block. As a result, the signal state of the timer status can change at the next query or upon access to "MyTimer".Q or "MyTimer".ET.

---

### Note

The "Tag\_Input\_2" is executed as pulse flag in order that the time duration is loaded only throughout one program cycle.

---

## SIMATIC Timers

### S\_PULSE: Assign pulse timer parameters and start

#### Description

The "Assign pulse timer parameters and start" instruction starts a programmed timer when a transition from "0" to "1" (positive signal edge) is detected in the result of logic operation (RLO) at input S. The timer expires with the programmed duration (TV) as long as the signal state at input S is "1". If the signal state at input S changes to "0" before the programmed duration expires, the timer is stopped. In this case, the signal state at output Q is "0".

The duration is made up internally of a time value and a time base and is programmed at parameter TV. When the instruction is started, the programmed time value is counted down

to zero. The time base determines the time period of the time value. The current time value is output binary-coded at output BI and BCD-coded at output BCD.

If the timer is running and the signal state at input R changes to "1", the current time value and the time base are also set to zero. If the timer is not running, the signal state "1" at the R input has no effect.

The "Assign pulse timer parameters and start" instruction needs a preceding logic operation for the edge evaluation and can be placed within or at the end of the network.

The instruction data is updated with each access. It can therefore happen that the query of the data at the start of the cycle returns different values than at the end of the cycle.

**Note**

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

**Parameters**

The following table shows the parameters of the "Assign pulse timer parameters and start" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Timer>	InOut/Input	TIMER	T	Time of the instruction The number of timers depends on the CPU.
S	Input	BOOL	I, Q, M, T, C, D, L, P	Start input
TV	Input	S5TIME, WORD	I, Q, M, D, L or constant	Time duration
R	Input	BOOL	I, Q, M, T, C, D, L, P or constant	Reset input
BI	Output	WORD	I, Q, M, D, L, P	Current time value (binary-coded)
BCD	Output	WORD	I, Q, M, D, L, P	Current time value (BCD format)
Q	Output	BOOL	I, Q, M, D, L, P	Status of the timer

For additional information on valid data types, refer to "See also".

### Pulse timing diagram

The following figure shows the pulse timing diagram of the "Assign pulse timer parameters and start" instruction:

### Example

The following example shows how the instruction works:

"Timer\_1" starts when the signal state of the "TagIn\_1" operand changes from "0" to "1". The timer runs for the time value of the "TagIn\_Number" operand as long as the "TagIn\_1" operand has the signal state "1". If the signal state of the operand "TagIn\_1" changes from "1" to "0" before the timer expires, the timer "Timer\_1" is stopped. The "TagOut" operand is reset to signal state "0".

The "TagOut" operand has the signal state "1" as long as the timer is running and the "TagIn\_1" operand has the signal state "1". When the time has expired or is reset, the "TagOut" operand is reset to "0".

## S\_PEXT: Assign extended pulse timer parameters and start

### Description

The "Assign extended pulse timer parameters and start" instruction starts a programmed timer when a transition from "0" to "1" (positive signal edge) is detected in the result of logic operation (RLO) at input S. The timer expires with the programmed duration (TV), even if the signal state at input S changes to "0". As long as the timer is running, output Q has the signal state "1". When the timer has expired, output Q is reset to "0". If the signal state at input S changes from "0" to "1" while the timer is running, the timer is restarted with the duration programmed at input TV.

The duration is made up internally of a time value and a time base and is programmed at parameter TV. When the instruction is started, the programmed time value is counted down to zero. The time base determines the time period of the time value. The current time value is output binary-coded at output BI and BCD-coded at output BCD.

If the timer is running and the signal state at input R changes to "1", the current time value and the time base are also set to zero. If the timer is not running, the signal state "1" at the R input has no effect.

The "Assign extended pulse timer parameters and start" instruction needs a preceding logic operation for the edge evaluation and can be placed within or at the end of the network.

The instruction data is updated with each access. It can therefore happen that the query of the data at the start of the cycle returns different values than at the end of the cycle.

---

### Note

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

---

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

## Parameters

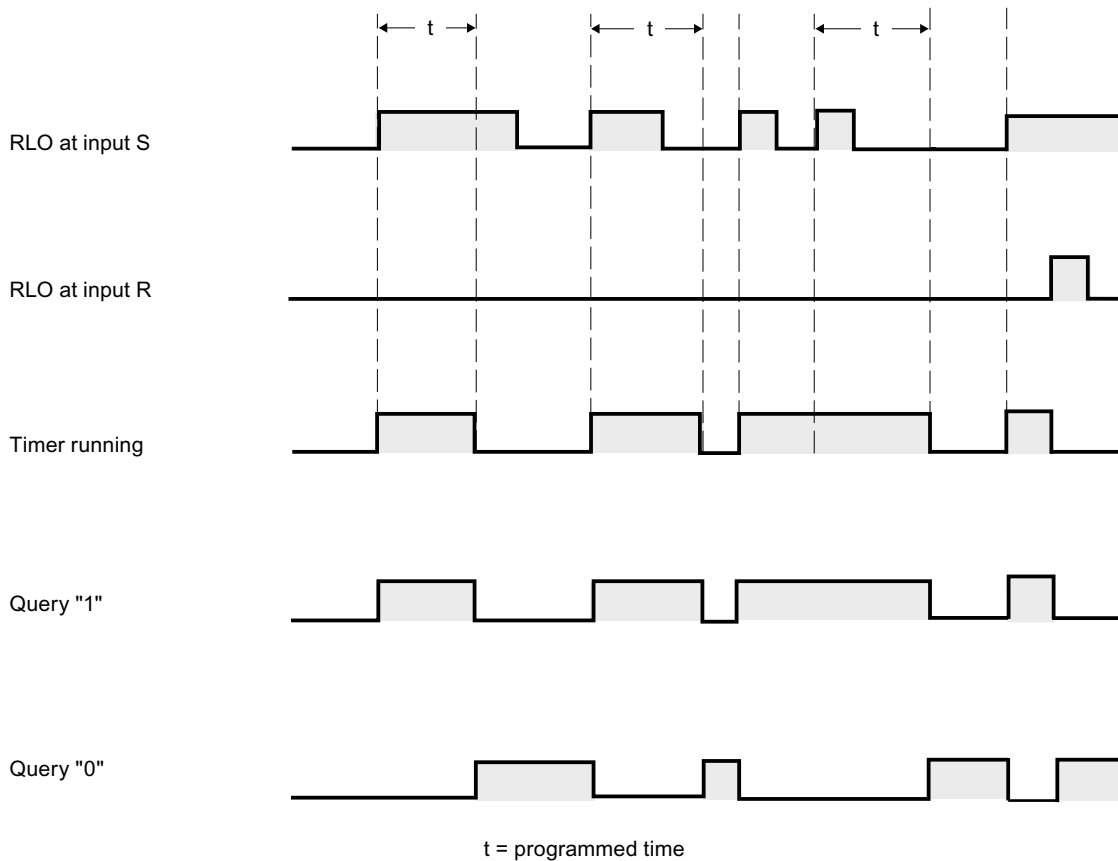

The following table shows the parameters of the "Assign extended pulse timer parameters and start" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Timer>	InOut/Input	TIMER	T	Time of the instruction The number of timers depends on the CPU.
S	Input	BOOL	I, Q, M, T, C, D, L, P	Start input
TV	Input	S5TIME, WORD	I, Q, M, D, L or constant	Time duration
R	Input	BOOL	I, Q, M, T, C, D, L, P or constant	Reset input
BI	Output	WORD	I, Q, M, D, L, P	Current time value (binary-coded)
BCD	Output	WORD	I, Q, M, D, L, P	Current time value (BCD format)
Q	Output	BOOL	I, Q, M, D, L, P	Status of the timer

For additional information on valid data types, refer to "See also".

**Pulse timing diagram**

The following figure shows the pulse timing diagram of the "Assign extended pulse timer parameters and start" instruction:

**Example**

The following example shows how the instruction works:

"Timer\_1" starts when the signal state of the "TagIn\_1" operand changes from "0" to "1". The timer runs for the time value of the "TagIn\_Number" operand without being affected by a negative edge at the S input. If the signal state at the "TagIn\_1" operand changes from "0" to "1" before the timer expires, the timer is restarted.

The "TagOut" operand has the signal state "1" as long as the timer is running. When the time has expired or is reset, the "TagOut" operand is reset to "0".

**S\_ODT: Assign on-delay timer parameters and start****Description**

The "Assign on-delay timer parameters and start" instruction starts a programmed timer when a transition from "0" to "1" (positive signal edge) is detected in the result of logic operation (RLO) at input S. The timer expires with the programmed duration (TV) as long as the signal state at input S is "1". If the timer expires correctly and input S still has signal state "1", output Q returns signal state "1". If the signal state at input S changes from "1" to "0" while the timer is running, the timer is stopped. In this case, output Q is reset to signal state "0".

The duration is made up internally of a time value and a time base and is programmed at parameter TV. When the instruction is started, the programmed time value is counted down to zero. The time base determines the time period of the time value. The current time value is output binary-coded at output BI and BCD-coded at output BCD.

If the time is running and the signal state at input R changes from "0" to "1", the current time value and the time base are also set to zero. In this case, the signal state at output Q is "0". The timer is reset if the signal state is "1" at the R input even if the timer is not running and the RLO at input S is "1".

The "Assign on-delay timer parameters and start" instruction needs a preceding logic operation for the edge evaluation and can be placed within or at the end of the network.

The instruction data is updated with each access. It can therefore happen that the query of the data at the start of the cycle returns different values than at the end of the cycle.

---

**Note**

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

---

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

**Parameters**

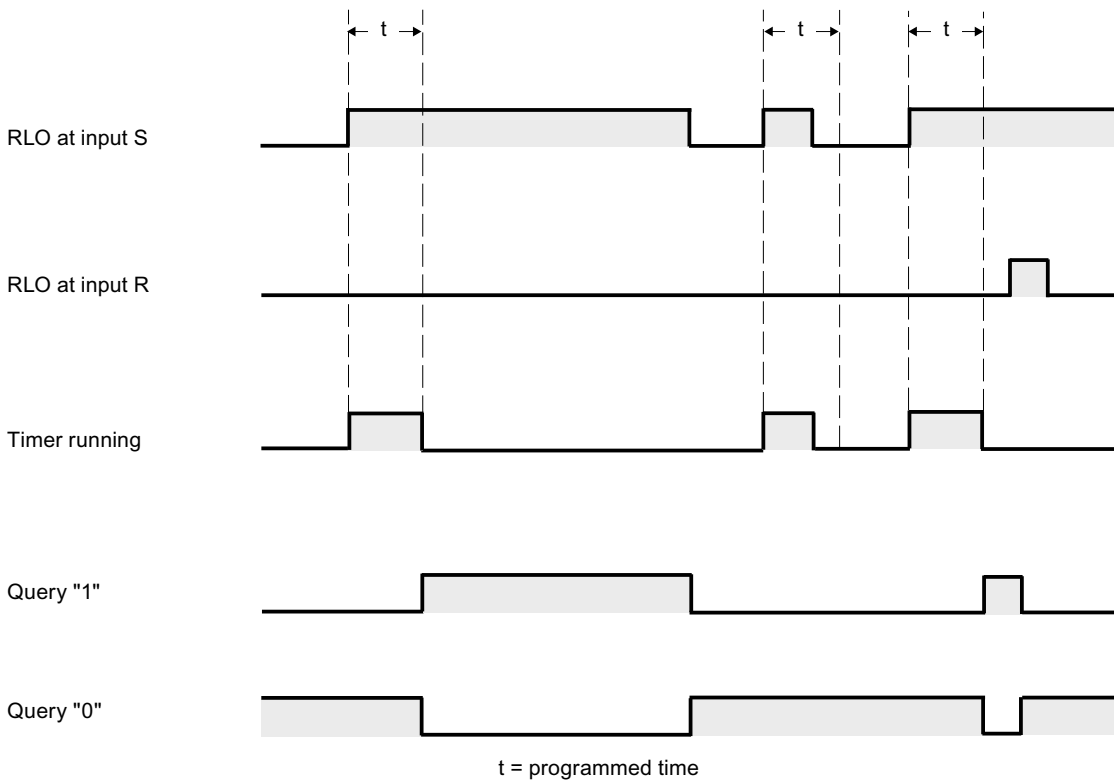

The following table shows the parameters of the "Assign on-delay timer parameters and start" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Timer>	InOut/Input	TIMER	T	Time of the instruction The number of timers depends on the CPU.
S	Input	BOOL	I, Q, M, T, C, D, L, P	Start input
TV	Input	S5TIME, WORD	I, Q, M, D, L or constant	Time duration
R	Input	BOOL	I, Q, M, T, C, D, L, P or constant	Reset input
BI	Output	WORD	I, Q, M, D, L, P	Current time value (binary-coded)
BCD	Output	WORD	I, Q, M, D, L, P	Current time value (BCD format)
Q	Output	BOOL	I, Q, M, D, L, P	Status of the timer

For additional information on valid data types, refer to "See also".

### Pulse timing diagram

The following figure shows the pulse timing diagram of the "Assign on-delay timer parameters and start" instruction:

### Example

The following example shows how the instruction works:

"Timer\_1" starts when the signal state of the "TagIn\_1" operand changes from "0" to "1". The timer expires with the value of operand "TagIn\_Number". If the timer expires and the signal state of the operand is "1", the "TagOut" operand is set to "1". If the signal state at the "TagIn\_1" operand changes from "1" to "0" before the timer expires, the timer is stopped. The "TagOut" operand has the signal state "0".

**S\_ODTS: Assign retentive on-delay timer parameters and start**

**Description**

The "Assign retentive on-delay timer parameters and start" instruction starts a programmed timer when a transition from "0" to "1" (positive signal edge) is detected in the result of logic operation (RLO) at input S. The timer expires with the programmed duration (TV), even if the signal state at input S changes to "0". If the timer expires, the "Q" output returns signal state "1" regardless of the signal state at input "S". If the signal state at input S changes from "0" to "1" while the timer is running, the timer is restarted with the duration programmed at input (TV).

The duration is made up internally of a time value and a time base and is programmed at parameter TV. When the instruction is started, the programmed time value is counted down to zero. The time base determines the time period of the time value. The current time value is output binary-coded at output BI and BCD-coded at output BCD.

Signal state "1" at input R resets the current time value and time base to "0" regardless of the signal state at start input S. In this case, the signal state at output Q is "0".

The "Assign retentive on-delay timer parameters and start" instruction needs a preceding logic operation for the edge evaluation and can be placed within or at the end of the network.

The instruction data is updated with each access. It can therefore happen that the query of the data at the start of the cycle returns different values than at the end of the cycle.

---

**Note**

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

---

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

## Parameters

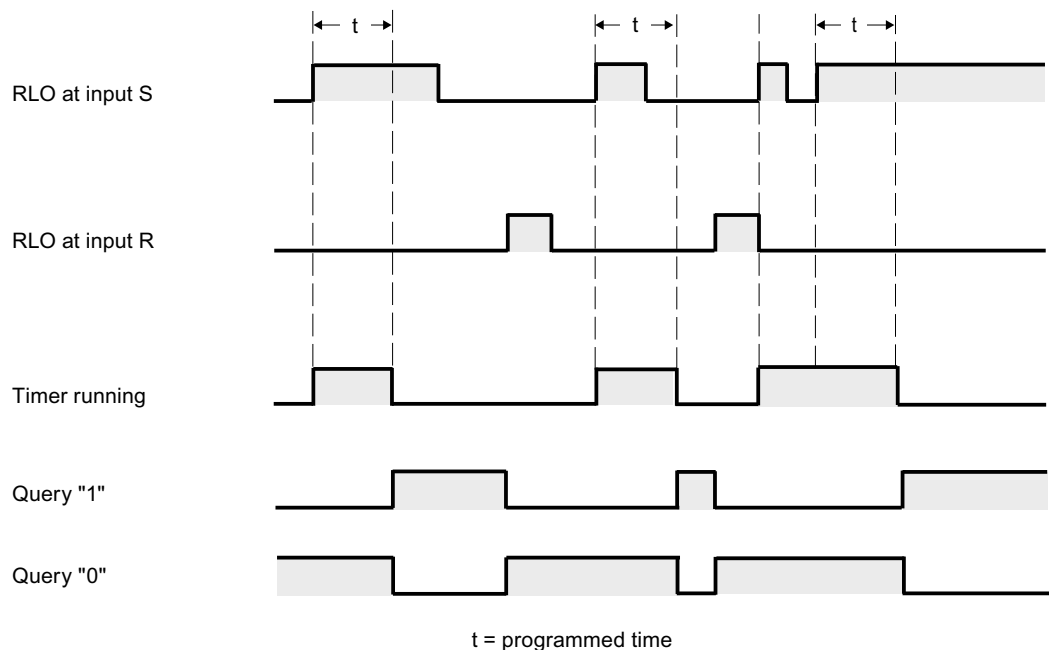

The following table shows the parameters of the "Assign retentive on-delay timer parameters and start" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Timer>	InOut/Input	TIMER	T	Time of the instruction The number of timers depends on the CPU.
S	Input	BOOL	I, Q, M, T, C, D, L, P	Start input
TV	Input	S5TIME, WORD	I, Q, M, D, L or constant	Time duration
R	Input	BOOL	I, Q, M, T, C, D, L, P or constant	Reset input
BI	Output	WORD	I, Q, M, D, L, P	Current time value (binary-coded)
BCD	Output	WORD	I, Q, M, D, L, P	Current time value (BCD format)
Q	Output	BOOL	I, Q, M, D, L, P	Status of the timer

For additional information on valid data types, refer to "See also".

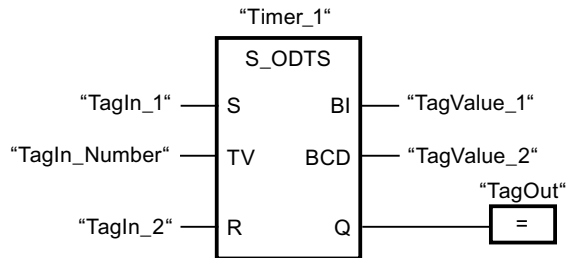

## Pulse timing diagram

The following figure shows the pulse timing diagram of the "Assign retentive on-delay timer parameters and start" instruction:

**Example**

The following example shows how the instruction works:

"Timer\_1" starts when the signal state of the "TagIn\_1" operand changes from "0" to "1". The timer expires with the time value of the "TagIn\_Number" operand, even when the signal state of the "TagIn\_1" operand changes to "0". When the time expires, the "TagOut" operand is reset to "1". If the signal state at the "TagIn\_1" operand changes from "0" to "1" while the timer is running, the timer is restarted.

**See also**

**S\_OFFDT: Assign off-delay timer parameters and start**

**Description**

The "Assign off-delay timer parameters and start" instruction starts a programmed timer when a transition from "1" to "0" (negative signal edge) is detected in the result of logic operation (RLO) at input S. The timer expires with the programmed duration (TV). As long as the timer is running or input S returns signal state "1", output Q has signal state "1". If the timer expires and the signal state is "0", output Q is reset to signal state "0". If the signal state at input S changes from "0" to "1" while the timer is running, the timer is stopped. The timer is only restarted after a falling signal edge is detected at input S.

The duration is made up internally of a time value and a time base and is programmed at parameter TV. When the instruction is started, the programmed time value is counted down to zero. The time base determines the time period of the time value. The current time value is output binary-coded at output BI and BCD-coded at output BCD.

Signal state "1" at input R resets the current time value and time base to "0". In this case, the signal state at output Q is "0".

The "Assign off-delay timer parameters and start" instruction needs a preceding logic operation for the edge evaluation and can be placed within or at the end of the network.

The instruction data is updated with each access. It can therefore happen that the query of the data at the start of the cycle returns different values than at the end of the cycle.

#### Note

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

## Parameters

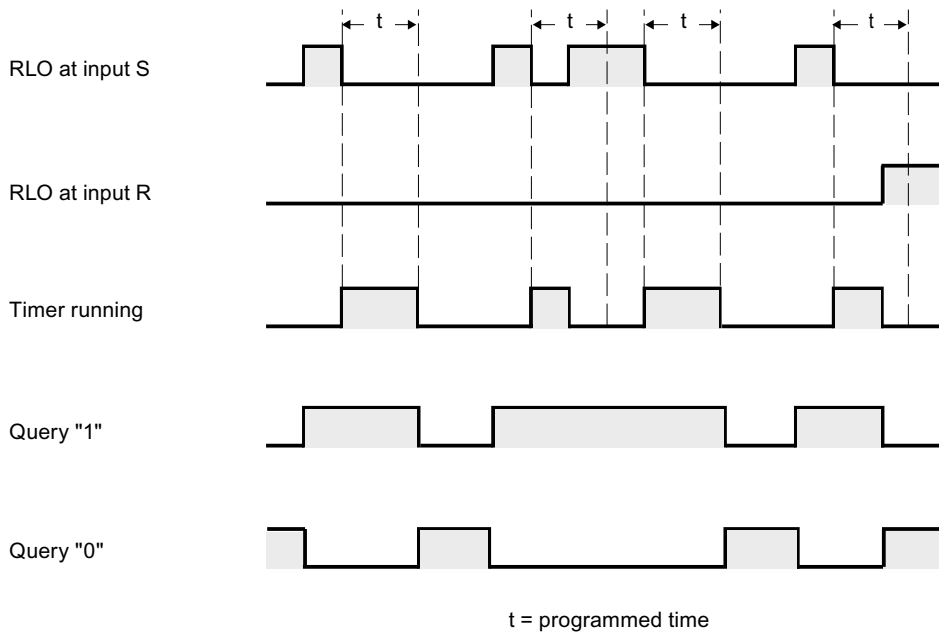

The following table shows the parameters of the "Assign off-delay timer parameters and start" instruction:

Parameter	Declaration	Data type	Memory area	Description
<Timer>	InOut/Input	TIMER	T	Time of the instruction The number of timers depends on the CPU.
S	Input	BOOL	I, Q, M, T, C, D, L, P	Start input
TV	Input	S5TIME, WORD	I, Q, M, D, L or constant	Time duration
R	Input	BOOL	I, Q, M, T, C, D, L, P or constant	Reset input
BI	Output	WORD	I, Q, M, D, L, P	Current time value (binary-coded)
BCD	Output	WORD	I, Q, M, D, L, P	Current time value (BCD format)
Q	Output	BOOL	I, Q, M, D, L, P	Status of the timer

For additional information on valid data types, refer to "See also".

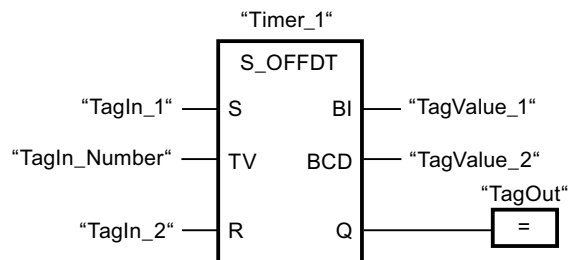

### Pulse timing diagram

The following figure shows the pulse timing diagram of the "Assign off-delay timer parameters and start" instruction:

### Example

The following example shows how the instruction works:

"Timer\_1" starts when the signal state of the "TagIn\_1" operand changes from "1" to "0". The timer expires with the value of operand "TagIn\_Number". The "TagOut" operand is set to "1" if the timer is running or the "TagIn\_1" operand has the signal state "0". If the signal state at the "TagIn\_1" operand changes from "0" to "1" while the timer is running, the timer is reset.

**SP: Start pulse timer****Description**

The instruction "Start pulse timer" starts a programmed timer when a change from "0" to "1" (positive signal edge) is detected in the result of logic operation (RLO) at the start input. The timer runs with the specified duration as long as the RLO has the signal state "1". As long as the timer is running, the query of timer status "1" returns the signal state "1". If there is a change from "1" to "0" in the RLO before the time value has elapsed, the timer stops. In this case, the query for timer status for "1" returns the signal state "0".

The duration is made up internally of a time value and a time base and is programmed at parameter TV. When the instruction is started, the programmed time value is counted down to zero. The time base determines the time period of the time value.

The "Start pulse timer" instruction needs a preceding logic operation for the edge evaluation and can only be placed on the right edge of the network.

**Note**

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

**Parameters**

The following table shows the parameters of the instruction "Start pulse timer":

Parameter	Declaration	Data type	Memory area	Description
<Operand>	Input	BOOL	I, Q, M, T, C, D, L, P	Start input
TV	Input	S5TIME, WORD	I, Q, M, D, L or constant	Time duration
<Timer>	InOut/Input	TIMER	T	Timer which is started.  The number of timers depends on the CPU.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

Network 1

Network 2

Network 3

"Timer\_1" starts when the signal state of the "TagIn\_1" operand changes from "0" to "1". The timer expires with the time value of the "TagIn\_Number" operand as long as the signal state of the "TagIn\_1" operand is "1". If the signal state at the "TagIn\_1" operand changes from "1" to "0" before the timer expires, the timer is stopped. As long as the timer is running, the "TagOut" operand returns signal state "1". If the signal state of the "TagIn\_1" operand changes from "0" to "1", the timer is reset, i.e. the timer is stopped and the current time value is set to "0".

Overview of the valid data types (Page 1262)

**SE: Start extended pulse timer**

**Description**

The "Start extended pulse timer" instruction starts a programmed timer when a change from "0" to "1" (positive signal edge) is detected in the result of logic operation (RLO) at the start input. The timer runs for the specified time period even when the RLO changes to signal state "0". As long as the timer is running, the query of timer status "1" returns the signal state "1". If the RLO changes from "0" to "1" while the timer is running, the timer is restarted with the programmed time period. When the timer expires, the query for timer status for "1" returns the signal state "0".

The duration is made up internally of a time value and a time base and is programmed at parameter TV. When the instruction is started, the programmed time value is counted down to zero. The time base determines the time period of the time value.

The "Start extended pulse timer" instruction needs a preceding logic operation for the edge evaluation and can only be placed on the right edge of the network.

---

#### Note

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

---

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

## Parameters

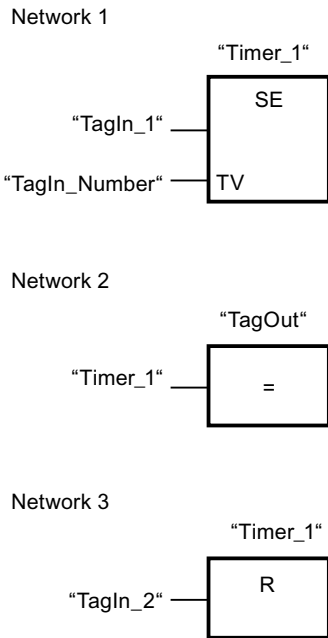

The following table shows the parameters of the instruction "Start extended pulse timer":

Parameter	Declaration	Data type	Memory area	Description
<Operand>	Input	BOOL	I, Q, M, T, C, D, L, P	Start input
TV	Input	S5TIME, WORD	I, Q, M, D, L or constant	Time duration
<Timer>	InOut/Input	TIMER	T	Timer which is started. The number of timers depends on the CPU.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

"Timer\_1" starts when the signal state of the "TagIn\_1" operand changes from "0" to "1". The timer expires with the time value of the "TagIn\_Number" operand without being affected by a negative edge at the RLO. As long as the timer is running, the "TagOut" operand returns signal state "1". If the signal state at the "TagIn\_1" operand changes from "0" to "1" before the timer expires, the timer is restarted.

**SD: Start on-delay timer**

**Description**

The "Start on-delay timer" instruction starts a programmed timer when a change from "0" to "1" (positive signal edge) is detected in the result of logic operation (RLO) at the start input. The timer runs for the specified period of time as long as the RLO is "1". If the timer expires and the RLO has the signal state "1", the query timer status "1" returns the signal state "1". If the RLO changes from "1" to "0" while the timer is running, the timer is stopped. In this case, querying the timer status for "1" returns the signal state "0".

The duration is made up internally of a time value and a time base and is programmed at parameter TV. When the instruction is started, the programmed time value is counted down to zero. The time base determines the time period of the time value.

The "Start on-delay timer" instruction needs a preceding logic operation for the edge evaluation and can only be placed on the right edge of the network.

#### Note

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

## Parameters

The following table shows the parameters of the instruction "Start on-delay timer":

Parameter	Declaration	Data type	Memory area	Description
<Operand>	Input	BOOL	I, Q, M, T, C, D, L, P	Start input
TV	Input	S5TIME, WORD	I, Q, M, D, L or constant	Time duration
<Timer>	InOut/Input	TIMER	T	Timer which is started.  The number of timers depends on the CPU.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

"Timer\_1" starts when the signal state of the "TagIn\_1" operand changes from "0" to "1". The timer expires with the value of operand "TagIn\_Number". If the timer expires and the RLO has the signal state "1", the "TagOut" operand is set to "1". If the signal state at the "TagIn\_1" operand changes from "1" to "0" before the timer expires, the timer is stopped. If the signal state of the "TagIn\_2" operand changes to "1", "Timer\_1" is reset, i.e. the timer is stopped and the current time value is set to "0".

### See also

Overview of the valid data types (Page 1262)

### SS: Start retentive on-delay timer

#### Description

The "Start retentive on-delay timer" instruction starts a programmed timer when a change from "0" to "1" (positive signal edge) is detected in the result of logic operation (RLO) at the start input. The timer runs for the specified time period even when the RLO changes to signal state "0". When the timer expires, the query for timer status for "1" returns the signal state "1". When the timer expires, the timer can only be restarted if it is explicitly reset.

The duration is made up internally of a time value and a time base and is programmed at parameter TV. When the instruction is started, the programmed time value is counted down to zero. The time base determines the time period of the time value.

The "Start retentive on-delay timer" instruction needs a preceding logic operation for the edge evaluation and can only be placed on the right edge of the network.

---

#### Note

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

---

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

## Parameters

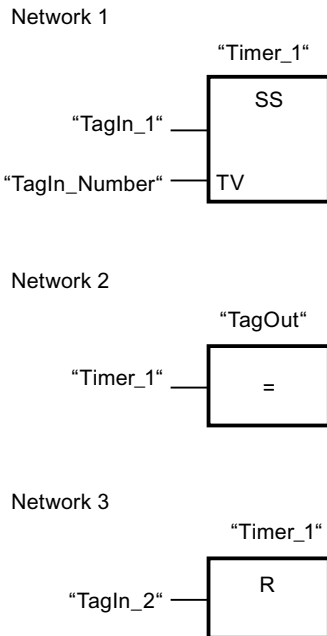

The following table shows the parameters of the instruction "Start retentive on-delay timer":

Parameter	Declaration	Data type	Memory area	Description
<Operand>	Input	BOOL	I, Q, M, T, C, D, L, P	Start input
TV	Input	S5TIME, WORD	I, Q, M, D, L or constant	Time duration
<Timer>	InOut/Input	TIMER	T	Timer which is started.  The number of timers depends on the CPU.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

"Timer\_1" starts when the signal state of the "TagIn\_1" operand changes from "0" to "1". The timer expires with the value of operand "TagIn\_Number". When the time expires, the "TagOut" operand is reset to "1". If the signal state at the "TagIn\_1" operand changes from "0" to "1" while the timer is running, the timer is restarted. If the signal state of the "TagIn\_2" operand changes to "1", "Timer\_1" is reset, i.e. the timer is stopped and the current time value is set to "0".

### See also

Overview of the valid data types (Page 1262)

### SF: Start off-delay timer

#### Description

The "Start off-delay timer" instruction starts a programmed timer when a change from "1" to "0" (negative signal edge) is detected in the result of logic operation (RLO) at the start input. The timer runs for the specified time period. As long as the timer is running, the query of timer status "1" returns the signal state "1". If the RLO changes from "0" to "1" while the timer is running, the timer is reset. The timer is always restarted when the RLO changes from "1" to "0".

The duration is made up internally of a time value and a time base and is programmed at parameter TV. When the instruction is started, the programmed time value is counted down to zero. The time base determines the time period of the time value.

The "Start off-delay timer" instruction needs a preceding logic operation for the edge evaluation and can only be placed on the right edge of the network.

---

#### Note

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

---

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

## Parameters

The following table shows the parameters of the instruction "Start off-delay timer":

Parameter	Declaration	Data type	Memory area	Description
<Operand>	Input	BOOL	I, Q, M, T, C, D, L, P	Start input
TV	Input	S5TIME, WORD	I, Q, M, D, L or constant	Time duration
<Timer>	InOut/Input	TIMER	T	Timer which is started.  The number of timers depends on the CPU.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

Network 1

Network 2

Network 3

"Timer\_1" starts when the signal state of the "TagIn\_1" operand changes from "1" to "0". The timer expires with the value of operand "TagIn\_Number". As long as the timer is running, the "TagOut" operand is set to "1". If the signal state at the "TagIn\_1" operand changes from "1" to "0" while the timer is running, the timer is restarted. If the signal state of the "TagIn\_2" operand changes to "1", "Timer\_1" is reset, i.e. the timer is stopped and the current time value is set to "0".

### See also

Overview of the valid data types (Page 1262)

### Counter operations

#### IEC Counters

#### CTU: Count up

#### Description

You can use the "Count up" instruction to increment the value at output CV. When the signal state at the CU input changes from "0" to "1" (positive signal edge), the instruction is executed and the current counter value at the CV output is incremented by one. When the instruction executes for the first time, the current counter value at the CV output is set to zero. The counter is incremented each time a positive signal edge is detected, until it reaches the high limit for

the specified data type at output CV. When the high limit is reached, the signal state at the CU input no longer has an effect on the instruction.

You can scan the counter status at the Q output. The signal state at the Q output is determined by the PV parameter. If the current counter value is greater than or equal to the value of the PV parameter, the Q output is set to signal state "1". In all other cases, the Q output has signal state "0". You can also specify a constant for the PV parameter.

The value at the CV output is reset to "0" and saved to an edge memory bit when the signal state at input R changes to "1". As long as the R input has the signal state "1", the signal state at the CU input has no effect on the instruction.

---

#### Note

Only use a counter at a single point in the program to avoid the risk of counting errors.

---

Each call of the "Count up" instruction must be assigned an IEC counter in which the instruction data is stored. An IEC counter is a structure with one of the following data types:

#### For S7-1200 CPU

Data block of system data type IEC_<Counter> (Shared DB)	Local tag
<ul style="list-style-type: none"> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> </ul>	<ul style="list-style-type: none"> <li>• CTU_SINT / CTU_USINT</li> <li>• CTU_INT / CTU_UINT</li> <li>• CTU_DINT / CTU_UDINT</li> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> </ul>

#### For S7-1500 CPU

Data block of system data type IEC_<Counter> (Shared DB)	Local tag
<ul style="list-style-type: none"> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> <li>• IEC_LCOUNTER / IEC_ULCOUNTER</li> </ul>	<ul style="list-style-type: none"> <li>• CTU_SINT / CTU_USINT</li> <li>• CTU_INT / CTU_UINT</li> <li>• CTU_DINT / CTU_UDINT</li> <li>• CTU_LINT / CTU_ULINT</li> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> <li>• IEC_LCOUNTER / IEC_ULCOUNTER</li> </ul>

You can declare an IEC counter as follows:

- Declaration of a data block of system data type IEC\_<Counter> (for example, "MyIEC\_COUNTER")
- Declaration as a local tag of the type CTU\_<Data type> or IEC\_<Counter> in the "Static" section of a block (for example #MyIEC\_COUNTER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC counter is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, it is saved to the "Program resources" folder in the "Program blocks > System blocks" path of the project tree. For additional information on this topic, refer to "See also".

When you set up the IEC counter in a separate data block (single instance), the instance data block is created by default with "optimized block access" and the individual tags are defined as retentive. For additional information on setting retentivity in an instance data block, refer to "See also".

When you set up the IEC counter as local tag (multiple instance) in a function block with "optimized block access", it is defined as retentive in the block interface.

The execution of the "Count up" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

## Parameters

The following table shows the parameters of the "Count up" instruction:

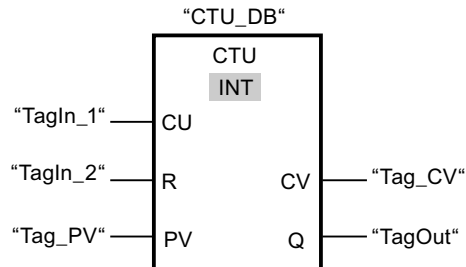

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
CU	Input	BOOL	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Count input
R	Input	BOOL	I, Q, M, D, L, P or constant	I, Q, M, T, C, D, L, P or constant	Reset input
PV	Input	Integers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Value at which the output Q is set.
Q	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Counter status
CV	Output	Integers, CHAR, DATE	I, Q, M, D, L, P	I, Q, M, D, L, P	Current counter value

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

When the signal state of the "TagIn\_1" operand changes from "0" to "1", the "Count up" instruction executes and the current counter value of the "Tag\_CV" operand is incremented by one. With each additional positive signal edge, the counter value is incremented until the high limit of the specified data type (INT = 32767) is reached.

The value of the PV parameter is adopted as the limit for determining the "TagOut" output. The "TagOut" output has signal state "1" as long as the current counter value is greater than or equal to the value of the "Tag\_PV" operand. In all other cases, the "TagOut" output returns the signal state "0".

Setting the retentivity of local tags (Page 1449)

## CTD: Count down

### Description

You can use the "Count down" instruction to decrement the value at output CV. When the signal state at the CD input changes from "0" to "1" (positive signal edge), the instruction is executed and the current counter value at the CV output is decremented by one. When the instruction is executed the first time, the counter value of the CV parameter is set to the value of the PV parameter. Each time a positive signal edge is detected, the counter value is decremented until it reaches the low limit of the specified data type. When the low limit is reached, the signal state at the CD input no longer has an effect on the instruction.

You can scan the counter status at the Q output. If the current counter value is less than or equal to "0", the Q output is set to signal state "1". In all other cases, the Q output has signal state "0". You can also specify a constant for the PV parameter.

The value at the CV output is set to the value of the PV parameter and saved to a edge memory bit when the signal state at the LD input changes from "0" to "1". As long as the LD input has the signal state "1", the signal state at the CD input has no effect on the instruction.

**Note**

Only use a counter at a single point in the program to avoid the risk of counting errors.

Each call of the "Count down" instruction must be assigned an IEC counter in which the instruction data is stored. An IEC counter is a structure with one of the following data types:

**For S7-1200 CPU**

Data block of system data type IEC_<Counter> (Shared DB)	Local tag
<ul style="list-style-type: none"> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> </ul>	<ul style="list-style-type: none"> <li>• CTD_SINT / CTD_USINT</li> <li>• CTD_INT / CTD_UINT</li> <li>• CTD_DINT / CTD_UDINT</li> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> </ul>

**For S7-1500 CPU**

Data block of system data type IEC_<Counter> (Shared DB)	Local tag
<ul style="list-style-type: none"> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> <li>• IEC_LCOUNTER / IEC_ULCOUNTER</li> </ul>	<ul style="list-style-type: none"> <li>• CTD_SINT / CTD_USINT</li> <li>• CTD_INT / CTD_UINT</li> <li>• CTD_DINT / CTD_UDINT</li> <li>• CTD_LINT / CTD_ULINT</li> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> <li>• IEC_LCOUNTER / IEC_ULCOUNTER</li> </ul>

You can declare an IEC counter as follows:

- Declaration of a data block of system data type IEC\_<Counter> (for example, "MyIEC\_COUNTER")
- Declaration as a local tag of the type CTD\_<Data type> or IEC\_<Counter> in the "Static" section of a block (for example #MyIEC\_COUNTER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC counter is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, it is saved to the "Program resources" folder in the "Program blocks > System blocks" path of the project tree. For additional information on this topic, refer to "See also".

When you set up the IEC counter in a separate data block (single instance), the instance data block is created by default with "optimized block access" and the individual tags are defined as retentive. For additional information on setting retentivity in an instance data block, refer to "See also".

When you set up the IEC counter as local tag (multiple instance) in a function block with "optimized block access", it is defined as retentive in the block interface.

The execution of the "Count down" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

## Parameters

The following table shows the parameters of the "Count down" instruction:

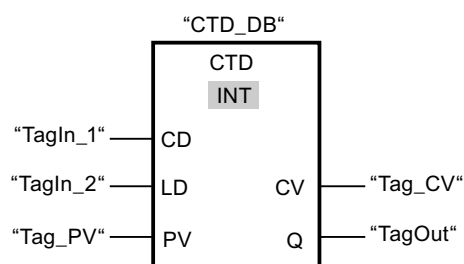

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
CD	Input	BOOL	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Count input
LD	Input	BOOL	I, Q, M, D, L, P or constant	I, Q, M, T, C, D, L, P or constant	Load input
PV	Input	Integers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Value at which the output Q is set.
Q	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Counter status
CV	Output	Integers, CHAR, DATE	I, Q, M, D, L, P	I, Q, M, D, L, P	Current counter value

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

When the signal state of the "TagIn\_1" operand changes from "0" to "1", the "Count down" instruction executes and the value at the "Tag\_CV" output is decremented by one. With each additional positive signal edge, the counter value is decremented until the low limit of the specified data type (INT = -32768) is reached.

The value of the PV parameter is adopted as the limit for determining the "TagOut" output. The "TagOut" output has signal state "1" as long as the current counter value is less than or equal to "0". In all other cases, the "TagOut" output returns the signal state "0".

## CTUD: Count up and down

### Description

You can use the "Count up and down" instruction to increment and decrement the counter value at the CV output. If the signal state at the CU input changes from "0" to "1" (positive signal edge), the current counter value is incremented by one and stored at the CV output. If the signal state at the CD input changes from "0" to "1" (positive signal edge), the current counter value at the CV output is decremented by one. If there is a positive signal edge at the CU and CD inputs in one program cycle, the current counter value at the CV output remains unchanged.

The counter value can be incremented until it reaches the high limit of the data type specified at the CV output. When the high limit is reached, the counter value is no longer incremented on a positive signal edge. When the low limit of the specified data type is reached, the counter value is not decremented any further.

When the signal state at the LD input changes to "1", the counter value at the CV output is set to the value of the PV parameter and stored in an edge memory bit. As long as the LD input has the signal state "1", the signal state at the CU and CD inputs has no effect on the instruction.

The counter value is set to "0" and stored in an edge memory bit when the signal state at input R changes to "1". As long as the R input has the signal state "1", a change in the signal state of the CU, CD and LD inputs has no effect on the "Count up and down" instruction.

You can scan the current status of the up counter at the QU output. If the current counter value is greater than or equal to the value of the PV parameter, the QU output is set to signal state "1". In all other cases, the QU output has signal state "0". You can also specify a constant for the PV parameter.

You can scan the current status of the down counter at the QD output. If the current counter value is less than or equal to zero, the QD output is set to signal state "1". In all other cases, the QD output has signal state "0".

---

### Note

Only use a counter at a single point in the program to avoid the risk of counting errors.

---

Each call of the "Count up and down" instruction must be assigned an IEC counter in which the instruction data is stored. An IEC counter is a structure with one of the following data types:

## For S7-1200 CPU

Data block of system data type IEC_<Counter> (Shared DB)	Local tag
<ul style="list-style-type: none"> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> </ul>	<ul style="list-style-type: none"> <li>• CTUD_SINT / CTUD_USINT</li> <li>• CTUD_INT / CTUD_UINT</li> <li>• CTUD_DINT / CTUD_UDINT</li> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> </ul>

## For S7-1500 CPU

Data block of system data type IEC_<Counter> (Shared DB)	Local tag
<ul style="list-style-type: none"> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> <li>• IEC_LCOUNTER / IEC_ULCOUNTER</li> </ul>	<ul style="list-style-type: none"> <li>• CTUD_SINT / CTUD_USINT</li> <li>• CTUD_INT / CTUD_UINT</li> <li>• CTUD_DINT / CTUD_UDINT</li> <li>• CTUD_LINT / CTUD_ULINT</li> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> <li>• IEC_LCOUNTER / IEC_ULCOUNTER</li> </ul>

You can declare an IEC counter as follows:

- Declaration of a data block of system data type IEC\_<Counter> (for example, "MyIEC\_COUNTER")
- Declaration as a local tag of the type CTUD\_<Data type> or IEC\_<Counter> in the "Static" section of a block (for example #MyIEC\_COUNTER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC counter is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, it is saved to the "Program resources" folder in the "Program blocks > System blocks" path of the project tree. For additional information on this topic, refer to "See also".

When you set up the IEC counter in a separate data block (single instance), the instance data block is created by default with "optimized block access" and the individual tags are defined as retentive. For additional information on setting retentivity in an instance data block, refer to "See also".

When you set up the IEC counter as local tag (multiple instance) in a function block with "optimized block access", it is defined as retentive in the block interface.

The execution of the "Count up and down" instruction requires a preceding logic operation. It can be placed within or at the end of the network.

**Parameters**

The following table shows the parameters of the "Count up and down" instruction:

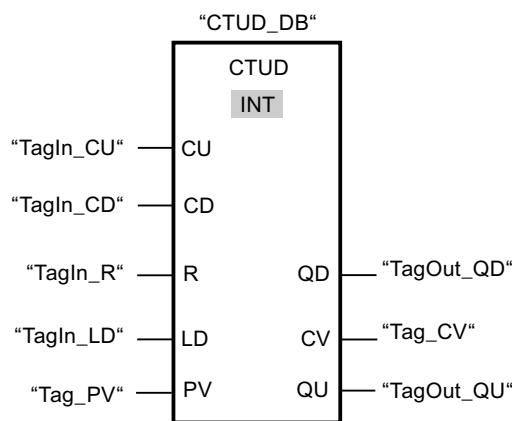

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
CU	Input	BOOL	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Count up input
CD	Input	BOOL	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Count down input
R	Input	BOOL	I, Q, M, D, L, P or constant	I, Q, M, T, C, D, L, P or constant	Reset input
LD	Input	BOOL	I, Q, M, D, L, P or constant	I, Q, M, T, C, D, L, P or constant	Load input
PV	Input	Integers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Value at which the output QU is set.
QU	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Up-counter status
QD	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Down-counter status
CV	Output	Integers, CHAR, DATE	I, Q, M, D, L, P	I, Q, M, D, L, P	Current counter value

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

If the signal state at the "TagIn\_CU" or "TagIn\_CD" input changes from "0" to "1" (positive signal edge), the "Count up and down" instruction is executed. When there is a positive signal edge at the "TagIn\_CU" input, the current counter value is incremented by one and stored at the "Tag\_CV" output. When there is a positive signal edge at the "TagIn\_CD" input, the counter value is decremented by one and stored at the "Tag\_CV" output. When there is a positive edge

at the CU input, the counter value is incremented until it reaches the high limit (INT = 32767). If input CD has a positive signal edge, the counter value is decremented until it reaches the low limit (INT = -32768).

The "TagOut\_GU" output has signal state "1" as long as the current counter value is greater than or equal to the value at the "Tag\_PV" input. In all other cases, the "TagOut\_QU" output returns the signal state "0".

The "TagOut\_QD" output has signal state "1" as long as the current counter value is less than or equal to "0". In all other cases, the "TagOut\_QD" output has signal state "0".

## SIMATIC counters

### S\_CUD: Assign parameters and count up / down

#### Description

You can use the "Assign parameters and count up / down" instruction to increment or decrement the value of a counter. If the signal state at the CU input changes from "0" to "1" (positive signal edge), the current counter value is incremented by one. If the signal state at the CD input changes from "0" to "1" (positive signal edge), the counter value is decremented by one. The current counter value is output as a hexadecimal value at output CV and BCD-coded at output CV\_BCD. If there is a positive signal edge at the CU and CD inputs in one program cycle, the counter value remains unchanged.

The counter value is incremented until the high limit of "999" is reached. When the high limit value is reached, the counter value is no longer incremented on a positive signal edge. When the low limit of "0" is reached, the counter value is no longer decremented.

When the signal state at input S changes from "0" to "1", the counter value is set to the value of the PV parameter. If the counter is set and if RLO is "1" at the inputs CU and CD, the counter counts accordingly in the next scan cycle, even if no change in the signal edge is detected.

The counter value is set to zero when the signal state at the R input changes to "1". As long as the R input has the signal state "1", processing of the signal state of the CU, CD and S inputs has no effect on the counter value.

The signal state at output Q is "1" if the counter value is greater than zero. If the counter value is equal to zero, output Q has the signal state "0".

---

#### Note

Only use a counter at a single point in the program to avoid the risk of counting errors.

---

The "Assign parameters and count up / down" instruction needs a preceding logic operation for the edge evaluation and can be placed within or at the end of the network.

**Parameters**

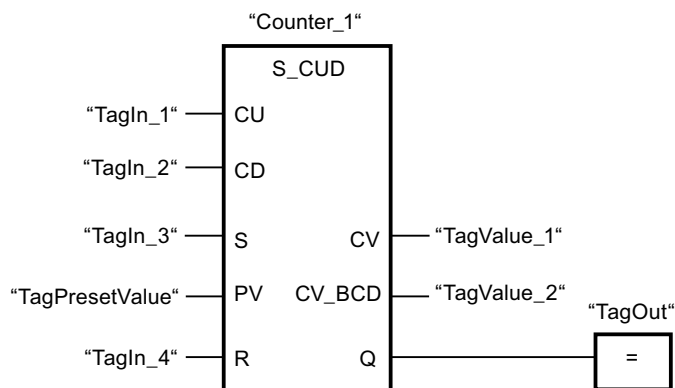

The following table shows the parameters of the "Assign parameters and count up / down" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Counter>	InOut/Input	COUNTER	C	Counter of the instruction The number of counters depends on the CPU.
CU	Input	BOOL	I, Q, M, D, L, T, C	Count up input
CD	Input	BOOL	I, Q, M, D, L, T, C or constant	Count down input
S	Input	BOOL	I, Q, M, D, L, T, C or constant	Input for presetting counter
PV	Input	WORD	I, Q, M, D, L or constant	Preset counter value (C#0 to C#999)
R	Input	BOOL	I, Q, M, D, L, T, C or constant	Reset input
CV	Output	WORD, S5TIME, DATE	I, Q, M, D, L	Current counter value (hexadecimal)
CV_BCD	Output	WORD, S5TIME, DATE	I, Q, M, D, L	Current counter value (BCD format)
Q	Output	BOOL	I, Q, M, D, L	Status of the counter

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

If the signal state at the "TagIn\_1" or "TagIn\_2" input changes from "0" to "1" (positive signal edge), the "Assign parameters and count up / down" instruction is executed. When there is a positive signal edge at the "TagIn\_1" input and the current counter value is less than "999", the counter value is incremented by one. When there is a positive signal edge at the "TagIn\_2" input and the current counter value is greater than "0", the counter value is decremented by one.

When the signal state at the "TagIn\_3" input changes from "0" to "1", the counter value is set to the value of the "TagPresetValue" operand. The counter value is reset to "0" when the "TagIn\_4" operand has signal state "1".

The current counter value is hexadecimal in the "TagValue\_1" operand and BCD-coded in the "TagValue\_2" operand.

The "TagOut" output has the signal state "1" as long as the current counter value is not equal to "0".

## S\_CU: Assign parameters and count up

### Description

You can use the "Assign parameters and count up" instruction to increment the value of a counter. If the signal state at the CU input changes from "0" to "1" (positive signal edge), the current counter value is incremented by one. The current counter value is output as a hexadecimal value at output CV and BCD-coded at output CV\_BCD. The count is incremented until the limit of "999" is reached. When the limit is reached, the counter value is no longer incremented on a positive signal edge.

When the signal state at input S changes from "0" to "1", the counter value is set to the value of the PV parameter. If the counter is set and if RLO at input CU is "1", the counter will count accordingly in the next scan cycle, even when no change has been detected in the signal edge.

The counter value is set to zero when the signal state at the R input changes to "1". As long as the R input has the signal state "1", processing of the signal state of the CU and S inputs has no effect on the counter value.

The signal state at output Q is "1" if the counter value is greater than zero. If the counter value is equal to zero, output Q has the signal state "0".

**Note**

Only use a counter at a single point in the program to avoid the risk of counting errors.

The "Assign parameters and count up" instruction needs a preceding logic operation for the edge evaluation and can be placed within or at the end of the network.

**Parameters**

The following table shows the parameters of the "Assign parameters and count up" instruction:

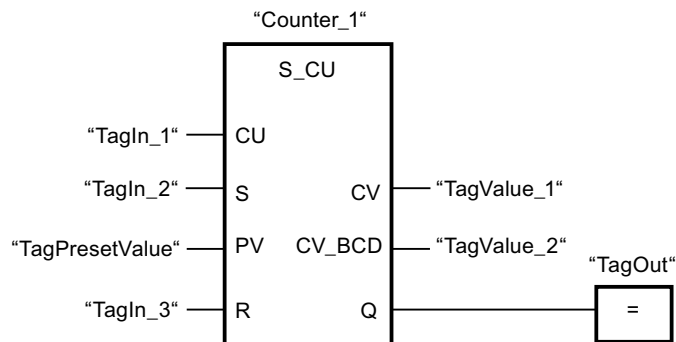

Parameters	Declaration	Data type	Memory area	Description
<Counter>	InOut/Input	COUNTER	C	Counter of the instruction The number of counters depends on the CPU.
CU	Input	BOOL	I, Q, M, D, L, T, C	Count up input
S	Input	BOOL	I, Q, M, D, L, T, C or constant	Input for presetting counter
PV	Input	WORD	I, Q, M, D, L or constant	Preset counter value (C#0 to C#999)
R	Input	BOOL	I, Q, M, D, L, T, C or constant	Reset input
CV	Output	WORD, S5TIME, DATE	I, Q, M, D, L	Current counter value (hexadecimal)
CV_BCD	Output	WORD, S5TIME, DATE	I, Q, M, D, L	Current counter value (BCD format)
Q	Output	BOOL	I, Q, M, D, L	Status of the counter

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

When the signal state at the "TagIn\_1" input changes from "0" to "1" (positive signal edge) and the current counter value is less than "999", the counter value is incremented by one. When the signal state at the "TagIn\_2" input changes from "0" to "1", the counter value is set to the value of the "TagPresetValue" operand. The counter value is reset to "0" when the "TagIn\_3" operand has signal state "1".

The current counter value is hexadecimal in the "TagValue\_1" operand and BCD-coded in the "TagValue\_2" operand.

The "TagOut" output has the signal state "1" as long as the current counter value is not equal to "0".

## See also

Overview of the valid data types (Page 1262)

## S\_CD: Assign parameters and count down

### Description

You can use the "Assign parameters and count down" instruction to decrement the value of a counter. If the signal state at the CD input changes from "0" to "1" (positive signal edge), the counter value is decremented by one. The current counter value is output as a hexadecimal value at output CV and BCD-coded at output CV\_BCD. The count is decremented until the low limit of "0" is reached. When the low limit is reached, the counter value is no longer decremented on a positive signal edge.

When the signal state at input S changes from "0" to "1", the counter value is set to the value of the PV parameter. If the counter is set and if RLO at input CD is "1", the counter will count accordingly in the next scan cycle, even when no change has been detected in the signal edge.

The counter value is set to zero when the signal state at the R input changes to "1". As long as the R input has the signal state "1", processing of the signal state of the CD and S inputs has no effect on the counter value.

The signal state at output Q is "1" if the counter value is greater than zero. If the counter value is equal to zero, output Q has the signal state "0".

**Note**

Only use a counter at a single point in the program to avoid the risk of counting errors.

The "Assign parameters and count down" instruction needs a preceding logic operation for the edge evaluation and can be placed within or at the end of the network.

**Parameters**

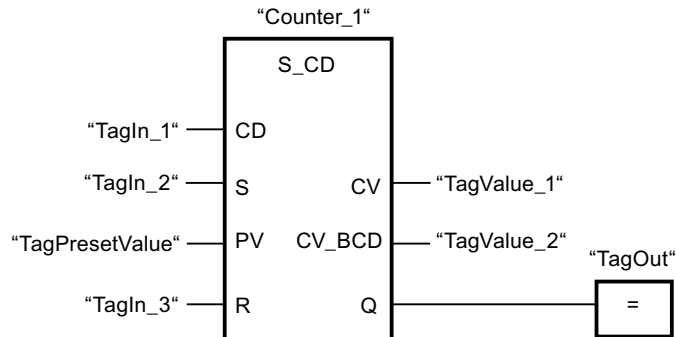

The following table shows the parameters of the "Assign parameters and count down" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Counter>	InOut/Input	COUNTER	C	Counter of the instruction The number of counters depends on the CPU.
CD	Input	BOOL	I, Q, M, D, L or constant	Count down input
S	Input	BOOL	I, Q, M, D, L, T, C or constant	Input for presetting counter
PV	Input	WORD	I, Q, M, D, L or constant	Preset counter value (C#0 to C#999)
R	Input	BOOL	I, Q, M, D, L, T, C or constant	Reset input
CV	Output	WORD, S5TIME, DATE	I, Q, M, D, L	Current counter value (hexadecimal)
CV_BCD	Output	WORD, S5TIME, DATE	I, Q, M, D, L	Current counter value (BCD format)
Q	Output	BOOL	I, Q, M, D, L	Status of the counter

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

When the signal state at the "TagIn\_1" input changes from "0" to "1" (positive signal edge) and the current counter value is greater than "0", the counter value is decremented by one. When the signal state at the "TagIn\_2" input changes from "0" to "1", the counter value is set to the value of the "TagPresetValue" operand. The counter value is reset to "0" when the "TagIn\_3" operand has signal state "1".

The current counter value is hexadecimal in the "TagValue\_1" operand and BCD-coded in the "TagValue\_2" operand.

The "TagOut" output has the signal state "1" as long as the current counter value is not equal to "0".

## See also

Overview of the valid data types (Page 1262)

## SC: Set counter value

### Description

You can use the "Set counter value" instruction to set the value of a counter. The instruction is executed when the result of logic operation (RLO) at the start input of the instruction changes from "0" to "1". When the instruction is executed, the counter is set to the specified counter value.

The "Set counter value" instruction needs a preceding logic operation for the edge evaluation and can only be placed on the right edge of the network.

### Parameters

The following table lists the parameters of the "Set counter value" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Input	BOOL	I, Q, M, T, C, D, L	Start input
CV	Input	WORD	I, Q, M, D, L or constant	Value with which the counter is preset in the BCD format. (C#0 to C#999)
<Counter>	InOut/Input	COUNTER	C	Counter that is preset.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

the counter "Counter\_1" starts with the value "100" when the signal state of the "TagIn" operand changes from "0" to "1".

### See also

Overview of the valid data types (Page 1262)

### CU: Count up

### Description

You use the "Count up" instruction to increment the value of the specified counter by the count of one on a rising edge at the start input. The count is incremented until the limit of "999" is reached. When the limit is reached, the counter value is no longer incremented on a positive signal edge.

The "Count up" instruction needs a preceding logic operation for the edge evaluation and can only be placed on the right edge of the network.

## Parameters

The following table shows the parameters of the "Count up" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Input	BOOL	I, Q, M, T, C, D, L	Start input
<Counter>	InOut/Input	COUNTER	C	Counter whose value is incremented.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

Network 1

Network 2

Network 3

When the signal state of the operand "TagIn\_1" changes from "0" to "1" (positive signal edge), the counter "Counter\_1" is preset with the value "100".

The value of "Counter\_1" is incremented by the count of one when the signal state of the "TagIn\_2" operand changes from "0" to "1".

If the "TagIn\_3" operand returns signal state "1", the value of "Counter\_1" is reset to "0".

## See also

Overview of the valid data types (Page 1262)

## CD: Count down

### Description

You use the "Count down" instruction to decrement the value of the specified counter by the count of one on a rising edge at the start input. The count is decremented until the limit of "0" is reached. When the limit is reached, the counter value is no longer changed on a positive signal edge.

The "Count down" instruction needs a preceding logic operation for the edge evaluation and can only be placed on the right edge of the network.

### Parameters

The following table shows the parameters of the "Count down" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Input	BOOL	I, Q, M, T, C, D, L	Start input
<Counter>	InOut/Input	COUNTER	C	Counter whose value is decremented.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

Network 1

Network 2

Network 3

When the signal state of the operand "TagIn\_1" changes from "0" to "1" (positive signal edge), the counter "Counter\_1" is preset with the value "100".

The value of "Counter\_1" is incremented by the count of one when the signal state of the "TagIn\_2" operand changes from "0" to "1".

If the "TagIn\_3" operand returns signal state "1", the value of "Counter\_1" is reset to "0".

Overview of the valid data types (Page 1262)

## Comparator operations

### CMP ==: Equal

#### Description

You can use the "Equal" instruction to query whether the value at input IN1 is equal to the value at input IN2.

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0".

The individual characters are compared by means of their code (for example, 'a' is greater than 'A') during the comparison of the strings. The comparison is performed from left to right. The first character to be different decides the result of the comparison.

The following table lists examples of string comparisons:

IN1	IN2	RLO of the instruction
'AA'	'AA'	1
'Hello World'	'HelloWorld'	0
'AA'	'aa'	0

The "Equal" instruction also compares individual characters of a string. The number of the character to be compared is specified in square brackets next to the operand name. "MyString[2]", for example, compares the second character of the "MyString" string.

If IEC check is enabled, the operands to be compared must be of the same data type. If IEC check is not enabled, the width (length) of the operands must be the same. If the floating-point numbers are being compared, the operands to be compared must be of the same data type regardless of the IEC check setting.

#### Note

##### Comparison of floating-point numbers

If you want to compare the data types REAL or LREAL, instead of the instruction "CMP ==: Equal", use the instruction "IN\_RANGE: Value within range".

**Note**

**Comparison of the data type PORT**

To be able to compare the operands of the PORT data type with the "Equal" instruction, you need to select the WORD data type from the drop-down list of the instructions box.

**Parameters**

The following table lists the parameters of the "Equal" instruction:

Parameter	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
IN1	Input	Bit strings, integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Bit strings, integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	First comparison value
IN2	Input	Bit strings, integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Bit strings, integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	Second value to compare

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also":

**Example**

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operand "TagIn\_1" has the signal state "1".
- The condition of the comparison instruction is fulfilled if "Tag\_Value1" = "Tag\_Value2".

**See also**

Overview of the valid data types (Page 1262)

**CMP <>: Not equal****Description**

You can use the "Not equal" instruction to query whether the value at input IN1 is not equal to the value at input IN2.

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0".

The individual characters are compared by means of their code (for example, 'a' is greater than 'A') during the comparison of the strings. The comparison is performed from left to right. The first character to be different decides the result of the comparison.

The following table lists examples of string comparisons:

IN1	IN2	RLO of the instruction
'AA'	'aa'	1
'Hello World'	'HelloWorld'	1
'AA'	'AA'	0

The "Not equal" instruction also compares individual characters of a string. The number of the character to be compared is specified in square brackets next to the operand name. "MyString[2]", for example, compares the second character of the "MyString" string.

If IEC check is enabled, the operands to be compared must be of the same data type. If IEC check is not enabled, the width (length) of the operands must be the same. If the floating-point numbers are being compared, the operands to be compared must be of the same data type regardless of the IEC check setting.

**Note****Comparison of the data type PORT**

To be able to compare the operands of the PORT data type with the "Not equal" instruction, you need to select the WORD data type from the drop-down list of the instructions box.

### Parameters

The following table lists the parameters of the "Not equal" instruction:

Parameters	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
IN1	Input	Bit strings, integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Bit strings, integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	First comparison value
IN2	Input	Bit strings, integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Bit strings, integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	Second value to compare

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operand "TagIn\_1" has the signal state "1".
- The condition of the comparison instruction is fulfilled if "Tag\_Value1" <> "Tag\_Value2".

### See also

Overview of the valid data types (Page 1262)

## CMP >=: Greater or equal

### Description

You can use the "Greater or equal" instruction to query whether the value at input IN1 is greater or equal to the value at input IN2. Both values to be compared must be of the same data type.

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0".

The individual characters are compared by means of their code (for example, 'a' is greater than 'A') during the comparison of the strings. The comparison is performed from left to right. The first character to be different decides the result of the comparison. If the left part of the longer string is identical to the shorter string, the longer string is considered greater.

The following table lists examples of string comparisons:

IN1	IN2	RLO of the instruction
'BB'	'AA'	1
'AAA'	'AA'	1
'Hello World'	'Hello World'	1
'Hello World'	'HelloWorld'	0
'AA'	'aa'	0
'AAA'	'a'	0

The "Greater or equal" instruction also compares individual characters of a string. The number of the character to be compared is specified in square brackets next to the operand name. "MyString[2]", for example, compares the second character of the "MyString" string.

In comparing timer values, the RLO of the instruction is "1" if the timer at input IN1 is greater (more recent) than or equal to the timer at input IN2.

### Parameters

The following table lists the parameters of the "Greater or equal" instruction:

Parameters	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
IN1	Input	Integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	First comparison value
IN2	Input	Integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	Second value to compare

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operand "TagIn\_1" has the signal state "1".
- The condition of the comparison instruction is fulfilled if "Tag\_Value1" >= "Tag\_Value2".

### See also

Overview of the valid data types (Page 1262)

Example of detecting the fill level of a storage area (Page 1784)

## CMP <=: Less or equal

### Description

You can use the "Less or equal" instruction to query whether the value at input IN1 is less or equal to the value at input IN2. Both values to be compared must be of the same data type.

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0".

The individual characters are compared by means of their code (for example, 'a' is greater than 'A') during the comparison of the strings. The comparison is performed from left to right. The first character to be different decides the result of the comparison. If the left part of the longer string is identical to the shorter string, the shorter string is considered smaller.

The following table lists examples of string comparisons:

IN1	IN2	RLO of the instruction
'AA'	'aa'	1
'AAA'	'a'	1
'Hello World'	'Hello World'	1
'HelloWorld'	'Hello World'	0
'BB'	'AA'	0
'AAA'	'AA'	0

The "Less or equal" instruction also compares individual characters of a string. The number of the character to be compared is specified in square brackets next to the operand name. "MyString[2]", for example, compares the second character of the "MyString" string.

In comparing timer values, the RLO of the instruction is "1" if the timer at input IN1 is smaller (less recent) than or equal to the timer at input IN2.

### Parameters

The following table lists the parameters of the "Less or equal" instruction:

Parameters	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
IN1	Input	Integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	First comparison value
IN2	Input	Integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	Second value to compare

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operand "TagIn\_1" has the signal state "1".
- The condition of the comparison instruction is fulfilled if "Tag\_Value1" <= "Tag\_Value2".

### See also

Overview of the valid data types (Page 1262)

**CMP >: Greater than****Description**

You can use the "Greater than" instruction to query whether the value at input IN1 is greater than the value at input IN2. Both values to be compared must be of the same data type.

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0".

The individual characters are compared by means of their code (for example, 'a' is greater than 'A') during the comparison of the strings. The comparison is performed from left to right. The first character to be different decides the result of the comparison. If the left part of the longer string is identical to the shorter string, the longer string is considered greater.

The following table lists examples of string comparisons:

IN1	IN2	RLO of the instruction
'BB'	'AA'	1
'AAA'	'AA'	1
'AA'	'aa'	0
'AAA'	'a'	0

The "Greater than" instruction also compares individual characters of a string. The number of the character to be compared is specified in square brackets next to the operand name. "MyString[2]", for example, compares the second character of the "MyString" string.

In comparing timer values, the RLO of the instruction is "1" if the timer at input IN1 is greater (more recent) than the timer at input IN2.

**Parameters**

The following table lists the parameters of the "Greater than" instruction:

Parameters	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
IN1	Input	Integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	First comparison value
IN2	Input	Integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	Second value to compare

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operand "TagIn\_1" has the signal state "1".
- The condition of the comparison instruction is fulfilled if "Tag\_Value1" > "Tag\_Value2".

**See also**

Overview of the valid data types (Page 1262)

**CMP <: Less than**

**Description**

You can use the "Less than" instruction to query whether the value at input IN1 is less than the value at input IN2. Both values to be compared must be of the same data type.

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0".

The individual characters are compared by means of their code (for example, 'a' is greater than 'A') during the comparison of the strings. The comparison is performed from left to right. The first character to be different decides the result of the comparison. If the left part of the longer string is identical to the shorter string, the shorter string is considered smaller.

The following table lists examples of string comparisons:

<Operand1>	<Operand2>	RLO of the instruction
'AA'	'aa'	1
'AAA'	'a'	1
'BB'	'AA'	0
'AAA'	'AA'	0

The "Less than" instruction also compares individual characters of a string. The number of the character to be compared is specified in square brackets next to the operand name. "MyString[2]", for example, compares the second character of the "MyString" string.

In comparing timer values, the RLO of the instruction is "1" if the timer at input IN1 is less (less recent) than the timer at input IN2 .

## Parameters

The following table lists the parameters of the "Less than" instruction:

Parameters	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
IN1	Input	Integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	First comparison value
IN2	Input	Integers, floating-point numbers, character strings, TIME, DATE, TOD, DTL	Integers, floating-point numbers, character strings, TIME, LTIME, DATE, TOD, LTOD, DTL, DT, LDT	I, Q, M, D, L, P or constant	Second value to compare

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operand "TagIn\_1" has the signal state "1".
- The condition of the comparison instruction is fulfilled if "Tag\_Value1" < "Tag\_Value2".

## See also

Overview of the valid data types (Page 1262)

Example of detecting the fill level of a storage area (Page 1784)

## IN\_RANGE: Value within range

### Description

You can use the "Value within range" instruction to query whether of the value at input VAL is within a specific value range.

You specify the limits of the value range with the MIN and MAX inputs. The "Value within range" instruction compares the value at input VAL with the values of the inputs MIN and MAX and sends the result to the box output. If the value at input VAL satisfies the comparison  $MIN \leq VAL$  or  $VAL \leq MAX$ , the box output has the signal state "1". If the comparison is not fulfilled, the signal state is "0" at the box output.

The comparison function can only execute if the values to be compared are of the same data type.

### Parameters

The following table shows the parameters of the "Value within range" instruction:

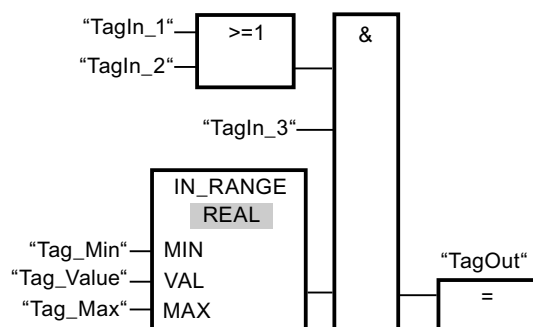

Parameters	Declaration	Data type	Memory area	Description
MIN	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Low limit of the value range
VAL	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Comparison value
MAX	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	High limit of the value range
Box output	Output	BOOL	I, Q, M, D, L	Result of the comparison

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also":

### Example

The following example shows how the instruction works:

Output "TagOut" is set when the following conditions are fulfilled:

- The operands "TagIn\_1" or "TagIn\_2" have signal state "1".
- The operand "TagIn\_3" has the signal state "1".
- The value of the operand "Tag\_Value" is within the value range that is specified by the current values of the operands "Tag\_Min" and "Tag\_Max" ( $\text{MIN} \leq \text{VAL}$  or  $\text{VAL} \leq \text{MAX}$ ).

## See also

Overview of the valid data types (Page 1262)

## OUT\_RANGE: Value outside range

### Description

You can use the "Value outside range" instruction to query whether of the value at input VAL is outside a specific value range.

You specify the limits of the value range with the MIN and MAX inputs. The "Value outside range" instruction compares the value at input VAL with the values of the inputs MIN and MAX and sends the result to the box output. If the value at input VAL satisfies the comparison  $\text{MIN} > \text{VAL}$  or  $\text{VAL} > \text{MAX}$ , the box output has the signal state "1". The box output has the signal state "1" if a specified operand of data type REAL has an invalid value.

The box output returns the signal state "0", if the value at input VAL does not satisfy the  $\text{MIN} > \text{VAL}$  or  $\text{VAL} > \text{MAX}$  condition.

The comparison function can only execute if the values to be compared are of the same data type.

### Parameters

The following table shows the parameters of the "Value outside range" instruction:

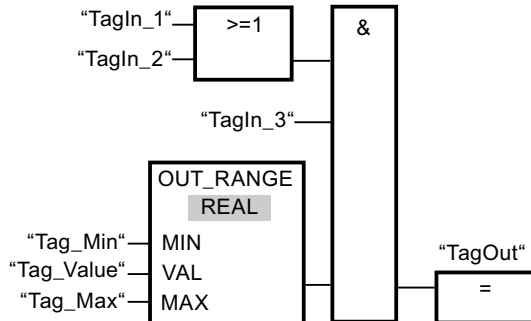

Parameters	Declaration	Data type	Memory area	Description
MIN	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Low limit of the value range
VAL	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	Comparison value
MAX	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	High limit of the value range
Box output	Output	BOOL	I, Q, M, D, L	Result of the comparison

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

Output "TagOut" is set when the following conditions are fulfilled:

- The operands "TagIn\_1" and "TagIn\_2" have signal state "1".
- The operand "TagIn\_3" has the signal state "1".
- The value of the operand "Tag\_Value" is outside the value range that is specified by the values of the operands "Tag\_Min" and "Tag\_Max" (MIN > VAL or VAL > MAX).

**See also**

Overview of the valid data types (Page 1262)

**OK: Check validity**

**Description**

You can use the "Check validity" instruction to check if the value of an operand (<Operand>) is a valid floating-point number. The check is performed in every program cycle. If the operand value at the time of the query is a valid floating-point number, the output box will return the signal state "1". In all other cases, the signal state at the output of the "Check validity" instruction is "0".

You can use the "Check validity" instruction together with the EN mechanism. If you connect the instruction box to an EN enable input, the enable input is set only when the result of the validity query of the value is positive. You can use this function to ensure that an instruction is enabled only when the value of the specified operand is a valid floating-point number.

**Parameters**

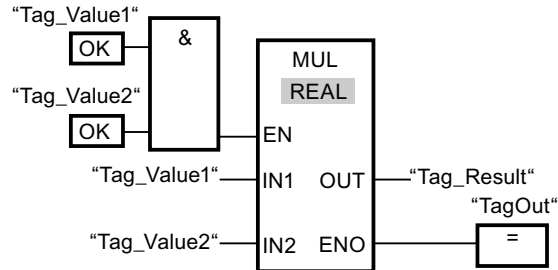

The following example shows how the "Check validity" instruction works:

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Input	Floating-point numbers	I, Q, M, D, L	Value to be checked.

For additional information on valid data types, refer to "See also":

## Example

The following example shows how the instruction works:

When the values of the operands "Tag\_Value1" and "Tag\_Value2" show valid floating-point numbers, the "Multiply" (MUL) instruction is activated and the ENO output is set. During the execution of the "Multiply" (MUL) instruction, the value of the operand "Tag\_Value1" is multiplied by the value of operand "Tag\_Value2". The product of the multiplication is then stored in the operand "Tag\_Result". If no errors occur during the execution of the instruction, the outputs ENO and "TagOut" are set to signal state "1".

## See also

Overview of the valid data types (Page 1262)

## NOT\_OK: Check invalidity

### Description

You can use the "Check invalidity" instruction to check if the value of an operand (<Operand>) is an invalid floating-point number. The check is performed in every program cycle. If the operand value at the time of the query is a valid floating-point number, then the output box will return the signal state "1". In all other cases, the signal state on the output box is "0".

### Parameters

The following table shows the parameters of the instruction "Check invalidity":

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Input	Floating-point numbers	I, Q, M, D, L	Value to be checked.

For additional information on valid data types, refer to "See also":

**Example**

The following example shows how the instruction works:

When the value of operand "TagIn\_Value" is an invalid floating-point number, the instruction "Move value" (MOVE) is not executed. The "TagOut" output is reset to signal state "0".

**See also**

Overview of the valid data types (Page 1262)

**VARIANT instructions**

**EQ\_Type: Compare data type for EQUAL with the data type of a tag**

**Description**

You can use the "Compare data type for EQUAL with the data type of a tag" instruction to query the data type of a tag to which a VARIANT points. You compare the data type of the tag to the data type of a tag that you have declared in the block interface to determine if they are "Equal".

The IN1 parameter must have the same VARIANT data type. The IN2 parameter can be an elementary data type or a PLC data type.

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0".

**Parameters**

The following table shows the parameters of the "Compare data type for EQUAL with the data type of a tag" instruction:

Parameters	Declaration	Data type	Memory area	Description
IN1	Input	VARIANT	L	First operand
IN2	Input	Bit strings, integers, floating-point numbers, timers, date and time, character strings, ARRAY, PLC data types	I, Q, M, D, L	Second operand

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operand "TagIn" has the signal state "1".
- The condition of the comparison instruction is fulfilled, i.e. the "#Tag\_Operand1" operand is equal to "Tag\_Operand2".

## See also

Overview of the valid data types (Page 1262)

## NE\_Type: Compare data type for UNEQUAL with the data type of a tag

### Description

You can use the "Compare data type for UNEQUAL with the data type of a tag" instruction to query which data type the tag to which a VARIANT points does not have. You compare the data type of the tag to the data type of a tag that you have declared in the block interface to determine if they are "Unequal".

The IN1 parameter must have the same VARIANT data type. The IN2 parameter can be an elementary data type or a PLC data type.

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0".

### Parameters

The following table shows the parameters of the "Compare data type for UNEQUAL with the data type of a tag" instruction:

Parameters	Declaration	Data type	Memory area	Description
IN1	Input	VARIANT	L	First operand
IN2	Input	Bit strings, integers, floating-point numbers, timers, date and time, character strings, ARRAY, PLC data types	I, Q, M, D, L	Second operand

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operand "TagIn" has the signal state "1".
- The condition of the comparison instruction is fulfilled, i.e. the "#Tag\_Operand1" operand is not equal to "Tag\_Operand2".

**See also**

Overview of the valid data types (Page 1262)

**EQ\_ElemType: Compare element data type for EQUAL with the data type of a tag**

**Description**

You can use the "Compare element data type for EQUAL with the data type of a tag" instruction to query the data type of a tag to which a VARIANT points. You compare the data type of the tag to the data type of a tag that you have declared in the block interface to determine if they are "Equal".

The IN1 parameter must have the same VARIANT data type. The IN2 parameter can be an elementary data type or a PLC data type.

If the data type of the VARIANT tag is an ARRAY, the data type of the ARRAY elements is compared.

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0".

**Parameters**

The following table shows the parameters of the "Compare element data type for EQUAL with the data type of a tag" instruction:

Parameters	Declaration	Data type	Memory area	Description
IN1	Input	VARIANT	L	First operand
IN2	Input	Bit strings, integers, floating-point numbers, timers, date and time, character strings, ARRAY, PLC data types	I, Q, M, D, L	Second operand

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operand "TagIn" has the signal state "1".
- The condition of the comparison instruction is fulfilled, i.e. the "#Tag\_Operand1" operand is equal to "Tag\_Operand2".

## See also

Overview of the valid data types (Page 1262)

## NE\_ElemType: Compare element data type for UNEQUAL with the data type of a tag

### Description

You can use the "Compare element data type for UNEQUAL with the data type of a tag" instruction to query which data type the tag to which a VARIANT points does not have. You compare the data type of the tag to the data type of a tag that you have declared in the block interface to determine if they are "Unequal".

The IN1 parameter must have the same VARIANT data type. The IN2 parameter can be an elementary data type or a PLC data type.

If the data type of the VARIANT tag is an ARRAY, the data type of the ARRAY elements is compared.

If the condition of the comparison is fulfilled, the instruction returns the result of logic operation (RLO) "1". If the comparison condition is not fulfilled, the instruction returns RLO "0".

### Parameters

The following table shows the parameters of the "Compare element data type for UNEQUAL with the data type of a tag" instruction:

Parameters	Declaration	Data type	Memory area	Description
IN1	Input	VARIANT	L	First operand
IN2	Input	Bit strings, integers, floating-point numbers, timers, date and time, character strings, ARRAY, PLC data types	I, Q, M, D, L	Second operand

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operand "TagIn" has the signal state "1".
- The condition of the comparison instruction is fulfilled, i.e. the "#Tag\_Operand1" operand is not equal to "Tag\_Operand2".

**See also**

Overview of the valid data types (Page 1262)

**IS\_NULL: Compare for EQUALS ZERO**

**Description**

You can use the instruction "Compare for EQUALS ZERO" to query whether the VARIANT does not point to an object.

The <Operand> must have the VARIANT data type.

**Note**

**VARIANT tag points to an ANY pointer**

If the VARIANT tag points to an ANY pointer, the instruction always returns the result RLO = "0" even if the ANY pointer is ZERO.

**Parameters**

The following table shows the parameters of the "Compare for EQUALS ZERO" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Input	VARIANT	L	Operand that is compared for EQUAL ZERO

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operands "Tag\_In1" and "Tag\_In2" have signal state "1".
- The condition of the comparison instruction is fulfilled, i.e. the "#Tag\_Operand" operand does not point to an object.

## See also

Overview of the valid data types (Page 1262)

## NOT\_NULL: Compare for UNEQUALS ZERO

### Description

You can use the instruction "Compare for UNEQUALS ZERO" to query whether the VARIANT points to an object.

The <Operand> must have the VARIANT data type.

#### Note

#### VARIANT tag points to an ANY pointer

If the VARIANT tag points to an ANY pointer, the instruction always returns the result RLO = "1" even if the ANY pointer is ZERO.

## Parameters

The following table shows the parameters of the "Compare for UNEQUALS ZERO" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Input	VARIANT	L	Operand that is compared for NOT EQUAL ZERO

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operands "Tag\_In1" and "Tag\_In2" have signal state "1".
- The condition of the comparison instruction is fulfilled, i.e. the "#Tag\_Operand" operand points to an object.

**See also**

Overview of the valid data types (Page 1262)

**IS\_ARRAY: Check for ARRAY**

**Description**

You can use the "Check for ARRAY" instruction to query whether the VARIANT points to a tag of the ARRAY data type.

The <Operand> must have the VARIANT data type.

**Parameters**

The following table shows the parameters of the "Check for ARRAY" instruction:

Parameters	Declaration	Data type	Memory area	Description
<Operand>	Input	VARIANT	L	Operand that is queried for ARRAY

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The "TagOut" output is set when the following conditions are fulfilled:

- The operands "Tag\_In1" and "Tag\_In2" have signal state "1".
- The condition of the comparison instruction is fulfilled, i.e. the "#Tag\_VARIANTToArray" operand has the ARRAY data type.

## Math functions

### CALCULATE: Calculate

#### Description

The "Calculate" instruction is used to define and execute an expression for the calculation of mathematical operations or complex logic operations depending on the selected data type.

You can select the data type of the instruction from the "<???" drop-down list of the instruction box. Depending on the selected data type, you can combine the functionality of specific instructions to execute a complex calculation. The expression to be calculated is specified via a dialog you can open via the "Calculator" icon at the top of the instruction box. The expression can contain the names of the input parameters and the syntax of the instructions. It is not permitted to specify operand names or operand addresses.

In its initial state, the instruction box contains at least 2 inputs (IN1 and IN2). The number of inputs can be extended. The inserted inputs are numbered in ascending order in the box.

The values of the inputs are used to execute the specified expression. Not all defined inputs have to be used in the expression. The result of the instruction is transferred to the box output OUT.

---

#### Note

If one of the mathematical operations fails in the expression, then no result is transferred to the OUT output and the ENO enable output has the signal state "1".

---

If, in the expression, you use inputs that are not available in the box, these inputs are automatically inserted. Provided that there are no gaps in the numbering of the inputs that are to be newly defined in the expression. You cannot, for example, use the input IN4 in the expression if the input IN3 is not defined.

Enable output ENO has the signal state "0" if one of the following conditions is fulfilled:

- Enable input EN has the signal state "0".
- The result or an interim result of the "Calculate" instruction is outside the range permitted for the data type specified at output OUT.
- A floating-point number has an invalid value.
- An error occurred during the execution of one of the instructions specified in the expression.

The following table shows the instructions that, depending on the selected data type, can be combined and executed in the expression of the "Calculate" instruction:

Data type	Instruction	Syntax	Example
Bit strings	AND: AND logic operation	AND	IN1 AND IN2 OR IN3
	OR: OR logic operation	OR	
	XOR: EXCLUSIVE OR logic operation	XOR	
	INV: Create ones complement	NOT	
	SWAP: Swap <sup>1)</sup>	SWAP	
Integers	ADD: Add	+	(IN1 + IN2) * IN3; (ABS(IN2)) * (ABS(IN1))
	SUB: Subtract	-	
	MUL: Multiply	*	
	DIV: Divide	/	
	MOD: Return remainder of division	MOD	
	INV: Create ones complement	NOT	
	NEG: Create twos complement	-(in1)	
	ABS: Form absolute value	ABS( )	
Floating-point numbers	ADD: Add	+	((SIN(IN2) * SIN(IN2)) + (SIN(IN3) * SIN(IN3)) / IN3)); (SQR(SIN(IN2)) + (SQR(COS(IN3)) / IN2))
	SUB: Subtract	-	
	MUL: Multiply	*	
	DIV: Divide	/	
	EXPT: Exponentiate	**	
	ABS: Form absolute value	ABS( )	
	SQR: Form square	SQR( )	
	SQRT: Form square root	SQRT( )	
	LN: Form natural logarithm	LN( )	
	EXP: Form exponential value	EXP( )	
	FRAC: Return fraction	FRAC( )	
	SIN: Form sine value	SIN( )	
	COS: Form cosine value	COS( )	
	TAN: Form tangent value	TAN( )	
	ASIN: Form arcsine value	ASIN( )	
	ACOS: Form arccosine value	ACOS( )	

Data type	Instruction	Syntax	Example
	ATAN: Form arctangent value	ATAN( )	
	NEG: Create twos complement	-(in1)	
	TRUNC: Truncate numerical value	TRUNC( )	
	ROUND: Round numerical value	ROUND( )	
	CEIL: Generate next higher integer from floating-point number	CEIL( )	
	FLOOR: Generate next lower integer from floating-point number	FLOOR( )	

<sup>1)</sup> Not possible for data type BYTE.

## Parameters

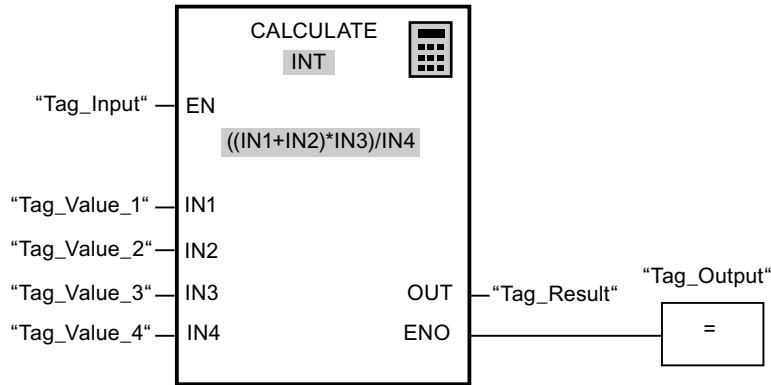

The following table shows the parameters of the instruction "Calculate":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN1	Input	Bit strings, integers, floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	First available input
IN2	Input	Bit strings, integers, floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Second available input
INn	Input	Bit strings, integers, floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Additionally inserted inputs
OUT	Output	Bit strings, integers, floating-point numbers	I, Q, M, D, L, P	I, Q, M, D, L, P	Output to which the end result is to be transferred.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN1	Tag_Value_1	4
IN2	Tag_Value_2	4
IN3	Tag_Value_3	3
IN4	Tag_Value_4	2
OUT	Tag_Result	12

The "Calculate" instruction is executed when input "Tag\_Input" has the signal state "1". The value of operand "Tag\_Value\_1" is added to the value of operand "Tag\_Value\_2". The sum is multiplied with the value of the operand "Tag\_Value\_3". The product is divided by the value of the operand "Tag\_Value\_4". The quotient is transferred as end result to the operand "Tag\_Result" at the OUT output of the instruction. If no errors occur during the execution of the individual instructions, output ENO and the operand "Tag\_Output" are set to "1".

- Adding additional inputs and outputs to FBD elements (Page 1527)
- Removing instruction inputs and outputs (Page 1528)
- Basics of the EN/ENO mechanism (Page 1357)

**ADD: Add**

**Description**

You can use the "Add" instruction to add the value at input IN1 to the value at input IN2 and query the sum at output OUT (OUT := IN1+IN2).

In its initial state the instruction box contains at least 2 inputs (IN1 and IN2). The number of inputs can be extended. The inserted inputs are numbered in ascending order in the box.

During the execution of the instruction, the values of all available input parameters are added. The sum is stored at output OUT.

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- The result of the instruction is outside the range permitted for the data type specified at output OUT.
- A floating-point number has an invalid value.

## Parameters

The following table shows the parameters of the instruction "Add":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN1	Input	Integers, floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	First number to be added
IN2	Input	Integers, floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Second number to be added
INn	Input	Integers, floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Optional input values, which are added.
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L, P	I, Q, M, D, L, P	Sum

You can select the data type of the instruction from the "<???"> drop-down list of the instruction box.

For additional information on valid data types, refer to "See also":

## Example

The following example shows how the instruction works:

If the operand "TagIn" has the signal state "1", the "Add" instruction is executed. The value of operand "Tag\_Value1" is added to the value of operand "Tag\_Value2". The result of the

addition is stored in the operand "Tag\_Result". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

- Adding additional inputs and outputs to FBD elements (Page 1527)

**SUB: Subtract**

**Description**

You can use the "Subtract" instruction to subtract the value at input IN2 from the value at input IN1 and query the difference at output OUT (OUT := IN1-IN2).

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- The result of the instruction is outside the range permitted for the data type specified at output OUT.
- A floating-point number has an invalid value.

**Parameters**

The following table shows the parameters of the instruction "Subtract":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN1	Input	Integers, floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Minuend
IN2	Input	Integers, floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Subtrahend
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L, P	I, Q, M, D, L, P	Difference

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

If the operand "TagIn" has the signal state "1", the "Subtract" instruction is executed. The value of operand "Tag\_Value2" is subtracted from the value of operand "Tag\_Value1". The result of the subtraction is stored in the operand "Tag\_Result". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

## MUL: Multiply

### Description

You can use the "Multiply" instruction to multiply the value at input IN1 with the value at input IN2 and query the total at output OUT (OUT := IN1\*IN2).

In its initial state the instruction box contains at least 2 inputs (IN1 and IN2). The number of inputs can be extended. The inserted inputs are numbered in ascending order in the box. When the instruction is executed, the values of all available input parameters are multiplied. The product is stored at the OUT output.

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- The result is outside the range permitted for the data type specified at output OUT.
- A floating-point number has an invalid value.

### Parameters

The following table shows the parameters of the instruction "Multiply":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN1	Input	Integers, floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	First value for multiplication
IN2	Input	Integers, floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Second value for multiplication
INn	Input	Integers, floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Optional input values, which are multiplied.
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L, P	I, Q, M, D, L, P	Product

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

If the operand "TagIn" has the signal state "1", the "Multiply" instruction is executed. The value of operand "Tag\_Value1" is multiplied with the value of operand "Tag\_Value2". The result of the multiplication is stored in the operand "Tag\_Result". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

## DIV: Divide

### Description

You can use the "Divide" instruction to divide the value at input IN1 by the value at input IN2 and query the quotient at output OUT (OUT := IN1/IN2).

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- The result of the instruction is outside the range permitted for the data type specified at output OUT.
- A floating-point number has an invalid value.

### Parameters

The following table shows the parameters of the instruction "Divide":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN1	Input	Integers, floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Dividend
IN2	Input	Integers, floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Divisor
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L, P	I, Q, M, D, L, P	Quotient value

You can select the data type of the instruction from the "<???"> drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

If the operand "TagIn" has the signal state "1", the "Divide" instruction is executed. The value of operand "Tag\_Value1" is divided by the value of operand "Tag\_Value2". The result of the division is stored in the operand "Tag\_Result". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

**MOD: Return remainder of division**

**Description**

You can use the "Return remainder of division" instruction to divide the value at input IN1 by the value at input IN2 and query the quotient at output OUT.

**Parameters**

The following table shows the parameters of the instruction "Return remainder of division":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN1	Input	Integers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Dividend
IN2	Input	Integers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Divisor
OUT	Output	Integers	I, Q, M, D, L, P	I, Q, M, D, L, P	Remainder of division

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

If the operand "TagIn" has the signal state "1", the "Return remainder of division" instruction is executed. The value of operand "Tag\_Value1" is divided by the value of operand "Tag\_Value2". The remainder of division is stored in operand "Tag\_Result". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

## NEG: Create twos complement

### Description

You can use the "Create twos complement" instruction to change the sign of the value at input IN and query the result at output OUT. If there is a positive value at input IN, for example, the negative equivalent of this value is sent to output OUT.

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- The result of the instruction is outside the range permitted for the data type specified at output OUT.
- A floating-point number has an invalid value.

**Parameters**

The following table shows the parameters of the "Create twos complement" instruction:

Parameters	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
EN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	SINT, INT, DINT, Floating-point numbers	SINT, INT, DINT, LINT, Floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Input value
OUT	Output	SINT, INT, DINT, Floating-point numbers	SINT, INT, DINT, LINT, Floating-point numbers	I, Q, M, D, L, P	I, Q, M, D, L, P	Twos complement of the input value

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

If the operand "TagIn" has the signal state "1", the "Create twos complement" instruction is executed. The sign of the value at input "TagIn\_Value" is changed and the result is stored at output "TagOut\_Value". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

## INC: Increment

### Description

You can use the "Increment" instruction to change the value of the operand at parameter IN/OUT to the next higher value and query the result.

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- A floating-point number has an invalid value.

### Parameters

The following table shows the parameters of the "Increment" instruction:

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN/OUT	InOut	Integers	I, Q, M, D, L	I, Q, M, D, L	Value to be incremented.

You can select the data type of the instruction from the "<???"> drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

If the operands TagIn\_1 and TagIn\_2 have the signal state "1", the value of the operand "Tag\_InOut" is incremented by one and the output "TagOut" is set.

### See also

## DEC: Decrement

### Description

You can use the "Decrement" instruction to change the value of the operand at parameter IN/OUT to the next lower value and query the result.

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- A floating-point number has an invalid value.

### Parameters

The following table shows the parameters of the instruction "Decrement":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN/OUT	InOut	Integers	I, Q, M, D, L	I, Q, M, D, L	Value to be decremented.

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

If the operands "TagIn\_1" and "TagIn\_2" have the signal state "1", the value of the operand "Tag\_InOut" is decremented by one and the output "TagOut" is set.

### See also

## ABS: Form absolute value

### Description

You can use the "Form absolute value" instruction to calculate the absolute value of the value specified at input IN. The result of the instruction is provided at output OUT and can be queried there.

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- A floating-point number has an invalid value.

### Parameters

The following table shows the parameters of the instruction "Form absolute value":

Parameters	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
EN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	SINT, INT, DINT, floating-point numbers	SINT, INT, DINT, LINT, floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Input value
OUT	Output	SINT, INT, DINT, floating-point numbers	SINT, INT, DINT, LINT, floating-point numbers	I, Q, M, D, L, P	I, Q, M, D, L, P	Absolute value of the input value

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	TagIn_Value	-6.234
OUT	TagOut_Value	6.234

If the operand "TagIn" has the signal state "1", the "Form absolute value" instruction is executed. The instruction calculates the absolute value of the value at input "TagIn\_Value" and sends the result to output "TagOut\_Value". If no errors occur during the execution of the instruction, the output "TagOut" is set.

**See also**

Overview of the valid data types (Page 1262)

Basics of the EN/ENO mechanism (Page 1357)

Adding additional inputs and outputs to FBD elements (Page 1527)

**MIN: Get minimum**

**Description**

The "Get minimum" instruction compares the values at the available inputs and writes the lowest value to the OUT output. The number of inputs can be expanded at the instruction box by additional inputs. The inputs are numbered in ascending order in the box.

In its initial state the instruction contains at least two inputs (IN1 and IN2) and no more than 100 inputs.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- Enable input EN has the signal state "0".
- The implicit conversion of the data types fails during execution of the instruction.
- A floating-point number has an invalid value.

**Parameters**

The following table shows the parameters of the "Get minimum" instruction:

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
EN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output

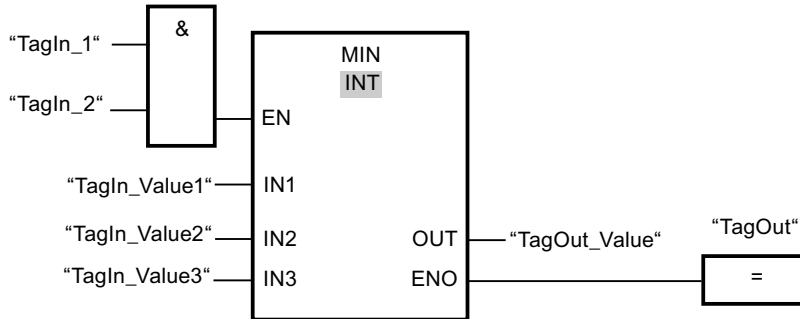

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
IN1	Input	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	First input value
IN2	Input	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Second input value
INn	Input	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Additionally inserted inputs whose values are to be compared
OUT	Output	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P	I, Q, M, D, L, P	Result
The data types TOD, LTOD, DATE, and LDT can only be used if the IEC test is not enabled.						

You can select the data type of the instruction from the "<???"> drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN1	TagIn_Value1	12222
IN2	TagIn_Value2	14444
IN3	TagIn_Value3	13333
OUT	TagOut_Value	12222

If the "TagIn\_1" and "TagIn\_2" operands have signal state "1", the "Get minimum" instruction is executed. The instruction compares the values of the specified operands and copies the lowest value ("TagIn\_Value1") to output "TagOut\_Value". If the instruction is executed without errors, the output "TagOut" is set.

**See also**

**MAX: Get maximum**

**Description**

The "Get maximum" instruction compares the values at the available inputs and writes the highest value to the OUT output. The number of inputs can be expanded at the instruction box by additional inputs. The inputs are numbered in ascending order in the box.

In its initial state the instruction contains at least two inputs (IN1 and IN2) and no more than 100 inputs.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- Enable input EN has the signal state "0".
- The implicit conversion of the data types fails during execution of the instruction.
- A floating-point number has an invalid value.

## Parameters

The following table shows the parameters of the "Get maximum" instruction:

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
EN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN1	Input	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	First input value
IN2	Input	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Second input value
INn	Input	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Additionally inserted inputs whose values are to be compared.
OUT	Output	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P	I, Q, M, D, L, P	Result

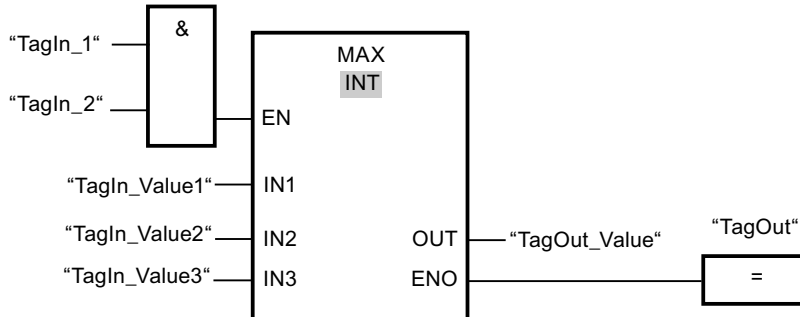

The data types TOD, LTOD, DATE, and LDT can only be used if the IEC test is not enabled.

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN1	TagIn_Value1	12222
IN2	TagIn_Value2	14444
IN3	TagIn_Value3	13333
OUT	TagOut_Value	14444

If the "TagIn\_1" and "TagIn\_2" operands have signal state "1", the "Get maximum" instruction is executed. The instruction compares the values of the specified operands and copies the highest value ("TagIn\_Value2") to output "TagOut\_Value". If no errors occur during the execution of the instruction, the output "TagOut" is set.

**See also**

**LIMIT: Set limit value**

**Description**

You can use the "Set limit value" instruction to limit the value at input IN to the values at the inputs MN and MX. If the value at the IN input meets the MN condition  $MN \leq IN \leq MX$ , it is copied to the OUT output. If the condition is not fulfilled and the input value IN is below the low limit MN, output OUT is set to the value of the input MN. If the high limit MX is exceeded, output OUT is set to the value of the input MX.

If the value at input MN is greater than that at input MX, the result is undefined and the enable output ENO is "0".

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- The specified tags are not of the same data type.
- An operand has an invalid value.
- The value at the MN input is greater than the value at input MX.

## Parameters

The following table shows the parameters of the "Set limit value" instruction:

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
EN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
MN	Input	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Low limit
IN	Input	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Input value
MX	Input	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	High limit
OUT	Output	Integers, floating-point numbers, TIME, TOD, DATE	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P	I, Q, M, D, L, P	Result

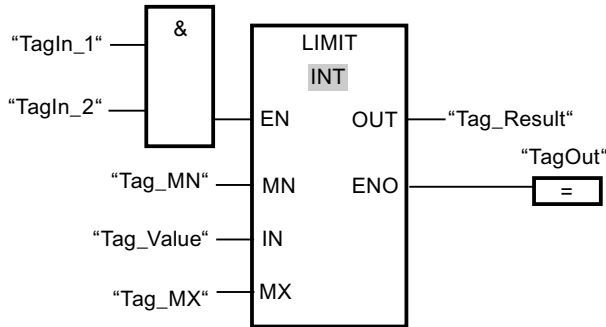

The data types TOD, LTOD, DATE, and LDT can only be used if the IEC test is not enabled.

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
MN	Tag_MN	12000
IN	Tag_Value	8000
MX	Tag_MX	16000
OUT	Tag_Result	12000

If the "TagIn\_1" and "TagIn\_2" operands have the signal state "1", the "Set limit value" instruction is executed. The value of operand "Tag\_Value" is compared with the values of operands "Tag\_MN" and "Tag\_MX". Since the value at the operand "Tag\_Value" is less than the low limit, the value of the operand "Tag\_MN" is copied to output "Tag\_Result". If the instruction is executed without errors, the output "TagOut" is set.

**SQR: Form square**

**Description**

You can use the "Form square" instruction to square the value at input IN and query the result at output OUT.

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- The value at input IN is not a valid floating-point number.

## Parameters

The following table shows the parameters of the instruction "Form square":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Input value
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	I, Q, M, D, L, P	Square of the input value

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	Tag_Value	5.0
OUT	Tag_Result	25.0

If the operand "TagIn" has the signal state "1", the "Form square" instruction is executed. The instruction squares the value of the operand "Tag\_Value" and sends the result to output "Tag\_Result". If no errors occur during the execution of the instruction, the output "TagOut" is set.

## See also

Overview of the valid data types (Page 1262)

## SQRT: Form square root

### Description

You can use the "Form square root" instruction to form the square root of the value at input IN and query the result at output OUT. The instruction has a positive result if the input value is greater than zero. If input values are less than zero, output OUT returns an invalid floating-point number. If the value at input IN is "0", the result is also "0".

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- The value at input IN is not a valid floating-point number.
- The value at input IN is negative.

### Parameters

The following table shows the parameters of the instruction "Form square root":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Input value
OUT	Output	Floating-point numbers	I, Q, M, D, L	I, Q, M, D, L	Square root of the input value

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	Tag_Value	25.0
OUT	Tag_Result	5.0

If the operand "TagIn" has the signal state "1", the "Form square root" instruction is executed. The instruction calculates the square root of the operand "Tag\_Value" and sends the result to output "Tag\_Result". If no errors occur during the execution of the instruction, the output "TagOut" is set.

## See also

Overview of the valid data types (Page 1262)

Basics of the EN/ENO mechanism (Page 1357)

## LN: Form natural logarithm

### Description

You can use the "Form natural logarithm" instruction to calculate the natural logarithm to base  $e$  ( $e = 2.718282$ ) of the value at input IN. The result is sent to output OUT and can be queried there. The instruction has a positive result if the input value is greater than zero. If input values are less than zero, output OUT returns an invalid floating-point number.

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- The value at input IN is not a valid floating-point number.
- The value at input IN is negative.

### Parameters

The following table shows the parameters of the instruction "Form natural logarithm":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Input value
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	I, Q, M, D, L, P	Natural logarithm of the input value

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

If the operand "TagIn" has the signal state "1", the "Form natural logarithm" instruction is executed. The instruction forms the natural logarithm of the value at input "Tag\_Value" and sends the result to output "Tag\_Result". If no errors occur during the execution of the instruction, the output "TagOut" is set.

**See also**

- Overview of the valid data types (Page 1262)

**EXP: Form exponential value**

**Description**

You can use the "Form exponential value" instruction to calculate the exponent from the base e (e = 2.718282 and the value specified at input IN. The result is provided at output OUT and can be queried there (OUT = e<sup>IN</sup>).

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- The value at input IN is not a valid floating-point number.

**Parameters**

The following table shows the parameters of the instruction "Form exponential value":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Input value
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	I, Q, M, D, L, P	Exponential value of the input value IN

You can select the data type of the instruction from the "<???"> drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

If the operand "TagIn" has the signal state "1", the "Form exponential value" instruction is executed. The instruction forms the exponent from base e and the value of the operand "Tag\_Value" and sends the result to output "Tag\_Result". If no errors occur during the execution of the instruction, the output "TagOut" is set.

## SIN: Form sine value

### Description

You can use the "Form sine value" instruction to calculate the sine of an angle. The size of the angle is specified in the radian measure at input IN. The result of the instruction is provided at output OUT and can be queried there.

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- The value at input IN is not a valid floating-point number.

### Parameters

The following table shows the parameters of the instruction "Form sine value":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Size of angle in the radian measure
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	I, Q, M, D, L, P	Sine of the specified angle

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	Tag_Value	+1.570796 ( $\pi/2$ )
OUT	Tag_Result	1.0

If the operand "TagIn" has the signal state "1", the "Form sine value" instruction is executed. The instruction calculates the sine of the angle specified at input "Tag\_Value" and sends the result to output "Tag\_Result". If no errors occur during the execution of the instruction, the output "TagOut" is set.

**See also**

- Overview of the valid data types (Page 1262)

**COS: Form cosine value**

**Description**

You can use the "Form cosine value" instruction to calculate the cosine of an angle. The size of the angle is specified in the radian measure at input IN. The result of the instruction is provided at output OUT and can be queried there.

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- The value at input IN is not a valid floating-point number.

## Parameters

The following table shows the parameters of the instruction "Form cosine value":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Size of angle in the radian measure
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	I, Q, M, D, L, P	Cosine of the specified angle

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	Tag_Value	+1.570796 ( $\pi/2$ )
OUT	Tag_Result	0

If the operand "TagIn" has the signal state "1", the "Form cosine value" instruction is executed. The instruction calculates the cosine of the angle specified at input "Tag\_Value" and sends the result to output "Tag\_Result". If no errors occur during the execution of the instruction, the output "TagOut" is set.

**TAN: Form tangent value**

**Description**

You can use the "Form tangent value" instruction to calculate the tangent of an angle. The size of the angle is specified in the radian measure at input IN. The result of the instruction is provided at output OUT and can be queried there.

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- The value at input IN is not a valid floating-point number.

**Parameters**

The following table shows the parameters of the instruction "Form tangent value":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Size of angle in the radian measure
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	I, Q, M, D, L, P	Tangent of the specified angle

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	Tag_Value	+3.141593 ( $\pi$ )
OUT	Tag_Result	0

If the operand "TagIn" has the signal state "1", the "Form tangent value" instruction is executed. The instruction calculates the tangent of the angle specified at input "Tag\_Value" and stores the result at output "Tag\_Result". If no errors occur during the execution of the instruction, the output "TagOut" is set.

## ASIN: Form arcsine value

### Description

You can use the "Form arcsine value" instruction to calculate the size of the angle from the sine value specified at input IN, which corresponds to this value. Only valid floating-point numbers within the range -1 to +1 can be specified at input IN. The calculated angle size is output in radians at output OUT and can range in value from  $-\pi/2$  to  $+\pi/2$ .

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- The value at input IN is not a valid floating-point number.
- The value at input IN is outside the permitted range (-1 to +1).

### Parameters

The following table shows the parameters of the instruction "Form arcsine value":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Sine value
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	I, Q, M, D, L, P	Size of angle in the radian measure

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	Tag_Value	1.0
OUT	Tag_Result	+1.570796 ( $\pi/2$ )

If the operand "TagIn" has the signal state "1", the "Form arcsine value" instruction is executed. The instruction calculates the size of the angle corresponding to the sine value at input "Tag\_Value". The result of the instruction is stored at output "Tag\_Result". If no errors occur during the execution of the instruction, the output "TagOut" is set.

**See also**

**ACOS: Form arccosine value**

**Description**

You can use the "Form arccosine value" instruction to calculate the size of the angle from the cosine value specified at input IN, which corresponds to this value. Only valid floating-point numbers within the range -1 to +1 can be specified at input IN. The calculated angle size is output in radians at output OUT and can range in value from 0 to  $\pi$ .

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- The value at input IN is not a valid floating-point number.
- The value at input IN is outside the permitted range (-1 to +1).

## Parameters

The following table shows the parameters of the instruction "Form arccosine value":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Cosine value
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	I, Q, M, D, L, P	Size of angle in the radian measure

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	Tag_Value	0
OUT	Tag_Result	+1.570796 ( $\pi/2$ )

If the operand "TagIn" has the signal state "1", the "Form arccosine value" instruction is executed. The instruction calculates the size of the angle corresponding to the cosine value at input "Tag\_Value". The result of the instruction is stored at output "Tag\_Result". If no errors occur during the execution of the instruction, the output "TagOut" is set.

## ATAN: Form arctangent value

### Description

You can use the "Form arctangent value" instruction to calculate the size of the angle from the tangent value specified at input IN, which corresponds to this value. Only valid floating-point numbers may be specified at input IN. The calculated angle size is output in radians at the output OUT and can range in value from  $-\pi/2$  to  $+\pi/2$ .

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- The value at input IN is not a valid floating-point number.

### Parameters

The following table shows the parameters of the instruction "Form arctangent value":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Tangent value
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	I, Q, M, D, L, P	Size of angle in the radian measure

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	Tag_Value	1.0
OUT	Tag_Result	+0.785398 ( $\pi/4$ )

If the operand "TagIn" has the signal state "1", the "Form arc tangent value" instruction is executed. The instruction calculates the size of the angle corresponding to the tangent value at input "Tag\_Value". The result of the instruction is stored at output "Tag\_Result". If no errors occur during the execution of the instruction, the output "TagOut" is set.

## See also

## FRAC: Return fraction

### Description

You can use the "Return fraction" instruction to determine the decimal places of the value at the IN input. The result of the query is stored at output OUT and can be queried there. If the input IN has e.g. the value 123.4567, the output OUT has the value 0.4567.

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- Errors occur during the execution of the instruction, for example there is no valid floating-point number at the input.

### Parameters

The following table shows the parameters of the "Return fraction" instruction:

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Input value, whose decimal places are to be determined.
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	I, Q, M, D, L, P	Decimal places of the input value at input IN

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	Tag_Value	2.555
OUT	Tag_Result	0.555

If the operands "TagIn\_1" and "TagIn\_2" have signal state "1", the "Return fraction" instruction is executed. The decimal places from the value at the operand "Tag\_Value" are copied to the operand "Tag\_Result". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

Adding additional inputs and outputs to FBD elements (Page 1527)

**EXPT: Exponentiate**

**Description**

You can use the "Exponentiate" instruction to raise the value at the input IN1 by a power specified with the value at input IN2. The result of the instruction is stored at output OUT and can be queried there (OUT = IN1<sup>IN2</sup>).

The value at input IN1 must be a valid floating-point number. Integers are also allowed for setting the input IN2.

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- Errors occur during the instruction processing, for example, if there is an overflow.

## Parameters

The following table shows the parameters of the instruction "Exponentiate":

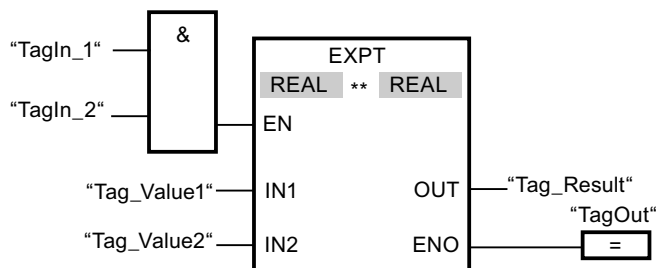

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN1	Input	Floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Base value
IN2	Input	Integers, floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Value with which the base value is exponentiated
OUT	Output	Floating-point numbers	I, Q, M, D, L, P	I, Q, M, D, L, P	Result

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

If the operands "TagIn\_1" and "TagIn\_2" have signal state "1", the "Exponentiate" instruction is executed. The value of operand "Tag\_Value1" is raised by the power of the value of the operand "Tag\_Value2". The result is stored at output "Tag\_Result". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

## Move operations

### MOVE: Move value

#### Description

You use the "Move value" instruction to transfer the content of the operand at the IN input to the operand at the OUT1 output. The transfer is always made in the direction of ascending address.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The data type at the IN parameter does not correspond to the specified data type at the OUT1 parameter.

The following table lists the possible transfers for the S7-1200 CPU series:

Source (IN)	Destination (OUT1)	
	With IEC check	Without IEC check
BYTE	BYTE, WORD, DWORD	BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, TIME, DATE, TOD, CHAR
WORD	WORD, DWORD	BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, TIME, DATE, TOD, CHAR
DWORD	DWORD	BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, REAL, TIME, DATE, TOD, CHAR
SINT	SINT	BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, TIME, DATE, TOD
USINT	USINT, UINT, UDINT	BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, TIME, DATE, TOD
INT	INT	BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, TIME, DATE, TOD
UINT	UINT, UDINT	BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, TIME, DATE, TOD
DINT	DINT	BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, TIME, DATE, TOD

IEC_COUNTER	IEC_COUNTER	IEC_COUNTER
IEC_UCOUNTER	IEC_UCOUNTER	IEC_UCOUNTER
IEC_DCOUNTER	IEC_DCOUNTER	IEC_DCOUNTER
IEC_UDCOUNTER	IEC_UDCOUNTER	IEC_UDCOUNTER
IEC_LCOUNTER	IEC_LCOUNTER	IEC_LCOUNTER
IEC_ULCOUNTER	IEC_ULCOUNTER	IEC_ULCOUNTER

<sup>1)</sup> You can also use the "Move value" instruction to transfer individual characters of a string to operands of the CHAR or WCHAR data type. The number of the character to be transferred is specified in square brackets next to the operand name. "MyString[2]", for example, transfers the second character of the "MyString" string. It is also possible to transfer from operands of the data type CHAR to the individual characters of a string. You can also replace a specific character of a string with the character of another string.

<sup>2)</sup> Transferring entire arrays (ARRAY) is possible only when the array components of the operands at input IN and at output OUT1 are of the same data type.

If the bit length of the data type at input IN exceeds the bit length of the data type at output OUT1, the higher-order bits of the source value are lost. If the bit length of the data type at input IN is less than the bit length of the data type at output OUT1, the higher-order bits of the destination value will be overwritten with zeros.

In its initial state, the instruction box contains 1 output (OUT1). The number of outputs can be extended. The added outputs are numbered in ascending order on the box. During the execution of the instruction, the content of the operand at the input IN is transferred to all available outputs. The instruction box cannot be extended if structured data types (DTL, STRUCT, ARRAY) or characters of a string are transferred.

You can also use the "Move block" (MOVE\_BLK) and "Move block uninterruptible" (UMOVE\_BLK) instructions to move operands of the ARRAY data type. You can move operands of the STRING data type with the instruction "Move character string" (S\_MOVE).

## Parameters

The following table lists the parameters of the "Move value" instruction:

Parameters	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
EN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output

Parameters	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
IN	Input	Bit strings, integers, floating-point numbers, DATE, TIME, TOD, DTL, CHAR, STRUCT, ARRAY, IEC data types, PLC data type (UDT)	Bit strings, integers, floating-point numbers, DATE, DT, LDT, S5TIME, TIME, LTIME, TOD, LTOD, DTL, CHAR, STRUCT, ARRAY, TIMER, COUNTER, IEC data types, PLC data type (UDT)	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Element used to overwrite the destination address.
OUT1	Output	Bit strings, integers, floating-point numbers, DATE, TIME, TOD, DTL, CHAR, STRUCT, ARRAY, IEC data types, PLC data type (UDT)	Bit strings, integers, floating-point numbers, DATE, DT, LDT, S5TIME, TIME, LTIME, TOD, LTOD, DTL, CHAR, STRUCT, ARRAY, TIMER, COUNTER, IEC data types, PLC data type (UDT)	I, Q, M, D, L	I, Q, M, D, L	Destination address

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table lists how the instruction works using specific operand values:

Parameters	Operand	Value
IN	TagIn_Value	0011 1111 1010 1111
OUT1	TagOut_Value	0011 1111 1010 1111

If the operand "TagIn" has the signal state "1", the "Move value" instruction is executed. The instruction copies the content of the "TagIn\_Value" operand to the "TagOut\_Value" operand. If the instruction is executed without errors, the ENO and "TagOut" enable outputs are set to signal state "1".

## Deserialize: Deserialize

### Description

You can use the "Deserialize" instruction to convert the sequential representation of a PLC data type (UDT) back to a PLC data type and to fill its entire contents.

The memory area in which the sequential representation of a PLC data type is located must have the ARRAY of BYTE data type and be declared with standard access. Make sure that there is enough memory space prior to the conversion.

The instruction enables you to convert multiple sequential representations of converted PLC data types back to their original state step-by-step.

**Note**

If you only want to convert back a single sequential representation of a PLC data type (UDT), you can also use the instruction "TRCV: Receive data via communication connection" directly.

**Parameter**

The following table shows the parameters of the "Deserialize" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
SRC_ARRAY	Input	VARIANT	I, Q, D, L	Global data block in which the generated data stream is stored
DEST_VARIABLE	InOut	VARIANT	I, Q, D, L	Tag in which the returned converted PLC data type (UDT) is stored
POS	InOut	DINT	I, Q, M, D, L	Number of bytes that the converted PLC data types use. The POS parameter is calculated zero-based.
RET_VAL	Output	INT	I, Q, M, D, L	Error information

For additional information on valid data types, refer to "See also".

**RET\_VAL parameter**

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
80B0	The memory areas for the SRC_ARRAY and DEST_VARIABLE parameters overlap.
8136	The data block at the DEST_VARIABLE parameter is not a block with standard access.
8150	The VARIANT data type at the SRC_ARRAY parameter contains no value.
8151	Code generation error at SRC_ARRAY parameter
8153	There is not enough free memory available at the SRC_ARRAY parameter.
8250	The VARIANT data type at the DEST_VARIABLE parameter contains no value.
8251	Code generation error at DEST_VARIABLE parameter
8254	Invalid data type at the DEST_VARIABLE parameter

Error code* (W#16#...)	Explanation
8382	The value at the POS parameter is outside the limits of the array.
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

### Example

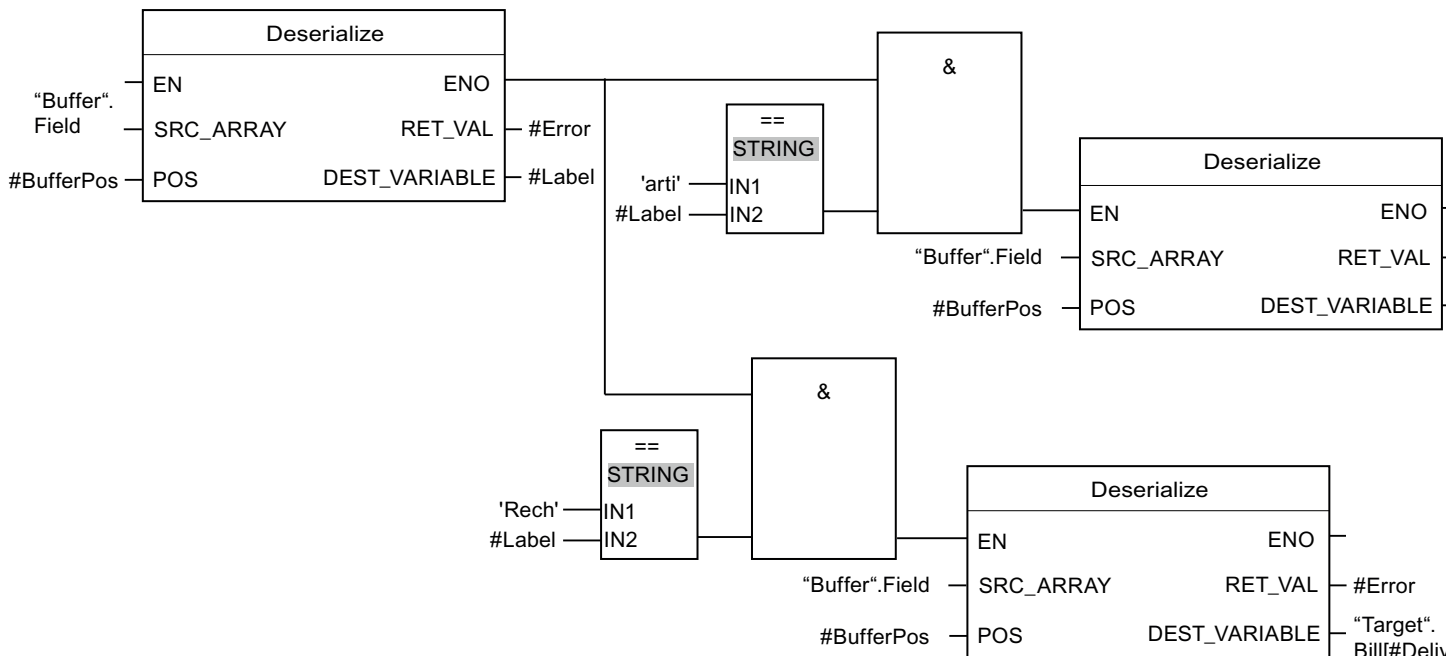

The following example shows how the instruction works:

Network 1:

The "Move value" instruction moves the value "0" to the "#BufferPos" operand. The "Deserialize" instruction deserializes the sequential representation of the customer data from the "Buffer" data block and writes it to the "Target" data block. The number of bytes used by the converted customer data is stored in the "#BufferPos" operand.

Network 2:

The "Deserialize" instruction deserializes the sequential representation of the separator sheet, which was saved with the sequential representation after the customer data, from the "Buffer" data block and writes the characters to the "#Label" operand. The characters are compared using comparison instructions for "arti" and "Bill". If the comparison for "arti" = TRUE, these

are article data that have been deserialized and written to the "Target" data block. If the comparison for "Bill" = TRUE, these are billing data that have been deserialized and written to the "Target" data block.

The following table shows the declaration of the operands:

Operand	Data type	Declaration
DeliverPos	INT	In the "Input" section of the block interface
BufferPos	DINT	In the "Temp" section of the block interface
Error	INT	In the "Temp" section of the block interface
Label	STRING[4]	In the "Temp" section of the block interface

The following table lists the declarations of the PLC data types:

Name of the PLC data types	Name	Data type
Article	Number	DINT
	Declaration	STRING
	Colli	INT
Client	Title	INT
	First name	STRING[10]
	Surname	STRING[10]

The following table shows the declaration of the data blocks:

Name of the data blocks	Name	Data type
Target	Client	"Client" (PLC data type)
	Article	Array[0..] of "Article" (PLC data type)
	Bill	Array[0..10] of INT
Buffer	Field	Array[0..294] of BYTE

**See also**

- Overview of the valid data types (Page 1262)

- PLC data types (Page 1306)

**Serialize: Serialize**

**Description**

You can use the "Serialize" instruction to convert several PLC data types (UDT) to a sequential representation without losing parts of their structure.

You can use the instruction to temporarily save multiple structured data items from your program in a buffer, which should preferably be in a global data block, and send them to another CPU. The memory area in which the converted PLC data types are stored must have the

ARRAY of BYTE data type and be declared with standard access. Make sure that there is enough memory space prior to the conversion.

The operand at the POS parameter contains information about the number of bytes used by the converted PLC data types.

---

#### Note

If you want to send a single PLC data type (UDT), you can directly call the instruction "TSEND: Send data via communication connection".

---

## Parameters

The following table shows the parameters of the "Serialize" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
SRC_VARIABLE	Input	VARIANT	I, Q, D, L	PLC data type (UDT) that is converted to sequential representation.
DEST_ARRAY	InOut	VARIANT	I, Q, D, L	Data block in which the generated data stream is stored.
POS	InOut	DINT	I, Q, M, D, L	Number of bytes that the converted PLC data types use. The POS parameter is calculated zero-based.
RET_VAL	Output	INT	I, Q, M, D, L	Error information

For additional information on valid data types, refer to "See also".

## RET\_VAL parameter

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
80B0	The memory areas for the SRC_VARIABLE and DEST_ARRAY parameters overlap.
8150	The VARIANT data type at the SRC_VARIABLE parameter contains no value.
8152	Code generation error at SRC_VARIABLE parameter
8236	The data block at the DEST_ARRAY parameter is not a block with standard access.
8250	The VARIANT data type at the DEST_ARRAY parameter contains no value.
8252	Code generation error at DEST_ARRAY parameter
8253	There is not enough free memory available at the DEST_ARRAY parameter.

Error code* (W#16#...)	Explanation
8254	Invalid data type at the DEST_ARRAY parameter
8382	The value at the POS parameter is outside the limits of the array.

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

**Example**

The following example shows how the instruction works:

Network 1:

The "Move value" instruction moves the value "0" to the "#BufferPos" operand. The "Serialize" instruction serializes the customer data from the "Source" data block and writes them in sequential representation to the "Buffer" data block. The number of bytes used by the sequential representation is stored in the "#BufferPos" operand.

Network 2:

A kind of separator sheet is inserted now to make it easier to deserialize the sequential representation later. The "Move character string" instruction moves the "arti" characters to the "#Label" operand. The "Serialize" instruction writes these characters after the customer data to the "Buffer" data block. The number of bytes that the characters need is added to the number already stored in the "#BufferPos" operand.

Network 3:

The "Serialize" instruction serializes the data of a specific article, which is calculated in runtime, from the "Source" data block and writes them in sequential representation to the "Buffer" data block after the "arti" characters.

The following table shows the declaration of the operands:

Operand	Data type	Declaration
DeliverPos	INT	In the "Input" section of the block interface
BufferPos	DINT	In the "Temp" section of the block interface
Error	INT	In the "Temp" section of the block interface
Label	STRING[4]	In the "Temp" section of the block interface

The following table lists the declarations of the PLC data types:

Name of the PLC data types	Name	Data type
Article	Number	DINT
	Declaration	STRING
	Colli	INT
Client	Title	INT
	First name	STRING[10]
	Surname	STRING[10]

The following table shows the declaration of the data blocks:

Name of the data blocks	Name	Data type
Source	Client	"Client" (PLC data type)
	Article	Array[0..10] of "Article" (PLC data type)
Buffer	Field	Array[0..294] of BYTE

## FieldRead: Read field

### Description

You can use the "Read field" instruction to read out a specific component from the field specified in the MEMBER parameter and transfer its content to the tag in the VALUE parameter. You use the parameter INDEX to define the index of the field components that are to be read. At the parameter MEMBER you specify the first component of the field to be read.

The data types of the field component at parameter MEMBER and the tags at parameter VALUE must correspond to the data type of the instruction "Read field".

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- The field component specified at the parameter INDEX is not defined in the field specified at the parameter MEMBER.
- Errors, such as an overflow, occur during execution.

## Parameters

The following table shows the parameters of the instruction "Read field":

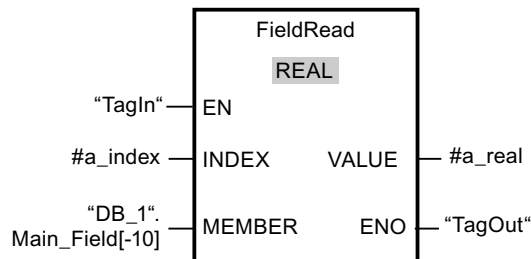

Parameters	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
EN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
INDEX	Input	DINT	DINT	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Index of field components whose content is read out
MEMBER	Input	Binary numbers, integers, floating-point numbers, TIME, DATE, TOD and CHAR as components of an ARRAY tag	Binary numbers, integers, floating-point numbers, timers, DATE, TOD, LTOD and CHAR as components of an ARRAY tag	D, L	D, L	First component of the field from which will be read
VALUE	Output	Bit strings, integers, floating-point numbers, TIME, DATE, TOD and CHAR	Bit strings, integers, floating-point numbers, timers, DATE, TOD, LTOD and CHAR	I, Q, M, D, L, P	I, Q, M, D, L, P	Operand to which the contents of the field component are transferred.

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Tag	Value
INDEX	a_index	4
MEMBER	"DB_1".Main_Field[-10]	First component of the field "Main_Field[-10..10] of REAL" in the data block "DB_1"
VALUE	a_real	Component with Index 4 of the field "Main_Field[-10..10] of REAL"

The field component with index 4 is read out from the field "Main\_Field[-10...10] of REAL" and written to the tag "a\_real". The field component to be read is defined by the value at the parameter INDEX.

## See also

Overview of the valid data types (Page 1262)

Basics of the EN/ENO mechanism (Page 1357)

## FieldWrite: Write field

### Description

The "Write field" instruction is used to transfer the content of the tag at the VALUE input to a specific component of the field at the MEMBER output. You use the value at the INDEX input to specify the index of the field component that is described. At the MEMBER output, enter the first component of the field which is to be written to.

The data types of the field component specified at the MEMBER output and the tags at the VALUE input have to match the data type of the "Write field" instruction.

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- The field component specified at the input INDEX is not defined in the field specified at the output MEMBER.
- Errors, such as an overflow, occur during execution.

**Parameters**

The following table shows the parameters of the instruction "Write field":

Parameters	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
EN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
INDEX	Input	DINT	DINT	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Index of field component that is written with the content of VALUE
VALUE	Input	Bit strings, integers, floating-point numbers, TIME, DATE, TOD and CHAR	Bit strings, integers, floating-point numbers, timers, DATE, TOD, LTOD and CHAR	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Operand whose contents are copied
MEMBER	Output	Binary numbers, integers, floating-point numbers, TIME, DATE, TOD and CHAR as components of an ARRAY tag	Binary numbers, integers, floating-point numbers, timers, DATE, TOD, LTOD and CHAR as components of an ARRAY tag	D, L	D, L	First component of the field to which the content of VALUE is written.

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
INDEX	a_index	4
VALUE	a_real	10.54
MEMBER	"DB_1".Main_Field[-10]	First component of the field "Main_Field[-10..10] of REAL" in the data block "DB_1"

The value "10.54" of the "a\_real" tag is written to the field component with index 4 of the "Main\_Field[-10 ... 10] of REAL" field. The index of the field component to which the content of the tag "a\_real" is transferred is specified by the value at the input INDEX.

## MOVE\_BLK: Move block

### Description

You can use the "Move block" instruction to move the content of a memory area (source area) to another memory area (destination area). The number of elements to be moved to the destination area is specified with the COUNT parameter. The width of the elements to be moved is defined by the width of the element at input IN.

The instruction can only be executed if the source area and the destination area are of the same data type.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- More data is moved than is made available at input IN or output OUT.

When a Array of BOOL is copied, the enable output ENO for an overflow is set to "1" until the byte limit of the Array structure is exceeded. If the byte limit of the Array structure is exceeded by the value at the COUNT input, the ENO enable output is reset to "0".

**Parameters**

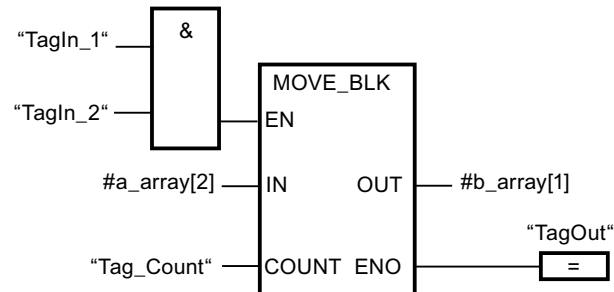

The following table lists the parameters of the "Move block" instruction:

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
EN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN <sup>1)</sup>	Input	Binary numbers, integers, floating-point numbers, TIME, DATE, CHAR, TOD	Binary numbers, integers, floating-point numbers, timers, DATE, CHAR, TOD, LTOD	D, L	D, L	The first element of the source area that is being copied
COUNT	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Number of elements to be copied from the source area to the destination area
OUT <sup>1)</sup>	Output	Binary numbers, integers, floating-point numbers, TIME, DATE, CHAR, TOD	Binary numbers, integers, floating-point numbers, timers, DATE, CHAR, TOD, LTOD	D, L	D, L	The first element of the destination area to which the contents of the source area are being copied
<sup>1)</sup> The specified data types can only be used as elements of an Array structure.						

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	a_array[2]	The data type of the a_array operand is Array [0..5] of INT. It consists of six elements of data type INT.
COUNT	Tag_Count	3
OUT	b_array[1]	The data type of the b_array operand is Array [0..6] of INT. It consists of seven elements of data type INT.

If the operands "TagIn\_1" and "TagIn\_2" have signal state "1", the "Move block" instruction is executed. Starting from the third element, the instruction selects three INT elements from the #a\_array tag and copies their contents to the #b\_array output tag, beginning with the second element. If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

## MOVE\_BLK\_VARIANT: Move block

### Description

You can use the "Move block" instruction to move the content of a memory area (source area) to another memory area (destination area). You can copy elements of an array to another array of the same data type. The size (number of elements) of the source and destination array may be different. You can copy several elements within an array or individual elements.

If you are using the instruction, the array must not yet be known at the time the block is created, as the source and the destination are transferred using VARIANT.

9.7 References

The counting at the parameters SRC\_INDEX and DEST\_INDEX always starts with the low limit "0", regardless of the later declaration of the array.

If the VARIANT pointer (source or destination) is of the data type BOOL, it must be addressed absolutely and the length specified must be divisible by 8; otherwise the instruction is not executed.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- More data is copied than is made available.

**Parameters**

The following table shows the parameters of the "Move block" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
SRC	Input	VARIANT (array or single element)	L	Source block from which to copy
COUNT	Input	UDINT	I, Q, M, D, L or constant	Number of elements which are copied Set the value at the parameter COUNT to "1", if no Array is specified at the parameter SRC or the parameter DEST.

Parameter	Declaration	Data type	Memory area	Description
SRC_INDEX	Input	DINT	I, Q, M, D, L or constant	<ul style="list-style-type: none"> <li>• The SRC_INDEX parameter is calculated zero-based. If an Array is specified at parameter SRC, the integer at the SRC_INDEX parameter specifies the first element within the source area from which copying is to take place. This is independent of the declared array limits.</li> <li>• If no Array is set at the SRC parameter or only an individual element of an array is specified, assign the SRC_INDEX parameter the value "0".</li> </ul>
DEST_INDEX	Input	DINT	I, Q, M, D, L or constant	<ul style="list-style-type: none"> <li>• The DEST_INDEX parameter is calculated zero-based. If an Array is specified at the DEST parameter, the integer at the DEST_INDEX parameter specifies the first element within the destination area to which copying is to take place. This is independent of the declared array limits.</li> <li>• If no Array is specified at the DEST parameter, assign the DEST_INDEX parameter the value "0".</li> </ul>

Parameter	Declaration	Data type	Memory area	Description
DEST	Output	VARIANT	L	Destination area into which the contents of the source block are copied.
RET_VAL	Output	INT	I, Q, M, D, L	Error information: If an error occurs during the execution of the instruction, an error code is output at the RET_VAL parameter.

For additional information on valid data types, refer to "See also".

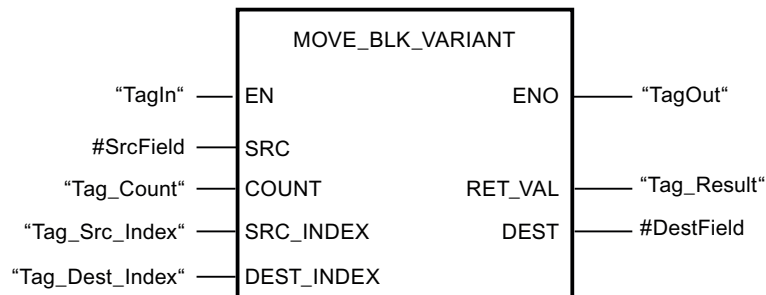

### RET\_VAL parameter

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
80B4	Data types do not correspond
8151	Access to the SRC parameter is not possible.
8152	The operand at the SRC parameter is not typed.
8153	Code generation error at SRC parameter
8154	The operand at the SRC parameter has the data type BOOL.
8281	The COUNT parameter has an invalid value
8382	The value at the SRC_INDEX parameter is outside the limits of the VARIANT.
8383	The value at the SRC_INDEX parameter is outside the high limit of the array.
8482	The value at the DEST_INDEX parameter is outside the limits of the VARIANT.
8483	The value at the DEST_INDEX parameter is outside the high limit of the array.
8534	The DEST parameter is write protected
8551	Access to the DEST parameter is not possible.
8552	The operand at the DEST parameter is not typed.
8553	Code generation error at DEST parameter
8554	The operand at the DEST parameter has the data type BOOL.
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
SRC	#SrcField	The local operand #SrcField uses a UDT that was still unknown at the time when the block was programmed. (Array [0 to 10] of "MOVE_UDT")
COUNT	Tag_Count	2
SRC_INDEX	Tag_Src_Index	3
DEST_INDEX	Tag_Dest_Index	3
DEST	#DestField	The local operand #DestField uses a UDT that was still unknown at the time when the block was programmed. (Array [10 to 20] of "MOVE_UDT")

If the operand "TagIn" has the signal state "1", the "Move block" instruction is executed. 2 elements are copied from the source area into the destination area beginning with the fourth element of the array of UDT. The copies are inserted in the array of UDT beginning with the fourth element. If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

## UMOVE\_BLK: Move block uninterruptible

### Description

You can use the "Move block uninterruptible" instruction to move the content of a memory area (source area) to another memory area (destination area). The number of elements to be moved

to the destination area is specified with the COUNT parameter. The width of the elements to be moved is defined by the width of the element at input IN.

The instruction can only be executed if the source area and the destination area have the same data type.

**Note**

The move operation cannot be interrupted by other operating system activities. This is why the alarm reaction times of the CPU increase during the execution of the "Move block uninterruptible" instruction.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- More data is moved than is made available at input IN or output OUT.

When a Array of BOOL is copied, the enable output ENO for an overflow is set to "1" until the byte limit of the Array structure is exceeded. If the byte limit of the Array structure is exceeded by the value at the COUNT input, the ENO enable output is reset to "0".

You can use the "Move block uninterruptible" instruction to move a maximum of 16 KB. Note the CPU-specific restrictions for this.

**Parameters**

The following table shows the parameters of the "Move block uninterruptible" instruction:

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
EN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN <sup>1)</sup>	Input	Binary numbers, integers, floating-point numbers, TIME, DATE, CHAR, TOD	Binary numbers, integers, floating-point numbers, timers, DATE, CHAR, TOD, LTOD	D, L	D, L	The first element of the source area that is being copied
COUNT	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Number of elements to be copied from the source area to the destination area

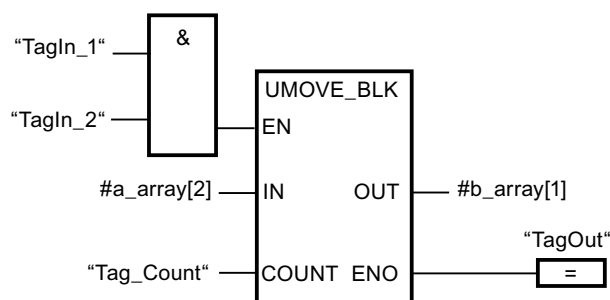

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
OUT <sup>1)</sup>	Output	Binary numbers, integers, floating-point numbers, TIME, DATE, CHAR, TOD	Binary numbers, integers, floating-point numbers, timers, DATE, CHAR, TOD, LTOD	D, L	D, L	The first element of the destination area to which the contents of the source area are being copied
1) The specified data types can only be used as elements of an array structure.						

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	a_array[2]	The data type of the a_array operand is Array [0..5] of INT. It consists of six elements of data type INT.
COUNT	Tag_Count	3
OUT	b_array[1]	The data type of the b_array operand is Array [0..6] of INT. It consists of seven elements of data type INT.

If the operands "TagIn\_1" and "TagIn\_2" have signal state "1", the "Move block uninterruptible" instruction is executed. Starting from the third element, the instruction selects three INT elements from the #a\_array tag and copies their contents to the #b\_array output tag, beginning with the second element. The move operation cannot be interrupted by other operating system activities. If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

**See also**

- Overview of the valid data types (Page 1262)
- Basics of the EN/ENO mechanism (Page 1357)

**FILL\_BLK: Fill block**

**Description**

You can use the "Fill block" instruction to fill a memory area (destination area) with the value of input IN. The destination area is filled beginning with the address specified at the OUT output. The number of repeated move operations is specified with the COUNT parameter. When the instruction is executed, the value at the input IN is selected and moved to the destination area as often as specified by the value of the COUNT parameter.

The instruction can only be executed if the source area and the destination area are of the same data type.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- More data is moved than is made available at input IN or output OUT.

When a Array of BOOL is copied, the enable output ENO for an overflow is set to "1" until the byte limit of the Array structure is exceeded. If the byte limit of the Array structure is exceeded by the value at the COUNT input, the ENO enable output is reset to "0".

**Parameters**

The following table shows the parameters of the "Fill block" instruction:

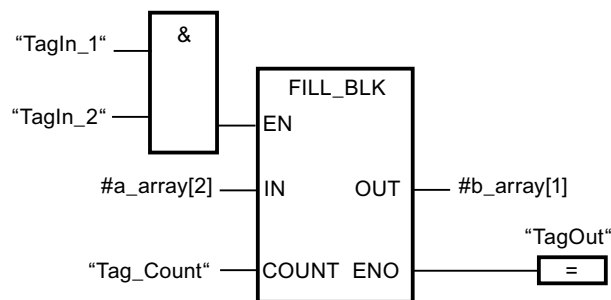

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
EN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN <sup>1)</sup>	Input	Binary numbers, integers, floating-point numbers, TIME, DATE, TOD, CHAR	Binary numbers, integers, floating-point numbers, timers, DATE, CHAR, TOD, LTOD	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Element used to fill the destination area
COUNT	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Number of repeated move operations

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
OUT <sup>2)</sup>	Output	Binary numbers, integers, floating-point numbers, TIME, DATE, TOD, CHAR	Binary numbers, integers, floating-point numbers, timers, DATE, CHAR, TOD, LTOD	D, L	D, L	Address in destination area from which filling starts.
<sup>1)</sup> The specified data types can also be used as elements of an Array structure. <sup>2)</sup> The specified data types can only be used as elements of an Array structure.						

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	a_array[2]	The data type of the a_array operand is Array [0..5] of INT. It consists of six elements of data type INT.
COUNT	Tag_Count	3
OUT	b_array[1]	The data type of the b_array operand is Array [0..6] of INT. It consists of seven elements of data type INT.

If the operands "TagIn\_1" and "TagIn\_2" have signal state "1", the "Fill block" instruction is executed. The instruction copies the third element (#a\_array[2]) of the #a\_array tag three times to the #b\_array output tag. If no errors occur during the execution of the instruction, the outputs ENO and "TagOut" are set to signal state "1".

**See also**

- Overview of the valid data types (Page 1262)

**UFILL\_BLK: Fill block uninterruptible**

**Description**

You can use the instruction "Fill block uninterruptible" to fill a memory area (destination area) with the value of input IN uninterruptibly. The destination area is filled beginning with the address specified at the OUT output. The number of repeated move operations is specified with the COUNT parameter. When the instruction is executed, the value at the input IN is selected and moved to the destination area as often as specified by the value of the COUNT parameter.

The instruction can only be executed if the source area and the destination area have the same data type.

**Note**

The move operation cannot be interrupted by other operating system activities. This is why the alarm reaction times of the CPU increase during the execution of the "Fill block uninterruptible" instruction.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- More data is moved than is made available at input IN or output OUT.

When a Array of BOOL is copied, the enable output ENO for an overflow is set to "1" until the byte limit of the Array structure is exceeded. If the byte limit of the Array structure is exceeded by the value at the COUNT input, the ENO enable output is reset to "0".

You can use the "Fill block uninterruptible" instruction to move a maximum of 16 KB. Note the CPU-specific restrictions for this.

**Parameters**

The following table shows the parameters of the "Fill block uninterruptible" instruction:

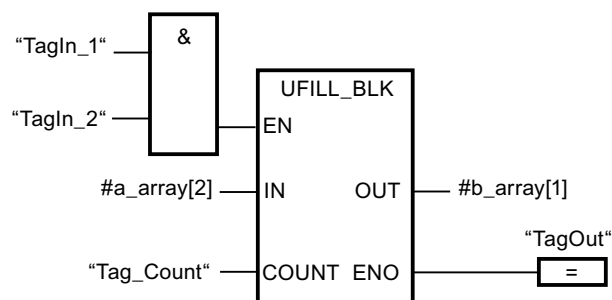

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
EN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
IN <sup>1)</sup>	Input	Binary numbers, integers, floating-point numbers, TIME, DATE, CHAR, TOD	Binary numbers, integers, floating-point numbers, timers, DATE, CHAR, TOD, LTOD	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Element used to fill the destination area
COUNT	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Number of repeated move operations
OUT <sup>2)</sup>	Output	Binary numbers, integers, floating-point numbers, TIME, DATE, CHAR, TOD	Binary numbers, integers, floating-point numbers, timers, DATE, CHAR, TOD, LTOD	D, L	D, L	Address in destination area from which filling starts.
<sup>1)</sup> The specified data types can also be used as elements of an Array structure. <sup>2)</sup> The specified data types can only be used as elements of an Array structure.						

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	a_array[2]	The data type of the a_array operand is Array [0..5] of INT. It consists of six elements of data type INT.
COUNT	Tag_Count	3
OUT	b_array[1]	The data type of the b_array operand is Array [0..6] of INT. It consists of seven elements of data type INT.

If the operands "TagIn\_1" and "TagIn\_2" have signal state "1", the "Fill block uninterruptible" instruction is executed. The instruction copies the third element (#a\_array[2]) of the #a\_array tag three times to the #b\_array output tag. The move operation cannot be interrupted by other operating system activities. If no errors occur during the execution of the instruction, the outputs ENO and "TagOut" are set to signal state "1".

- Basics of the EN/ENO mechanism (Page 1357)

**SWAP: Swap**

**Description**

You can use the instruction "Swap" to change the order of the bytes within the tag at input IN and query the result at output OUT.

The following figure shows how the bytes of a DWORD data type operand are swapped using the "Swap" instruction:

## Parameters

The following table shows the parameters of the "Swap" instruction:

Parameters	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
EN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	WORD, DWORD	WORD, DWORD, LWORD	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Operand whose bytes are swapped.
OUT	Output	WORD, DWORD	WORD, DWORD, LWORD	I, Q, M, D, L, P	I, Q, M, D, L, P	Result

You can select the data type of the instruction from the "<???"> drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN	TagIn_Value	0000 1111 0101 0101
OUT	TagOut_Value	0101 0101 0000 1111

If the operand "TagIn" has the signal state "1", the "Swap" instruction is executed. The arrangement of the bytes is changed and stored in the operand "TagOut\_Value".

**ARRAY DB instructions**

**ReadFromArrayDB: Read from array data block**

**Description**

You can use the "Read from array data block" instruction to read data from an array DB and write them to a destination area.

An array DB is a data block which consists of exactly one array of [data type]. The elements of the array can be UDT data type or any other elementary data type. The counting of the array always starts with the low limit "0", regardless of the later declaration of the array.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- If an error occurs during the execution of the instruction.

## Parameters

The following table shows the parameters of the "Read from array data block" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
DB	Input	DB_ANY	I, Q, M, D, L	Data block that is read
INDEX	Input	DINT	I, Q, M, D, L, P or constant	Element that is read
VALUE	Output	VARIANT	L	Value that is read and output
RET_VAL	Output	INT	I, Q, M, D, L, P	Error information: If an error occurs during the execution of the instruction, an error code is output at the RET_VAL parameter.

For additional information on valid data types, refer to "See also".

## Parameters RET\_VAL

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
80B4	Data types do not correspond
80B5	Copying process was interrupted
8132	The data block does not exist or is too short
8133	The data block is located in the load memory
8134	The data block is write protected
8135	The array DB contains invalid values
8154	The data type is not correctly declared
8282	The value at the INDEX parameter is outside the limits of the array.
8350	The VARIANT data type contains no value
8352	Code generation error
8353	Code generation error
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
DB	ArrayDB	The data type of the "ArrayDB" operand is Array [0 to 10] of INT.
INDEX	ArrayDB.THIS[2]	Third element of the "ArrayDB"
VALUE	TargetField[10].Data2[1]	The data type of the "TargetField" operand is Array [10 to 20] of "MOVE_UDT".

If the "TagIn1" operand has the signal state "1", the "Read from array data block" instruction is executed. The third element is read from "ArrayDB" and written to the "TargetField[10].Data2[1]" operand. If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

**See also**

- Overview of the valid data types (Page 1262)
- Basics of the EN/ENO mechanism (Page 1357)

**WriteToArrayDB: Write to array data block**

**Description**

You can use the "Write to array data block" instruction to write data to an array DB. An array DB is a data block which consists of exactly one array of [data type]. The elements of the array can be UDT data type or any other elementary data type. The counting of the array always starts with the low limit "0", regardless of the later declaration of the array. The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- If an error occurs during the execution of the instruction.

## Parameters

The following table shows the parameters of the "Write to array data block" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
DB	Input	DB_ANY	I, Q, M, D, L	Data block to which data is written
INDEX	Input	DINT	I, Q, M, D, L, P or constant	Element in the DB to which data is written
VALUE	Input	VARIANT	L	Value to be written
RET_VAL	Output	INT	I, Q, M, D, L, P	Error information: If an error occurs during the execution of the instruction, an error code is output at the RET_VAL parameter.

For additional information on valid data types, refer to "See also".

## Parameters RET\_VAL

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
80B4	Data types do not correspond
80B5	Copying process was interrupted
8132	The data block does not exist or is too short
8133	The data block is located in the load memory
8134	The data block is write protected
8135	The DB is not an array data block.
8282	The value at the INDEX parameter is outside the limits of the array.
8350	The VARIANT data type contains no value
8352	Code generation error
8353	Code generation error
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
DB	ArrayDB	The data type of the "ArrayDB" operand is Array [0 to 10] of INT.
INDEX	ArrayDB.THIS[2]	Third element of the "ArrayDB"
VALUE	SourceField[1].Data1[6]	The data type of the "SourceField" operand is Array [0 to 10] of "MOVE_UDT".

If the "TagIn1" operand has the signal state "1", the "Write to the ARRAY data block" instruction is executed. From the "SourceField" operand, the "Data1[6]" element from the second element is written to the "ArrayDB". The third element is written to the "ArrayDB". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

**See also**

- Overview of the valid data types (Page 1262)

**ReadFromArrayDBL: Read from array data block in load memory**

**Description**

You can use the "Read from array data block in load memory" instruction to read data from an array DB in load memory.

An array DB is a data block which consists of exactly one array of [data type]. The elements of the array can be UDT data type or any other elementary data type. The counting of the array always starts with the low limit "0", regardless of the later declaration of the array.

If the array DB is marked with the "Only store in load memory" block attribute, it is only stored in load memory.

The instruction is executed when a positive signal edge is detected at the REQ parameter. The BUSY parameter then has the signal state "1". The instruction is terminated if a negative signal edge is detected at the BUSY parameter. The DONE parameter has the signal state "1"

for one program cycle and the read value is output at the VALUE parameter within this cycle. With all other program cycles, the value at the VALUE parameter is not changed.

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, it is saved to the "Program resources" folder in the "Program blocks > System blocks" path of the project tree. For additional information on this topic, refer to "See also".

---

#### Note

The array DB must be located in a data block with the block property "Optimized".

---

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- If an error occurs during the execution of the instruction.

## Parameters

The following table shows the parameters of the "Read from array data block in load memory" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
REQ	Input	BOOL	I, Q, M, D, L or constant	REQ = "1": Starting with the reading of the array DB
DB	Input	DB_ANY	I, Q, M, D, L	Data block that is read
INDEX	Input	DINT	I, Q, M, D, L, P or constant	Element that is read
BUSY	Output	BOOL	I, Q, M, D, L	BUSY = "1": The array DB is still being read
DONE	Output	BOOL	I, Q, M, D, L	DONE = "1": The instruction was executed successfully

Parameter	Declaration	Data type	Memory area	Description
VALUE	InOut	VARIANT	D, L	Value that is read and output
ERROR	Output	INT	I, Q, M, D, L, P	Error information: If an error occurs during the execution of the instruction, an error code is output at the ERROR parameter.

For additional information on valid data types, refer to "See also".

### ERROR parameter

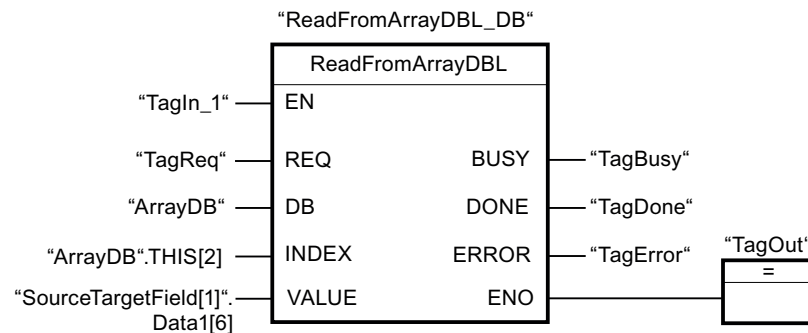

The following table shows the meaning of the values of the ERROR parameter:

Error code* (W#16#...)	Explanation
0000	No error
80B4	Data types do not correspond
80B5	Copying process was interrupted
80C3	Too many concurrent calls
8132	The data block does not exist or is too short
8133	The data block is not located in load memory
8134	The data block is write protected
8135	The DB is not an array data block.
8282	The value at the INDEX parameter is outside the limits of the array.
8350	The VARIANT data type contains no value
8352	Code generation error
8353	Code generation error
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

You can find descriptions of the error codes triggered by the instructions "READ\_DBL: Read from data block in load memory" and "WRIT\_DBL: Write to data block in load memory" under "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
REQ	TagReq	BOOL
DB	ArrayDB	The data type of the "ArrayDB" operand is Array [0 to 10] of INT.
INDEX	ArrayDB.THIS[2]	Third element of the "ArrayDB"
VALUE	SourceTargetField[1].Data1[6]	The data type of the "SourceTargetField" operand is Array [0 to 10] of "MOVE_UDT".
BUSY	TagBusy	BOOL
DONE	TagDone	BOOL

If the "TagIn1" operand has the signal state "1" and a positive edge is detected at the "TagReq" operand, the "Read from ARRAY data block in load memory" instruction is executed. The third element is read from "ArrayDB" and written to the "SourceTargetField[1].Data1[6]" operand. As soon as a negative signal edge is detected at the "TagBusy" operand, the instruction is terminated and the value at the VALUE parameter is no longer changed. If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set. After the instruction has been processed, the "TagDone" operand the signal state "1".

## WriteToArrayDBL: Write to array data block in load memory

### Description

You can use the "Write to array data block in load memory" instruction to write data to an array DB in load memory.

An array DB is a data block which consists of exactly one array of [data type]. The elements of the array can be UDT data type or any other elementary data type. The counting of the array always starts with the low limit "0", regardless of the later declaration of the array.

If the array DB is marked with the "Only store in load memory" block attribute, it is only stored in load memory.

The instruction is executed when a positive signal edge is detected at the REQ parameter. The BUSY parameter then has the signal state "1". If a negative signal edge is detected at the BUSY parameter, the instruction is terminated and the value at the VALUE parameter is written to the data block. The DONE parameter then has the signal state "1" for one program cycle.

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, it is saved to the "Program resources" folder in the "Program blocks > System blocks" path of the project tree. For additional information on this topic, refer to "See also".

---

### Note

The array DB must be located in a data block with the block property "Optimized".

---

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- If an error occurs during the execution of the instruction.

### Parameters

The following table shows the parameters of the "Write to array data block in load memory" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
REQ	Input	BOOL	I, Q, M, D, L or constant	REQ = "1": Start writing to the array DB
DB	Input	DB_ANY	D	Data block to which data is written
INDEX	Input	DINT	I, Q, M, D, L, P or constant	Element in the DB to which data is written

Parameter	Declaration	Data type	Memory area	Description
VALUE	Input	VARIANT	D, L	Value to be written
BUSY	Output	BOOL	I, Q, M, D, L	BUSY = "1": The array DB is still being written
DONE	Output	BOOL	I, Q, M, D, L	DONE = "1": The instruction was executed successfully
ERROR	Output	INT	I, Q, M, D, L, P	Error information: If an error occurs during the execution of the instruction, an error code is output at the ERROR parameter.

For additional information on valid data types, refer to "See also".

## ERROR parameter

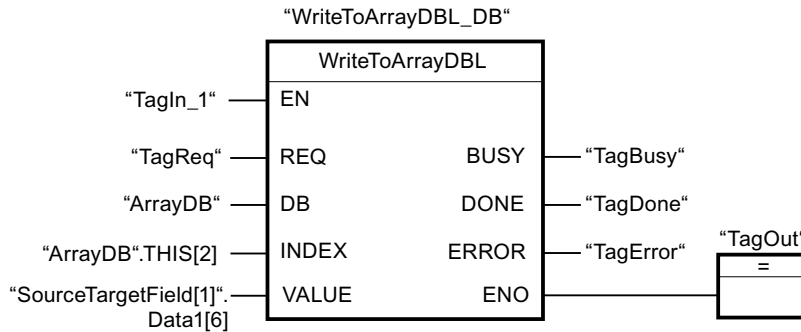

The following table shows the meaning of the values of the ERROR parameter:

Error code* (W#16#...)	Explanation
0000	No error
80B4	Data types do not correspond
80B5	Copying process was interrupted
8132	The data block does not exist or is too short
8133	The data block is not located in the load memory
8134	The data block is write protected
8135	The DB is not an array data block.
8282	The value at the INDEX parameter is outside the limits of the array.
8350	The VARIANT data type contains no value
8352	Code generation error
8353	Code generation error
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

You can find descriptions of the error codes triggered by the instructions "READ\_DBL: Read from data block in load memory" and "WRIT\_DBL: Write to data block in load memory" under "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
REQ	TagReq	BOOL
DB	ArrayDB	The data type of the "ArrayDB" operand is Array [0 to 10] of INT.
INDEX	ArrayDB.THIS[2]	Third element of the "ArrayDB"
VALUE	SourceTargetField[1].Data1[6]	The data type of the "SourceTargetField" operand is Array [0 to 10] of "MOVE_UDT".
BUSY	TagBusy	BOOL
DONE	TagDone	BOOL

If the "TagIn1" operand has the signal state "1" and a positive edge is detected at the "TagReq"operand, the "Write to ARRAY data block in load memory" instruction is executed. As soon as a negative signal edge is detected at the "TagBusy" operand, the instruction is terminated and the value at the VALUE parameter is written in the third element in the "ArrayDB". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set. After the instruction has been processed, the "TagDone" operand the signal state "1".

## VARIANT instructions

### VariantGet: Read out VARIANT tag value

#### Description

You can use the "Read out VARIANT tag value" instruction to read the value of the tag to which the VARIANT at the SRC parameter points and write it in the tag at the DST parameter.

The SRC parameter must have the VARIANT data type. Any data type except for VARIANT can be specified at the DST parameter.

The data type of the tag at the DST parameter must match the data type to which the VARIANT points.

---

#### Note

The tag to which the VARIANT at parameter SRC points must be a PLC data type.

To copy structures and ARRAYS, you can use the "MOVE\_BLK\_VARIANT: Move block" instruction. For additional information, refer to "See also".

---

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The data types do not correspond. (No value is transferred.)

#### Parameters

The following table shows the parameters of the "Read out VARIANT tag value" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
SRC	Input	VARIANT	L	Tag to be read
DST	Output	Bit strings, integers, floating-point numbers, timers, date and time, character strings, ARRAY	I, Q, M, D, L	Result of the instruction

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

If the "TagIn" operand has the signal state "1", the "Read out VARIANT tag value" instruction is executed. The value of the tag to which the VARIANT at the "#TagIn\_Source" operand points is read and written to the "TagOut\_Dest" operand.

### See also

- Overview of the valid data types (Page 1262)
- Basics of the EN/ENO mechanism (Page 1357)
- VARIANT (Page 1303)
- MOVE\_BLK\_VARIANT: Move block (Page 2235)

### VariantPut: Write VARIANT tag value

#### Description

You can use the "Write VARIANT tag value" instruction to write the value of the tag at the SRC parameter to the tag at the DST parameter to which the VARIANT points.

The DST parameter must have the VARIANT data type. Any data type except for VARIANT can be specified at the SRC parameter.

The data type of the tag at the SRC parameter must match the data type to which the VARIANT points.

---

#### Note

The tag to which the VARIANT at parameter DST points must be a PLC data type.

---

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The data types do not correspond. (No value is transferred.)

## Parameters

The following table shows the parameters of the "Write VARIANT tag value" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
SRC	Input	Bit strings, integers, floating-point numbers, timers, date and time, character strings, ARRAY	I, Q, M, D, L	Tag to be read
DST	Input	VARIANT	L	Result of the instruction

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

If the "TagIn" operand has the signal state "1", the "Write VARIANT tag value" instruction is executed. The value of the "TagIn\_Source" operand is written to the tag to which the VARIANT at the "#TagIn\_Dest" operand points.

## See also

Overview of the valid data types (Page 1262)

Basics of the EN/ENO mechanism (Page 1357)

VARIANT (Page 1303)

## CountOfElements: Get number of ARRAY elements

### Description

You can use the "Get number of ARRAY elements" instruction to query how many ARRAY elements a tag pointing to an VARIANT has.

If it is a one-dimensional ARRAY, the difference between the high and low limit +1 is output as a result. If it is a multi-dimensional ARRAY, the product of all dimensions is output as the result.

The IN parameter must have the same VARIANT data type.

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- The VARIANT tag is not an ARRAY. (The result is "0".)

If the VARIANT points to an ARRAY of BOOL, the fill elements are included in the count. (For example, 8 is returned for an ARRAY[0..1] of BOOL)

### Parameters

The following table shows the parameters of the "Get number of ARRAY elements" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	VARIANT	L	Tag to be queried
RET_VAL	Output	UDINT	I, Q, M, D, L	Result of the instruction

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

If the "TagIn" operand has the signal state "1", the "Get number of ARRAY elements" instruction is executed. The number of ARRAY elements of the tag to which the VARIANT at the "#TagIn\_Source" operand points is read and output at the "TagOut\_RetVal" operand.

### See also

- Format of array (16-bit limits) (Page 1293)
- Format of array (32-bit limits) (Page 1294)

- VARIANT (Page 1303)

## Other

### BLKMOV: Move block

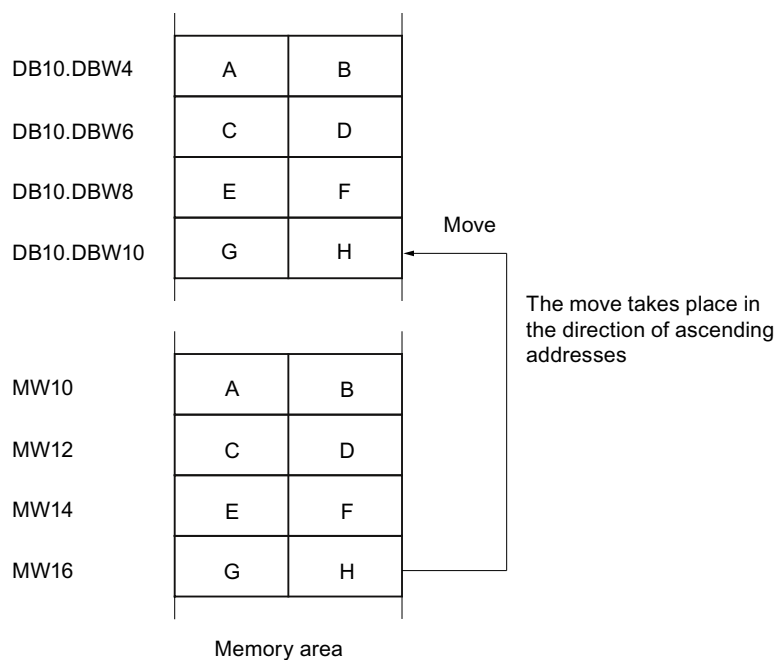

#### Description

You can use the "Move block" instruction to move the content of a memory area (source area) to another memory area (destination area). The move operation takes place in the direction of ascending addresses. You use VARIANT to define the source and destination area.

#### Note

The tags of the instruction can only be used in data blocks in which the "Optimized block access" attribute is not set. If the tag with the retentive setting "Set in IDB" has been declared, you can also use the tags "with optimized access".

The following figure shows the principle of the move operation:

#### Consistency of the source data and the target data

Make sure that the source data remain unchanged during the execution of the "Move block" instruction. Otherwise the consistency of the target data cannot be ensured.

#### Interruptibility

There is no limit to the nesting depth.

### Memory areas

You can use the "Move block" instruction to move the following memory areas:

- Areas of a data block
- Bit memory
- Process image of the inputs
- Process image of the outputs

### General rules for moving

The source and destination area must not overlap. If the source and destination area have different lengths, only the length of the smaller area will be moved.

If the source area is less than the destination area, the entire source area will be written to the destination area. The remaining bytes of the destination area remain unchanged.

If the destination area is less than the source area, the entire destination area will be written. The remaining bytes of the source area are ignored.

If a block of data type BOOL is moved, the tag must be addressed absolutely and the specified length of the area must be divisible by 8, otherwise the instruction cannot be executed.

### Rules for moving character strings

You can use the "Move block" instruction to also move source and destination areas of the STRING data type. If only the source area is STRING data type, the characters will be moved that are actually contained in the character string. Information on the actual and maximum length is also written to the destination area. If the source and destination area are each STRING data type, the current length of the character string in the destination area is set to the number of actually moved characters.

If you want to move the information on the maximum and actual length of a character string, specify the areas in bytes in the SRCBLK and DSTBLK parameters.

### Parameters

The following table shows the parameters of the "Move block" instruction:

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
SRCBLK	Input	VARIANT	L, P	L, P	Specifies the memory area to be moved (source area).

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
RET_VAL	Output	INT	I, Q, M, D, L, P	I, Q, M, D, L, P	Error information: If an error occurs during the execution of the instruction, an error code is output at the RET_VAL parameter.
DSTBLK	Output	VARIANT	L, P	L, P	Specifies the memory area to which the block is to be moved (destination area).

## RET\_VAL parameter

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
8152	The data types WSTRING, WCHAR and BOOL are not supported.
8092	The source or target area is only available in the load memory.
General error information	See also: "GET_ERR_ID: Get error ID locally"
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

## See also

Overview of the valid data types (Page 1262)

Basics of the EN/ENO mechanism (Page 1357)

GET\_ERR\_ID: Get error ID locally (Page 2306)

## UBLKMOV: Move block uninterruptible

### Description

You can use the "Move block uninterruptible" instruction to move the content of a memory area (source area) to another memory area (destination area). The move operation takes place in the direction of ascending addresses. You use VARIANT to define the source and destination area.

The move operation cannot be interrupted by other operating system activities. As a result the interrupt reaction time of the CPU can increase during the execution of the "Move block uninterruptible" instruction.

---

**Note**

The tags of the instruction can only be used in data blocks in which the "Optimized block access" attribute is not set. If the tag with the retentive setting "Set in IDB" has been declared, you can also use the tags "with optimized access".

---

## Memory areas

You can use the "Move block uninterruptible" instruction to move the following memory areas:

- Areas of a data block
- Bit memory
- Process image of the inputs
- Process image of the outputs

## General rules for moving

The source and destination area must not overlap during the execution of the "Move block uninterruptible" instruction. If the source area is less than the destination area, the entire source area will be written to the destination area. The remaining bytes of the destination area remain unchanged.

If the destination area is less than the source area, the entire destination area will be written. The remaining bytes of the source area are ignored.

If a source or destination area defined as a formal parameter is less than a destination or source area specified on the SRCBLK or DSTBLK parameter, no data is transferred.

If a block of data type BOOL is moved, the tag must be addressed absolutely and the specified length of the area must be divisible by 8, otherwise the instruction cannot be executed.

You can use the "Move block uninterruptible" instruction to move a maximum of 16 KB. Note the CPU-specific restrictions for this.

## Rules for moving character strings

You can use the "Move block uninterruptible" instruction to also move source and destination areas of the STRING data type. If only the source area is STRING data type, the characters will be moved that are actually contained in the character string. Information on the actual and maximum length are not written in the destination area. If the source and destination area are each STRING data type, the current length of the character string in the destination area is set to the number of actually moved characters. If areas of the data type STRING are moved, you have to specify "1" as area length.

## Parameters

The following table shows the parameters of the "Move block uninterruptible" instruction:

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
SRCBLK	Input	VARIANT	L, P	L, P	Specifies the memory area to be moved (source area).
RET_VAL	Output	INT	I, Q, M, D, L, P	I, Q, M, D, L, P	Error information: If an error occurs during the execution of the instruction, an error code is output at the RET_VAL parameter.
DSTBLK	Output	VARIANT	L, P	L, P	Specifies the memory area to which the block is to be moved (destination area).

## Parameters RET\_VAL

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code (W#16#...)	Explanation
0000	No error
8152	The data types WSTRING, WCHAR and BOOL are not supported.
8091	The source area is in a data block that is not relevant for program execution.
General error information	See also: "GET_ERR_ID: Get error ID locally"
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

## See also

**FILL: Fill block**

**Description**

You can use the "Fill block" instruction to fill a memory area (destination area) with the content of another memory area (source area). The "Fill block" instruction moves the content of the source area to the destination area until the destination area is completely written. The move operation takes place in the direction of ascending addresses.

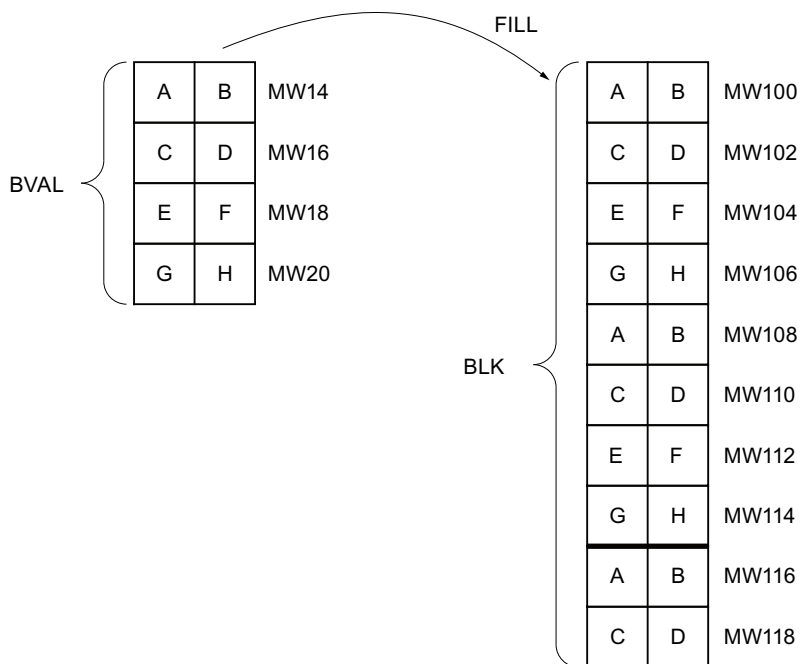

You use VARIANT to define the source and destination area.

**Note**

The tags of the instruction can only be used in data blocks in which the "Optimized block access" attribute is not set. If the tag with the retentive setting "Set in IDB" has been declared, you can also use the tags "with optimized access".

For blocks with the "Optimized block access" attribute, you can use the "FILL\_BLK: Fill block" instruction.

The following figure shows the principle of the move operation:

**Consistency of the source data and the target data**

Note that while the instruction "Fill block" is being executed, the source data remains unchanged; otherwise the consistency of the destination data cannot be guaranteed.

## Memory areas

You can use the "Fill block" instruction to move the following memory areas:

- Areas of a data block
- Bit memory
- Process image of the inputs
- Process image of the outputs

## General rules for moving

The source and destination area must not overlap. If the destination area to be preset is not an integer multiple of the length of the input parameter BVAL, the destination area is nevertheless written up to the last byte.

If the destination area to be preset is smaller than the source area, the function only copies as much data as can be written to the destination area.

If the destination or source area actually present is smaller than the assigned memory area for the source or destination area (BVAL, BLK parameters), no data is transferred.

If the ANY pointer (source or destination) is of the data type BOOL, it must be addressed absolutely and the length specified must be divisible by 8; otherwise the instruction is not executed.

If the destination area is of data type STRING, the instruction writes the entire string including the administration information.

## Parameters

The following table shows the parameters of the "Fill block" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
BVAL	Input	VARIANT	L, P	Specification of the memory area (source area) with the content used to fill the destination area at the BLK parameter.
RET_VAL	Output	INT	I, Q, M, D, L, P	Error information: If an error occurs during the execution of the instruction, an error code is output at the RET_VAL parameter.
BLK	Output	VARIANT	L, P	Specification of the memory area that is filled with the content of the source area.

### Parameters RET\_VAL

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
8152	The data types WSTRING, WCHAR and BOOL are not supported.
General error information	See also: "GET_ERR_ID: Get error ID locally"
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

### See also

### Conversion operations

#### CONVERT: Convert value

#### Description

The "Convert value" instruction reads the content of the IN parameter and converts it according to the data types configured in the instruction box. The converted value is provided at output OUT.

For information on possible conversions, refer to section "Explicit conversion" under "See also".

The ENO enable output has the signal state "0" if one of the following conditions is fulfilled:

- The EN enable input has the signal state "0".
- Errors, such as an overflow, occur during execution.

#### Parameters

The following table shows the parameters of the "Convert value" instruction:

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
IN	Input	Bit strings, integers, floating-point numbers, CHAR, BCD16, BCD32	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Value to be converted.
OUT	Output	Bit strings, integers, floating-point numbers, CHAR, BCD16, BCD32	I, Q, M, D, L, P	I, Q, M, D, L, P	Result of the conversion

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

Bit strings (BYTE, WORD, DWORD, LWORD) cannot be selected in the instruction box. If you specify an operand of data type BYTE, WORD, DWORD or LWORD at a parameter of the instruction, it is interpreted according to the data type of the input or output parameter. Data type BYTE is then interpreted as USINT, WORD as UINT, DWORD as UDINT, and LWORD as LINT, for example.

#### Note

For S7-1500 CPU: You can select the data types DWORD and LWORD if REAL or LREAL were selected as IN data type.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

If the operand "TagIn" has the signal state "1", the content of the operand "TagIn\_Value" is read and converted to an integer (16 bits). The result is stored in the operand "TagOut\_Value". The output "TagOut" is set to "1" if the instruction was executed without errors.

**See also**

- Overview of the valid data types (Page 1262)
- Basics of the EN/ENO mechanism (Page 1357)

**ROUND: Round numerical value**

**Description**

You can use the "Round numerical value" instruction to round the value at input IN to the nearest integer. The instruction interprets the value at input IN as a floating-point number and converts this to the nearest integer. If the input value is exactly between an even and odd number, then the even number is converted. The result of the instruction is provided at output OUT and can be queried there.

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- Errors, such as an overflow, occur during execution.

**Parameters**

The following table shows the parameters of the "Round numerical value" instruction:

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Input value to be rounded.
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L, P	I, Q, M, D, L, P	Result of the rounding

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value	
IN	TagIn_Value	1.50000000	-1.50000000
OUT	TagOut_Value	2	-2

If the operand "TagIn" has the signal state "1", the "Round numerical value" instruction is executed. The floating-point number at input "TagIn\_Value" is rounded to the nearest even integer and sent to output "TagOut\_Value". If no errors occur during the execution of the instruction, the output "TagOut" is set.

## CEIL: Generate next higher integer from floating-point number

### Description

You can use the "Generate next higher integer from floating-point number" instruction to round the value at input IN to the next higher integer. The instruction interprets the value at input IN as a floating-point number and converts this to the next higher integer. The result of the instruction is provided at output OUT and can be queried there. The output value can be greater than or equal to the input value.

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- Errors, such as an overflow, occur during execution.

### Parameters

The following table shows the parameters of the instruction "Generate next higher integer from floating-point number":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Input value as floating-point number
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L, P	I, Q, M, D, L, P	Result with the next higher integer

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value	
IN	TagIn_Value	0.50000000	-0.50000000
OUT	TagOut_Value	1	0

If the operand "TagIn" has the signal state "1", the instruction "Generate next higher integer from floating-point number" is executed. The floating-point number at input "TagIn\_Value" is rounded to the next higher integer and sent to output "TagOut\_Value". If no errors occur during the execution of the instruction, the output "TagOut" is set.

### See also

## FLOOR: Generate next lower integer from floating-point number

### Description

You can use the "Generate next lower integer from floating-point number" instruction to round the value at input IN to the next lower integer. The instruction interprets the value at input IN as a floating-point number and converts this to the next lower integer. The result of the instruction is provided at output OUT and can be queried there. The output value can be less than or equal to the input value.

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- Errors, such as an overflow, occur during execution.

### Parameters

The following table shows the parameters of the instruction "Generate next lower integer from floating-point number":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Input value as floating-point number
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L, P	I, Q, M, D, L, P	Result with the next lower integer

You can select the data type of the instruction from the "<???"> drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value	
IN	TagIn_Value	0.50000000	-0.50000000
OUT	TagOut_Value	0	-1

If the operand "TagIn" has the signal state "1", the instruction "Generate next lower integer from floating-point number" is executed. The floating-point number at input "TagIn\_Value" is rounded to the next lower integer and displayed at output "TagOut\_Value". If no errors occur during the execution of the instruction, the output "TagOut" is set.

**See also**

- Overview of the valid data types (Page 1262)

**TRUNC: Truncate numerical value**

**Description**

You can use the "Truncate numerical value" instruction to form an integer from the value at input IN. The value at input IN is interpreted as a floating-point number. The instruction selects only the integer part of the floating-point number and sends this to output OUT without decimal places.

Enable output ENO has the signal state "0" if one of the following conditions applies:

- Enable input EN has the signal state "0".
- Errors, such as an overflow, occur during execution.

**Parameters**

The following table shows the parameters of the instruction "Truncate numerical value":

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Floating-point numbers	I, Q, M, D, L or constant	Input value as floating-point number
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L	Result with integer part of the floating-point number

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value	
IN	TagIn_Value	1.50000000	-1.50000000
OUT	TagOut_Value	1	-1

If the operand "TagIn" has the signal state "1", the "Truncate numerical value" instruction is executed. The integer part of the floating-point number at input "TagIn\_Value" is converted to an integer and sent to output "TagOut\_Value". If no errors occur during the execution of the instruction, the output "TagOut" is set.

## SCALE\_X: Scale

### Description

You can use the "Scale" instruction to scale the value at the VALUE input by mapping it to a specified value range. When the instruction "Scale" is executed, the floating-point value at input VALUE is scaled to the value range, which is defined by the parameters MIN and MAX. The result of the scaling is an integer, which is stored at output OUT.

The following figure shows an example of how values can be scaled:

The "Scale" instruction works with the following equation:

$$OUT = [VALUE * (MAX - MIN)] + MIN$$

Enable output ENO has the signal state "0" if one of the following conditions is fulfilled:

- Enable input EN has the signal state "0".
- The value at input MIN is greater than or equal to the value at input MAX.
- The value of a specified floating-point number is outside the range of the normalized numbers according to IEEE-754.
- An overflow occurs.
- The value at input VALUE is NaN (Not a number = result of an invalid arithmetic operation).

---

**Note**

For more information on the conversion of analog values, refer to the respective manual.

---

**Parameters**

The following table shows the parameters of the "Scale" instruction:

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
MIN	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Low limit of the value range

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
VALUE	Input	Floating-point numbers	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Value to be scaled. If you enter a constant, you must declare it.
MAX	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	I, Q, M, D, L or constant	High limit of the value range
OUT	Output	Integers, floating-point numbers	I, Q, M, D, L	I, Q, M, D, L	Result of scaling

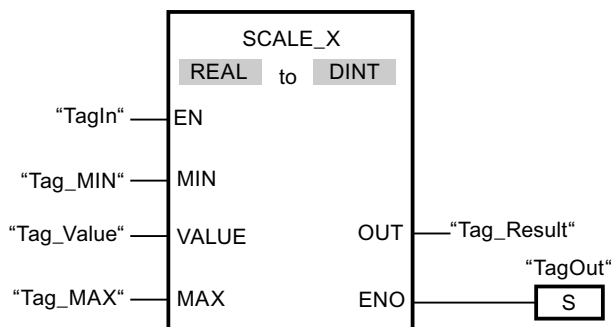

You can select the data type of the instruction from the "<???"> drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

For additional information on declaring constants, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
MIN	Tag_MIN	10
VALUE	Tag_Value	0.5
MAX	Tag_MAX	30
OUT	Tag_Result	20

If the operand "TagIn" has the signal state "1", the "Scale" instruction is executed. The value at input "Tag\_Value" is scaled to the range of values defined by the values at inputs "Tag\_MIN" and "Tag\_MAX". The result is stored at output "Tag\_Result". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

**See also**

- Overview of the valid data types (Page 1262)
- Basics of the EN/ENO mechanism (Page 1357)
- NORM\_X: Normalize (Page 2280)
- Declaring global constants (Page 1378)

**NORM\_X: Normalize**

**Description**

You can use the instruction "Normalize" to normalize the value of the tag at the VALUE input by mapping it to a linear scale. You can use the parameters MIN and MAX to define the limits of a value range that is applied to the scale. Depending on the location of the normalized value in this value range, the result at output OUT is calculated and stored as a floating-point number. If the value to be normalized is equal to the value at input MIN, output OUT returns the value "0.0". If the value to be normalized is equal to the value at input MAX, output OUT returns the value "1.0".

The following figure shows an example of how values can be normalized:

The "Normalize" instruction works with the following equation:

$$OUT = (VALUE - MIN) / (MAX - MIN)$$

Enable output ENO has the signal state "0" if one of the following conditions is fulfilled:

- Enable input EN has the signal state "0".
- The value at input MIN is greater than or equal to the value at input MAX.

- The value of a specified floating-point number is outside the range of the normalized numbers according to IEEE-754.
- The value at input VALUE is NaN (result of an invalid arithmetic operation).

---

**Note**

For more information on the conversion of analog values, refer to the respective manual.

---

## Parameters

The following table shows the parameters of the instruction "Normalize":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
MIN <sup>1)</sup>	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Low limit of the value range
VALUE <sup>1)</sup>	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Value to be normalized.
MAX <sup>1)</sup>	Input	Integers, floating-point numbers	I, Q, M, D, L or constant	I, Q, M, D, L or constant	High limit of the value range
OUT	Output	Floating-point numbers	I, Q, M, D, L	I, Q, M, D, L	Result of the normalization

<sup>1)</sup> If you use constants in these three parameters, you only need to declare one of them.

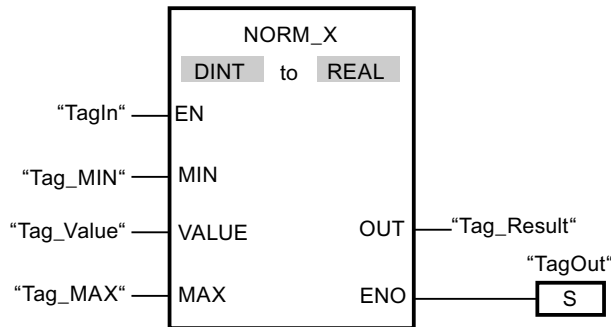

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

For additional information on declaring constants, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
MIN	Tag_MIN	10
VALUE	Tag_Value	20
MAX	Tag_MAX	30
OUT	Tag_Result	0.5

If the operand "TagIn" has the signal state "1", the "Normalize" instruction is executed. The value at input "Tag\_Value" is assigned to the range of values defined by the values at inputs "Tag\_MIN" and "Tag\_MAX". The tag value at input "Tag\_Value" is normalized corresponding to the defined value range. The result is stored as a floating-point number at output "Tag\_Result". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

**See also**

- Overview of the valid data types (Page 1262)
- Basics of the EN/ENO mechanism (Page 1357)
- SCALE\_X: Scale (Page 2277)
- Declaring global constants (Page 1378)

**Other**

**SCALE: Scale**

**Description**

Use the Scale instruction to convert the integer at the IN parameter into a floating-point number, which can be scaled in physical units between a low limit value and a high limit value. You can

use the LO\_LIM and HI\_LIM parameters to specify the low limit and high limit of the value range to which the input value is scaled. The result of the instruction is output at the OUT parameter.

The "Scale" instruction works with the following equation:

$$\text{OUT} = [((\text{FLOAT}(\text{IN}) - \text{K1}) / (\text{K2} - \text{K1})) * (\text{HI\_LIM} - \text{LO\_LIM})) + \text{LO\_LIM}]$$

The values of the constants "K1" and "K2" are determined by the signal state on the BIPOLAR parameter. The following signal states are possible on the BIPOLAR parameter:

- Signal state "1": It is assumed that the value at the IN parameter is bipolar and in a value range between -27648 and 27648. In this case the "K1" constant has the value "-27648.0" and the "K2" constant the value "+27648.0".
- Signal state "0": It is assumed that the value at the IN parameter is unipolar and in a value range between 0 and 27648. In this case the "K1" constant has the value "0.0" and the "K2" constant the value "+27648.0".

When the value at the IN parameter is greater than the value of the constant "K2", the result of the instruction is set to the value of the high limit (HI\_LIM) and an error is output.

When the value at the IN parameter is less than the value of the constant "K1", the result of the instruction is set to the value of the low limit value (LO\_LIM) and an error is output.

When the indicated low limit value is greater than the high limit value (LO\_LIM > HI\_LIM), the result is scaled in reverse proportion to the input value.

## Parameters

The following table shows the parameters of the "Scale" instruction:

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	INT	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Input value to be scaled.
HI_LIM	Input	REAL	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	High limit
LO_LIM	Input	REAL	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Low limit
BIPOLAR	Input	BOOL	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Indicates if the value at IN parameter is to be interpreted as bipolar or unipolar. The parameter can assume the following values: 1: Bipolar 0: Unipolar

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
OUT	Output	REAL	I, Q, M, D, L, P	I, Q, M, D, L, P	Result of the instruction
RET_VAL	Output	WORD	I, Q, M, D, L, P	I, Q, M, D, L, P	Error information

**Parameters RET\_VAL**

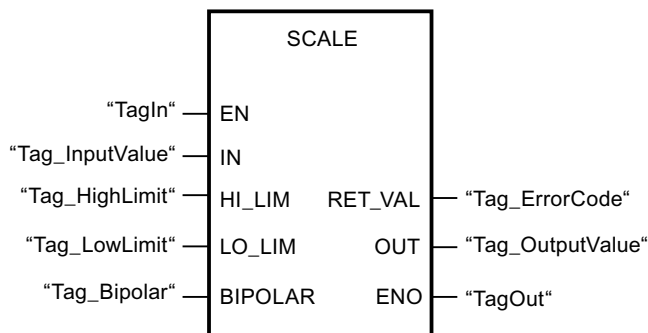

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
0008	The value of the IN parameter is greater than the value of the "K2" constant or less than the value of the "K1" constant.
General error information	See also: "GET_ERR_ID: Get error ID locally"

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	Tag_InputValue	22
HI_LIM	Tag_HighLimit	100.0
LO_LIM	Tag_LowLimit	0.0
BIPOLAR	Tag_Bipolar	1
OUT	Tag_OutputValue	50.03978588
RET_VAL	Tag_ErrorCode	W#16#0000

**See also**

- Overview of the valid data types (Page 1262)
- Basics of the EN/ENO mechanism (Page 1357)
- GET\_ERR\_ID: Get error ID locally (Page 2306)

**UNSCALE: Unscale****Description**

The "Unscale" instruction unscales the floating-point number at the IN parameter into physical units between a low limit value and a high limit and converts them into integers. You can use the LO\_LIM and HI\_LIM parameters to specify the low limit and high limit of the value range to which the input value is unscaled. The result of the instruction is output at the OUT parameter.

The "Unscale" instruction works with the following equation:

$$\text{OUT} = [ ((\text{IN} - \text{LO\_LIM}) / (\text{HI\_LIM} - \text{LO\_LIM})) * (\text{K2} - \text{K1}) ] + \text{K1}$$

The values of the constants "K1" and "K2" are determined by the signal state on the BIPOLAR parameter. The following signal states are possible on the BIPOLAR parameter:

- Signal state "1": It is assumed that the value at the IN parameter is bipolar and in a value range between -27648 and 27648. In this case the "K1" constant has the value "-27648.0" and the "K2" constant the value "+27648.0".
- Signal state "0": It is assumed that the value at the IN parameter is unipolar and in a value range between 0 and 27648. In this case the "K1" constant has the value "0.0" and the "K2" constant the value "+27648.0".

When the value at the IN parameter is greater than the value of the constant "HI\_LIM", the result of the instruction is set to the value of the constant (K2) and an error is output.

When the value at the IN parameter is less than the value of the constant of the low limit (LO\_LIM), the result of the instruction is set to the value of the constant (K1) and an error is output.

**Parameters**

The following table shows the parameters of the "Unscale" instruction:

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	REAL	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Input value to be unscaled to an integer value.
HI_LIM	Input	REAL	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	High limit

Parameter	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
LO_LIM	Input	REAL	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Low limit
BIPOLAR	Input	BOOL	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Indicates if the value at the IN parameter is to be interpreted as bipolar or unipolar. The parameter can assume the following values: 1: Bipolar 0: Unipolar
OUT	Output	INT	I, Q, M, D, L, P	I, Q, M, D, L, P	Result of the instruction
RET_VAL	Output	WORD	I, Q, M, D, L, P	I, Q, M, D, L, P	Error information

### Parameters RET\_VAL

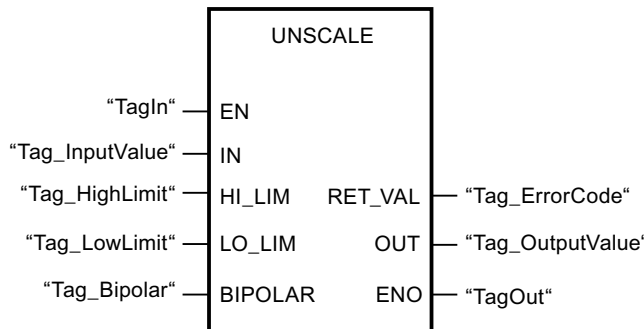

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
0008	The value of the IN parameter is greater than the value of the high limit (HI_LIM) or less than the value of the low limit (LO_LIM).
General error information	See also: "GET_ERR_ID: Get error ID locally"

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

### Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	Tag_InputValue	50.03978588
HI_LIM	Tag_HighLimit	100.0
LO_LIM	Tag_LowLimit	0.0
BIPOLAR	Tag_Bipolar	1
OUT	Tag_OutputValue	22
RET_VAL	Tag_ErrorCode	W#16#0000

### Program control operations

#### JMP: Jump if RLO = 1

#### Description

You can use the "Jump if RLO = 1" instruction to interrupt the linear execution of the program and resume it in another network. The target network must be identified by a jump label (LABEL). The jump label description is entered in the placeholder above the instruction box.

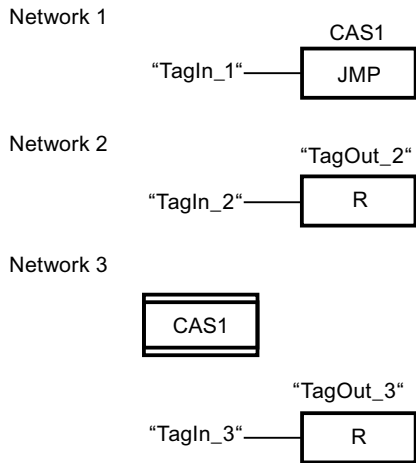

The specified jump label must be in the same block in which the instruction is executed. The name you specify can only occur once in the block. Only one jumping coil can occur in a network.

If the result of logic operation (RLO) at the input of the instruction is "1", the jump to the network identified by the jump label is executed. The jump direction can be towards higher or lower network numbers.

If the condition at the input of the instruction is not fulfilled (RLO = 0), execution of the program continues in the next network.

### Example

The following example shows how the instruction works:

If the operand "TagIn\_1" has the signal state "1", the instruction "Jump if RLO = 1" is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. If input "TagIn\_3" has the signal state "1", output "TagOut\_3" is reset.

### See also

Overview of the valid data types (Page 1262)

### JMPN: Jump if RLO = 0

#### Description

You can use the instruction "Jump if RLO = 0" to interrupt the linear execution of the program and resume it in another network, when the result of logic operation at the input of the instruction is "0". The target network must be identified by a jump label (LABEL). The jump label description is entered in the placeholder above the instruction box.

The specified jump label must be in the same block in which the instruction is executed. The name you specify can only occur once in the block. Only one jumping coil can occur in a network.

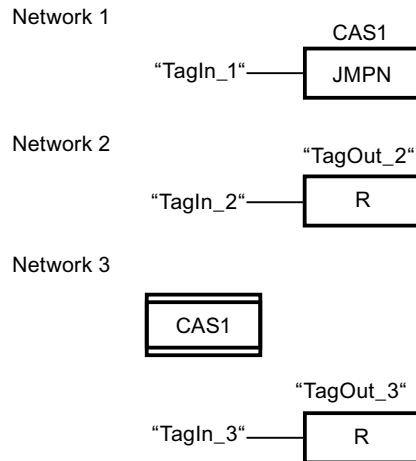

If the result of logic operation (RLO) at the input of the instruction is "0", the jump to the network identified by the jump label is executed. The jump direction can be towards higher or lower network numbers.

If the result of the logic operation RLO at the input of the instruction is "1", execution of the program continues in the next network.

## Example

The following example shows how the instruction works:

If the operand "TagIn\_1" has the signal state "0", the instruction "Jump if RLO = 0" is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. If input "TagIn\_3" has the signal state "1", output "TagOut\_3" is reset.

## See also

Overview of the valid data types (Page 1262)

## LABEL: Jump label

### Description

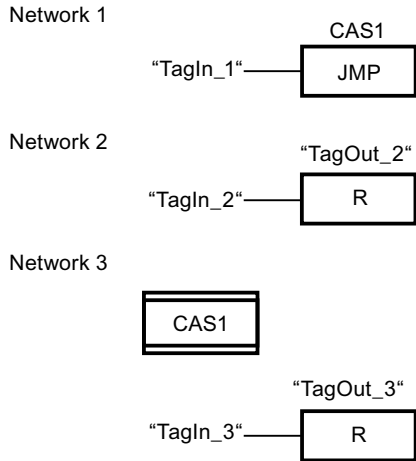

The jump label identifies a destination network in which the execution of the program can be resumed after the execution of a jump instruction.

The jump label and the instruction in which the jump label is specified must be located in the same block. The name of a jump label can only be assigned once in a block. You can declare up to 32 jump labels when you use a CPU S7-1200 and a maximum of 256 jump labels when you use a CPU S7-1500.

Only one jump label can be placed in a network. Each jump label can jump to several locations.

**Example**

The following example shows how the instruction works:

If the operand "TagIn\_1" has the signal state "1", the instruction "Jump if RLO = 1" is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. If input "TagIn\_3" has the signal state "1", output "TagOut\_3" is reset.

**JMP\_LIST: Define jump list**

**Description**

You can use the "Define jump list" instruction to define several conditional jumps and continue the program execution in a specific network depending on the value of the K parameter.

You define the jumps with jump labels (LABEL), which you specify at the outputs of the instruction box. The number of outputs can be expanded in the instruction box. You can declare up to 32 outputs when you use a CPU S7-1200 and a maximum of 99 outputs when you use a CPU S7-1500.

The numbering of the outputs begins with the value "0" and is continued in ascending order with each new output. Only jump labels can be specified at the outputs of the instruction. It is not permitted to specify instructions or operands.

The value of the K parameter specifies the number of the output and thus the jump label where the program execution is to be resumed. If the value in the K parameter is greater than the number of available outputs, the program execution is resumed in the next network of the block.

The "Define jump list" instruction is only executed if the signal state is "1" at the EN enable input.

## Parameters

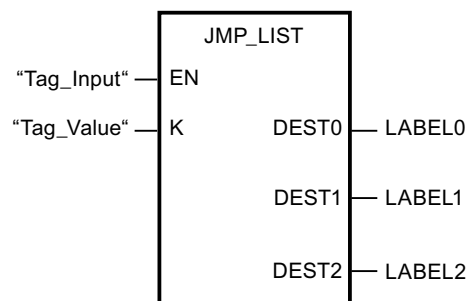

The following table shows the parameters of the "Define jump list" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, L, D	Enable input
K	Input	UINT	I, Q, M, L, D or constant	Specifies the number of the output and thus the jump that is executed.
DEST0	-	-	-	First jump label
DEST1	-	-	-	Second jump label
DESTn	-	-	-	Optional jump labels

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand/Jump label	Value
K	Tag_Value	1
DEST0	LABEL0	Jump to the network that is identified with the jump label "LABEL0".
DEST1	LABEL1	Jump in the network that is identified with the jump label "LABEL1".
DEST2	LABEL2	Jump in the network that is identified with the jump label "LABEL2".

If the operand "Tag\_Input" has the signal state "1", the instruction "Define jump list" is executed. The execution of the program is continued according to the value of the operand "Tag\_Value" in the network that is identified with the jump label "LABEL1".

**See also**

Overview of the valid data types (Page 1262)

Removing instruction inputs and outputs (Page 1528)

**SWITCH: Jump distributor**

**Description**

You can use the "Jump distributor" instruction to define multiple program jumps to be executed depending on the result of one or more comparison instructions.

At the parameter K, you specify the value to be compared. This value is compared with the values that the individual inputs return. You select the type of comparison for each input. The availability of various comparison instructions depends on the data type of the instruction.

The following table shows the comparison instructions that are available depending on the selected data type:

Data type		Instruction	Syntax
S7-1200	S7-1500		
Bit strings	Bit strings	Equal	==
		Not equal	<>
Integers, floating-point numbers, TIME, DATE, TOD	Integers, floating-point numbers, TIME, LTIME, DATE, TOD, LTOD, LDT	Equal	==
		Not equal	<>
		Greater or equal	>=
		Less or equal	<=
		Greater than	>
		Less than	<

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box. If you select a comparison instruction and the data type of the instruction is not yet defined, then the "<???">" drop-down list will only list those data types that are permitted for the selected comparison instruction.

The execution of the instruction begins with the first comparison and is executed until a comparison condition is fulfilled. When a comparison condition is fulfilled the subsequent comparison conditions are not considered. If none of the specified comparison conditions are fulfilled, the jump is executed at output ELSE. If not jump label is defined at output ELSE, the linear execution of the program is not interrupted but instead continued in the next network.

In its initial state the instruction box contains at least 2 outputs (DEST0 and DEST1). The number of outputs can be extended. The numbering of the outputs begins with the value "0" and is continued in ascending order with each new output. Specify jump labels (LABEL) at the

outputs of the instruction. It is not permitted to specify instructions or operands at the outputs of the instruction.

An input is automatically inserted to each additional output. The jump programmed at an output is executed when the comparison condition of the corresponding is fulfilled.

## Parameters

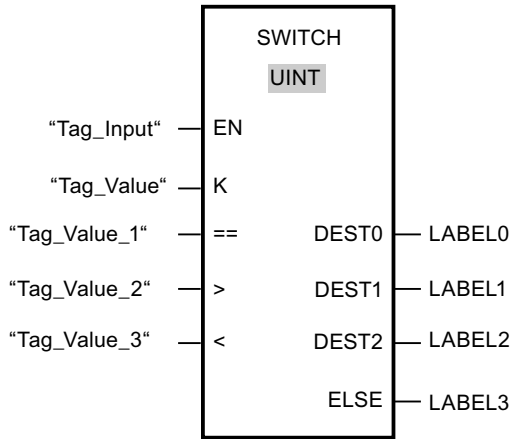

The following table shows the parameters of the instruction "Jump distributor":

Parameters	Declaration	Data type		Memory area	Description
		S7-1200	S7-1500		
EN	Input	BOOL	BOOL	I, Q, M, D, L	Enable input
K	Input	UINT	UINT	I, Q, M, D, L or constant	Specifies the value to be compared.
<Comparison values>	Input	Bit strings, integers, floating-point numbers, TIME, DATE, TOD	Bit strings, integers, floating-point numbers, TIME, LTIME, DATE, TOD, LTOD, LDT	I, Q, M, D, L or constant	Input values with which the value of the parameter K is compared.
DEST0	-	-	-	-	First jump label
DEST1	-	-	-	-	Second jump label
DEST(n)	-	-	-	-	Optional jump labels (n = 2 to 99)
ELSE	-	-	-	-	Program jump which is executed if none of the comparison conditions are fulfilled.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand/Jump label	Value
K	Tag_Value	23
==	Tag_Value_1	20
>	Tag_Value_2	21
<	Tag_Value_3	19
DEST0	LABEL0	Jump to jump label "LABEL0", if the value of parameter K is equal to 20.
DEST1	LABEL1	Jump to jump label "LABEL1", if the value of parameter K is greater than 21.
DEST2	LABEL2	Jump to jump label "LABEL2", if the value of parameter K is less than 19.
ELSE	LABEL 3	Jump to jump label "LABEL3", if none of the comparison conditions are fulfilled.

If the operand "Tag\_Input" changes to signal state "1", the instruction "Jump distributor" is executed. The execution of the program is continued in the network that is identified with the jump label "LABEL1".

**See also**

Adding additional inputs and outputs to FBD elements (Page 1527)

Removing instruction inputs and outputs (Page 1528)

**RET: Return****Description**

You can use the instruction "Return" to stop the execution of a block. This results in three types, in which the block processing can be completed:

- Without call of the "Return" instruction  
The block is exited after the execution of the last network. The ENO of the call function is set to the signal state "1".
- Call of the "Return" instruction with logic operation (see example)  
If the left connector has the signal state "1", then the block is exited. The ENO of the function call corresponds to the operand.
- Call of the "Return" instruction without logic operation  
The block is exited. The ENO of the function call corresponds to the operand.

**Note**

Only one jumping coil may be used in a network ("Return", "Jump if RLO = 1", "Jump if RLO = 0").

If the result of logic operation (RLO) at the input of the instruction "Return" is "1", the execution of the program is terminated in the currently called block and continued after the call function in the calling block (for example, in the calling OB). The status (ENO) of the call function is determined by the parameter of the instruction. This can assume the following values:

- RLO
- TRUE/FALSE
- <Operand>

To set the parameter values, double-click the instruction and select the corresponding value in the drop-down list.

The following table shows the status of the call function when the instruction "Return" is programmed in a network within the called block:

RLO	Parameter value	ENO of the call function
1	RLO	1
	TRUE	1
	FALSE	0
	<Operand>	<Operand>
0	RLO	In this case, the execution of the program continues in the next network of the called block.
	TRUE	
	FALSE	
	<Operand>	

If an OB is completed, another block is selected by the priority class system and started or re-executed.

- If the OB program cycle was completed, it is restarted.
- If an OB, which interrupted another block (e.g. an Alarm OB), is completed, then the interrupted block (e.g. OB program cycle) is executed.

**Parameters**

The following table shows the parameters of the instruction "Return":

Parameters	Declaration	Data type	Memory area	Description
Status of the calling function when RLO = 1:				
RLO	-	-	-	Is set to the signal state of the RLO.
TRUE	-	-	-	1
FALSE	-	-	-	0
<Operand>	Input	BOOL	I, Q, M, D, L	Signal state of the specified operand

**Example**

The following example shows how the instruction works:

If the operands "TagIn\_1" or "TagIn\_2" have signal state "1", the instruction "Return" is executed. Program execution in the called block is terminated and continues in the calling block. The enable output ENO of the call function is reset to signal state "0".

**See also**

Overview of the valid data types (Page 1262)

**Runtime control**

**ENDIS\_PW: Limit and enable password legitimation**

**Description**

You use the "Limit and enable password legitimation" instruction to specify whether passwords configured for the CPU are legitimized or not. In this way, you can prevent legitimized connections, even if the correct password is known.

When the instruction is called and the REQ parameter has the signal state "0", the currently set state is displayed at the output parameters. If changes have been made to the input parameters, these are not transferred to the output parameters.

When the instruction is called and the REQ parameter has the signal state "1", the signal state is taken from the input parameters (F\_PWD, FULL\_PWD, R\_PWD, HMI\_PWD). FALSE means that legitimation per password is not permitted; TRUE means the password can be used.

Disable or enabling of the passwords can be allowed or prohibited individually. For example, all passwords can be prohibited except the fail-safe password. You can thus limit access options to a small user group. The output parameters (F\_PWD\_ON, FULL\_PWD\_ON, R\_PWD\_ON, HMI\_PWD\_ON) always show the current status of the password use, regardless of the REQ parameter.

Passwords that are not configured must have the signal state TRUE at the input and return the signal state TRUE at the output. The fail-safe password can only be configured for an F-CPU and must therefore always be interconnected with the signal state TRUE in a standard CPU. If the instruction returns an error, the call has no effect and the previous lock is still in effect.

Disabled passwords can be enabled again under the following conditions:

- The CPU is reset to its factory settings.
- The front panel of the S7-1500 CPU supports a dialog that allows you to navigate to the appropriate menu in which the passwords can be enabled again.
- When you call the "Limit and enable password legitimation" instruction, the input parameter of the desired password has the signal state "1".
- Set the mode selector to STOP. The restriction to password legitimation is re-established as soon as the switch is set back to RUN.
- Plugging an empty memory card (transfer module or program card) into an S7-1200 CPU.
- The transition from POWER OFF to POWER ON disables the protection in the S7-1200 CPU. The "Limit and enable password legitimation" instruction must be called once again in the program (e.g. in the startup OB).

---

**Note**

The "Limit and enable password legitimation" instruction blocks access from HMI systems if the HMI password has not been enabled.

---

**Note**

Existing legitimized connections retain their access rights and you cannot use the "Limit and enable password legitimation" instruction to restrict them.

---

## Preventing unintentional lockout on an S7-1500 CPU

The settings can be made on the front panel of the CPU and the CPU saves the most recent setting.

To prevent accidental lockout, the protection can be disabled by setting the mode selector to STOP with an S7-1500 CPU. The protection is automatically enabled again by setting mode

selector to RUN without having to call the "Limit and enable password legitimation" instruction again or taking additional actions on the front panel.

### Preventing unintentional lockout on an S7-1200 CPU

Because the S7-1200 CPU does not have a mode switch, protection is disabled with POWER OFF - POWER ON. This means that it is possible and advisable to prevent accidental lockout with the help of specific program sequences within your program.

To do so, program a time control either by means of a cyclic interrupt OB or a timer in the Main OB (OB 1). This gives you the option of calling the "Limit and enable password legitimation" instruction in the respective OB (e.g., OB 1 or OB 35) relatively quickly after a transition from POWER OFF to POWER ON and the associated disabling of the protection. Call the instruction in the startup OB (OB 100) to keep the time window in which the instruction is inactive and there are no limitations for password legitimation relatively small. This procedure will give you the best possible protection from unauthorized access.

If there has been an accidental lockout, you can skip the call in the startup OB (by querying an input parameter, for example) and you have the set time (for example, 10 seconds up to 1 minute) to establish a connection to the CPU before the lock becomes active once again.

If there is no timer in your program code and a lockout has occurred, insert an empty transfer card or an empty program card into the CPU. The empty transfer card or program card deletes the internal load memory of the CPU. You must then download the user program once again from STEP 7 to the CPU.

### Procedure for lost passwords with an S7-1200 CPU

If you have lost the password for a password-protected S7-1200 CPU, delete the password-protected program with an empty transfer card or program card. The empty transfer card or program card deletes the internal load memory of the CPU. You can then load a new user program from STEP 7 Basic in the CPU.

 **WARNING**

**Inserting an empty transfer card**

When you insert a transfer card in a CPU during runtime, the CPU goes to STOP mode. If operating states are unstable, controllers may fail and thus cause the uncontrolled operation of the controlled devices. This leads to an unforeseen operation of the automation system which can cause deadly or serious injuries and/or damage to property.

Once you have pulled the transfer card, the content of the transfer card is available in the internal load memory. Make sure that the card does not include a program at this point.

 <b>WARNING</b>
<b>Inserting an empty program card</b>
When you insert a program card in a CPU during runtime, the CPU goes to STOP mode. If operating states are unstable, controllers may fail and thus cause the uncontrolled operation of the controlled devices. This leads to an unforeseen operation of the automation system which can cause deadly or serious injuries and/or damage to property.
Make sure that the program card is empty. The internal load memory is copied to the empty program card. Once you have pulled the previously empty program card, the internal load memory is empty.

You must remove the transfer card or program card before you put the CPU into RUN mode.

### Effects of password use on the operating modes

The following table shows what effects the password use by means of the "Limit and enable password legitimation" instruction has on the operating modes and the corresponding user actions.

Action	Password protection by means of the instruction
Basic state after <ul style="list-style-type: none"> <li>Operating mode switch to STOP</li> <li>Reset memory manually (PG, switch, change of MC (Motion Control))</li> <li>Reset to factory setting</li> </ul>	Not activated (no restrictions)
Basic state after POWER ON	<ul style="list-style-type: none"> <li>S7-1200 CPU: The lock is disabled and the instruction must be called once again in the program (e.g., in the startup OB).</li> <li>S7-1500 CPU: Enabled (if a lock was activated before POWER OFF). The option of not allowing passwords is retentive.</li> </ul>
Operating mode transition RUN/STARTUP/HOLD -> STOP (by terminating the instruction, an error or communication) or STOP -> STARTUP/RUN/HOLD	Activated Passwords still cannot be used.

### Parameters

The following table shows the parameters of the "Limit and enable password legitimation" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output

Parameter	Declaration	Data type	Memory area	Description
REQ	Input	BOOL	I, Q, M, D, L or constant	When the REQ parameter has the signal state "0", the currently set signal state of the passwords is queried.
F_PWD	Input	BOOL	I, Q, M, D, L or constant	Read/write access including fail-safe <ul style="list-style-type: none"> <li>• F_PWD = "0": Do not allow password</li> <li>• F_PWD = "1": Allow password</li> </ul>
FULL_PWD	Input	BOOL	I, Q, M, D, L or constant	Read/write access <ul style="list-style-type: none"> <li>• FULL_PWD = "0": Do not allow password</li> <li>• FULL_PWD = "1": Allow password</li> </ul>
R_PWD	Input	BOOL	I, Q, M, D, L or constant	Read access <ul style="list-style-type: none"> <li>• R_PWD = "0": Do not allow password</li> <li>• R_PWD = "1": Allow password</li> </ul>
HMI_PWD	Input	BOOL	I, Q, M, D, L or constant	HMI access <ul style="list-style-type: none"> <li>• HMI_PWD = "0": Do not allow password</li> <li>• HMI_PWD = "1": Allow password</li> </ul>
F_PWD_ON	Output	BOOL	I, Q, M, D, L	Read/write access including fail-safe <ul style="list-style-type: none"> <li>• F_PWD_ON = "0": Password not allowed</li> <li>• F_PWD_ON = "1": Password allowed</li> </ul>
FULL_PWD_ON	Output	BOOL	I, Q, M, D, L	Read/write access status <ul style="list-style-type: none"> <li>• FULL_PWD_ON = "0": Password not allowed</li> <li>• FULL_PWD_ON = "1": Password allowed</li> </ul>
R_PWD_ON	Output	BOOL	I, Q, M, D, L	Read-access status <ul style="list-style-type: none"> <li>• R_PWD_ON = "0": Password not allowed</li> <li>• R_PWD_ON = "1": Password allowed</li> </ul>
HMI_PWD_ON	Output	BOOL	I, Q, M, D, L	HMI-access status <ul style="list-style-type: none"> <li>• HMI_PWD_ON = "0": Password not allowed</li> <li>• HMI_PWD_ON = "1": Password allowed</li> </ul>
RET_VAL	Output	WORD	I, Q, M, D, L	Error information

For additional information on valid data types, refer to "See also".

### Parameters RET\_VAL

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
8090	The "Limit and enable password legitimation" instruction is not supported
80D0	The password for fail-safe is not configured. The signal state must be TRUE for standard CPUs.
80D1	The read/write access is not configured
80D2	The read access is not configured

Error code* (W#16#...)	Explanation
80D3	The HMI access is not configured
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

Enabling local error handling for a block (Page 1581)

## RE\_TRIGR: Restart cycle monitoring time

### Description

You can use the "Restart cycle monitoring time" instruction to restart the cycle time monitoring of the CPU. The cycle monitoring time then starts over for the duration you have set in the CPU configuration.

The instruction "Restart cycle monitoring time" can be called regardless of the priority in all blocks.

If the instruction is called in a block with a higher priority, such as a hardware interrupt, a diagnostics interrupt or a cyclic interrupt, the instruction is not executed and the ENO enable output is set to signal state "0".

The instruction "Restart cycle monitoring time" can be called a maximum of 10 times in a program cycle.

### Parameters

The instruction "Restart cycle monitoring time" has no parameters.

### See also

Overview of the valid data types (Page 1262)  
Basics of error handling (Page 1577)  
Principles of local error handling (Page 1579)  
Error output priorities (Page 1580)  
Enabling local error handling for a block (Page 1581)

## STP: Exit program

### Description

The instruction "Exit program" instruction is used to set the CPU to STOP mode and therefore to terminate the execution of the program. The effects of changing from RUN to STOP depend on the CPU configuration.

When the (RLO) at the input of the instruction is "1", the CPU changes to STOP mode and the execution of the program is terminated. The signal state at the output of the instruction is not evaluated.

If the RLO at the input of the instruction is "0", then the instruction will not be executed.

### Parameters

The instruction "Exit program" has no parameters.

### See also

Overview of the valid data types (Page 1262)

## GET\_ERROR: Get error locally

### Description

The "Get error locally" instruction is used to query the occurrence of errors within a block. This is usually to access error. If the system reports an error during the processing of the block, detailed information is stored in the operand at the ERROR output for the first error to occur during the execution of the block since the last execution of the instruction.

Only operands of the "ErrorStruct" system data type can be specified at the ERROR output. The "ErrorStruct" system data type specifies the exact structure in which the information about the error is stored. Using additional instructions, you can evaluate this structure and program an appropriate response. If several errors occur in the block, the error information about the next error to occur in the instruction is output only after the first error that occurred has been remedied.

---

#### Note

The ERROR output is only changed if error information is present. To set the output back to "0" after handling an error, you have the following options:

- Declare the tag in the "Temp" section of the block interface.
  - Reset the tag to "0" before calling the instruction.
  - Query the enable output ENO.
- 

The enable output ENO of the instruction "Get error locally" instruction is set only if the enable input EN returns signal state "1" and error information is present. If one of these conditions is

not fulfilled, the remaining program execution is not affected by the "Get error locally" instruction.

You can find an example of how you can implement the instruction in combination with other troubleshooting options under "See also".

---

#### Note

The "Get error locally" instruction enables local error handling within a block. If "Get error locally" is inserted in the program code of a block, any predefined system reactions are ignored if errors occur.

---

## Parameters

The following table lists the parameters of the "Get error locally" instruction:

Parameter	Declaration	Data type	Memory area	Description
ERROR	Output	ErrorStruct	D, L	Error information

## Data type "ErrorStruct"

The following table lists the structure of the "ErrorStruct" data type:

Structure component	Data type	Description
ERROR_ID	WORD	Error ID
FLAGS	BYTE	Shows if an error occurred during a block call. 16#01: Error during a block call 16#00: No error during a block call
REACTION	BYTE	Default reaction: 0: Ignore (write error), 1: Continue with substitute value "0" (read error), 2: Skip instruction (system error)
CODE_ADDRESS	CREF	Information about the address and type of block
BLOCK_TYPE	BYTE	Type of block where the error occurred: 1: OB 2: FC 3: FB
CB_NUMBER	UINT	Number of the code block
OFFSET	UDINT	Reference to the internal memory
MODE	BYTE	Information about the address of an operand

Structure component		Data type	Description
OPERAND_NUMBER		UINT	Operand number of the machine command
POINTER_NUMBER_LOCATION		UINT	(A) Internal pointer
SLOT_NUMBER_SCOPE		UINT	(B) Storage area in internal memory
DATA_ADDRESS		NREF	Information about the address of an operand
	AREA	BYTE	(C) Memory area: L: 16#40 – 4E, 86, 87, 8E, 8F, C0 – CE I: 16#81 Q: 16#82 M: 16#83 DB: 16#84, 85, 8A, 8B Range violations for a directly editable tag of data type DINT: 16#04
	DB_NUMBER	UINT	(D) Number of the data block
	OFFSET	UDINT	(E) Relative address of the operand

**Structure component "ERROR\_ID"**

The following table lists the values that can be output at the structure component "ERROR\_ID":

ID* (hexadecimal)	ID* (decimal)	Description
0	0	No error
2503	9475	Invalid pointer
2520	9504	Invalid STRING
2522	9506	Read error: Operand outside the valid range
2523	9507	Write error: Operand outside the valid range
2524	9508	Read error: Invalid operand
2525	9509	Write error: Invalid operand
2528	9512	Read error: Data alignment
2529	9513	Write error: Data alignment
252C	9516	Invalid pointer
2530	9520	Write error: Data block
2533	9523	Invalid pointer used
2538	9528	Access error: DB does not exist
2539	9529	Access error: Wrong DB used
253A	9530	Global data block does not exist
253C	9532	Faulty information or the function does not exist
253D	9533	System function does not exist
253E	9534	Faulty information or the function block does not exist
253F	9535	System block does not exist
2550	9552	Access error: DB does not exist

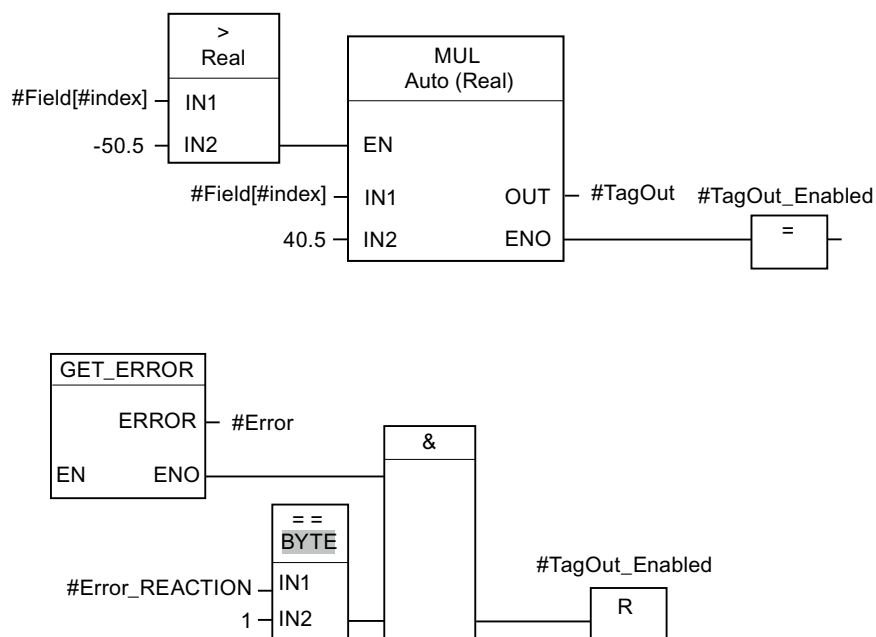

ID* (hexadecimal)	ID* (decimal)	Description
2551	9553	Access error: Wrong DB used
2575	9589	Error in the program nesting depth
2576	9590	Error in the local data distribution
2577	9591	The block property "Parameter passing via registers" is not selected.
25A0	9632	Internal error in TP
25A1	9633	Tag is write-protected
25A2	9634	Invalid numerical value of tag
2942	10562	Read error: Input
2943	10563	Write error: Output

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

## Example

The following example shows how the instruction works:

An error occurred accessing the "#Field[#index]" tag. The enable output ENO of the "Multiply" instruction and the "#TagOut\_Enabled" operand have signal state "1" despite the read/access error and the multiplication is performed with the value "0.0". If this error scenario occurs, it is recommended to program the "Get error locally" instruction after the "Multiply" instruction to get the error. The error information supplied by the "Get error locally" instruction is evaluated with the comparison instruction "Equal". If the "#Error.REACTION" structure component has the value "1", this involves a read/access error and the "#TagOut\_Enabled" output is reset.

### GET\_ERR\_ID: Get error ID locally

#### Description

The "Get error ID locally" instruction is used to query the occurrence of errors within a block. This is usually to access error. If the system reports during the block processing errors within the block execution since the last execution of the instruction, the error ID of the first error that occurred in the tag is stored at the ID output.

Only operands of the WORD data type can be specified at the ID output. If several errors occur in the block, the error ID of the next error to occur in the instruction is output only after the first error that occurred has been remedied.

---

#### Note

The ID output is only changed if error information is present. To set the output back to "0" after handling an error, you have the following options:

- Declare the tag in the "Temp" section of the block interface.
- Reset the tag to "0" before calling the instruction.
- Query the enable output ENO.

---

The enable output ENO of the instruction "Get error ID locally" instruction is set only if the enable input EN returns signal state "1" and error information is present. If one of these conditions is not fulfilled, the remaining program execution is not affected by the "Get error ID locally" instruction.

You can find an example of how you can implement the instruction in combination with other troubleshooting options under "See also".

---

#### Note

The "Get error ID locally" instruction enables local error handling within a block. If the "Get error ID locally" instruction is inserted in the program code of a block, any predefined system reactions are ignored if errors occur.

---

## Parameters

The following table lists the parameters of the "Get error ID locally" instruction:

Parameter	Declaration	Data type	Memory area	Description
ID	Output	WORD	I, Q, M, D, L	Error ID

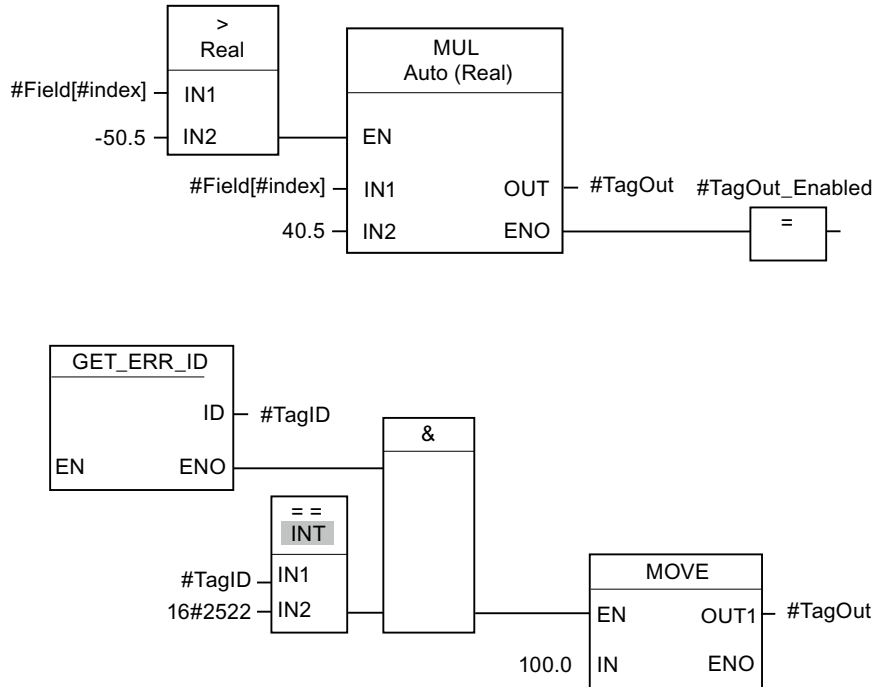

## ID parameter

The following table lists the values that can be output at the ID parameter:

ID* (hexadecimal)	ID* (decimal)	Description
0	0	No error
2503	9475	Invalid pointer
2520	9504	Invalid STRING
2522	9506	Read error: Operand outside the valid range
2523	9507	Write error: Operand outside the valid range
2524	9508	Read error: Invalid operand
2525	9509	Write error: Invalid operand
2528	9512	Read error: Data alignment
2529	9513	Write error: Data alignment
252C	9516	Invalid pointer
2530	9520	Write error: Data block
2533	9523	Invalid pointer used
2538	9528	Access error: DB does not exist
2539	9529	Access error: Wrong DB used
253A	9530	Global data block does not exist
253C	9532	Faulty information or the function does not exist
253D	9533	System function does not exist
253E	9534	Faulty information or the function block does not exist
253F	9535	System block does not exist
2550	9552	Access error: DB does not exist
2551	9553	Access error: Wrong DB used
2575	9589	Error in the program nesting depth
2576	9590	Error in the local data distribution
2577	9591	The block property "Parameter passing via registers" is not selected.
25A0	9632	Internal error in TP
25A1	9633	Tag is write-protected
25A2	9634	Invalid numerical value of tag
2942	10562	Read error: Input
2943	10563	Write error: Output
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".		

**Example**

The following example shows how the instruction works:

An error occurred accessing the "#Field[#index]" tag. The enable output ENO of the "Multiply" instruction and the "#TagOut\_Enabled" operand have signal state "1" despite the read/access error and the multiplication is performed with the value "0.0". If this error scenario occurs, it is recommended to program the "Get error ID locally" instruction after the "Multiply" instruction to get the error. The error information supplied by the "Get error ID locally" instruction is evaluated with the comparison instruction "Equal". If the operand "#TagID" returns the ID 2522, this involves a read/access error and the value "100.0" is written to the "#TagOut" output.

**INIT\_RD: Initialize all retain data****Description**

The "Initialize all retain data" instruction is used to reset the retentive data of all data blocks, bit memories and SIMATIC timers and counters at the same time. The instruction can only be executed within a startup OB because the execution exceeds the program cycle duration.

**Parameters**

The following table shows the parameters of the "Initialize all retain data" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
REQ	Input	BOOL	I, Q, M, D, L, T, C or constant	If the input "REQ" has the signal state "1", all retentive data are reset.
RET_VAL	Output	INT	I, Q, M, D, L	Error information: If an error occurs during the execution of the instruction, an error code is output at the RET_VAL parameter.

For additional information on valid data types, refer to "See also".

**Parameters RET\_VAL**

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
80B5	The instruction cannot be executed because it was not programmed within a startup OB.
General error information	See also: "GET_ERR_ID: Get error ID locally"

\*The error codes can be displayed as integer or hexadecimal values in the program editor. For information on toggling display formats, refer to "See also".

### Example

The following example shows how the instruction works:

If the operands "TagIn\_1" and "Tag\_REQ" have signal state "1", the instruction is executed. All retentive data of all data blocks, bit memories and SIMATIC timers and counters are reset. If the instruction is executed without errors, the ENO enable output has the signal state "1".

### WAIT: Configure time delay

#### Description

The "Configure time delay" instruction is used to halt the execution of the program for a set period of time. You indicate the period of time in microseconds on the WT parameter of the instruction.

You can configure time delays of up to 32767 microseconds ( $\mu\text{s}$ ). The smallest possible delay time depends on the respective CPU and corresponds to the execution time of the "Configure time delay" instruction.

The execution of the instruction can be interrupted by higher priority events.

The "Configure time delay" instruction supplies no error information.

## Parameters

The following table shows the parameters of the "Configure time delay" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
WT	Input	INT	I, Q, M, D, L, P or constant	Time delay in microseconds ( $\mu$ s)

## RUNTIME: Measure program runtime

### Description

The "Measure program runtime" instruction is used to measure the runtime of the entire program, individual blocks or command sequences.

If you want to measure the runtime of your entire program, call the instruction "Measure program runtime" in OB1. Measurement of the runtime is started with the first call and the output RET\_VAL returns the runtime of the program after the second call. The measured runtime includes all CPU processes that can occur during the program execution, for example, interruptions caused by higher-level events or communication. The instruction "Measure program runtime" reads an internal counter of the CPU and write the value to the IN-OUT parameter MEM. The instruction calculates the current program runtime according to the internal counter frequency and writes it to output RET\_VAL.

If you want to measure the runtime of individual blocks or individual command sequences, you need three separate networks. Call the instruction "Measure program runtime" in an individual network within your program. You set the starting point of the runtime measurement with this first call of the instruction. Then you call the required program block or the command sequence in the next network. In another network, call the "Measure program runtime" instruction a second time and assign the same memory to the IN-OUT parameter MEM as you did during the first call of the instruction. The "Measure program runtime" instruction in the third network reads an internal CPU counter and calculates the current runtime of the program block or the command sequence according to the internal counter frequency and writes it to the output RET\_VAL.

The "Measure program runtime" instruction uses an internal high-frequency counter to calculate the time. If the counter overruns, the instruction returns values  $\leq 0.0$ . Ignore these runtime values.

**Note**

The runtime of a command sequence cannot be determined exactly, because the sequence of instructions within a command sequence is changed during optimized compilation of the program.

**Parameters**

The following table lists the parameters of the "Measure program runtime" instruction:

Parameters	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
MEM	InOut	LREAL	M, D, L	Saves the starting point of the runtime measurement.
RET_VAL	Output	LREAL	I, Q, M, D, L	Returns the measured runtime in seconds

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works based on the runtime calculation of a program block:

Network 1:

Network 2:

Network 3:

When the "TagIn1" operand in network 1 has the signal state "1", the instruction is executed. The starting point for the runtime measurement is set with the first call of the instruction and buffered as reference for the second call of the instruction in the "TagMemory" operand.

The "Best\_before\_date" program block FB1 is called in network 2.

When the FB1 program block has been executed and the "TagIn1" operand has the signal state "1", the instruction in network 3 is executed. The second call of the instruction calculates the runtime of the program block and writes the result to the output RET\_VAL.

## Word logic operations

### AND: AND logic operation

#### Description

You can use the instruction "AND logic operation" to link the value at input IN1 to the value at input IN2 bit-by-bit by AND logic and query the result at the output OUT.

When the instruction is executed, bit 0 of the value at input IN1 is linked by AND logic to bit 0 of the value at input IN2. The result is stored in bit 0 of output OUT. The same logic operation is executed for all other bits of the specified values.

In its initial state the instruction box contains at least 2 inputs (IN1 and IN2). The number of inputs can be extended. The inserted inputs are numbered in ascending order in the box. During the execution of the instruction, the values of all available input parameters are linked by AND logic. The result is stored at output "OUT".

The result bit has the signal state "1" only when both of the bits in the logic operation also have signal state "1". If one of the two bits of the logic operation has signal state "0", the corresponding result bit is reset.

### Parameters

The following table shows the parameters of the instruction "AND logic operation":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN1	Input	Bit strings	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	First value for logic operation
IN2	Input	Bit strings	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Second value for logic operation
INn	Input	Bit strings	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Optional input values
OUT	Output	Bit strings	I, Q, M, D, L, P	I, Q, M, D, L, P	Result of the instruction

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN1	Tag_Value1	0101 0101 0101 0101
IN2	Tag_Value2	0000 0000 0000 1111
OUT	Tag_Result	0000 0000 0000 0101

If the operand "TagIn" has the signal state "1", the instruction "AND logic operation" is executed. The value of operand "Tag\_Value1" is linked by AND to the value of the operand "Tag\_Value2". The result is mapped bit-for-bit and sent to the operand "Tag\_Result". The enable output ENO and the output "TagOut" are set to signal state "1".

**OR: OR logic operation****Description**

You can use the instruction "OR logic operation" to link the value at input IN1 to the value at input IN2 bit-by-bit by OR logic and query the result at the output OUT.

When the instruction is executed, bit 0 of the value at input IN1 is linked by OR logic to bit 0 of the value at input IN2. The result is stored in bit 0 of output OUT. The same logic operation is executed for all bits of the specified tags.

In its initial state the instruction box contains at least 2 inputs (IN1 and IN2). The number of inputs can be extended in the instruction box. The inserted inputs are numbered in ascending order in the box. During the execution of the instruction, the values of all available input parameters are linked by OR logic. The result is stored at output "OUT".

The result bit has the signal state "1" when at least one of the two bits in the logic operation has the signal state "1". If both of the bits of the logic operation have signal state "0", the corresponding result bit is reset.

**Parameters**

The following table shows the parameters of the instruction "OR logic operation":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN1	Input	Bit strings	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	First value for logic operation
IN2	Input	Bit strings	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Second value for logic operation
INn	Input	Bit strings	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Optional input values
OUT	Output	Bit strings	I, Q, M, D, L, P	I, Q, M, D, L, P	Result of the instruction

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN1	Tag_Value1	0101 0101 0101 0101
IN2	Tag_Value2	0000 0000 0000 1111
OUT	Tag_Result	0101 0101 0101 1111

If the operand "TagIn" has the signal state "1", the instruction "OR logic operation" is executed. The value of operand "Tag\_Value1" is linked by OR to the value of the operand "Tag\_Value2". The result is mapped bit-for-bit and sent to the operand "Tag\_Result". The enable output ENO and the output "TagOut" are set to signal state "1".

**See also**

**XOR: EXCLUSIVE OR logic operation**

**Description**

You can use the instruction "EXCLUSIVE OR logic operation" to link the value at input IN1 to the value at input IN2 bit-by-bit by EXCLUSIVE OR logic and query the result at the output OUT.

When the instruction is executed, bit 0 of the value at input IN1 is linked by EXCLUSIVE OR logic to bit 0 of the value at input IN2. The result is stored in bit 0 of output OUT. The same logic operation is executed for all other bits of the specified value.

In its initial state the instruction box contains at least 2 inputs (IN1 and IN2). The number of inputs can be extended in the instruction box. The inserted inputs are numbered in ascending order in the box. During the execution of the instruction, the values of all available input parameters are linked by EXCLUSIVE OR logic. The result is stored at output "OUT".

The result bit has the signal state "1" when one of the two bits in the logic operation has the signal state "1". If both of the bits of the logic operation have signal state "1" or "0", the corresponding result bit is reset.

## Parameters

The following table shows the parameters of the instruction "EXCLUSIVE OR logic operation":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN1	Input	Bit strings	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	First value for logic operation
IN2	Input	Bit strings	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Second value for logic operation
INn	Input	Bit strings	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Optional input values
OUT	Output	Bit strings	I, Q, M, D, L, P	I, Q, M, D, L, P	Result of the instruction

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value
IN1	Tag_Value1	0101 0101 0101 0101
IN2	Tag_Value2	0000 0000 0000 1111
OUT	Tag_Result	0101 0101 0101 1010

If the operand "TagIn" has the signal state "1", the instruction "EXCLUSIVE OR logic operation" is executed. The value of operand "Tag\_Value1" is linked by EXCLUSIVE OR to the value of

the operand "Tag\_Value2". The result is mapped bit-for-bit and sent to the operand "Tag\_Result". The enable output ENO and the output "TagOut" are set to signal state "1".

**See also**

- Basics of the EN/ENO mechanism (Page 1357)

**INV: Create ones complement**

**Description**

You can use the instruction "Create ones complement" to invert the signal status of the bits at input IN. When the instruction is processed, the value at input IN is linked to EXCLUSIVE OR by a hexadecimal mask (W#16#FFFF for 16-bit numbers or DW#16#FFFF FFFF for 32-bit number). This inverts the signal state of the individual bits that are then stored at output OUT.

**Parameters**

The following table shows the parameters of the instruction "Create ones complement":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	Bit strings, integers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Input value
OUT	Output	Bit strings, integers	I, Q, M, D, L, P	I, Q, M, D, L, P	Ones complement of the value at input IN

You can select the data type of the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameters	Operand	Value	
IN	TagIn_Value	W#16#000F	W#16#7E
OUT	TagOut_Value	W#16#FFF0	W#16#81

If the operand "TagIn" has the signal state "1", the "Create ones complement" instruction is executed. The instruction inverts the signal state of the individual bits at input "TagIn\_Value" and writes the result to output "TagOut\_Value". The enable output ENO and the output "TagOut" are set to signal state "1".

## See also

## DECO: Decode

### Description

You can use the "Decode" instruction to set a bit in the output value specified by the input value.

The "Decode" instruction reads the value at the IN input and sets the bit in the output value whose bit position corresponds to the read value. The other bits in the output value are filled with zeroes. If the value at input IN is greater than 31, a modulo 32 instruction is executed.

### Parameters

The following table shows the parameters of the "Decode" instruction:

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
IN	Input	UINT	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Position of the bit in the output value which is set.
OUT	Output	Bit strings	I, Q, M, D, L, P	I, Q, M, D, L, P	Output value

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following figure shows how the instruction works using specific operand values:

If the operand "TagIn" has the signal state "1", the "Decode" instruction is executed. The instruction reads bit number "3" from the value of the operand "TagIn\_Value" and sets the third bit to the value of the operand "TagOut\_Value".

If no errors occur during the execution of the instruction, the output ENO has the signal state "1" and the output "TagOut" is set.

**See also**

- Overview of the valid data types (Page 1262)
- Basics of the EN/ENO mechanism (Page 1357)

**ENCO: Encode**

**Description**

The instruction "Encode" is used to read the bit number of the lowest bit in the input value and output it to the output OUT.

The instruction "Encode" selects the least significant bit of the value at the IN input and writes its bit number to the tag in the output OUT.

## Parameters

The following table shows the parameters of the instruction "Encode":

Parameters	Declaration	Data type	Memory area		Description
			S7-1200	S7-1500	
EN	Input	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	Bit strings	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Input value
OUT	Output	INT	I, Q, M, D, L, P	I, Q, M, D, L, P	Output value

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following figure shows how the instruction works using specific operand values:

If the operand "TagIn" has the signal state "1", the "Encode" instruction is executed. The instruction selects bit position "3" as the least significant bit at input "TagIn\_Value" and writes the value "3" to the tag at the output "TagOut\_Value".

If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

Basics of the EN/ENO mechanism (Page 1357)

**SEL: Select**

**Description**

Depending on the signal state at switch (input G), the "Select" instruction selects one of the inputs IN0 or IN1 and moves its content to the output OUT. When the input G has the signal state "0", the value at the input IN0 is moved. When the input G has the signal state "1", the value at the input IN1 is moved to the output OUT.

The instruction can only be executed if the enable input EN has the signal state "1" and the tags at all parameters have the same data type.

**Parameters**

The following table shows the parameters of the "Select" instruction:

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
EN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
G	Input	BOOL	BOOL	I, Q, M, D, L or constant	I, Q, M, D, L, T, C or constant	Switch
IN0	Input	Bit strings, integers, floating-point numbers, TIME, TOD, DATE, CHAR	Bit strings, integers, floating-point numbers, timers, TOD, LTOD, DATE, CHAR	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	First input value
IN1	Input	Bit strings, integers, floating-point numbers, TIME, TOD, DATE, CHAR	Bit strings, integers, floating-point numbers, timers, TOD, LTOD, DATE, CHAR	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Second input value
OUT	Output	Bit strings, integers, floating-point numbers, TIME, TOD, DATE, CHAR	Bit strings, integers, floating-point numbers, timers, TOD, LTOD, DATE, CHAR	I, Q, M, D, L, P	I, Q, M, D, L, P	Result

You can select the data type of the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value	
G	TagIn_G	0	1
IN0	TagIn_Value0	W#16#0000	W#16#4C
IN1	TagIn_Value1	W#16#FFFF	W#16#5E
OUT	TagOut_Value	W#16#0000	W#16#5E

If the operand "TagIn" has the signal state "1", the instruction "Select" is executed. Based on the signal state at the "TagIn\_G" input, the value of the "TagIn\_Value0" or "TagIn\_Value1" input is selected and moved to the "TagOut\_Value" output. If the instruction is executed without errors, the enable output ENO has the signal state "1" and the output "TagOut" is set.

## MUX: Multiplex

### Description

You can use the instruction "Multiplex" to copy the content of a selected input to output OUT. In its initial state the instruction box contains at least 2 inputs (IN0 and IN1). The number of selectable inputs of the instruction box can be expanded. You can declare a maximum of 32 inputs.

The inputs are numbered automatically in the box. Numbering starts at IN0 and is incremented continuously with each new input. You can use the parameter K to determine the input whose content should be copied to output OUT. If the value of the parameter K is greater than the number of available inputs, the content of the parameter ELSE is copied to output OUT and enable output ENO is assigned the signal state "0".

The "Multiplex" instruction can only be executed if the tags have the same data type in all inputs and in the OUT output. The exception here is the parameter K, which can only be specified as an integer.

The enable output ENO is reset if one of the following conditions applies:

- Enable input EN has the signal state "0".
- The value of the parameter K is greater than the number of available inputs.
- Errors occurred during the execution of the instruction.

### Parameters

The following table shows the parameters of the "Multiplex" instruction:

Parameter	Declaring	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
EN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
K	Input	Integers	Integers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Specifies the input whose content is to be copied. <ul style="list-style-type: none"> <li>• If K = 0 =&gt; Parameter IN0</li> <li>• If K = 1 =&gt; Parameter IN1, etc.</li> </ul>
IN0	Input	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	First input value
IN1	Input	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Second input value

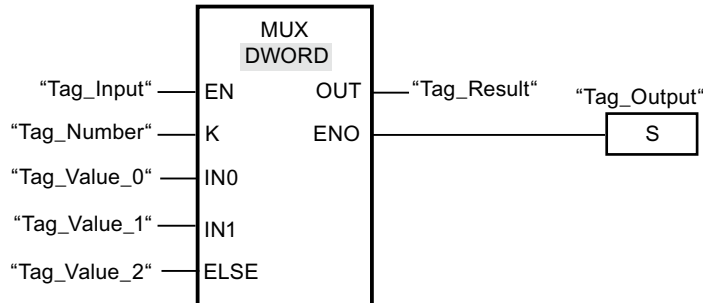

Parameter	Declaring	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
INn	Input	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Optional input values
ELSE	Input	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Specifies the value to be copied when K > n.
OUT	Output	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P	I, Q, M, D, L, P	Output to which the value is to be copied.

You can select the data type for the instruction from the "<???"> drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
K	Tag_Number	1
IN0	Tag_Value_0	DW#16#00000000
IN1	Tag_Value_1	DW#16#003E4A7D
ELSE	Tag_Value_2	DW#16#FFFF0000
OUT	Tag_Result	DW#16#003E4A7D

If the operand "Tag\_Input" has the signal state "1", the "Multiplex" instruction is executed. Depending on the value of the operand "Tag\_Number", the value at input "Tag\_Value\_1" is copied and assigned to the operand at output "Tag\_Result". If no errors occur during the execution of the instruction, the outputs ENO and "Tag\_Output" are set.

**DEMUX: Demultiplex**

**Description**

You can use the instruction "Demultiplex" to copy the content of the input IN to a selected output. In its initial state the instruction box contains at least 2 outputs (OUT0 and OUT1). The number of selectable outputs can be extended in the instruction box. The outputs are numbered automatically in the box. Numbering starts at OUT0 and continues consecutively with each new output. You can use the parameter K to define the output to which the content of input IN will be copied. The other outputs will not be changed. If the value of the parameter K is greater than the number of available outputs, then the content of input IN in the parameter ELSE and the enable output ENO will be assigned to the signal state "0".

The instruction "Demultiplex" can only be executed if the tags at the input IN and at all outputs are of the same data type. The exception here is the parameter K, which can only be specified as an integer.

The enable output ENO is reset if one of the following conditions applies:

- Enable input EN has the signal state "0".
- The value of the parameter K is greater than the number of available outputs.
- Errors occurred during the execution of the instruction.

## Parameters

The following table shows the parameters of the instruction "Demultiplex":

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
EN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
K	Input	Integers	Integers	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Specifies the output to which the input value (IN) will be copied. <ul style="list-style-type: none"> <li>• If K = 0 =&gt; Parameter OUT0</li> <li>• If K = 1 =&gt; Parameter OUT1, etc.</li> </ul>
IN	Input	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P or constant	I, Q, M, D, L, P or constant	Input value
OUT0	Output	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P	I, Q, M, D, L, P	First output

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
OUT1	Output	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P	I, Q, M, D, L, P	Second output
OUTn	Output	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P	I, Q, M, D, L, P	Optional outputs
ELSE	Output	Binary numbers, integers, floating-point numbers, strings, TIME, TOD, DATE	Binary numbers, integers, floating-point numbers, strings, timers, TOD, LTOD, DATE, LDT	I, Q, M, D, L, P	I, Q, M, D, L, P	Output to which the input value (IN) at K > n is copied.

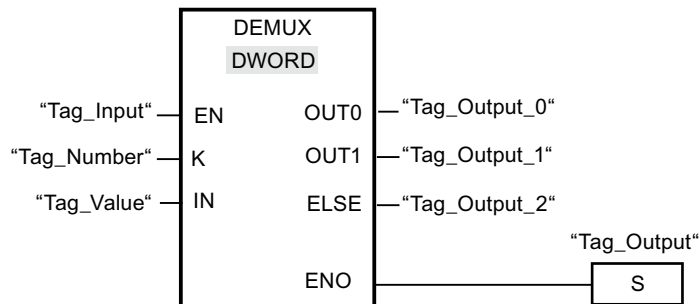

You can select the data type for the instruction from the "<???" drop-down list of the instruction box.

For additional information on available data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following tables show how the instruction works using specific operand values:

Table 9-26 Input values of the "Demultiplex" instruction before network execution

Parameter	Operand	Values	
K	Tag_Number	1	4
IN	Tag_Value	DW#16#FFFFFFFF	DW#16#003E4A7D

Table 9-27 Output values of the "Demultiplex" instruction after network execution

Parameter	Operand	Values	
OUT0	Tag_Output_0	Unchanged	Unchanged
OUT1	Tag_Output_1	DW#16#FFFFFFFF	Unchanged
ELSE	Tag_Output_2	Unchanged	DW#16#003E4A7D

The "Demultiplex" instruction is executed when input "Tag\_Input" has the signal state "1". Depending on the value of the operand "Tag\_Number", the value at input "IN" is copied to the corresponding output.

## Shift and rotate

### SHR: Shift right

## Description

You can use the "Shift right" instruction to shift the content of the operand at the input IN bit-by-bit to the right and query the result at the OUT output. The input N is used to specify the number of bit positions by which the specified value should be moved.

If the value at the input N is "0", the value at input IN is copied unchanged to the operand at output OUT.

If the value at the input N is greater than the number of available bit positions, the operand value at input IN is shifted to the right by the available number of bit positions.

The freed bit positions in the left area of the operand are filled by zeroes when values without signs are shifted. If the specified value has a sign, the free bit positions are filled with the signal state of the sign bit.

The following figure show how the content of an integer data type operand is shifted four bit positions to the right:

## Parameters

The following table shows the parameters of the instruction "Shift right":

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
EN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	Bit strings, integers	Bit strings, integers	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Value to be shifted
N	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Number of bit positions by which the value is shifted
OUT	Output	Bit strings, integers	Bit strings, integers	I, Q, M, D, L	I, Q, M, D, L	Result of the instruction

You can select the data type for the instruction from the "<???"> drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	TagIn_Value	0011 1111 1010 1111
N	Tag_Number	3
OUT	TagOut_Value	0000 0111 1111 0101

If the operand "TagIn" has the signal state "1", the instruction "Shift right" is executed. The content of the operand "TagIn\_Value" is shifted three bit positions to the right. The result is sent at output "TagOut\_Value". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

## SHL: Shift left

### Description

You can use the "Shift left" instruction to shift the content of the operand at the input IN bit-by-bit to the left and query the result at the OUT output. The input N is used to specify the number of bit positions by which the specified value should be moved.

If the value at the input N is "0", the value at input IN is copied unchanged to the operand at output OUT.

If the value at the input N is greater than the number of available bit positions, the operand value at input IN is shifted to the left by the available number of bit positions.

The bit positions in the right part of the operand freed by shifting are filled with zeros.

The following figure show how the content of an operand of the data type WORD is shifted six bit positions to the left:

## Parameters

The following table shows the parameters of the instruction "Shift left":

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
EN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	Bit strings, integers	Bit strings, integers	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Value to be shifted.
N	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Number of bit positions by which the value is shifted.
OUT	Output	Bit strings, integers	Bit strings, integers	I, Q, M, D, L	I, Q, M, D, L	Result of the instruction

You can select the data type for the instruction from the "<???" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	TagIn_Value	0011 1111 1010 1111
N	Tag_Number	4
OUT	TagOut_Value	1111 1010 1111 0000

If the operand "TagIn" has the signal state "1", the instruction "Shift left" is executed. The content of the operand "TagIn\_Value" is shifted four bit positions to the left. The result is sent at output "TagOut\_Value". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

## ROR: Rotate right

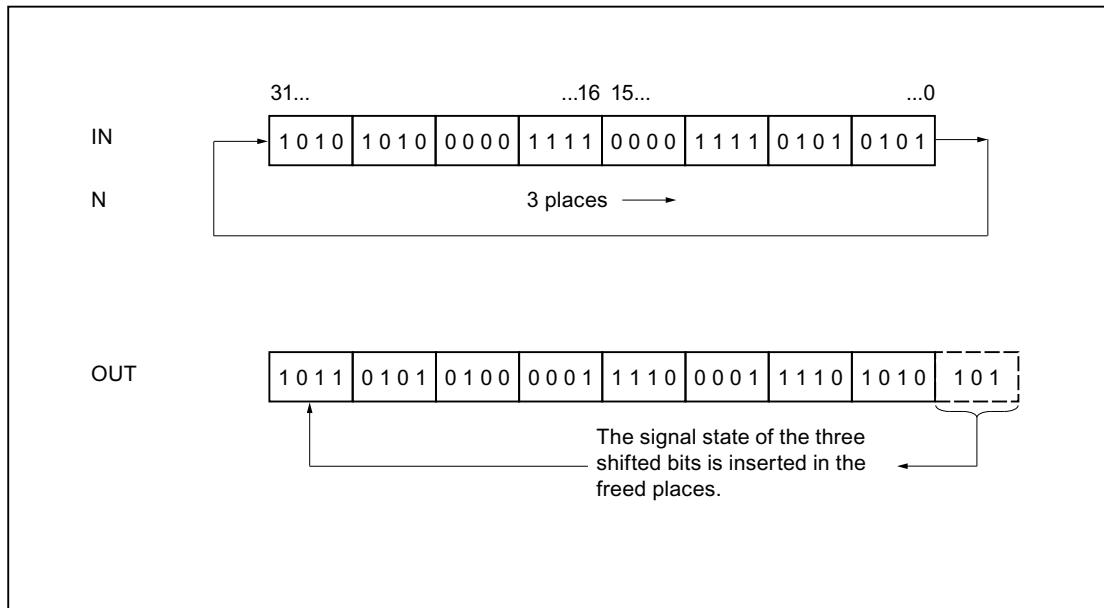

### Description

You can use the "Rotate right" instruction to rotate the content of the operand at the input IN bit-by-bit to the right and query the result at the OUT output. The input N is used to specify the number of bit positions by which the specified value should be rotated. The bit positions freed by rotating on the left-hand side are filled true-to-position with the bit positions that are pushed out from the left-hand side.

If the value at the input N is "0", the value at input IN is copied unchanged to the operand at output OUT.

If the value at the parameter N is greater than the number of available bit positions, the operand value at input IN is nevertheless rotated by the specified number of bit positions.

The following figure shows how the content of an operand of the data type DWORD is rotated three bit positions to the right:

Parameters

The following table shows the parameters of the instruction "Rotate right":

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
EN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	Bit strings, integers	Bit strings, integers	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Value to be rotated
N	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Number of bit positions by which the value is rotated
OUT	Output	Bit strings, integers	Bit strings, integers	I, Q, M, D, L	I, Q, M, D, L	Result of the instruction

You can select the data type for the instruction from the "<???"> drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	TagIn_Value	0000 1111 1001 0101
N	Tag_Number	5
OUT	TagOut_Value	1010 1000 0111 1100

If the operand "TagIn" has the signal state "1", the instruction "Rotate right" is executed. The content of the operand "TagIn\_Value" is rotated five bit positions to the right. The result is sent at output "TagOut\_Value". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

## ROL: Rotate left

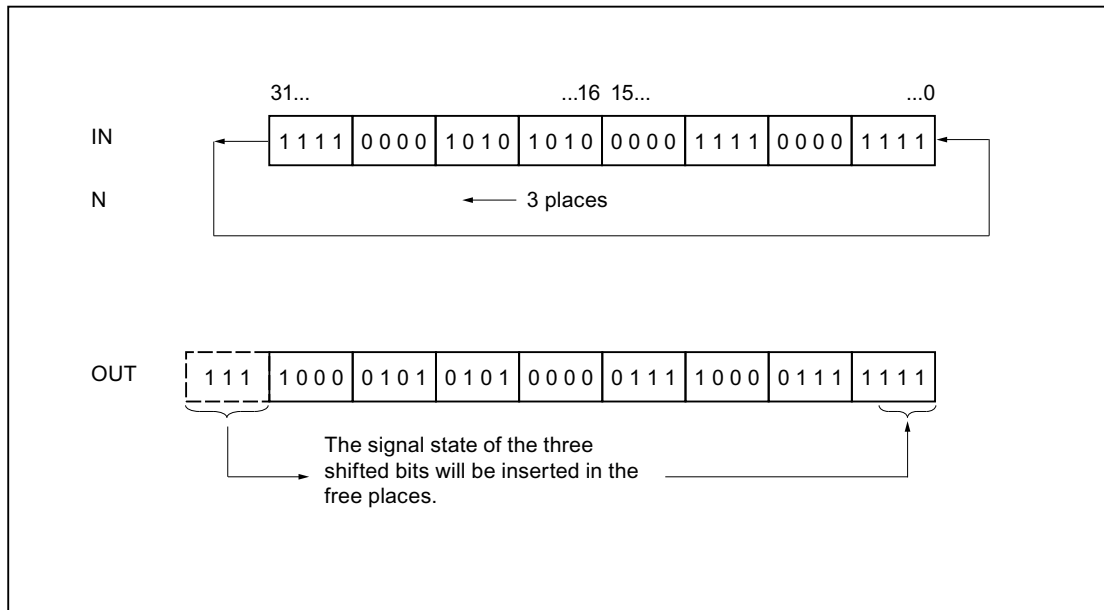

### Description

You can use the "Rotate left" instruction to rotate the content of the operand at the input IN bit-by-bit to the left and query the result at the OUT output. The input N is used to specify the number of bit positions by which the specified value should be rotated. The bit positions freed by rotating on the right-hand side are filled true-to-position with the bit positions that are pushed out from the left-hand side.

If the value at the input N is "0", the value at input IN is copied to the operand at output OUT.

If the value at the parameter N is greater than the number of available bit positions, the operand value at input IN is nevertheless rotated by the specified number of bit positions.

The following figure shows how the content of an operand of the data type DWORD is rotated three bit positions to the left:

Parameters

The following table shows the parameters of the instruction "Rotate left":

Parameter	Declaration	Data type		Memory area		Description
		S7-1200	S7-1500	S7-1200	S7-1500	
EN	Input	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	BOOL	I, Q, M, D, L	I, Q, M, D, L	Enable output
IN	Input	Bit strings, integers	Bit strings, integers	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Value to be rotated.
N	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	I, Q, M, D, L or constant	I, Q, M, D, L or constant	Number of bit positions by which the value is rotated.
OUT	Output	Bit strings, integers	Bit strings, integers	I, Q, M, D, L	I, Q, M, D, L	Result of the instruction

You can select the data type for the instruction from the "<???">" drop-down list of the instruction box.

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	TagIn_Value	1010 1000 1111 0110
N	Tag_Number	5
OUT	TagOut_Value	0001 1110 1101 0101

If input "TagIn" has the signal state "1", the instruction "Rotate left" is executed. The content of the operand "TagIn\_Value" is rotated five bit positions to the left. The result is sent at output "TagOut\_Value". If the instruction is executed without errors, the ENO enable output has the signal state "1" and the "TagOut" output is set.

## Additional instructions

### DRUM: Implement sequencer

#### Description

You can use the "Implement sequencer" instruction to assign the programmed values of the OUT\_VAL parameter of the corresponding step to the programmed output bits (OUT1 to OUT16) and the output word (OUT\_WORD). The specific step must thereby satisfy the conditions of the programmed enable mask on the S\_MASK parameter while the instruction remains at this step. The instruction advances to the next step if the event for the step is true and the programmed time for the current step elapses or if the value at the JOG parameter changes from "0" to "1". The instruction is reset if the signal state on the RESET parameter changes to "1". The current step is hereby equated to the preset step (DSP).

The amount of time spent on a step is determined by the product of the preset timebase (DTBP) and the preset counter value (S\_PRESET) for each step. At the start of a new step, this calculated value is loaded into the DCC parameter, which contains the time remaining for the current step. If, for example the value of the DTBP parameter is "2" and the preset value for the first step is "100" (100 ms), the DCC parameter has the value "200" (200 ms).

A step can be programmed with a timer value, an event or both. Steps that have an event bit and the timer value "0" advance to the next step as soon as the signal state of the event bit is "1". Steps that are programmed only with a timer value start the time immediately. Steps that are programmed with an event bit and a timer value greater than "0" start the time when the signal state of the event bit is "1". The event bits are initialized with a signal state of "1".

When the sequencer is on the last programmed step (LST\_STEP) and the time for this step has expired, the signal state on the Q parameter is set to "1"; otherwise it is set to "0". When the Q parameter is set, the instruction remains on the step until it is reset.

In the configurable mask (S\_MASK), you can selected the individual bits in the output word (OUT\_WORD) and set or reset the output bits (OUT1 to OUT16) by means of the output values (OUT\_VAL). If a bit of the configurable mask has signal state "1", the OUT\_VAL value sets or resets the corresponding bit. If the signal state of a bit of the configurable mask is "0", the corresponding bit is left unchanged. All the bits of the configurable mask for all 16 steps are initialized with a signal state of "1".

The output bit at the OUT1 parameter corresponds to the least significant bit of the output word (OUT\_WORD). The output bit at the OUT16 parameter corresponds to the most significant bit of the output word (OUT\_WORD).

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

## Parameters

The following table shows the parameters of the "Implement sequencer" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
RESET	Input	BOOL	I, Q, M, D, L or constant	The signal state "1" indicates the reset condition.
JOG	Input	BOOL	I, Q, M, D, L or constant	When the signal state changes from "0" to "1", the instruction advances to the next step.
DRUM_EN	Input	BOOL	I, Q, M, D, L or constant	The signal state "1" causes the sequencer to advance based on the event and time criteria.
LST_STEP	Input	BYTE	I, Q, M, D, L or constant	Number of the last programmed step

Parameter	Declaration	Data type	Memory area	Description
EVENT(i), 1 ≤ i ≤ 16	Input	BOOL	I, Q, M, D, L or constant	Event bit (i); Initial signal state is "1".
OUT(j), 1 ≤ j ≤ 16	Output	BOOL	I, Q, M, D, L	Output bit (j)
Q	Output	BOOL	I, Q, M, D, L	The signal state "1" indicates that the time for the last step has elapsed.
OUT_WORD	Output	WORD	I, Q, M, D, L, P	Word address to which the sequencer writes the output values.
ERR_CODE	Output	WORD	I, Q, M, D, L, P	Error information
JOG_HIS	Static	BOOL	I, Q, M, D, L or constant	JOG parameter history bit
EOD	Static	BOOL	I, Q, M, D, L or constant	The signal state "1" indicates that the time for the last step has elapsed.
DSP	Static	BYTE	I, Q, M, D, L, P or constant	Preset step of the sequencer
DSC	Static	BYTE	I, Q, M, D, L, P or constant	Current step of the sequencer
DCC	Static	DWORD	I, Q, M, D, L, P or constant	Current numerical value of the sequencer
DTBP	Static	WORD	I, Q, M, D, L, P or constant	Preset timebase of the sequencer
PREV_TIME	Static	DWORD	I, Q, M, D, L or constant	Previous system time
S_PRESET	Static	ARRAY of WORD	I, Q, M, D, L or constant	Preset count for each step [1 to 16]; where 1 clock pulse = 1 ms.
OUT_VAL	Static	ARRAY of BOOL	I, Q, M, D, L or constant	Output values for each step [1 to 16, 0 to 15].
S_MASK	Static	ARRAY of BOOL	I, Q, M, D, L or constant	Configurable mask for each step [1 to 16, 0 to 15]. Initial signal states are "1".

For additional information on valid data types, refer to "See also".

## Parameters ERR\_CODE

The following table shows the meaning of the values of the ERR\_CODE parameter:

ERR_CODE*	Explanation
W#16#0000	No error
W#16#000B	The value at the LST_STEP parameter is less than 1 or greater than 16.
W#16#000C	The value at the DSC parameter is less than 1 or greater than the value of the LST_STEP parameter.
W#16#000D	The value at the DSP parameter is less than 1 or greater than the value of the LST_STEP parameter.
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

## DCAT: Discrete control-timer alarm

### Description

The "Discrete control-timer alarm" instruction is used to accumulate the time from the point at which the CMD parameter issued the command to open or close. The time is accumulated until the preset time (PT) is exceeded or the information is received that the device was opened or closed (O\_FB or C\_FB) within the specified time. If the preset time is exceeded before the information on the opening or closing of the device is received, the corresponding alarm is activated. If the signal state of the command input changes state before the preset time, the time is restarted.

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

The "Discrete control-timer alarm" instruction has the following reactions to the input conditions:

- When the signal state of the CMD parameter changes from "0" to "1", the signal states of the parameters Q, CMD\_HIS, ET (only if ET is < PT) OA and CA are influenced as follows:
  - The parameters Q and CMD\_HIS are set to "1".
  - The parameters ET, OA and CA are reset to "0".
- When the signal state of the parameter CMD changes from "1" to "0", the parameters Q, ET (only if ET < PT), OA, CA and CMD\_HIS are reset to "0".

- When the signal state of the CMD and CMD\_HIS parameters is "1" and the parameter O\_FB is set to "0", the time difference (ms) since the last execution of the instruction is added to the value at the parameter ET. If the value of the parameter ET exceeds the value of the parameter PT, the signal state at the parameter OA is set to "1". If the value of the ET parameter does not exceed the value of the PT parameter, the signal state at the OA parameter is reset to "0". The value at the parameter CMD\_HIS is reset to the value of the parameter CMD.
- If the signal state of the CMD, CMD\_HIS and O\_FB parameters are set to "1" and the parameter C\_FB has the value "0", the signal state of the parameter OA is set to "0". The value of the parameter ET is set to the value of the parameter PT. If the signal state of the O\_FB parameter changes to "0", the alarm is set the next time the instruction is executed. The value of the parameter CMD\_HIS is set to the value of the parameter CMD.
- If the CMD, CMD\_HIS and C\_FB parameters return signal state "0", the time difference (ms) since the last execution of the instruction is added to the value of the ET parameter. If the value of the ET parameter exceeds the value of the PT parameter, the signal state of the parameter CA is reset to "1". If the value at the parameter PT is not exceeded, the parameter CA has the signal state "0". The value of the parameter CMD\_HIS is set to the value of the parameter CMD.
- If the parameters CMD, CMD\_HIS and O\_FB have the signal state "0" and the parameter C\_FB is set to "1", the parameter CA is set to "0". The value of the parameter ET is set to the value of the parameter PT. If the signal state of the C\_FB parameter changes to "0", the alarm is set the next time the instruction is executed. The value of the parameter CMD\_HIS is set to the value of the parameter CMD.
- If the parameters O\_FB and C\_FB simultaneously have the signal state "1", the signal states of both alarm outputs are set to "1".

The "Discrete control-timer alarm" instruction returns no error information.

## Parameters

The following table shows the parameters of the "Discrete control-timer alarm" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
CMD	Input	BOOL	I, Q, M, D, L or constant	The signal state "0" indicates a "close" command. The signal state "1" indicates the "open" command.
O_FB	Input	BOOL	I, Q, M, D, L or constant	Feedback input when opening
C_FB	Input	BOOL	I, Q, M, D, L or constant	Feedback input when closing

Parameter	Declaration	Data type	Memory area	Description
Q	Output	BOOL	I, Q, M, D, L	Shows the status of the parameter CMD
OA	Output	BOOL	I, Q, M, D, L	Alarm output when opening
CA	Output	BOOL	I, Q, M, D, L	Alarm output when closing
ET	Static	DINT	D, L or constant	Currently elapsed time, where one count = 1 ms.
PT	Static	DINT	D, L or constant	Preset timer value, where one count = 1 ms.
PREV_TIME	Static	DWORD	D, L or constant	Previous system time
CMD_HIS	Static	BOOL	D, L or constant	CMD history bit

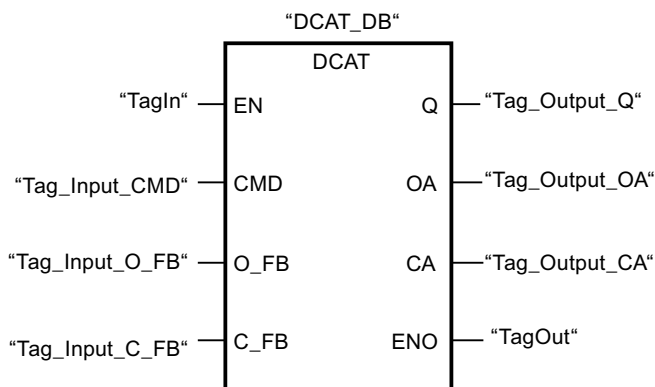

For additional information on valid data types, refer to "See also".

### Example

In the following example the parameter CMD changes from "0" to "1". After the execution of the instruction the parameter Q is set to "1" and the two alarm outputs OA and CA have the signal state "0". The parameter CMD\_HIS of the instance data block is set to the signal state "1" and the parameter ET is reset to "0".

#### Note

You can initialize static parameters in the data block.

The following tables show how the instruction works using specific values.

#### Before processing

In this example, the following values are used for the input and output parameters:

Parameter	Operand	Value
CMD	Tag_Input_CMD	TRUE
O_FB	Tag_Input_O_FB	FALSE
C_FB	Tag_Input_C_FB	FALSE
Q	Tag_Output_Q	FALSE
OA	Tag_Output_OA	FALSE
CA	Tag_Output_CA	FALSE

The following values are saved in the instance data block "DCAT\_DB" of the instruction:

Parameter	Address	Value
ET	DBD4	L#12
PT	DBD8	L#222
CMD_HIS	DBX16.0	FALSE

#### After processing

The following values are written to the output parameters after the instruction has been executed:

Parameter	Operand	Value
Q	Tag_Output_Q	TRUE
OA	Tag_Output_OA	FALSE
CA	Tag_Output_CA	FALSE

The following values are saved in the instance data block "DCAT\_DB" of the instruction:

Parameter	Address	Value
ET	DBD4	L#0
CMD_HIS	DBX16.0	TRUE

#### MCAT: Motor control-timer alarm

##### Description

The instruction "Motor control-timer alarm" is used to accumulate the time from the point in time as of which one of the command inputs (open or close) is activated. The time is accumulated until the preset time is exceeded or the relevant feedback input indicates that the device has executed the requested operation within the specified time. If the preset time is exceeded before the feedback is received, the corresponding alarm is triggered.

9.7 References

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

The "Motor control-timer alarm" instruction returns no error information.

**Execution of the "Motor control-timer alarm" instruction**

The following table shows the reactions of the "Motor control-timer alarm" instruction to the various input conditions:

Input parameters								Output parameters								
ET	O_H IS	C_H IS	O_C MD	C_C MD	S_C MD	O_F B	C_F B	OO	CO	OA	CA	ET	O_H IS	C_H IS	Q	Status
X	1	1	X	X	X	X	X	0	0	1	1	PT	0	0	0	Alarm
X	X	X	X	X	X	1	1	0	0	1	1	PT	0	0	0	Alarm
X	X	X	X	X	1	X	X	0	0	0	0	X	0	0	1	Stop
X	X	X	1	1	X	X	X	0	0	0	0	X	0	0	1	Stop
X	0	X	1	0	0	X	X	1	0	0	0	0	1	0	1	Start opening
<PT	1	0	X	0	0	0	X	1	0	0	0	INC	1	0	1	Open
X	1	0	X	0	0	1	0	0	0	0	0	PT	1	0	1	Opened
>=PT	1	0	X	0	0	0	X	0	0	1	0	PT	1	0	0	Opening alarm
X	X	0	0	1	0	X	X	0	1	0	0	0	0	1	1	Start closing
<PT	0	1	0	X	0	X	0	0	1	0	0	INC	0	1	1	Close
X	0	1	0	X	0	0	1	0	0	0	0	PT	0	1	1	Closed
>=PT	0	1	0	X	0	X	0	0	0	0	1	PT	0	1	0	Closing alarm
X	0	0	0	0	0	X	X	0	0	0	0	X	0	0	1	Stopped
Legend:																
INC	Add the time difference (ms) since the last processing of the FB to ET															
PT	PT is set to the same value as ET															
X	Cannot be used															
<PT	ET < PT															
>=PT	ET >= PT															
If the input parameters O_HIS and C_HIS both have the signal state "1", they are immediately set to signal state "0". In this case, the last row of the above-named table (X) is valid. Because it is therefore no longer possible to check whether the input parameters O_HIS and C_HIS have the signal state "1", the output parameters are set as follows in this case: OO = FALSE CO = FALSE OA = FALSE CA = FALSE ET = PT Q = TRUE																

## Parameters

The following table shows the parameters of the "Motor control-timer alarm" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
O_CMD	Input	BOOL	I, Q, M, D, L or constant	"Open" command input
C_CMD	Input	BOOL	I, Q, M, D, L or constant	"Close" command input
S_CMD	Input	BOOL	I, Q, M, D, L or constant	"Stop" command input
O_FB	Input	BOOL	I, Q, M, D, L or constant	Feedback input when opening
C_FB	Input	BOOL	I, Q, M, D, L or constant	Feedback input when closing
OO	Output	BOOL	I, Q, M, D, L	"Open" output
CO	Output	BOOL	I, Q, M, D, L	"Close" output
OA	Output	BOOL	I, Q, M, D, L	Alarm output when opening
CA	Output	BOOL	I, Q, M, D, L	Alarm output when closing
Q	Output	BOOL	I, Q, M, D, L	The signal state "0" indicates an error condition.
ET	Static	DINT	D, L or constant	Currently elapsed time, where one count = 1 ms
PT	Static	DINT	D, L or constant	Preset timer value, where one count = 1 ms
PREV_TIME	Static	DWORD	D, L or constant	Previous system time
O_HIS	Static	BOOL	D, L or constant	"Open" history bit
C_HIS	Static	BOOL	D, L or constant	"Close" history bit

For additional information on valid data types, refer to "See also".

## Example

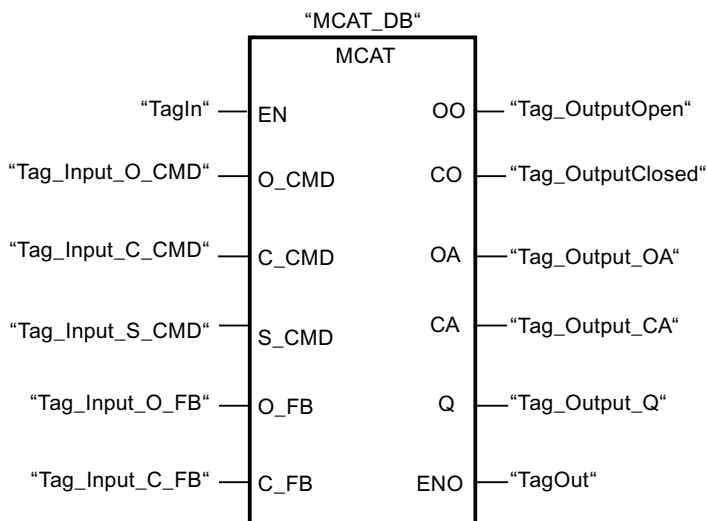

The following example shows how the instruction works:

---

### Note

You can initialize static parameters in the data block.

---

The following tables show how the instruction works using specific values.

**Before processing**

In this example, the following values are used for the input and output parameters:

Parameter	Operand	Value
O_CMD	Tag_Input_O_CMD	TRUE
C_CMD	Tag_Input_C_CMD	FALSE
S_CMD	Tag_Input_S_CMD	FALSE
O_FB	Tag_Input_O_FB	FALSE
C_FB	Tag_Input_C_FB	FALSE
OO	Tag_OutputOpen	FALSE
CO	Tag_OutputClosed	FALSE
OA	Tag_Output_OA	FALSE
CA	Tag_Output_CA	FALSE
Q	Tag_Output_Q	FALSE

The following values are saved in the instance data block "MCAT\_DB" of the instruction:

Parameter	Address	Value
ET	DBD4	L#2
PT	DBD8	L#22
O_HIS	DBX16.0	TRUE
C_HIS	DBX16.1	FALSE

**After processing**

The following values are written to the output parameters after the instruction has been executed:

Parameter	Operand	Value
OO	Tag_OutputOpen	TRUE
CO	Tag_OutputClosed	FALSE
OA	Tag_Output_OA	FALSE
CA	Tag_Output_CA	FALSE
Q	Tag_Output_Q	TRUE

The following values are saved in the instance data block "MCAT\_DB" of the instruction:

Parameter	Address	Value
ET	DBD4	L#0
O_HIS	DBX16.0	TRUE
CMD_HIS	DBX16.1	FALSE

## IMC: Compare input bits with the bits of a mask

### Description

The instruction "Compare input bits with the bits of a mask" is used to compare the signal state of up to 16 programmed input bits (IN\_BIT0 to IN\_BIT15) with the corresponding bits of a mask. Up to 16 steps with masks can be programmed. The value of the IN\_BIT0 parameter is compared with the value of the mask CMP\_VAL[x,0], with "x" indicating the step number. At the CMP\_STEP parameter, specify the step number of the mask that is used for the comparison. All programmed values are compared in the same manner. Unprogrammed input bits or unprogrammed bits of the mask have the default signal state FALSE.

If a match is found in the comparison, the signal state of the OUT parameter is set to "1". Otherwise, the OUT parameter is set to "0".

If the value of the CMP\_STEP parameter is greater than 15, the instruction is not executed. An error message is output at the ERR\_CODE parameter.

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

**Parameters**

The following table shows the parameters of the "Compare input bits with the bits of a mask" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN_BIT0	Input	BOOL	I, Q, M, D, L or constant	Input bit 0 is compared with bit 0 of the mask.
IN_BIT1	Input	BOOL	I, Q, M, D, L or constant	Input bit 1 is compared with bit 1 of the mask.
IN_BIT2	Input	BOOL	I, Q, M, D, L or constant	Input bit 2 is compared with bit 2 of the mask.
IN_BIT3	Input	BOOL	I, Q, M, D, L or constant	Input bit 3 is compared with bit 3 of the mask.
IN_BIT4	Input	BOOL	I, Q, M, D, L or constant	Input bit 4 is compared with bit 4 of the mask.
IN_BIT5	Input	BOOL	I, Q, M, D, L or constant	Input bit 5 is compared with bit 5 of the mask.
IN_BIT6	Input	BOOL	I, Q, M, D, L or constant	Input bit 6 is compared with bit 6 of the mask.
IN_BIT7	Input	BOOL	I, Q, M, D, L or constant	Input bit 7 is compared with bit 7 of the mask.
IN_BIT8	Input	BOOL	I, Q, M, D, L or constant	Input bit 8 is compared with bit 8 of the mask.
IN_BIT9	Input	BOOL	I, Q, M, D, L or constant	Input bit 9 is compared with bit 9 of the mask.
IN_BIT10	Input	BOOL	I, Q, M, D, L or constant	Input bit 10 is compared with bit 10 of the mask.
IN_BIT11	Input	BOOL	I, Q, M, D, L or constant	Input bit 11 is compared with bit 11 of the mask.
IN_BIT12	Input	BOOL	I, Q, M, D, L or constant	Input bit 12 is compared with bit 12 of the mask.
IN_BIT13	Input	BOOL	I, Q, M, D, L or constant	Input bit 13 is compared with bit 13 of the mask.
IN_BIT14	Input	BOOL	I, Q, M, D, L or constant	Input bit 14 is compared with bit 14 of the mask.
IN_BIT15	Input	BOOL	I, Q, M, D, L or constant	Input bit 15 is compared with bit 15 of the mask.
CMP_STEP	Input	BYTE	I, Q, M, D, L, P or constant	The step number of the mask used for the comparison.
OUT	Output	BOOL	I, Q, M, D, L	The signal state "1" indicates that a match was found. The signal state "0" indicates that no match was found.

Parameter	Declaration	Data type	Memory area	Description
ERR_CODE	Output	WORD	I, Q, M, D, L, P	Error information
CMP_VAL	Static	ARRAY OF WORD	I, Q, M, D, L or constant	Comparison masks [0 to 15, 0 to 15]: The first number of the index is the step number and the second number is the bit number of the mask.

For additional information on valid data types, refer to "See also".

## Parameters ERR\_CODE

The following table shows the meaning of the values of the ERR\_CODE parameter:

Error code* (W#16#...)	Explanation
0000	No error
000A	The value at the CMP_STEP parameter is greater than 15.

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

## See also

## SMC: Compare scan matrix

### Description

The instruction "Compare scan matrix" is used to compare the signal state of up to 16 programmed input bits (IN\_BIT0 to IN\_BIT15) with the corresponding bits of the comparison masks for each step. Processing starts at step 1 and is continued until the last programmed step (LAST) or until a match is found. The input bit of the IN\_BIT0 parameter is compared with the value of the mask CMP\_VAL[x,0], with "x" indicating the step number. All programmed values are compared in the same manner. If a match is found, the signal state of the OUT parameter is set to "1" and the step number with the matching mask is written to the OUT\_STEP parameter. Unprogrammed input bits or unprogrammed bits of the mask have the default signal state FALSE. If more than one step has a matching mask, only the first one found is indicated in the OUT\_STEP parameter. If no match is found, the signal state of the OUT parameter is set to "0". In this case the value at the OUT\_STEP parameter is greater by "1" than the value of the LAST parameter.

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

**Parameters**

The following table shows the parameters of the "Compare scan matrix" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN_BIT0	Input	BOOL	I, Q, M, D, L or constant	Input bit 0 is compared with bit 0 of the mask.
IN_BIT1	Input	BOOL	I, Q, M, D, L or constant	Input bit 1 is compared with bit 1 of the mask.
IN_BIT2	Input	BOOL	I, Q, M, D, L or constant	Input bit 2 is compared with bit 2 of the mask.
IN_BIT3	Input	BOOL	I, Q, M, D, L or constant	Input bit 3 is compared with bit 3 of the mask.
IN_BIT4	Input	BOOL	I, Q, M, D, L or constant	Input bit 4 is compared with bit 4 of the mask.
IN_BIT5	Input	BOOL	I, Q, M, D, L or constant	Input bit 5 is compared with bit 5 of the mask.
IN_BIT6	Input	BOOL	I, Q, M, D, L or constant	Input bit 6 is compared with bit 6 of the mask.
IN_BIT7	Input	BOOL	I, Q, M, D, L or constant	Input bit 7 is compared with bit 7 of the mask.
IN_BIT8	Input	BOOL	I, Q, M, D, L or constant	Input bit 8 is compared with bit 8 of the mask.
IN_BIT9	Input	BOOL	I, Q, M, D, L or constant	Input bit 9 is compared with bit 9 of the mask.
IN_BIT10	Input	BOOL	I, Q, M, D, L or constant	Input bit 10 is compared with bit 10 of the mask.
IN_BIT11	Input	BOOL	I, Q, M, D, L or constant	Input bit 11 is compared with bit 11 of the mask.
IN_BIT12	Input	BOOL	I, Q, M, D, L or constant	Input bit 12 is compared with bit 12 of the mask.
IN_BIT13	Input	BOOL	I, Q, M, D, L or constant	Input bit 13 is compared with bit 13 of the mask.
IN_BIT14	Input	BOOL	I, Q, M, D, L or constant	Input bit 14 is compared with bit 14 of the mask.
IN_BIT15	Input	BOOL	I, Q, M, D, L or constant	Input bit 15 is compared with bit 15 of the mask.
OUT	Output	BOOL	I, Q, M, D, L	The signal state "1" indicates that a match was found. The signal state "0" indicates that no match was found.
ERR_CODE	Output	WORD	I, Q, M, D, L, P	Error information

Parameter	Declaration	Data type	Memory area	Description
OUT_STEP	Output	BYTE	I, Q, M, D, L, P	Contains the step number with the matching mask or the step number which is greater by "1" than the value of the LAST parameter, provided no match is found.
LAST	Static	BYTE	I, Q, M, D, L, P or constant	Specifies the step number of the last step to be scanned for a matching mask.
CMP_VAL	Static	ARRAY OF WORD	I, Q, M, D, L or constant	Comparison masks [0 to 15, 0 to 15]: The first number of the index is the step number and the second number is the bit number of the mask.

For additional information on valid data types, refer to "See also".

### Parameters ERR\_CODE

The following table shows the meaning of the values of the ERR\_CODE parameter:

Error code* (W#16#...)	Explanation
0000	No error
000E	The value at the LAST parameter is greater than 15.

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

### See also

### LEAD\_LAG: Lead and lag algorithm

#### Description

The "Lead and lag algorithm" instruction is used to process signals with an analog tag. The gain value at the GAIN parameter must be greater than zero. The result of the instruction "Lead and lag algorithm" is calculated using the following equation:

$$\text{OUT} = \left[ \frac{\text{LG\_TIME}}{\text{LG\_TIME} + \text{SAMPLE\_T}} \right] \text{PREV\_OUT} + \text{GAIN} \left[ \frac{\text{LD\_TIME} + \text{SAMPLE\_T}}{\text{LG\_TIME} + \text{SAMPLE\_T}} \right] \text{IN} - \text{GAIN} \left[ \frac{\text{LD\_TIME}}{\text{LG\_TIME} + \text{SAMPLE\_T}} \right] * \text{PREV\_IN}$$

The "Lead and lag algorithm" instruction supplies plausible results only when processing is in fixed program cycles. The same units must be specified for the LD\_TIME, LG\_TIME, and SAMPLE\_T parameters. At  $LG\_TIME > 4 + SAMPLE\_T$ , the instruction approaches the following function:

$$OUT = GAIN * ((1 + LD\_TIME * s) / (1 + LG\_TIME * s)) * IN$$

When the value of the GAIN parameter is less than or equal to zero, the calculation is not performed and an error information is output on the ERR\_CODE parameter.

You can use the "Lead and lag algorithm" instruction in conjunction with loops as a compensator in dynamic feed-forward control. The instruction consists of two operations. The "Lead" operation shifts the phase of the OUT output so that the output leads the input. The "Lag" operation, on the other hand, shifts the output so that the output lags behind the input. Because the "Lag" operation is equivalent to an integration, it can be used as a noise suppressor or as a low-pass filter. The "Lead" operation is equivalent to a differentiation and can therefore be used as a high-pass filter. The two instructions together (Lead and Lag) result in the output phase lagging behind the the input at lower frequencies and leading it at higher frequencies. This means that the "Lead and lag algorithm" instruction can be used as a band pass filter.

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find this in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

## Parameters

The following table shows the parameters of the "Lead and lag algorithm" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	REAL	I, Q, M, D, L, P or constant	The input value of the current sample time (cycle time) to be processed.
SAMPLE_T	Input	INT	I, Q, M, D, L, P or constant	Sample time
OUT	Output	REAL	I, Q, M, D, L, P	Result of the instruction
ERR_CODE	Output	WORD	I, Q, M, D, L, P	Error information
LD_TIME	Static	REAL	I, Q, M, D, L, P or constant	Lead time in the same unit as sample time.
LG_TIME	Static	REAL	I, Q, M, D, L, P or constant	Lag time in the same unit as sample time

Parameter	Declaration	Data type	Memory area	Description
GAIN	Static	REAL	I, Q, M, D, L, P or constant	Gain as % / % (the ratio of the change in output to a change in input as a steady state).
PREV_IN	Static	REAL	I, Q, M, D, L, P or constant	Previous input
PREV_OUT	Static	REAL	I, Q, M, D, L, P or constant	Previous output

For additional information on valid data types, refer to "See also".

### Parameters ERR\_CODE

The following table shows the meaning of the values of the ERR\_CODE parameter:

Error code* (W#16#...)	Explanation
0000	No error
0009	The value at the GAIN parameter is less than or equal to zero.

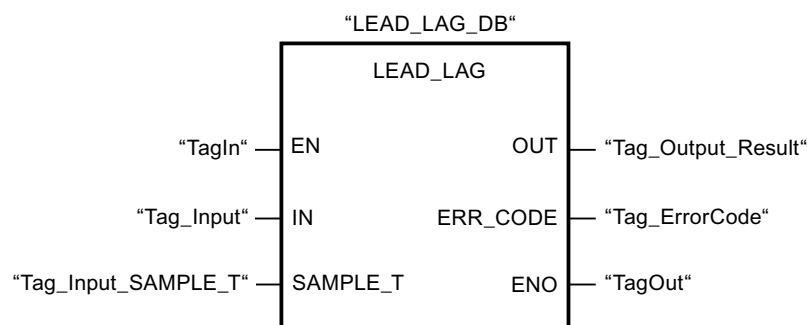

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For additional information on toggling display formats, refer to "See also".

### Example

The following example shows how the instruction works:

#### Note

You can initialize static parameters in the data block.

The following table shows how the instruction works using specific operand values:

#### Before processing

In this example the following values are used for the input parameters:

Parameters	Operand	Value
IN	Tag_Input	2.0
SAMPLE_T	Tag_InputSampleTime	10

The following values are saved in the instance data block "LEAD\_LAG\_DB" of the instruction:

Parameters	Address	Value
LD_TIME	DBD12	2.0
LG_TIME	DBD16	2.0
GAIN	DBD20	1.0
PREV_IN	DBD24	6.0
PREV_OUT	DBD28	6.0

**After processing**

The following values are written to the output parameters after the instruction has been executed:

Parameters	Operand	Value
OUT	Tag_Output_Result	2.0

The following values are saved in the instance data block "LEAD\_LAD\_DB" of the instruction:

Parameters	Operand	Value
PREV_IN	DBD24	2.0
PREV_OUT	DBD28	2.0

**SEG: Create bit pattern for seven-segment display**

**Description**

The instruction "Create bit pattern for seven-segment display" is used to convert each of the four hexadecimal digits of the specified source word (IN) into an equivalent bit pattern for a seven-segment display. The result of the instruction is output in the double word on the OUT parameter.

The following relation exists between the hexadecimal digits and the assignment of the 7 segments (a, b, c, d, e, f, g):

Input digit (Binary)	Assignment of the segments - g f e d c b a	Display (Hexadecimal)	Seven-segment display
0000	00111111	0	
0001	00000110	1	
0010	01011011	2	
0011	01001111	3	
0100	01100110	4	
0101	01101101	5	
0110	01111101	6	
0111	00000111	7	
1000	01111111	8	
1001	01100111	9	
1010	01110111	A	
1011	01111100	B	
1100	00111001	C	
1101	01011110	D	
1110	01111001	E	
1111	01110001	F	

### Parameters

The following table shows the parameters of the "Create bit pattern for seven-segment display" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	WORD	I, Q, M, D, L, P or constant	Source word with four hexadecimal digits
OUT	Output	DWORD	I, Q, M, D, L, P	Bit pattern for the seven-segment display

### Example

The following example shows how the instruction works:

The following table shows how the instruction functions using specific values:

Parameters	Operand	Value	
Hexadecimal	Binary		
IN	Tag_Input	W#16#1234	0001 0010 0011 0100
OUT	Tag_Output	DW#16065B4F66	00000110 01011011 01001111 01100110 Display: 1234

**BCDCPL: Create tens complement**

**Description**

You can use the "Create tens complement" instruction to create the tens complement of a seven-digit BCD number specified in the IN parameter. This instruction uses the following mathematical formula to calculate:

$$\begin{array}{r}
 10000000 \text{ (as BCD)} \\
 - \text{7-digit BCD value} \\
 \hline
 \text{Tens complement (as BCD)}
 \end{array}$$

**Parameters**

The following table shows the parameters of the "Create tens complement" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	Bit strings	I, Q, M, D, L, P or constant	7-digit BCD number
ERR_CODE	Output	DWORD	I, Q, M, D, L, P	Result of the instruction

## Example

The following example shows how the instruction works:

The following table shows how the instruction functions using specific values:

Parameter	Operand	Value*
IN	Tag_Input	DW#16#01234567
ERR_CODE	Tag_Output	DW#16#08765433
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

## BITSUM: Count number of set bits

### Description

The "Count number of set bits" instruction is used to count the number of bits of an operand that is set to the signal state "1". The operand whose bits are to be counted is specified on the IN parameter. The result of the instruction is output at the RET\_VAL parameter.

### Parameters

The following table shows the parameters of the "Count number of set bits" instruction:

Parameter	Declaration	Data type	Memory area	Description
EN	Input	BOOL	I, Q, M, D, L, T, C	Enable input
ENO	Output	BOOL	I, Q, M, D, L	Enable output
IN	Input	DWORD	I, Q, M, D, L, P or constant	Operand whose set bits are counted.
RET_VAL	Output	INT	I, Q, M, D, L, P	Number of bits to be set

**Example**

The following example shows how the instruction works:

The following table shows how the instruction functions using specific values:

Parameter	Operand	Value*
IN	Tag_Input	DW#16#12345678
RET_VAL	Tag_Output	W#16#000D (13 Bits)

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For additional information on toggling display formats, refer to "See also".

**9.7.2.3 SCL**

**Bit logic operations**

**R\_TRIG: Set tag on positive signal edge**

**Description**

You can use the "Set tag on positive signal edge" instruction to set a specified tag in the instance DB when there is a "0" to "1" change in the result of logic operation (RLO). The instruction compares the current RLO at the input CLK with the RLO from the previous query, which is saved in the specified instance DB. If the instruction detects a change in the result of logic operation (RLO) from "0" to "1", there is a positive, rising edge.

If a positive edge is detected, the tag in the instance DB is set to signal state "1" and the output Q returns the signal state "1" In all other cases, the signal state at the output of the instruction is "0".

When you insert the instruction in the program, the "Call options" dialog opens automatically. In this dialog you can specify whether the edge memory bit is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

## Syntax

The following syntax is used for the "Set tag on positive signal edge" instruction:

```
SCL
<Instance_DB>(CLK := <Operand>,
              Q => <Operand>)
```

## Parameter

The following table shows the parameters of the instruction "Set tag on positive signal edge":

Parameter	Declaration	Data type	Description
CLK	Input	BOOL	Incoming signal, the edge of which is to be queried
Q	Output	BOOL	Result of edge evaluation

## Example

The following example shows how the instruction works:

```
SCL
"R_TRIG_DB"(CLK := "TagIn",
            Q => "TagOut");
```

The RLO of the preceding query is saved in the instance DB "R\_TRIG\_DB". If a change in the signal state of the RLO from "0" to "1" is detected in the operand "TagIn", the output "TagOut" has signal state "1".

## See also

## F\_TRIG: Set tag on negative signal edge

### Description

You can use the "Set tag on negative signal edge" instruction to set a specified tag in the instance DB when there is a "1" to "0" change in the result of logic operation (RLO). The instruction compares the current RLO at the input CLK with the RLO from the previous query, which is saved in the specified instance DB. If the instruction detects a change in the result of logic operation (RLO) from "1" to "0", there is a negative, falling edge.

If a negative edge is detected, the tag in the instance DB is set to signal state "1" and the output Q returns the signal state "1" In all other cases, the signal state at the output of the instruction is "0".

When you insert the instruction in the program, the "Call options" dialog opens automatically. In this dialog you can specify whether the edge memory bit is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

### Syntax

The following syntax is used for the "Set tag on negative signal edge" instruction:

```
SCL  
<Instance_DB>(CLK := <Operand>,  
              Q => <Operand>)
```

### Parameter

The following table shows the parameters of the instruction "Set tag on negative signal edge":

Parameter	Declaration	Data type	Description
CLK	Input	BOOL	Incoming signal, the edge of which is to be queried
Q	Output	BOOL	Result of edge evaluation

### Example

The following example shows how the instruction works:

```
SCL  
"F_TRIG_DB"(CLK := "TagIn",  
            Q => "TagOut");
```

The RLO of the preceding query is saved in the instance DB "F\_TRIG\_DB". If a change in the signal state of the RLO from "1" to "0" is detected in the operand "TagIn", the output "TagOut" has signal state "1".

## Timer operations

### IEC Timers

#### TP: Generate pulse

#### Description

You can use the "Generate pulse" instruction to set the Q parameter for the duration PT. The instruction starts when the result of logic operation (RLO) of the IN parameter changes from "0" to "1" (positive signal edge). The programmed time PT begins when the instruction starts. The Q parameter is set for the time PT, regardless of the subsequent changes in the input signal. Even when a new positive signal edge is detected, the signal state of the Q parameter is not affected as long as the time duration PT is active.

The current time value can be queried in the ET parameter. The time value starts at T#0s and ends when the value of the time duration PT is reached. When the time duration PT is reached and the signal state at the IN parameter is "0", the ET parameter is reset.

---

#### Note

If the timer is not called in the program because it is skipped, for example, output ET returns a constant value as soon as the timer has expired.

---

Each call of the "Generate pulse" instruction must be assigned to an IEC timer in which the instruction data is stored.

#### For S7-1200 CPU

An IEC Timer is a structure of the data type IEC\_TIMER or TP\_TIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the TP\_TIME type in the "Static" section of a block (for example, #MyTP\_TIMER)

#### For S7-1500 CPU

An IEC timer is a structure of the data type IEC\_TIMER, IEC\_LTIMER, TP\_TIME or TP\_LTIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER or IEC\_LTIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TP\_TIME or TP\_LTIME in the "Static" section of a block (for example #MyTP\_TIMER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC timer is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find

it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

The instruction data is updated both when an instruction is called and also at each access to the Q or ET outputs.

### Syntax

Use the following syntax for the "Generate pulse" instruction:

- Data block of system data type IEC\_Timer (global DB):

**SCL**

```
<IEC_Timer_DB> TP(IN := <Operand>,
                 PT := <Operand>,
                 Q => <Operand>,
                 ET => <Operand>)
```

- Local tag:

**SCL**

```
#myLocal_timer(IN := <Operand>,
               PT := <Operand>,
               Q => <Operand>,
               ET => <Operand>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
IN	Input	BOOL	BOOL	Start input
PT	Input	TIME	TIME, LTIME	Duration of the pulse. The value of the PT parameter must be positive.
Q	Output	BOOL	BOOL	Operand that is set for the PT duration.
ET	Output	TIME	TIME, LTIME	Current time value

For additional information on valid data types, refer to "See also".

## Pulse timing diagram

The following figure shows the pulse timing diagram of the "Generate pulse" instruction:

## Example

The following example shows how the instruction works:

```
SCL
"TP_DB".TP(IN := "Tag_Start",
           PT := "Tag_PresetTime",
           Q => "Tag_Status",
           ET => "Tag_ElapsedTime");
```

When the signal state of the "Tag\_Start" operand changes from "0" to "1", the time period programmed for the PT parameter is started and the "Tag\_Status" operand is set to "1". The current time value is stored in the "Tag\_ElapsedTime" operand.

## See also

Overview of the valid data types (Page 1262)

## TON: Generate on-delay

### Description

You can use the "Generate on-delay" instruction to delay the setting of the Q parameter for the programmed duration PT. The instruction starts when the result of logic operation (RLO) of the IN parameter changes from "0" to "1" (positive signal edge). The programmed time PT begins when the instruction starts. When the duration PT has expired, the Q parameter returns signal state "1". The Q parameter remains set as long as the start input is still "1". If the signal

state of the IN parameter changes from "1" to "0", the parameter Q will be reset. The timer function is restarted when a new positive signal edge is detected at the IN parameter.

The current time value can be queried in the ET parameter. The time value starts at T#0s and ends when the value of the time duration PT is reached. The ET parameter is reset as soon as the signal state of the IN parameter changes to "0".

---

**Note**

If the timer is not called in the program because it is skipped, for example, output ET returns a constant value as soon as the timer has expired.

---

Each call of the "Generate on-delay" instruction must be assigned to an IEC timer in which the instruction data is stored.

### For S7-1200 CPU

An IEC Timer is a structure of the data type IEC\_TIMER or TON\_TIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the TON\_TIME type in the "Static" section of a block (for example, #MyTON\_TIMER)

### For S7-1500 CPU

An IEC timer is a structure of the data type IEC\_TIMER, IEC\_LTIMER, TON\_TIME or TON\_LTIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER or IEC\_LTIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TON\_TIME or TON\_LTIME in the "Static" section of a block (for example #MyTON\_TIMER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC timer is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

The instruction data is updated both when an instruction is called and also at each access to the Q or ET outputs.

### Syntax

Use the following syntax for the "Generate on-delay" instruction:

- Data block of system data type IEC\_Timer (global DB):

**SCL**

```
<IEC_Timer_DB> TON(IN := <Operand>,
                  PT := <Operand>,
```

**SCL**

```

Q => <Operand>,
ET => <Operand>

```

- Local tag:

**SCL**

```

#myLocal_timer(IN := <Operand>,
               PT := <Operand>,
               Q => <Operand>,
               ET => <Operand>)

```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
IN	Input	BOOL	BOOL	Start input
PT	Input	TIME	TIME, LTIME	Duration of the on delay. The value of the PT parameter must be positive.
Q	Output	BOOL	BOOL	Operand that is set when the timer PT expires.
ET	Output	TIME	TIME, LTIME	Current time value

For additional information on valid data types, refer to "See also".

### Pulse timing diagram

The following figure shows the pulse timing diagram of the "Generate on-delay" instruction:

## Example

The following example shows how the instruction works:

```
SCL
"TON_DB".TON(IN := "Tag_Start",
             PT := "Tag_PresetTime",
             Q => "Tag_Status",
             ET => "Tag_ElapsedTime");
```

When the signal state of the "Tag\_Start" operand changes from "0" to "1", the time programmed for the PT parameter is started. After the end of the period the "Tag\_Status" operand is set to the signal state "1". The operand Tag\_Status remains set to signal state "1" as long as the operand Tag\_Start has signal state "1". The current time value is stored in the operand "Tag\_ElapsedTime". When the signal state at the operand "Tag\_Start" changes from "1" to "0", the "Tag\_Status" operand is reset.

## See also

Overview of the valid data types (Page 1262)

## TOF: Generate off-delay

### Description

You can use the "Generate off-delay" instruction to delay the resetting of the Q parameter for the programmed duration PT. The Q parameter is set when the result of logic operation (RLO) of the IN parameter changes from "0" to "1" (positive signal edge). When the signal state of the IN parameter changes back to "0", the programmed time PT starts. The Q parameter remains set as long the time duration PT is running. When the time PT expires, the Q parameter is reset. If the signal state of the IN parameter changes to "1" before the time duration PT has expired, the timer is reset. The signal state of the Q parameter remains set to "1".

The current time value can be queried in the ET parameter. The time value starts at T#0s and ends when the value of the time duration PT is reached. When the time duration PT expires, the ET parameter remains set to the current value until the IN parameter changes back to "1". If the IN parameter changes to "1" before the time PT has expired, the ET parameter is reset to the value T#0s.

---

### Note

If the timer is not called in the program because it is skipped, for example, output ET returns a constant value as soon as the timer has expired.

---

Each call of the "Generate off-delay" instruction must be assigned to an IEC timer in which the instruction data is stored.

### For S7-1200 CPU

An IEC Timer is a structure of the data type IEC\_TIMER or TOF\_TIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the TOF\_TIME type in the "Static" section of a block (for example, #MyTOF\_TIMER)

### For S7-1500 CPU

An IEC timer is a structure of the data type IEC\_TIMER, IEC\_LTIMER, TOF\_TIME or TOF\_LTIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER or IEC\_LTIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TOF\_TIME or TOF\_LTIME in the "Static" section of a block (for example #MyTOF\_TIMER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC timer is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

The instruction data is updated both when an instruction is called and also at each access to the Q or ET outputs.

### Syntax

Use the following syntax for the "Generate off-delay" instruction:

- Data block of system data type IEC\_Timer (global DB):

#### SCL

```
<IEC_Timer_DB> TOF(IN := <Operand>,
                  PT := <Operand>,
                  Q => <Operand>,
                  ET => <Operand>)
```

- Local tag:

#### SCL

```
#myLocal_timer(IN := <Operand>,
               PT := <Operand>,
               Q => <Operand>,
               ET => <Operand>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
IN	Input	BOOL	BOOL	Start input
PT	Input	TIME	TIME, LTIME	Duration of the off delay. The value of the PT parameter must be positive.
Q	Output	BOOL	BOOL	Operand that is reset when the time PT expires.
ET	Output	TIME	TIME, LTIME	Current time value

For additional information on valid data types, refer to "See also".

### Pulse timing diagram

The following figure shows the pulse timing diagram of the instruction "Generate off-delay":

### Example

The following example shows how the instruction works:

```

SCL
"TOF_DB".TOF(IN := "Tag_Start",
             PT := "Tag_PresetTime",
             Q => "Tag_Status",
             ET => "Tag_ElapsedTime");
    
```

With a change in the signal state of the "Tag\_Start" operand from "0" to "1", the "Tag\_Status" operand is set. When the signal state of the "Tag\_Start" operand changes from "1" to "0", the time programmed for the PT parameter is started. As long as the time is running, the

"Tag\_Status" operand remains set. When the time has expired, the "Tag\_Status" operand is reset. The current time value is stored in the operand "Tag\_ElapsedTime".

### See also

Overview of the valid data types (Page 1262)

### TONR: Time accumulator

#### Description

The "Time accumulator" instruction is used to accumulate time values within a period set by the PT parameter. When the signal state of the IN parameter changes to "1", the instruction executes and the time duration PT starts. While the time duration PT is running, the time values that are recorded when the IN parameter has signal state "1" are accumulated. The accumulated time is output in the ET parameter and can be queried there. When the time duration PT is reached, the Q parameter has signal state "1". The Q parameter remains set to "1", even when the signal state at the IN parameter changes to "0".

The R parameter resets the ET and Q parameters regardless of the signal state at the IN parameter.

Each call of the "Time accumulator" instruction must be assigned to an IEC timer in which the instruction data is stored.

#### For S7-1200 CPU

An IEC Timer is a structure of the data type IEC\_TIMER or TONR\_TIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the TONR\_TIME type in the "Static" section of a block (for example, #MyTONR\_TIMER)

#### For S7-1500 CPU

An IEC timer is a structure of the data type IEC\_TIMER, IEC\_LTIMER, TONR\_TIME or TONR\_LTIME that you can declare as follows:

- Declaration of a data block of system data type IEC\_TIMER or IEC\_LTIMER (for example, "MyIEC\_TIMER")
- Declaration as a local tag of the type TONR\_TIME or TONR\_LTIME in the "Static" section of a block (for example #MyTONR\_TIMER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC timer is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

The instruction data is updated both when an instruction is called and also at each access to the Q or ET outputs.

**Syntax**

Use the following syntax for the "Time accumulator" instruction:

- Data block of system data type IEC\_Timer (global DB):

**SCL**

```
<IEC_Timer_DB> TONR(IN := <Operand>,
                    R := <Operand>,
                    PT := <Operand>,
                    Q => <Operand>,
                    ET => <Operand>)
```

- Local tag:

**SCL**

```
#myLocal_timer(IN := <Operand>,
               R := <Operand>,
               PT := <Operand>,
               Q => <Operand>,
               ET => <Operand>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
IN	Input	BOOL	BOOL	Start input
R	Input	BOOL	BOOL	Reset of the ET and Q parameters
PT	Input	TIME	TIME, LTIME	Maximum duration of time recording. The value of the PT parameter must be positive.
Q	Output	BOOL	BOOL	Operand that remains set when the timer PT has expired.
ET	Output	TIME	TIME, LTIME	Accumulated time

For additional information on valid data types, refer to "See also".

## Pulse timing diagram

The following figure shows the pulse timing diagram of the "Time accumulator" instruction:

## Example

The following example shows how the instruction works:

```
SCL
"TONR_DB".TONR(IN := "Tag_Start",
                R := "Tag_Reset",
                PT := "Tag_PresetTime",
                Q => "Tag_Status",
                ET => "Tag_Time");
```

When the signal state of the "Tag\_Start" operand changes from "0" to "1", the time programmed for the PT parameter is started. While the timer is running, the time values that are recorded at signal state "1" of the operand "Tag\_Start" is accumulated. The accumulated times is stored in the "Tag\_Time" operand. When the time value displayed at the PT parameter is reached, the "Tag\_Status" operand is set to the signal state "1". The current time value is stored in the operand "Tag\_Time".

## See also

Overview of the valid data types (Page 1262)

## RESET\_TIMER: Reset timer

### Description

You can use the "Reset timer" instruction to reset an IEC timer to "0". The structure components of the timer in the specified data block are reset to "0".

The instruction does not influence the RLO. At the TIMER parameter, the "Reset timer" instruction is assigned an IEC timer declared in the program.

The instruction data is updated only when the instruction is called and not each time the assigned IEC timer is accessed. Querying the data is only identical from the call of the instruction to the next call of the instruction.

### Syntax

Use the following syntax for the "Reset timer" instruction:

```
SCL
RESET_TIMER(TIMER := <IEC timer>)
```

### Parameters

The following table shows the parameters of the "Reset timer" instruction:

Parameter	Declaration	Data type	Description
<IEC timer>	Output	IEC_TIMER, IEC_LTIMER, TP_TIME, TP_LTIME, TON_TIME, TON_LTIME, TOF_TIME, TOF_LTIME, TONR_TIME, TONR_LTIME	IEC timer that is reset

For more information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

```
SCL
IF #started = false THEN
"TON_DB".TON(IN := "Tag_Start",
             PT := "Tag_PresetTime",
             Q => "Tag_Status",
             ET => "Tag_ElapsedTime");
#started := true;
```

**SCL**

```
END_IF;  
  
IF "TON_DB".ET < T#25s THEN  
  RESET_TIMER(TIMER := "TON_DB");  
  #started := false;  
END_IF;
```

When the tag #started has the signal state "0", the instruction "Generate on-delay" is executed when there is positive signal edge on the operand "Tag\_Start". The IEC timer stored in the instance data block "TON\_DB" is started with the time duration that is specified by the operand "Tag\_PresetTime". The operand "Tag\_Status" is set if the time duration specified by the operand "Tag\_PresetTime" has expired. The parameter Q remains set as long as the operand "Tag\_Start" still has the signal state "1". When the signal state of the start input changes from "1" to "0", the operand on the Q parameter is reset.

If the expired time of the IEC timer "TON\_DB" is less than 25s, the "Reset timer" instruction is executed and the timer stored in the "TON\_DB" instance data block is reset.

**See also**

Overview of the valid data types (Page 1262)

**PRESET\_TIMER: Load time duration****Description**

You can use the "Load time duration" instruction to set the time for an IEC timer. The instruction is executed in every cycle when the result of logic operation (RLO) at the input of the instruction has the signal state "1". The instruction writes the specified time to the structure of the specified IEC timer.

**Note**

If the specified IEC timer is running while the instruction executes, the instruction overwrites the current time of the specified IEC timer. This can change the timer status of the IEC timer.

You assign an IEC timer declared in the program to the "Load time duration" instruction.

The instruction data is updated only when the instruction is called and each time the assigned IEC timer is accessed. The query on Q or ET (for example, "MyTimer".Q or "MyTimer".ET) updates the IEC\_TIMER structure.

**Syntax**

Use the following syntax for the "Load time duration" instruction:

**SCL**

```
PRESET_TIMER(PT := <Operand>,
```

**SCL**

```
TIMER := <IEC timer>
```

**Parameter**

The following table shows the parameters of the "Load time duration" instruction:

Parameter	Declaration	Data type	Description
<Time duration>	Input	TIME, LTIME	Duration with which the IEC timer runs.
<IEC timer>	Output	IEC_TIMER, IEC_LTIMER, TP_TIME, TP_LTIME, TON_TIME, TON_LTIME, TOF_TIME, TOF_LTIME, TONR_TIME, TONR_LTIME	IEC timer whose duration of which is set.

For more information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

**SCL**

```
IF #started = false THEN
  "TON_DB".TON(IN := "Tag_Start",
               PT := "Tag_PresetTime",
               Q => "Tag_Status",
               ET => "Tag_ElapsedTime");
  #started := true;
  #preset = true
END_IF;

IF "TON_DB".ET < T#10s AND #preset = true THEN
  PRESET_TIMER(PT := T#25s,
               TIMER := "TON_DB");
  #preset := false;
END_IF;
```

When the tag #started has the signal state "0" and the operand "Tag\_Start" has a positive signal edge, the instruction "Generate on-delay" is executed. The IEC timer stored in the instance data block "TON\_DB" is started with the time duration that is specified by the operand "Tag\_PresetTime". The operand "Tag\_Status" is set if the time duration PT specified by the operand "Tag\_PresetTime" has expired. The parameter Q remains set as long as the operand "Tag\_Start" still has the signal state "1". When the signal state of the start input changes from "1" to "0", the operand on the Q parameter is reset.

The instruction "Load time duration" is executed when the expired time of the IEC timer "TON\_DB" is less than 10s and the tag #preset has the signal state "1". The instruction writes the time duration that is specified at the parameter "PT" in the instance data block "TON\_DB", thereby overwriting the time value of the operand "Tag\_PresetTime" within the instance data block. The signal state of the timer status may therefore change at the next query or when "TON\_DB".Q or "TON\_DB".ET are accessed.

## SIMATIC Timers

### S\_PULSE: Assign pulse timer parameters and start

#### Description

The "Assign pulse timer parameters and start" instruction starts the time programmed in the T\_NO parameter when a change from "0" to "1" (positive signal edge) is detected in the result of logic operation (RLO) of the S parameter. The timer runs for the programmed time (TV) as long as the signal state of the S parameter is "1".

When the signal state of the S parameter changes to "0" before the programmed time has expired, the timer is stopped and the "Q" parameter is reset to "0".

Internally, the time is made up of a time value and a time base and is programmed in the TV parameter. When the instruction starts, the programmed time value counts down to zero. The time base specifies the time increment by which the time value changes. The current time value is provided at the parameter BI.

If the timer is running and the signal state at input R changes to "1" then the current time value and the time base are also set to zero. If the timer is not running, the signal state "1" at the R input has no effect.

Parameter Q returns signal state "1" as long as the timer is running and the signal state at parameter S is "1". When the signal state of the S parameter changes to "0" before the programmed time has expired, the Q parameter returns signal state "0". If the timer is reset by parameter R or if the timer has expired then parameter Q also returns signal state "0".

The instruction data is updated with each access. It is therefore possible that the query of the data at the start of the cycle returns different values from those at the end of the cycle.

---

#### Note

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

---

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

**Syntax**

Use the following syntax for the "Assign pulse timer parameters and start" instruction:

```

SCL
S_PULSE(T_NO := <Operand>,
        S := <Operand>,
        TV := <Operand>,
        R := <Operand>,
        Q => <Operand>,
        BI => <Operand>)
    
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
T_NO	Input	TIMER, INT	The timer that is started. The number of timers depends on the CPU.
S	Input	BOOL	Start input
TV	Input	S5TIME, WORD	Preset time value
R	Input	BOOL	Reset input
Q	Output	BOOL	Status of the timer
BI	Output	WORD	Current dual-coded timer value
Function value		S5TIME	Current time value

For additional information on valid data types, refer to "See also".

## Pulse timing diagram

The following figure shows the pulse timing diagram of the "Assign pulse timer parameters and start" instruction:

## Example

The following example shows how the instruction works:

```

SCL
"Tag_Result" := S_PULSE(T_NO := "Timer_1",
                        S := "Tag_1",
                        TV := "Tag_Number",
                        R := "Tag_Reset",
                        Q := "Tag_Status",
                        BI := "Tag_Value");

```

"Timer\_1" starts when the signal state of the "Tag\_1" operand changes from "0" to "1". The timer counts down with the time value of the operand "Tag\_Number" until operand "Tag\_1" returns signal state "1".

If the signal state at the S parameter changes to "0" before the programmed time has elapsed, the "Tag\_Status" operand is reset to "0". If the timer is reset by the R parameter or if the timer has expired, the "Tag\_Status" operand also returns signal state "0".

The current time value is stored both dual-coded at the "Tag\_Value" operand and returned as a function value.

## S\_PEXT: Assign extended pulse timer parameters and start

### Description

The "Assign extended pulse timer parameters and start" instruction starts a programmed timer when a positive signal edge is detected at the S parameter. The timer runs for the programmed time (TV) even if the signal state at the S parameter changes to "0". As long as the timer runs, parameter Q returns the signal state "1".

When the timer has expired, parameter Q is reset to "0". If the signal state at the S parameter changes from "0" to "1" while the timer is running, the timer is restarted with the time programmed in the TV parameter.

Internally, the time is made up of a time value and a time base and is programmed in the TV parameter. When the instruction starts, the programmed time value counts down to zero. The time base specifies the time increment by which the time value changes. The current time value is provided at the parameter BI.

If the timer is running and the signal state at parameter R changes to "1" then the current time value and the time base are also set to zero. If the timer is not running then signal state "1" at parameter R has no effect.

The instruction data is updated with each access. It is therefore possible that the query of the data at the start of the cycle returns different values from those at the end of the cycle.

---

### Note

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

---

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

### Syntax

Use the following syntax for the "Assign extended pulse timer parameters and start" instruction:

```
SCL
S_PEXT(T_NO := <Operand>,
      S := <Operand>,
      TV := <Operand>,
      R := <Operand>,
```

**SCL**

```

Q => <Operand>,
BI => <Operand>

```

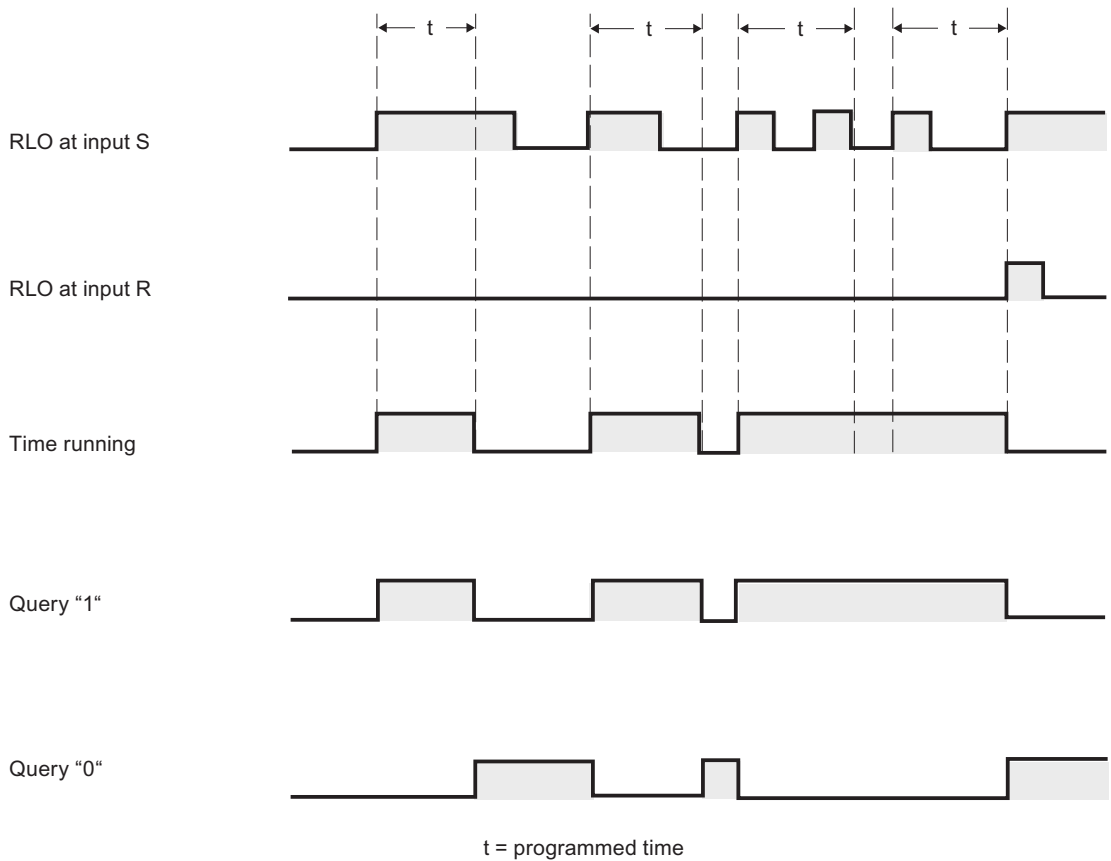

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
T_NO	Input	TIMER, INT	The timer that is started. The number of timers depends on the CPU.
S	Input	BOOL	Start input
TV	Input	S5TIME, WORD	Preset time value
R	Input	BOOL	Reset input
Q	Output	BOOL	Status of the timer
BI	Output	WORD	Current dual-coded timer value
Function value		S5TIME	Current time value

For additional information on valid data types, refer to "See also".

**Pulse timing diagram**

The following figure shows the pulse timing diagram of the "Assign extended pulse timer parameters and start" instruction:

**Example**

The following example shows how the instruction works:

```

SCL
"Tag_Result" := S_PEXT(T_NO := "Timer_1",
                      S := "Tag_1",
                      TV := "Tag_Number",
                      R := "Tag_Reset",
                      Q := "Tag_Status",
                      BI := "Tag_Value");
    
```

"Timer\_1" starts when the signal state of the "Tag\_1" operand changes from "0" to "1". As long as the timer runs, operand "Tag\_Status" returns the signal state "1". When the timer has expired, operand "Tag\_Status" is reset to "0". If the signal state at the S input changes from "0" to "1" while the timer is running, the timer is restarted with the time "Tag\_Number".

The current time value is stored both dual-coded at the "Tag\_Value" operand and returned as a function value.

## S\_ODT: Assign on-delay timer parameters and start

### Description

The "Assign on-delay timer parameters and start" instruction starts a programmed timer as on-delay when a positive signal edge is detected at the S parameter. The timer runs for the programmed time (TV) as long as the signal state of the S parameter is "1".

If the timer expires correctly and parameter S still has signal state "1" then parameter Q returns signal state "1". If the signal state at the S parameter changes from "1" to "0" while the timer is running, the timer is stopped. In this case, output Q is reset to signal state "0".

Internally, the time is made up of a time value and a time base and is programmed in the TV parameter. When the instruction starts, the programmed time value counts down to zero. The time base specifies the time increment by which the time value changes. The current time value is provided at the parameter BI.

If the time is running and the signal state at input R changes from "0" to "1" then the current time value and the time base are also set to zero. In this case, the signal state at parameter Q is "0". The timer is reset if the signal state at the R parameter is "1", even if the timer is not running and the result of logic operation (RLO) at the S parameter is "1".

The instruction data is updated with each access. It is therefore possible that the query of the data at the start of the cycle returns different values from those at the end of the cycle.

---

### Note

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

---

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

### Syntax

Use the following syntax for the "Assign on-delay timer parameters and start" instruction:

```
SCL  
S_ODT(T_NO := <Operand>,  
      S := <Operand>,  
      TV := <Operand>,  
      R := <Operand>,  
      Q => <Operand>,  
      BI => <Operand>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
T_NO	Input	TIMER, INT	The timer that is started. The number of timers depends on the CPU.
S	Input	BOOL	Start input
TV	Input	S5TIME, WORD	Preset time value
R	Input	BOOL	Reset input
Q	Output	BOOL	Status of the timer
BI	Output	WORD	Current dual-coded timer value
Function value		S5TIME	Current time value

For additional information on valid data types, refer to "See also".

### ulse timing diagram

The following figure shows the pulse timing diagram of the "Assign on-delay timer parameters and start" instruction:

### Example

The following example shows how the instruction works:

```

SCL
"Tag_Result" := S_ODT(T_NO := "Timer_1",

```

**SCL**

```
S := "Tag_1",  
TV := "Tag_Number",  
R := "Tag_Reset",  
Q := "Tag_Status",  
BI := "Tag_Value");
```

"Timer\_1" starts when the signal state of the "Tag\_1" operand changes from "0" to "1". The timer runs for the duration "Tag\_Number" as long as the signal state of operand "Tag\_1" is "1".

If the timer expires correctly and operand "Tag\_Status" has signal state "1" then operand "Tag\_Status" is reset to "1". If the signal state of the "Tag\_1" operand changes from "1" to "0" while the timer is running, the timer is stopped. In this case, operand "Tag\_Status" returns signal state "0".

The current time value is stored both dual-coded at the "Tag\_Value" operand and returned as a function value.

Overview of the valid data types (Page 1262)

**S\_ODTS: Assign retentive on-delay timer parameters and start****Description**

The "Assign retentive on-delay timer parameters and start" instruction starts a programmed timer when a positive signal edge is detected at the S parameter. The timer runs for the programmed time (TV) even if the signal state at the S parameter changes to "0".

If the timer expires, the "Q" parameter returns signal state "1" regardless of the signal state of the "S" parameter. If the signal state at the S parameter changes from "0" to "1" while the timer is running, the timer is restarted with the programmed time TV.

Internally, the time is made up of a time value and a time base and is programmed in the TV parameter. When the instruction starts, the programmed time value counts down to zero. The time base specifies the time increment by which the time value changes. The current time value is provided at the parameter BI.

Signal state "1" at parameter R resets the current time value and time base to "0", independent of the signal state at parameter S. In this case, the signal state at parameter Q is "0".

The instruction data is updated with each access. It is therefore possible that the query of the data at the start of the cycle returns different values from those at the end of the cycle.

**Note**

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

**Syntax**

Use the following syntax for the "Assign retentive on-delay timer parameters and start" instruction:

```

SCL
S_ODTS(T_NO := <Operand>,
      S := <Operand>,
      TV := <Operand>,
      R := <Operand>,
      Q => <Operand>,
      BI =><Operand>)
    
```

The syntax of the instruction consists of the following parts:

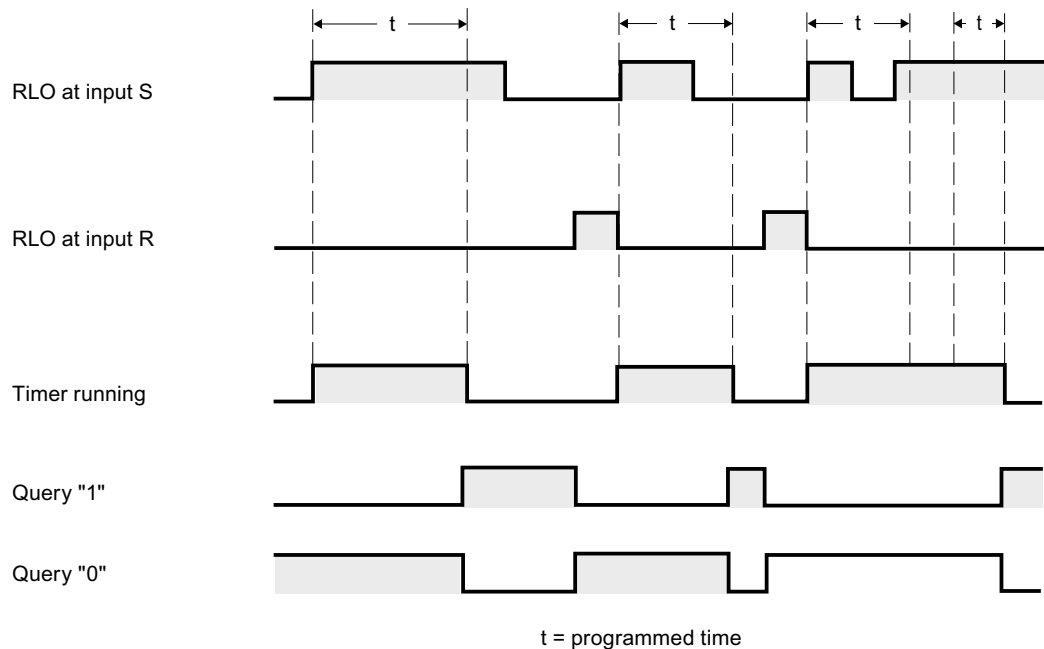

Parameter	Declaration	Data type	Description
T_NO	Input	TIMER, INT	The timer that is started. The number of timers depends on the CPU.
S	Input	BOOL	Start input
TV	Input	S5TIME, WORD	Preset time value
R	Input	BOOL	Reset input
Q	Output	BOOL	Status of the timer
BI	Output	WORD	Current dual-coded timer value
Function value		S5TIME	Current time value

For additional information on valid data types, refer to "See also".

## Pulse timing diagram

The following figure shows the pulse timing diagram of the "Assign retentive on-delay timer parameters and start" instruction:

## Example

The following example shows how the instruction works:

```
SCL
"Tag_Result" := S_ODTS(T_NO := "Timer_1",
                      S := "Tag_1",
                      TV := "Tag_Number",
                      R := "Tag_Reset",
                      Q := "Tag_Status",
                      BI := "Tag_Value");
```

"Timer\_1" starts when the signal state of the "Tag\_1" operand changes from "0" to "1". The timer runs for the duration "Tag\_Number".

If the timer expires, operand "Tag\_Status" returns signal state "1" independent of the signal state of operand "Tag\_1". If the signal state of the "Tag\_1" operand changes from "0" to "1" while the timer is running, the timer is restarted with the time "Tag\_Number".

The current time value is stored both dual-coded at the "Tag\_Value" operand and returned as a function value.

Overview of the valid data types (Page 1262)

## S\_OFFDT: Assign off-delay timer parameters and start

### Description

The "Assign off-delay timer parameters and start" instruction starts a programmed timer when a negative signal edge is detected at the S parameter. The timer runs for the programmed time (TV). As long as the timer is running or parameter S returns signal state "1", then parameter Q has signal state "1".

If the timer expires and the signal state is "0" then parameter Q is reset to signal state "0". If the signal state at parameter S changes from "0" to "1" while the timer is running, the timer is stopped. The timer is only restarted after a falling signal edge is detected at parameter S.

Internally, the time is made up of a time value and a time base and is programmed in the TV parameter. When the instruction starts, the programmed time value counts down to zero. The time base specifies the time increment by which the time value changes. The current time value is provided at the parameter BI.

Signal state "1" at parameter R resets the current time value and time base to "0". In this case, the signal state at parameter Q is "0".

The instruction data is updated with each access. It is therefore possible that the query of the data at the start of the cycle returns different values from those at the end of the cycle.

---

#### Note

In the time cell, the operating system reduces the time value in an interval specified by the time base by one unit until the value equals "0". The decrementation is performed asynchronously to the user program. The resulting timer is therefore at maximum up to one time interval shorter than the desired time base.

---

You can find an example of how a time cell can be formed under: See also "L: Load timer value".

### Syntax

Use the following syntax for the "Assign off-delay timer parameters and start" instruction:

```

SCL
S_OFFDT(T_NO := <Operand>,
        S := <Operand>,
        TV := <Operand>,
        R := <Operand>,
        Q => <Operand>,
        BI =><Operand>)
    
```

The syntax of the instruction consists of the following parts:

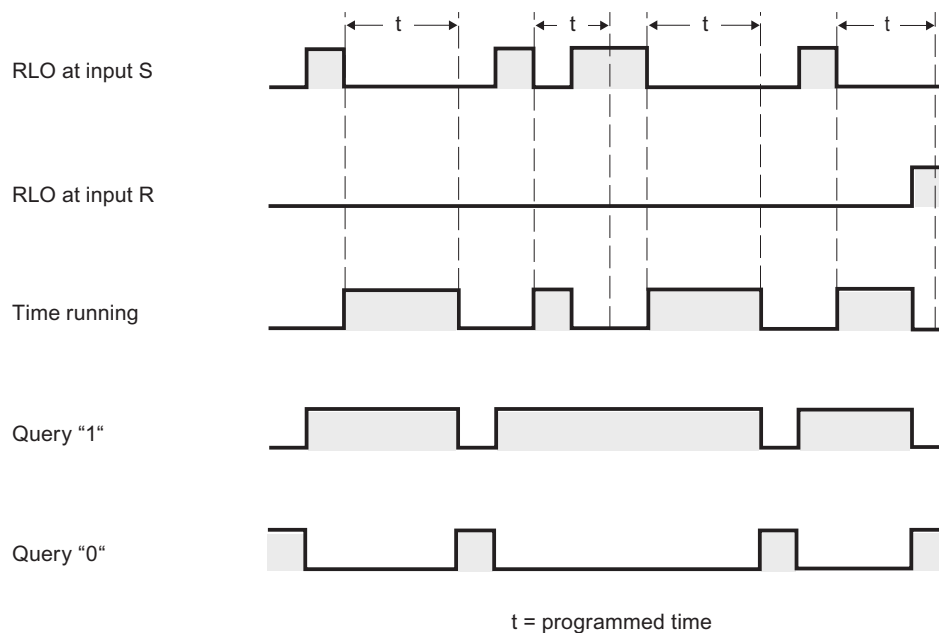

Parameter	Declaration	Data type	Description
T_NO	Input	TIMER, INT	The timer that is started. The number of timers depends on the CPU.
S	Input	BOOL	Start input

Parameter	Declaration	Data type	Description
TV	Input	S5TIME, WORD	Preset time value
R	Input	BOOL	Reset input
Q	Output	BOOL	Status of the timer
BI	Output	WORD	Current dual-coded timer value
Function value		S5TIME	Current time value

For additional information on valid data types, refer to "See also".

### Pulse timing diagram

The following figure shows the pulse timing diagram of the "Assign off-delay timer parameters and start" instruction:

### Example

The following example shows how the instruction works:

```

SCL
"Tag_Result" := S_OFFDT(T_NO := "Timer_1",
                        S := "Tag_1",
                        TV := "Tag_Number",
                        R := "Tag_Reset",
                        Q := "Tag_Status",
                        BI := "Tag_Value");

```

"Timer\_1" starts when the signal state of the "Tag\_1" operand changes from "0" to "1". The timer runs for the duration "Tag\_Number". As long as the timer is running or operand "Tag\_1" returns signal state "1", then operand "Tag\_Status" has signal state "1".

If the timer expires and the signal state of operand "Tag\_1" is "0" then operand "Tag\_Status" is reset to signal state "0". If the signal state of the "Tag\_1" operand changes from "0" to "1" while the timer is running, the timer is reset. The timer is only restarted after a falling edge is detected at parameter S.

The current time value is stored both dual-coded at the "Tag\_Value" operand and returned as a function value.

Overview of the valid data types (Page 1262)

### Counter operations

#### IEC Counters

#### CTU: Count up

#### Description

You can use the "Count up" instruction to increment the value at the CV parameter. When the signal state at the CU parameter changes from "0" to "1" (positive signal edge), the instruction is executed and the current counter value of the CV parameter is incremented by one. When the instruction is executed for the first time the current count of the CV parameter is set to zero. The counter value is incremented each time a positive signal edge is detected, until it reaches the high limit of the data type specified for the CV parameter. When the high limit is reached, the signal state of the CU parameter no longer has an effect on the instruction.

You can query the count status of the Q parameter. The signal state of the Q parameter is determined by the PV parameter. When the current counter value is greater than or equal to the value of the PV parameter, the Q parameter is set to signal state "1". In all other cases, the signal state of the Q parameter is "0". You can also specify a constant for the PV parameter.

The value of the CV parameter is reset to zero when the signal state at the R parameter changes to "1". As long as the R parameter has the signal state "1", the signal state of the CU parameter has no effect on the instruction.

---

#### Note

Only use a counter at a single location in the program to avoid counting errors.

---

Each call of the "Count up" instruction must be assigned an IEC counter in which the instruction data is stored. An IEC counter is a structure with one of the following data types:

## For S7-1200 CPU

Data block of system data type IEC_<Counter> (Shared DB)	Local tag
<ul style="list-style-type: none"> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> </ul>	<ul style="list-style-type: none"> <li>• CTU_SINT / CTU_USINT</li> <li>• CTU_INT / CTU_UINT</li> <li>• CTU_DINT / CTU_UDINT</li> </ul>

## For S7-1500 CPU

Data block of system data type IEC_<Counter> (Shared DB)	Local tag
<ul style="list-style-type: none"> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> <li>• IEC_LCOUNTER / IEC_ULCOUNTER</li> </ul>	<ul style="list-style-type: none"> <li>• CTU_SINT / CTU_USINT</li> <li>• CTU_INT / CTU_UINT</li> <li>• CTU_DINT / CTU_UDINT</li> <li>• CTU_LINT / CTU_ULINT</li> </ul>

You can declare an IEC counter as follows:

- Declaration of a data block of system data type IEC\_<Counter> (for example, "MyIEC\_COUNTER")
- Declaration as a local tag of the type CTU\_<Data type> in the "Static" section of a block (for example, #MyCTU\_COUNTER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC counter is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

When you set up the IEC counter in a separate data block (single instance), the instance data block is created by default with "optimized block access" and the individual tags are defined as retentive. For additional information on setting retentivity in an instance data block, refer to "See also".

When you set up the IEC counter as local tag (multiple instance) in a function block with "optimized block access", it is defined as retentive in the block interface.

## Syntax

The following syntax is used for the "Count up" instruction:

Table 9-28 Data block of system data type IEC\_counter (global DB)

```

SCL
<IEC_Counter_DB>.CTU(CU := <Operand>,
                    R := <Operand>,
                    PV := <Operand>,
                    Q => <Operand>,
                    CV => <Operand>)

```

Table 9-29 Local tag

**SCL**

```
#myLocal_counter(CU := <Operand>,
                 R := <Operand>,
                 PV := <Operand>,
                 Q => <Operand>,
                 CV => <Operand>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
CU	Input	BOOL	Count input
R	Input	BOOL	Reset input
PV	Input	Integers	Value at which the Q output is set
Q	Output	BOOL	Counter status
CV	Output	Integers, CHAR, DATE	Current counter value

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

**SCL**

```
"IEC_COUNTER_DB".CTU(CU := "Tag_Start",
                    R := "Tag_Reset",
                    PV := "Tag_PresetValue",
                    Q => "Tag_Status",
                    CV => "Tag_CounterValue");
```

When the signal state at the "Tag\_Start" operand changes from "0" to "1", the "Count up" instruction is executed and the current counter value of the "Tag\_CounterValue" operand is incremented by one. With each additional positive signal edge, the counter value is incremented until the high limit of the specified data type (INT = 32767) is reached.

The "Tag\_Status" output has signal state "1" as long as the current counter value is greater than or equal to the value of the "Tag\_PresetValue" operand. In all other cases, the "Tag\_Status" output has signal state "0". The current counter value is stored in the "Tag\_CounterValue" operand.

- Setting the retentivity of local tags (Page 1449)

**CTD: Count down****Description**

The "Count down" instruction is used to decrement the value at the parameter CV. When the signal state at the CD parameter changes from "0" to "1" (positive signal edge), the instruction is executed and the current counter value of the CV parameter is decremented by one. When the instruction is executed the first time, the counter value of the CV parameter is set to the value of the PV parameter. Each time a positive signal edge is detected, the counter value is decremented until it reaches the low limit of the specified data type. When the low limit is reached, the signal state of the CD parameter no longer has an effect on the instruction.

You can query the count status of the Q parameter. If the current counter value is less than or equal to zero, the Q parameter is set to signal state "1". In all other cases, the signal state of the Q parameter is "0". You can also specify a constant for the PV parameter.

The value of the CV parameter is set to the value of the PV parameter when the signal state of the LD parameter changes to "1". As long as the LD parameter has the signal state "1", the signal state of the CD parameter has no effect on the instruction.

**Note**

Only use a counter at a single location in the program to avoid counting errors.

Each call of the "Count down" instruction must be assigned an IEC counter in which the instruction data is stored. An IEC counter is a structure with one of the following data types:

**For S7-1200 CPU**

Data block of system data type IEC_<Counter> (Shared DB)	Local tag
<ul style="list-style-type: none"> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> </ul>	<ul style="list-style-type: none"> <li>• CTD_SINT / CTD_USINT</li> <li>• CTD_INT / CTD_UINT</li> <li>• CTD_DINT / CTD_UDINT</li> </ul>

**For S7-1500 CPU**

Data block of system data type IEC_<Counter> (Shared DB)	Local tag
<ul style="list-style-type: none"> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> <li>• IEC_LCOUNTER / IEC_ULCOUNTER</li> </ul>	<ul style="list-style-type: none"> <li>• CTD_SINT / CTD_USINT</li> <li>• CTD_INT / CTD_UINT</li> <li>• CTD_DINT / CTD_UDINT</li> <li>• CTD_LINT / CTD_ULINT</li> </ul>

You can declare an IEC counter as follows:

- Declaration of a data block of system data type IEC\_<Counter> (for example, "MyIEC\_COUNTER")
- Declaration as a local tag of the type CTD\_<Data type> in the "Static" section of a block (for example, #MyCTD\_COUNTER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC counter is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

When you set up the IEC counter in a separate data block (single instance), the instance data block is created by default with "optimized block access" and the individual tags are defined as retentive. For additional information on setting retentivity in an instance data block, refer to "See also".

When you set up the IEC counter as local tag (multiple instance) in a function block with "optimized block access", it is defined as retentive in the block interface.

## Syntax

The following syntax is used for the "Count down" instruction:

Table 9-30 Data block of system data type IEC\_counter (global DB)

```

SCL
<IEC_Counter_DB>.CTD(CD := <Operand>,
                    LD := <Operand>,
                    PV := <Operand>,
                    Q => <Operand>,
                    CV => <Operand>)
    
```

Table 9-31 Local tag

```

SCL
#myLocal_counter(CD := <Operand>,
                LD := <Operand>,
                PV := <Operand>,
                Q => <Operand>,
                CV => <Operand>)
    
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
CD	Input	BOOL	Count input
LD	Input	BOOL	Load input
PV	Input	Integers	Value at which the Q output is set
Q	Output	BOOL	Counter status
CV	Output	Integers, CHAR, DATE	Current counter value

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

```
SCL
"IEC_SCOUNTER_DB".CTD(CD := "Tag_Start",
                      LD := "Tag_Load",
                      PV := "Tag_PresetValue",
                      Q => "Tag_Status",
                      CV => "Tag_CounterValue");
```

When the signal state at the "Tag\_Start" changes from "0" to "1", the "Count down" instruction executes and the value of the "Tag\_CounterValue" operand is decremented by one. With each additional positive signal edge, the counter value is decremented until it reaches the low limit of the specified data type (-128).

The operand "Tag\_Status" has the signal state "1" as long as the current counter value is less than or equal to zero. In all other cases, the "Tag\_Status" output has signal state "0". The current counter value is stored in the "Tag\_CounterValue" operand.

## CTUD: Count up and down

### Description

Use the "Count up and down" instruction to increment or decrement the counter value at the CV parameter. When the signal state at the CU parameter changes from "0" to "1" (positive signal edge), the current counter value of the CV parameter is incremented by one. When the signal state at the CD parameter changes from "0" to "1" (positive signal edge), the counter value of the CV parameter is decremented by one. If there is a positive signal edge at the CU and CD inputs in a program cycle, the current counter value of the CV parameter remains unchanged.

The counter value can be incremented until it reaches the high limit of the data type specified for the CV parameter. When the high limit is reached, the counter value is no longer incremented on a positive signal edge. The counter value is no longer decremented once the low limit of the specified data type has been reached.

When the signal state at the LD parameter changes to "1", the counter value of the CV parameter is set to the value of the PV parameter. As long as the LD parameter has the signal state "1", the signal state of the CU and CD parameters has no effect on the instruction.

The counter value is set to zero when the signal state of the R parameter changes to "1". As long as the R parameter has signal state "1", a change in the signal state of the CU, CD and LD parameters has no effect on the "Count up and down" instruction.

You can query the status of the up counter at the QU parameter. When the current counter value is greater than or equal to the value of the PV parameter, the QU parameter is set to signal state "1". In all other cases, the signal state of the QU parameter is "0". You can also specify a constant for the PV parameter.

You can query the status of the down counter at the QD parameter. If the current counter value is less than or equal to zero, the QD parameter is set to signal state "1". In all other cases, the signal state of the QD parameter is "0".

**Note**

Only use a counter at a single location in the program to avoid counting errors.

Each call of the "Count up and down" instruction must be assigned an IEC counter in which the instruction data is stored. An IEC counter is a structure with one of the following data types:

**For S7-1200 CPU**

Data block of system data type IEC_<Counter> (Shared DB)	Local tag
<ul style="list-style-type: none"> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> </ul>	<ul style="list-style-type: none"> <li>• CTUD_SINT / CTUD_USINT</li> <li>• CTUD_INT / CTUD_UINT</li> <li>• CTUD_DINT / CTUD_UDINT</li> </ul>

**For S7-1500 CPU**

Data block of system data type IEC_<Counter> (Shared DB)	Local tag
<ul style="list-style-type: none"> <li>• IEC_SCOUNTER / IEC_USCOUNTER</li> <li>• IEC_COUNTER / IEC_UCOUNTER</li> <li>• IEC_DCOUNTER / IEC_UDCOUNTER</li> <li>• IEC_LCOUNTER / IEC_ULCOUNTER</li> </ul>	<ul style="list-style-type: none"> <li>• CTUD_SINT / CTUD_USINT</li> <li>• CTUD_INT / CTUD_UINT</li> <li>• CTUD_DINT / CTUD_UDINT</li> <li>• CTUD_LINT / CTUD_ULINT</li> </ul>

You can declare an IEC counter as follows:

- Declaration of a data block of system data type IEC\_<Counter> (for example, "MyIEC\_COUNTER")
- Declaration as a local tag of the type CTUD\_<Data type> in the "Static" section of a block (for example, #MyCTUD\_COUNTER)

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the IEC counter is stored in its own data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

When you set up the IEC counter in a separate data block (single instance), the instance data block is created by default with "optimized block access" and the individual tags are defined

as retentive. For additional information on setting retentivity in an instance data block, refer to "See also".

When you set up the IEC counter as local tag (multiple instance) in a function block with "optimized block access", it is defined as retentive in the block interface.

## Syntax

The following syntax is used for the "Count up and down" instruction:

Table 9-32 Data block of system data type IEC\_counter (global DB)

### SCL

```
<IEC_Counter_DB>.CTUD(CU := <Operand>,
                      CD := <Operand>,
                      R := <Operand>,
                      LD := <Operand>,
                      PV := <Operand>,
                      QU=> <Operand>,
                      QD := <Operand>,
                      CV => <Operand>)
```

Table 9-33 Local tag

### SCL

```
myLocal_counter(CU := <Operand>,
                CD := <Operand>,
                R := <Operand>,
                LD := <Operand>,
                PV := <Operand>,
                QU=> <Operand>,
                QD := <Operand>,
                CV => <Operand>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
CU	Input	BOOL	Count up input
CD	Input	BOOL	Count down input
R	Input	BOOL	Reset input
LD	Input	BOOL	Load input
PV	Input	Integers	Value at which the QU output is set.
QU	Output	BOOL	Status of the up counter
QD	Output	BOOL	Status of the down counter
CV	Output	Integers, CHAR, DATE	Current counter value

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

```
SCL  
"IEC_COUNTER_DB".CTUD(CU := "Tag_Start1",  
                      CD := "Tag_Start2",  
                      LD := "Tag_Load",  
                      R := "Tag_Reset",  
                      PV := "Tag_PresetValue",  
                      QU => "Tag_CU_Status",  
                      QD => "Tag_CD_Status",  
                      CV => "Tag_CounterValue");
```

If the "Tag\_Start1" operand has a positive signal edge in the signal state, the current counter value is incremented by one and stored in the "Tag\_CounterValue" operand. If the "Tag\_Start2" operand has a positive signal edge in the signal state, the counter value is decremented by one and is also stored in the "Tag\_CounterValue" operand. The counter value is incremented on the positive signal edge of the CU parameter until it reaches the high limit of the specified data type (INT). If the CD parameter has a positive signal edge, the counter value is decremented until it reaches the low limit of the specified data type (INT).

The operand "Tag\_CU\_Status" has the signal state "1" as long as the current counter value is greater than or equal to the value of the operand "Tag\_PresetValue". In all other cases, the "Tag\_CU\_Status" output has signal state "0".

The operand "Tag\_CD\_Status" has the signal state "1" as long as the current counter value is less than or equal to zero. In all other cases, the "Tag\_CD\_Status" output has signal state "0".

## SIMATIC Counters

### S\_CU: Assign parameters and count up

#### Description

You can use the "Assign parameters and count up" instruction to increment the value of a counter. When the signal state of the parameter CU changes from "0" to "1" (positive signal edge), the current counter value is incremented by one. The current counter value is provided at the parameter CV. The counter value is incremented until the limit of "999" is reached. When the limit value is reached, the counter value is no longer incremented on a positive signal edge.

When the signal state of the parameter S changes from "0" to "1", the counter value is set to the value of the parameter PV. If the counter is set and if the result of logic operation (RLO) at the CU input is "1", the counter counts once in the next cycle, even when no signal edge change is detected.

The counter value is set to zero when the signal state of the parameter R changes to "1". As long as the parameter R has the signal state "1", a change in the signal state of the parameters CU and S has no effect on the counter value.

The signal state at parameter Q is "1" if the counter value is greater than zero. When the counter value equals zero, parameter Q returns signal state "0".

---

#### Note

Only use a counter at a single point in the program to avoid the risk of counting errors.

---

## Syntax

The following syntax is used for the "Assign parameters and count up" instruction:

#### SCL

```
S_CU(C_NO := <Operand>,
      CU:= <Operand>,
      S := <Operand>,
      PV := <Operand>,
      R := <Operand>,
      Q => <Operand>,
      CV=> <Operand>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
C_NO	Input	COUNTER, INT	Counters The number of counters depends on the CPU.
CU	Input	BOOL	Count up input
S	Input	BOOL	Input for presetting the counter
PV	Input	WORD	Preset counter value (C#0 to C#999) in BCD format
R	Input	BOOL	Reset input
Q	Output	BOOL	Status of the counter
CV	Output	WORD, S5TIME, DATE	Current counter value
Function value		WORD, S5TIME, DATE	Current counter value in BCD format

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

```
SCL  
"Tag_Result" := S_CU(C_NO := "Counter_1",  
                    CU := "Tag_Start",  
                    S := "Tag_1",  
                    PV := "Tag_PresetValue",  
                    R := "Tag_Reset",  
                    Q => "Tag_Status",  
                    CV => "Tag_Value");
```

If the signal state of the "Tag\_Start" parameter changes from "0" to "1" (positive signal edge) and the current counter value is less than "999", the counter value is incremented by one. If the signal state of the input "Tag\_1" changes from "0" to "1", the counter value in BCD format is set to the value of the operand "Tag\_PresetValue". The counter value is reset to "0" when the operand "Tag\_Reset" has signal state "1".

The current counter value is stored in hexadecimal form in the operand "Tag\_Value".

The output "Tag\_Status" has the signal state "1" as long as the current counter value is not equal to "0". The current counter value is returned in the "Tag\_Value" operand and as a function value.

## See also

Overview of the valid data types (Page 1262)

## S\_CD: Assign parameters and count down

### Description

You can use the "Assign parameters and count down" instruction to decrement the value of a counter. When the signal state of the parameter CD changes from "0" to "1" (positive signal edge), the current counter value is decreased by one. The current counter value is provided at the parameter CV. The counter value is decreased until the low limit of "0" is reached. When the low limit value is reached, the counter value is no longer decreased on a positive signal edge.

When the signal state of the parameter S changes from "0" to "1", the counter value is set to the value of the parameter PV. If the counter is set and if the result of logic operation (RLO) at the parameter CD is "1", the counter counts once in the next cycle, even when no signal edge change is detected.

The counter value is set to zero when the signal state of the parameter R changes to "1". As long as the parameter R has the signal state "1", a change in the signal state of the parameters CD and S has no effect on the counter value.

The signal state at parameter Q is "1" if the counter value is greater than zero. When the counter value equals zero, parameter Q returns signal state "0".

### Note

Only use a counter at a single location in the program to avoid risk of counting errors.

## Syntax

The following syntax is used for the "Assign parameters and count down" instruction:

```
SCL
S_CD(C_NO:= <Operand>,
      CD:= <Operand>,
      S:= <Operand>,
      PV:= <Operand>,
      R:= <Operand>,
      Q=> <Operand>,
      CV=> <Operand>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
C_NO	Input	COUNTER, INT	Counters The number of counters depends on the CPU.
CD	Input	BOOL	Count down input
S	Input	BOOL	Input for presetting the counter
PV	Input	WORD	Preset counter value (C#0 to C#999) in BCD format
R	Input	BOOL	Reset input
Q	Output	BOOL	Status of the counter
CV	Output	WORD, S5TIME, WORD	Current counter value
Function value		WORD, S5TIME, DATE	Current counter value in BCD format

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

```
SCL
"Tag_Result" := S_CD(C_NO := "Counter_1",
```

```

SCL
    CD := "Tag_Start",
    S := "Tag_1",
    PV := "Tag_PresetValue",
    R := "Tag_Reset",
    Q => "Tag_Status",
    CV => "Tag_Value");

```

When the signal state of the operand "Tag\_Start" changes from "0" to "1" (positive signal edge) and the current counter value is greater than "0", the counter value is decreased by one. If the signal state of the operand "Tag\_1" changes from "0" to "1", the counter value is set to the value of the operand "Tag\_PresetValue". The counter value is reset to "0" when the operand "Tag\_Reset" has signal state "1".

The current counter value is stored in the operand "Tag\_Value".

The operand "Tag\_Status" returns signal state "1" as long as the current counter value is not equal to "0". The current counter value is returned in the "Tag\_Value" operand and as a function value.

**See also**

Overview of the valid data types (Page 1262)

**S\_CUD: Assign parameters and count up / down**

**Description**

You can use the "Assign parameters and count up / down" instruction to increment and decrement the value of a counter. When the signal state of the parameter CU changes from "0" to "1" (positive signal edge), the current counter value is incremented by one. When the signal state of the parameter CD changes from "0" to "1" (positive signal edge), the counter value is decreased by one. The current counter value is provided at the parameter CV. If there is a positive signal edge at the parameters CU and CD in one program cycle, the counter value remains unchanged.

The counter value is incremented until the high limit value of "999" is reached. When the high limit value is reached, the counter value is no longer incremented on a positive signal edge. When the low limit value "0" is reached, the counter value is not decremented any further.

When the signal state of the parameter S changes from "0" to "1", the counter value is set to the value of the parameter PV. If the counter is set and if the result of logic operation (RLO) of the parameters CU and CD is "1", the counter will count once in the next cycle, even if no signal edge change was detected.

The counter value is set to zero when the signal state of the parameter R changes to "1". As long as the parameter R has the signal state "1", processing of the signal state of the parameters CU, CD and S has no effect on the counter value.

The signal state at parameter Q is "1" if the counter value is greater than zero. When the counter value equals zero, parameter Q returns signal state "0".

#### Note

Only use a counter at a single location in the program to avoid risk of counting errors.

## Syntax

The following syntax is used for the "Assign parameters and count up / down" instruction:

```

SCL
S_CUD(C_NO:= <Operand>,
      CU:= <Operand>,
      CD:= <Operand>,
      S:= <Operand>,
      PV:= <Operand>,
      R:= <Operand>,
      Q=> <Operand>,
      CV=> <Operand>)

```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
C_NO	Input	COUNTER, INT	Counters The number of counters depends on the CPU.
CU	Input	BOOL	Count up input
CD	Input	BOOL	Count down input
S	Input	BOOL	Input for presetting the counter
PV	Input	WORD	Preset counter value (C#0 to C#999) in BCD format
R	Input	BOOL	Reset input
Q	Output	BOOL	Status of the counter
CV	Output	WORD, S5TIME, DATE	Current counter value (hexadecimal)
Function value		WORD, S5TIME, DATE	Current counter value in BCD format

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

```
SCL
"Tag_Result" := S_CD(C_NO := "Counter_1",
                    CU := "Tag_CU",
                    CD := "Tag_CD",
                    S := "Tag_1",
                    PV := "Tag_PresetValue",
                    R := "Tag_Reset",
                    Q => "Tag_Status",
                    CV => "Tag_Value");
```

When a positive signal edge is detected in the signal state of the operand "Tag\_CU" and the current counter value is less than "999", the counter value is incremented by one. When a positive signal edge is detected in the signal state of the operand "Tag\_CD" and the current counter value is greater than "0", the counter value is decremented by one.

If the signal state of the operand "Tag\_1" changes from "0" to "1", the counter value is set to the value of the operand "Tag\_PresetValue". The counter value is reset to "0" when the operand "Tag\_Reset" has signal state "1".

The current counter value is stored in the operand "Tag\_Value".

The operand "Tag\_Status" returns signal state "1" as long as the current counter value is not equal to "0". The current counter value is returned in the "Tag\_Value" operand and as a function value.

## Comparator operations

### TypeOf: Query data type of a VARIANT tag

#### Description

You can use the "Check data type of a VARIANT tag" instruction to query the data type of a tag to which a VARIANT tag is pointing. You compare the data type of the tag to the data type of a tag that you have declared in the block interface to determine whether they are "Equal" or "Not equal".

The operand must have the VARIANT data type. The comparison operand can be an elementary data type or a PLC data type.

You can only use the "Check data type of a VARIANT tag" instruction within an IF instruction.

## Syntax

The following syntax is used for the "Check data type of a VARIANT tag" instruction:

```
SCL
  TypeOf (<Operand>)
```

## Parameters

The following table shows the parameters of the "Check data type of a VARIANT tag" instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	VARIANT	First operand

For additional information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

```
SCL
  IF TypeOf (#TagVARIANT) = TypeOf ("TagBOOL") THEN
  ...;
  END_IF;
```

If the operand to which the VARIANT "#TagVARIANT" is pointing has the BOOL data type, a specific command is to be executed.

## See also

Overview of the valid data types (Page 1262)

## TypeOfElements: Check element data type of a VARIANT tag

### Description

You can use the "Check element data type of a VARIANT tag" instruction to query the data type of a tag to which a VARIANT is pointing. You compare the data type of the tag to the data type of a tag that you have declared in the block interface to determine whether they are "Equal" or "Not equal".

The operand must have the VARIANT data type. The comparison operand can be an elementary data type or a PLC data type.

If the data type of the VARIANT tag is an ARRAY, the data type of the ARRAY elements is compared.

You can only use the "Check element data type of a VARIANT tag" instruction within an IF instruction.

### Syntax

The following syntax is used for the "Check element data type of a VARIANT tag" instruction:

```
SCL
TypeOfElements (<Operand>)
```

### Parameter

The following table shows the parameters of the "Check element data type of a VARIANT tag" instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	VARIANT	First operand

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

```
SCL
IF TypeOfElements (#Tag_VARIANT) = TypeOf ("GlobalDB".Product[1]) THEN
"Tag_Result" := "GlobalDB".Product[1] * 3;
END_IF;
```

The following table shows how the instruction works using specific operand values:

Operand	Value
#Tag_VARIANT	1.5
"GlobalDB".Product[1]	3.5

If the tag to which the VARIANT points and the ""GlobalDB".Product[1]" operand have the REAL data type, the "GlobalDB".Product[1]" operand is then multiplied by 3 and the result is written to the "Tag\_Result" operand.

### See also

Overview of the valid data types (Page 1262)

## IS\_ARRAY: Check for ARRAY

### Description

You can use the "Check for ARRAY" instruction to query whether the VARIANT points to a tag of the ARRAY data type.

The <Operand> must have the VARIANT data type.

You can only use the "Check for ARRAY" instruction within an IF instruction.

### Syntax

The following syntax is used for the "Check for ARRAY" instruction:

#### SCL

```
IS_ARRAY (<Operand>)
```

### Parameter

The following table shows the parameters of the "Check for ARRAY" instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	VARIANT	Operand that is queried for ARRAY
Function value		UDINT	Result of the instruction

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

#### SCL

```
IF IS_ARRAY(#Tag_VARIANTToArray) THEN
  "Tag_Result" := CountOfElements(#Tag_VARIANT);
END_IF;
```

If the tag to which the VARIANT points is an ARRAY, the number of ARRAY elements is output.

Overview of the valid data types (Page 1262)

**Math functions**

**ABS: Form absolute value**

**Description**

Use the "Form absolute value" instruction to calculate the absolute value of an input value and to save the result in the specified operands.

**Syntax**

Use the following syntax for the "Form absolute value" instruction:

```
SCL
ABS (<Expression>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
<Expression>	Input	SINT, INT, DINT, floating-point numbers	SINT, INT, DINT, LINT, floating-point numbers	Input value
Function value		SINT, INT, DINT, floating-point numbers	SINT, INT, DINT, LINT, floating-point numbers	Absolute value of the input value

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

```
SCL
"Tag_Result1" := ABS("Tag_Value");
"Tag_Result2" := ABS("Tag_Value1"*"Tag_Value2");
```

The absolute value of the input value is returned in the format of the input value as a function value.

The following table shows how the instruction works using specific operand values:

Operand	Value
Tag_Value	-2
Tag_Result1	2
Tag_Value1	4

Operand	Value
Tag_Value2	-1
Tag_Result2	4

## MIN: Get minimum

### Description

The "Get minimum" instruction compares the values of the available inputs and returns the lowest value as the result.

A minimum of two and a maximum of 32 inputs can be specified at the instruction.

The result is invalid if any of the following conditions are met:

- The implicit conversion of the data types fails during execution of the instruction.
- A floating-point number has an invalid value.

### Syntax

The following syntax is used for the "Get minimum" instruction:

```
SCL  
MIN (IN1 := <Operand>,  
      IN2 := <Operand>)
```

**Parameter**

The following table shows the parameters of the "Get minimum" instruction:

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
IN1	Input	Integers, floating-point numbers, TIME, TOD, DATE, DTL	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT, DT, DTL	First input value
IN2	Input	Integers, floating-point numbers, TIME, TOD, DATE, DTL	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT, DT, DTL	Second input value
INn	Input	Integers, floating-point numbers, TIME, TOD, DATE, DTL	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT, DT, DTL	Additionally inserted inputs whose values are to be compared
Function value		Integers, floating-point numbers, TIME, TOD, DATE, DTL	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT, DT, DTL	Result of the instruction
The data types TOD, LTOD, DATE, and LDT can only be used if the IEC test is not enabled.				

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

```

SCL
"Tag_Result" := MIN(IN1 := "Tag_Value1",
                    IN2 := "Tag_Value2",
                    IN3 := "Tag_Value3");
    
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN1	Tag_Value1	12222
IN2	Tag_Value2	14444
IN3	Tag_Value3	13333
Function value	Tag_Result	12222

The instruction compares the values of the available inputs and copies the lowest value ("Tag\_Value1") to operand "Tag\_Result".

Overview of the valid data types (Page 1262)

Expressions (Page 1538)

Operators and operator precedence (Page 1544)

### MAX: Get maximum

#### Description

The "Get maximum" instruction compares the values of the available inputs and returns the greatest value as the result.

A minimum of two and a maximum of 32 inputs can be specified at the instruction.

The result is invalid if any of the following conditions are met:

- The implicit conversion of the data types fails during execution of the instruction.
- A floating-point number has an invalid value.

#### Syntax

The following syntax is used for the "Get maximum" instruction:

```
SCL  
MAX (IN1 := <Operand>,  
      IN2 := <Operand>)
```

**Parameters**

The following table shows the parameters of the "Get maximum" instruction:

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
IN1	Input	Integers, floating-point numbers, TIME, TOD, DATE, DTL	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT, DT, DTL	First input value
IN2	Input	Integers, floating-point numbers, TIME, TOD, DATE, DTL	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT, DT, DTL	Second input value
INn	Input	Integers, floating-point numbers, TIME, TOD, DATE, DTL	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT, DT, DTL	Additionally inserted inputs whose values are to be compared
Function value		Integers, floating-point numbers, TIME, TOD, DATE, DTL	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT, DT, DTL	Result of the instruction
The data types TOD, LTOD, DATE, and LDT can only be used if the IEC test is not enabled.				

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

```

SCL
"Tag_Result" := MAX(IN1 := "Tag_Value1",
                   IN2 := "Tag_Value2",
                   IN3 := "Tag_Value3");
    
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN1	Tag_Value1	12 222
IN2	Tag_Value2	14 444
IN3	Tag_Value3	13 333
Function value	Tag_Result	14 444

The instruction compares the values of the specified operands and copies the greatest value ("Tag\_Value2") to the operand "Tag\_Result".

Operators and operator precedence (Page 1544)

### LIMIT: Set limit value

#### Description

The "Set limit value" instruction limits the value of the parameter IN to the values of the parameters MN and MX. The value of the parameter MN may not be greater than the value of the parameter MX.

If the value of the IN parameter fulfills the MN condition  $\leq \text{IN} \leq \text{MX}$ , it is returned as the result of the instruction. If the condition is not fulfilled and the IN input value is less than the MN low limit, the value of the MN parameter is returned as the result. If the high limit MX is exceeded, the value of the MX parameter is returned as the result.

If the value of the MN input is greater than the value of the MX input, the result is undefined.

The instruction is only executed if the operands of all parameters are of the same data type.

#### Syntax

The following syntax is used for the "Set limit value" instruction:

```
SCL  
LIMIT (MN := <Operand>,  
       IN := <Operand>,  
       MX := <Operand>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
MN	Input	Integers, floating-point numbers, TIME, TOD, DATE, DTL	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT, DT, DTL	Low limit
IN	Input	Integers, floating-point numbers, TIME, TOD, DATE, DTL	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT, DT, DTL	Input value
MX	Input	Integers, floating-point numbers, TIME, TOD, DATE, DTL	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT, DT, DTL	High limit
Function value		Integers, floating-point numbers, TIME, TOD, DATE, DTL	Integers, floating-point numbers, TIME, LTIME, TOD, LTOD, DATE, LDT, DT, DTL	Result of the instruction

The data types TOD, LTOD, DATE, and LDT can only be used if the IEC test is not enabled.

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

```

SCL
"Tag_Result" := LIMIT(MN := "Tag_Minimum",
                     IN := "Tag_Value",
                     MX := "Tag_Maximum");
    
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
MN	Tag_Minimum	12 000
IN	Tag_Value	8 000
MX	Tag_Maximum	16 000
Function value	Tag_Result	12 000

The value of operand "Tag\_Value" is compared with the values of operands "Tag\_Minimum" and "Tag\_Maximum". Because the value of the operand "Tag\_Value" is less than the low limit value, the value of operand "Tag\_Minimum" will be copied to operand "Tag\_Result".

**SQR: Form square****Description**

Use the "Form square" instruction to square the input value and save the result in the specified operand.

**Syntax**

Use the following syntax for the instruction "Form square":

<b>SCL</b>
SQR(<Expression>)

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
<Expression>	Input	Floating-point numbers	Input value
Function value		Floating-point numbers	Square of the input value

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

<b>SCL</b>
"Tag_Result1" := SQR("Tag_Value");
"Tag_Result2" := SQR((SQR("Tag_Value1"))*"Tag_Value2");

The square of the input value is returned in the operand "Tag\_Result" as a function value.

The following table shows how the instruction works using specific operand values:

Operand	Value
Tag_Value	2.5
Tag_Result1	6.25
Tag_Value1	6.0
Tag_Value2	2.0
Tag_Result2	5184.0

**See also**

- Overview of the valid data types (Page 1262)

- Operators and operator precedence (Page 1544)

**SQRT: Form square root**

**Description**

Use the "Form square root" instruction to calculate the square root of the the input value and save the result in the specified operand. The instruction has a positive result if the input value is greater than zero. If input values are less than zero, the instruction returns an invalid floating-point number. If the input value is "-0", the result is also "-0".

**Syntax**

Use the following syntax for the "Form square root" instruction:

```
SCL
SQRT(<Expression>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
<Expression>	Input	Floating-point numbers	Input value
Function value		Floating-point numbers	Square root of the input value

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

```
SCL
"Tag_Result1" := SQRT("Tag_Value");
"Tag_Result2" := SQRT((SQR("Tag_Value1"))+"Tag_Value2");
```

The square root of the input value is returned in the operand "Tag\_Result" as a function value. The following table shows how the instruction works using specific operand values:

Operand	Value
Tag_Value	4.0
Tag_Result1	2.0
Tag_Value1	3.0

Operand	Value
Tag_Value2	16.0
Tag_Result2	5.0

## LN: Form natural logarithm

### Description

You can use the "Form natural logarithm" instruction to calculate the natural logarithm to base e ( $e=2.718282$ ) of the input value. The instruction has a positive result if the input value is greater than zero. If input values are less than zero, the instruction returns an invalid floating-point number.

### Syntax

Use the following syntax for the "Form natural logarithm" instruction:

```
SCL
LN(<Expression>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
<Expression>	Input	Floating-point numbers	Input value
Function value		Floating-point numbers	Natural logarithm of the input value

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

```
SCL
"Tag_Result1" := LN("Tag_Value");
"Tag_Result2" := LN("Tag_Value1"+"Tag_Value2");
```

The result of the instruction is returned in the operand "Tag\_Result" as a function value.

The following table shows how the instruction works using specific operand values:

Operand	Value
Tag_Value	2.5
Tag_Result1	0.916
Tag_Value1	1.5
Tag_Value2	3.2
Tag_Result2	1.548

**See also**

**EXP: Form exponential value**

**Description**

The "Form exponential value" instruction calculates the exponent from the base e (e = 2.718282) and the input value and saves the result in the specified operand.

**Syntax**

The following syntax is used for the "Form exponential value" instruction:

```

SCL
EXP (<Expression>)
    
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
<Expression>	Input	Floating-point numbers	Input value
Function value		Floating-point numbers	Exponential value of the input value

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

```

SCL
"Tag_Result1" := EXP("Tag_Value");
"Tag_Result2" := EXP("Tag_Value1"/"Tag_Value2");
    
```

The result of the instruction is returned in the operand "Tag\_Result" as a function value.

The following table shows how the instruction works using specific operand values:

Operand	Value
Tag_Value	20.5
Tag_Result1	799 902 200
Tag_Value1	15.5
Tag_Value2	30.2
Tag_Result2	1.671

## SIN: Form sine value

### Description

Use the "Form sine value" instruction to calculate the sine of the input value. The input value must be given in the radian measure.

### Syntax

Use the following syntax for the "Form sine value" instruction:

```
SCL
SIN(<Expression>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
<Expression>	Input	Floating-point numbers	Input value (size of an angle in the radian measure)
Function value		Floating-point numbers	Result of the instruction

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

```
SCL
"Tag_Result" := SIN("Tag_Value");
```

The result of the instruction is returned in the "Tag\_Result" operand as a function value.

The following table shows how the instruction works using specific operand values:

Operand	Value
Tag_Value	+1.570796 ( $\pi/2$ )
Tag_Result	1.0

**See also**

**COS: Form cosine value**

**Description**

Use the "Form cosine value" instruction to calculate the cosine of the input value. The input value must be given in the radian measure.

**Syntax**

Use the following syntax for the "Form cosine value" instruction:

```
SCL
COS(<Expression>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
<Expression>	Input	Floating-point numbers	Input value (size of an angle in the radian measure)
Function value		Floating-point numbers	Result of the instruction

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

```
SCL
"Tag_Result" := COS("Tag_Value");
```

The result of the instruction is returned in the operand "Tag\_Result" as a function value.

The following table shows how the instruction works using specific operand values:

Operand	Value
Tag_Value	+1.570796 ( $\pi/2$ )
Tag_Result	0

## See also

## TAN: Form tangent value

### Description

Use the "Form tangent value" instruction to calculate the sine of the input value. The input value must be given in the radian measure.

### Syntax

Use the following syntax for the "Form tangent value" instruction:

SCL
TAN(<Expression>)

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
<Expression>	Input	Floating-point numbers	Input value (size of an angle in the radian measure)
Function value		Floating-point numbers	Result of the instruction

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

SCL
"Tag_Result" := TAN("Tag_Value");

The result of the instruction is returned in the operand "Tag\_Result" as a function value.

The following table shows how the instruction works using specific operand values:

Operand	Value
Tag_Value	+3.141593 ( $\pi$ )
Tag_Result	0

**See also**

**ASIN: Form arcsine value**

**Description**

You can use the "Form arcsine value" instruction to calculate the size of the angle from a sine value, which corresponds to this value. Only valid floating-point numbers within the range -1 to +1 can be specified as input values. The calculated angle size is given in the radian measure and can range in value from  $-\pi/2$  to  $+\pi/2$ .

**Syntax**

Use the following syntax for the "Form arcsine value" instruction:

```

scl
ASIN(<Expression>)
    
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
<Expression>	Input	Floating-point numbers	Sine value
Function value		Floating-point numbers	Size of angle in the radian measure

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

```

scl
"Tag_Result" := ASIN("Tag_Value");
    
```

The result of the instruction is returned in the operand "Tag\_Result" as a function value.

The following table shows how the instruction works using specific operand values:

Operand	Value
Tag_Value	1.0
Tag_Result	+1.570796 ( $\pi/2$ )

## See also

Overview of the valid data types (Page 1262)

Expressions (Page 1538)

Operators and operator precedence (Page 1544)

## ACOS: Form arccosine value

### Description

You can use the "Form arccosine value" instruction to calculate the size of the angle from a cosine value, which corresponds to this value. Only valid floating-point numbers within the range -1 to +1 can be specified as input values. The calculated angle size is given in the radian measure and can range in value from 0 to  $+\pi$ .

### Syntax

Use the following syntax for the "Form arccosine value" instruction:

SCL
ACOS (<Expression>)

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
<Expression>	Input	Floating-point numbers	Cosine value
Function value		Floating-point numbers	Size of angle in the radian measure

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

SCL
"Tag_Result" := ACOS("Tag_Value");

The result of the instruction is returned in the "Tag\_Result" operand as a function value.

The following table shows how the instruction works using specific operand values:

Operand	Value
Tag_Value	0
Tag_Result	+1.570796 ( $\pi/2$ )

**See also**

- Overview of the valid data types (Page 1262)
- Expressions (Page 1538)

**ATAN: Form arctangent value**

**Description**

You can use the "Form arctangent value" instruction to calculate the size of the angle from a tangent value, which corresponds to this value. Only valid floating-point numbers may be specified as input values. The calculated angle size is given in the radian measure and can range in value from  $-\pi/2$  to  $+\pi/2$ .

**Syntax**

Use the following syntax for the "Form arctangent value" instruction:

```

scl
-----
ATAN (<Expression>)
    
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
<Expression>	Input	Floating-point numbers	Tangent value
Function value		Floating-point numbers	Size of angle in the radian measure

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

```

scl
-----
"Tag_Result" := ATAN("Tag_Value");
    
```

The result of the instruction is returned in the operand "Tag\_Result" as a function value.

The following table shows how the instruction works using specific operand values:

Operand	Value
Tag_Value	1.0
Tag_Result	+0.785398 ( $\pi/4$ )

## See also

Operators and operator precedence (Page 1544)

## FRAC: Return fraction

### Description

The result of the instruction "Return fraction" returns the decimal places of a value. Input value 123.4567, for example, returns the value 0.4567.

### Syntax

The following syntax is used for the instruction "Return fraction":

SCL
FRAC (<Expression>)
FRAC_<Data type> (<Expression>)

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type	Description
<Expression>	Input	Floating-point numbers	Input value
_<Data type>		Floating-point numbers Default: REAL	Data type of the function value: <ul style="list-style-type: none"> <li>You do not need to specify the data type if using the default.</li> <li>Any other valid data type you may use must be declared explicitly.</li> </ul>
Function value		Floating-point numbers	Decimal places of the input value

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

```
SCL
"Tag_Result1" := FRAC("Tag_Value");
"Tag_Result2" := FRAC_LREAL("Tag_Value");
```

The following table shows how the instruction works using specific operand values:

Operand	Value	
Tag_Value	2.555	-1.4421
Tag_Result1	0.555	-0.4421

### See also

- Overview of the valid data types (Page 1262)
- Expressions (Page 1538)
- Operators and operator precedence (Page 1544)

### Move operations

#### Deserialize: Deserialization

#### Description

You can use the "Deserialize" instruction to convert the sequential representation of a PLC data type (UDT) back to a PLC data type and to fill its entire contents.

The memory area in which the sequential representation of a PLC data type is located must have the ARRAY of BYTE data type and be declared with standard access. Make sure that there is enough memory space prior to the conversion.

The instruction enables you to convert multiple sequential representations of converted PLC data types back to their original state step-by-step.

---

#### Note

If you only want to convert back a single sequential representation of a PLC data type (UDT), you can also use the instruction "TRCV: Receive data via communication connection" directly.

---

## Syntax

The following syntax is used for the "Deserialize" instruction:

### SCL

```
Deserialize(SRC_ARRAY := <Operand>,
           DEST_VARIABLE:= <Operand>,
           POS := <Operand>)
```

## Parameter

The following table shows the parameters of the "Deserialize" instruction:

Parameter	Declaration	Data type	Description
SRC_ARRAY	Input	VARIANT	Global data block in which the generated data stream is stored
DEST_VARIABLE	InOut	VARIANT	Tag in which the returned converted PLC data type (UDT) is stored
POS	InOut	DINT	Number of bytes that the converted PLC data types use. The POS parameter is calculated zero-based.
Function value		INT	Error information

For additional information on valid data types, refer to "See also".

## RET\_VAL parameter

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
80B0	The memory areas for the SRC_ARRAY and DEST_VARIABLE parameters overlap.
8136	The data block at the DEST_VARIABLE parameter is not a block with standard access.
8150	The VARIANT data type at the SRC_ARRAY parameter contains no value.
8151	Code generation error at SRC_ARRAY parameter
8153	There is not enough free memory available at the SRC_ARRAY parameter.
8250	The VARIANT data type at the DEST_VARIABLE parameter contains no value.
8251	Code generation error at DEST_VARIABLE parameter
8254	Invalid data type at the DEST_VARIABLE parameter
8382	The value at the POS parameter is outside the limits of the array.
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

**Example**

The following example shows how the instruction works:

**SCL**

```
#Tag_RetVal := Deserialize(SRC_ARRAY := "Buffer".Field,
                          DEST_VARIABLE := "Target".Client,
                          POS := #BufferPos);

#Tag_RetVal := Deserialize(SRC_ARRAY := "Buffer".Field,
                          DEST_VARIABLE := #Label,
                          POS := #BufferPos);

IF #Label = 'arti' THEN
#Tag_RetVal := Deserialize(SRC_ARRAY := "Buffer".Field,
                          DEST_VARIABLE := "Target".Article[#DeliverPos],
                          POS := #BufferPos);
ELSIF #Label = 'Bill' THEN
#Tag_RetVal := Deserialize(SRC_ARRAY := "Buffer".Field,
                          DEST_VARIABLE := "Target".Bill[#DeliverPos],
                          POS := #BufferPos);

;
ELSE
;
END_IF;
```

The "Move value" instruction moves the value "0" to the "#BufferPos" operand. The "Deserialize" instruction deserializes the sequential representation of the customer data from the "Buffer" data block and writes it to the "Target" data block. The number of bytes used by the converted customer data is stored in the "#BufferPos" operand.

The "Deserialize" instruction deserializes the sequential representation of the separator sheet, which was saved with the sequential representation after the customer data, from the "Buffer" data block and writes the characters to the "#Label" operand. The characters are compared using comparison instructions for "arti" and "Bill". If the comparison for "arti" = TRUE, these are article data that have been deserialized and written to the "Target" data block. If the comparison for "Bill" = TRUE, these are billing data that have been deserialized and written to the "Target" data block.

The following table shows the declaration of the operands:

Operand	Data type	Declaration
DeliverPos	INT	In the "Input" section of the block interface
BufferPos	DINT	In the "Temp" section of the block interface
Error	INT	In the "Temp" section of the block interface
Label	STRING[4]	In the "Temp" section of the block interface

The following table lists the declarations of the PLC data types:

Name of the PLC data types	Name	Data type
Article	Number	DINT
	Declaration	STRING
	Colli	INT
Client	Title	INT
	First name	STRING[10]
	Surname	STRING[10]

The following table shows the declaration of the data blocks:

Name of the data blocks	Name	Data type
Target	Client	"Client" (PLC data type)
	Article	Array[0..] of "Article" (PLC data type)
	Bill	Array[0..10] of INT
Buffer	Field	Array[0..294] of BYTE

Overview of the valid data types (Page 1262)

PLC data types (Page 1306)

## Serialize: Serialization

### Description

You can use the "Serialize" instruction to convert several PLC data types (UDT) to a sequential representation without losing parts of their structure.

You can use the instruction to temporarily save multiple structured data items from your program in a buffer, which should preferably be in a global data block, and send them to another CPU. The memory area in which the converted PLC data types are stored must have the ARRAY of BYTE data type and be declared with standard access. Make sure that there is enough memory space prior to the conversion.

The operand at the POS parameter contains information about the number of bytes used by the converted PLC data types.

---

### Note

If you want to send a single PLC data type (UDT), you can directly call the instruction "TSEND: Send data via communication connection".

---

**Syntax**

The following syntax is used for the "Serialize" instruction:

**SCL**

```
Serialize(SRC_VARIABLE := <Operand>,
         DEST_ARRAY := <Operand>,
         POS := <Operand>)
```

**Parameter**

The following table shows the parameters of the "Serialize" instruction:

Parameter	Declaration	Data type	Description
SRC_VARIABLE	Input	VARIANT	PLC data type (UDT) that is converted to sequential representation.
DEST_ARRAY	InOut	VARIANT	Data block in which the generated data stream is stored.
POS	InOut	DINT	Number of bytes that the converted PLC data types use. The POS parameter is calculated zero-based.
Function value		INT	Error information

For additional information on valid data types, refer to "See also".

**RET\_VAL parameter**

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
80B0	The memory areas for the SRC_VARIABLE and DEST_ARRAY parameters overlap.
8150	The VARIANT data type at the SRC_VARIABLE parameter contains no value.
8152	Code generation error at SRC_VARIABLE parameter
8236	The data block at the DEST_ARRAY parameter is not a block with standard access.
8250	The VARIANT data type at the DEST_ARRAY parameter contains no value.
8252	Code generation error at DEST_ARRAY parameter
8253	There is not enough free memory available at the DEST_ARRAY parameter.
8254	Invalid data type at the DEST_ARRAY parameter
8382	The value at the POS parameter is outside the limits of the array.

\*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".

## Example

The following example shows how the instruction works:

### SCL

```
#Tag_RetVal := Serialize(SRC_VARIABLE := "Source".Client,
                        DEST_ARRAY := "Buffer".Field,
                        POS := #BufferPos);

#Label := STRING_TO_WSTRING('arti');

#Tag_RetVal := Serialize(SRC_VARIABLE := #Label,
                        DEST_ARRAY := "Buffer".Field,
                        POS := #BufferPos);

#Tag_RetVal := Serialize(SRC_VARIABLE := "Source".Article[#DeliverPos],
                        DEST_ARRAY := "Buffer".Field,
                        POS := #BufferPos);
```

The "Move value" instruction moves the value "0" to the "#BufferPos" operand. The "Serialize" instruction serializes the customer data from the "Source" data block and writes them in sequential representation to the "Buffer" data block. The number of bytes used by the sequential representation is stored in the "#BufferPos" operand.

A kind of separator sheet is inserted now to make it easier to deserialize the sequential representation later. The "Move character string" instruction moves the "arti" characters to the "#Label" operand. The "Serialize" instruction writes these characters after the customer data to the "Buffer" data block. The number of bytes that the characters need is added to the number already stored in the "#BufferPos" operand.

The "Serialize" instruction serializes the data of a specific article, which is calculated in runtime, from the "Source" data block and writes them in sequential representation to the "Buffer" data block after the "arti" characters.

The following table shows the declaration of the operands:

Operand	Data type	Declaration
DeliverPos	INT	In the "Input" section of the block interface
BufferPos	DINT	In the "Temp" section of the block interface
Error	INT	In the "Temp" section of the block interface
Label	STRING[4]	In the "Temp" section of the block interface

The following table lists the declarations of the PLC data types:

Name of the PLC data types	Name	Data type
Article	Number	DINT
	Declaration	STRING
	Colli	INT
Client	Title	INT

Name of the PLC data types	Name	Data type
	First name	STRING[10]
	Surname	STRING[10]

The following table shows the declaration of the data blocks:

Name of the data blocks	Name	Data type
Source	Client	"Client" (PLC data type)
	Article	Array[0..10] of "Article" (PLC data type)
Buffer	Field	Array[0..294] of BYTE

**MOVE\_BLK: Move block**

**Description**

The instruction "Move block" copies the contents of a memory area (source area) to another memory area (destination area). The number of elements to be copied to the destination area is specified with the COUNT parameter. The width of the elements to be moved is defined by the width of the first element in the source area.

The instruction can only be executed if the source area and the destination area are of the same data type.

The value of the OUT output is invalid if the following condition is met:

- More data is moved than is made available at the IN parameter or OUT parameter.

**Syntax**

The following syntax is used for the instruction "Move block":

```
SCL  
MOVE_BLK (IN := <Operand>,  
          COUNT := <Operand>,  
          OUT => <Operand>)
```

## Parameter

The following table shows the parameters of the "Move block" instruction:

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
IN <sup>1)</sup>	Input	Binary numbers, integers, floating-point numbers, TIME, DATE, CHAR, TOD	Binary numbers, integers, floating-point numbers, timers, DATE, CHAR, TOD, LTOD	The first element of the source area that is being copied
COUNT	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	Number of elements to be copied from the source area to the destination area
OUT <sup>1)</sup>	Output	Binary numbers, integers, floating-point numbers, TIME, DATE, CHAR, TOD	Binary numbers, integers, floating-point numbers, timers, DATE, CHAR, TOD, LTOD	The first element of the destination area to which the contents of the source area are being copied
<sup>1)</sup> The specified data types can only be used as elements of an ARRAY structure.				

For more information on valid data types, refer to "See also".

## Example

The following example shows how the instruction works:

```
SCL
MOVE_BLK(IN := #a_array[2],
          COUNT := "Tag_Count",
          OUT => #b_array[1]);
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	a_array[2]	The data type of the a_array operand is Array [0..5] of INT. It consists of six elements of data type INT.
COUNT	Tag_Count	3
OUT	b_array[1]	The data type of the b_array operand is Array [0..6] of INT. It consists of seven elements of data type INT.

Starting from the third element, the instruction selects three INT elements from the #a\_array tag and copies their contents to the #b\_array output tag, beginning with the second element.

**See also**

Overview of the valid data types (Page 1262)

**MOVE\_BLK\_VARIANT: Move block**

**Description**

The instruction "Move block" copies the contents of a memory area (source area) to another memory area (destination area). You can copy elements of an array to another array of the same data type. The size (number of elements) of the source and destination array may be different. You can copy several elements within an array or individual elements.

If you are using the instruction, the array must not yet be known at the time the block is created, as the source and the destination are transferred using VARIANT.

The counting at the parameters SRC\_INDEX and DEST\_INDEX always starts with the low limit "0", regardless of the later declaration of the array.

The instruction is not executed if more data is copied than is made available.

If the VARIANT pointer (source or destination) is of the data type BOOL, it must be addressed absolutely and the length specified must be divisible by 8; otherwise the instruction is not executed.

**Syntax**

The following syntax is used for the "Move block" instruction:

**SCL**

```
MOVE_BLK_VARIANT (SRC := <Operand>,
                  COUNT := <Operand>,
                  SRC_INDEX := <Operand>,
                  DEST_INDEX := <Operand>,
                  DEST => <Operand>)
```

**Parameter**

The following table shows the parameters of the "Move block" instruction:

Parameter	Declaration	Data type	Description
SRC	Input	VARIANT (array or single element)	Source block from which to copy
COUNT	Input	UDINT	Number of elements which are copied  Set the value at the parameter COUNT to "1", if no Array is specified at the parameter SRC or the parameter DEST.

Parameter	Declaration	Data type	Description
SRC_INDEX	Input	DINT	<ul style="list-style-type: none"> <li>The SRC_INDEX parameter is calculated zero-based. If an Array is specified at parameter SRC, the integer at the SRC_INDEX parameter specifies the first element within the source area from which copying is to take place. This is independent of the declared array limits.</li> <li>If no Array is set at the SRC parameter or only an individual element of an array is specified, assign the SRC_INDEX parameter the value "0".</li> </ul>
DEST_INDEX	Input	DINT	<ul style="list-style-type: none"> <li>The DEST_INDEX parameter is calculated zero-based. If an Array is specified at the DEST parameter, the integer at the DEST_INDEX parameter specifies the first element within the destination area to which copying is to take place. This is independent of the declared array limits.</li> <li>If no Array is specified at the DEST parameter, assign the DEST_INDEX parameter the value "0".</li> </ul>
DEST	Output	VARIANT	Destination area into which the contents of the source block are copied.
Function value (RET_VAL)		INT	Error information

For additional information on valid data types, refer to "See also".

### RET\_VAL parameter

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
80B4	Data types do not correspond
8151	Access to the SRC parameter is not possible.
8152	The operand at the SRC parameter is not typed.

Error code* (W#16#...)	Explanation
8153	Code generation error at SRC parameter
8154	The operand at the SRC parameter has the data type BOOL.
8281	The COUNT parameter has an invalid value
8382	The value at the SRC_INDEX parameter is outside the limits of the VARIANT.
8383	The value of the SRC_INDEX parameter is outside the high limit of the array.
8482	The value at the DEST_INDEX parameter is outside the limits of the VARIANT.
8483	The value of the DEST_INDEX parameter is outside the high limit of the array.
8534	The DEST parameter is write protected
8551	Access to the DEST parameter is not possible.
8552	The operand at the DEST parameter is not typed.
8553	Code generation error at DEST parameter
8554	The operand at the DEST parameter has the data type BOOL.
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

### Example

The following example shows how the instruction works:

#### SCL

```
"Tag_Result" := MOVE_BLK_VARIANT(SRC := #SrcField,
                                COUNT := "Tag_Count",
                                SRC_INDEX := "Tag_Src_Index",
                                DEST_INDEX := "Tag_Dest_Index",
                                DEST => #DestField);
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
SRC	#SrcField	The local operand #SrcField uses a UDT that was still unknown at the time when the block was programmed. (Array [0 to 10] of "MOVE_UDT")
COUNT	Tag_Count	2
SRC_INDEX	Tag_Src_Index	3
DEST_INDEX	Tag_Dest_Index	3
DEST	#DestField	The local operand #DestField uses a UDT that was still unknown at the time when the block was programmed. (Array [10 to 20] of "MOVE_UDT")

2 elements are copied from the source area into the destination area beginning with the fourth element of the array of UDT. The copies are inserted in the array of UDT beginning with the fourth element.

## UMOVE\_BLK: Move block uninterruptible

### Description

The instruction "Move block uninterruptible" copies the contents of a memory area (source area) to another memory area (destination area) without interruption. The number of elements to be copied to the destination area is specified with the COUNT parameter. The width of the elements to be moved is defined by the width of the first element in the source area.

The instruction can only be executed if the source area and the destination area have the same data type.

---

#### Note

The copy operation cannot be interrupted by other operating system activities. This is why the alarm reaction times of the CPU increase during the execution of the instruction "Move block uninterruptible".

---

The value of the OUT output is invalid if the following condition is met:

- More data is moved than is made available at the IN parameter or OUT parameter.

You can use the "Move block uninterruptible" instruction to move a maximum of 16 KB. Note the CPU-specific restrictions for this.

### Syntax

The following syntax is used for the instruction "Move block uninterruptible":

#### SCL

```
UMOVE_BLK (IN := <Operand>,
           COUNT := <Operand>,
           OUT => <Operand>)
```

**Parameter**

The following table shows the parameters of the "Move block uninterruptible" instruction:

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
IN <sup>1)</sup>	Input	Binary numbers, integers, floating-point numbers, TIME, DATE, CHAR, TOD	Binary numbers, integers, floating-point numbers, timers, DATE, CHAR, TOD, LTOD	The first element of the source area that is being copied
COUNT	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	Number of elements to be copied from the source area to the destination area
OUT <sup>1)</sup>	Output	Binary numbers, integers, floating-point numbers, TIME, DATE, CHAR, TOD	Binary numbers, integers, floating-point numbers, timers, DATE, CHAR, TOD, LTOD	The first element of the destination area to which the contents of the source area are being copied
<sup>1)</sup> The specified data types can only be used as elements of an ARRAY structure.				

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

```

SCL
UMOVE_BLK(IN := #a_array[2],
          COUNT := "Tag_Count",
          OUT => #b_array[1]);
    
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	a_array[2]	The data type of the a_array operand is Array [0..5] of INT. It consists of six elements of data type INT.
COUNT	Tag_Count	3
OUT	b_array[1]	The data type of the b_array operand is Array [0..6] of INT. It consists of seven elements of data type INT.

Starting from the third element, the instruction selects three INT elements from the #a\_array tag and copies their contents to the #b\_array output tag, beginning with the second element. The copy operation cannot be interrupted by other operating system activities.

**See also**

Overview of the valid data types (Page 1262)

**FILL\_BLK: Fill block****Description**

The "Fill block" instruction is used to copy the content of a memory area (source area) to a selected memory area (target area). The number of repeated copy operations is specified with the COUNT parameter. When the instruction is executed, the source area is selected and moved to the destination area as often as specified by the value of the COUNT parameter.

The instruction can only be executed if the source area and the destination area are of the same data type.

The value of the OUT output is invalid if the following condition is met:

- More data is moved than is made available at input IN or output OUT.

**Syntax**

The following syntax is used for the instruction "Fill block":

```
SCL
FILL_BLK(IN := <Operand>,
         COUNT := <Operand>,
         OUT => <Operand>)
```

**Parameter**

The following table shows the parameters of the "Fill block" instruction:

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
IN <sup>1)</sup>	Input	Binary numbers, integers, floating-point numbers, TIME, TOD, DATE, CHAR	Binary numbers, integers, floating-point numbers, timers, DATE, CHAR, TOD, LTOD	Element used to fill the destination area
COUNT	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	Number of repeated copy operations

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
OUT <sup>2)</sup>	Output	Binary numbers, integers, floating-point numbers, TIME, TOD, DATE, CHAR	Binary numbers, integers, floating-point numbers, timers, DATE, CHAR, TOD, LTOD	Address in destination area from which filling starts
<sup>1)</sup> The specified data types can also be used as elements of an ARRAY structure. <sup>2)</sup> The specified data types can only be used as elements of an ARRAY structure.				

For more information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

```

SCL
FILL_BLK(IN := #a_array[2],
         COUNT := "Tag_Count",
         OUT => #b_array[1]);
    
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	a_array[2]	The data type of the a_array operand is Array [0..5] of INT. It consists of six elements of data type INT.
COUNT	Tag_Count	3
OUT	b_array[1]	The data type of the b_array operand is Array [0..6] of INT. It consists of seven elements of data type INT.

The instruction copies the third element (#a\_array[2]) of the #a\_array tag three times to the #b\_array output tag.

Overview of the valid data types (Page 1262)

### UFILL\_BLK: Fill block uninterruptible

#### Description

The instruction "Fill block uninterruptible" is used to copy the content of a memory area (source area) to a selected memory area (target area). The number of repeated copy operations is specified with the COUNT parameter. When the instruction is executed, the value at the IN

input is selected and copied to the destination area as often as specified by the value in the COUNT parameter.

The instruction can only be executed if the source area and the destination area have the same data type.

---

### Note

The copy operation cannot be interrupted by other operating system activities. This is why the alarm reaction times of the CPU increase during the execution of the "Fill block uninterruptible" instruction.

---

The value of the OUT output is invalid if the following condition is met:

- More data is moved than is made available at input IN or output OUT.

You can use the "Fill block uninterruptible" instruction to move a maximum of 16 KB. Note the CPU-specific restrictions for this.

## Syntax

The following syntax is used for the "Fill block uninterruptible" instruction:

### SCL

```
UFILL_BLK(IN := <Operand>,
          COUNT := <Operand>,
          OUT => <Operand>)
```

## Parameter

The following table shows the parameters of the "Fill block uninterruptible" instruction:

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
IN <sup>1)</sup>	Input	Binary numbers, integers, floating-point numbers, TIME, DATE, CHAR, TOD	Binary numbers, integers, floating-point numbers, timers, DATE, CHAR, TOD, LTOD	Element used to fill the destination area
COUNT	Input	USINT, UINT, UDINT	USINT, UINT, UDINT, ULINT	Number of repeated copy operations
OUT <sup>2)</sup>	Output	Binary numbers, integers, floating-point numbers, TIME, TOD, DATE, CHAR	Binary numbers, integers, floating-point numbers, timers, DATE, CHAR, TOD, LTOD	Address in destination area from which filling starts
<sup>1)</sup> The specified data types can also be used as elements of an ARRAY structure. <sup>2)</sup> The specified data types can only be used as elements of an ARRAY structure.				

For additional information on valid data types, refer to "See also".

**Example**

The following example shows how the instruction works:

```

SCL
UFILL_BLK(IN := #a_array[2],
          COUNT := "Tag_Count",
          OUT => #b_array[1]);
    
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	a_array[2]	The data type of the a_array operand is Array [0..5] of INT. It consists of six elements of data type INT.
COUNT	Tag_Count	3
OUT	b_array[1]	The data type of the b_array operand is Array [0..6] of INT. It consists of seven elements of data type INT.

The instruction copies the third element (#a\_array[2]) of the #a\_array tag three times to the #b\_array output tag. The copy operation cannot be interrupted by other operating system activities.

**See also**

Overview of the valid data types (Page 1262)

**SWAP: Swap**

**Description**

You can use the "Swap" instruction to change the arrangement of the bytes of an input value and save the result in the specified operand.

The following figure shows how the bytes of an operand of the DWORD data type are swapped using the "Swap" instruction:

### Syntax

The following syntax is used for the "Swap" instruction:

```
SCL
SWAP (<Expression>)
```

The syntax of the instruction consists of the following parts:

Parameter	Declaration	Data type		Description
		S7-1200	S7-1500	
<Expression>	Input	WORD, DWORD	WORD, DWORD, LWORD	Input value
Function value		WORD, DWORD	WORD, DWORD, LWORD	Result of the instruction

For additional information on valid data types, refer to "See also".

### Example

The following example shows how the instruction works:

```
SCL
"Tag_Result" := SWAP("Tag_Value");
```

The result of the instruction is returned as a function value.

The following table shows how the instruction works using specific operand values:

Operand	Value
Tag_Value	0000 1111 0101 0101
Tag_Result	0101 0101 0000 1111

Overview of the valid data types (Page 1262)

**ARRAY DB instructions**

**ReadFromArrayDB: Read from array data block**

**Description**

You can use the "Read from array data block" instruction to read data from an array DB and write them to a destination area.

An array DB is a data block which consists of exactly one array of [data type]. The elements of the array can be UDT data type or any other elementary data type. The counting of the array always starts with the low limit "0", regardless of the later declaration of the array.

**Syntax**

The following syntax is used for the "Read from array data block" instruction:

**SCL**

```
ReadFromArrayDB (DB := <Operand>,
                INDEX := <Operand>,
                VALUE => <Operand>)
```

**Parameter**

The following table shows the parameters of the "Read from array data block" instruction:

Parameter	Declaration	Data type	Description
DB	Input	DB_ANY	Data block that is read
INDEX	Input	DINT	Element that is read
VALUE	Output	VARIANT	Value that is read and output
Function value (RET_VAL)		INT	Result of the instruction

For additional information on valid data types, refer to "See also".

## Parameters RET\_VAL

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
80B4	Data types do not correspond
80B5	Copying process was interrupted
8132	The data block does not exist or is too short
8133	The data block is located in the load memory
8134	The data block is write protected
8135	The array DB contains invalid values
8154	The data type is not correctly declared
8282	The value at the INDEX parameter is outside the limit values of the array.
8350	The VARIANT data type contains no value
8352	Code generation error
8353	Code generation error
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

## Example

The following example shows how the instruction works:

### SCL

```
"TagResult" := ReadFromArrayDB (DB := "ArrayDB",
                               INDEX := "ArrayDB"."THIS"[2],
                               VALUE => "TargetField[10].Data2[1]);
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
DB	ArrayDB	The data type of the "ArrayDB" operand is Array [0 to 10] of INT.
INDEX	ArrayDB."THIS"[2]	Third element of the "ArrayDB"
VALUE	TargetField[10].Data2[1]	The data type of the "TargetField" operand is Array [10 to 20] of "MOVE_UDT".

The third element is read from "ArrayDB" and written to the "TargetField[10].Data2[1]" operand.

## See also

Overview of the valid data types (Page 1262)

## WriteToArrayDB: Write to array data block

### Description

You can use the "Write to array data block" instruction to write data to an array DB.

An array DB is a data block which consists of exactly one array of [data type]. The elements of the array can be UDT data type or any other elementary data type. The counting of the array always starts with the low limit "0", regardless of the later declaration of the array.

### Syntax

The following syntax is used for the "Write to the ARRAY data block" instruction:

#### SCL

```
WriteToArrayDB (DB := <Operand>,
                INDEX := <Operand>,
                VALUE := <Operand>)
```

### Parameter

The following table shows the parameters of the "Write to array data block" instruction:

Parameter	Declaration	Data type	Description
DB	Input	DB_ANY	Data block to which data is written
INDEX	Input	DINT	Element in the DB to which data is written
VALUE	Input	VARIANT	Value to be written
Function value (RET_VAL)		INT	Result of the instruction

For additional information on valid data types, refer to "See also".

### Parameters RET\_VAL

The following table shows the meaning of the values of the RET\_VAL parameter:

Error code* (W#16#...)	Explanation
0000	No error
80B4	Data types do not correspond
80B5	Copying process was interrupted
8132	The data block does not exist or is too short
8133	The data block is located in the load memory
8134	The data block is write protected
8135	The DB is not an array data block.

Error code* (W#16#...)	Explanation
8282	The value at the INDEX parameter is outside the limit values of the array.
8350	The VARIANT data type contains no value
8352	Code generation error
8353	Code generation error
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

## Example

The following example shows how the instruction works:

### SCL

```
"TagResult" := WriteToArrayDB(DB := "ArrayDB",
                               INDEX := "ArrayDB"."THIS"[2],
                               VALUE := "SourceField[1].Data1[6]);
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
DB	ArrayDB	The data type of the "ArrayDB" operand is Array [0 to 10] of INT.
INDEX	ArrayDB."THIS"[2]	Third element of the "ArrayDB"
VALUE	SourceField[1].Data1[6]	The data type of the "SourceField" operand is Array [0 to 10] of "MOVE_UDT".

From the "SourceField" operand, the "Data1[6]" element from the second element is written to the "ArrayDB". The third element is written to the "ArrayDB".

## ReadFromArrayDBL: Read from array data block in load memory

### Description

You can use the "Read from array data block in load memory" instruction to read data from an array DB in load memory.

An array DB is a data block which consists of exactly one array of [data type]. The elements of the array can be UDT data type or any other elementary data type. The counting of the array always starts with the low limit "0", regardless of the later declaration of the array.

If the array DB is marked with the "Only store in load memory" block attribute, it is only stored in load memory.

The instruction is executed when a positive signal edge is detected at the REQ parameter. The BUSY parameter then has the signal state "1". The instruction is terminated if a negative signal edge is detected at the BUSY parameter. The DONE parameter has the signal state "1" for one program cycle and the read value is output at the VALUE parameter within this cycle. With all other program cycles, the value at the VALUE parameter is not changed.

When you insert the instruction in the program, the "Call options" dialog opens in which you can specify whether the block parameters will be stored in a separate data block (single instance) or as a local tag (multiple instance) in the block interface. If you create a separate data block, you will find it in the project tree in the "Program resources" folder under "Program blocks > System blocks". For additional information on this topic, refer to "See also".

**Note**

The array DB must be located in a data block with the block property "Optimized".

**Syntax**

The following syntax is used for the "Read from array data block in load memory" instruction:

**SCL**

```
"Instance DB" (REQ := <Operand>,
    DB := <Operand>,
    INDEX := <Operand>,
    BUSY => <Operand>,
    DONE => <Operand>,
    ERROR => <Operand>,
    VALUE := <Operand>)
```

**Parameter**

The following table shows the parameters of the "Read from array data block in load memory" instruction:

Parameter	Declaration	Data type	Description
REQ	Input	BOOL	REQ = "1": Starting with the reading of the array DB
DB	Input	DB_ANY	Data block that is read
INDEX	Input	DINT	Element that is read
BUSY	Output	BOOL	BUSY = "1": The array DB is still being read
DONE	Output	BOOL	DONE = "1": The instruction was executed successfully

Parameter	Declaration	Data type	Description
VALUE	InOut	VARIANT	Value that is read and output
ERROR	Output	INT	Error information: If an error occurs during the execution of the instruction, an error code is output on the ERROR parameter.

For additional information on valid data types, refer to "See also".

## ERROR parameter

The following table shows the meaning of the values of the ERROR parameter:

Error code* (W#16#...)	Explanation
0000	No error
80B4	Data types do not correspond
80B5	Copying process was interrupted
80C3	Too many concurrent calls
8132	The data block does not exist or is too short
8133	The data block is not located in the load memory
8134	The data block is write protected
8135	The DB is not an array data block.
8282	The value of the INDEX parameter is outside the limits of the array.
8350	The VARIANT data type contains no value
8352	Code generation error
8353	Code generation error
*The error codes can be displayed as integer or hexadecimal value in the program editor. For information on toggling display formats, refer to "See also".	

You can find descriptions of the error codes triggered by the instructions "READ\_DBL: Read from data block in load memory" and "WRIT\_DBL: Write to data block in load memory" under "See also".

## Example

The following example shows how the instruction works:

### SCL

```
"ReadFromArrayDBL_DB"(REQ := "TagReg",
    DB := "ArrayDB",
    INDEX := "ArrayDB"."THIS"[2],
    BUSY => "TagBusy",
```

**SCL**

```
DONE => "TagDone",
ERROR => "TagError",
VALUE := "SourceTargetField[1].Data1[6]";
```

The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
REQ	TagReq	BOOL
DB	ArrayDB	The data type of the "ArrayDB" operand is Array [0 to 10] of INT.
INDEX	ArrayDB."THIS"[2]	Third element of the "ArrayDB"
VALUE	SourceTargetField[1].Data1[6]	The data type of the "SourceTargetField" operand is Array [0 to 10] of "MOVE_UDT".
BUSY	TagBusy	BOOL
DONE	TagDone	BOOL

If a positive edge is detected at the "TagReq" operand, the "Read from array data block in load memory" instruction is executed. The third element is read from "ArrayDB" and written to the "SourceTargetField[1].Data1[6]" operand. As soon as a negative signal edge is detected at the "TagBusy" operand, the instruction is terminated and the value at the VALUE parameter is no longer changed. After the instruction has been processed, the "TagDone" operand the signal state "1".
